PUSHFUL THINKING—the busiest directors usually have the most progressive thoughts and ideas about the development of trade. But because they *are* so busy, many such ideas lie dormant or die for the sake of—what? Co-operation and inspired drive by men of similar calibre—men of ideas trained and well experienced in *pushful* thinking, *practical* interpretation and *profitable* follow through. *You* may need the alert, go-ahead services of the qualified team at Townend-Smith Ltd. (Advertising), 40-41, Conduit Street, W.1. Telephone Regent 2600 or write for an appointment without obligation.

HOLIDAYS abroad—not "organised" or mass produced but arranged as you or your friends may want. Cyprus—15 days (by air) from £131 9s.; also Malta and Gib. No currency restrictions. Europe—any country available on £25 limit with adequate spending money.—Write for brochure or phone Business and Holiday Travel Ltd., Grand Buildings, Trafalgar Sq., London, W.C.2. WHitehall 4114/5.

SHERRY EXPERTS SINCE 1664—in York, famed for sherry since the XVI Century! Send 20/- for a case of four quarter bottles—one of each of our four most popular wines (Cloister Cream, Cloister Fino, Old Bridge Amontillado and Mirador Dry S. African) carriage free.—J. & G. Oldfield Ltd., Bin 107, St. Sampson's Square, York.

PORTUGUESE Evening Classes, all grades. Term begins April 23rd. Summer Vacation Course at Coimbra University, July 14th-August 23rd.—Details from Portuguese Language Committee, 4, Upper Berkeley Street, London, W.1.

PLACE your Publicity in experienced hands.—Copyvets Press and Publicity, 316 Vauxhall Bridge Road, London, S.W.1. VICtoria 4189.

MONSANTO CHEMICALS LIMITED require a statistical assistant for the Newport Factory, South Wales. Applicants should be either graduates in economics (including statistics) or mathematics, and have had experience in the collection and analysis of statistical data. Work in the first instance will entail statistical analysis in the introduction of various production control programmes. The post is permanent and pensionable and a salary commensurate with qualifications and experience is offered.—Apply in writing, giving full details of age, education, training and experience, to the Chief Personnel Officer, Monsanto Chemicals Limited, Allington House, Allington Street, London, S.W.1. Please also quote ref. 509.

THE JOHN LEWIS PARTNERSHIP, a Co-Operative Society of Producers, requires Managing Director, man or woman, for Peter Jones, Chelsea. Policy high quality, good value. Present turnover exceeds two and a half million without advertising. Start £3,000 to £5,000 according to qualifications, advancing as business grows. Non-contributory pension one-sixtieth each year's pay. Negotiations strictly confidential.—Write fully "Chelsea Post," 35, Cavendish Square, London, W.1. Applications should be received by April 26th and will not be acknowledged earlier.

AN American Company in the pharmaceutical field offers a most progressive position to an Organic Chemist or Chemical Engineer between the ages of 30 and 35 years who has already embarked upon a career in commercial production. The Company is in early stages of production in the United Kingdom. Candidates should have a first-class general educational background, should possess a good University degree in either Organic Chemistry or Chemical Engineering and should have had some years' practical experience. Adequate training for this progressive executive position will be given and it is most important that the successful candidate should have the enthusiasm and ability to make the rapid progress envisaged by this Company.—Applications, giving complete details of education and career to date, to Box 903.

AUSTRALIAN manufacturers of diesel engines up to 15 h.p. prepared to negotiate agreement with company willing to manufacture in the U.K. for world markets. Australian company prepared to supply all manufacturing drawings and assistance under technical consultancy agreement and to place substantial initial order. This project should interest company foreseeing surplus foundry and machining capacity and available shop space for assembling the engines, a large proportion of which could consist of specialised bought-in parts.—Replies to Box 928.

STATISTICIAN required by rapidly expanding firm engaged on specialised market research. Applicants must have First or Upper Second Hons. Degree in mathematical statistics and practical experience in the tabulation and analysis of figures, together with grounding in market research. This post offers tremendous opportunities for advancement.—Write giving details of age, education, qualifications and previous experience, to Bedford Attwood; Attwood Statistics Limited, Chantrey House, Eccleston Street, S.W.1.

OLD-ESTABLISHED highly reputable Company, with selling agencies abroad, has spare capital and some factory space available. Would like to meet man or small Company in need of finance and space to manufacture some commodity in demand abroad, preferably in Colla countries. Raw material must be readily available. Recommendation by Solicitors or Accountants would be required. Strict confidence.—Box 916.

THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country-house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London. Reduced terms May. Open May 1st.—Write Major B. Carnegie, "Stronvar," Balquhidder, Perthshire.

IF you appreciate beautiful Gold and Silver Coins in finest condition, you cannot afford to miss our selection of choice specimens. Personal attention given to postal enquiries.—L. S. Forrer Ltd., 175, Piccadilly, London, W.1. (Regent 6974.)

IF YOUR PRODUCT is technical . . . and it needs advertising or some printed matter . . . get in touch with Geoffrey Dadd Ltd., the nationally known Technical Advertising Practitioners, 90, Epsom Road, Sutton, Surrey. Derwent 4444 (4 lines).

CANADIAN MARKETS.—May I represent you? I am in the United Kingdom for the next four weeks and could arrange to represent you in Canada.—Please write to B x 924.

FOR SALE—*The Economist* complete with Indexes 1946-47 bound. 1948 to June 1951 unbound.—Offers to Box 920.

UNIVERSITY OF OXFORD
DIRECTORSHIP OF THE INSTITUTE FOR RESEARCH IN AGRICULTURAL ECONOMICS

Applications are invited for the above directorship which will become vacant on December 31, 1952. Post tenable for seven years in the first instance. Applications should reach the Registrar of the University not later than May 3, 1952. Stipend £1,900 per annum (plus children's allowances). The duties will include responsibility for teaching in agricultural economics at both the undergraduate and post-graduate level. Special regard will be paid to applications from economists with special interest in agricultural problems. Retiring age 65. Further particulars may be obtained from the Registrar, University Registry, Oxford. WMG/RM. 8.3.52.

OXFORD UNIVERSITY COMMITTEE FOR COLONIAL STUDIES

Applications are invited for the post of Research Assistant to the Professor of Colonial Economic Affairs, at the Institute of Colonial Studies. Applicants should be graduates in Economics, History or Social Science and be able to take responsibility in the collection and collation of source material; experience in handling statistical material will be an advantage. Salary on scale £350 x £25 to £550 and F.S.S.U., entry into scale determined by qualifications, age and experience. The appointment will be for 3 years, of which the first will be regarded as a year of probation.—Applications, giving particulars of education, national service, and experience, and the names of two referees, should reach the Secretary, Institute of Colonial Studies, 10 Keble Road, Oxford, by May 15th.

UNIVERSITY OF BIRMINGHAM
ASSISTANT LECTURESHIP IN STATISTICS

Applications are invited for an Assistant Lectureship in Statistics, tenable in the Faculty of Commerce and Social Science. The post will be in Grade III (£450 x £50 — £500) and the appointment will be made in the first instance for a probationary period of three years. The successful candidate will be expected to teach and to develop work in economic or social statistics. He or she should be well grounded in statistical method and acquainted with current sources.

Applications, together with the names of three referees should reach The Registrar, The University, Birmingham, 15, by April 30th. Further particulars may be obtained from the undersigned.

C. G. BURTON, Secretary.

The University, Birmingham, 3.
March, 1952.

UNIVERSITY OF DURHAM
THE DURHAM COLLEGES

Applications are invited for the post of LECTURER IN POLITICS, which will be vacant on October 1, 1952. The appointment will be temporary for one year, and will carry a salary of £500.

Further particulars may be obtained from the Secretary, 38, North Bailey, Durham. Applications should be sent to him not later than May 6, 1952.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for the following posts in the Department of Economics and Political Science:—

(1) Assistant Lecturer in Economics. Salary £450 per annum, rising to £500.

(2) Two Research Assistants. Salary £450 per annum. Appointment for one year in the first instance but renewable up to a maximum of two further years. One Research Assistant will be required for a project in the field of Modern Welsh Economic History and one for a project in the field of Industrial Organisation.

Applications, with the names of two referees, should reach the undersigned, from whom further particulars may be obtained, not later than May 8, 1952.

T. MAELGWYN DAVIES, Registrar.

THE GLASGOW AND WEST OF SCOTLAND COMMERCIAL COLLEGE
(Central Institution for Higher Commercial Education)
Principal—Dr. ERIC THOMPSON, M.A.(Com.), B.Sc.(Econ.)
DEPARTMENT OF MANAGEMENT ACCOUNTANCY

AMENDED ADVERTISEMENT

Applications are invited for the post of Head of the Department of Management Accountancy in the College. This is a new Department and the present salary attached to the post is £1,050 x £50 to £1,250 per annum. The successful candidate will be required to take up his duties on May 1st or as soon thereafter as possible. Previous teaching experience, although desirable, is not necessarily essential, and age will not adversely affect a candidate's application. Further particulars of the post may be obtained from the Secretary of the College, and applications (no special form) should be received as soon as possible. A. W. MIDDLETON, Secretary.

Pitt Street, Glasgow, C.2.

UNITED NATIONS is seeking statisticians for immediate or future appointment at United Nations Headquarters, New York. Candidates should be University graduates in Statistics or in Economics, Mathematics or Sociology allied with Statistics. Preference will be given to candidates with higher degrees or with practical experience in Statistics.

Facility in English is essential and working knowledge of either French or Spanish is desirable.

Entrance base salaries range $4,250 to $5,750 gross equivalent to $3,600 and $4,800 free of all taxes, plus cost of living and other allowances.

Send full particulars, including age, nationality and record of employment, to Recruitment Section, Bureau of Personnel, United Nations Headquarters, New York City, U.S.A.

Applications which do not meet minimum requirements will not be acknowledged.

SPANISH Evening Classes, all grades. Term begins April 21st. Also Vacation Course at Universidad Internacional, Santander, August 1st-31st.—Details from the Hispanic Council, 4, Upper Berkeley Street, W.1.

QUALIFIED STAFF AVAILABLE NOW

Planning Unplanned

THE Economic Survey for 1952 is the sixth of its kind and the first to be produced by a Conservative government. It is a full and illuminating account of the British economy in 1951 and a useful restatement of present difficulties and known policies. But it is not for those things that the Survey is being anxiously read, both in Britain and abroad. Its importance lies in what it says about the future, and in particular about the methods by which this Government hopes during the next three years or so to strengthen and expand the British economy while making the country more secure.

At best, the 1952 crisis of sterling has as yet merely been put into suspense. It cannot be escaped unless last month's improvement in confidence is not only maintained but extended. The Government has to give the world more general grounds for optimism about Britain than are provided simply by raising Bank rate to 4 per cent and cutting the food subsidies. The need that the Survey could have met is to put these particular measures into the context of a general economic philosophy and strategy.

The outside world, more perhaps than the British voter, sees the ministers who have been in office for the past six months as the men who had spent the previous six years castigating the philosophy and strategy expressed in the last Government's economic surveys. This, surely, was the opportunity to demonstrate, to the small public at home and abroad which reads the Survey, that intellectually at least British Conservatism has an alternative, even if it is hedged round in practice by formidable political limitations. The opportunity was all the greater because this year's Survey is later than usual and comes after, not before, the Budget. The major decisions of immediate policy were made more than a month ago, and here the Survey could do little but repeat and explain. If it was to say anything constructive and important, if it was to contribute something of its own to confidence in Britain under a new Government, its primary function was to discuss the next stages in economic planning.

It does nothing of the kind. The obstacle that prevents it is perhaps technical rather than political. The Government does not know how to plan. The planning of the past has been discredited for two obvious reasons. It relied too much on physical controls and it was expressed too much in precise "targets," or estimates, for coal output, manpower movements, exports and all the rest. The present Survey will be worth a line or two in the history of economic policy in Britain only because it carries on to a stopping-point the trend of development in the Labour party's ideas of economic planning: the trend to vanishing-point. The targets of 1947 and 1948 became the estimates of 1949; in 1950 and 1951 the estimates become less detailed and more cautious. Now they have almost entirely disappeared. In itself, this is a welcome realism. But what is the replacement for too much ambition in planning? If the Government no longer sets itself to do precise things, or to see that precise things are done, how does it

fulfil its general responsibility for the course of the economy?

In principle, the answer is plain and familiar enough. Planning has gone wrong since the war because both the government's physical controls and its estimates have had little relation to the main economic policies, and particularly to the fiscal and monetary policies, of the planners themselves. Plans to shift workers to essential industries and the like have been gestures of defiance, brave hopes flung into the teeth of the gale. If the planners have been mocked, it is not because their estimates were so often wrong but because so little was done to make them right, to achieve what the government thought desirable. Planning itself was unplanned.

*

To stop setting targets or framing estimates does not change the nature of planning. It exposes the hollowness there has always been. It merely poses the question: What, under a Conservative government or even a future Labour government, is the purpose of the Survey that was intended to be the annual exercise in democratic planning? How, now that the initial illusions are finally broken, can reality be given to planning? If it is truly to express the government's general responsibility for the economy, the primary function of the Survey is to discuss—in concrete, quantitative terms—the significance for government policy of the main economic questions with which it has each year to deal. The questions for 1952 are apparent. What are the relative strengths of inflationary and deflationary forces in the world economy as a whole? How, in particular, is the level of demand in Britain itself likely to change? How seriously will British export trade be affected by the restrictions other governments put on imports, even if world activity is unchecked? What is the significance for the sterling area mechanism of cuts such as Australia has made in trade with other members of the area? What are the comparative prospects of British exports of different things and in different markets? In what directions and in what magnitude ought resources of manpower and materials to be redistributed between industries in order to meet the changing needs and opportunities of the year?

On such questions as these the government must have some tentative ideas—implicit if not explicit—in order to have any policy. The value of an economic survey consists in making the ideas explicit. They cannot be firm ideas; but they surely should be discussed—and be discussed with, where it is appropriate, figures to indicate the possible size of the changes that may happen or the results that may be achieved. There is no need to be afraid of making official estimates as long as they are acknowledged to be estimates. If there are no figures at all, there is no planning.

This year's Survey is almost as innocent of discussion as of figures. It points out uncertainties and in conclusions rarely gets beyond unexceptionable generalities. It emphasises, for example, this country's need to earn a surplus, not strike a mere balance, in overseas payments. It makes the obvious point that in the sort of world Britain now has to live in, expanding exports means primarily expanding engineering exports. It would surely be reasonable to go on to consider how large an expansion of the engineering industries this may call for if, over the next three or four years, there is also an effort to meet British industry's demand [illegible] equipment and the British consumer's demand [illegible] metal goods.

The Survey summarises the general problem [illegible] unusual neatness. In 1951 "we could not sell eno[illegible] of the things we could supply and we could not sup[illegible] enough of the things we could sell." It underlines w[illegible] some boldness the general need for shifting resourc[illegible] "Some industries may have to contract in order t[illegible] others can expand. Adjustments of this kind are alwa[illegible] difficult and painful, and they must inevitably cause[illegible] temporary increase in unemployment while workers [illegible] changing jobs." The question is how much practi[illegible] force lies behind these excellent sentiments. It is n[illegible] of course, a matter of detailed "planning" by gover[illegible] ment controls. The shifts are to be brought about [illegible] market forces, by letting financial pressure work on co[illegible] tracting industries and tolerating some small financi[illegible] inducements to expanding industries. But to rely [illegible] general policies does not make forecasting unnecessar[illegible] The Government can make a rough judgment ho[illegible] strong its policies ought to be—how far disinflatio[illegible] should go—only if it has some idea how much som[illegible] industries need to expand and therefore how much othe[illegible] ought to contract.

At such points the Survey is weak where it is nc[illegible] empty. It barely looks beyond the problems of this yea[illegible] and what it says about this year is a very mild reflectio[illegible] of the brave generalisations. Business men and trad[illegible] union leaders will look to it for an assessment of th[illegible] dangers of recession that worry them. They will loo[illegible] in vain. The Government assumes that "market forces [illegible] —in particular, the textile recession—will help to shif[illegible] labour where it is needed and so reduce the amount o[illegible] disinflation that must be brought about by deliberate[illegible] policy. But the Survey makes no attempt to assess how important this influence may be. And on the general prospects it says almost nothing.

Undeniably, there has been a change in the past six months in the economic weather in this country and throughout the world. To put it at its lowest, there is definitely less inflation than there was. But even so it is impossible to believe that at this moment, while the pace of rearmament is still increasing, any appreciable recession in the American economy, or in the world as a whole, is in sight. At home, unemployment in all industries except textiles and clothing has been small and almost constant for the past three months. At 317,000 it was only 52,000 bigger in March than at the same time last year—and smaller than it was at the same time in the two previous years. Except in textiles, there is no evidence whatever of anything but the mild financial difficulties that a policy of dearer money is intended to create, and on which the success of government policy depends. Indeed, the number of vacant jobs rose slightly last month and became equal to the number of unemployed outside textiles. The present talk of a slump is unreal. But that does not mean that it should not be discussed. Precisely because the state of the balance of payments would make it disastrous for this country to start fighting a slump before there is a slump, it is essential to watch for the earliest signs that a slump may really be beginning. Only one thing would be more foolish than to assume that it could not happen, and that is to let people talk themselves into a slump when there is no evidence of it. If an Economic Survey has any purpose at all, it should be to discuss—cautiously

but frankly—what the situation looks like from Whitehall.

There are, no doubt, two reasons for the emptiness of this year's Survey. Ministers are not clear in their own minds what economic planning under a Conservative government involves. They have let the momentum of the machine carry it on—but, for form's sake, slightly diluting the sort of document that it produced under their predecessors. That in itself is not, for one year, any great matter. But would ministers have been able to let their thoughts fall into this ready-made pattern if they really had anything new or important to say about future policy? They have devised, as their predecessors several times devised before them, a set of temporary expedients which may be inadequate—or may be inadequate—to carry through its immediate crisis. After the publication of the Survey they cannot pretend, either to themselves or to anyone else, that they have as yet done anything more. They cannot delude themselves that in 1955, or whenever the next election may be, the country will thank them for saving it from what did not happen in 1952. The test is whether the Government has a developing policy for making this country more prosperous and more secure in 1953 and 1954. It has not revealed any such design yet. If it finds a policy, next year's Survey may have something to say and planning will for the first time be planned.

SECRETARIAT LIBRARY 27 MAR 1952 PARLIAMENT

"Containment Plus"

THE discreet silence of western diplomacy about its hopes and purposes in Eastern Europe becomes more and more conspicuous. When the Russians declare that the eastern frontiers of Germany are settled once for all, the western Foreign Ministers are found to be ready with no effective reply. When the Communist governments of Poland and Czechoslovakia get into grave economic difficulties and blame western countries for restricting trade, no one in the West stands up and says "that is precisely what we want to do." Instead, leaders of public opinion speak piously of the need to relax tension and imply that to create a little, probably quite temporary, employment in Lancashire it is worth helping to save the prestige of the five-year plans beyond the iron curtain. And when Mr Bevan and his friends make it clear that they have ceased from mental strife about the tyranny that reigns there, it is left to a Spanish liberal in exile, Señor de Madariaga, to ask in the columns of the *Manchester Guardian* whether East Europeans are to maintain their standard of dying so that the British may maintain their standard of living. There is, indeed, a growing tendency in the West to assume that foreign policy consists in keeping the Russians quiet by a certain measure of rearmament—as little as possible—and by a great deal of organisation. The main purpose of policy is to keep things as they are. Containment is both the end and the means. What lies beyond is nobody's business.

There are, of course, good reasons both for official silence and for popular carelessness. People want peace, some of them at almost any price. They will make some effort to keep Communist power where it is now; they are not, as yet, willing to make any effort to push it back to where it was in 1939. British reactions to MacArthurism and Chiang Kai-shek make that quite clear. They are loth to consider how and where—if at all—that would be possible. They accept laconically statements—most of them American—that western policy is to create situations of strength and then strike bargains with Stalin, or his successors. This being the mood to which politicians appeal—not only in Britain—the diplomatists find it convenient to keep quiet. If they said, as they would be entitled to say, that Europe can enjoy no real security until Soviet forces have withdrawn behind their own frontiers, they would be called warmongers. If they said, with equal justification, that western policy has no plan for relieving its friends in Eastern Europe, they would be charged with betraying wartime pledges and—dread word—appeasing Stalin. For the moment, therefore, it is easier and seems wiser to say nothing.

From the viewpoint of the Kremlin this silence of embarrassment must look like the silence of conspiracy. From London and Paris, from the land and sea stations of the Voice of America, from Radio Free Europe in Munich, and from such guerrilla bases as Madrid and Belgrade and so-called "black" stations, there comes hour after hour a stream of criticism and exhortation directed at the Soviet Union and its satellites. The effort is comparable only to that of the Cominform itself. To Moscow monitoring services and to the Russians who read analyses of western output, it must all look systematic and sinister. To experienced Communists, who themselves plan ahead and think in terms of political warfare, it must seem incredible that all this activity is not harnessed to a plan for war and civil war among the western marches of the Soviet Union. To encourage resistance by words and to have no intention of supporting it later by arms does not, the Russian would argue, make sense.

He is obviously right. Propaganda that does not aim at making people act and think according to a plan of operation is poor stuff; and it may well be that some of the western output to Eastern Europe is poor stuff. But the extent of Soviet jamming and other evidence suggest that some of it is very hot stuff. There is, for example, the output of Radio Free Europe, whose headquarters in Munich is subject to no official control, and which can interpret as it pleases the aspirations of exiles and what it believes to be the policy of the State Department and the Pentagon. It is most unlikely that either friendly or hostile listeners distinguish clearly between what is said on the air officially and what is said unofficially; and the general atmosphere of conspiracy is heightened by the actual and alleged activities of the Central Intelligence Agency behind the iron curtain.

There can, indeed, be little doubt that there is in Eastern Europe a widespread belief that time will bring what the rulers call a war of aggression and what the ruled call liberation.

There is much to be said for frightening both the Politburo and its friends in Eastern Europe. For the West to allow tyrannical regimes to carry out their aims without making any effort to exploit their difficulties would be a craven and short-sighted policy. Its govern-

ments are fully entitled by the rules of the cold war to play the Cominform at its own game. What is dangerous is that an unofficial and covert policy of "actively supporting passive resistance" should run parallel with an official policy of doing next to nothing about Eastern Europe. In wartime the right hand need not always know what the left hand is doing; in peacetime it must. To encourage in any way, even by accident, the belief that the West is preparing to go to war for the liberation of Poland, Czechoslovakia and the rest is to mislead millions of gallant people, to fly in the face of the declared purposes of Atlantic alliance, and to cause Moscow the wrong kind of apprehension.

It would be natural to expect the closest Anglo-American co-operation in these matters, to assume regular consultation on activity and propaganda in Eastern Europe and general agreement on a carefully defined policy. It is uncertain whether this is yet the case. Although specialists and departments consult, there is no evidence that a concerted policy for Europe's most inflammable area exists. Yet the Russians and the security experts of their allies are probably convinced that there does exist a highly organised western plan of operations, and that official silence about Eastern Europe is designed to conceal it. They would naturally assume that their opposite numbers think and work like themselves.

This is obviously an unsatisfactory state of affairs, which might become dangerous. It may mean that American and British policies are out of step and that there are two policies in Washington. It may mean that planning has moved from containment pure and simple to containment plus all such interference with the Russian sphere of influence as can be safely got away with. The case for making the change to "containment plus" has been admirably argued in a pamphlet on British foreign policy recently published by a group of Oxford dons.* As the West gained strength it was bound to come; but it should not have come surreptitiously. In a decision to pass in Europe from containment to political, economic and social counter-attack there is nothing whatever to be ashamed of. So long as the cold war goes on it is a legitimate aim of policy to make life difficult for the Gottwalds and Bieruts. To restrict trade with them, and so increase their demands for Soviet capital goods and raw materials, is legitimate economic warfare against a government which supplies the Chinese in Korea with nearly a thousand jet aircraft. What is wrong is that policy in such a matter should be formed piecemeal under the pressure of special requirements without any formulation of how far it is to go and what its ultimate objectives are to be. Indeed, had it not been for the writings of Mr George Kennan, now about to become United States Ambassador in Moscow, no one would ever have known what the policy of cantainment amounts to.

★

It is clearly impossible for the western nations to accept, or give the impression of accepting, that Soviet forces should remain permanently poised for action in Eastern Europe; but it is likewise out of the question that they should propose to drive them out and supplant the Communist regimes with emigres. But it would be both wise and right that they should make at a suitable moment a declaration of aims which would restore a sense of reality on both sides of the iron curtain. They could say that in no circumstances will they attempt to change the state of affairs in Eastern Europe by force of arms: but they must go on to say that they will continue to condemn and work against the abuse of human rights and treaty pledges by the Communist governments of that area. They will go in Eastern Europe as far and no further than the Cominform itself goes in their own countries. Co-existence with Eastern Europe will be just as peaceful as Moscow likes to make its own co-existence with Western Europe. Such a statement might help to reassure the Soviet Government, in its more fearful moments, about the intentions of the Atlantic alliance, though this is doubtful. But it would certainly help to prevent "accidents" on the European frontier between East and West. And, above all, it would check the present tendency of people in Western Europe to thrust the plight of the East away from their consciences because they feel that there is no alternative between going to war and doing nothing. Much can be done and, apparently, is being done; but it has not been given the firm and considered support of public opinion. If it had, the West would not be witnessing the present undignified scramble for the trading favours of Moscow, Prague and Peking; and people would have a clearer understanding of what is needed to win the cold war and restore security in Europe. The policy of "containment plus" is just beginning to hurt the East; but unless it is formulated and explained, public opinion will not support it and accept its consequences.

A Noble Temple

When the question of removing the Crystal Palace was first mooted, while the Exhibition was in the full tide of its glory, we felt so certain of its being preserved that we spoke of the removal of St. Paul's as equally probable. The time, however, has arrived when the Crystal Palace is in great danger of being pulled down, and when it can only be saved by a strong and general expression of public opinion. . . . The very thought of defacing or injuring St. Paul's stately temple is considered a desecration. Yet it may be doubted if it now finds a fitting congregation or fitting service, and be not more visited by sightseers than worshippers. Human feelings—sufferings and enjoyments—"hallow to human hearts" "the ruin of a wall," and consecrated by human feelings the Crystal Palace is a noble temple. . . . Considered as a temple, the Crystal Palace was expressly consecrated to that industry by which life is sustained and filled with enjoyments. To pull it down is something like casting an insult on the manual skill it was erected to protect, exhibit and honour. It would be tantamount to declaring that labour has reverted to its old condition of serfdom, and is less worthy of respect than the idols that were worshipped in antiquity or in the middle ages. . . . The Vandals pulled down buildings that they regarded with superstitious terror, and were never connected in their minds with one kindly thought; but the Crystal Palace, which our Vandals would destroy, is entwined in the heart of the community by the most enobling and endearing sentiments. It is connected with intellectual enjoyment, the progress of knowledge, and the peace of the world; and no temple built by human hands is more worthy of preservation.

Government by Guillotine

THIS week the Government has resorted to the guillotine in order to get contested legislation through the House of Commons. The device is always distasteful. A guillotine resolution, such as was passed on Wednesday for the Health Service Bill, imposes a rigid timetable for the various stages of the Bill's passage through the House and for the detailed discussion of its clauses in committee. The normal processes of Parliamentary discussion are intended to give the minority party or parties the fullest possible rights of criticism of the government. The use of the guillotine is a confession that those normal processes have broken down.

This is always regrettable, but it does not condemn the guillotine. The test is why the breakdown in normal procedure has occurred. If the government is responsible, if it has unreasonably incited the opposition to delaying tactics, then in effect ministers have themselves chosen to govern by guillotine and stand condemned. They are asserting more authority over Parliament than they have any political right to. But, equally, it may be the opposition that tries to assert an undue authority. It may abuse the powers of delay that free discussion gives to it. The right to such discussion cannot be upheld against the primary responsibility of ministers, which is to conduct the business of Her Majesty's Government in Parliament. It is because that responsibility is paramount that the British system of government gives, as a measure of last resort, an almost unlimited power to any majority of the House of Commons that remains united and is prepared to risk the consequences at the next general election. The guillotine is the most extreme exercise of that power which convention has sanctioned. Oppositions will always vehemently protest against it—as the Liberals joined the Labour party in protesting this week. But there is no government that may not be driven to use it, however reluctantly, as a measure of last resort.

★

These general principles are clear, but it is not only the emotionalism of Wednesday's debate that makes them hard to apply. Responsibility for the breakdown in normal procedure over the Health Service Bill is divided between the Conservative and Labour parties. The Government's fault is not that it has tried to assert too much authority over Parliament, but that it has not known what it wanted to do. After only six months in office, it finds itself in a Parliamentary jam partly by ill-luck—particularly the death of King George VI, which held up debate for ten days—but chiefly through its own incompetence.

It began by shortening the session by taking an extra fortnight for the Christmas recess. That would have been wise if it had achieved what it was supposed to do—to enable ministers to return to Westminster at the end of January with a clear and settled programme of action. Most—Mr Butler and the housing ministers were the conspicuous exceptions—in fact came back as befogged as they left. Neither of the Government's two really contentious pieces of legislation, the Steel Bill and the Transport Bill, has yet seen the light of day. The Government lost Parliamentary time by fixing a date for the Budget it could not keep and by modifying the Health Service Bill under pressure from its own backbenchers. More than once it has lost time by sheer clumsiness in the leadership of the House, which has enabled the Opposition to out-manœuvre Mr Crookshank. And, to crown all, it is now wasting more time by incurring the necessity of a day's debate next week on the unprofitable folly of its intervention over transport fares. The result is plain. Unless it now imposes a rigid timetable, the Government cannot hope to get through its major legislation this session. Even if it faced the meekest of oppositions, the remaining days of the spring and summer would not provide it with time for more than one of the denationalisation bills.

It is difficult to have much sympathy with ministers in the predicament into which they have got themselves. But it is necessary to condemn far more the arrogance with which the Labour party is behaving. It is not the Government but the Opposition—led, as usual, by its tail—that is trying to assert more authority over the conduct of Parliament than is compatible with the ordinary processes of free discussion.

There is no firm line between delay, which is in moderation a normal and legitimate tactic of opposition, and obstruction, which is the abuse of the minority party's rights to criticism. But in recent weeks Labour has put itself far on the wrong side of any reasonable line. Its object, it is true, is the same as the Tories' own object a year ago: to block the Government's path and force it to go to the country. But there is this difference. A year ago the Labour Government had nothing to do; it had no legislative programme. It was patently clinging on in the hope that something would turn up. The present Government, for all its weaknesses, has something to do. The Tories were obstructing men, the Labour party is obstructing measures. Its technique is, according to one of its chief designers, to employ Government time in "administrative" measures—such as the Army (Annual) Bill—in order to deny it time to introduce "contentious" measures. During the first three days on the committee stage of the Health Service Bill, the Labour backbenchers carried the attempt to waste time to the point of attacking as much their own leaders as the Conservatives. No Government could or should quietly let its business be held up while the Opposition advertises its internal feuds. Whatever that may be, it is not the efficient democracy that the obstructionists claim to be defending.

The Opposition can justify its recent use of Parliamentary time only by denying that the Government has a right to govern. The denial takes two forms. It is argued that the Government has lost the support of the country and should resign. Somewhat more moderately, it is said that because the Government has a small majority it should not do anything that the Labour party dislikes.

Both claims are nonsense. British democracy does not work by referendum—still less by the vague indications of popular feeling that elections to county councils provide. A British Government is put into office for as long, within five years, as it can keep its majority in the House of Commons. The last thing wanted in a constitution is that it should force ministers continuously to look over their shoulders to make sure that they are popular all the time for all they do. No government should be judged

by its popularity after a few months. The last Labour government was urged to resign in 1951 not because it was manifestly unpopular but because it did not know what to do. The present government may get into the same condition, but it is not quite there yet, and if it has a policy it is entitled to carry it out. The more sophisticated of the Labour tacticians would accept this in principal but add a convenient rider: a government should avoid controversial legislation unless its majority is big enough for detailed discussion to be left to a standing committee rather than the whole House—which means, unless it has a majority of about sixty.

This would be strange doctrine from any party, but from the party that has done most to extend the power of the state it is patently insincere. To require more than a simple majority for controversial legislation might well paralyse British government. Who can be sure that any party will command a majority of sixty in the foreseeable future? Is the Labour party prepared to give an assurance that it will abjure anything the Tories dislike until it has a majority of sixty? Does it now regret that it put the Steel Bill into force in the last Parliament?

It is, of course, true that the sort of programme a government can and should carry out depends in part on its Parliamentary strength. If it is to govern effectively it cannot avoid controversy because it has a small majority. It should try to limit the scope of the controversy to essentials that are, as far as possible, familiar to public opinion. At the present time it would be wrong if, for example, Mr Churchill's Government set out to reform the House of Lords or to denationalise coal or the railways or electricity. But the criticism would in this case be of the measures—as was the criticism of Labour's nationalisation of steel in the last Parliament—not of the constitutional method. A small majority does not in itself give the opposition more right to be obstructive. Two principles may fairly be laid down. An opposition is entitled to go beyond the normal techniques of delay if the government tries to push through a programme that is unreasonable in scope—because it involves more legislation than there is time to criticise thoroughly. That has certainly not been true, even given the need to take Bills in committee of the whole House, of the present Government's programme so far, and there are no signs that it will become true. Secondly, an opposition is justified in obstruction if the government attempts a programme that is authoritarian in content—if it departs from its own clearly professed principles as the electors know them or if, without any acute pressure of circumstances, it does things on which public opinion has never had the chance to express itself. There cannot on those grounds by any objection to anything in the Government's economic policy or in its legislation—in the Army Bill, in the Health Service Bill or, when they come, in the Bills for steel and transport.

The immediate conclusion is plain. The Government is caught in a net that is partly of its own making and partly the product of circumstances beyond its control, but chiefly a net laid by the Opposition. It has no choice but to use the drastic weapon of the guillotine to clear a way for itself at this stage. But it is right to do so only on two conditions. First, it should remember, whatever the provocation from the Opposition, that it has to try to conduct the business of state in this Parliament for another four years ; it cannot hope to do so with credit unless it scrupulously keeps departures from full freedom of debate to the indispensable minimum. Secondly, it should not be afraid to draw the obvious moral from the state it is in. The way to avoid future jams of the same kind is for ministers to prepare their programme better and, above all, to make up their minds more quickly and more consistently. Indecision and muddled thinking are more dangerous than muddled procedure. To use the guillotine to force through Parliament a consistent policy honestly conceived in the national interest is justifiable even if it is unpleasant and unpopular. But to use the guillotine to impose the incoherent policies of frightened men would be damaging for the country, for Parliament and for the Conservative party alike.

NOTES OF THE WEEK

Sir Stafford Cripps

Sir Stafford Cripps seems unlikely to hold in history the stature as a Chancellor of the Exchequer that public opinion gave him in 1948. But that decline—visible already in the more sophisticated of the obituary notices—reflects the nature, not the size, of his achievement. It was the triumph of character rather than of deeds ; it was the changing of a mood rather than the formulation of a policy. It may look thin in the history books, but Sir Stafford's personal contribution was real and decisive in the experience of his times.

Few men have more certainly shortened their lives by selfless devotion to a chosen duty. There are even fewer politician whose sincerity of purpose has been so universally recognised—by friends, by opponents and, most significant of all, by rivals in his own camp. The tribute paid to him on Tuesday by Mr Churchill was as real as Mr Attlee's. Yet the rectitude that commanded such respect was curiously personal. It sprang from a conviction of the strength not merely of morality in general but of Sir Stafford's own particular moral force and of the competence it gave him to move the world not in faith and thought but in the dusty arena of politics. Such an attitude is scarcely comprehensible to most men and perhaps hardly at all to politicians. Yet it worked. Sir Stafford Cripps did move the world ; he forced a purpose on his party when it was bewildered and by that he saved his country from drifting disastrously.

His characteristic achievement was the policy of voluntary restraint in wages, which he put into precise form soon after he became Chancellor and which was finally breaking down as he resigned. That policy was a crazy improvisation. It defied gravity and commonsense. It could not and ought not to have lasted longer. Yet by the sheer force of Sir Stafford's character, it was fairly effective. And thereby rigidity became, for once, the stimulus to expansion ; wage restraint gave the economy an invaluable measure of internal stability at a time when production was expanding, and it therefore made possible the diversion of resources to export.

This was his distinctive success ; his distinctive weaknesses had been demonstrated in his political misjudgments before the war, and they were never hidden afterwards. Though over the years he changed his mind more widely and more often than most men, over the months he stuck to what he had once decided. That rigidity was both his weakness and his strength as a Chancellor. He remained as tightly bound as any of his colleagues by some of the emotions and misconceptions of Labour policy in 1945. But he appreciated earlier than anyone else the full force of the economic limitations on that policy. And having felt the moral call to a sterner economics, he listened to good advice and when he had made up his mind he stuck to it with an unusual faith in what the British people would stand if they believed it to be right. This would be a happier Parliament if more of his colleagues and his opponents had shared that faith.

Fares Befogged

Nothing has happened this week to remove the impression that the Government's intervention over fares was ill-judged or to disprove the Opposition's claim that the results of the county council elections were the cause of it. The House of Commons on Monday saw a remarkable display of evasion. The Minister of Transport refused to answer eleven questions, saying that they would be answered by a statement from the Prime Minister. But Mr Churchill did not answer them ; nor did he answer any of the supplementaries. He justified the standstill order on the ground that the Government had thought it wrong to allow extensive changes without giving the House a chance to debate them—which he proposed to do on Monday next.

In theory, it may be that this debate and the White Paper on transport, which is expected later, will make everything plain, and that the strange antics of the last few days will be shown as part of an integrated policy. But it is impossible to discover the vestige of a policy so far, and it is almost impossible to imagine any policy within which the Government's actions on fares would take a logical place. The Minister's intervention followed only a short time after he had said that it would not be proper for him to intervene. The standstill order on provincial fares was given when the Government already had in its hands the report of the Transport Consultative Committee justifying the rise in sub-standard fares in London. The committee's findings made it rather likely that it would uphold the tribunal over the rates proposed for provincial fares ; and in any case, if the Government refuses to allow sub-standard fares to be abolished in the provinces it will have to do the same for London, which would mean going flatly against the committee's advice. Finally, the Government seems to have intervened without any clear idea what its legal powers were, and to have sought reassurance on the point afterwards. Its action seems not to have been illegal, but it was certainly illogical.

When Mr Churchill was asked on Monday whether it was intended to subsidise the Transport Commission, he replied that it had in effect been subsidised for the last five years to the extent of its deficit. Did Conservative propaganda never protest against " the cost of Socialism " ? Is this Government not trying to reduce subsidies ? The intervention over fares cannot be justified by anything but the contradiction of the principles that the Government has applied to food and to the health service. It is trying to make itself less unpopular on one count by making its policies harder to justify on other counts. And what it is doing is therefore as foolish politics as it is poor economics.

* * *

Housing Unlimited

The responsibilities of office have still not shaken the Conservatives' determination to build more houses—in their eyes the most important of the social services. At Manchester last weekend Mr Macmillan said:

> It's not 200,000 or 250,000 or even 300,000 that we want. It's whatever the labour and materials available can produce or be made to produce. . . . To satisfy the housing needs of the nation there is a vast demand ahead.

To the House of Commons this week he said:

> Our aims . . . are not unduly ambitious, and the sights would have to be raised much further before we could be accused of singling out housing for some special favour or undue emphasis.

He even argued that more houses are essential for " the redeployment of our industry, for rearmament, for export and for our whole economic survival " because

> we need a margin of free accommodation in many areas of the country and we must not slacken until we can achieve it.

All this is preposterous nonsense. Mr Macmillan knows very well that the " vast demand " for houses is largely artificial because rents are kept artificially low. Yet he intends to build the houses before he tackles rent restriction, and one of the purposes of the Housing Bill—which was read a second time this week—is to protect tenants from the higher rate of interest that local authorities now have to pay on their loans.

Mr Macmillan hopes to build his houses by greater flexibility and by greater reliance on private enterprise ; and he declared at Manchester that his policy was already bearing fruit. But it is doubtful whether the improvement in the number of houses completed and started in the three months ended February this year, compared with the same period in 1950-51, is attributable to anything but better weather and a diversion of labour from general building work to housebuilding. It is also difficult to reconcile the published figures with Mr Macmillan's statement that the ratio of private enterprise housing to local authority housing is today working out at about one in four. It means that there must have been a big increase in the number of houses started by private enterprise this year. There will soon have to be a big increase in the total numbers started if 300,000 houses a year are ever to be finished in the lifetime of this Government.

Tariffs and Politics

It is a remarkably confusing fortnight which brings together American demands for higher tariffs, Mr Acheson's reminder that the dollar gap is America's problem, and a

Soviet bid to put American trade policy in the dock. In the United States the first signs of a recession in business activity have been accompanied by demands to withdraw tariff concessions on goods such as motor-cycles, bicycles, certain chinaware, tobacco pipes and wooden srews, imports of which represent only a small proportion of American supplies. No country likes to see foreign competition in its domestic market creating unemployment, but Mr Acheson ten days ago gave the honest and brave answer. He claimed that trade policy was an important part of a foreign policy which aimed at building a firm foundation for the defence of the free world. He might have quoted Article 2 of the North Atlantic Treaty which states that the contracting parties "will seek to eliminate conflict in their international economic policies and will encourage economic collaboration between any or all of them."

It is one thing for the Secretary of State to know what must be done, and it is another to convince the American public, particularly at a time when pockets of unemployment exist. Only two ways are open to the United States, if it does not want to maintain foreign aid as a permanent policy. It can either import more or export less—that is, force other countries to curtail their purchases of American goods. Of these alternatives the first offers the better return because it helps both the United States and Europe. It helps America by raising the standard of living of the American people, and in no case are imports likely to be large enough to cause serious hardship to domestic producers. It helps Europe because the United States exports essential foodstuffs and raw materials that cannot be readily replaced from other sources.

This incipient tariff tussle could have serious political repercussions in the western world. The American market has never been regarded as easy and British exporters were reluctant to enter it. They did so in response to exhortations from both the British and the American Governments. Now they are liable to punishment by the US Tariff Commission, which is being asked by American producers to invoke an escape clause which would permit it to withdraw tariff concessions previously granted. Admittedly Article XIX of the General Argeement on Tariffs and Trade permits a withdrawal of concessions if imports are threatening serious injury to domestic producers; but if it were invoked every time a reduction in tariffs leads to increased competition then the whole structure of Gatt would be made worthless. Such a policy could well drive some European producers straight into the arms of the Soviet trade delegations.

* * *

Moscow Trade Methods

The Russians have always been famous for camouflage, and the economic Potemkin village that was run up to impress visitors to the recent Moscow conference showed that they have not lost their touch. But here and there a crack is beginning to appear: some at least of the promising offers made to unofficial individuals by Mr Nesterov and his East Europe colleagues are proving to be merely for goods already overdue for delivery under official governmental trade treaties.

The Austrian Ministry of Trade, for example, has disclosed that there is a balance in favour of Austria on the Austro-Hungarian clearing account of $1,500,000; and that Hungary has delivered only 5,000 tons of rye out of the promised 30,000 tons of grain, comprising 15,000 tons of wheat and rye flour, 10,000 tons of rye and 5,000 tons of maize. In Moscow, the Hungarians offered an Austrian professor 10,000 tons of wheat, presumably part of the quantity for which they had been pressed for weeks through official channels. The meagreness of the offer is likewise remarkable. Hungary, a rich agricultural country, is Austria's traditional food supplier. The Vienna government has tried in vain to revive this trade, but even to the professor the Hungarians were not able to offer the pigs that once graced Austrian tables.

It has also emerged that Chinese Communist trade with Japan is to be revived only if the Japanese abandon rearmament. That this condition would be attached was always certain, but the Chinese seem to have been less cautious than the Russians in revealing during the Moscow talks the strings attached to deals. The same proviso will probably be found attached to Mr Nesterov's tempting offer to buy DM2 billion worth of industrial goods from Western Germany for delivery within two or three years, in return for Soviet manganese, chrome and other desirable commodities. There is good reason to think that the whole conference had the particular aim of luring Japan and Germany out of the American camp.

A further point which has come to light is that the Soviet negotiators insisted on sterling as the unit of account in deals with Western Germany. The Soviet government would gain a considerable amount of sterling during the two or three years that the Germans would require for manufacturing and delivering industrial equipment, for there was no talk of Moscow giving a credit. With this sterling the Soviet Union would be better placed than ever to buy rubber and other sterling area raw materials. The proposal has met a snag in Germany which has nothing to do with the Battle Act. Western Germany still has by law to settle in dollars all trade balances with countries that have not concluded special payments agreements with the Federal Republic. This regulation would of course apply to trade with the Soviet Union.

* * *

Australia Sets the Sights

The Australian Government is getting as worried about the decline in its agricultural production as its customers have been for some years past. This week Mr McEwen, the Federal Minister of Agriculture, submitted a five-year plan which could add about £A100 million—or nearly a tenth—to Australia's annual income and save some £A7 million of imports, particularly of tobacco, cotton and linseed. Products of the land still represent over four-fifths of Australia's exports, and these exports are as vital to it as they are to Britain. A policy of industrialisation should not imply a smaller volume of exports; on the contrary, most of the new industries require imported raw materials and all of them require imported capital goods which have to be paid for in part, at any rate, by the proceeds from exports. What Australia is doing now should have been done immediately after the war—build up its agricultural production to ensure an adequate volume of exports, and then industrialise.

The plan envisages increases in almost all sectors of agriculture. The wheat acreage is to be raised from 10½ million acres in 1951-52 to 14 million acres; oats and barley from under 3 million acres to 4½ million acres; tobacco from 5,000 acres to 20,000 acres and linseed from 30,000 acres to 200,000 acres. Meat production is to be increased by nearly a quarter from 1,000,000 to 1,230,000 tons, with a greater concentration on lamb then beef, and milk output is to be increased by 12 per cent. This is undoubtedly a wise policy, but its fulfilment depends on what action the Australian Government takes to stem the flow of labour to the towns, to increase the supply of agricultural machinery and equipment, and to encourage a greater use of fertilisers.

* * *

Making Out the Wage Bill

There is now no doubt that the trade unions' answer to the Budget will be unanimous, or as near unanimous as makes no matter. Last week the Confederation of Shipbuilding and Engineering Unions, whose members received

their last increase as lately as last November, decided to press for a substantial increase. With miners, transport workers, shop workers and agricultural workers, this brings the total number of workers who mean soon to ask for more money to between five and six million. The wages of two million other workers will increase automatically as the cost of living index rises. By the end of the summer, therefore, the national wage bill will almost certainly be a good deal higher than it is at present. And Mr Butler, who in theory hopes that if there are to be wage increases they will be linked to rises in productivity, will not see his hopes fulfilled this year—nor, indeed, are they ever likely to be realised so long as the incomes of most British workers depend not upon the prosperity of the plants in which they work but upon that of the industry to which the plants belong.

There would have been a round of wage claims whatever the Budget, for prices have risen since the last crop of awards. The Budget merely means that the claims are larger than they otherwise would have been. The most that Mr Butler could realistically hope was that it would not also accelerate them. In fact it has done. Wage claims are normally formulated at the unions' annual conferences, but several unions are not waiting until then. Yet for many workers increased family allowances and income tax concessions already offset the higher food prices; big wage increases can only give another fillip to prices. This is regrettable but at present inevitable. The unions are strong enough to ensure that no large group of their members suffers any reduction in living standards.

* * *

Devil's Advocate

If there is one theme on which economists of all persuasions generally speak in unison, it is the evil effects of private monopoly. The exceptions are not, however, always unimportant. Of late two eminent dissenting voices have been heard—Mr Galbraith in the United States and Sir Henry Clay in this country. In the current issue of *Lloyds Bank Review* Sir Henry argues that ever since the first world war the greatest progress, both technical and commercial, has been observed in industries that are heavily cartellised or dominated by a few large firms. More generally, he argues that unrestricted competition, combined with the high overhead costs typical of modern industry, almost certainly means a level of returns inadequate to cover total long-run costs of upkeep, modernisation and research. So far, indeed, from being detrimental to the public interest, restrictive practices are an essential part of modern economic life, a safeguard against chaos and a necessary condition of progress.

The arguments are ingeniously presented and often individually telling. But they are not new. In sum what they prove is, first, that they are genuine social advantages in a large unit of control; and, secondly, that in times of slump cartellised industry can and does push much of the burden of depression on to competitive industry. There is a distinct logical gap between these propositions and a conclusion in favour of the general beneficence of restrictive practices.

Sir Henry is on stronger ground in criticising the Monopolies and Restrictive Practices Act of 1948 not as a manifestation of anti-monopoly sentiment but simply as a piece of legislation. Both the powers and the scope of the present commission are, he holds, wrongly conceived; the powers are too great, the scope is too narrow. It can investigate organisations controlling competition, but not organisations abolishing it entirely—as do statutory monopolies; it is limited to manufacturing and building, and excluded from services and labour relations. The manufacturer

> will have his labour costs settled by negotiation with monopolistic trade unions . . . his power—coal, gas or electricity—he will buy from statutory monopolies . . . his raw material will frequently be controlled by some Government scheme for protecting primary producers.

But thus exposed to the action of monopolies on every side, he will find his own efforts at self-protection subjected to *ex post facto* regulation impossible to know in advance or even to deduce from general principles. The commission, Sir Henry argues, should be purely an investigating body with far wider powers of investigation. The second point should command ready agreement. Monopoly power, for good or for ill, does not cease to be fit matter for investigation in the public interest when wielded by a public corporation or a trade union.

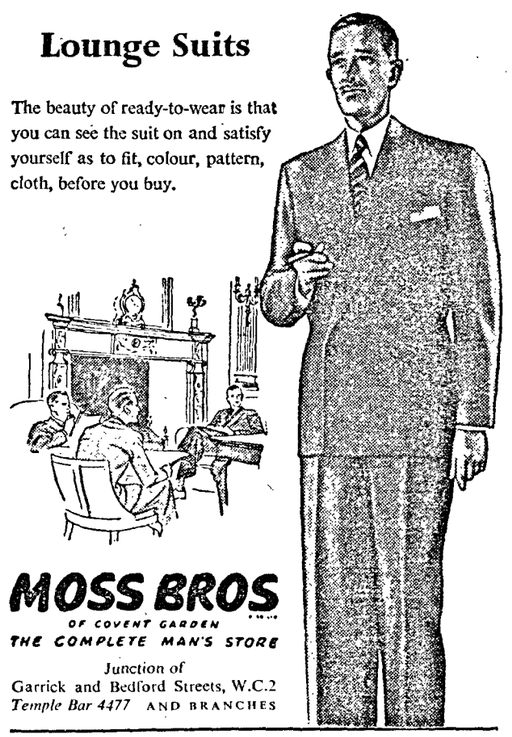
Selecting Students



The methods by which the universities choose their undergraduates are likely to attract more and more interest; an important contribution to the discussion is made this week in a pamphlet* by Dr F. W. Warburton, of the School of Education at Manchester University. There was no problem of selection when getting into a university depended on money, exceptional ability or grim determination; now that financial barriers have been removed, and there are already twice as many sixth-form pupils as before the war, the need to find the right kind of sieve is acute. In its latest report the University Grants Committee noted with approval that the universities were alive to this problem. Dr Warburton's survey shows that a great deal of thought is being given to it.

The traditional methods of selection can be relied on to sort out the best candidates and the worst; but they are clumsy instruments to measure the relative capabilities of the moderately good. Higher Certificate results—the most usual criterion—may, by a single mark and a stroke of ill-luck, deprive a candidate of a university career while his inferiors are admitted; and the chance element is strikingly brought

out by Dr Warburton's example of how different examining boards may vary in their assessment of the same papers. Testimonials from headmasters are equally liable to human variability, and especially to optimism. Personal interviews can be of little value unless the interviewers are skilled and, again, widely differing judgments are made by different interviewers.

Dr Warburton considers the new techniques that might be used to supplement the old—intelligence tests, for example. By themselves, these would not answer the purpose, for his general level of education is as important to a student as his innate intelligence. But according to research done at the London School of Economics, certain intelligence tests have proved valuable in conjunction with the traditional selection methods. Another possibility is the group interview, on the lines of the Civil Service's "house parties," but that method would have to be greatly modified if expense were not to put it out of court.

No firm conclusions are possible at this stage. Dr Warburton rightly urges that the universities should carry out research into the efficiency of both old and new methods by correlating their results with those obtained in degree examinations. When the nation is investing such large sums in its university students, it is certainly worth a little trouble to make surer that the investment is sound.

Rival to Ridgway

With remarkably little fuss public opinion has arrived at the view that General Eisenhower's successor as Supreme Commander in Europe must be an American soldier. The decision on which American it is to be now rests with the North Atlantic Council, which meets in Paris next week. President Truman is said to have asked the thirteen allies to choose between General Gruenther, the Supreme Commander's present Chief of Staff, and General Ridgway, the United Nations Commander in Korea. It would not be easy to decide between a proven organiser and a proven fighting man, each of whom has shown his talent for getting teamwork out of allies, even if military considerations were the only ones to present themselves. As it is, important political factors must play a part.

One thing, at least, is clear: Europe does not want the Eisenhower role taken over by someone who will try to play it in the manner of its creator. The result would be mere caricature. Shape must become less of a court and more of an operational headquarters; it should attract less sightseers, not more. On the other hand, the role of whip and spur to the allied forces and their defence ministers is already played with great energy by Lord Montgomery, and does not yet need the aid of a tight-lipped look and a grenade strapped to the shoulder. Likewise, for the actual command of land forces there is General Juin. Although neither his energy nor his concentration on this job have been conspicuous, there are political reasons in the way of his removal by promotion. There appears, therefore, to be no role in Supreme Headquarters for a fighting commander fresh from the battlefield—unless the official appreciation of the risks of war in Europe has lately changed. If Nato believes these risks have increased, or will increase, as its forces grow, then there would be a case for appointing General Ridgway with his admirable battle record. If, on the other hand, it is judged that the risks are decreasing, then General Gruenther, with his admirable record of getting things done quietly and quickly, should be the man.

Nato ministers will doubtless not ignore Moscow's possible reactions. What conclusions would be drawn there from General Ridgway's transfer to the cold war from the real war front? To western ears it sounds ridiculous that the inadequate ground and air forces of Nato should be accused of aggressive intentions; but the charge is made and may be believed by its makers. It would, perhaps, be wiser to keep battledress out of Supreme Headquarters unless there is a real risk of its becoming a battle headquarters in the next twelve months.

* * *

Egypt and the Sudan

The prospects for eventual agreement on the points in dispute between Britain and Egypt seem a little better; but in addition to the dangers that have already revealed themselves there are still some submerged rocks to be circumnavigated. To British eyes there seems no theoretical impossibility in the idea of a Sudan that has been granted complete freedom to determine its own fate, but is nominally linked with the Egyptian crown. Commonwealth experience has shown how many variations can be played on this theme. But the difference between the British and the Egyptian views of the political role of a monarch has only recently been illustrated by King Farouk's dismissal of the Wafd government. If it is difficult for Egyptian opinion to grasp the concept of a wholly non-political throne, it is virtually impossible for most Sudanese to understand it. There is thus a serious danger that even a morally impeccable formula for an Egyptian-Sudanese relationship would be regarded in Khartoum as an act of betrayal.

It can be assumed that the Foreign Secretary and the Governor-General of the Sudan, both honourable men and keenly conscious of Britain's pledges to the Sudanese, will accept no solution that violates the essential spirit of those pledges. But this is a case in which justice must not only be done, but must be seen to be done. If the simple villager of the upper Nile is left with the impression that he has been delivered into the hands of his wilier neighbours downstream, the damage done will be almost as great as if he had been so delivered. The repercussions of such a mistake would not be confined to the Middle East. Among the slender majority of Mr Churchill's Government there is probably a considerable number of MPs who would find it hard to stomach even the appearance of appeasing Egypt at the expense of the Sudan. The Government's decisions in the Khama affair have made minds suspicious and consciences sensitive—a point that should not be overlooked by the American Embassy in Cairo.

German Defence Costs Divided

The deadlock in Franco-German exchanges over the Saar is a grave development and puts yet another obstacle in the way of European integration, and optimistic forecasts about the European Defence Community are less justified than ever. None the less there seem to be good prospects of concluding by the end of May the EDC treaty and the contractual agreements with Western Germany that are to replace the occupation statute. The negotiators in Bonn and Paris have put on a spurt in the race to finish their work before the present session of Congress ends and the issue of all-German elections comes up for final settlement.

Finance is still the main obstacle in negotiations with the Germans, and it is still probable that the British Treasury will have to shoulder an additional burden when their army is set up within the EDC. The Federal government agreed to make a total contribution of DM 10.2 billion for the community's first full year, though a loophole of escape was left if German production failed to expand according to estimates. But the problem remained of dividing this sum between the cost of forming a German contingent in the EDC and the cost of maintaining American, British and French troops in Germany. Bonn's embryo Ministry of

History TODAY

and the Advertiser

HISTORY TODAY, first published in January, 1951, is a magazine designed for the intelligent man and woman, planned upon entirely new lines. The basic idea is very simple—that, to understand *today* and forecast *tomorrow*, one must have studied *yesterday*, and that the key to present problems often lies in the remote past.

But readers of HISTORY TODAY are not merely specialists. They are students of the modern world, whose interests extend to every field of human activity—industry, economics, the history of science, besides political thought, art and literature.

As HISTORY TODAY has grown and prospered, more and more advertisers have come to recognise its value as an advertising medium. Among its readers are many of the consumers to whom *your* product will make a strong appeal.

RUSSIA

Has Communist policy changed—does it mean PEACE?

Read the important contributions by

SIR DAVID KELLY

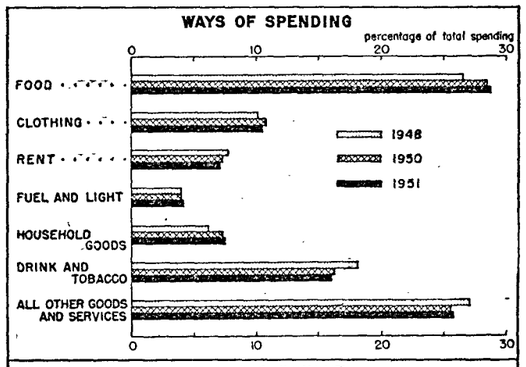
British Ambassador in Moscow, 1949-1951

Beginning next Sunday exclusively in

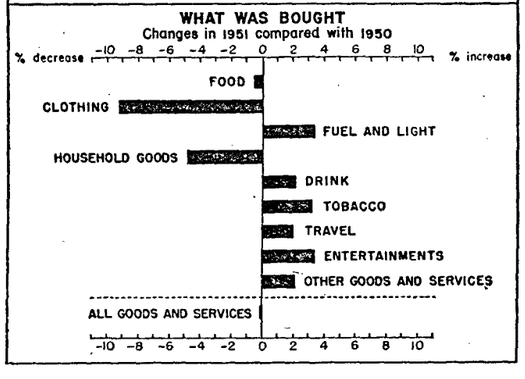
The Sunday Times

London's Best-informed Sunday Newspaper

Defence, the office of Herr Blank, drew up a so-called "minimum plan," in which the cost of setting up and equipping a German army with light weapons only was estimated at DM 9 billion for the first year. The High Commission for its part estimated as DM 6.8 billion the cost of maintaining the non-German troops. The German answer was in effect: "Canteens or cannon." Every pfennig that came out of the government's DM 10.2 billion for the comfort of the foreign troops and their families in Germany would, it was indicated, come off Germany's own contribution to defence.



Both Herr Blank's costing and the High Commission's estimates have been examined by EDC experts with experience of similar matters in their own countries, and the axe is being used on the exuberant growths which have come to Paris from both Bonn and the High Commission. Herr Blank's total has been cut to a sum which could actually be spent in the first year of the EDC. If this cut and others are accepted by both sides, there should be enough left of the German total to cover the greater part of American, British and French costs in the first year of the community's functioning.



It is now for the Germans to prove that they can be good partners by accepting the Paris verdict. They will also have to accept the fact that American heavy weapons will be allocated to the EDC as a whole for division among its members. The Americans have shown loyalty and good sense by refusing to deliver heavy weapons direct to Germany. The EDC, even in its present rudimentary stage, is proving its value.

The Consumer in 1951

Last year's Economic Survey forecast that personal consumption in 1951 would be slightly but definitely less than in 1950—by 0.5 per cent. In fact, it remained almost exactly constant. In money terms, of course, people spent much more. Total consumers' spending last year was £9,970 million, compared with £9,260 million in 1950, £8,796 million in 1949, and £8,419 million in 1948. But, after the rise in prices is taken into account, last year saw the first halt to the upward trend of consumption since the end of the war. People bought much less clothing, fewer household goods and just a little less food than in 1950—the last because increased buying of imported tinned meat did not offset the reduced ration of carcase meat. On the other hand, purchases of most other goods and services increased, so that on balance real consumption was just about the same in 1951 as in 1950 (the actual figures show a very slight drop of less than 0.1 per cent).

Doctors on Divorce

Much of the evidence submitted to the Royal Commission on Marriage and Divorce by the British Medical Association and the Royal Medico-Psychological Association is, naturally, concerned with insanity. Under the present law, a petition for divorce may be presented if either husband or wife is incurably of unsound mind and has been continuously under care and treatment for at least five years immediately preceding the petition. This last provision has prevented many petitions from being granted even though the insanity has persisted. Certification of insanity is avoided wherever possible in modern psychiatric practice, and continuous care and treatment as a voluntary patient, no matter for how long, does not satisfy the provision. The associations consider, therefore, that the best course is to abolish the existing provision altogether. Instead they propose that a person should be able to present a petition if the other spouse has been suffering from mental disorder continuously for five years, is unlikely to recover and at the time of the petition has been a patient in a mental hospital continuously for a year. This last stipulation, though covering voluntary patients, does not get round the difficulty that such patients can discharge themselves as often as they like, thereby breaking the continuity of treatment.

Some of the other recommendations are more general. Thus, the associations propose that, where husband and wife have been separated by mutual consent for a long time and there is no prospect of reconciliation, either party or both together should be able to present a petition for divorce—at present, this is not allowed because the separation does not amount to desertion. They also propose that where the offended person refuses to take any action for a divorce, the offending party should after a period be able to sue for divorce; and they suggest a wider definition of cruelty.

In general, it should be pointed out, the doctors' recommendations are based on a fundamental change that they would like to see in the attitude of the divorce courts. Instead of deciding whether one party has been deliberately wronged, as in a civil action, they should aim at the relief of suffering and hardship. This attitude would commend itself to the layman also. But it may be too vague to appeal to the lawyers.

Another Grievance for Pakistan

The intense indignation aroused in Pakistan by the British Home Secretary's endorsement of the court order for the extradition of Mr Mubanek Ali Ahmed, a Pakistani industrialist, to India on a criminal charge may appear to be a storm in a teacup. Yet it is in fact a serious matter, because in Pakistani eyes it appears to be further confirmation of the alleged British tendency to tip the scales in favour of India in Indo-Pakistan disputes. There is no reason to question the validity or fairness of the legal pro-

ceedings for Mr Ahmed's extradition ; he had been charged with forgery in Bombay and there was no claim to asylum on political grounds. There must always be, however, in cases of extradition a distinction between returning to the justice of his own country a man wanted on a criminal charge and handing over a citizen of a third state, especially when political tensions exist between the claimant state and the state of which the fugitive is a citizen. It is difficult to deny that the Home Secretary has considerable discretionary power, and one cannot feel quite certain that if Pakistan had been claiming an Indian citizen from Britain the outcome would have been the same.

The decision has been no inadvertent one, for the Pakistan High Commissioner protested vigorously both to the Home Secretary and the Secretary of State for Commonwealth Relations. The rejection has raised the incident from the status of an ordinary criminal case to the level of international political relations. It comes after four years of the Kashmir dispute, in which Pakistanis feel that British influence has been adverse to their cause, and almost simultaneously with the Security Council's refusal to hear their appeal on behalf of Tunisia. Opinion there is in a sensitive and irritable condition, and each time these disappointments occur, Pakistani ears hear again the siren voices which tell them that they should turn away from a pro-Indian Britain to a power which is always ready (at a price) to sponsor the grievances of discontented nations. This tendency has already led to a serious military conspiracy, and the trouble may break out again at any time. The effect of the Kashmir deadlock has been to render fundamentally unstable the position of any Pakistan government which must bear responsibility for the national frustration, and the official policy of adherence to the Commonwealth is affected by the same unpopularity.

* * *

Consoling the Poles

It looks as if the Russians are trying to soothe their Polish allies with an array of demonstrative and tactful gestures. The recent suggestion from Moscow that a united Germany should be granted control of its armed forces obviously caused the Poles alarm, and the embarrassment of Warsaw press comment at the time seeped up between the lines. For some time opposition to German rearmament had been one of the few things in common between the Communist Party and the people ; to have the Russians reviving the old fear of a deal with the Germans over Poland's dead body was a shock, even though their Note to the western powers had insisted on the finality of the Oder-Neisse line.

The chief feature in the current comfort campaign is a palace of culture, which is to be erected in Warsaw with Soviet money and the assistance of Soviet architects and workmen. Much was made of the matter when an agreement for the job was signed and work has now begun. The new building will house the Academy of Sciences and similar institutions, and it will be Poland's first skyscraper—30 storeys high. Other features have been the handing over by the Russians of manuscripts of Copernicus and others which they acquired in eastern Poland towards the end of the war ; specially warm greetings from Stalin to President Bierut for his birthday ; much mutual congratulation on the seventh anniversary of the Soviet-Polish Treaty ; and celebration of a month of friendship with Eastern Germany. What effect these gestures have on the people it is impossible to judge.

* * *

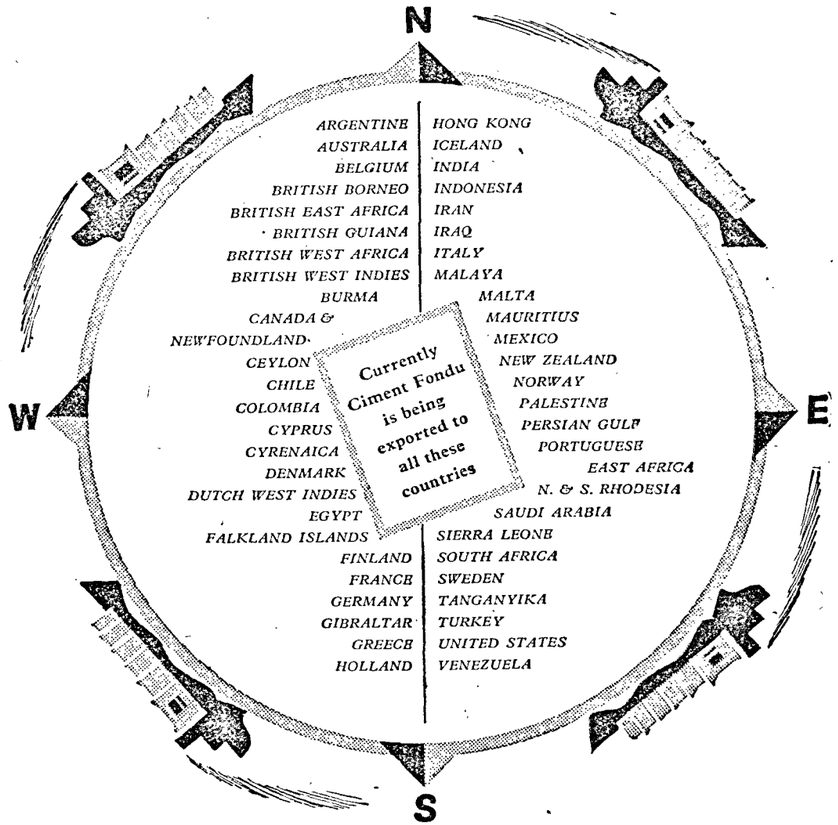
Keeping It Dark

Intriguing changes have taken place in the reasons given by the Communists for refusing to allow an impartial inquiry into their "germ warfare" charges. When it was first suggested, the Communist press declared that it was unnecessary, since no serious epidemics had broken out. But the logic of this argument was apparently not very clear even to good Marxists, and some European Communists joined with Mr Acheson in calling for an investigation by the International Red Cross. These unhappy deviationists were, however, rapped sharply over the knuckles when the new party line was promulgated. This took the form of a denunciation of the International Red Cross, the World Health Organisation, and all similar bodies as mere tools of American militarism, wholly unworthy of admission to North Korea or China, and incapable of producing an objective report.

Some flaw has now been found even in this process of reasoning, and a new argument has been put forward. The Communist press in Britain and elsewhere now says that the Chinese and North Koreans refuse to admit inquirers because the Americans merely want to assess the effectiveness of their alleged bacteriological operations. A report by the Red Cross or the World Health Organisation would provide them with free military intelligence. The authors of this particular ploy have not stopped to think of the slight they are putting on Mr Pritt's "democratic lawyers," who have returned from the "germ-ridden areas" with what purports to be a full and conclusive report of conditions there. If the danger of an objective report is that it would provide the Americans with information about their achievements, have not the "democratic lawyers" already done the damage? That these subtle minds should have overlooked both quarantine regulations and the security risks to their own side is one of the more delectable incidents of 1952.

* * *

Rats Among the Rations



Last week in Prague four men were sentenced to death for forging ration cards and other black market offences. Seven other people, including two women, were sent to prison for periods ranging from nine years to life. The Czechoslovak Government has, of course, every right to punish rationing offences with reasonable severity. But such severe sentences seem out of all proportion even if, as the prosecution alleged, the defendants' activities were extensive enough to cause a "hitch in the rationing system." The explanation probably lies in the prosecutor's admission that the forgers had concentrated on "the most sensitive sector of our economy—supplies for the nation." The government's grave uneasiness over food supplies will have been only partially allayed by the Soviet promise to send substantial food supplies, including over 1 million tons of bread grain and fodder, during the current year ; for the Czechs know that these supplies may not appear if they do not produce the increased quotas of "foundry products" which Dr Gregor, Minister of Foreign Trade, had to promise during his three months absence in Moscow.

It is clear that the Communists are playing up the activities of the ration forgers in order to distract from themselves the popular discontent which appears to be causing increasing concern. The ration forgers are linked up with the "US warmongers" who "breed rats in human shape infected with capitalist avarice." The defendants were said to be part of "Truman's army of rats" who were working to poison the "moral and political unity" of Czechoslovakia. Likewise Mr Bacilek, the Minister of States Security, when opening an exhibition on "*Ration Card Forgers and Gold* Hoarders," appealed for closer co-operation between the National Security Corps and the general public so that "no suspicious individual who could be an enemy agent shall remain undetected." He pointed to the example of the Soviet Union where the people's vigilance had successfully unmasked all enemy agents.

European Realists

Sir,—Western Europe needs a unity from which member countries, including Western Germany, cannot contract out. Such a unity is a vital British interest, and Britain has a key role to play in enabling this unity to be achieved (though it may not itself become a full member of any purely European union). This you have convincingly argued in the last few weeks.

What is the sort of union from which member countries cannot contract out? There are only two answers—a unitary state like the United Kingdom, and a federal union like the United States, Switzerland, Canada or Australia. To weld the countries of Western Europe, with their long separate national traditions, into a unitary state is at present neither desirable nor practical politics. On the other hand, to form them into a union under democratic control from which they could not contract out, while at the same time leaving all domestic matters in the individual countries' own hands, is not only highly desirable, it is something the leading European statesmen (and General Eisenhower) think practicable, and it is what federal union means; indeed, the Schuman and Pleven plans, which you rightly praise because they aim to make Western Germany an integral part of Western Europe, will succeed in this just in so far as they are federal in character. Why then, while you imply that the best hope for Western Europe lies in a union of this sort, do you—and the British Government—disparage federalists, who only call a spade a spade, as idealists?

Woolly thinking on a matter so fundamental, or a failure to acquaint the public with the logic of the case, will guarantee that we don't get for our country what is best for it. Let there be no doubt: nothing less than a federal union will ensure that Western Germany, once it has gained equality and arms, does not divorce itself from its Western partners. Treaties, alliances and guarantees have been broken too often to enumerate; the League ideal has failed, and the present United Nations charter is based on the same principles; confederations, that is, unions where the general government is subordinate to the regional ones, are invariably transitory—either they break up, or they are found to be inadequate for their purpose and the general government is, sooner or later, given independent powers; the Commonwealth idea, which some suggest should be applied to Europe, cannot by definition prevent member states from quitting; and as for the latest nostrum, an "organic union," it could not possibly grow to maturity in time to counter the very real risks of today and tomorrow, and even if it did it could only guarantee the continued adherence of the countries concerned if it developed into some federal (or unitary) form.

Never has there been so much talk of unity—international "communities," "partnerships," "integration" and the rest. We will do well to ask our leaders to define just what they mean by all this, and what ends they count on achieving by the type of "unity" they have in mind. Unless we in Britain are careful, we shall find our union-loving sentiments have become no less a mockery than the peace-loving double-talk of the East.—Yours faithfully,

MARTIN MADDAN

West Malling

[Federal union may well be the ultimate destiny for Western Europe; but its advocates have done their cause harm by neither examining nor admitting the serious sacrifices it would demand from individual nations. The form of co-operation attempted in Nato and in working European institutions has at least the merit that comes of learning how a car works before offering to drive it.—EDITOR.]

The Strain and its Sources

Sir,—The sterling area system, as operated during the past ten years, has enabled the United Kingdom to indulge in reckless borrowing from the rest of the area. A nation's liabilities may sometimes be its best assets: but this should not lead one to forget that there is an essential difference between debts and credits. Yet the terms used in the article in your issue of April 12th suggest that this difference has become, to say the least, somewhat blurred in your treatment of the sterling area balances.

You mention that the sterling area lent Britain £230 million in 1950 and £290 million in the first half of 1951: "and then," you say, "came the collapse into borrowing from Britain—to the extent of no less than £363 million." You add that "the record of the Dominions in 1951 was, of course, far worse than this. Despite an inflow of capital, their sterling balances fell by £367 million in the second half of 1951." Surely the United Kingdom cannot expect the rest of the sterling area always to lend to it and never to draw on its balances here. If we claim to be the bankers for the sterling area, we cannot complain if the rest of the area, having deposited with us £520 million in the eighteen months to the middle of 1951, chooses to draw out £363 million in the next six months. And as the total deposited with the United Kingdom by the Dominions amounted to nearly £2,000 million, even after the end of 1951, the record of the Dominions does not seems to compare so unfavourably with the record of the United Kingdom in this matter of mutual borrowing.

The doctrine enunciated by the Finance Ministers' Conference that each part of the sterling area should, in future, establish a balanced position is an important innovation. During the past four years, it would not have suited us very well as, so far from having a balanced position, the United Kingdom increased its debt to the rest of the sterling area by some £800 million. If, in future, the rest of the sterling area can manage to balance its accounts, without drawing on the sterling deposited here, it will greatly help us in the objective of restoring sterling convertibility, but it is scarcely a doctrine which we can reasonably treat as being a self-evident moral principle.

It is unfortunate that the official statistics do not give a fuller break-down of the sterling area dollar deficits and of the method by which they are compiled. For example, the suggestion has been frequently made that Australia in 1951 was running a large deficit with the dollar area. The United States foreign trade statistics, on the other hand, show that in 1951 Australia exported to the United States goods to the value of $350,083,000 and imported from the United States goods to the value of $176,796,000, leaving a surplus on current account in favour of Australia of $173,287,000. Perhaps Australia was running a dollar deficit on capital account; but the explanation may be that as much of this Australian export trade was financed by London, the dollars accruing from that trade were credited to the United Kingdom and not to Australia. Is this possible?—Yours faithfully. F. W. LEITH-ROSS

Crowborough

Trade with the Communists

Sir,—We noted with interest the Note which appeared in *The Economist*, on page 515, of the March 1, 1952, issue. A table in that article purports to show United States trade with Russia, China and the Soviet satellites during the year 1950 and the first three quarters of 1951. On the basis of this table your article stated that "United States exports to China [in 1951] were still much larger than Britain's." This is incorrect. The United States authorised no shipments whatsoever to China during the first three quarters of last year. In the fourth quarter of 1951, $181 worth of books were permitted to be sent by parcel post. This represents the total of United States exports to Communist China during all of last year.

We note that in your issue of March 22nd, on page 714, you indicate that the source of the figures which you used in compiling your table was the joint publications of the United Nations Statistical Office and the International Monetary Fund which have, until recently, been incorrectly showing United States exports to China, including exports to Formosa, under "China." It is these shipments to Formosa and not to China to which you incorrectly referred on March 1st as exports to China. We were glad to have you call attention to this error.

It is disturbing, however, to read in your correcting Note your comment that

> the point of the Note, however, is not materially altered, for an American import surplus with China implies that the United States is providing China

HARRAP

with dollars—the one universally accepted currency—which could be used to foster illicit trade.

Your readers would undoubtedly not concur in your comment if they knew that United States imports had declined in consequence of United States import regulations from $110 million in 1950 to $45 million in 1951. Whereas, in the first half of 1951, imports from China totalled $31 million, they were reduced to $14 million in the second half of the year. Under the Treasury Department's Foreign Assets Control Regulations, effective from December 17, 1950, all imports into the United States, directly or indirectly, of products of Communist Chinese origin are prohibited except under Treasury licence. The import of such goods during 1951 consisted of goods considered to be of security advantage, goods in which all Communist Chinese interest had ceased prior to December 17, 1950, and of goods the import of which was authorised where the failure to grant licences would have imposed a special hardship on an American importer, and would not have brought about a disadvantage to Communist China. The same regulations applied to goods of North Korean origin. —Yours faithfully,

LORING K. MACY

Is the Retailer Trying?

Sir,—Let me assure Mr Cohen and Mr Fox that I buy my apparel from a multiple clothier, that mills are not exempt from rates, that they, too, make a living by turning stock over at a profit and not by merely holding it, that they, too, cannot ask the landlord to defer the rent, that their profit in pence per unit also falls as prices fall, that I *have* seen hundreds of sales and bargains advertised by retailers, and that I had made to myself all the excuses now put forward for them (and one or two overlooked by your correspondents) before I wrote my letter which, in brief, asked:

> Why does the retailer not cut his stock prices to replacement cost as wool importers and mills have been compelled to do by world auction prices for wool?

Mr Cohen and Mr Fox do not answer this question.

In addition, mills have accepted cancellations, bad debts, "softened" contracts, given extra time to pay, and taken business at less than cost to find four days' work a week. Has the retailer balanced these efforts by his own? Last week a public wool textile company reported last year's profits at £300,000 against £1,300,000 for the previous year. Do any published retail store balance sheets show falls in profits like the average of those of the two dozen wool textile firms published in the last four months?

Retail bargain sales do not necessarily mean "cut to replacement cost." A part of the country's retail stocks may have been so cut, but the whole of importers' and mills' stocks have had to be. The high-priced overcoats have probably not been cut because fashion in men's overcoats changes little, and next winter will come. Making-up charges for ladies' costumes like those quoted are obviously for the few, but a mass-produced costume gives as many shillings to the retailer as to anyone else in the chain of its manufacture.

Rents and rates are certainly higher for shops than for mills, but below a certain point of activity mill overheads are just as big a drain.

If the retailer has not written down his selling prices to today's cost (plus profit, plus tax), he is keeping up the cost of living; doing less than he could to clear the pipe line and inviting eventual losses through change of fashion and shop-soiling. All that Mr Fox says about purchase tax is true. But taxation does not prevent cutting to replacement cost —or below. It is still arguable that the mills have done this, but that retailers in general have not.—Yours faithfully,

WEST RIDING

Ambitions in the Sudan

Sir,—The article in your issue of April 5th brings to mind a recent pronouncement by a public figure that "it is hard to play chess when your opponent insists on moving his knight like a bishop." As a student of international affairs, I feel that—within reason—it is high time for us to start moving knights like bishops ourselves. In this connection I can suggest two pragmatic solutions of two pressing political problems:

(1) The problem of Egypt and the Sudan. The British could publicly recognise Farouk as "King of the Sudan." After the Egyptian press has had forty-eight hours to exploit the announcement, the British should announce quietly—perhaps via the Court Circular—that henceforth, and until settlement of the Sudan issue on an equitable basis, Queen Elizabeth II, as the other of the two Co-Domini, has taken the style and title of Queen of the Sudan.

(2) The problem of prisoner exchange in Korea. The United Nations could give in, pro forma, to the Communists' demand that all prisoners be exchanged. However, in the days which are bound to intervene between signature of the armistice and actual prisoner exchange, the guard personnel could be found to be necessary for other duties. By the time the actual exchange takes place, it will be found that only those North Korean and Chinese prisoners who wish repatriation are being exchanged, the others having taken advantage of the reduction of guard personnel to effect their escape from the prisoner-of-war camps—so sorry.

In the short run, the actions outlined will, by throwing a sop to the vociferous demands of the opposition, enable the West to gain the substance of the argument. In the long run, it may teach the opposition that a game of chess becomes more even, if less correct, if both parties insist on moving their bishops as knights. —Yours faithfully,

Portrait of a Newspaper

The Story of *The Times*. Volume IV. Part I, 1912-20. 534 pages. **Part II, 1921-48.** 1182 pages. *The Times*. 25s. each.

The Times's history of itself has become more and more shapeless but more and more interesting as it has moved from "The Thunderer in the Making" through the "Twentieth Century Test" to the present volume, in which the reviewer is confronted with over 1700 admirably printed and indexed pages. There is now no longer one majestic theme but several: the swashbuckling Northcliffe theme, the curious and pathetic appeasement theme, the imperial theme, and the persistent prestige theme, a little like "Land of Hope and Glory," played quietly. The link between what leading articles say and what statesmen do becomes more tenuous or harder to believe in. Foreign correspondents seem to shrink in stature, although the historian is still fascinated above all by foreign affairs. It becomes less certain that public opinion is the opinion of those who announce their births, marriages and deaths on the front page.

It also becomes harder to distinguish a magnificent record of professional integrity and craftsmanship from a faded aristocratic tradition, which may at times have led the paper astray but always in the company of the "best" people. And a determined attempt to distinguish between the paper and the men who ran it sometimes leads to premature and uncharitable judgments. But there is no denying that the selection of material from rich and new sources, both public and private, is done with great journalistic skill; the story of 1912-48 is sometimes irritating but it is never dull. At times it is brilliant, notably in the account of how Rothermere was beaten on the tape by the Astor interest in the race to buy the paper after Northcliffe; or in the analysis of how and why Geoffrey Dawson came to amend and approve for publication the leading article of September 7, 1938, which hinted that "some quarters" favoured the cession to Hitler of the Sudeten German districts of Czechoslovakia; or in the appendix which describes the paper's handling of the abdication crisis of 1936.

A sense of regret and shame over the policy of appeasement has led to some wise comments on a newspaper's responsibility in public affairs and a skilful balance is struck between national, personal and office reasons for it. Geoffrey Dawson is shown as receiving too free a hand, the co-chief proprietors after Northcliffe's death as being too self-effacing. His direction of policy was too centralised; there was neither a foreign editor nor a military correspondent to provide an expert judgment in the formative years. The despatches and private messages from the men abroad no longer provided the basis of policy. Indeed, if they conflicted with policy they were cut.

Dawson's real interest lay in imperial affairs and in national affairs as seen from his own social circle. He had an acute instinct for politics without policy—provided the Conservative Party was in power. He and his assistants distrusted "viewey men"; those who analysed or philosophised the revolutionary trend of the time were classed as bores. That was, perhaps, one reason why the office did not understand until too late how radically Britain's political and economic position was changed by the first world war. The Victorian habit of following and interpreting public opinion no longer worked in a country that had had Lloyd George as Prime Minister. "As it turned out, the electorate was not sensible, statesmen were not wise, and *The Times* came near to abdicating its leadership." That is a stern judgment; and one would argue in exoneration of the offence that Dawson and his successor erred in company that has since become distinguished. Their upbringing and experience had prepared them to see national safety in a "new imperialism," in limited continental commitments, in a revision of the peace treaty, and in a nursing of the nation back to strength and normality—not a bad policy if there had been no Bolsheviks, Fascists or Nazis to deal with.

What is freshly revealed about Northcliffe in these volumes renews the conviction that there is a masterpiece of biography still to be written. The newspaper's debt to his genius is even now not adequately assessed, and throughout these pages there is a deplorable failure to understand how much the reader of *The Times* cherishes those features of entertainment in it which have little to do with high policy and the destinies of nations. It would have been a disaster if Northcliffe had had his own way against the "gentlemen scholars," but *The Times* would be a less prosperous, influential and readable journal if the struggle between him and the "giant sloth PHS" had never taken place. On the whole this history's treatment of him has been magnanimous, and it offers no more revealing and exquisite moment than the simple recording of his dying wish that he should get "a full page and a leader by the best available writer on the *night*."

Anthology of Opinion

Nineteenth Century Opinion. Compiled and edited by Michael Goodwin. *Penguin Books.* 283 pages. 2s. 6d.

The Victorian age saw the heyday of the serious political and literary periodicals. Mr Goodwin, the present editor of *The Twentieth Century*, has had the happy idea of compiling a stimulating anthology of extracts from his own review to illustrate the intellectual predicaments and viewpoints of the late Victorian period. *The Nineteenth Century* for the years 1877-1901 is a well-stocked hunting ground for the collector of intellectual trophies, for James Knowles, its founder and editor, was a skilled organiser of controversy. He had assembled in the Metaphysical Society men as sharply opposed as Huxley and Manning, Gladstone and Fitzjames Stephen. *The Nineteenth Century* provided a public arena for their contests, and Knowles also brought in writers as diverse as Ouida, Oscar Wilde and Tom Mann.

Mr Goodwin has chosen his excerpts with an eye for their present topicality. He prints some vivid pieces of social reporting, followed by an entertaining exchange of views on the emancipation of women. The problem of Leviathan loomed large. In 1883 the Earl of Shaftesbury was uttering Cassandra-like cries on the subject of state subsidised housing. In 1895 another contributor was prophesying that the growth of state intervention in economic matters would cause this country to fall before the competition of industrial rivals as surely as centralised and bureaucratic Rome had fallen before the vigorous and free barbarian invaders. But if the majority of the contributors refused to bow to the god of the state, they paid their homage to the altar of Science. "All the sciences," wrote one contributor in 1889, "are now fast resolving themselves into one—the Social Science."

The main trends of late nineteenth-century opinion, with their foreshadowing of present problems, are all represented fairly in Mr Goodwin's selection. But in seeking to illustrate so much he has done less than justice to the character of the review and the quality of the chief contributors. The blood has been drained away from some of the controversies. Gladstone's laboured ruminations on authority in matters of opinion are quoted, but not the trenchant attack on his loose thinking in this article delivered by Fitzjames Stephen. Huxley's discussion of natural rights loses much of its force and interest by being detached from its setting of an attack upon Rousseau. Mr Goodwin might with advantage have excluded some of the lesser game to allow us to observe more clearly the habits and contests of his greater captives.

Attack on Democracy

Liberty or Equality. By Erik von Kuehnelt-Leddihn. *Hollis and Carter.* 395 pages. 30s.

This is an attack on democracy in the name of liberty by a European Catholic. Mr von Kuehnelt-Leddihn begins by insisting on the distinction between democracy and liberty. The former, he truly observes, is concerned with the question who shall govern; the latter with the rights of the individual regardless of the form of government. This distinction is not a new one, and the dangers to liberty inherent in egalitarian political theories have long been noted by writers of various kinds. The second chapter of this book is indeed a long catalogue of observations made on this theme since the French Revolution, but it probably serves a purpose to remind communities obsessed with democratic shibboleths that parliamentary democracy has many shortcomings in practice and some latent dangers in theory.

The present author's recommendations will not, however, command as much sympathy as his analysis. His aims are to ensure the greatest possible individual liberty, to abolish the party system, to relegate ideological and philosophical struggles to the private sphere of society, and to establish the proposition that the will of the majority is of less account than the reasonable and the useful (which presumably remain to be discovered). His formula for achieving these aims is the establishment of a monarchy, in which the king acts as an umpire between a co-operative elected Diet and the experts and bureaucrats who form the executive. In addition there is to be a Supreme Court to safeguard the constitution and to act as *censor morum*; this court will be appointed by the Church and the universities. "It is obvious," says Mr von Kuehnelt-Leddihn, "that a deep religious cleavage or a variety of denominations would constitute a not inconsiderable obstacle to the establishment of such a court." And liberty of conscience or religion is not included in the liberties to be safeguarded by his constitution.

The chapters intervening between the author's analysis and his recommendations contain a critique of democracy, thirty points in praise of monarchy (not the constitutional variety but the enlightened paternalism of Maria Theresa), an elaborate derivation of the Nazi creed from the errors of Hus and Luther, and an appraisal of the political temper of Catholic nations. At one point the author remarks that a monarchy might have been the best solution for Rome about A.D. 100 but was impossible because of popular recollections of Tarquinius Superbus. One cannot help feeling that the somewhat romantic backward glances of the present writer ignore similar impossibilities.

A NEW LIBRARY SERVICE

Hitherto the Library 'guarantee' has only covered novels up to 10/6, and non-fiction up to 21/-.

To meet current higher book prices Harrods now offer the KNIGHTSBRIDGE SERVICE, which includes in the 'guarantee' novels up to 15/- and non-fiction up to 30/-. Each librarian attends to a limited number of subscribers only, ensuring a personal service to each.

Books are delivered by van within the area and posted anywhere.

HARRODS LTD LONDON SW1

The West and the Middle East

The Near East and the Great Powers. Edited by Richard N. Frye. *Harvard University Press.* (London: *Geoffrey Cumberlege.*) 214 pages. 22s. 6d.

Until 1950—the year of the conference of which this book is the record—the Near East consisted, for most Americans, of Israel and little else besides. Since then, a revolution of thought has taken place. Considerations of oil, strategy and the need to vote aid for needy Arab countries have brought it about. So has television with its display of the personalities and photogenic qualities of many Arab delegates to the United Nations. The Arab world is on the map, and this conference held at Harvard helped to place it there.

It was attended by a wealth of talent from the State Department, from Middle Eastern legations in the United States, from the United Nations staff, and from universities in America and Britain. The talks here reproduced therefore assume that the hearer, or reader, has some background knowledge, though not much. The book is, as it were, a grade III primer. In this class, it is excellent, and worth even its exorbitant English price. It contains chapters which the expert can read with profit, for though the contributions by Anglo-Saxon speakers are almost all statements of the obvious, those by men with other blood in their veins—Ralph Bunche, Charles Issawi, Majid Khadduri, Charles Malik—stimulate some less prosaic thoughts. Charles Issawi, for instance, points out that the modern tendency to build oil refineries in consumer rather than in producer countries deals a grievous blow to the industrialisation that the Near East is or ought to be, trying to promote (he was speaking nearly a year before the Persians gave the Middle Eastern refining industry a push in the wrong direction by reducing the security of investment at Abadan).

But the most interesting and perspicacious of the contributions comes from Charles Malik of Lebanon—the professor turned diplomat who has made such a name as his country's representative both in Washington and at the United Nations. Western money, he says in effect, is not by itself enough to win the friendships of the Arabs. People take it, and forget the giver. The West must give, in addition, something which he at one point calls "love," but which—in more prosaic western idiom—can be described as a change of heart that cuts out a superiority complex based on material superiority alone. If the West fails to execute this change, he says, it will discover that Islam is not, as it so smugly imagines, basically opposed to Communism. It is not strong enough, or prosperous enough, to stand a social onslaught of Communist type. Most Arabs, he adds, prefer the West, but not while it cherishes the illusion that there are no limits to the liberties it can take with certain parts of the Middle East because there is no danger that these will ever turn Communist. His reasons why "despite everything" it is possible for the West to win Near Eastern confidence is the most stimulating section of a good and useful book.

Shorter Notice

European and Comparative Government. By Robert G. Neumann. *McGraw-Hill.* 730 pages. 42s. 6d.

It is symptomatic of the current position in American universities that the author of this quite respectable textbook should feel himself obliged to apologise to his colleagues in the history departments for having included brief historical introductions to the institutions of the four countries he deals with—Great Britain, France, Germany and Russia. The other novelty, the addition of a chapter comparing particular institutions, is also welcome and in the hands of a good teacher might be very useful. The book contains texts of the French, German (Bonn) and Soviet constitutions. The last would be more useful if the date up to which amendments are included were given.

On the other hand, there seems to be no escape from the fact that no American textbook on government ever gets the position in Great Britain completely right. Mr Neumann does better than most, but even he has his lapses. The Committee of Imperial Defence is spoken of as though it were still a current part of British government; the statement that a broad system of scholarships does not exist at Oxford and Cambridge makes one wonder if the author knows anything about their present situation; the Bishop of London is not known as the Lord Bishop of Lambeth; there must by now be more than twenty Labour peers.

"As important as my telephone – and as easy to use!"

The Dictaphone Time-Master is the simplest dictating machine

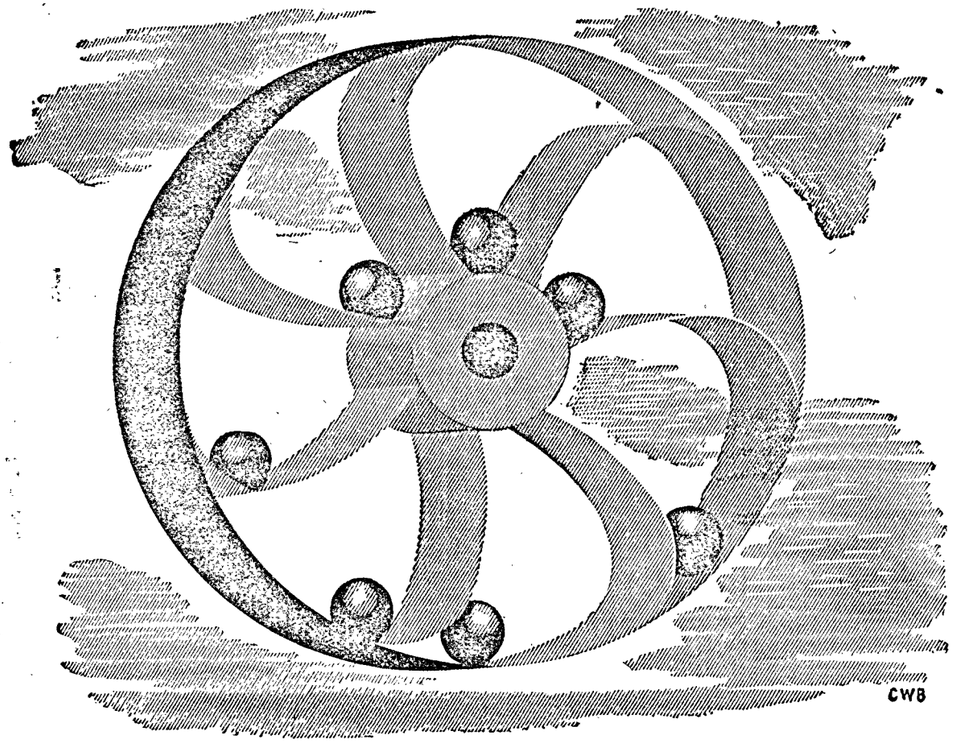
Here is a dictating machine that is really simple to operate—just as simple as using your telephone! The Time-Master requires the minimum of controls. There are no intricate, time-wasting adjustments to be made.

THE MARVEL OF THE DICTABELT

The great advances in both design and performance shown in the Time-Master were made possible by the use of the Dictabelts. These little plastic belts carry on the well-proved principles of cylindrical recording, which ensures uniform quality recording, uniform speed *and* uniform back-spacing.

Slip in a Dictabelt and you are all ready for 15 minutes perfect crystal-clear dictation. Flick a lever, the completed Dictabelt pops out, ready for your secretary to transcribe.

ONLY THE TIMEMASTER OFFERS ALL THIS



1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Dictabelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Perpetuum mobile

FROM THE VAIN SEARCH for a machine that would continually rewind itself emerged the most important of all generalizations of physical science—the principle of the conservation of energy. With the development of the diesel engine science has come close to an approximation of this principle. And today the diesel engine is being applied to the services for mankind to which the search for perpetual motion was dedicated—the raising of water, the fertilising of deserts, the grinding of corn.

BRUSH ABOE is a group of companies concerned mainly with the production of diesel engines — from the small 8 h.p. engines, more than 20,000 of which are working in India, to powerful 3,000 h.p. engines for heavy diesel-electric generating plants. In 1951 over 70% of the production of THE BRUSH ABOE GROUP was exported — to make the earth more fruitful by irrigation, to bring light and power to the under-developed areas of the East, to modernise locomotion everywhere. Every day and every hour the diesel engines exported by BRUSH ABOE are somewhere in the world improving living conditions — thus ensuring a " perpetual motion " of service to mankind.

AMERICAN SURVEY

Eisenhower's Problems

Washington, DC

WITH every week that passes the political situation in the United States gets curiouser and curiouser. Those whose names have been mentioned over the past few months as possible presidential candidates can be divided into two groups—the over modest and the over ardent. In the Democratic party the best prospective candidates are too modest and among the Republicans the worst are too ardent. Midway between these two groups, however, is General Eisenhower whose official reluctance is counterbalanced by the ardour of those who had his tacit approval for their campaign.

The General is lucky to have others to blow his trumpet for him. That is surely the way trumpets should be blown and it has been apparent in the public statements of Mr Warren, Mr Stevenson, Senator Russell and Mr Harriman that all four felt uncomfortable when called upon to announce their own availability for the highest post in the country. Senator Taft, Mr Stassen and Senator Kefauver have, however, shown no reluctance to shout their wares, while the supporters of Senator Taft are prepared to go even further and hint at the existence of possible impurities in some of the competitive products.

General Eisenhower will come back at the beginning of June to an atmosphere of rapidly increasing bitterness within the party he has chosen as his own. If this had not been apparent before, the Taft tactics in the New Jersey primary and the speech of Representative Clarence Brown, who was representing the Senator officially, at a dinner in Washington last week, have now made it quite clear that nothing will be left unattempted in the effort to stop the General's nomination. The problem of how he is to handle himself and how his managers are to handle him between June 1st and the Republican Convention is therefore not an easy one. The man whose chief attraction is his promise of national unity can hardly begin his political life by indulging in a violent quarrel inside his own party before he even starts to cross swords with the real enemy. And yet the Taft forces are determined that he shall:

★

But General Eisenhower's worst problems lie farther ahead—beyond the time when, or if, he has been nominated. He will then, presumably, take the traditional trips round the country, speaking from the back platform of a train and helping those Republicans who are up for election or re-election to Congress this year. And the list of Senators who will come back to Washington on his back is enough to make the most courageous General of the Army quail. Mr Truman's own qualities had much to do with the miraculous victory of 1948 but, in many states, Mr Dewey was carried to defeat by the type of man the local Republican machine had given him as a running-mate. And Mr Dewey's burdens were light compared to the load which the General, or any progressive Republican candidate for the Presidency, will have this year.

The problem is made no simpler by the fact that the Republicans have only a slender chance of winning control of the Senate, whatever the outcome of the Presidential election; for this reason, the sacrifice of one or two of the worst Senators on the altar of decency is not, in political terms, a very practicable proposition. It is not easy to see how the Republicans can achieve the necessary gain of four seats, or even how they can hold all the states won by Republicans in 1946, when the voters made their only postwar lunge towards normalcy. For the group of Republicans elected in that year is generally admitted to be the most unpleasing that anyone in Washington can remember.

Some weeks ago a large number of leading political scientists were asked to place the 96 members of the Senate in order of merit. As the political affiliation of those who answered did not seem to affect their opinions of the Senators, all the replies were lumped together. They made a revealing document and, as five of the nine Senators who came out best were Republicans, presumably not one which could be accused of being grossly partisan. What was important about it, from General Eisenhower's point of view, was that, of the 25 worst Senators, 22 were Republicans—the three Democrats were Messrs McCarran, McKellar and Eastland—and, of these 22, eleven, including the four at the bottom of the list, are running for re-election this year.

This group would probably create no problems for Senator Taft; he has already formed a public alliance with Mr McCarthy, of Wisconsin, the worst of them all. But they would be a continuing embarrassment to General Eisenhower, for his strength in the country comes from the independent voters who want Mr Taft disposed of as quickly as possible and are tired of Mr Truman, and particularly of the operations of the less reputable characters in his Administration. But if the General is nominated and starts to campaign against a new Democratic face, the independent voters would at once begin to inquire into his attitude towards this unprepossessing team of Senators.

One of the problems of being a White Knight is that of staying white; it would be a simpler task for Senator Kefauver, whose role is also that of a crusader, should he be the Democratic nominee. He would not have to go into the South, where Democrats need no help, he could support those Democratic Senators who are in danger with a clear conscience and he could attack the General's eleven albatrosses with all the vigour of righteousness, secure in the knowledge that his own party's candidates could not be worse and that, in nearly all cases, they were demonstrably better. Which would be the more comfortable, for example, in the State of Washington—General Eisenhower speaking for Senator Cain, the 91st in the political scientists' order of merit, or Mr Kefauver advocating the election of Mr Cain's opponent, Mr Jackson, one of the best men in the House of Representatives?

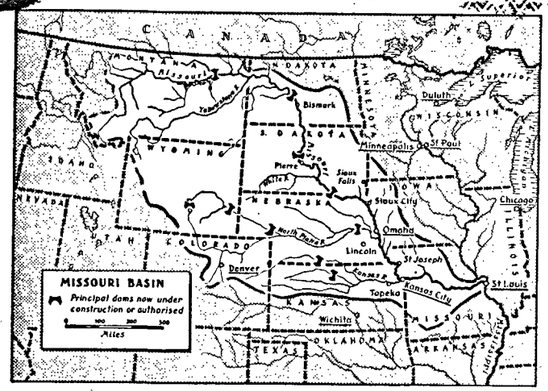
"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

It would be politically impossible—and almost equally impossible physically—for the Republican train to cross the continent without going into the states where these eleven worst Republicans are running. Only three of them, Mr Malone, of Nevada, Mr Brewster, of Maine, and Mr Langer, of North Dakota, are in any danger from within their own party. There is plenty of danger, however, from Democratic opponents in some of these states, as well as in others where better Republicans are running. So it would be no surprise, particularly since the American electorate is showing a growing tendency to abandon its old habit of voting a "straight ticket" for all the candidates of one party, and becoming more selective, if the General were to win the Presidency without difficulty while his party lost some Senate seats at the same time.

*

But, although this could well happen, there is no doubt that, if General Eisenhower is nominated and elected, the size of his majority cannot help being seriously affected by these Senators, and that they could cause his defeat if the Democrats find a strong opponent for him. Mr Bernard de Voto reported in *Harper's Magazine* this month that the independent voters have become increasingly depressed as they have begun to understand what the nomination of the General would mean. The Republican party in the Senate would still be led by Mr Taft, who, as Mr de Voto says, "would be fixed in absolute hostility to the foreign policy the President had been elected to support"; and the committee chairman in both Houses—if the Republicans could win both Houses—would constitute a "Murderers' Row" which not even the prestige of an Eisenhower "could convert or subdue . . . to a foreign policy which they have opposed through war, peace and rearmament."

The problems which confront General Eisenhower now, and would continue to confront him all through his Presidency, are, therefore, so vast that few men would have the courage to try to solve them. If the Democrats had not been in power for twenty years, in a country where the spoils system makes too long a period of consecutive power unhealthy, there would be no obligation on anyone to try to save the Republican party from its attempts to commit suicide. Even as things are, it will take all the General's powers of persuasion and all his ability as a chairman to get anything he wants done. He must often, during the last year, have cursed the day when he accepted the task of trying to keep the governments of a dozen European countries together as a team. After a few months of trying to keep the Republican party's Senators in line he may well wish that he were back among more reasonable men.



Floods of Controversy

[FROM A CORRESPONDENT IN MISSOURI]

IN the valley of the Missouri River, which drains over 500,000 square miles, one-sixth of the United States, heavy snows in winter ensure political controversy in spring and summer. The snows have been exceptionally heavy during the winter just past, and their consequence this April is the greatest flood ever recorded along the middle stretch of the Missouri between Pierre, South Dakota, and Kansas City, Missouri. While the muddy water was spreading across the bottoms from bluff to bluff, engulfing valuable farm land and homes and factories on the riverbank, President Truman flew to Omaha for an urgent conference with the Governors of the states in the region. It was certain that the flood would leave a deposit of heavy silt wherever it crept, and that it would leave a deposit of talk—in the valley, in Congress and in the Administration at Washington—to the effect that something must be done about the Missouri River.

Something is in fact being done. Eight years ago the army engineers, who have jurisdiction over navigation and flood control, got together with the Bureau of Reclamation, the sub-agency of the Department of the Interior which deals with irrigation for the federal government, to work out the Pick-Sloan plan for the Missouri basin. On the drawing boards or under construction are nearly 150 dams for the river and its tributaries. Electricity plants, levees, dykes, irrigation canals and all the other apparatus of a river control system are in various stages of planning, design or construction. Nearly $1.5 billion has already been spent, and $4 billion or more is to be spent in the future.

But the work goes slowly, especially since rearmament became a prior claimant on the federal budget. Meanwhile floods keep recurring, and the accompanying political debate keeps churning. Last summer unseasonable rains produced the greatest property damage ever known along the Kansas River, which flows into the Missouri at Kansas City. There was at once a clamour to build certain dams which might have held back part of those waters. The dams have never been started; Congress is still debating them, with some

members insisting that these particular dams would not have stopped the 1951 flood as effectively as would certain others.

So it will go, no doubt, with the Missouri flood of 1952. The series of big dams now planned, or being built, on the Missouri in North and South Dakota would have held back most of this April's flood, which originated from melting snows on the prairies in the Dakotas and Montana. But before these dams are finally completed, there is sure to be furious dispute from those who insist that the river would be better controlled by terracing and contour ploughing, by farm ponds, and by regulating the creeks rather than by damming the main stream. Water, like theology, brings out the fanatic and the doctrinaire.

The bitterest controversy of all has lately taken on new life with President Truman's appointment of a Missouri Basin Commission to make one more study and one more set of recommendations. The President acted at the request of Senator Thomas Hennings of Missouri, a Democrat and a liberal, who is presumed to favour the principle of a Missouri Valley Authority, modelled on the successful Tennessee Valley Authority. The suspicions of those who oppose such an all-embracing solution were further aroused when Mr James Lawrence, a Nebraska editor, was appointed chairman of the commission; he was the protégé and is the biographer

of the late Senator George Norris of Nebraska, the father of the TVA. Mr Lawrence's commission is to bring in a report by the end of this year, recommending how the federal government can best organise and administer the many water control projects which now occupy various agencies, including the Bureau of Reclamation, the army engineers, the Department of Agriculture and the Federal Security Agency.

The predominantly Republican states of the valley have so far resisted an MVA with passionate intensity, the passion deriving from a combination of state's rights sentiment, dislike of the New Deal, prejudice against "socialism," attachment to things as they are, and the complexity of the problems involved, which defy solution by any simple formula. This does not mean that the states want the federal government to withhold funds. Indeed, when Congress tries to economise, the popular demand for money to build dams, bring new land under irrigation, produce hydro-electric power and improve the channel for barge navigation becomes almost irresistible. The valley wants the projects and its own people cannot pay for them, so it turns to the federal government, and finds it more comfortable to deal with the traditional agencies than with a newfangled valley authority.

The federal agencies, notably the Bureau of Reclamation and the army engineers, have a strong position. Each has a lobby and a set of faithful Congressmen who look out for its interests. How the Army Corps of Engineers got into the business of water development in the first place is lost in the mists of history. In the early days of western migration army men charted the routes and explored the rivers. Lewis and Clark, for example, broke the Oregon trail on an army mission. Later, when river navigation became important, before the days of railways, the army inherited the job. It has kept the assignment ever since, on the excuse that the work offers valuable peacetime training for engineer officers.

When fifty years ago Theodore Roosevelt inaugurated federal spending to irrigate arid western lands, a new agency, the Bureau of Reclamation, was created to carry on this function. In the Missouri basin the Bureau started upriver and worked down; the army engineers started downriver and worked up. They collided some fifteen years ago. The army wanted certain dam sites to maintain a navigable channel and to control floods, the Bureau wanted the same sites and water for new irrigation projects. After a good deal of conflict, the two agencies made an uneasy peace by agreeing on the Pick-Sloan plan, which is now the official blueprint for development of the basin. There are those who say the marriage was one of convenience, intended to forestall the threat of an MVA which might displace both the older agencies.

*

As each new dam is begun, the need for integration becomes more apparent. The Missouri is one river, even though it drains a vast and diverse area, and many of its problems demand a unified approach. This has been recognised by the formation of an inter-agency committee, which brings all the federal agencies and the states together for periodic discussion of water problems. The committee is purely informal and has no power to act. The Hoover Commission, in its study of governmental reorganisation, strongly recommended that integration become real rather than make-believe, through the creation of a new Department of Natural Resources which would direct all water development in all basins.

President Truman, while inching toward a possible MVA through such moves as his appointment of the Lawrence Commission, also seems to be going in the direction suggested by the Hoover Commission. The White House is reported to be ready to sponsor a reorganisation plan taking all river work away from the army engineers and concentrating it in the Department of the Interior. This would be a good trick if Mr Truman could do it, but the power of the army engineers, its captive Congressmen and its friendly lobby, is such that the engineers have at times over-ridden the President's own budget recommendations by direct appeal to Congress over the head of their Commander-in-Chief.

Yet the sheer logic of integrated water development—either through a single federal department, or through a series of valley authorities, perhaps co-ordinated by such a department—stands out like a beacon. Not only would unification save money, but the conflicting demands on water may ultimately make it a practical necessity. Serious doubt exists whether the Missouri basin, in spite of its momentary glut, has enough water to supply all the irrigation projects now planned and at the same time maintain a navigable channel below Sioux City, also planned. An MVA or a governmental reorganisation could not eliminate these problems, but it might make them more easily soluble.

American Notes

Marking Time in Steel

Once the steel companies and the steel workers failed to reach a quick agreement under the pressure of the seizure of the industry, the government was faced with the possibility of a long and increasingly bitter occupation of the steel plants. That is still in prospect, for there has been no real change in the situation during the past week. But, whatever

other members of the Administration may feel, it is a prospect that is certainly not pleasing to Mr Sawyer, the Secretary of Commerce, who is in control of the industry. He has been putting off the step that would finally dash any slight hope of a negotiated settlement that remains. That step, to give the unions at least part of the recommended wage increase even though the stabilisation authorities refuse to allow a price increase, is one which would involve the government in a second legal battle. The first is over Mr Truman's constitutional right to seize the steel plants ; the second, probably even more complicated, would be over his right to interfere in the industry's conditions of employment and to use its funds to pay higher wages.

Neither side in the dispute is doing anything to help Mr Sawyer avoid this battle. The union spokesmen, secure in the President's approval of their position and with the members becoming increasingly restive, accuse the companies of attempting to obtain higher prices by blackmail. The industry, spreading its case across the country by heavy advertising, attacks the integrity of the independent members of the board which recommended the steel wage rise. Nor is Congress acting constructively in spite of an appeal from the President. The situation can hardly be improved either by the Senate's attempt to deny him money to operate the steel mills, or by the suggestion in the House that he should be impeached, even though neither of these projects is likely to be carried out.

The President's position has, however, just been strengthened by the approval of his national advisory board on mobilisation policy and, as *The Economist* goes to press, a last effort to settle the dispute is apparently being made. Mr Putnam, the Economic Stabiliser, is now deciding, at Mr Sawyer's request, what increase in wages is justified, and he has already forced upon the industry an increase of $3 a ton in steel. This increase had long been on the way under the Capehart amendment to the Defence Production Act, which allows price rises to cover higher costs incurred in the first half of last year. But it had been resisted by the industry for fear that the case for higher prices in connection with the present dispute would be weakened by acceptance of the earlier increase.

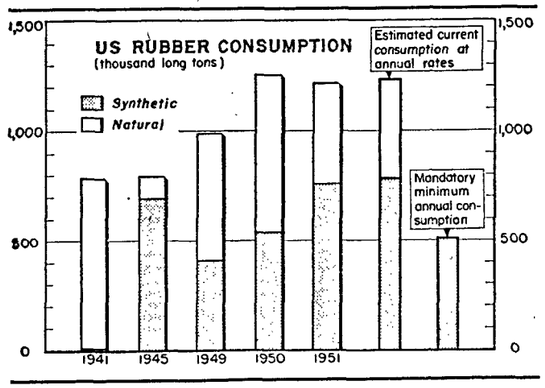
Presidential Parade

When the Democratic party's stable of possible presidential candidates was paraded at a dinner in New York last week, the most applauded was the one who had just withdrawn from the race—Governor Stevenson of Illinois—and as a result there are still those who hope that, when the Convention comes, he may be forced to run. Meanwhile, his withdrawal has stimulated the hopes of a string of other wishful starters, but not one of them looks like a winner to the party tipsters. Senator Russell of Georgia is too southern and too conservative to appeal to the trade unions, the Negroes and the liberals on whom the party depends for victory ; Senator Kerr of Oklahoma is also a southerner and he is tarred with the oil industry's brush. The Vice-President, Mr Barkley, is too old, and Senators Humphrey and McMahon are too progressive for the South. Senator Kefauver is distrusted by party officials in South and North alike, but he has collected impressive proofs of his popularity with the voters in the Democratic primary elections. Governor Stevenson's withdrawal, therefore, made it essential for the party organisation to find a candidate at once who could overtake Mr Kefauver.



At first sight Mr Averell Harriman hardly seems to have the necessary turn of speed, in spite of his long and efficient service as an Administration wheel-horse. But he is nationally known and respected, he is a liberal who apparently has no enemies within the party, in spite of his big business heritage, and, above all, he is willing to run. So he has been chosen by the Democratic organisation to lead the parade, for the present at least, and he has begun by collecting most of New York's huge delegation to the Democratic National Convention.

At the Republican Convention, General Eisenhower should be able to rely on the New York delegates, for most of them will do as Governor Dewey tells them, and he is one of the General's most faithful supporters. These delegates were chosen last Tuesday: few of the places were contested and of those that were General Eisenhower lost only one to Senator Taft. The Republican delegates elected in Pennsylvania on the same day are not officially committed either, but in that State there was also a popularity contest. Senator Taft was not entered, but a surprisingly large number of voters wrote his name in. However, the size of the vote for General Eisenhower was much more impressive and he has come out of this week at the head of the Republican parade—for the moment. With his New York delegates and at least some of the Pennsylvania ones, the General can now claim to have in his pocket as many Convention votes as can Senator Taft. But neither of them can yet count on anything approaching the full 603 that are needed to secure the Republican nomination.

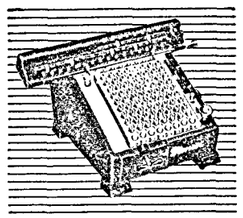
Rubber Half Free

This week the United States collected a prize for having remembered at least one of the lessons of the last war. The lesson, that of the dependence of America on rubber from overseas, was learnt the hard way and, as a result, rubber was never entirely decontrolled even in the postwar rush for freedom. When the Korean outbreak began and the need for natural rubber for the stockpile became acute, it was



therefore possible at once to put restrictions on the use of natural rubber in civilian products and to make up the deficiency by increasing output from the synthetic rubber plants built during the war and still owned by the government. These plants have an annual capacity of about 860,000 tons.

Now, however, the reserve of natural rubber is apparently satisfactory and manufacturers of rubber products, who accepted the restrictions with remarkably good grace, have been rewarded by having them almost entirely lifted, the first important decontrol measure since the present rearmament programme began. Output of synthetic rubber is to be cut back gradually while the government collects a stockpile of this too, amounting to 122,000 tons. This would be enough to fill the gap until the synthetic factories could return to full production, should it again become necessary to restrict the use of natural rubber. In order that the synthetic facilities should be kept in active working condition and that there should be a market for their output, a minimum annual consumption of 450,000 tons of GRS and of 60,000 of butyl rubber is required by the latest regulations.

BRITISH OVERSEAS AIRWAYS CORPORATION

It is expected that this rate of consumption will in fact continue to be substantially exceeded, for at present prices synthetic rubber is more acceptable than natural for many purposes; in addition, recently the quality of some shipments of natural rubber has been criticised. The government is at present selling GRS at 23 cents a pound; the price was reduced from 26 cents early in March and a further reduction may come when lowered output makes it possible to do without the expensive alcohol which is now being used as a base for a certain proportion of the synthetic rubber. On the other hand, it has been suggested in Congress that it might be easier to induce private firms to take over the synthetic factories if the price was raised to a level which would enable manufacturers to cover interest, taxes and other expenses which the government does not have to provide for. The government is still selling natural rubber at 48.5 cents a pound, well above the present world price of around 37 cents, to cover the higher cost of rubber bought some time ago. But the price is expected to go down before the end of June, when the natural rubber trade will return to private hands. Then there will be free competition, on one side at least, between natural and synthetic to provide the 250,000 tons, and more if consumption goes up, of rubber which has been left unaccounted for by the removal of the restrictions.

Strains on Good Neighbours

The Secretary of State's coming visit to Rio de Janeiro is a recognition of the need to relieve some of the strains that have recently developed between the United States and its "good neighbours." Brazil's economic leadership in Latin America, its importance as a trading partner of the United States, and the fact that the mutual defence pact between the United States and Brazil has yet to be ratified by the Brazilian Congress, make that nation a natural starting point for reinforcing ties with the countries south of the border. That those ties need reinforcing has been shown by the considerable opposition in Brazil to the pact, the strong nationalist sentiment in Chile and in Mexico against similar agreements (the talks collapsed completely in Mexico), and the general instability now apparent below the Rio Grande.

The *coup d'état* in Cuba and the bloodshed in Bolivia are dramatic highlights in an area that may produce more such surprises, for most of these countries are facing major economic and political problems. These are problems for the United States, too, not only because of the $6 billion that is invested there and the annual trade between the United States and Latin America, amounting altogether to over $7 billion last year, but also because of the vital importance to US security of good hemispheric relations.

The disquieting weakness that is developing in these bonds is apparent from the growth of nationalism and of its counterpart, resentment against the United States. While the leadership in the anti-*Yanqui* crusade has been taken by Argentina, the current election campaigns in Mexico, Chile, Panama and Venezuela show that Sr Peron's words have not fallen on deaf ears. This feeling against the United States is based on something more solid than propaganda, for the distortion of the normal trade pattern in the hemisphere by the United States defence programme has brought new difficulties to the southern neighbours. The rising prices of many US exports, the shortage of some capital goods for export to countries anxious to industrialise, attempts to raise US tariff barriers, and US price ceilings on such key Latin American exports as Brazilian coffee and Bolivian tin, have all contributed to the increasing strain. Mr Acheson, in his first official visit to a leading sister republic, will presumably try to counteract it by showing that, in spite of its concern with the cold war in Europe and Asia, the United States has not forgotten the importance of its allies nearer home.

Springtime for Television

It is over a year since the Federal Communications Commission first heralded the approaching end of the freeze which since 1948 has kept new television stations from sprouting, but it was only on Easter Sunday that the thaw finally set in. Then the FCC announced that, as the result of its long study of the airwaves, it had decided to open up 70 new channels in the ultra-high-frequency band, ranging from 470 to 890 megacycles, in addition to the 12 already available in the very-high-frequency band, from 54 to 216 megacycles. This would eventually make room for 2,053 new television stations in nearly 1,300 towns all across the United States; there are 108 stations telecasting at present from 65 centres to about half of the population. The new scheme, designed to provide what the old one did not, "the widest possible service with the least amount of interference," will mean that a state like California, which now has 11 stations, will be able to have 87, while Texas, where there are now 6, will have 179; even under-populated states like Maine and South Dakota, neither of which have television at present, are allowed 29 and 30 stations respectively.

Applications for permission to build and operate the new stations must be sent to the FCC by July 1st; over 500 are already pending but it is likely to be years before all the new licences are granted. The FCC plans to begin by considering requests from such large centres as Denver, Colorado, Portland, Oregon, and Charleston, South Carolina, which do not yet enjoy the blessing of television at all. Competition for the

new channels will be especially fierce in important marketing areas such as Pitttsburgh and Boston, each of which has been allotted four additional channels, but with only one in the very-high-frequency range. This range is more coveted than the ultra-high-frequency, because existing sets need adapters to enable them to receive UHF programmes. In both the cities mentioned and in many others, a VHF channel has been set aside for an educational telecaster; altogether 242 channels, more than was expected, have been reserved for non-commercial use, to the chagrin of the commercial television interests.

The objection to UHF stations is that they may not have enough viewers to be able to operate profitably at first; however, it seems probable that the set makers will have caught up with this new demand before many of the stations are ready to go on the air. No serious difficulty in obtaining transmitters and other equipment is expected and in the course of next year the television industry is hoping to branch out in a way that will make its phenomenal growth in the immediate postwar years look stunted. This second flowering will be as welcome to the set makers, whose sales have been lagging badly, as to the telecasters, who need the promise of bigger and better audiences to attract advertisers who are finding that television programmes today cost more than they are worth.

THE WORLD OVERSEAS

Success and Stress in Nigeria

(From Our Correspondent)

THE Nigerian budget sessions have shown that to end an empire is at least as difficult as empire-building. It is a slow, painful, hazardous business, demanding political maturity on both sides of the imperial relationship. Still, the budgets have been got through, both in the regions and at the centre; the achievement in fact has been great. At the lowest, the first big task of the part-African government under the new constitution has been accomplished without a breakdown. At the highest, although dozens of speakers have exploited their opportunities for pure denunciation, African ministers have shown courage and staying power. On the whole, they were moderate and balanced in their criticisms of the budget proposals, and co-operated in the job of getting them accepted. The proposals were not their own, as they had to be framed before the present ministers were appointed. The first test therefore has been one of patience and understanding rather than of inventiveness; and many of the Nigerian leaders have shown that they can digest as equals what they could not stomach as dependants. There is now a measure of political stability and this, plus a realistic if orthodox central budget, should go a long way to create reasonably favourable conditions for social and economic progress. It has to be admitted, however, that many people believe the most recent opposition tactics of Mr Awolowo's Action Group party in the central House of Representatives have ben damaging, and prophetic of things to come.

Shadow Boxing

In the regions, the progress of the western budget was the least smooth, partly because of the ding-dong battle between Mr Awolowo and Dr Azikiwe. Members everywhere felt the strain of British parliamentary procedure. Often it was difficult to tell whether speakers were being deliberately obstructive or genuinely tripped up by standing orders and the rules of debate. Much of the discussion, too, in all three regional assemblies was mere shadow boxing. Sessions began in February, only a week or two after ministers took up office, and had to be ended in time for members of the House of Representatives to rush down to Lagos to try to get the central budget through if possible before the end of March. The time factor alone put any redeployment of resources out of the question. The new ministers were quick to appreciate the limits of possible action, and accepted the main lines of the administration estimates—"budgets of necessity dictated by circumstances." Some minor changes were made (big scholarship schemes were promised for higher education, the money to be cut out from other votes), but an extreme clash between the desirable and the practicable was avoided.

In the central House of Representatives the Ministers had agreed to accept the deliberately conservative budget proposals of the former government as a working basis. Politically, then, these proposals were less interesting than the reception they got in the House. The spirit of the budget was one of incredulous joy. It was wonderful that income should continue to grow (from £5.8 million in 1938-39 to an estimate of £42.6 million for 1952-53), that imports and exports should go up by leaps and bounds, that cocoa may fetch anything over £200 a ton, so that, with some other crops doing almost equally well, export duties alone may produce £8.5 million next year. But, as the Financial Secretary said when introducing the budget, Nigerian prosperity in agriculture is "prosperity of price." The economy is dependent on the world market and the budget is dependent on customs duties. The house could be brought down with a huff and a puff; so that in addition to the very considerable reserves of the Marketing Boards the Government on its own account is wisely tucking away tidy little sums, this year £3¼ million into the Revenue Equalisation Fund, another £2 million in the Loan Development Fund as well as collecting a small surplus. This still leaves enough for increased expenditure on docks, roads, public works, and higher education, among other things.

Encouraging Foreign Capital

Otherwise a main object of the budget and of the other financial proposals associated with it was to stimulate the investment of foreign capital in Nigerian industry, partly by trying to build up a stable and balanced economy, in itself an inducement to overseas investors, and partly by such direct encouragement as tax reliefs. By 1956 the Ten Year Development Plan should have led to the investment in general development of £55 million from the Colonial Development and Welfare fund and from Nigerian revenue and loans. This probably represents the largest programme that could be financed from these sources. The Government is also sending out "a call to overseas capital" to share the task. The Pioneer Industries Bill offers exemption from company tax for five years to enterprises entering new fields of industry, or extending others not yet fully developed; and a Bill to amend the Income Tax Ordinance will permit all companies, pioneer and otherwise, to "write down" their capital assets for the purpose of assessing income tax more rapidly; it will also allow new companies to build up liquid reserves and established ones to renew equipment.

Although all the bills were passed the Government did not avoid some political troubles. Mr Awolowo, head of the Action Group Government in the west and western regional Minister of Local Government, but a back-bencher in the central House, struck out an entirely new line for himself and his party and startled everybody by the vehemence of his attack on government policy. Saying that the budget was dominated by "cautious conservatism and a traditional street-beggar mentality," entirely unrelated to the "vast potentialities and phenomenal dynamism of the country," he demanded a large-scale improvement in agriculture, and vast expansion of health, education, and other social services. "I agree that side by side with these projects," he is reported to have said, "some industrialisation should be introduced. But this in my view should be partial, and should be left to the initiative of Africans. . . ." Later other speakers from his party seemed to modify this attitude a little, not so much attacking industrialisation as demanding a comprehensive plan for industry, nationalisation of industries, the creation of a national industrial board and other boards to fix and control prices, and a Central National Bank. They and their press made great play with the drift from "political slavery to economic bondage"; "the new bills are a clarion call to foreign investors to flood Nigeria and help Britain

to keep us in perpetual economic servitude." In the end the Minister of Mines challenged the westerners to declare whether or not they had confidence in the central ministers. They replied with another editorial salvo:

> The west has implicit and unqualified confidence in the western ministers of the central legislature. . . . We do not have any iota of confidence in certain Nigerian ministers who hobnob with the imperialist and are ready any day (except during elections) to blow the imperialist trumpet. . . . We have no confidence in lily-livered imperialist hirelings.

The western province representatives clearly reserve the right to walk out at any moment.

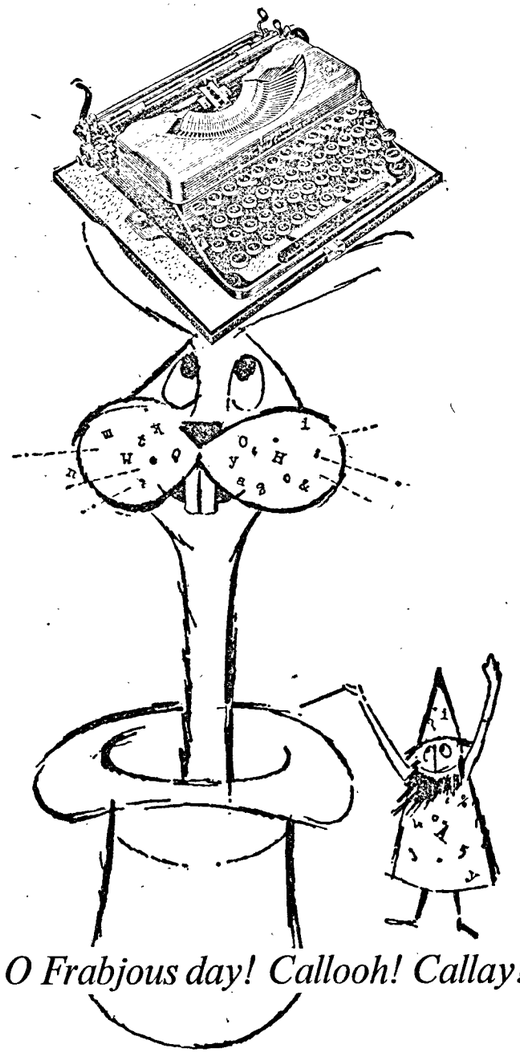
All this manœuvring for position has given Mr Awolowo the initiative and put everyone else on the defensive. It may be very useful in the nationalist game to be able to point out, in the future, that it was Action Group that fought for the economic freedom of Nigeria. In attempting to fill the dual role of Prime Minister of the west and leader of the opposition at the centre, Mr Awolowo may achieve two separate reputations, as a constructive statesman in the one case and as the nationalist leader in the other. On the other hand, his plans may be based on a huge miscalculation. Already he has driven the north into alliance with the east and lost the support of some moderate opinion. But moderate opinion counts for less and less in elections and Mr Awolowo has stolen Zik's clothes with a vengeance.

How Strong is the Chinese Air Force?

[BY A CORRESPONDENT]

For over a year now it has been common knowledge that China's air force has, apart from the Russian, become the most important in the Communist sphere. The Chinese Air Force received large numbers of modern Soviet-built jet fighters and supplies of Soviet radar equipment early in 1950, long before the air forces of Czechoslovakia, Poland, Hungary, Rumania and Bulgaria. Last November General Vandenberg, Chief of Staff of the US Air Force, surprised many people when he said at a Washington press conference: "Overnight, China has become one of the major air powers of the world." He went on to say that the United Nations complete air superiority over Korea was being seriously challenged. It is now more than five months since General Vandenberg made that statement. During the prolonged truce negotiations, air operations over Korea have continued as far as weather conditions have allowed. The fighting of the past few months, together with the record of Chinese air operations in 1951, make possible a reasonably valid assessment of the true fighting value of the Chinese Air Force.

Numerically the Chinese are much stronger in the air than ever before. It was noticeable that, at the beginning of 1951, Chinese fighters were encountered over Korea in groups of as many as 50 to 75 compared with 15 to 20 in the autumn of 1950. By the end of 1951, a single United Nations bomber operation was sometimes opposed by several hundred Chinese fighter aircraft. In November, 1951, General Vandenberg's official estimate gave the Chinese Air Force an operational strength of about 1,500 aircraft. Of these, some 700 were obsolescent fighter bombers and light bombers and the rest modern jet fighters, mostly MiG 15s and some twin Tupolev jets used mainly, so far, as night fighters. The latest intelligence reports from Washington, which were confirmed by General Vandenberg in a speech last Sunday, put the Chinese strength at about 1,700 aircraft. This increase is not surprising. Air operations over Korea have been restricted lately, and losses on both sides have been slight. In such conditions nearly all air forces will increase their strength, and in General Vandenberg's opinion the Chinese have been receiving from the Russians "some seventy MiG 15s monthly."



But, as Lord Tedder has so often insisted, air statistics are not the true yardstick of air power. To judge a nation's air strength it is necessary to assess its ability to defend its own territory from air attack, its power to carry the air offensive to enemy territory, and, finally, to ask whether it has enough transport aircraft to carry equipment and supplies to and from the battlefront. How strong is the Chinese Air Force measured by these three important yardsticks? Undoubtedly it has shown more ability to defend the target areas in Northern Korea during the past six months. Increased supplies of radar from Russia have improved the Chinese early warning system and also the accuracy of the anti-aircraft fire. Chinese MiG 15 jet pilots are more experienced and more determined in their attacks on bomber formations. But the Chinese Communist fighter squadrons are operating under ideal combat conditions at the moment. They have only to defend the small combat area of North Korea and they know that United Nations bombers must always return to the same target areas. If the area of bombing were to spread (to the Chinese mainland, for instance) they would for the first time be subjected to a severe air test. Some of their basic weaknesses would then be exposed.

Some of these weaknesses have already been indicated in the recently published statistics of Korean air battles during the last year or so. In air combat between United Nations Sabre jets and Chinese MiG 15s, the "losses" (or should one say claims?) have been about 7 to 1 against the Chinese Air Force. And this despite the superior technical performance of the MiG 15 at certain heights and the highly advantageous defensive situation of the Chinese fighter force. The United Nations air crews have been greatly superior in tactics and training and their radar gun sights are better than the gyroscopic uncertainty of the equipment so far fitted to the Communist MiG.

Failure in Reconnaissance

As for carrying the air offensive to enemy territory, the Chinese Air Force has failed to attempt this task seriously. United Nations troops and lines of communication have been virtually free from Chinese air attack. In fact, it is very rare for a Chinese Air Force plane to be seen south of the front line in Korea. On the odd occasion when they have appeared, the obsolescent Tupolev and Ilyushin bombers have run into heavy losses. The Chinese Air Force has failed in its reconnaissance task of keeping Communist headquarters up-to-date with information on United Nations ground movements behind the Korean battle front. The Chinese Air Force also lacks an adequate force of transport aircraft, though it is slowly acquiring a small force of Soviet Dakotas (PS. 84) and Ilyushin twin transports. Whenever the Communist communications system has been severely affected by United Nations bombers in Korea, the Chinese Air Force has been unable to bridge the gap by bringing supplies by air to Chinese front-line troops, except on a very small scale. This, of course, is not such a serious deficiency as it might be, as the Chinese Army fights—and fights well—with the minimum of equipment and supplies.

The real test of the Chinese Communist Air Force will come during the next few months of better flying weather. If the truce negotiations fail, it may find that it will have to operate over a much wider area of combat. Increase in the scale of operations and increase in the area of operations will almost certainly prevent any further considerable expansion during 1952. It will continue to gain in experience and, no doubt, modernise its obsolescent bomber force and fit its fighters with radar gun sights. As long as it does not have to meet fresh operational commitments it may continue to gain in effectiveness. But, as General Vandenberg said last November, from the United Nations point of view, the situation is in hand and will almost certainly remain so in the foreseeable future.

O Frabjous day! Callooh! Callay!

The news that the Imperial Good Companion portable is here again is falling sweetly on many an ear . . . and many a set of fingers that have itched to work on a Good Companion are flexing themselves . . . and many a Good Companion owner will be gratified years from now to find it still working flawlessly . . . and last but far from least, many of you will find that the Good Companion, for all its virtues, is so reasonably priced that it's almost magical.

Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

The French in Algeria—I

Moslems Look Both Ways

[FROM OUR SPECIAL CORRESPONDENT]

THE events in Tunisia that were described in last week's issue of *The Economist* have naturally stirred much interest in next-door Algeria. The French element in the population, which belongs, as do nearly all Europeans settled in Africa, to the right rather than the left in home politics, takes a short-term view and is pleased at the firmness with which the Pinay Government has stamped on Tunisian separatism. The Moslem element is by contrast indignant and—among its moderates and pro-French members—dismayed at an act so arbitrary as the arrest of the Tunisian cabinet. These moderates are finding the incident unsavoury, if not impossible to defend among fellow Moslems who criticise their fondness for France. Yet the incident, provided that it is an isolated one, is not sufficient cause for an upset in Algeria. The Algerian Moslem is sturdier, though far less quick witted, than his Tunisian neighbour and in any case has in the forefront of his mind a rather different set of problems to resolve.

In many ways Algeria is, politically speaking, unique in the Moslem world, and, indeed, in the world as a whole. It is made so by its nearness to France, as well as by the high proportion of Europeans to Africans among its inhabitants—one in eight. Further, many of its European settlers are now Algerian to the fifth generation. For one hundred and twenty years they have founded homes and recovered waste land and invested money in a territory which, before they came, was peopled by a few coastal nests of pirates and by inland tribes who had no communications and no culture. They have therefore been able to practise the traditional French policy of assimilation in peculiarly advantageous circumstances—near home, and on what was, socially and psychologically speaking, virgin soil. The thirty Algerian members of the French Chamber and the 14 in the Senate—some of them French, some Moslem—sit not as a group but with their parties and are indistinguishable from their fellows in speech and even in face.

Arab and European

Yet the educated Algerian is Arab or Berber by blood and Moslem by faith. Even though he writes all but one of his newspapers in French, and, often enough, talks French at home, he would not be human if he did not on occasion feel pricks of the primitive emotion which is kinship with his own race. Algeria is an unusual place because there is so much room for speculation as to which of two pulls will win it over. At present, that part of its Moslem population which is politically awake stands hesitant between the two and could, by policy, be drawn either way. And where it went the great mass of 6 million uneducated Arabs and Berbers in rural Algeria would naturally follow.

In the towns, the pull of France has been enhanced by the noticeable levelling as between the European and the indigenous population that has taken place in the last ten years. Its effects are visible not only in Algiers but in country towns inland, and its cause was the war. Shortages of fuel, clothes and foodstuffs quickly equate conditions for all; the French took to bicycles and to gathering their own firewood and vegetables, and the Moslems to catching fish; all took what they could get. A change was wrought and survives in assimilation of diet, clothing and the upbringing of women.

This social phenomenon has been furthered politically. In 1946, in the flush of postwar eagerness to make equal all members of the French Union, all Algerians were endowed with French citizenship. Previously, the indigenous Jews had had it since 1870; they are content with it, since only 1 per cent of Algerian Jews have gone to Israel. But Moslems had been able to acquire it only if they abandoned their "personal status"—that is, their right to be tried and marry under Moslem law. In 1947 there followed a new organic statute for the territory designed partly to meet Moslem aspirations and partly to quell the separatist tendencies that had developed during the war among a certain number of Algerian Frenchmen. By this statute Algeria enjoys a slightly increased measure of home rule; it had since 1898 managed its own internal finances, but can now also initiate and discuss legislation prior to endorsement by the French Parliament. It also enjoys universal and direct suffrage in electing its Assembly and a reduction in the former European predominance in its management. Formerly, economic arguments were uppermost, and the Europeans claimed to hold the reins because, though possessing only a third of the cultivated land, they produced all its wine (which constitutes between one-half and two-thirds of the value of its exports), roughly half its grain supplies, and also because they operated its other principal source of wealth—the mines.

Illiterate Voters

From 1947, the demographic argument began to take pride of place. The Algerian Assembly consists of two colleges of equal size, one elected purely by Moslems and the other mixed because Moslems with certain qualifications—education, or an ex-service record—can vote in this college if they wish. The President is drawn alternately from each college. Ingenious voting arrangements ensure that the one shall never be pitted against the other. The present house is lightly peppered with the turbaned heads of sheikhs, but in general creates an impression of sober suits and accents among which the Corsican is the most marked. It is about evenly balanced between the "independent" and "liberal" groups to which most Frenchmen belong, and contains only a negligible number of obstructionist elements—the Communist and three members of the MTLD (Movement for the Triumph of Democratic Liberties) the *Führer* of which is the one-time rebel Messali Hadj. The few representatives of UDMA (Democratic Union of the Algerian Manifesto), which is led by the more sober Ferhat Abbas, and which wants a republic federated to France, on the whole work constructively on the framing of laws in general and the budget in particular. French settlers who in 1947 feared for their future under the new statute have become inured to the innovation, thanks to this cosy apportionment of seats.

But it cannot be said to be representative of Moslem opinion in the territory. The high proportion of sitting Moslem members who—in the words of their chairman at the spring session—"love France and want to be French" was attained only by rigging the elections. In justification of this act, Frenchmen point out that when an electorate is for the most part illiterate (only 15 per cent of the 1,800,000 Algerians of school age are at school) someone is bound to exert undue influence. If they had not done so, Messali Hadj would have filled the role, and a highly disturbed Algeria would have been the result. The argument rings with some truth in the ear of anyone who has watched elections among the illiterate—for instance, in Persia or Iraq—but to have to advance it reveals some specious thinking. Algeria has, as it were, been given the comforter of universal suffrage to suck but is not deriving from it the real taste of democracy. Whether this is a good method of hastening slowly in a part of Africa that is also an integral part of France only time can show. At present, it is working.

(To be concluded)

The Pulp War

[FROM OUR SCANDINAVIAN CORRESPONDENT]

THERE is more than a smack of a "phoney war" about the "pulp war" which has recently exercised public opinion in Scandinavia and led to a special meeting of Uniscan in London. The exporters of pulp and other forest products have for some time expected that the uncommonly high prices they were getting would not last; but they did not expect them to be forced down so brusquely by governmental action. The British Government, having watched both the price of pulp and the export tax imposed by the Scandinavian governments rise sharply throughout 1951, decided in conjunction with certain other members of the Organisation for European Economic Co-operation, not to issue import licences for pulp bought at prices above those stipulated by the importing countries; these prices were some 20 per cent below prevailing rates. The vociferous resentment in Scandinavia was caused not so much by the fact that pulp prices were immediately forced downwards as by the method Britain and these other countries used—the method of dictation instead of negotiation. The resentment was accompanied by a sly if rueful satisfaction that the immediate cause of this strong action was the maintenance of the high export taxes on pulp which the producers themselves have frequently tried to get their governments to reduce or abolish.

These duties on forest products are imposed in various forms by all three of the Scandinavian timber countries. Their avowed purpose was to prevent the high postwar earnings of the forest industries adding to the inflationary pressure at home. Hence part of this export income was "sterilised." Pulp has the highest tax of all the forest products and Sweden is the worst offender. As the price of pulp rises and falls, so does the tax but not in a direct ratio; in all three countries it rises much more rapidly than it falls. At intervals a basic price, based on British prices, is agreed as a norm, and a sum fixed for payment as export tax so long as prices do not deviate more than a certain amount from that norm. Thus, with a basic price for Swedish pulp on European markets of about 1,500 kronor for bleached and 1,350 kronor for unbleached pulp, export duties in the first quarter of 1952 amounted to 560 kronor a ton for bleached and 540 kronor for unbleached pulp. In Norway with a basic price for chemical pulp of 987 kroner a ton, the export tax is N. kroner 280 up to a price of N. kroner 1,280. Above N. kroner 1,280 the tax is 280 kroner plus half the amount by which the price exceeds 1,280 kroner. In Finland the tax is calculated on quantity and is at present 900 Finmarks per cubic metre. Provision is made to increase and decrease the tax with the rise and fall of prices and beyond a certain level the tax rises by four times the increase of the price above that level.

Scandinavian Boom

The receipts of the export taxes are used for various purposes in the different countries. In Finland 1 per cent is used for sylvicultural research, half of the remainder goes to subsidise import prices, and the other half is placed in an export fund which is to be paid back to exporters (without interest) in the years 1959-61. The Norwegians return none of the money to producers and use most of it for subsidising imports. The export taxes collected on pulp in Sweden are held by the National Debt Office and, under the current agreement, 34 per cent of the total will be released in the period 1959-63 and must be spent on directly promoting the interests of the forest industry while the balance will be repaid to the industry after the usual business taxes amounting to about 50 per cent, have been paid.

Whatever the merits or demerits of such devices it is clear that they always constitute a potential source of friction between buyer and seller. And once the buyer begins to feel that the price he is charged is in any case getting too high, the gratuitous addition to it of an arbitrary tax may, as on this occasion, strain his patience to breaking point. Of course, much has been made of the fact that the British Government acted suddenly without giving the trade time to produce substantially the same results. Much has been heard also of the increased price of British steel which was announced about the same time as pulp prices were cut. Such comments, however, ignore several decisive factors. The terms of trade of the three Scandinavian pulp-producing countries have been very favourable since the outbreak of the Korean war—and increasingly so to the end of 1951. By contrast the prices of British steel and coal, and indeed of many British exports, tend to be low, and the British terms of trade, although improving, are still adverse. The cut in pulp prices will still leave Sweden, Finland and Norway with the most advantageous terms of trade in Europe.

Finally, it is practically certain that the British action was neither as sudden nor as unheralded as publicly alleged. At the annual trade talks at the end of 1951, both the Swedes and the Finns were left in no doubt either of Britain's economic difficulties or of its dislke of the export taxes these countries added to already high prices. Discussions between Britain, France, Germany and other interested parties later took place with the aim of putting pressure on the producers to lower their prices when the next quarter's prices came to be fixed. In any case, for some time prior to the official announcement Britain had not been granting import licences for pulp bought at peak prices. All this would have led to normal, if obstinate, negotiations, starting presumably with the review of the Anglo-Swedish trade agreement at the end of March. It appears, however, that the producers forced the issue by trying to get a written agreement from the purchasing countries in Paris at the end of January that prices would not be lowered. This first "shot" in the "war" provoked a heavy British broadside in which other countries soon joined. In these circumstances it is misleading to complain of unsympathetic action by Britain and to pretend that, particularly after the United States had introduced maximum prices for imported pulp in the middle of 1951, the whole affair was a horrid surprise.

New German Dollar Export Bonus

THE German Federal Government has introduced a bold new scheme which, if it works according to plan, should stimulate direct sales to the dollar area, and at the same time allow exporters to cut their prices. The authorities have been worried at the increase in so-called "switch" transactions, by which German exports are sold to the dollar area by way of soft-currency countries, notably Holland. Under the new scheme, the German exporter to the dollar area will receive an "import right" valid for six months and equal to 40 per cent of the gross effective proceeds of his contract. The bonus is also given for sales in Swiss francs. These "import rights" will allow anyone to import dollar goods from a specified list, without special permission. Previous dollar bonuses have been traded illegally; the new rights can be freely bought and sold. It is envisaged that they will be sold at a premium for buying goods or commodities that are either cheaper than soft currency equivalents, or are more easily obtainable from the dollar area than elsewhere. With the prospect of this premium for his rights, the exporter can afford to cut the price of his goods to the American buyer, and secure an advantage over his foreign competitors.

To prevent this partial liberalisation of dollar imports from reaching too dangerous a scale, the total of goods imported under the special rights has been limited. In all its other conditions, however, the new scheme reflects the Bonn government's policy of relying upon incentives rather than on restrictions.

The Federal Republic is running a small deficit in its dollar trade, but its reserves do not make as poor a showing as might be expected on this account. Income from the spending of Americans in Germany was $18 million in March; it thus reached the rate of $200 million a year, which was called impossibly optimistic by the German authorities some months ago. The German surplus in the European Payments Union brought in a payment of $17.6 million at the end of March. In all, the Republic's reserves, inadequate though they are for the volume of trade which the country is doing, are about a quarter of those which Britain holds for the entire sterling area

The United States rose to the position of Germany's second largest customer in 1951, but this achievement does not make the Germans optimistic about the future. In negotiations on the Reich debts and in comment on the offer to buy DM 2 billion worth of goods which the Soviets made at the Moscow economic conference, Germans never forget that their prewar pattern of trade is completely distorted. Western Germany is now dependent on the dollar area for its main supplies of wheat and sugar and is now even to import rye from the United States with funds from the Mutual Security Agency. It is small wonder that the desire to return to the old days should grow as the difficulty of selling in the American market increases.

Revolution in Bolivia

[BY A CORRESPONDENT]

THIS month's outbreak in Bolivia was long overdue. It did not result in a mere swapping of *caudillos*, but was a revolution in the modern sense of the word. Just as, at the beginning of the nineteenth century, the ideals of the American War of Independence and the French Revolution gradually penetrated Latin America and inspired the local liberating movements, so are the ideologies of twentieth-century Europe influencing the evolution of Latin America today. In Argentina, President Perón has devised a policy that is a hotchpotch of Marxism, Fascism and British "Labourism," mixed with more colourful local ingredients. In Bolivia the now victorious *Movimiento Nacionalista Revolucionario* is pledged to release the poverty-stricken miners and peasants from economic oppression, to nationalise the tin mines (which are owned, principally, by three fabulously wealthy families), and to resist United States interference.

The revolution was inevitable. A grave economic crisis had been aggravated by Washington's refusal to pay the price which the Bolivians demanded for their tin; and shipments of tin to the United States had been suspended since October. No adequate measures had been taken to alleviate the lot of the neglected Indians who inhabit Bolivia's lunar altitudes or of the peasants who live in virtual serfdom in the subtropical valleys and jungles. It was evident that the MNR, denied the fruit of their electoral victory last year, were bound to resort to force, and that their insurrection would have a substantial foundation in discontent and hunger.

In the centre of La Paz (altitude 12,000 feet) are streamlined modern buildings of concrete and glass: hotels, apartments, bars, and night-clubs. On the *altiplano*—a vast plateau situated on the outskirts of the city, but 1,400 feet above it—the Indians seem to belong to another planet. There is no vegetation on this eerie tableland, where dark-brown men wrapped in woollen blankets trudge inscrutably beside their llamas. Attached to their waist the Indians wear a bag containing a day's supply of the dried coca leaf, which is grown in the hot damp valleys of the lower Andes. They chew the leaf for about half an hour four times a day. Coca is cheaper than any food, and the cocaine which exudes from the leaf during mastication deadens the feeling of hunger and stimulates physical exertion and endurance at high altitudes. Many enlightened Bolivians condemn the sale of this drug to the Indians.

The owners of the coca plantations in the lowlands naturally have a vested interest in the trade. Their labourers provide so many days' work a year, and in return receive a small plot of land for their own use. Sometimes they are required to surrender to the landlord a proportion of their produce. They are an isolated, neglected and illiterate race. Opponents of the coca traffic have been stigmatised as agitators, Communists and enemies of the state; but the fact remains that peasants cultivate coca instead of food, and that the Indians receive a drug instead of bread. This is one of the roots of the discontent which took violent form in the recent revolution.

Although it is unlikely that President Perón gave any practical assistance to the revolutionaries, it is certain that their success will have pleased him. The Argentines normally look upon Bolivia as part of the River Plate system., which they themselves dominate. And they are keenly interested in Bolivia's mineral resources and in the possibilities of extending their communications across its territory. They therefore welcome any sign of a weakening in American influence at La Paz. Washington has promised to supply Point Four aid to Bolivia (to be devoted, primarily, to agricultural development); but resentment against the United States, as a result of the prolonged dispute over tin prices, is acute. A few weeks ago the Bolivian Ambassador at Buenos Aires presented a note asking the Argentine Government for its support in obtaining higher tin prices and in resisting "this typical case of economic aggression." Earlier, an agreement was signed authorising the creation of an Argentine-Bolivian Economic Development Company, and Argentina undertook to help financially in certain projects for increasing the output of "products required by Argentina." Argentine-United States rivalry is a very important factor in the life of Bolivia, and there is no doubt that the victory of the MNR was a victory also for General Perón.

It is an unfortunate fact that even today in many Latin American countries an Opposition cannot attain power by democratic methods. The use of force is particularly to be deplored in the case of Bolivia, because that nation was about to begin an unprecedented experiment in administrative reform which, if successful, might have been copied with advantage elsewhere. Last October the military *junta* announced that, on the advice of a United Nations mission, they had decided to appoint a team of ten foreign experts to reorganise the Bolivian civil service. The plan was still only in a preliminary stage at the time of the revolution, and

Binding Cases

Because of increased size, THE ECONOMIST *will this year have to be bound in quarterly instead of half-yearly volumes, and* RECORDS & STATISTICS *in half-yearly instead of yearly volumes. Suitable binding cases are now available in stiff, dark blue cloth covers, with gilt lettering on the spine. These cases provide a firm and effective binding, and the year can also be stamped on the spine if required. The cost per case, post free throughout the world, is* **11/-**.

Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** *to* THE ECONOMIST, *but to—*

EASIBIND Ltd.

(Dept. E), 84 Newman St., London, W.1.

A binding case can be sent on approval, if required.

it is now unlikely to be put into effective operation for years to come, if at all.

It remains to be seen whether the MNR will be able to diversify the nation's economy and thus diminish its dependence on the unpredictable world tin market. The much-needed development of agriculture will require a vast improvement in the communications linking the barren *altiplano* with the remote fertile regions, and a formidable increase in agricultural research, training and mechanisation. Not only is Bolivia divided internally: it is also surrounded by vigorous and relatively homogeneous nations. The natural economic ties of its tropical hinterland are with Argentina, Paraguay and Brazil, rather than with Bolivia's own highlands. Bolivia is a buffer state which, unlike Uruguay, has failed to acquire a social cohesion capable of withstanding pressure from outside. It has already lost to neighbouring republics its Pacific seaboard and part of its Chaco plains. Unless a real national unity can be created by enabling the miners and peasants to participate fully in the life of the state, the disintegration may well continue.

Russia Cuts Its Prices

THOUGH there have been regular price reductions in Russia every year since 1947, the recent cut in Soviet retail prices came partly as a surprise. Hitherto price reductions preceded the budget. This year the order was reversed and the delay would lead one to believe that the Soviet planners did not find it easy to decide whether they could afford a further increase in consumption in the present international situation. They finally decided that they could, and the prices of the main foodstuffs have now been officially cut by from 10 to 30 per cent. This should result in the current year in a "saving" by consumers of 23,000 million roubles in their purchases in state retail shops, compared with a saving of 27,000 million roubles last year and of 80,000 million roubles in 1950. When these figures are linked with the estimated increased yield of the turnover tax, it appears that the rise in consumption in 1952, if smaller than two years ago, is expected to be about as large as last year—or more than ten per cent.

Like last year, but unlike two years ago, the reductions are limited to foodstuffs. This fits into the pattern of recent Soviet economic development, in which a growing emphasis is put on defence. In a period of rearmament food is the branch of consumption that the Russians must find least difficult to foster since the development of food production does not involve a very great drain on scarce resources. It is also interesting that a rise in consumption is expected despite last year's unsuccessful harvest. The price of potatoes has not been cut, but bread has and increased consumption of flour may well result in a reduction of stocks or exports or both. The greater supply of foodstuffs for the towns is also probably due to more efficient methods of extracting surpluses from collective farms and to improvements in the technique of food production itself.

Any appraisal of the average Russian's condition on the basis of the new prices must naturally be very tentative. The Russians do not publish any detailed indices of cost of living and for some time now they have not given any figures of wages either. Prices of some commodities in recent years are given in the accompanying table.

Compared with before the war the changes have been of varying magnitude. Buckwheat and tea, for example, have now come down roughly to the level of 1940. Rye bread, on the other hand, is still much dearer and sugar nearly three times as expensive. The general level probably lies somewhere in between, at roughly 50 per cent above the 1940 prices. If the average wage be taken as lying half-way between the planned level for 1950 and a higher estimate—based on an unconfirmed statement by Moscow—then it would appear that in terms of foodstuffs the purchasing power of the Russian town dweller is now greater than it was before the war.

A claim to the same effect was made recently by the Soviet Minister of Food Industry. Reviewing the planned production of food for 1952, Mr Sivolap insisted on the important rise compared with 1940. As usual, he spoke in percentages, but thanks to certain Soviet documents which have now become available the mysterious percentages may be translated into fairly accurate actual figures. When these are divided by the appropriate percentage of the population (excluding those farmers who consume on the spot) estimates of per caput consumption are obtained. The estimates confirm the view expressed in *The Economist* of November 17, 1951, that the prewar level of consumption has now been regained and exceeded (the improvement would now appear even more marked, since the figures in *The Economist* referred to 1950 while the new estimates are based on the plan for 1952), that the average Russian is now incomparably better off than immediately after the war, but that his standard of life and of food consumption still lags far behind the average for the United States or even for the United Kingdom.

SOVIET PRICES
(Roubles)

Commodity	Unit	1940	1950	1951	1952	% Decrease 1952 over 1951	% Increase 1952 over 1940
Rye bread	kg.	0·85	2·0	1·7	1·5	12	76
Wheat bread	,,	1·70	4·4	3·8	3·3	12	94
Buckwheat	,,	3·0	4·3	3·65	3·1	15	3
Beef	,,	10·5	20·5	17·5	15·0	15	43
Butter	,,	21·0	40·3	34·3	29·0	15	38
Vegetable oil	,,	15·7	27·0	27·0	21·6	20	38
Eggs	unit	0·85	1·0 / 1·4	0·9 / 1·2	0·76 / 1·02	15	5
Tea	100 gms.	10·0	14·4	13·0	10·3	20	3
Sugar	kg.	3·8	13·2	13·2	11·9	10	213
Salt	,,	0·05	0·65	0·50	0·35	30	600

The latter view would seem to conflict with the statements made by some visitors to Moscow for the recent economic conference. The difference may be partly explained away by the fact that foreign visitors are sometimes easily deceived, and that anyhow Moscow presents a deceptive picture, being a shop-window rather than a faithful mirror of Russian conditions. Yet, even changes in the aspect of a shop-window are significant. Besides, there seem to be other indications that Soviet consumption may well be somewhat greater than the production of consumer goods would warrant. Thus, from the plan outlined by Mr Sivolap it appears that the production of foodstuffs in 1952 should rise by roughly 10 per cent compared with the previous year. This is not more, but rather slightly less, than the estimated general rise in consumption. Hence, either the production of other consumer goods will develop at least as quickly as that of foodstuffs—which seems unlikely—or the home production of consumer goods is expected to be substantially supplemented by imports.

It has for some time been known that the Polish textile mills and the Czech shoe factories could claim some responsibility for the external appearance of the inhabitant of, say, Moscow. Now, it would seem these imports have increased both in range and in scale. At the recent Moscow Conference the Soviet delegate, M. Nesterov, claimed that the foreign trade turnover of the Soviet Union is now three times greater than before the war. In this increased turnover the share of Western countries has been dwindling and that of Eastern Europe growing at a fast pace. It would not be unreasonable to assume that some three quarters of Soviet trade is now being carried on with countries within its orbit. Consumer goods, not only the products of light industry but foodstuffs as well, must account for quite an important proportion of these exchanges. Soviet grain shipments westwards always get a great amount of publicity. Shipments of consumer goods in the opposite direction are certainly more substantial, though less advertised.

HEAVY CONSTRUCTIONAL ENGINEERING, EXCAVATORS, INDUSTRIAL AND DOMESTIC HEATING APPLIANCES, FUEL ECONOMISERS, IZAL AND OTHER CHEMICAL PRODUCTS.

More than half the income from Britain's exports is drained away in importing food from abroad. The price of foreign food is rising. Dearer food means dearer living and increased production costs. It becomes increasingly difficult, therefore, to sell goods abroad at a competitive price unless this trend can be reversed. The quickest way to do this is to grow cheaper, more plentiful food for ourselves.

There are 17 million acres of rough grazing in this country where the fertility could be enormously increased with the proper treatment. So we have the land to grow more food.

But the £5 million in 3 years, which is all that has been allocated for this purpose, is inadequate.

What farmers need is more of the modern farming equipment that can bring to agriculture the efficiency, increased output and lower production costs that modern machinery and methods have brought to industry. Once this is understood this leak in the nation's economy can soon be plugged.

THE BUSINESS WORLD

Economic Survey for 1952

THE latest Economic Survey, presented this week as Cmd. 8509, sketches an admirably clear picture of the shape of Britain's economy at the beginning of 1952 and assembles in convenient form most of the data that explain the plunge during 1951 from external surplus into a crisis of insolvency. Inevitably, however, it is a document of less immediate interest than any of its five predecessors. Each of these served as a revealing curtain-raiser to an impending budget, whereas this latest survey has followed not only the budget but also the balance of payments White Paper (Cmd. 8505), the preliminary estimates of national income and expenditure (Cmd. 8486), and two major pre-budget pronouncements on economic policy from the Chancellor himself. In addition, as the article on page 201 emphasises, this survey "for 1952" carries much further the reticence about making economic forecasts that has become increasingly apparent in the Surveys of recent years.

For these reasons, it adds very little to the previously available official data upon the present state and 1951 trends of the national economy, and scarcely anything to what was already known about the policies the Government is pursuing or hopes to pursue. But, for the many people who cannot keep pace with the fast-moving stream of economic news, and for the many more who even now are wondering about the nature and causes of this latest crisis, this Survey (or even its "popular" version) will provide a valuable and instructive guide.

In presentation, it follows the familiar pattern, reviewing in turn the problems of the balance of payments; the defence programme; industrial production, investment and manpower; and the problem of securing a balance in the domestic economy as a whole. Each of these analyses is related to the over-riding objectives, first, of restoring a surplus in the gold and dollar accounts of the sterling area and, later, of maintaining a surplus in the total external payments both of Britain and of the whole sterling area, so that the reserves may be "built up towards the level at which they would provide adequate protection against fluctuations in world trade" and Britain may be enabled to secure sufficient imports to support both a growth of industrial production and a rise in the standard of living. For 1952, the main task is to provide, with as little friction as possible, more workers for essential industries; a movement of workers from contracting to expanding industries, inevitably at the cost of some transitional unemployment, is in present circumstances "a condition of national survival."

The Balance of Payments

The only specific target that the Government sets up is the one revealed in the budget speech. Britain "has undertaken" to its partners in the sterling area to balance its non-sterling current payments for the second half of this year, after taking credit for defence aid received from the United States; by comparison with the second half of 1951, this will require an improvement of almost £600 million. The rest of the sterling area is aiming, for its part, at a surplus of £100 million on its non-sterling payments for the same six months, compared with a deficit of £150 million. An integral part of the plan is that Britain, which earned a surplus of £171 million with the overseas sterling area in the second half of last year, should remain in surplus with this area—at least to the extent of the dollar aid. On this minimum basis, therefore, Britain's external account as a whole would be in balance; but it is evidently hoped that it will swing into surplus—though much is admitted to depend upon the extent to which the exports frustrated in sterling markets can be switched to other markets.

The import cuts, as already announced, are expected to save fully £300 million in this calendar year, "almost wholly" in non-sterling expenditure, and at the cost of a "substantial" reduction in consumption of non-rationed food. The bridging of the non-sterling gap will be assisted, too, by the cuts in invisible payments, by foreign aid, and possibly by some improvement in the terms of trade and in the volume of non-sterling exports; but at none of these points does the Survey attempt quantitative forecasts, so that it is impossible to discern precisely the manner in which the Government expects the £600 million non-sterling gap to be closed. For the purpose of guessing the shape of the domestic economy as a whole, the assumptions about the total balance of payments are the same as those made in the budget speech, so that the volume of exports is put at £50 million more than for 1951. But the detailed discussion makes no export forecast at all. It is stated—or, rather, understated—that the outlook for exports of consumer goods, comprising two-fifths of the total, is "not promising"; yet it is regarded as "of the utmost importance at least to maintain the current volume" of such exports.

The possibility of doing this now looks even more slender than it did at the time of the budget speech; yet the hoped-for diversion of capital goods from home investment into export markets is certainly not larger, and may be smaller, than that implied by earlier statements. Moreover, it is now evident that the Government shares some of the doubts expressed in these columns, and elsewhere, about the reasonableness of several of the assumptions on which the budget was based. The Chancellor then assumed that in the fiscal year 1952-53 £200-£250 million of the external gap could be filled by improvements in the terms of trade and in net invisible receipts. Now it is confessed that the terms of trade are only "rather more favourable," that "there can be no assurance" that they will stay so, and that invisible earnings "are not likely to be much

higher than in 1951." In the previous statements, these earnings were apparently reckoned to include defence aid, which, may conceivably be $104 million more this year than has been generally assumed, thanks to allocations made, but not yet received, from the US Government appropriations for 1949-50 and 1950-51.

The "Balance" of the Economy

It is also admitted that the uncertainties about the scope for exports of consumption goods create parallel uncertainties about the volume of industrial production, since the industries suffering from loss of markets in the sterling area will have to contract if they cannot find export markets elsewhere. Especially for this reason, but also because shortage of key materials may cause some contraction of output at the fringes of the metal-using group of industries, estimates of production are regarded as "more than usually hazardous." Yet the arithmetic by which the final chapter in the Survey seeks to demonstrate, in "real" terms, the balance of the economy as a whole follows at all points the arithmetic of the budget speech. Here it is still assumed that the loss of £300 million of imports will be offset to the extent of £250 million by a gain in production, so that, after providing an additional £200 million of real

TABLE I. TRENDS OF PRODUCTION AND EMPLOYMENT, 1948-51
1946=100

	1948	1949	1950	1951
All industries covered by Interim Index of Industrial Production:				
Output	121	129	140	144

Manufacturing Industries:				
Output	123	132	146	150
Employment	110	112	115	118

resources for defence and £50 million for exports, the amount to be released by economies elsewhere will be no more than £300 million. As in the budget analysis, it is reckoned that the whole gap can be filled by cutting total domestic investment by £250 million and by the expected reduction of £50 million in the Government's civil demands for resources, so that the real level of consumption need not be reduced—although the range of consumers' choice will be significantly narrowed.

On the monetary side, no evidence is adduced to justify the budgetary assumption that the rise in prices will just suffice this year, as it apparently did last year, to mop up the expansion of consumers' net spendable incomes—except that it is expected that the tighter money policy will not only curtail investment, especially floating investment, but will also promote a greater flexibility of resources and a slowing down of the rise in prices. One heartening realistic comment amid an otherwise pedestrian account of the new monetary policy is the observation that the induced fall in stock exchange prices, led by gilt-edged, reinforced the effects of the increased difficulty in obtaining bank advances.

Prospects for Industry

No evidence to document or even to support the budgetary assumption of a rise of £250 million in national output is to be found in the detailed review of industrial production. Last year's rise of 3 per cent is prudently written down: "When the allowance is

made for normal seasonal changes, it appears that there has been no real upward movement since early last year"—and output per man-year rose during the year as a whole by only 1 per cent (though it is worth recalling that independent estimates put both figures slightly higher than the official index). For 1952, the Survey gives warning that the demand experienced since the war for the utmost increase in output that almost every industry could achieve "cannot be assumed" to continue this year; that production of some metal goods must be cut down to concentrate resources upon more important metal goods, partly by the use of steel allocation; and that production in many consumer goods industries must depend upon ability to increase exports. It also contains some discussion of likely supplies of imported raw materials: these should in general be sufficient to match the steel available, though some uncertainty remains about non-ferrous metals. What it does not contain is any quantitative forecast of the volume of production.

The additional burden placed upon the metal-using industries by the obligation to expand engineering exports while continuing to carry the rising weight of rearmament is also fully discussed but not measured. Only £275 million of the output of these industries went into defence in 1951-52, compared with the £360 million that had been intended. This was partly because of difficulties in design and planning, and in the supply of labour, materials and tools; but it was also partly attributable to the shift of emphasis towards engineering exports. To make further room for exports, the total requirements of defence for metal goods in 1952-53 have been held down to £460 million, though of this the "super-priority" work—perhaps £80-£90 million—takes precedence over all other engineering production. By implication, the expansion in volume of engineering exports required this year has to suffice to increase total exports by £50 million in spite of the inevitable decline in exports of consumer goods. The cuts in investment, also designed primarily to assist metal exports, should eventually reduce home demand upon these industries by £150 million a year compared with 1951, but not all of this relief can be expected in 1952, while investment for defence is expected to rise in 1952 by about £30 million. The one-third cut promised in home deliveries of metal consumer goods should free another £70 million a year of resources in these industries. But the exports of consumer goods that can be attained remain an unknown quantity, and no attempt is made in the Survey to estimate the amount by which engineering exports need to grow.

Not all metal goods, it is frankly admitted, will be equally easy to sell abroad. Last year there was a sharp check to the growth of engineering exports; they did increase by 4 per cent in volume compared with 1950, but in that year they had risen by 16 per cent. World demand for capital goods remains very high and should permit a considerable increase in British exports. But the prospects for cars, cycles and other durable consumer goods are "nothing like so good," though not so bad as for textiles. This is particularly unfortunate, in that these are the metal goods that could most readily be switched to export. The metal consumer goods make up about a quarter of the country's total engineering exports at present; in general they come from mass production plants that will not be easy to switch to other products. With certain exceptions, including agricultural machinery and commercial vehicles, capital goods

will take longer to divert; much equipment is custom-built, and the cut in investment cannot become effective quickly. It should, however, enable manufacturers to quote shorter delivery dates.

Even if the reduction in supplies of metal goods at home covers whatever increase is achieved in engineering exports, the output of the metal-using industries will need to grow by at least £185 million to meet the extra claims of defence. This represents an increase of about 5½ per cent by value over the 1951 output of these industries. That output, on which more than two-fifths of all workers in manufacturing industry are employed, appears to have grown in value by no less than 17½ per cent last year, from the revised figure of £2,850 million in 1950 to £3,350 million. As Table II shows, about

TABLE II. DISTRIBUTION OF SUPPLIES OF METAL GOODS
(£ Million)

	1950	1951
Supplies:		
Production	2,850	3,350
Imports	80	100
Total	2,930	3,450
Used for		
Defence	165	275
Investment (including all passenger cars)	925	1,060
Consumer goods	230	265
Other industrial goods, repair work, etc.	710	800
Export	960	1,050

half the output of these two years has gone to provide industry at home with new capital equipment and maintain its plant, and almost a third for export; defence took about one-fourteenth of output of metal products over the two years (rising to one-twelfth in 1951), while consumer goods took most of the remainder. In physical terms, it is stated, there was a "considerable further increase" in the output of these industries last year, though the progress of different industries in the group was uneven. But the increase in volume of output appears to have been much smaller than that in value. Indices of production for the different metal-using industries—these indices are omitted from the Survey this year but have been incorporated in Table III—show that engineering output rose by a much smaller percentage than in recent years—perhaps only 4 per cent as a whole—and production in 1951 did not remain at the level attained in the last quarter of 1950, as was hoped in the 1951 Survey. The current Survey expresses the hope that there will be enough steel to permit these industries as a whole "to continue to expand production"; and it may be agreed that the total increase necessary does not seem beyond their powers. But the pattern of output within the group will have to alter. Certain industries are to be encouraged: the Survey instances machine tools, output of which rose in numbers by almost 20 per cent last year after having been static since 1947. By the end of this year three-quarters of the tools required for defence should have been met from home or abroad, and more of this increased output can be freed for export. But output of other metal goods—cars and civilian commercial vehicles are cited—may be expected to fall; and the switches of resources within engineering thus made necessary "must inevitably entail some temporary loss of output."

The main physical lever that the Government can use to bring about such switches is its allocation of steel. The Survey agrees that when the benefit of American imports is obtained in the second half of the year supplies to home industry should improve, but holds that, "with the increased demands for rearmament and export production, a shortage of steel is likely to persist," perhaps particularly of alloy steels. This is cautious; but official caution is perhaps justified. British steel output in 1952, as the Survey says, "can equal or better the 1951 output [itself 4 per cent below output in 1950] only if there is a very substantial increase in the production of pig iron for steel-making, which depends in turn upon a substantial increase in iron ore and coke supplies." The intended increase in defence production and engineering exports thus depends largely upon more steel, and more steel largely upon more hard coke. An increase in output in the basic industries and in engineering is described as "the really important thing" in production. The coal outlook for 1952 is regarded as "very uncertain," and only the increase in mining manpower offers any hope of a substantial expansion of output. Consumption of coal in Britain is expected to rise by about 2 per cent above the 1951 figure; hardly any increase has been recorded so far this year, but this assumed expansion will be indispensable if the hopes of higher production, particularly in the metal industries, are to be fulfilled. Coal exports are being raised by 2 million tons to 8½ million tons this year; the Survey adds cogently that "a further increase would be of particular value" in obtaining raw materials for Britain as well as in assisting Europe. Higher output also means bigger demands on transport. The railways were under strain last year because an increase in freight traffic came at the same time as a drift of labour from them, but there are signs that this drift has been checked. The slow turn-round of shipping, which might hamper the expansion of exports, remains "a matter for grave concern."

Cuts in the replacement of railway rolling stock, in work on stations, bridges and tunnels, and some curtailment of track renewal, have been decided upon in the

TABLE III. OUTPUT OF THE METAL-USING INDUSTRIES

	1947	1948	1949	1950	1951

present steel shortage. These are the only cuts in fixed investment that are specifically mentioned in the Survey, and the table of gross fixed investment up to 1951 (revised once again according to slightly altered definitions) is merely a compressed version of that already given in the preliminary White Paper on National Income and Expenditure. This is no real loss of information: the detailed forecasts of investment industry by industry, which finally disappeared from the Survey last year, gave an impression of precision in control over investment that was always illusory. A big increase in investment in stocks—some £300 million—took place

in 1951; but fixed investment, in real terms, was no higher, the increase of £188 million in value being entirely accounted for by the rise in prices. There was a decline in real investment in building and works, offset by an increase in the volume of output of plant, machinery, vehicles, ships and aircraft. This decline was partly due to a fall in total building output: productivity in the industry decreased early in 1951 and, though it later recovered to some extent, it did not regain the level of 1950. Shortage of constructional steel hampered building; partly because a large amount of new defence work was started during the year, the industry became overloaded and too much material was locked up in unfinished work. This may have been partly corrected by the postponement of new building projects outside the spheres of housing and defence. The 1952 building programme will be larger than in 1950 though not so large as was originally intended; but defence expenditure on works services is due to rise from £77 million in 1951-52 to £116 million in 1952-53.

TABLE IV. CONSUMPTION OF SELECTED RAW MATERIALS

(1) Including recovered sulphur.
(2) 100 per cent. acid equivalent.
(3) Excluding English refined lead.
(4) Estimated clean weight.
(5) Excluding sleepers, poles, boxboards, pitwood and pulpwood.

The revision of economic policy has completely reversed last year's reliance upon an expansion of exports of textiles and other consumer goods. The recession of demand for textiles last year was world-wide, and still continues: the Survey does not discuss how long it may be expected to last. In 1951 production of cotton and rayon yarn was 2½ per cent higher than in 1950 and cotton and rayon cloth production 4½ per cent higher, but production of wool yarn fell by nearly 10 per cent and of wool cloth by 7 per cent. Exports of cotton piecegoods expanded considerably in volume, though mainly as a result of increased shipments to Australia and South Africa, markets that have since been drastically restricted. Unemployment grew last year in the wool, hosiery and clothing industries, and is now growing in Lancashire; the labour force in the wool industry at the end of 1951 was no larger than at the end of 1947, and in some sections may be below the point at which, in the Survey's words, it could "take advantage of a revival of world trade as soon as it shows itself." In the home market these industries may find some hope in the fact that, while personal consumption in real terms is not expected to vary much this year from the level maintained in 1950 and 1951, metal consumer goods will become more scarce. Consumers should be able to afford more clothing, furniture and other consumer goods produced at home if they want them. Nevertheless, the Survey recognises that additional workers for engineering must come mainly from the consumer goods industries, "many of which will in any case be tending to lose labour during 1952."

Manpower

The main problem of 1952, says the Survey, is "how to bring about a change in the pattern of the use of resources so that more are devoted to defence and exports, even though total resources will be less." Allocation of the main scarce materials is in Government hands, and in general the engineering industry does not lack plant capacity; the crucial problem this year and later, therefore, will be the transfer of manpower. On this matter the Survey says the right things fairly often and fairly firmly:

> We cannot afford to have labour and scarce materials engaged in producing goods for consumption at home when these resources could be used to increase exports. . . . Adjustments of this kind are always difficult and painful, and they must inevitably cause a temporary increase in unemployment while workers are changing jobs. But this country cannot expect to survive in a competitive world without continually adjusting the pattern of its production to meet changes in overseas demand for its exports.

In broad terms, it can be said that the prescription is already beginning to work: labour has begun to move, and to move in the right direction. In 1951 the "metals, engineering and vehicles" group of industries gained 118,000, and increases took place in coal-mining, public utilities and chemicals, while employment in the consumer goods industries began to fall in the second half of the year. But labour is not yet moving fast enough; nor are employers and workpeople convinced that the transfer cannot be avoided.

*

This is the point at which the Survey's refusal to come to quantities most weakens its effect. The pitfalls of forecasting manpower changes have been blatantly demonstrated in earlier Surveys. Nevertheless, some appreciation of the problem for 1952 and beyond, showing in the broadest of terms the transfers of labour within the economy that the Government would consider necessary for Britain's long-run stability, might have strengthened its unexceptionable principles. It might also have forestalled, or more obviously weakened, the special pleas that are coming from workers and employers in industries suffering recession. Those pleas are already beginning to grow more powerful, not only from the soft goods industries but from producers of metal consumer goods who are naturally reluctant to accept cuts in their deliveries at home just at the time when their export markets are showing more resistance. Tenderness towards these industries might begin to frustrate the whole purpose of current policy; but already some signs of it can be detected. The Government's desire to retain flexibility is to be applauded; and even a broad outline of the change in the pattern of national output that the situation requires might be mistaken for a commitment, but this is the only way of demonstrating the order of magnitude of the task that lies ahead—and such a demonstration would surely help the Government to carry through the requisite policies.

Limited Freedom for Cotton

The resumption this year of the private purchase of raw cotton on a limited scale, which was announced by the President of the Board of Trade on Tuesday, has been made possible by the unanimity, ingenuity and expedition shown by the Cotton Import Committee, whose report (Cmd. 8510) was published on the same day. This committee was set up under the chairmanship of Sir Richard Hopkins only last December, and it comprised representatives of all sections of the Lancashire cotton industry, including the trade unions. It says much for the unity and far-sightedness of the industry that the committee has been able to submit a unanimous report within four months, in time for something to be done before the new buying season starts in August. The President of the Board of Trade and the Chancellor of the Duchy of Lancaster took only four weeks to consider and accept the recommendations. Briefly, they are that spinners should be given the option each year of buying cotton privately if they so desire, but that the Raw Cotton Commission should continue to supply those spinners who choose to buy from it as well as to offer forward cover to the whole industry (including those spinners who prefer to do their own buying and the merchants who will serve them).

These recommendations seem to provide an ingenious solution to a problem that has its principal roots in the foreign exchange restrictions that are at present unavoidable, but that had threatened, nevertheless, to become a subject of bitter and sterile political controversy. The Raw Cotton Commission was set up by the Labour Government in January, 1948. It took over from the wartime Cotton Control the purchase and import of raw cotton, and it was intended to be a permanent organisation replacing the prewar Liverpool market. It was given a monopoly of the import trade in raw cotton, and from the outset it bought most of its supplies in Britain through agents of foreign shippers. The commission was required by law to sell cotton to spinners "at prices best calculated to further the public interest," and it was enjoined "to balance its revenue and expenditure taking good years with bad." It soon became evident, however, that its selling prices had to be based more or less on current replacement costs—that is to say, on the prices that reflected those in the two remaining cotton markets of the world. So much of Britain's cotton yarn and cloth is sold in competitive export markets that the commission quickly realised that British spinners should not be asked to pay more in the aggregate for their raw material, at any given moment, than their foreign competitors. It has, however, used the price mechanism to encourage spinners to take certain growth of cotton and to discourage them from others.

The main complaints that have been levelled by the spinners at the commission seem to have arisen, not from any alleged inefficiency on its part, but from the fact that the Treasury allows it only a limited allocation of dollars. Some two thirds of Britain's annual consumption of raw cotton is of the "American" type, and the commission has normally been able to buy only about a half of this from the United States or other dollar account countries. The rest has had to come from non-dollar producers of "American" cotton; as many other importing countries have imposed similar restrictions on dollar purchases, demand—and therefore prices—have tended to be higher in these non-dollar markets. In order to balance its books, the commission has had to "average" its selling prices, so that spinners have paid higher prices for United States growths than those ruling in the world market and lower than "world" prices for American-type cotton obtained from non-dollar sources. While the sellers' market persisted, it was easy to pass this higher cost of raw material on to the consumer, but as soon as a buyers' market appeared—as it did towards the end of 1951—British manufacturers found that those of their foreign competitors who were free to buy dollar cotton at the world price could undercut them.

*

The commission also took over the function of the prewar Liverpool Futures Market by providing its customers with a comprehensive cover or insurance against price fluctuations. This scheme, which was introduced, in its present form, for spinners in November, 1949, and which was later extended to include converters, doublers and manufacturers, provides a better service than that enjoyed by some other European cotton industries. Hedging facilities are indispensable, and if private importation were to be fully restored, such facilities could be provided privately only if freedom were given to import cotton of a whole group, such as American-type or Egyptian-type, irrespective of the country of origin or the currency used.

It is, therefore, only in the context of present exchange restrictions that a comparison between the virtues of the Raw Cotton Commission and the prewar system can be made. The advantages claimed for the present system

Capital Replacement Costs

This service, prepared jointly with the Association of Certified and Corporate Accountants, provides indices of changes in the replacement cost of industrial plant, and is being steadily expanded. We have recently added new indices covering the following types of equipment:

Mechanical Handling Equipment.
Foundry Plant.
Tanning Machinery

These are in addition to our indices for factory buildings, agricultural machinery, electrical equipment, chemical plant, machine tools, textile machinery, food processing machinery, office equipment, and commercial vehicles.

Other indices can be prepared on request. For further particulars please write to:

The Economist Intelligence Unit
22 Ryder Street, St. James's,
London, S.W.1

certainly right to address themselves to the general body of investors, for subscriptions from them offer the best assurance that the loan, when it finds its home, will not be financed directly or indirectly through the banking system. The trouble is, however, that a loan does not find such a home quickly, and the turn offered on this operation does not seem large enough to make this process as speedy as possible. In the meantime, the "departments" have to carry the load, financing themselves by floating debt borrowings from the banks—which will be likely to find their liquid assets increased by the very operation that reduces their advances. For the time being, therefore, the grip of monetary discipline upon them will be somewhat slackened. In short, these issue terms are consistent with a firm, but not with a really tough, objective for monetary policy. By the standards of gilt-edged market management, they may prove to have been highly skilful and well in the interests of BEA; but if monetary control is to be kept as taut as the national interest requires, some further initiatives may be required from the authorities before many weeks have passed.

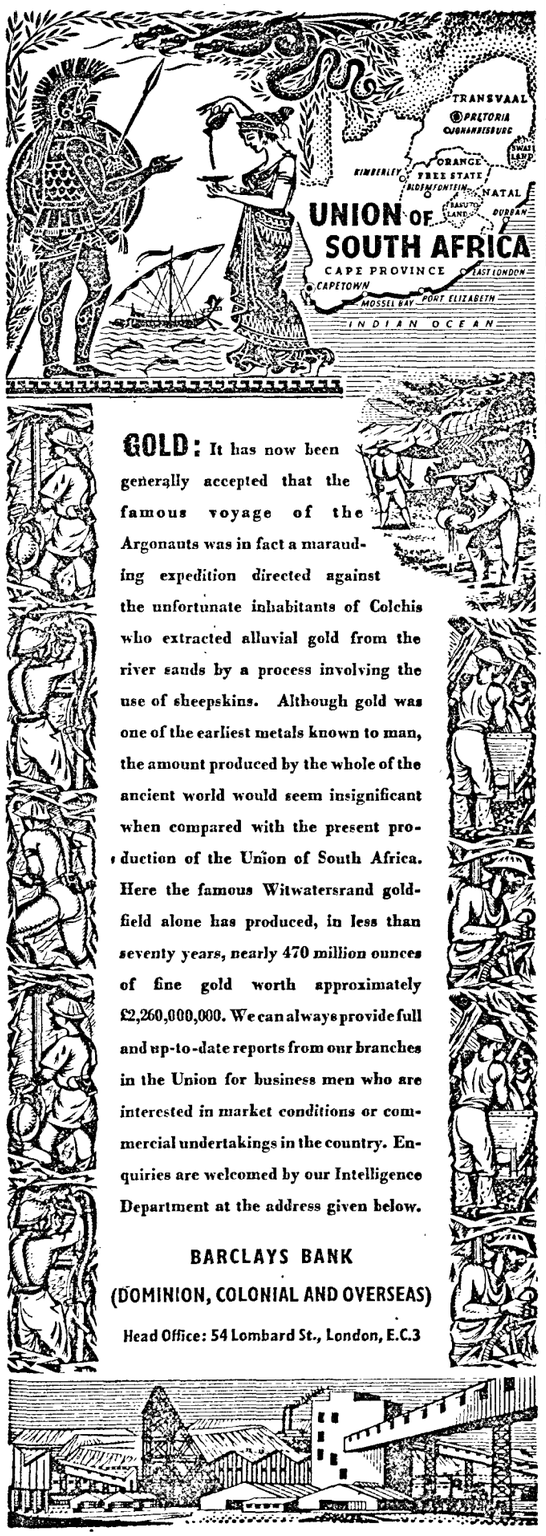
EPU and the Monetary Fund

The Managing Board of the European Payments Union has given further consideration in Paris to the amendments that will have to be made to EPU before it is renewed for a third year on June 30th next. The board is due to report to the Ministerial Council of the Organisation for European Economic Co-operation by the middle of May and to make definite proposals under two heads, the capital needs of EPU and the measures to be taken to meet the case of the exceptional creditors. An earlier proposal of the Managing Board was that a further $200 million is required as an addition to the capital resources of the Union if it is to fulfil its task with efficiency. Any hopes that this additional sum might be provided by the United States Government have by now been shattered. The refusal from Washington has, however, been softened by suggestions that the International Monetary Fund might intervene to assist EPU. The ways and means of such assistance have probably been discussed in Paris, where the IMF has an observer who can be taken into consultation by the Managing Board of EPU. The Monetary Fund is not allowed to deal direct with organisations. Its transactions must be with member countries. It could, however, come to the assistance of EPU indirectly by arranging deals with, for example, Belgium and Britain, the effect of which would be to convert part of the British overdraft with EPU into a purchase of dollars from the IMF, the dollars being used to effect payments to Belgium and reduce that country's credit position with the Union.

The position of Belgium was discussed at some length in London this week when the Belgian Finance Minister and the Governor of the National Bank met the Chancellor of the Exchequer. Although there are indications that the Belgian surplus with other members of EPU is at long last beginning to run off, Belgium wishes to fund, and if possible market, part of its large surplus with EPU. Up to the end of March Belgium had run up a cumulative surplus of $733.3 million with EPU, or more than twice its quota of $360 million. Various schemes have been put forward for funding at least the excess over the quota, one suggestion being that Belgium might convert it into bonds for which it might find a market in Switzerland and other hard currency countries. In March Belgium was again the main EPU creditor, with a surplus of $45.4 million. It was followed by the Netherlands with a surplus of $39.2 million and Germany with a surplus of $35.5 million. Later indications from Paris suggest that the Belgian surplus for this month will be considerably smaller. In accordance with the gold payment arrangements made with Belgium for the second quarter of this year, the whole of it will probably be payable in gold, thus encroaching further on already seriously depleted capital resources of the Union.

Relief for Rubber?

Despite the news that the United States Government has lifted most of its controls over domestic consumption of natural rubber the price of rubber on the London market has remained virtually unaltered this week. There was a minor boom in rubber shares on the stock exchange on Monday, but it was short-lived. This dull response was due to recognition that so long as the Government-operated synthetic rubber industry in America keeps its product sheltered behind a fixed minimum consumption level and an artificially low price, natural rubber will be unable to compete—in this, its largest market—on anything like equal terms. Moreover until July the American manufacturer will have to buy all his natural rubber from the United States Government at its present price of 48½ cents a lb, which is far above the world level. In the third quarter of the year United States imports may begin to rise, but it would be optimistic to suppose that its imports of natural rubber for 1952 as a whole will now be much more than 100,000 tons above the earlier estimate of 475,000 tons exclusive of stockpile needs.



For the longer term, too, the prospect is still very difficult to assess. In freeing natural rubber, the American Government has announced that it will allow consumption of general purpose synthetic (GR-S) to fall to 450,000 tons a year and of special purpose synthetic to 60,000 tons a year, compared with present total consumption of 775,000 tons of both types of synthetic. Until the stockpile of GR-S reaches 75,000 tons, however (it is now believed to be about 55,000), production will only be allowed to fall to an annual rate of 600,000 tons—that is, 100,000 tons below the present level; when the stockpile reaches 122,000 tons, production may come down to 450,000 tons. Unfortunately, the reduction of the obligatory level of consumption does not mean that American industry will necessarily take an extra 265,000 tons of natural rubber. The National Production Authority considers it unlikely that synthetic consumption will drop to the minimum level; in any case, there will be some delay because of the technical difficulties of switching back to natural rubber.

Whether or not American industry will take advantage of the opportunity to use more natural rubber will depend largely on how its price compares with that of synthetic—at present GR-S at 23½ cents a lb, is about 13 cents a lb below the world price of natural rubber and 25 cents a lb below the American price. This difference in price may tempt manufacturers to go on using synthetic for many products. So long as GR-S is kept at this absurdly low price—which is below the price that would have to be charged by any privately-owned synthetic rubber plant—there seems little prospect of any really marked improvement in the rubber market. In any case, rubber producers have hanging over their heads the American government's threat that controls will be reimposed on natural rubber if consumption of synthetic rubber falls below 450,000 tons a year.

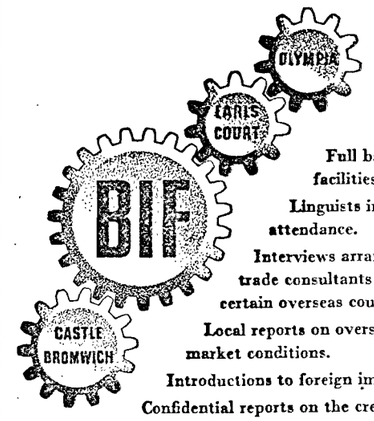
Freight Rates Fall Sharply

The steady decline in tramp freight rates that began in November last accelerated during March. The Chamber of Shipping's index of sterling tramp freight rate index was 137.7 for March, having fallen 20 points from the level in February. It can be compared with an average of 173.7 for the whole of 1951 and of 84 for 1950. The index may slightly overstate the downward drift, since the feature of the freight market in March was the large number of forward fixtures arranged, for which lower terms are normally accepted. Several early fixtures for grain from the St. Lawrence to the U.K/Continent were made at the beginning of March at 16s. per quarter; by the middle of the month 14s. 6d. per quarter was being accepted for June loading and at the end of the month 13s. was arranged for July. Such a sequence of fixtures during a particular



GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand goldfield alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

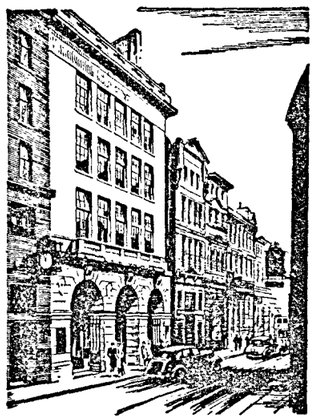
LONDON OFFICES: 29 Threadneedle Street, E.C.2.
and 47 Berkeley Square, W.1

INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY

GB5102E

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.



Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

calendar month is bound to exert an influence on the index; but apart from vagaries of this nature, the general trend of freight rates is reflected, and that trend is clearly downward. The rate for sugar from Cuba to the United Kingdom, for example, declined from 125s. to 95s. a ton during March, and the rate for coal cargoes outward to the Plate, which has remained for months at 120s. a ton, dropped to 90s.

The major cause of this fall in rates has undoubtedly been the easing of coal shortages in Europe in a mild winter permitting a cessation of transatlantic coal chartering, another cause has been the import cuts imposed by many countries. European imports were once estimated at 42,000,000 tons.

of American coal for this year, but the estimate has now been cut to 17,000,000 tons, of which nearly half has already been shipped. Large numbers of vessels have thus become available in the Atlantic, although this sudden surplus of tonnage is being offset by the withdrawal of vessels previously released from the American reserve fleet. By the end of March the US authorities had ordered that 266 ships should be laid up, and a week later it was reported that another 100 would be withdrawn. It was stated in Washington that Government ships operated under general agency agreements would in future be confined to war cargoes, leaving all "aid" cargoes for private operators. Vessels owned outside America are now willing to accept cargoes at rates which would be completely uneconomical for American-operated vessels.

When freight rates dropped to their lowest level in 1950, owners were faced with the prospect of being forced to lay some ships up. Since then operating costs have risen considerably. The level has now probably already been reached at which the owners of American-flag tramp tonnage are being compelled to lay up ships, but it is fairly certain that the majority of British ships are still able to operate at a profit. Many of them, in any case, are already fixed for fairly long periods at much higher rates than prevail at the moment: vessels are still being fixed on time charter at about 28s. per month, compared with 12s. 6d. before the Korean campaign. Some British shipowners moreover find some evidence for their hope that the downward trend of freights in general is coming to a halt for the time being, in the fact that charterers are certainly tending to cover their requirements well forward rather than wait in the hope of catching the market at a much lower level.

* * *

Free Gold Weakens

The free market premium over the official dollar price for gold has been sagging in recent weeks. The current price for free gold is no higher than $37\frac{1}{4}$-$\frac{1}{2}$ per ounce, the lowest figure quoted since the official price was fixed at $35 per ounce in 1934. The price broke through what was regarded as a minimum floor of $38 in mid-March, following the troubles in the Bombay bullion market. These led to the suspension of dealings and to a temporary cessation in the offtake of gold by India. The pipelines that feed this market—through Kuwait from the West and Macao from the East—filled up rapidly. The traffic to India is smuggling pure and simple and does not immediately adjust itself to changes in the Bombay market. By the time the true import of events in the Bombay market had percolated to the sources of supply the pipelines were overfilled. The result is that though Bombay is open again and taking modest amounts of gold, it will be a considerable time before the resumed offtake from India begins to affect the free market price of gold in Europe and the Middle East.

The most important single factor in the more recent decline of the free market price has been the cessation of buying in France. During 1951 French hoarding demand was probably the largest single source of buying in the free market. It cannot be claimed that the battle of the French franc has been won; but the surprising longevity of the Pinay Government, the voting of a seemingly balanced budget for 1952 and the readiness with which further United States assistance has been forthcoming have combined to create a respite for the franc and a virtual cessation of gold hoarding in France.

While these two important props of support for the gold market have been temporarily withdrawn or weakened, the supply of gold reaching the free markets has continued to flow strongly. The latest quarterly returns of the South African mines indicate an appreciable increase in the profits earned from premium sales. Since the premium over the first quarter of 1952, the period covered by the returns, was falling, it must be concluded that the South African mines have been selling in the free market a larger proportion of their production. Another straw showing a similar direction of wind is the announcement by the Finance Minister of Southern Rhodesia that the gold mines in that country will henceforth be allowed to sell the whole of their production in the free market and will no longer be limited to the former proportion of 40 per cent. Another indication of the easing and official recognition of the free market for gold is the decision of the Swiss Government to free from licensing all traffic in gold to, from or through Switzerland. The co-existence of the two markets in gold—free and official—is becoming increasingly recognised and officially tolerated; but by the same token the price margin that separates them is narrowing.

Productivity Reports and Results

It is only on the factory floor that the real value of the many productivity reports published in Britain in the last two years can be proved or written off. The Anglo-American Council on Productivity, therefore, has done well in the present period of uncertainty about its future to publish progress reports assessing just how much influence two of the earliest reports published have had in practice. These concern steel-founding, which published the first report late in 1949, and drop-forging, upon which a report was published in May, 1950. The assessments have been made by the Council, which disclaims any pretence of completeness; but it may safely be assumed that few important or measurable improvements in practice following upon the reports will have been missed.

The results recorded in both industries are impressive. Something has been heard before of the advances achieved in steel-founding; for this reason, and also perhaps because some of its work is more easy to measure, the report upon changes in drop-forging has more immediate interest. A number of companies report increases in output by 1951 such as 40 per cent over 1949, 50 per cent over 1945 or 1946, and 100 per cent (and in one case 500 per cent) over prewar. One of the leading firms in the industry claims a rate of output between 5 and 48 per cent higher than American for 12 identical forgings made on similar plant,

and an equivalent rate of output for seven others. Three trends of advance can be discerned in the industry; greater use of the board hammer, which is similar to the Ceco hammer used in America and described in the report; improvement of the friction-lift hammer generally in use in Britain; and use of the forging press—which since 1949 has begun to be produced in this country. The industry's trade association has commissioned a long-term investigation into furnace design, which has already thrown up some weaknesses in British designs of furnace.

The British Steelfounders' Association at the end of last year assessed the general increase in productivity throughout its industry as 15 to 20 per cent in the last two or three years, though this is particularly difficult to measure with any precision. Apart from the technical advances that have followed within the industry, this particular report may be credited with a considerable influence outside. It was the first, and its comparisons of productivity were sensational enough to arouse wide discussion about their applicability to British industry in general. Its outspoken comments upon the two countries' different attitudes to industry perhaps did more to interest other industries in sending productivity teams to the United States than any propaganda of the Council could have done. It might even be said that it provided a pattern for the general conclusions—and some of the vocabulary—used by many of the teams that reported later.

Surplus of Wool

The recent weakness in the wool market is partly explained by the revised estimates of world wool production that are published by the Commonwealth Economic Committee in the current issue of *Wool Intelligence*. Although the world clip is now estimated at 3,954 million lb (greasy) or 130 million lb less than the first estimates made at the beginning of the season, the clean content of 2,290 million lb is still some 250 million lb above the current rate of consumption. Nevertheless, part—at any rate—of this surplus is likely to be used in increasing strategic and manufacturers' stocks, and the prospect for large supplies next year is not bright.

The Australian clip has declined for the second year in succession owing to lighter fleeces; the recent bush fires and drought will probably cause a serious fall in next season's output. New Zealand, United States and Uruguayan production has remained practically stationary this year, while wool production in Argentina is now believed to be about 20 million lb (greasy) below 1950-51. South Africa is the only major wool producing country to show an increase—one of about 3½ per cent—above the 1950-51 level; more than 85 per cent of the South African clip is merino wool and this has offset the smaller merino output from Australia. In all, world supplies of merino wool this season at 1,348 million lb greasy (729 million lb clean) are estimated to be a little below those available last year—the first time supplies have not increased since 1947-48. Next year supplies of wool for apparel may decline quite sharply, for the loss of sheep in Australia—especially among the merino sheep that graze mainly on upland pastures—is said to be severe.

Prelude to the Comet

The de Havilland Comet has been giving a series of demonstration flights to a mixed bag of passengers before starting the world's first jet service next Friday afternoon. Many of them were noticeably subdued when they boarded the aircraft which has nearly the same speed and is capable of a rather better rate of climb than the RAF's jet fighters. A middle-aged passenger can be excused for expecting a flight under these conditions to be a little alarming, but the passenger's view of the Comet is very different from that seen from the ground. The scream of the jet engines that deafens the ground crew and disturbs the sleep of the local residents is for the great part shut out of the cabin. The absence of any vibration from the engines, or of any visible means of propulsion, gives an impression of immobility even when the aircraft is flying at 500 mph and gaining height at the rate of more than 1,000 feet a minute. These flights have proved that the Comet's claim to introduce a new standard of comfort into air travel was no idle boast. The months of development flying that proceeded them have also shown BOAC that its operating costs compare more favourably with those of other aircraft than its critics would admit. Such comparisons are limited to aircraft on which BOAC has its own operating data, but they provide a rough and ready yardstick by which to measure the Comet's performance.

The Johannesburg route is not ideally suited to the Comet, and it tends to exaggerate what is the biggest handicap of any jet airliner; its high fuel consumption by comparison with that of a piston-engined aircraft. Until night landings are made at Cairo again, the Comet must make five refuelling stops on the 6,700 mile journey between London and Johannesburg. This gives a total journey time of nearly 24 hours, less than 19 of which are spent in the air. Some of the new piston-engined aircraft that are just coming into service can do the same journey with only one stop. BOAC's competitors could therefore provide nearly as fast a service on the Comet route, but only if their passengers are prepared to spend ten hours at a stretch in the air. The Comet is also penalised by the short life of its engines. While piston engines are overhauled at intervals of between 600 to 900 hours, the Comet's Ghost engines, being new, are overhauled at less than 400 hours, soon to be raised to 450 hours. It will be some time before the Air Registration Board is prepared to grant them the same life as that of the piston engines with several thousands of hours flying experience behind them. The cost of these overhauls is difficult to estimate. The first few engines may cost as much as £2,500 apiece; compared with £1,500 to £3,000 for a piston engine, depending on its complexity. By the end of the year, the cost of overhauling the Ghost may be nearly halved, and if the period between overhauls has by then been lengthened, the comparison with a piston engine in, say, a Stratocruiser, should be in the Ghost's favour.

Nevertheless, there is no longer any doubt that from the outset the aircraft will pay its way over this route with a slight margin over some of the aircraft now in service. Operating experience will make it possible to tighten flight schedules and this, combined with a reduction in engine overhauls, makes it reasonable to expect a ten per cent reduction in operating costs by the beginning of next year.

SUBSCRIBED CAPITAL	Rs.40,000,000
PAID-UP CAPITAL	Rs.20,000,000
RESERVE FUND . .	Rs. 6,750,000

With over 80 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

This brings the Ghost Comet's costs to the level of those of the Constellation, the most economic aircraft that the industry has seen for many years. The costs of the Avon Comet may show a further reduction of 20 per cent, giving a 30 per cent drop in costs within two years of the start of operations. The spotlight on Friday will be on BOAC but the Comet was from start to finish the project of the aptly named de Havilland Enterprise, built and developed with several million pounds of the company's own money. It should prove a profitable investment to the company and to the country.

Is Beer Output Falling?

Beer production in February amounted to 1,530,000 bulk barrels, 121,000 barrels, or over 7 per cent less than in February, 1951. This is an unexpected development, since in each of the previous four months output was greater than a year earlier. It does not seem to accord with the conclusion that has been formed in recent months that the long postwar decline in output was at last over and that beer production had perhaps begun to increase. But one month's evidence cannot entirely upset that conclusion.

The rate of brewing depends largely upon the kind of trade expected in the future. How far ahead the brewer looks will vary with the proportions of draught and bottled beer he sells. Draught beer is more perishable than bottled, and is normally consumed within two or three weeks, but bottled beer is good for six weeks or longer. Since draught beer now comprises two-thirds of total production and bottled beer one-third, the weighted average period of consumption for beer as a whole is about four weeks after its brewing. Easter, 1951, came in late March; this year three weeks later, in mid-April. Beer for the Easter trade last year was probably brewed in February; this year it will probably have been brewed in March. Here is one reason why output was lower this February; though it is hard to assess how much of the difference it explains. It may be concluded at least that the lower February figure alone does not prove that the decline in beer consumption has been resumed. For the same special reason, output in March this year may be expected to be higher than in March last, so that comparison of the combined output for February and March in each year will be a better guide to the trend of demand. Since Whitsun this year is also three weeks later than last year—it comes early in June compared with mid-May in 1951—similar caution will be needed in interpreting the figures of output in April and May when they appear.

* * *

Television for Industry?

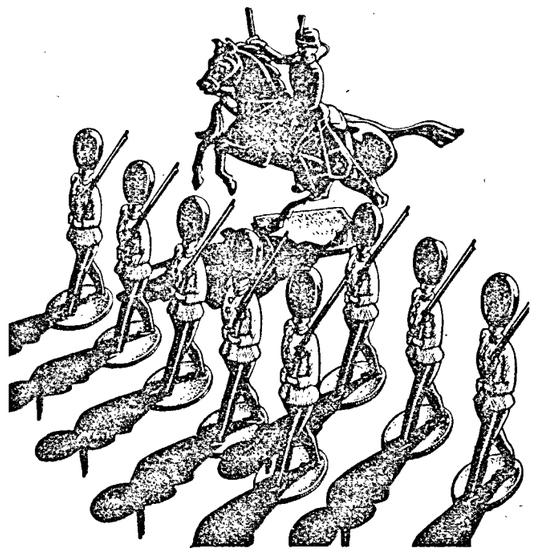
A demonstration given last week of the private television link installed by Pye Radio between the office of Glyn Mills Bank in Whitehall and its records office at Osterley, ten miles away, suggests that there may be a substantial market for television in industry. The television link was not suggested until the bank had tried and abandoned several more conventional methods of direct communication with the records office. It has the advantage over them of not only making the recorded information on customers' accounts immediately available, but also of presenting them visually so that they can be read over in the normal way or the specimen signatures checked at will. Glyn Mills was forced by circumstances to store records at Osterley; other companies keeping bulky records might find that the two-to-one difference between central and suburban rents makes it worth while to adopt a similar procedure. The deciding factor will be the capital and running costs of the installation. Pye Radio puts this as low as £10,000, with running costs of £5 to £10 weekly. But the ten miles between Whitehall and Osterley represents the effective limit of the transmitters' range.

Pye has worked hard since the war to find markets outside the BBC for television transmission equipment. The BBC does not often want more than one transmitter at a time or a small number of cameras, and orders on this scale hardly justify the extensive development expenditure that must be incurred if a company's products are to be kept to front line standards. If the equipment can be mass produced at the price quoted by Pye, there is scope for using it more widely in industry for monitoring dangerous reactions, for supervising operations, and inspecting instruments. The few private television systems such as those in the atomic energy plants operate on a closed circuit with the cameras and receivers linked by direct cable, but Pye has been giving advice on the installation of a system similar to that developed for Glyn Mills in the Trostre tin-plate mills where machinery obstructs the use of closed circuit cables. Exports also relieve dependence on the bounty of the BBC; British companies are competing strongly with each other for these markets but among them Pye has what must be a unique arrangement with American equipment distributors that is giving it a comfortable business in the sale of equipment—mostly cameras—in the United States. This is now running at the rate of $1 million a year and may secure the company one of the contracts to supply cameras to the Atomic Energy Commission.

* * *

Cheaper Secondhand Ships

The decline in freight rates has had its inevitable effect on the prices of secondhand dry-cargo tonnage in the ship market. The prices of secondhand ships, moreover, fluctuate much more sharply than freight rates. Reviewing sales of ships in the first quarter of this year, Harley, Mullion and Company, Ltd., the London shipbrokers, estimate that a Liberty ship might now be secured for about £375,000, compared with the peak of about £600,000 at the end of last year. Even at this figure, buyers are holding back, and it may be that prices will have to sink lower before any more sales take place. Before the outbreak of war in Korea a Liberty ship changed hands at £105,000. By October, 1950, the value was £200,000, and by June, 1951, it had risen to about £400,000. Secondhand tankers, indeed which showed even more spectacular rises in value, have been maintained, in company with tanker freight rates, although sales have been few. For example, a tanker built over 20 years ago changed hands in January last for over £1 million; a sister ship of the same age was sold for only £162,500 in June, 1950.



Prices have not declined to the same degree for all classes of tonnage. In dry-cargo tonnage, whereas the value of Liberty and other standard war-built ships may have declined by about 30 per cent in the last three months, prices for ships built before the war but not more than 25 years old have declined by only about 20 per cent. Good class modern ships, not built during the war, have declined only by about 10 per cent in value; at the secondhand prices recently prevailing it was conjecturable whether it would not be cheaper to buy a new ship. The prospect of immediate earnings at high freight rates was commanding a substantial premium. Now that freight rates are returning to a more normal level the demand for immediate tonnage loses its force, except in special circumstances, and the prices of secondhand ships seem likely to decline still further unless there is another sharp rise in freight rates this year.

Electrical Exports

World exports of electrical equipment in 1951 reached a record level of about £625 million, according to estimates

LEAD

LEAD, one of the heaviest of the elements, is found in many parts of the world as galena or sulphide of lead. It is still mined in Northern England and in Wales. Lead was one of the first metals to be worked by Man. The baths of ancient Rome were supplied with water through pipes made of lead, and for centuries it has been used as a roofing material. Soft, easy to shape and resistant to corrosion, lead is still employed for these purposes, but today it has many other important uses. Large quantities alloyed with antimony are now used to make plates for electric accumulators and to protect insulated cables. Soft solder is an alloy of lead and tin, and alloys of copper, tin and lead are used for bearings. Litharge, an oxide of lead, is used in making flint glass, pottery glazes and in the processing of rubber. Red lead, another oxide, and white lead, or lead carbonate are well known in the manufacture of paint. In the chemical industry, plant and equipment for the manufacture and storage of sulphuric acid are lined with lead because of its resistance to corrosion.

I.C.I. makes wrought lead products such as sheet, pipes, tape and wire for a wide variety of purposes. It also makes the compounds, lead-azide and lead-styphnate for the detonators used with blasting explosives in mining and quarrying.

of the British Electrical and Allied Manufacturers' Association; this was more than eight times the average value in the thirties. The United States and Britain are the main exporters today, as might be expected, and during recent years the value of their trade has been roughly of the same order; in 1935 the two countries accounted for well under a half of total electrical exports, but last year their combined proportion made up more than 62 per cent. British electrical exports make up nearly a fifth of the total exports of the engineering industries, upon which the main reliance is now being placed. What are the prospects of further expansion of overseas sales by this industry?

This is a question that BEAMA, which has one of the most elaborate export departments that any trade association could maintain, still finds it very difficult to answer regarding 1952. Import cuts in the Commonwealth countries weigh against much further expansion in those markets. Last year they received about three-fifths of the total of £189 million; Australia, for example, buying more electrical equipment last year from Britain than had ever been purchased in one year by any single country. The import cuts at home may also have some repercussions affecting electrical exports to Europe; last year's sales were helped to some extent by measures to encourage intra-European trade. But Canada offers excellent prospects for higher dollar exports: British companies have secured, for example, large amounts of traction equipment for the new Toronto underground, and contracts for generators and transformers for the Aluminium Company of Canada and the Ontario hydro-electric power authorities.

British manufacturers are watching closely the rapid advance of Germany in this field. In 1949 German exports of electrical machinery were negligible in comparison with British; last year they were nearly one-third as high. German manufacturers, without defence preoccupations, have been able to offer shorter deliveries; direct incentive to export is provided by profits tax relief; and there is some prospect that a German Export Bank may be formed to finance long-term export credits. Competition from Japan last year turned out to be less important than some manufacturers feared in 1950, largely because Japanese prices for electrical machinery are now in general no lower than British; but some penetration of the market has been achieved of India and Pakistan, which are valuable British customers.

Earnings and Hours

In October last year the average earnings of all workers in the wide range of industries covered by the Ministry of Labour's twice-yearly inquiry was £7 1s. 1d. a week; the average for men was £8 6s. a week. Six months earlier the average for all workers was £6 12s. 2d. and for men £8 0s. 2d.; while compared with twelve months before, these average earnings had risen by about 11 per cent and 10 per cent respectively. This 1950-51 rise is roughly in line with that of wage rates in general and with the rise in the index of retail prices. But as compared with October, 1938, earnings have risen by about 165 per cent, compared with an estimated rise of about 96 per cent in wage rates in the industries covered by the earnings investigation.

The highest average weekly earnings recorded by the Ministry were in the paper and printing trades, where men were earning an average of £9 7s. 5d. a week. But it is interesting to note that in the manufacturing industries covered average earnings for all workers were slightly lower than in the non-manufacturing—mining, building, a small section of the transport industries and national and local government services. Here men's earnings are lower than in manufacturing industries; but the higher earnings of youths and women shift the balance. Railway earnings are excluded from this sample; but a census taken by the Railway Executive for April last shows that average earnings of men in the conciliation grades were £7 12s. 11d.—well below the general average. In coal mining, on the other hand, figures recorded by the National Coal Board showed that in October last men in the industry were earning an average of £10 11s. 11d., with allowances in kind worth 8s. 10d. a week. In the docks, the average earnings in October amounted to £9 14s. 9d. a week, including all allowances.

The Ministry's records of hours worked in the industries covered by its sample show considerable stability. In 1938 the average period of work was 46.3 hours a week; in 1947 and 1948 this dropped slightly below 45 hours; in October, 1950, it was back to 45.7 and last October it was 45.6 hours. Though the proportion of these working weeks represented by overtime has obviously changed, these figures make nonsense of some recent appeals for a "return to the 45-hour week in industry."

Company Notes

Vickers.—When the directors of Vickers doubled the distribution on ordinary capital last year they pointed out that the payment should be regarded as a dividend of 10 per cent and an additional payment of 2½ per cent from undistributed profits that were no longer required by subsidiaries; at the subsequent annual general meeting in June, the chairman emphasised that the payment in this form was a warning in itself that a distribution of 12½ per cent could not automatically be expected in 1951. In these circumstances shareholders will welcome the news that a dividend of 12½ per cent will, in fact, be paid for the year ending on December 31st last. This distribution has been recommended despite a sharp setback in group net profits, which have fallen from £2,838,074 to £2,072,872. This decline is mainly due to an increase in the provision for taxation from £3,575,537 to £4,434,606; gross profits appear to have risen moderately, from £6.9 million to £7.1 million. A large increase in gross profits was not to be expected in a year when Vickers' energies—as far as the aircraft division was concerned—were concentrated upon tooling up.

In contrast to the experience of the group as a whole, the net profit of the holding company has risen from £1,643,644 to £1,793,996 after providing £2,055,226 (against £1,735,570) for income tax, and £516,038 (against £317,800) for depreciation on British government securities. Depreciation on investments has been a very serious matter for the group, since its £6,316,273 holding in English Steel was vested in the Iron and Steel Corporation last February. The £15,267,081 of steel stock then received as compensation is included in the balance sheet at par, but its market value on December 31st was only £13,385,674. As both

Vickers and Cammell Laird have apparently held on to the stock issued in compensation for the vesting of English Steel, the return of the holdings to their original owners would seem to be a comparatively easy operation. The terms on which steel denationalisation is carried out will be eagerly awaited by Vickers shareholders.

Vickers has, of course, an important part to play in rearmament. It also has the underlying financial strength to meet any calls that are made on its resources. In the last year consolidated revenue reserves and undistributed profits have risen from £19,592,824 to £29,551,810, and total net assets from £50,056,013 to £59,953,754, including the £8,950,808 surplus arising on the vesting of English Steel. Now that tooling up is almost completed, earnings from the production of aircraft should soon begin to be reaped. At the current price of 45s. 6d. the £1 ordinary stock units yield 5½ per cent.

Consolidated earnings :—	Years to Dec. 31, 1950	1951

£1 ordinary stock at 75s. 0d. xd. yields £5 6s. per cent.

*

British Oxygen.—The British Oxygen group enjoyed a greater volume of sales last year, but "continuous and heavy advances in operating costs" kept the increase in trading profits down to modest proportions, from £4,312,514 to £4,805,112; moreover much of this increase was absorbed by higher provisions for depreciation and taxation. Equity shareholders, however, receive a little more. On an ordinary capital of £4,162,922 the full year's distribution is 20 per cent. A year ago a final dividend of 12 per cent was paid on this capital following an interim of 8 per cent paid on a capital of £3,469,102. About £645,000 (against £615,000) has been ploughed back into the business.

Consolidated earnings :—	Years to Dec. 31, 1950	1951
	£	£
Trading profit	4,312,514	4,805,112
Total income	4,320,475	4,814,666

Cash	2,685,266	711,058
Reserves	8,464,583	9,278,348
Ordinary capital	4,162,922	4,162,922

£1 ordinary stock at 75s. 0d. xd. yields £5 6s. per cent.

The balance sheet shows that further investment in fixed and working capital has led to a marked deterioration in the group's liquid resources. The net book value of fixed assets has risen from £12,057,397 to £14,724,037 and the value of stocks from £5,705,629 to £7,461,504. Bank borrowings and sums due to creditors have both increased and cash balances have fallen substantially, from £2,685,266 to £711,058; part of this fall must be due to the investment of £600,000 in tax reserve certificates, but it is clear that the balance of the proceeds of the new issue in 1950 has been quickly absorbed into the business. By the end of the year the group had already placed £4.1 million orders on capital account, and shareholders must expect that this year the emphasis will be upon profit retentions rather than upon increases in equity distribution.

*

British Insulated Callender's.—Six weeks ago, when British Insulated made an offer of just over 3,100,000 new £1 ordinary shares at 22s. a share, the terms of the offer did not look particularly generous on the basis of the 1950 dividend of 7½ per cent. The over-subscription of that issue showed, however, that shareholders had every confidence in the future prosperity of the company. Their confidence has not been misplaced. The ordinary distribution for 1951 has been raised to 9 per cent by the addition of a cash bonus of 1½ per cent to the maintained ordinary dividend of 7½ per cent. The new shares, which are not yet fully paid, do not rank for this distribution.

Consolidated earnings :—	Years to Dec. 31, 1950	1951
	£	£
Trading profit	6,130,642	7,966,464
Total income	6,307,027	8,288,039
Depreciation	781,899	845,836
Taxation	2,945,201	4,081,211
Group earnings for ordinary stock	*1,801,127*	*2,570,442*
Ordinary dividends	368,460	436,608
Ordinary dividends (per cent)	7½	9
Capital reserves	7,589	5,308
Revenue reserves	1,323,977	1,938,013
Added to group carry forward	307,987	257,349

£1 ordinary stock at 30s. 3d. yields £5 19s. per cent.

When the offer was made, the directors indicated that profits earned in 1951 were in excess of those earned in 1950. This statement is amply borne out by the preliminary announcement that group trading profits in the year to December 31st last jumped from £6,130,642 to £7,966,464. Taxation absorbed £4,081,211 (against £2,945,201) but group net profits still show an impressive rise, from £2,309,147 to £3,054,868. Despite the increased equity distribution, the appropriation to revenue reserves has therefore been increased from £1,323,977 to £1,938,013, while £257,349 (against £307,987) has been added to the carry forward. This is the year of opportunity for the capital goods industries and British Insulated should share in their prosperity, provided raw material shortages do not hold up production. There is clearly every chance that the cash bonus will be consolidated into the ordinary dividend this year and that a rate of 9 per cent will be paid on the new capital of £12,350,000. On this basis, the yield on the new shares at their issued price of 22s. is nearly 8.2 per cent.

*

United Molasses.—In the year to December 31st last, group profits of United Molasses more than doubled, from £3,643,644 to £8,186,344. These bumper profits, which more than bear out the chairman's optimism of a year ago, must largely reflect the prosperity of the group's shipping subsidiaries in last year's buoyant freight market. In addition, the demand for molasses remained high last year and the earnings from the group's other interests probably showed substantial increases.

Consolidated earnings :—	Years to December 31 1950	1951
	£	£
Total profit	3,643,644	8,186,344
Depreciation	1,203,358	1,577,128
Taxation	1,382,256	4,086,628
Group earnings for ordinary stock	*1,079,302*	*2,360,306*
Ordinary dividends†	459,368	610,781
Ordinary dividends (per cent)*..	14·60	19·84
General reserves	205,000	1,010,000
Added to group carry forward	414,994	739,525

10s. ordinary stock at 32s. 9d. yields £5 17s. per cent.

* Equivalent gross rates on ordinary capital of £5,683,500
† Tax free.

The rise in gross earnings has been so sharp that in spite of an equally sharp increase in taxation (from £1,382,256 to £4,086,628), group net profits have also more than doubled, from £1,173,052 to £2,452,650. This has allowed the company to pass on some of the increased earnings to stockholders. A final tax-free dividend of 6½ per cent makes the total ordinary distribution for the year equal to 19.84 per cent gross on a capital of £5,863,500, compared with an equivalent distribution of 14.60 per cent gross in 1950. The directors have also transferred £1,010,000 (against £205,000) to general reserves, while £739,525 (against £414,994) has been added to the carry forward. As freight rates have recently been falling, 1951 may prove to have been the peak year for United Molasses' earnings, but the demand for molasses for industrial purposes seems likely to remain high, and though total earnings may fall, the dividend should not be in jeopardy.

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 19, 1952, total ordinary revenue was £48,474,000, against ordinary expenditure of £97,215,000 and issues to sinking funds £545,000. Thus, including sinking fund allocations of £1,101,000 the deficit accrued since April 1, 1952, was £74,221,000 compared with a deficit of £25,615,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THOMAS TILLING LIMITED

INCREASED PROFIT

POSITION OF VARIOUS INTERESTS

MR W. LIONEL FRASER'S REVIEW

The fifty-fifth annual general meeting of Thomas Tilling Limited will be held on May 15th at Crewe House, Curzon Street, London, W.

The following is an extract from the review by the chairman, Mr W. Lionel Fraser, CMG, in respect of the year ended December 31, 1951, circulated to stockholders:—

As you will see from the consolidated profit and loss account our trading profits amounted to £1,018,283, an increase of £262,070. Of this increase approximately £100,000 is due to improved trading results, and the balance is due to the inclusion of our new subsidiaries. The profit of the group before taxation is £1,249,894, but this sum has to bear taxation at an increased rate and a larger amount is attributable to minority shareholders. As a result, the net profit attributable to your company is £354,561, which is £31,798 more than the figure for 1950.

DIVIDEND MAINTAINED

Out of the available profits of £659,854 there has been paid the preference dividend for the year, and the directors now recommend the payment of a dividend on the ordinary stock of 6 per cent, which is the same rate as was paid last year.

I should point out that the suggested Excess Profits Levy, as the Finance Bill is at present drafted, will bear most harshly on your company, owing to the incidence of the capital profits dividend which was paid in 1949. It goes without saying that your board are taking energetic steps to impress upon the Chancellor of the Exchequer the injustice of the proposals as they would affect your company, and one must hope that the Finance Bill will be suitably amended in the Committee stage.

I will now review your company's interests:

SUBSIDIARY COMPANIES

Cornhill Insurance Company, Limited.—Marine, Fire, Accident, Employers' Liability, Engineering, Motor and Contingency Insurance.

During 1951 there was a healthy expansion of business both in the British Isles and overseas, and the total premium income for the year is the largest ever reached. As in 1950, home motor insurance was affected both by the increase in the number of accidents and by the tendency for claims to outstrip premium rates, due to national inflationary conditions. This position was, however, more than counterbalanced by the excellent underwriting experience of the fire department. The company has recently introduced wider forms of insurance protection for householders and houseowners than are normally available elsewhere. Close attention is being devoted to the development of new overseas markets, and with the persistent broadening of the basis of the company's operations, we count on continuing progress in the future.

Daimler Hire Limited.—Motor car hirers, chauffeur driven and drive yourself services.

The results have again been highly satisfactory. The programme of expansion has continued and 50 new Daimler limousines, specially designed and constructed to meet the requirements of American, Dominion and other overseas tourists, have been added to the fleet. No other hire company operates cars of such comfort and dignity. This Daimler limousine service is, of course, well known throughout the world both for its efficiency and for the high standards set by its chauffeurs. To meet today's conditions, however, an additional service has been introduced and is already proving very popular. It is for clients who insist on the Daimler Hire standard of service, but are quite happy to hire a car slightly smaller than the big Daimler limousine, provided the charge is correspondingly lower. Daimler Hire has therefore introduced two new chauffeur-driven services, the Humber Pullman limousine and the Humber Super Snipe saloon at charges 15 per cent and 30 per cent, respectively, less than for the Daimler limousines. In spite of considerable competition, the Drive Yourself section is going from strength to strength, due to the quality of the service provided, the variety of cars available for hire and the very moderate charges. The managing director expresses confidence about the demand for the company's services, both from overseas visitors and from clients at home. The Theatre Ticket Bureau has now become firmly established and is much appreciated.

Hobcurn Aero Components Limited.—Engineers, manufacturers of textile machinery, rotor oil pumps, electrical radiators and light engineering components for the automobile, aircraft and agricultural industries: at Stroud, Kent.

The results of this group, in which we purchased a 60 per cent interest early in 1951, have exceeded our best expectations. Additional machines are being installed to cope with the increasing demand for the group's products. The re-allocation of raw materials occasioned by the rearmament programme may affect production of certain lines, but this will be more than counterbalanced by rearmament work being undertaken by the group.

"PYREX"

James A. Jobling and Company, Limited.—Glass manufacturers, specialising in "Pyrex" brand ovenware, and laboratory and scientific glassware; at Sunderland.

Once again this company—our biggest subsidiary—has established a new record both for sales and profits. Judging by the orders, their industrial glass is becoming as well known as "Pyrex" ovenware, and many manufacturers in the food and drink trades and the fine chemical industry are now going over to "Pyrex" glass pipe-lines in place of metal pipes. As a result, additional plant and equipment have been installed, and a modern factory close to the main works has recently been leased. A concentrated drive is being made to increase export sales, and it is meeting with success, despite import restrictions in a number of countries.

Stratstone, Limited. — Distributors of Daimler and Lanchester cars, holding the Royal Appointment as suppliers of motor cars to His late Majesty King George VI and the Royal Family.

This company also earned record profits during the past year. It has now been appointed a main distributor for Lanchester cars, and this with the Daimler agency, further enhances the position of Stratstone as one of the leading motor car dealers in the country. Its reputation stands very high, and it is unequalled for efficient service and courtesy. Included in the company's activities is the marketing of the Essex Bus and Coach Washer. This automatic machine is quite unique in its design and contributes to a marked degree in reducing labour and other costs. It is accepted by the transport industry as of outstanding value. Here again special efforts are being made in the export markets.

F. Troy and Company Limited.—Building and Painting Contractors.

In my review last year I anticipated that the rearmament programme was likely to increase the difficulties of the building trade in general, and this, in fact, has been the case. During 1951 there developed an acute shortage of all kinds of steel required for building work, causing serious delays and a consequent reduction in turnover. These, and other factors, have adversely affected operations, and unfortunately there does not appear to be any immediate prospect of an improvement in supplies. Nevertheless, the company is doing everything possible to overcome the current obstacles.

ASSOCIATED COMPANIES

The British Steam Specialties Limited.—Manufacturers and Distributors of Valves, Gauges, etc., for Steam, Gas, Air and Water; at Leicester.

This company continues to trade at an increasingly high level, although material shortages are causing difficulties. The company has its own distributing warehouses in most of the big cities in the United Kingdom, and the demand for its products continues to grow. If materials and labour are not further restricted, the future looks promising.

Timothy Hird and Sons Limited.—Worsted Combers and Spinners; at Keighley, Yorkshire.

The hopeful anticipations expressed for 1951 proved themselves to have been justified although the appalling state of the wool textile market naturally had its effect on trading profits. In spite of this, the company's machinery was kept fully employed, which was a commendable achievement in the circumstances. The coming year may be even more difficult, but the management is alert and experienced and faces 1952 with resolution.

E. R. Holloway Limited (includes The Barnet Comb Co. and Lustrac Plastics)—Comb Manufacturers and Producers of Plastic Powders; at Welwyn Garden City.

This company has successfully maintained, and has indeed improved, its position in the comb industry. It is doing an ever increasing export trade, and last year it shipped overseas no less than one third of its production. Many new lines have been, and are being, introduced, and these should add to the prestige of this progressive concern.

Western Motor Holdings Limited. Group of companies engaged in the Motor Retail Trade and Repair Business in the West of England.

The trading results of this Group have fully confirmed the confidence we held when making the investment reported last year. The number of new vehicles delivered to

them was slightly less than in the previous year, but the Group substantially increased its turnover in the sale of used cars and commercial vehicles.

PROPERTIES

Our policy of development within the limits of current restrictions continues, and the income from our properties has increased. New purchases, conversion of old properties, and increased revenue from properties previously let at pre-war rentals have contributed to the improvement. Properties which are at present held on requisition and others which are war-damaged, offer scope for additional income when existing restrictions are removed.

NEW ACQUISITIONS

In the autumn of 1951 we took the opportunity to purchase the whole of the share capital of Mark Dawson and Son, Limited, an old-established firm of worsted spinners with mills at Bradford and Thornton. This business appealed to us as a unit in a basic industry, and it is also complementary to our interest in Timothy Hird and Sons, Limited. Obviously the industry as a whole is in an unhappy state just now, having had to face a storm of gale force, but we look beyond this with assurance, especially having regard to the attractive basis on which the business was bought.

During the year we also acquired an interest in Stevensons (Dyers) Limited, which is an old-established family business of hosiery dyers and finishers situated in the Midlands, with a long record of progressive development and an excellent relationship with its customers. Its buildings, plant and machinery are all of the most modern types, and it has large interests in the export markets. Trading has been at capacity for a long period.

Since the date of the balance sheet we have purchased a 60 per cent interest in Newey and Eyre Limited, industrial electrical engineering suppliers. This company, which was established in Birmingham 25 years ago, has branch offices and warehouses in Dudley, Wolverhampton, Derby, Peterborough, Cardiff and London. Its activities consist mainly of the distribution of electric lighting, heating and power equipment in a widespread industrial field. The company's progress is not bound up with trade fluctuations in any specific industry, and it should have great scope over the years.

GENERAL REVIEW AND PROSPECTS

The past year has again been one of consolidation, as well as of growth and of progress. New friends have been found, and older friendships have been cemented. I said last year that we were encouraged by the development and expansion of our interests. This still holds good today, and we see no reason to change our view that over the years our varied interests will yield an increasing income, provided nothing untoward overtakes us. Our underlying companies are all admirably managed by men of character and ability, and their boards enjoy complete latitude to conduct their affairs in their own way, subject always to the benign guidance and supervision of the parent company on matters of policy and finance. We describe Tillings as an industrial holding company, and are creating a loosely bound, active and well co-ordinated group of companies, free and unlimited in their possibilities, able to devote themselves to the advancement of their respective businesses and animated by a desire to be of service to the community. We still have considerable resources in the form of funds at short call and quoted investments. As stated on previous occasions, it is our policy to dispose of these investments as and when we think fit, and to use the proceeds for the development of our existing interests or by further direct participation in industry.

This then is the path which the new Tillings is following. It will take us some time to emerge from the re-development period which commenced three years ago. We are proceeding carefully, thoughtfully, but vigorously, and we shall try to carry on in this way.

Once again please let me conclude by assuring the directors, executives and all employees, men and women, of our subsidiary and associated companies of our deep appreciation of their work during the past year.

"SOFINA"

The annual shareholders' meeting of the Société Financière de Transports et d'Entreprises Industrielles (SOFINA) was held on April 24th in Brussels, Mr. Charles K. Wilmers (General Manager) presided in the absence of Vicomte Van de Vyvere (the chairman of the board).

In their introductory remarks to the report, the directors make, *inter alia*, the following statements:

The danger of a third world war appears to be less threatening, and cohesion is strengthening between the policies of the Atlantic Union nations. Some consideration should, however, be given to the situation which will arise when rearmament is judged to be sufficient, especially in the event of the United States deciding simultaneously to lighten the burden which aid to other countries imposes upon taxpayers at home. The problem will then be to maintain full activity of the means of production which have been so greatly expanded under the impetus of those two influences. The essay attached this year to our annual report surveys a field which affords immense opportunity for employment: the promotion of decent housing conditions, with which wide sections of the population are still inadequately provided even in the most advanced countries.

Wherever the demand for consumers goods has increased more rapidly than the supply, the retail price index has continued to rise, and in countries where this rise has been reflected in wages and profits, imports have increased and exports have fallen. The governments of some of these countries have imposed new restrictions on imports with a view to improving the balance of payments in their external trade, although, as a recent study by the E.C.C.'s Research Division points out, "these restrictions themselves will have inflationary repercussions." Again, despite the risk of causing unemployment at home, other governments have sought to direct exports exclusively to destinations from which payments will be received in some desired currency. . . .

In normal circumstances, balances of international payments were adjusted by means of transfers of money to debtor countries and of investments in them, effected by private capital. But foreign capital is deterred from contributing to such adjustments because its deposits and investments run the danger of being "frozen" for the very reason that the recipient country's balance of payments shows a deficit. Until this vicious circle is broken international exchanges will remain blocked. . . .

Our company has increased during 1951 its participations in countries where proper treatment of private enterprise obtains, and where the remuneration derived from its services and investments remains at its disposal, notably in the United States and the Belgian Congo.

In the wider general interest, no less than by reason of its duty towards the companies concerned and of its holdings in those undertakings, our company is endeavouring to obtain redress of the wrongs inflicted on the Barcelona Traction, Light and Power Company in Spain.

Addressing the meeting, Mr Dannie N. Heineman, chairman of the standing committee, drew attention to devious methods by which a government is apt to practice "expropriation without due process of law."

Liquid and realisable assets stand at B.Frs. 2,978,847,668 as against B.Frs. 2,903,820,590 at the end of the preceding year. A footnote to the balance sheet mentions that the former amount comprises investments and claims in Argentina, where present economic conditions are difficult, for a total of B.Frs. 721,900,422. The book value of "Holdings" increased to B.Frs. 1,944,606,000 or B.Frs. 87,640,000 more than last year; "Liquid Assets" (Government bonds and bank acceptances in US dollars, cash on hand and on deposit) are valued at B.Frs. 460,960,360 or B.Frs. 46,153,569 less than in the preceding balance sheet, while advances to associated companies and other debtors have risen by B.Frs. 33,540,647.

Income from all sources amounted to B.Frs. 239,591,899 as against B.Frs. 217,917,531. Profits derived from sales of securities (B.Frs. 69,075,301 as against B.Frs. 41,165,161) have been applied mainly to writing down "Holdings," the balance—B.Frs. 19,000,017—being carried to "Reserve Fund and Sundry Provisions." Earnings which could not be cashed in Belgian francs—B. Fr.s 43,650,728 as against B. Frs. 55,896,235—have also, as last year, been applied to writing down "Holdings."

A dividend of B.Frs. 70 net per share has been declared, the same as for 1950.

CRUSADER INSURANCE COMPANY

At the annual general meeting of the Crusader Insurance Company Limited, held on April 18, 1952, at Crusader House, Pall Mall, London, the chairman, Colonel Sir Gilbertson Smith, TD, DL, CA, in outlining the progress made by this office since 1945, pointed out that whereas in that year the company maintained a total of nine district offices, the number had grown to 22; all departments had been able to report outstanding achievements in 1951 when new life assurances totalled £2,443,752—a record year; a feature of this result had been the growth in the number of group pensions and life assurance plans underwritten by the Crusader. A group service department had been formed to assist employers in the installation of virtually any type of staff welfare plan.

The fire branch premium income rose from £32,655 (after deducting reinsurances) in 1950 to £46,175 in 1951. The company was participating in a number of overseas treaties.

The sickness and accident weekly premium income had again substantially increased to £347,673, while the ordinary branch figure was also greater at £56,204. In the miscellaneous branches the premium income had been raised to £23,144.

A dividend of 7½ per cent was recommended, with £13,737 to be carried forward to profit and loss account.

The chairman concluded by paying tribute to all who had contributed to the company's excellent results, including connections such as other companies, brokers, solicitors, valuers and agents, and making special mention of the staff, to whose willingness to give a standard of service out of the ordinary the company owed its present strong position.

The report was adopted.

THE DECCA RECORD COMPANY

SUBSTANTIAL VOLUME OF EXPORTS

EPL—"THE WHEEL OF FORTUNE"

SIR CYRIL F. ENTWISTLE'S VIEWS

The twenty-second annual general meeting of The Decca Record Company, Limited, was held on April 18th in London.

Sir Cyril F. Entwistle, QC, MC (the chairman), who presided, said:—

I gave last year an extensive account of your companies up to what was virtually the end of the year covered by the present accounts now under review.

You will, no doubt, be more interested now in a report of the trading experience for the financial year which finished some three weeks ago, covering a period in which your business has shown a greater expansion than at any previous time.

Dealing with the record side first, the main features have been the increase in the sales of long-playing microgroove records, which has been largely responsible for a big growth in record exports, which for the first time have passed the million pound mark. Similarly, in the home market long-playing records have become an increasing percentage of our total turnover, and there is every indication of continued expansion. Combined home and export turnover shows an increase of approximately a third over that of the previous year.

Teldec in Germany has completed its first year's trading, with a small net profit. The sale of Decca and Telefunken records is becoming a factor of increasing importance on the German market and prospects are favourable.

A new Italian company has been formed, Decca Italiana S.p.a., a controlling interest being held by Decca Holding, Limited, Liechtenstein. This company commenced its operations on January 1, 1952. A large number of records has already been shipped from our English factory.

A major improvement has taken place in the operations of the London Gramophone Corporation, New York. We have every reason to anticipate that the results for the year to March 31, 1952, will show a satisfactory profit as against a loss for the previous year. The company is in a healthy condition, and as one of the three major companies in the classical record field in the USA it has assumed a prominent position of considerable importance in that market.

THE NAVIGATOR

Decca Navigator hirings continued to expand, new commercial hire contracts secured for the year ended March 31, 1952, being double those of the previous year. This was due largely to the extension of the coverage through the erection of the North British Chain of Transmitters which was opened in June, 1951.

In December last the contract for the erection of the French chain of transmitters was signed by the French Government. The chain is being constructed by our licensees, the Societe Francaise Radio-Electrique and should be in operation by the end of the year.

The German chain, built by the Telefunken Company and the first to be erected primarily for aerial navigation purposes, was officially opened in Dusseldorf in January last by Dr Seebohm, the Federal Minister of Transport, Sir Norman Guttery representing the British Minister of Transport at the function.

British European Airways announced last month that, subject to a satisfactory contract arrangement, they would equip their entire fleet with the Decca Navigator, following the corporation's technical and operational analyses of the various means of meeting their requirements for a precise navigational aid in Europe. The importance of this decision by the biggest air operator in Europe needs no emphasis.

The south-west chain of transmitters is now being erected and should be in operation by June of this year. Altogether contracts for hire and sale total over 1,650 installations, excluding the large number of fittings which will result from the BEA decision.

MARINE RADAR

Decca marine radar has continued to forge ahead, with deliveries for the year to March 31, 1952, amounting to 800 installations, just double those of the previous year. Over 470 shipowners and authorities at home and abroad have either fitted, or contracted to fit, Decca radar to a total of nearly 2,000 vessels of all types and sizes. Already adopted by the Royal Navy, Decca radar has also been selected by no less than 12 British Commonwealth and foreign navies, including those of Australia, New Zealand, Sweden and Denmark.

The largest tank ship yet built in the United Kingdom, the *World Unity*, completed trials last week, and is one of the 12 new large tankers building in this country for the North American Shipping and Trading Company, all of which are being fitted with Decca radar. Two of them are of 44,000 tons, the largest to be laid down in the world. In all, over 2 million tons of tankers are fitted, or are to be fitted, with Decca radar.

Many important customers for radar include the British Electricity Authority, British Railways, General Post Office, Mersey Docks and Harbour Board, Northern Lighthouse Board, North Thames Gas Board, Scottish Home Department, South Eastern Gas Board, Trinity House and Meteorological Office ocean weather ships.

We have established world-wide connections for the exploitation of our business overseas and to provide the highest standard of maintenance and service. As at this date we have appointed agents in 30 countries. Export sales of our marine radar, which exceeded half a million pounds for the 12 months to March 31st last, are expected to show a further marked expansion in the year on which we have just embarked.

EXCESS PROFITS LEVY

It is at this stage in our company's progress that we are faced with the Excess Profits Levy, that most pernicious of all forms of company taxation, with its arbitrary incidence.

The directors report gives some details to illustrate how your own company may be penalised for its strenuous and successful efforts to establish new enterprises and to expand its exports, efforts that have entailed the investment of very large sums since the end of the war. During the standard years of 1947, 1948 and 1949 we made no profits on long-playing records, now a major portion of our record production, no profits on the Decca Navigator, and no profits on Decca Marine Radar. During the period of re-equipment priority in effort and sales was given to exports, particularly to the dollar area, but it would now seem that some £1,800,000 of working capital then raised, as well as £1,406,700 written off in two pre-war reconstruction schemes, will be ignored in computing a capital standard.

SUCCESS OF EXPORT DRIVE

The success of the export drive is shown by the following figures:—

		£
Export sales	1939	54,000
	1949	758,000
	1950	1,139,000
	1951	1,896,000

Despite import restrictions in certain markets, exports have been maintained for the first three months of 1952. If we are successful, as we believe we shall be, in holding our own, and indeed improving our overseas trade still further, the Government will extort a heavy fine under EPL, a tax as unfair in its principle, and as arbitrary in its incidence, as any imposed even in Tudor days.

Cardinal Morton has at long last, five hundred years after his death, found his master, and if this Act, which should be scrapped in its entirety, reaches the Statute Book, I am tempted to suggest that with the eclipse of the Cardinal schoolboys for centuries to come will be swotting up on the intricacies of "Butler's Fork."

It has become fashionable for a producer of a radio programme to adopt a signature tune. There is a record coming up fast, in fact our best seller, with the title "Wheel of Fortune," which would make a most suitable one for the Chancellor's EPL programme.

Despite fine phrases about the encouragement and reward of enterprise, inventiveness and energy, I am forced to question whether the Government really believes in private enterprise with the profit motive as its driving force. If it does, it is acting in a very strange way. If it does not, it is only a matter of time before the wells of capital run dry and the wheels of industry slow down.

Come what may, you may rest assured that we shall do everything in our power to increase our profits—the only sanction we know. We experienced many years of heavy and sustained losses, and understand full well how narrow is the margin between a profit and a loss, and that if we were to relax our efforts in any way the great enterprise we have built up so laboriously would be placed in jeopardy. Whatever taxation we have to face, and however inequitable it may be, we shall continue to do our utmost to increase the prosperity of our business.

We already know that profits for the year just completed will show a substantial improvement; as for the future, we have started the new year with contracts signed and in immediate prospect for radar and navigator equipment exceeding £2,500,000, with the factory production for the month of March at the highest level yet achieved. Despite signs of a slackening in world trade and increasing import restrictions which will make direct exports of records more difficult, we have confidence in the future and in our ability to maintain our leadership in the industry.

IONIAN BANK LIMITED

EXPANSION OF BUSINESS

The one hundred and thirteenth annual general meeting of Ionian Bank Limited, was held on April 22nd in London.

Mr A. H. Reid, CBE, the chairman, presided.

The following is an extract from his circulated statement:—

The figures for the year 1951 indicate a noteworthy expansion in the bank's activities. This is due mainly to the expansion of business in our Greek branches. The total balance sheet figures have increased from £14,989,258 to £18,813,514. Loans and advances now stand at £7,140,439 compared with £6,401,789 at the end of 1950, though there has been an insignificant fall in bills receivable, from £947,033 to £937,262. On the liability side, you will observe that there is an increase in current, deposit and other accounts from £10,493,406 to £12,520,798. At the same time, the liquid position of the bank has been strengthened; cash in hand and balances with bankers and foreign correspondents stood at the high figure of £3,408,148. The corresponding figure at the end of 1950 was £1,948,004. Naturally this increase diminishes the earning power of the bank, but your directors felt that this was a year in which a strong cash position should be maintained.

Profits are just a little lower than in 1950, the net profits for the year amounting to £35,580, as against £36,329. It is proposed that a sum of £25,000 should be appropriated to the contingency fund, and that a dividend of 3 per cent should be paid. Our two Greek subsidiary companies have had a good year, though in conformity with a desire conveyed by the Greek authorities to all Greek banks the Popular Bank S.A. has slightly reduced its dividend, which is payable in drachmæ.

IMPROVED CONDITIONS IN GREECE

In Greece, 1951 was on the whole a year of further progress in the restoration of the damage caused by the war and by the years of guerrilla warfare which followed it. This progress, however, would not have been possible without the funds provided under the Marshall Plan.

Our Greek branches continued to benefit from the general improvement in local conditions, but drachma deposits are still inadequate and as in previous years we have reason to be grateful to the Bank of Greece for its financial support and co-operation. In the later months of the year some reductions were made in the amount of financing provided for certain classes of imports, but facilities continued to be granted on the old scale for other approved types of business. Thanks to these facilities, and to the gradual increase in our deposits, we were able to expand our activities and although the continued rise in the cost of living caused a further substantial increase in expenses our drachma profits were higher than in 1950. As in previous years, however, Greek exchange restrictions allowed us to remit to London only limited amounts which could be shown to be required for the purpose of meeting specific liabilities incurred in this country on behalf of our Greek branches.

The outlook in Egypt has been obscured by the difficulties which have arisen in Anglo-Egyptian relations, and by the artificial prices which have obtained locally for cotton. Until a free market is re-established in this commodity, the uncertainty as to the country's immediate economic prospects will persist. Moreover, it should not be forgotten that cotton growing is now on the increase elsewhere in the Middle East, and that Egypt must expect competition in the future.

Conditions in Cyprus last year showed some improvement over 1950. Foreign trade was again at a higher level than ever before, and the total of exports and imports stood at £34 million, exports increasing from £11 to £14½ million. On the whole, the cereals harvest was poor, but this was offset by higher prices obtained abroad for some of the island's exportable surplus. Cyprus has suffered from inflation, the cost of living has risen notably, and there has been a tendency to seek refuge from these movements in the purchase of real estate. Our own branches have on the whole had a good year and have played their part in the expansion of Cyprus's foreign trade.

The report was adopted.

LEWIS'S INVESTMENT TRUST LIMITED

DIFFICULT TRADING CONDITIONS SUCCESSFULLY SURMOUNTED

CONSTANT EXPANSION FINANCED FROM INTERNAL RESOURCES

MR S. H. LEAKE ON THE SELFRIDGE ACQUISITION

The twenty-third annual ordinary general meeting of Lewis's Investment Trust Limited, was held on April 24th in London. Mr S. H. Leake, OBE (chairman and senior managing director) presiding.

In the course of his speech the chairman said: I wish to refer to the resignation of Lord Woolton on his acceptance of office as a Minister of the Crown. Lord Woolton has been actively concerned with the direction of this group of companies for some 30 years. During that period our trading profit has increased nearly 40 times. All my colleagues on the board have spent almost the whole of their working life in the closest association with him. Hence none know better than they how much the development of the group into one of the largest commercial organisations in the country owes to his inspiration, leadership and business genius.

We report a trading profit which, together with other miscellaneous revenue, totals £3,724,852. Of this total the contribution made by Selfridge (Holdings) Limited, is £891,583.

The net profit for the year, after tax, has now reached £444,509, of which the dividend from Selfridge (Holdings) Limited, accounts for £77,179. We propose to pay the same final dividend of 20 per cent on the ordinary stock as increased during the year, making 25 per cent in all, and to increase our carry forward to £146,069 as against the balance brought in of £139,795.

It has been a source of great satisfaction that in spite of the difficult trading conditions of the past year, we have still ploughed back into the business £812,998 or no less than 58.47 per cent. of our net profits. In the case of nearly all our companies, it has been possible to set aside the customary amounts to reserve as well as to increase our carry forward to next year's accounts without interfering with the rate of dividend our shareholders have come to expect. In other words and in spite of the constant expansion which is taking place in the scope of our activities, we have been able to handle from our own internal resources and without undue financial strain, a business deal of the first magnitude.

THE SELFRIDGE ACQUISITION

In this connection you will no doubt wish me to say a few words about the Selfridge acquisition. The actual take-over of effective control in September was completed with the utmost harmony, and it is a source of genuine satisfaction to us that the two organisations are now working smoothly together. As we have been in control for little more than six months, the work of integration is, of course, far from complete; but whatever financial benefits may ultimately accrue from this latest investment, we are satisfied that the impact on the parent organisation has already been of value. We have also no doubt that in due course the trading methods which have brought us success in the provinces will contribute to a further substantial development of Selfridges. Thus we look for development both in London and the Provinces, and this must be of increasing advantage to the parent company.

EXPORT TRADE

The group as a whole is now substantially interested in the export trade. Selfridge's store alone accounted for £584,918 of direct export sales and a further £706,126 of this valuable export trade, mostly to hard currency countries, was handled by subsidiary companies of Lewis's and Selfridges.

REBUILDING OF LIVERPOOL STORE

With regard to our main subsidiary, I may mention that the rebuilding of our mother store in Liverpool, which was largely destroyed by enemy action in 1941, is proceeding satisfactorily. In view of the publicity given to that rebuilding, I desire emphatically to deny that we sought or have been given any preferential treatment in the allocation of steel or any other raw material, or in skilled or unskilled labour in the restoration of our store. On the contrary, we have voluntarily demolished and used the steel framework of a contemplated prewar extension to our Manchester store.

In another of our Liverpool subsidiaries—S. Reece and Sons—we have almost completed the erection of a new dairy plant which will enable us to cope with an expanding milk distribution service on Merseyside with greater efficiency.

Amongst the subsidiary companies, your company is interested through its main subsidiary—Lewis's Limited—in Lewis's Bank. The confidence shown by our customers in the services afforded by this Bank is such that there is a continued increase in the number of accounts, and today the total number approaches 100,000. Another feature of the bank is its appeal to children for whom we have a special counter at each branch so that children can bank for themselves. This innovation has been widely appreciated, and we have opened nearly 3,000 children's accounts. We opened, during the year, a new head office in Liverpool, to replace that which was destroyed by enemy action in 1941, and are finding it necessary to extend our branches in both Manchester and Birmingham. We also have branches of this bank in the Glasgow, Leeds, Hanley and Leicester Stores.

TRADING CONDITIONS

After referring to the economic conditions with which they had had to contend during the past year, Mr Leake continued: The trend towards consumer resistance is persisting. It is accentuated by falls in raw material prices, which have already resulted in certain reductions in retail prices, and by an increase in supplies for the home market, as a consequence of which the public is reverting to its prewar shopping habits. We welcome this as a healthy and wholly desirable development. If a time of economic crisis lies ahead, as the position of the textile industries already suggests, I have no doubt that the period of transition until economic health is restored must prove difficult for the retail trade, and will call for the highest qualities of leadership and determination.

In this connection we could not fail to give the warmest possible welcome to the removal of price control and of most of the other restrictions with which we have been hampered for so long. We are keenly looking forward to the opportunity which we hope current conditions will soon provide of exercising our merchandising skill to the advantage of the spending public.

DEPARTURE OF AN OUTMODED SCHEME

It is for this reason that we shed very few tears about the departure of the Utility Scheme. In our view, this scheme had long outlived its usefulness. No large-scale organisation needs to be supplied with a series of specifications for providing merchandise of good quality for its customers. Its whole reputation depends upon and, in the last resort, its success has generally been due to, the very fact that its customers can rely upon getting good value for money at its counters. And, indeed as early as the 1920s, when prices were fluctuating, we had established a range of merchandise which we named "Standex" in order to provide our public with a reliable standard of value. We also maintained a similar range of children's clothing called "Wilwer." These "Standex" and "Wilwer" ranges had perforce to be abandoned during the war but now that freedom has been restored to us we have already set to work to reintroduce these lines on what we hope will be the same high standard of value. We have guaranteed satisfaction or money back to our customers since 1856, and shall continue to do so.

PURCHASE TAX

I regret that the recent opportunity for reviewing Purchase Tax was largely restricted to a consideration of its effects upon the export and import trades, and that the Treasury insisted upon any changes in its incidence producing the same total revenue. Whatever justification there may originally have been for this tax when supplies were limited and it was desired to discourage consumption, this now no longer exists. By applying Purchase Tax to a greatly increased range of articles, the Government has extended the use of what is now proving to be an inflationary tax and is to this extent on a falling market preventing a healthy fall in retail prices with all its implications on the cost of living. In particular I would urge that the home dressmaker who makes up clothes for herself and her children from textiles which she buys in a shop should not be expected to pay twice as much Purchase Tax as that charged upon ready-made garments.

I conclude by assuring shareholders that in each of our nine stores we have managers, buyers and staff who are skilled and experienced in retailing, and that whatever problems face us in the future, your business is in good hands.

The report and accounts were adopted.

GENERAL REFRACTORIES

NEW HOME AND EXPORT SALES RECORDS

The fifty-second annual general meeting of General Refractories Limited was held on April 22nd at the Royal Victoria Hotel, Sheffield.

The following are extracts from the statement by the chairman (Sir Ronald W. Matthews, DL, JP) which has been circulated with the accounts for the year 1951:

The demand for all kinds of refractory products continues at a very high level and during the past year our manufacturing resources have been fully employed. Once again fresh records have been established for turnover, the increases over 1950 being 16.1 per cent for home sales and 19.3 per cent for export sales. The increase in export business is particularly gratifying in view of the large increase we recorded the previous year of 40 per cent over 1949 and is a measure of the success your company has achieved in extending its hold in foreign markets.

ANOTHER MILESTONE IN THE COMPANY'S HISTORY

The group trading surplus was substantially higher at £529,731, an increase of £43,978 over the previous year. This is the first time the group surplus has exceeded £500,000 and marks another milestone in the history of the company. All subsidiaries contributed their share to this outstanding achievement.

The inflationary spiral continued its upward course during 1951 and has had its repercussions on the operations of your company. Whilst it is true that by far the greater proportion of the raw materials required by the group is obtained from our own mines and quarries, nevertheless your company requires to purchase considerable tonnages of imported raw materials for the manufacture of basic bricks and other high-grade products. Besides steadily advancing in price, many of these materials are tending to be in short supply owing to an exceptional world demand and stockpiling for rearmament. There is, inevitably, always a time lag between increases in costs and the necessary adjustment in selling prices, which reacts unfavourably on results.

The group surplus for the year, after providing for interest, depreciation and taxation, amounts to £159,852. The proposed dividend of 11 per cent on the new capital as increased by the bonus issue in September last is equal to 17.6 per cent on the old capital. I feel that it should also be pointed out that the proposed dividend represents only 6.4 per cent on the capifal employed in your business.

THE OUTLOOK

I do not feel we can see any further into the immediate future than we could at this time last year. 1951 has been full of alarums and excursions and to whatever quarter of the world we turn we see no lessening of the pressure of Soviet Imperialism. But we can say with truth that there is in many parts of what has come to be known as the Western World a much greater awareness of the immediacy of our peril and a real determination to get to grips with our problems. But there are still far too many people here and in neighbouring states who, bemused by the subtlety of Communist propaganda, are not putting in all they know and so are deferring the hour of absolute security. Your company at all events and all those employed in it can look back with real satisfaction on the achievements of 1951.

The report was adopted.

W. & A. GILBEY LIMITED

MR A. RONALD GILBEY'S REVIEW

The annual general meeting of W. and A. Gilbey Limited was held on Monday, April 21st, at Gilbey House, Oval Road, N.W.1, Mr A. Ronald Gilbey presiding.

The following are extracts from the chairman's circulated statement:—

The trading profits show a satisfactory increase. Most of the credit for this must be ascribed to our increasing export trade and to the activities of our overseas branches. Unfortunately the latter now have to bear taxation at levels almost comparable with our own, with the result that the net surplus for the year is slightly less than that of 1950.

We are recommending the payment of a final dividend of 3.6d. per share, together with a bonus of .6d. per share, making the equivalent of 6.6d. for the year, which compares with the equivalent of 6d. per share paid for 1950.

HOME AND EXPORT TRADE

The wine markets of the world have not been over favourable to us during the past year, inasmuch as prices in all wine producing countries have shown a considerable hardening and are tending to increase further.

Costs of production on this side are also rising; and the increases in rail charges and the price of petrol, added to the continued excessive rates of duty on our products, are all factors which tend to place yet a further burden upon the already highly taxed British citizen.

However, our sales of port have shown a substantial increase, and the demand for Gilbey's ports continued throughout the the year. Our slogan, "The People Who Made Port Famous," has been amply justified.

Our three distilleries in Scotland worked to full capacity during last season, and we filled largely at other distilleries to make good the shortage of production during the years in which distillation of Scotch whisky was restricted.

Turning to the export side of our business, I think we have justification for considerable optimism. The sales during the past three years have shown a really marked upward trend, and the figure for 1951 is the largest since the year 1928, being well over the average for the years 1935 to 1938.

I think I am correct in saying that for the first time in the history of the business, the export department earned over a million pounds worth of foreign currency for Great Britain. Two-thirds of this foreign currency was earned in the dollar area, and must therefore have been of great value to the nation as a whole.

It appears that as we had a satisfactory profit standard in the years 1947/49 the proposed Excess Profits Levy should not have any serious effect on us.

THE FUTURE

I think, though, I would be rash indeed if I attempted to forecast the trading prospects for 1952.

World economic conditions are so precarious, particularly in the sterling area, that a business like Gilbey's, which depends a great deal on imports and exports, will undoubtedly have its trials and tribulations.

I do feel that with all our overseas branches, coupled with the fact that we own practically all our sources of production, we should be in a good position to weather any economic storms that may arise.

The report and accounts were adopted.

BONDOR LIMITED

SATISFACTORY RESULTS

MR JOHN GOODENDAY'S STATEMENT

The Twenty-fourth Annual Ordinary General Meeting of Bondor Limited is to be held on April 28th at 10a, Hanover Square, London, W.1.

The following is the statement by the chairman, Mr John Goodenday, circulated with the Report and Accounts.

I am able to report that the turnover, both in domestic and export sales for the past year again constitutes a record in the Company's history.

As the accounts are set out in considerable detail, I will only make brief comments thereon. In the Consolidated Profit and Loss Account profit from trading operations amounts to £1,324,936 and the net profit available for distribution, after providing for depreciation, debenture interest, taxation and all other expenses, amounts to £419,840.

DIVIDENDS

A Final Dividend of 13 per cent, less tax, is proposed, which will require £40,950 and which, together with the Interim Dividend of 7 per cent paid last September, will make a total distribution for the year of 20 per cent, less tax, absorbing £63,000.

With regard to the balance of the available profits, the Directors recommend that £250,000 be transferred to General Reserve. With this transfer the General Reserve will stand at £700,000, which sum is £100,000 in excess of the present issued capital. It is also recommended that a further £100,000 should be added to the Contingencies Reserve, increasing that Reserve to £200,000. If these recommendations are accepted, there will be an increase in the Carry Forward of £6,840, making a total of £113,950.

It is further proposed that £50,000 of the Share Premium Account should be capitalised and that this amount should be distributed to Stockholders in fully paid Ordinary Shares of 5s. in the proportion of one new Ordinary Share of 5s. for each twelve 5s. units of Ordinary Stock held by them on April 3, 1952. The new Ordinary Shares will be converted into Ordinary Stock and will rank pari passu with the present outstanding Ordinary Stock. Fractions will be sold and Ordinary Stockholders will receive the appropriate amount in cash. The Resolution to cover the issue of these new Shares will be submitted at an Extraordinary General Meeting to follow the Annual Meeting.

The effect of this proposed capitalisation will only become apparent in the Balance Sheet as at December 31, 1952, which will then show the Issued Ordinary Capital increased from £600,000 to £650,000 and the Share Premium Account reduced from £56,772 to £6,772.

BALANCE SHEET ITEMS

As far as the Consolidated Balance Sheet is concerned, it will be noted that the stock in trade at the close of the year amounted to £1,643,314, an increase of £692,291 compared with the previous year, and that debtors and payments in advance have increased from £698,946 to £985,630 during the year under review. Whilst the increase in debtors is in line with the increase in turnover, the increase in stock in trade is partly due to the more competitive conditions prevailing but in the main to increased stocks of cloth to which reference will be made later in my statement.

Our investment in our Associated Company, Workington Rayon Mills Limited, has increased during the year as a result of an advance to that company of £17,000. Workington Rayon Mills Limited, incurred a loss during its first financial year which ended on June 30, 1951, against which we have provided in these Accounts our share amounting to £13,000.

Before leaving the Balance Sheet, reference must be made to the Taxation Equalisation Account, which after crediting a further £45,000, this year represents the approximate benefit up to December 31, 1951, resulting from the excess of capital allowances granted on plant and machinery acquired over the actual depreciation charged in the Accounts. As you are aware, the 1951 Finance Act provided for the termination of this concession as and from April 1, 1952. There have, however, been some further deliveries of machinery in the first quarter of this year and the benefit of the initial allowances in respect of these deliveries will be reflected in the current year's Accounts.

RESISTANCE TO HIGH RETAIL PRICES

The reaction of the public to high retail prices is increasingly noticeable. Consumers are reverting to prewar buying habits and are becoming increasingly discriminating in the matter of values. In consequence the trade is faced with stronger competition, both in home and overseas markets. Despite the change to a buyers' market, there have not been any noticeable reductions in the price of raw materials during last year. In fact, during 1951 the cost of cotton yarn increased by 22 per cent, packing materials by 80 per cent, and the wages of employees in the Hosiery Division have, under the sliding scale which operates in that industry, increased by a further 15 per cent.

Despite these large advances in costs we have refrained from making increases in the selling prices of our products, and we have in fact effected a number of reductions. This has been made possible by the development of new processes, the benefit of new machinery and the increase in production in every section of our business.

We welcome the introduction of the Douglas Committee recommendations in the Budget which have permitted us to reduce prices in our entire hosiery range. They have also enabled us to give better comparative values in garments as a result of the elimination of the tax anomalies inherent in the old Utility Scheme.

INCREASED MANUFACTURING SPACE

Last July we purchased a small freehold factory at Southwick to supplement the brassiere production of the adjacent factory at Portslade. This unit is now operating at full capacity. This acquisition, together with new buildings constructed at Baldock and Biggleswade, have during the past year provided an additional 31,500 square feet of manufacturing space. The Company's manufacturing operations now occupy 450,000 square feet. In this inflationary period the cost of building and replacement of machinery is continually in the minds of your Directors. New hosiery machines—although more efficient—cost five times as much as in 1939. In all, since the end of the war, we have purchased or entered into contracts to purchase new machinery at a cost of almost £1 million.

The difficult supply position to which I referred last year no longer exists and there is now no shortage of yarns and fabric other than nylon yarn, the allocation of which is related to export performance. During the period of shortage a year ago, we contracted for a substantial yardage of cloth for our expanding Underwear Division. Our purchases have proved to be in excess of actual requirements, and this factor is responsible for a considerable proportion of the increase in stock in trade. If we can maintain sales, it is hoped that these stocks will be reduced to normal proportions by the end of 1952.

THE FUTURE

In view of general market conditions, I have to be restrained in anticipating the future. So far this year our turnover has been maintained, and there is every reason to believe that our brand Kayser Bondor continues to gain prestige in the opinion of the trade and public. To maintain flow of production in the Hosiery and Underwear Divisions from factories through to warehouse, retailer and consumer is, of course, our aim; but to achieve this objective during the period of a buyers' market will involve a reduction in profit margins.

In July last Mr Percy Lawrence McConnell was appointed a Director of the company. Mr McConnell joined us in October, 1945, as Manager of the Purchasing Department. In January, 1951, he was placed in control of underwear manufacture and his position in the company is now that of director of Underwear Production. You will be asked to confirm this appointment. Mr David Goodenday, who previously held this position, is now General Manager of Kayser-Bondor Limited.

TRIBUTE TO STAFF

The Board feels a deep sense of appreciation and gives its warm thanks to the staff and employees for the loyalty and zeal with which they have performed their duties and responded to all calls made upon them. It is to their ungrudging support that we must attribute the satisfactory results of the year's activities.

RIO DE JANEIRO FLOUR MILLS AND GRANARIES

IMPROVED CASH POSITION

The sixty-sixth annual general meeting of the Rio de Janeiro Flour Mills and Granaries Limited was held on April 17 in London, Mr E. McT. Sheppard (the chairman) presiding.

In his statement the chairman said that the same rate of exchange was again applicable for the conversion of Brazilian currency assets and liabilities. He drew attention to the much improved cash position in London, due to the substantial remittances made during the year under review and added that a further good remittance had been received shortly before the end of the last calendar year.

The satisfactory profits estimated and the remittances received enabled the board to pay interim dividends of 4 per cent in June, 1951, and 6 per cent and a bonus dividend of 4 per cent in January, 1952, all less income tax, making a total distribution of 14 per cent, less tax, for the year.

Reporting on his recent extensive tour of the Group's properties, the chairman said that everywhere he found the factories in good trim, and he was very well impressed with all he saw in Brazil. Transport was one of the greatest problems with which the Brazilian authorities were faced, but great strides continued to be made in this direction by the opening up of more and more roads in the interior, and he understood that in the not too distant future railway rolling stock, and in particular locomotives and waggons, would be renewed and augmented.

The report was adopted.

KRIAN RUBBER PLANTATIONS

RECORD PROFIT

MR T. B. BARLOW ON E. P. LEVY

The forty-third annual general meeting of The Krian Rubber Plantations Company, Limited, was held on April 22nd at Plantation House, Mincing Lane, London.

Mr T. B. Barlow, the chairman, in the course of his remarks, said: The accounts for 1951 show the record profit of £29,721 and in addition there is a capital profit of £40,000 arising from the liquidation and reconstruction of Chamek Rubber Estate, Limited. An interim dividend of 12½ per cent has been declared, and it is not proposed to recommend a final distribution. Taxation is estimated to require £18,000 and the carry forward will be increased to £14,479.

CAPITAL CASH DISTRIBUTION

Last year the Chamek board decided to liquidate and reconstruct so that we now own 10,000 shares in Chamek Plantations, Limited, which stand in our balance sheet at £10,644, and in addition we have received to date £40,000 from the liquidator. Under the circumstances the board decided to pay a capital cash distribution of 2s. per share, which will not attract income tax from recipients, but the company will have to pay a tax of nearly 3d. on every 2s. so distributed. This is the explanation of the heavy taxation appropriation.

The excess profits levy recently announced will be particularly unfair to rubber estates raising their rate of taxation from 63 per cent to a possible 83 per cent, but—and this does not happen in other industries—rubber has already been heavily taxed by a special export levy in the country of origin. In view of the losses during the war and the expenses of rehabilitation which covered the standard years there is every justification for exempting rubber estates from the excess profits levy.

POSITION IN MALAYA

The position in Malaya has drifted during the past twelve months, but with the appointment of General Sir Gerald Templer as High Commissioner our hopes are raised that at last it is realised that our duty to the Sultans and the people is to provide Government today rather than self-government tomorrow. There are signs that the general public are beginning to have confidence in us again. Once this is re-established our difficulties will be easily solved. Recently a distinguished visitor to Malaya was told: "The people are 99 per cent on the side of Government; if they were not, you would have been finished long ago. But until they are sure that Government is going to govern they will sit on the fence."

The company's outlook for this year is governed entirely by political considerations, first in Malaya and then in America. Shareholders must form their own opinion on this matter, but in the meantime they can rest assured that the company's finances are strong and it will continue to uphold its good record.

A debt of gratitude is due to the staff on the estate and the eastern agents for their loyal work during difficult times.

The report and accounts were adopted.

EVANS MEDICAL SUPPLIES

INDUSTRY'S EXPORT CONTRIBUTION

The following is an extract from the circulated statement of Mr I. V. L. Fergusson (chairman and managing director of Evans Medical Supplies Ltd.):—

The division of the parent company profits disbursed or to be disbursed is: UK income-tax and profits tax £194,958, preference dividend (net) £7,617, ordinary dividends and bonus (net) £28,283.

Although we have increased reserves and carry-forward by £91,054 and charged for depreciation of buildings and plant £71,074, a total of £162,128, the removal from the business of £194,958 in taxation will make further inroads into our working capital and render ever more difficult the replacement of assets at existing inflated prices. These penal levels of taxation deny us the ability to improve our competitive position in overseas markets.

Pharmaceutical Exports.—Total British exports in 1951 increased in value by 19 per cent over the previous year. Exports of "drugs, medicines and medicinal preparations" increased by nearly 50 per cent. Our own increase as stated elsewhere was above the average for the industry as a whole.

The pharmaceutical industry is small but highly complex. The value to the country's economy of its exports at £33 million should not be compared with those of larger industries without paying full regard to the profitability of pharmaceutical exports, measured in terms of their insignificant consumption of imported raw materials and scarce home produced steel, metals, coal, etc.

If regard is paid to these and other relevant factors and to the continuing high trend of increase it is clear that the pharmaceutical industry is making a real national contribution in the export field.

According to the Civil Estimates the gross expenditure for the National Health Service for the year 1951/1952 amounted to £470.5 million. Of this £24.5 million was paid to chemists for ingredient costs, which include dressings and appliances, and for container allowances and £10.9 million was paid by hospitals for drugs and dressings.

After deducting from the total of £35.4 million a reasonable estimate for the proportion attributable to container allowances, surgical dressings and appliances and adding an appropriate amount for drugs dispensed by doctors and dentists, the total received by pharmaceutical manufacturers and wholesalers for drugs and medicines for the National Health Service would appear to be of the order of £28 million.

Based on statistics issued by the Inland Revenue the net profit of the chemical and allied trades, in which group the pharmaceutical industry is included, averaged 5.6 per cent on turnover. On the basis of these figures the total net profit the industry has earned from the National Health Service—or from perhaps 90 per cent. of its home market—is approximately £1.5 million.

If the industry had supplied all the drugs and medicines required by the National Health Service without profit and with no return on the capital invested in the industry the cost to the Health Service might have been reduced from £470.5 million to £469 million.

I deem it expedient to stress these facts and conclusions in view of the suggestions which have been made that the high cost of drugs and medicines is an important contributory factor to the high cost of the Health Service.

UPSONS LIMITED

(The Dolcis Shoe Company)

A PROFITABLE YEAR

The annual general meeting of Upsons Limited was held on April 17th in London.

Mr F. J. Stratton (chairman and managing director), in the course of his speech, said: The accounts presented are for the 12 months ended January, 1952. The year has been a profitable one, though not without its special difficulties. Freedom from price control helped us to merchandise much more efficiently during the whole year and, although trade in general showed a declining resilience we were able to increase our financial turnover once more. These two factors taken together placed us in a strong position and enabled us to clean our stock aggressively during the last two months of the year. During the period of the Christmas trade and January sale we exceeded the all-time high records set up the previous year.

POLICY OF EXPANSION

We have continued our policy of steady expansion and opened three Dolcis and three Delores stores. All are making satisfactory progress. In addition we have recently opened new premises at 22, Old Bond Street. This is a development which we have had in mind for some time. It is designed to give us an outlet and at the same time a sounding board for the highest fashion and best quality goods we can provide from our contacts the world over. In so doing it will act as a style and fashion stimulator and infect advantageously our whole business. It is highly necessary for your business to have at its disposal the best possible imaginative and creative work, not only from original work performed in our own design studio but from the world at large. By such means are we able to maintain our place as leaders in shoe fashions. Architecturally the store aims to provide the best which can be done in the idiom of the age in which we live, relying on contemporary design and materials.

In Ottawa and Toronto, Canada, we opened two new stores in August last. In this Dominion we have been well received, and have in course of construction a further store at Toronto which we hope will be opened later this year. I think we have made a promising start in a market which should become more and more valuable as Canada develops her truly wonderful potentialities.

THE "D" SCHEME

You will expect me to make some reference to the trading possibilities for the present year. I fear that the proposals of the Douglas Committee will result in increased difficulty and unemployment in the footwear industry. The new scheme brings within the field of tax a large proportion of our shoes and a good deal of our hosiery and underwear. This has had a very serious effect on the industry as a whole. The tax discriminates against medium and better priced goods, depresses quality, restricts design and damages efforts in the export field. It disrupts and confuses the whole normal pattern of the industry just when vigorous competition between firms has returned. Distributors' and manufacturers' organisations are doing their very best to convince the Government that a tax on quality and craftsmanship must be thoroughly unsound.

The report and accounts were adopted, and the payment of a final dividend of 12½ per cent, less tax, on the ordinary stock of the company, making 20 per cent, less tax, for the year, was approved.

BLOCK & ANDERSON, LIMITED

(Manufacturers and Distributors of Office Machines and Equipment)

RECORD RESULTS

INCREASED EXPORT ACTIVITIES

MR W. E. BLOCK'S STATEMENT

The twenty-first annual general meeting of Block and Anderson, Limited, was held on April 21st at the registered office of the company, 58-60, Kensington Church Street, London, W., Mr A. E. Block (assistant managing director) presiding in the absence of Mr W. E. Block, the chairman and managing director, who was abroad on the company's business.

The secretary read the notice convening the meeting and Captain R. M. Peat, of Messrs Peat, Marwick, Mitchell and Co., read the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended November 30, 1951, and was taken as read:

It gives me pleasure to report that your company's operations during the financial year, which ended in November last, have produced results which are, in all respects, a record in the history of the company.

INCREASED GROUP PROFIT

The group profit before taxation amounts to £147,312, which shows an increase of £70,635 over the corresponding figure for the previous year.

Your directors have recommended a dividend of 60 per cent and a bonus of 15 per cent, both less income-tax.

Allowing for this distribution and also for an allocation of £15,000 to a reserve for any contingencies which may arise in the future, the balance remaining to be carried forward to the current year amounts to £98,315, as compared with £83,942 brought in.

During the year under review, arrangements were made to bring into being a pension and life assurance scheme for the benefit of all the company's employees and this was started on August 1st last. The scheme was enthusiastically received and should prove beneficial to all concerned.

NEW SHOWROOMS

Towards the end of 1951, work was completed on new showrooms at our head office in Kensington, giving us the opportunity to display a full range of our office machines and equipment in suitably attractive surroundings.

Also, at long last, we have been able to provide badly needed additional space in London for our development division, as well as our stores, packing and despatch departments, by taking over a modern well-lit five-storied building, not far from our West Central Street premises.

The export activities of your company were very successfully developed and increased during the period under review. The import restrictions which have since been introduced by some countries such as France and Australia must, of course, affect this section of our business, but all possible steps are being taken to counteract such temporary difficulties by increasing deliveries to other countries and opening up one or two important new markets.

THE AYCLIFFE FACTORY

Our factory at Aycliffe, I am glad to say, did extremely well by considerably increasing the output of "BandA" spirit duplicating machines during the year while maintaining the high standard of quality for which our machines are known the world over.

In conclusion, I should again like to extend, on your behalf, our best thanks to the managers and staff at head office, in our service department, in all our branches at home and abroad and at our factory, for their continued valuable and loyal co-operation.

It may be of interest to you to know that in March, 1952, it was exactly thirty years since I laid the foundations of our business in London.

The report and accounts were unanimously adopted and the dividend and bonus, as recommended, were approved.

The retiring director, Mr W. H. Bennett, was re-elected and the proceedings then terminated.

GEORGE BRETTLE AND COMPANY, LIMITED

A YEAR OF EXCEPTIONAL DIFFICULTY

DIVIDEND AND BONUS MAINTAINED

SIR HARRY TWYFORD'S STATEMENT

The thirty-eighth annual ordinary general meeting of George Brettle and Company Limited, was held on April 21st, at the offices of Messrs Josolyne Miles and Company, 28 King Street, London, E.C., Sir Harry E. A. Twyford, KBE (chairman and joint managing director) presiding.

The secretary (Mr H. O. Randall) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended January 19, 1952, and was taken as read:—

It will be generally acknowledged that the past year has been one of exceptional difficulty. From January to July trading opened propitiously, and our sales had increased by 39 per cent. But the sudden fall in the price of raw wool, and indiscreet advice from certain sections of the press and some politicians caused the public to expect a general fall in prices of manufactured textile articles, and changed a sellers' market into a buyers' market.

No account of increased taxation and higher costs, which are in the main responsible for high prices, was made, and the inevitable result was an almost complete cessation of trade, reducing this increase to 11 per cent in comparison with 1950.

During this period stocks mounted up, and it will have been seen from the accounts in your possession that these were particularly high in raw materials, work in progress and finished stock.

THE YEAR'S TRADING PROFIT

In spite of this setback, from the figures now before you it will be seen that the net trading profit for the past year, after charging all expenses other than taxation and dividends, amounts to £128,520, which is £14,830 less than in the previous year.

Plant and machinery have again been increased during the year by £63,852. This is due to the installation of more modern machinery, including the latest 51-gauge and 60-gauge fully-fashioned hosiery machines.

The policy of the directors in this respect is still not complete, as it will be seen from the note on the balance sheet that there is an estimated balance of uncompleted contracts for capital expenditure of £75,000.

Current assets now exceed the current liabilities by £276,000, as compared with £270,000 last year, without taking into account the investments amounting to £100,000.

APPROPRIATIONS

We recommend the same dividend and bonus as last year; but this calls for an extra allocation of £2,325 due to the increased capital.

Taxation calls for the provision of £68,000, as against £71,000 last year. The directors have also decided to place £20,000 to general reserve and £20,000 to stock reserve, which I am sure the shareholders will agree, in these days of fluctuating prices, is a wise policy to adopt.

After dealing with the dividends, taxes and reserves, to which I have previously referred, we are able to carry forward a balance of £66,334, against £65,620 brought in.

Early in the new year the company decided to apply to the Stock Exchange for permission for transactions of the company's ordinary shares to take place "unnumbered," and transfers have accordingly been dealt with in this manner since Feburary 1st last.

The company has a scheme for the paying of bonuses to employees on fixed incomes, and in 1951 such bonuses were paid representing an additional ten weeks' pay.

A SOUND POSITION

In view of the disturbed condition of affairs in general at the present time, it is futile to try to make any forecast for the present year; but it will, I am sure, be quite obvious from the figures already presented to you that the position of our company is a sound one. I have the greatest confidence in the management and in the efficiency of our staff, and I would like to emphasise very strongly that my appreciation of their efforts and their loyalty is very sincere.

For the information of the shareholders I again give details as to how each £1 of the company's income is expended:—

Per cent		s.	d.
78.16	Raw materials and Manufactured Goods	15	7¼
13.45	Wages, Salaries, Pensions and Welfare	2	8¼
2.26	Taxation		5¼
4.14	New Machinery, Equipment and all other Services		9¼
0.66	Dividends to Shareholders		1¼
1.33	Reserves retained in the business		3¼
100.00		20	0

THANKS TO EMPLOYEES

In conclusion, may I add my thanks to every employee whatever his contribution towards the satisfactory results of 1951 may have been, and express the hope that the hitherto happy relations between us all will continue so that when times become more normal we shall find ourselves ready to meet any competition that may confront us.

The report and accounts were unanimously adopted and a final dividend of 7½ per cent (making 12½ per cent for the year) and a special bonus of 2½ per cent on the ordinary shares were approved.

The retiring director, Mr Walter Bennett, was re-elected and the remuneration of the auditors, Messrs Josolyne Miles and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman.

BALLITO HOSIERY MILLS

COMPREHENSIVE EXPORT TRADE

The twenty-third annual general meeting of Ballito Hosiery Mills Limited, was held at St. Albans, on April 23rd.

Sir Cyril F. Entwistle, QC, MC, LLB (chairman of the company) in the course of his speech said: We have had another highly successful year. The net profit, before taxation, amounts to £183,127, as compared with £166,054—an increase of £17,073. We are recommending payment of dividends at the same rates as in the previous year.

I am very pleased to report that despite a considerable falling off in the general demand from foreign countries over the last quarter of the year, our total export sales for 1951 were substantially the same as for 1950, during which year we were not only supplying for current public demand but also to replenish the depleted stocks which existed at that time.

Our export effort is one of the most comprehensive in the trade; we have 57 foreign agents covering practically every country in the world where it is possible to sell stockings, and our sales director has made personal visits to a considerable number of the markets.

Through increased production we have been able substantially to increase our home sales over the year, and therefore satisfy to a further extent the ever-growing demand for our Ballito brand stockings. We successfully launched on the market, during the latter part of the year, two new Mirrasilk styles, which have proved extremely popular, and repeat orders are reaching us every day.

HALL-MARK OF QUALITY

It is no idle boast to say that Ballito is not only a household name as far as women are concerned in this country, but it is established as a hall-mark for the highest quality. Our production of fully fashioned hose shows an increase of 12½ per cent over last year, and our total turnover an increase of 30.77 per cent.

The installation of new machinery mentioned last year is still proceeding and will, we hope, continue without interruption during the whole of 1952. Our hosiery production is of a specialised nature, the fibres used being mainly nylon, pure silk and rayon, and as a result of this we have not been adversely affected by the abnormal fluctuations in the price of wool.

With regard to the current year, of which three months are completed, there have been some reductions in gross profit margins, but, owing to our continuously increasing productive capacity, our estimated profits are being satisfactorily maintained. We shall, of course, be subject to Excess Profits Levy this year. It is quite impossible to say exactly how we shall be affected by this tax until the Finance Bill is on the Statute Book. The year 1947 was for us one of rehabilitation and the reconditioning of our premises and plant requisitioned during the war. The years 1948 and 1949 were good, and we have since and during the standard years ploughed back a large portion of our profits and we have also raised fresh share capital for new machinery. I can at least safely say that our standard profit will be sufficient to cover our present rates of dividend with an ample margin to spare.

I am happy again to be able to say that the relationship between management and workers is excellent and cordial, and I am sure you will wish me to conclude by expressing our thanks and hearty appreciation to our management, staff and employees for their enthusiastic and successful efforts.

The report was adopted.

PLATERS AND STAMPERS, LIMITED

A RECORD YEAR

The annual general meeting of Platers and Stampers, Limited, was held on April 17th in London, Mr Lloyd W. Sichel, managing director, presiding in the absence in the USA of the chairman, Mr Arthur Keating.

The following is an extract from his circulated statement for 1951:—

I am happy to tell you that 1951 was a record year for your company. The consolidated profits amounted to £819,296, compared with £335,504 in 1950. There remains a net profit after taxation of £347,949, which compares favourably with the previous year's net earnings of £152,879.

The final dividend on the ordinary shares represents, when added to the interim dividend already paid, 25 per cent on the issued ordinary share capital of the company as compared with 20 per cent for 1950. Whereas the profit is 144 per cent greater than for 1950, the corresponding proposed dividend is increased by only 25 per cent.

The demand for our products was such that sales were limited only by the availability of material and of our capacity to produce. The popular trade names, "Prestige," "Skyline," "Overnex," "Kumfi-Kut," etc., have been increased by the addition of yet another. I refer to "Tru-Spot," the name under which we are marketing electric torches. Sales of Prestige pressure cookers and hollow ground cutlery were higher than ever. Export business has continued to expand.

The outlook for the immediate future appears reasonably favourable.

The report was adopted.

JOHN BARKER AND COMPANY, LIMITED

CHANGED TRADING CONDITIONS

The fifty-ninth ordinary general meeting of John Barker and Company, Limited, was held on April 24th in London.

Mr Trevor A. Bowen, DL, JP (chairman and joint managing director), in the course of his speech, said: I have to report a net profit of £624,415 in the Barker Group. Of this amount taxation absorbs £367,591, or 58¾ per cent of the net profit, leaving a balance of £256,824. The drop of £322,334 in the net profit, before taxation, is not altogether surprising, as last year I laid special stress on the menace of rising costs and on the probability that our future trade would be adversely affected.

The Douglas Committee, which had been set up to consider the relationship between the existing utility scheme and purchase tax arrangements, published its report recommending the introduction of the "D" scheme.

Following on the introduction of the "D" scheme, comes the winding up of the old utility scheme, freeing from price control all goods except furniture and some minor items. Henceforth competition must be the safeguard from high prices and debasement of quality, and the hallmark of future business transactions.

Largely as a result of the prudent policy pursued in the past, your company is in a strong position as regards its current assets, and therefore well able to cope with any trouble that may come.

The report was adopted and the total distribution of 20 per cent was approved.

INNS AND COMPANY, LIMITED

SUBSTANTIALLY INCREASED OUTPUT

The seventeenth annual general meeting of Inns and Company, Limited, was held on April 18th, in London, Mr. Walter Wallace (joint managing director) presided, and in the course of his speech, said: The net trading profits amount to £284,628, being an increase of approximately £88,000 over those for the preceding year. Not only are the profits good but I am happy to tell you again that every department shows proportionate profit increases this year.

There have been substantial increases in output and the company's efficient organisation has enabled economies to be made both in production and working.

The heavy burden of taxation on the profits for the year amounts to more than 12s. 9d. in the £ leaving the company with a little under 7s. 3d. for each £1, out of which the directors have to provide remuneration to shareholders, carry amounts to reserve for replacement of assets, and to cover other contingencies.

The effect of the new Excess Profits Levy cannot be accurately worked out until the Finance Bill, 1952, has passed through Parliament. On the information at present available it is calculated that on the assumption that the profits for 1952 will equal those of the previous year, the increase in taxation will amount to about 1s. 9d. in the £, making a total of 14s. 6d. out of every £1 of net profits.

MILLARD TUCKER COMMITTEE

I informed shareholders last year that officials of your company had given evidence before the Millard Tucker Committee on the taxation of trading profits, particularly with reference to companies whose business, like ours, is to extract minerals from land. This evidence and other evidence on the point was reviewed in the report, which contained the following statement on this subject: "It will be sufficient for us to record our view that the business profits of a concern of the kind in question cannot be properly computed without a proper allowance for depletion of minerals."

Your company obtained a special depletion relief concession during the late 1939-45 war period for parts of its trading. Your board is continuing to press for the correction of what cannot be regarded as other than an unfair, illogical and incorrect basis of taxation as applied to the company's sand and gravel pits.

The report was adopted and the total distribution of 17½ per cent, less tax, was approved.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit

THE HISTORY OF ZINC

Hunting — a favourite motive in Ancient Indian Art.

14th Century India knew ZINC

The earliest records of Zinc being obtained by distillation were those made in India about the 14th century.

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last 30 years a great Zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal, include the production of Sulphuric Acid, Zinc Pigments, Fluorine and Fluorine Compounds and ancillary products.

Food Without Thought

IN nothing is there more need for the Government to be bold and inventive than in food policy. The problems that it has inherited do not permit of any quick or easy solution. Britain has been living in a siege economy for food ever since 1940. It is the melancholy truth that an end to this predicament is not yet in sight. The notion that physical shortages might be overcome simply by making a bonfire of controls, an idea nourished by some foolish boasting from Lord Woolton himself, has already evaporated. Indeed the crisis of solvency forced the new government, as one of its first acts, to cut food imports and thus add to its domestic difficulties.

But this situation does not commit the Government to a torpid acceptance of its predecessors' policies. The machinery for getting and distributing food operated during the six years of Labour rule was in all its essentials a continuation of wartime methods. It has produced rigidities in both supply and demand, and inefficiencies of distribution, which are not inevitable consequences of economic stringency. It has completely insulated British agriculture from its domestic market. One Ministry fixes farm prices; another Ministry purchases the whole national supply of food (home and imported), regulates all the channels of distribution, and fixes retail food prices. The fact that the gap between the two price levels is simply charged to the taxpayers' account is hardly calculated to stimulate realism and efficiency in the official controllers.

Labour's shibboleths prevented any attack on this cumbrous machinery of control bolstered by food subsidies. The Conservatives need not operate under such inhibitions. It is possible for them to work towards the restoration of a free market in food, subject to two limitations. Those are, first, that agricultural producers should enjoy some measure of stability in their earnings, as promised by the Agriculture Act, and, secondly, that the poorer consumers should be shielded from any large rise in food prices by devices such as family allowances and welfare schemes. To dismantle the whole apparatus of state control is at present quite impossible. To substitute a looser and more flexible model for the rigid wartime one is both possible and highly desirable—though it calls for hard thinking and ingenuity rather than for party polemics.

The Conservative Government started quite well. The appointment of Lord Woolton as co-ordinator of food and agriculture suggested that a real attempt would be made to think out policy afresh and to bridge the narrower departmental interests and jealousies. The new Minister of Agriculture made speeches in which he emphasised the consumer's interest in keeping down the cost of food production. Best of all, the Chancellor found the courage to take an axe to the food subsidies.

The dawn was false. Last week the Government announced the results of this year's review of farm prices. The announcement itself comes unpardonably late in the year; the new livestock prices

are meant to operate from April 1st. Its presentation was extraordinarily inept and obscure. The Minister withheld all the relevant economic data for later publication in a White Paper; he gave a single, misleading figure of the cost of the new award. The trick of breaking awkward news by instalments rarely profits a government, and this was not one of the exceptions. The announcement was not accompanied by the expected declaration of the Government's long-term agricultural policy. That is also reserved to a later date—apart, again, from one stray figure to the effect that by 1956 net farm output ought to be 60 per cent higher than it was before the war. The Minister did assert, however, that the present award provides "a firm foundation for the long-term policy." It can therefore be regarded as pointing the direction in which the Government will go.

If that is the case, its treatment of agriculture will be the Achilles heel of Conservative policy for food. The party's tenderness towards rural interests is well known and of long standing. But the very strength of the Government's position in its rural bailiwicks, in contrast with its tenuous hold on some urban constituencies, produced hopes that it would not sacrifice the interests of food consumers to those of British food producers. These hopes have been dashed. The effect of the present award, so far as it can be understood, seems to be to give farmers as a class full recoupment for the rise in costs during the last year. Some of the more influential groups, such as the milk producers, have done rather better than this, while others may have done less well. The general intention of the settlement is to repeat, on a smaller scale, the special stimulus to agricultural production that was last given in 1947.

*

The objective of growing more food at home is not in dispute; it is given further emphasis by Lord Woolton's gloomy forebodings about imported supplies in the House of Lords this week. And in one important respect the present award is a great improvement on that of 1947. The costly device of price incentives was then relied on exclusively. This time, a considerable portion of the extra money for agricultural production will be handed out in the form of direct subsidies to producers. The fertiliser and ploughing-up subsidies are to be extended, the calf-rearing subsidy is to be reintroduced, and the price of feedingstuffs is to be stabilised at its present level. These devices promote good farm practice and, by keeping down costs, act as a surer stimulus to expansion than do higher prices. In particular, the benefit goes most directly to small farmers and to all those who are short of working capital, whereas higher prices give the chief gain to the large producers who are not in need of assistance.

If the award had concentrated on measures of this kind, it would have been entirely welcome. In fact they are a small part of it. The Government is also providing an appreciable general increase in farm prices—the second such increase within a year. The total cost is known to be a good deal more than the Government originally intended. The Minister put it at £39 million a year, but this figure is misleading for three reasons. First, it is kept down by the happy circumstance that wool, which is now treated as a guaranteed commodity, is able to make a contribution towards the agricultural pool through an overdue cut in its price. Secondly, it excludes the £14 million given to farmers only a few months ago through a special review. Finally, it does not allow for the cost of the new feedingstuffs subsidy, presumably because that cannot be accurately calculated.

The true amount by which the cost of home-grown food has been raised is more like £60 million over a full year. This is serious enough in itself. It is particularly damaging because it undermines the figures on which the Chancellor worked out his cut in the food subsidies. The increase in the cost of home food production will be bigger than he allowed for. He has said, however, that the increase in food prices to the consumer will be no more than he forecast on March 11th. This must mean that the cut in the subsidies will be less. Retail food prices are being raised only slowly, and it now seems that the subsidy bill for the present financial year would not be brought below £325 million even if the annual rate were down to £250 million by next winter. The immediate impact of the whole policy of retrenchment is in doubt. And since little more than a third of the subsidy bill was attributable to imported food even before last week's announcement, the high cost of home-grown food is plainly the major obstacle to the fulfilment of the Government's good intentions.

*

No agricultural policy will make that cost low. No one disputes the farmer's claim to a fair price for the output the nation so urgently needs. No one denies his right to such protection against violent fluctuations in income as the Agriculture Act was intended to provide. But there is also no doubt that the cost of home-grown food need not be quite as high as it is. Government assistance to agriculture will plainly do most good the more it is concentrated on the farmers who most need assistance if they are to expand output, instead of being treated as a general bounty which inordinately inflates the taxable incomes of the farmers who can already produce most cheaply. As in social security, the function of the welfare state is to help the most needy rather than give money to everyone at everyone's expense.

That is supposed to be Tory policy. It is not being applied to agriculture because the Government is allowing itself to be bound by the conventions of its predecessor. In theory, the state fixes farm prices according to the general national interest. In practice, the annual price review has become a process of hard bargaining between two parties who meet as equals and feel themselves under a political constraint to reach agreement. The bargaining has two stages: first, to agree what total sum ought to be added on to farmers' gross incomes; secondly, to apportion this sum among the various crops and livestock products. At both stages, the wishes of the National Farmers Union count for as much as the intentions of the Government. The Government cannot, without breaking what are now the conventions, implement the guarantee to agriculture in some other form than a general increase in prices. It cannot, save within narrow limits, concentrate its assistance on those producers who need it most. It cannot relate farm prices effectively to the needs of consumers.

This time, for instance, it is milk producers who have gained the most favourable treatment, although milk is one of the few foods that is being produced up to, or rather beyond, the limits of effective demand. If more money is spent on milk production, less is available for other foods which are more urgently wanted. Yet the Minister of Agriculture is permitted to make the Minister of Food's task more difficult, and to stimulate the production of a food which, however intrinsically desirable, ought now to be put last rather than first on the nation's shopping list.

It was not intended that the Agriculture Act, to which all political parties subscribed, should be worked in this way. The farmers' organisations have a statutory right to be consulted. That is all. But the Government, through a series of precedents, has been led to a point where it has lost its freedom of action for determining agricultural policy. The blame for this attaches to the last Minister of Agriculture, who walked into the farmers' parlour with bland self-assurance. But the situation is far worse now that a new government has accepted a convention it could perfectly well have repudiated. The price review took so long because ministers put up some fight, but in the end they made concessions rather than face the embarrassment of a public quarrel.

After this, there is no alternative to radical reform. The present method of determining agricultural prices ought to be scrapped. It is not fair to consumers; in the long run it will not prove in the true interests of producers; and it threatens to bring government itself into disrepute. If ministers have no ideas of their own for bettering the system, they should at least accept the suggestion that a Royal Commission be appointed to investigate the problem. But they ought to have ideas of their own. The Government even has a minister specially charged to produce such ideas. Lord Woolton's denial on Wednesday that this is his job cannot be interpreted as anything but an admission that he has tried and failed. There is emphatically a job to be done, and it is Mr Churchill's responsibility to find someone who can do it.

New Start With Japan

THE peace treaty with Japan concluded last year at San Francisco came into force this week. With this event Japan has regained its place among the nations as a fully sovereign state in normal diplomatic relations with the signatories of the treaty. In London there is now again a Japanese Embassy and Mr Asakai, who has for many months ably represented his country in the status of Agent-General, becomes Chargé d'Affaires pending the appointment of an Ambassador. The Commonwealth countries which were represented at San Francisco have likewise resumed diplomatic relations with Japan; and India, which was not a signatory to the treaty, has formally terminated the state of war with Japan and appointed an Ambassador in Tokyo.

This change of international status may seem to some a matter more of form than of substance; for a long time now it has been possible for Britain and other countries to have dealings with the Japanese Government without having to refer everything to the bureaucracy of the American occupation authority. But even if it were only a matter of form, the change would be significant, for the Japanese have a great regard for formality, and the psychological effect of the return to normal in foreign relations is an important factor in the political situation. The change is, in fact, more than formal, for as long as the occupation authority remained, with powers that were theoretically almost unlimited, it overshadowed all Japanese politics, even though it lost something of its awe-inspiring grandeur with the departure of General MacArthur. In the new era no nation will have a right of control or interference in Japan beyond the specific provisions of the Peace Treaty and the American-Japanese Security Pact. It is clear that the United States, by its special responsibility for the defence of Japan, as well as by its general position in the Pacific, will continue to be the foremost power in Japan's foreign relations, and there will certainly be no disposition in this country to challenge such an American preponderance. But Japan will be much freer than before to frame its own foreign policy and enter into international agreements in accordance with its own national interest on particular questions. The resumption of full diplomatic relations should, therefore, be an occasion in this country for taking stock of the situation and considering what kind of policy should be followed in future.

It must be admitted at the outset that there is no very lively interest in this country and no great fund of friendly feeling. Japan is an ex-enemy nation in relation to which wartime attitudes have not been radically altered as they have with regard to Germany by the urgent sense of danger in Europe. There is, of course, an awareness that there is a danger to peace in the Far East as well; but it is obscured by the Anglo-American controversy over policy towards China. There is a tendency to regard contemporary Japan not as a partner in a common front against Communist expansion in Asia, but rather as a satellite of Washington in courses of action of which Britain does not approve. Further, the competition of the Japanese in foreign trade means that the picture of that people most widely accepted by the British public is that of dangerous industrial rivals. The number of people in this country who have had close acquaintance with them has never been large and the days of the Anglo-Japanese alliance are now remembered only by a few. There are, nevertheless, favourable opportunities for a fresh start in relations.

*

Policy towards Japan has not only to take account of the United Kingdom's interests and of relations with the United States, but also of the interests and opinions of Commonwealth nations more closely concerned with the Far East. Both Australia and India have strong, though divergent, views on the subject. Australia has always been the exponent of a "tough" policy towards Japan, sceptical of alleged regeneration of heart among its people and opposed to any policies which may seem to involve risks of a new expansion of their power. On the other hand, Australian non-recognition of the Communist regime in China inclines Canberra to a position closer than the British to the American policy of promoting an alignment of Japan with the Chinese Nationalists. The attitude of India is the opposite. India has always tended (partly as a consequence of the Congress policy during the war) to urge leniency for Japan; further, it has not only recognised and entered into full diplomatic relations with the Chinese Communist Government, but has largely accepted Peking's picture

of Japan as an Asian country compelled against its will to conform to a purely American policy of unjustified interference in Asian affairs.

★

It is no easy matter for London to maintain harmony with both Canberra and Delhi on the delicate and controversial issues involving Japan's relations with China and role in the front for containing Communism in the Far East. There is, however, another sphere in which Britain's own interests are more directly concerned and which offers more common ground for members of the Commonwealth. The association of Commonwealth and non-Commonwealth states in the Colombo Plan is at present the most promising and constructive effort of international co-operation in Asian affairs, and it is vitally important for Britain that, in spite of all the difficulties in the way, this great undertaking should be successfully carried forward. It is no luxury of policy, but a bold attempt, taken in hand none too soon, to meet the needs of a vast region of the world in which a continual increase of population unaccompanied by any corresponding increase of productivity has been threatening economic and social catastrophe. Success in this enterprise would mean not only greater political stability (which makes it a part of policy for the containment of Communism), but also new markets for world trade in which all the great industrial exporting countries may hope to benefit. It is here that there should be a chance to adjust the commercial interests of Britain and Japan in a scheme of economic co-operation beneficial to both as well as to the under-developed areas of Asia.

The best means for such co-operation would be the association of Japan with the Colombo Plan. However, there would at present be strong political objection in the Commonwealth to any suggestion that Japan should be directly associated with the Colombo Plan, and no such proposal is practical politics for the present. More urgent is the question whether Japan can be persuaded to use more sterling, which in itself would tend to bring about closer relations with Commonwealth countries and solve the problem of its trade surpluses in the sterling area. Its dollar-mindedness is a natural consequence of the finance of the occupation period, when it acquired the habit of dollar spending. But it is basically an illusion for post-treaty Japan, for in normal trade it would not have a hope of balancing its accounts with America. The Japanese economy cannot be really healthy as long as it rests on a fantasy. Much depends on the American attitude, for habits of dollar luxury are only encouraged by such aid as last year's loan to Japan by the Export-Import Bank for the purpose of buying cotton in America which it could have obtained from Pakistan. At present the Japanese pile up sterling balances and buy all they can from the dollar area. It is necessary to convince them that, as the sterling area must trade on a sterling basis, Japan will only bring about a contraction of trade if it continues on present lines.

There is reason to believe that patient diplomacy may have an effect on the Tokyo Government's commercial policy in this matter. The Japanese, like the British, will desire, as an economically mature and independent nation, to be as self-reliant as is compatible with the common defence needs of the free world, and it is very improbable that they will wish to remain permanently in a relation of economic dependence on the United States. Nor is it in the long run in the American interest to perpetuate the artificial state of affairs that grew up under the occupation; for even though certain special American interests may benefit from it, it is politically more advantageous that a stable Japan, standing on the side of the free world, should exert its full influence in South and South East Asia. This it cannot do if it stands aside from Asia and has its main economic ties with another continent. Moreover, if Japanese governments —and certain industries—are not to be lured into dangerous dependence on the trade that Communist China will offer, they will have to be shown evidence of the free world's good will in trading matters. Even without its former naval and military power, Japan is potentially a political factor of the greatest importance in Asian affairs and the implications of this need to be carefully studied both in Washington and in London.

A Truce for the Saar

THE European spirit is still a feeble and febrile thing. When it only contemplates action it can show an impressive zest for life; when action has to be taken it can turn faint-hearted and irritable. All the obstinate skill of Dr Adenauer has been needed to keep it alive and all the *bonhomie* of M. Schuman to keep it cheerful. And now it is going through an ordeal that could either kill it or give it a new lease of life. That it should thrive is a vital American and British interest; and the trouble that has arisen over the Saar is clearly an occasion for the Federal Chancellor and the French Foreign Minister to listen to a third opinion.

The problem can be simply stated. From the moment the war ended the French adopted in the Saar a policy designed to separate that territory politically from Germany and attach it economically to France. Had they attempted straight annexation of the territory as reparation for what Hitler's Germany did to France their case would have been straightforward. Instead they paid half-tribute to their allies' principles by insisting that it should be politically independent of Germany and economically united with France. They argued at the time, and have maintained ever since, that the Saar coal and Lorraine ore belong together and that France can feed the Saar more easily than can Germany. Because these economic facts pointed to economic union with France, they argued that political separation from Germany was a logical and essential consequence. And there the French case still stands. Time, of course, has been used to strengthen the evidence and the arguments. If France and Germany launched the Schumann Plan tomorrow, the German share of its members' coal and steel production would be 35 per cent and the French share 34 per cent; let the Saar return to Germany and the proportions become 42 to 27 in Germany's favour. This, say the French, would mean not partnership but subservience.

The German argument is, by comparison, simple. The Saarlanders, frontier folk though they are, talk and behave as Germans; therefore they belong to Germany now as they have in the past. In 1935 91 per cent of their voters chose to enter Hitler's Reich. Until recently all were content with the prosperity created by French efficiency which occupied Germany of 1947 could not offer. Now Western Germany, compared with France, offers stable government, a stable price level, and growing status in Europe. All these things—and the Roman Catholic Church—are pulling the Saar away from France. Germans who work sincerely for European integration would have preferred to leave the issue dormant between Paris and Bonn, provided that the French and their allies kept their repeated pledges to settle the future of the territory in a peace treaty and to do nothing meanwhile to prejudice the decision. Germans who care more for the power that comes of rousing national feeling declare—with good reason—that the French have been using the delay to tighten their grip on the Saar and prevent a German or European solution of the problem. Because Dr. Adenauer cannot pursue his European policy without concessions to national feeling in this matter, he has been drawn first into negotiations and then into altercation with M. Schuman.

★

The root of the trouble is that no French government could break suddenly with a policy that was adopted at a time when it was inconceivable that Germany should be thought of as an armed and equal partner. Occupation policies develop a momentum of their own, especially when they have behind them the driving force of a man like M. Grandval, first governor of the occupied Saar and now French Ambassador in Saarbruecken. The territory now has serious pretensions to statehood, and a constitution that embodies separation from Germany and economic attachment to France as principles. It has a Prime Minister and parties for whom a return to Germany offers no future on the European scene. They hope, by one means or another, to hang on until elections take place later this year. Then, all activity by pro-German parties having been banned, they hope to show the world that the Saar has voted for another five years of things as they are.

The Germans have also been, in some sense, carried along by events. When decisive steps were taken in the Saar there was no German government to protest. Now there is a West German government which finds itself in a bargaining position of unexpected strength. To expect it to negotiate for equality in Europe, for a contribution to western defence, and for membership of the Schuman Plan and the European Defence Community without raising a whisper about the Saar is unreasonable. Complaint and nationalist propaganda there was bound to be; and if the French regard the present outbursts as a sign of German bad faith they should not overlook the special reasons for them. In German eyes, and in some non-German eyes, M. Schuman has seemed at times not entirely master in his own house. Provocative things have been said and done in Paris at critical moments in Dr. Adenauer's parliamentary struggle, only to be avidly taken up by the intemperate opposition in Bonn led by Dr Schumacher.

Until ten days ago the French Foreign Minister and the German Chancellor hoped to carry through their policy for conciliation and co-operation in European institutions by skilful and semi-secret manœuvring, each feeling his government's position too weak to allow entire frankness before public opinion. M. Schuman seems to have tried to soothe Germany's fear of rigged elections in the Saar by agreeing to a commission of French, Germans and Saarlanders to investigate whether free political activity and voting are possible there. Dr Adenauer, for his part, seems to have agreed to modify the flat assertion of all German leaders that "the Saar is German." Their purpose was, presumably, to play for time while the preparations for the Allies' contractual agreements with Germany and for ratification of the new European institutions went ahead.

What then went wrong after this private agreement had been reached is not clear. To the German complaint that arrangements to investigate political freedom in the Saar should begin first, the French replied that the Germans should first explain how they proposed that the status of the territory should be changed. When it came last week to debate in Bonn, the German Chancellor found himself abandoned by his coalition partners. In order to avert the kind of resolution on the Saar that would slam the door on any dealings with Paris, he himself spoke in stern tones of the French attitude and said the negotiations "no longer offer hope of success." Meanwhile, tension is being made worse by the efforts of Herr Hoffman, the head of the Saar government, to prevent pro-German political activity. He has succeeded only in stimulating complaints from the Germans that they are being tricked and these complaints strengthen French belief that the German appetite is insatiable.

The United States and British governments cannot ignore this state of affairs. Not only does it threaten the whole progress of European integration but it underlines their own responsibility in the matter. Germany's increased bargaining power is the direct result of the American wish to get German divisions quickly. That the French are so firmly dug in at Saarbruecken is a direct result of British connivance at past actions. Both Washington and London have not only an interest in mediation but a moral obligation to offer it. But to say that is not to imply that a great deal can be done. The fault of the French has been to attempt a final solution of the Saar question in a rapidly changing situation. The fault of the Germans has been to try to exploit too quickly a situation changing in their favour. It would therefore seem that a solution—and it can be only a temporary one—can be found only by persuading the French to be less inflexible and the Germans to be less impatient.

*

On the face of it there is no sense in a territorial quarrel between two governments which propose to enter into an entirely new political and economic relationship, which will limit the sovereignty of each. To say this is, of course, to take the advocates of European integration at their word and that can easily be shown to be both unfair and unrealistic. But there is no obvious alternative to saying that there must be a European, a middle way between German demands and French resistance. One point of principle in the matter stands out. It is that the Saarlanders should be given real freedom to make their own choice. At the moment that choice is between being a satellite of France and becoming a state of the Federal Republic of Western Germany. It is possible —one cannot put it higher than this—that the future might present a third alternative. Five years hence the progress of European integration might have been such that to make of the Saar another Luxembourg might be attractive to Saarlanders. If the Schuman Plan pool became a reality and the European Defence Community produced the beginnings of federal institutions, it might be possible to reconcile French economic interests and German political interests in a manner that is now impossible. If, on the other hand, the European idea had by then died, nothing short of force could prevent the return of the Saar to Germany; and what British and American opinion would then be no one can foretell.

There is, therefore, a strong case for political truce and a temporary settlement with American and British help. The French would have to insist that Herr Hoffman should grant real political freedom ; the Germans would have to agree that the Saar should be offered the opportunity of becoming an independent state belonging to European institutions. Both would have to confirm that they contemplate such changes in Europe's economic structure as would give each nation equal access to the production and markets of the Saar.

It will be objected that things cannot work out that way; but if that objection is valid then the Schuman Plan and the European Defence Community mean much less than has been claimed for them. If the French object that their security is threatened by German predominance, the reply is that they have American and British guarantees that no French statesman would have believed possible five years ago. If the Germans object that their rights are ignored, the reply is that some sacrifice of national rights is inevitable whether they join the European or the Soviet system. If the experiment should break down, the Saar would come to them but they might lose the friendship of Western Europe and the support of the United States. If it succeeded they would doubtless find in an independent Saar a useful voting partner in the councils of Europe. To seek now a final solution of the problem is to court disaster to Franco-German relations and to frustrate Western policy for Europe when it may be within sight of success. There should be a European solution, but Europe is not yet ready to provide it.

Reforming the Certificate

THE Minister of Education is basking in the unfamiliar sunshine of popular approval. Her decision to let headmasters and headmistresses decide at what age children should take the General Certificate of Education is not, however, a political decision—although a review of the regulations was promised by the Conservative party at the election. It is a decision made on the advice of the Secondary Schools Examination Council—the same body that devised the general certificate five years ago. One year of its operation and a spate of protests from the teachers' associations, the Headmasters' Conference and the Central Advisory Council for Education have convinced it of what common sense should have told it long ago—that to set a minimum age of sixteen before which children should not be allowed to take the examination was a mistake.

In bowing to this weight of opinion, the council has retreated from an objective that the educational advisers of governments had been trying to reach ever since the Norwood committee reported in 1941. That objective was that ultimately there should be no external school-leaving examination, except for older pupils who needed a qualifying examination for the universities or professions. There was a good deal of sense in the reasoning that led to this conclusion. Only a small proportion of schoolchildren are going into careers that require a grammar school curriculum, and it would be wrong to force all those who now receive secondary education into the grammar school mould. It was true, too, that some children had suffered from the rigidity of the old school certificate curriculum and that a few had been subjected to strain by being forced to take it too early.

It was to avoid these evils that the examinations council devised its general certificate. The fact that it could be taken in individual subjects meant that the curriculum could be suited to the child—and this change was wholly to the good. But to use a minimum age as a means of protecting a few pupils from strain and the modern schools from a grammar school curriculum was absurd. It assumed that headmasters and headmistresses had no sense at all, and that they would be quite unable to resist the clamour of parents who thought that secondary education was a hoax unless it ended with a certificate ; or—worse still—that if the examination were not put largely out of their reach, the modern schools would never achieve the visionary "parity of esteem" with the

grammar schools that the egalitarians thought necessary.

Not only was the age limit unsound in theory but it worked badly in practice. First, there is the obvious point that bright children were held back and unable to devote themselves to their sixth-form work until they were sixteen. This would not have been such a serious problem if the general certificate had been used as the council had hoped. The intention was that pupils who were to enter the universities or professions would by-pass the Ordinary level of the general certificate, and take it at a still later age at either the Advanced or the Scholarship level. It was hoped that the universities, professional bodies and employers would be content with an external examination at these levels in a narrower range of the candidate's special subjects, and that, instead of insisting on, say, five subjects at Ordinary level they would accept three at Advanced level, and be content to rely for evidence of general education at a lower level on school records and testimonials. Both these hopes were unrealistic. The children of poor parents are never sure how long they will be able to stay at school and would be unwise to miss the Ordinary level lest they should have to leave without a certificate. They also have good reason to fear that an Advanced certificate in their special subjects would be thought too specialised. Universities, professional bodies and employers have not been prepared to rely on the schools for evidence of a candidate's general education, but have insisted on certificates that include a relatively wide range of subjects at Ordinary level. They may be forgiven for thinking that a teacher has an interest in showing that his instruction is not useless. And it seems to have escaped the egalitarians that if the universities and employers had been prepared to rely on reports from teachers, the result would have been to give an advantage to those who came from the better known schools.

Because a certificate in several subjects has been insisted on, pupils have had to keep subjects "ticking over" at Ordinary level while they went on with their advanced work. This meant that sixth-form pupils had to be divided into more groups, with the result that the shortage of teachers and classrooms, which is acute in any case, was made even worse. The comparatively ample staffs of the independent schools managed to cope with the situation fairly well, but for the smaller grammar schools it was desperate.

It is strange that the council did not foresee all this. It is even stranger that it should have been unanimously in favour of a minimum age for which very few other people have since found a good word to say. It is strangest of all that the regulations were imposed by the late Minister in spite of a clear warning from the grammar schools of the quandary in which it would place them. The story behind this is that before the schools examination council made its report some of its members wanted to abolish a school certificate examination altogether, and there was danger of a minority report. This led the other members to accept the minimum age proposal as a compromise that was the lesser of two evils. Later, when the grammar schools warned the Minister of Education of what would happen, Mr Tomlinson brushed aside their objections. As a Socialist he was strongly influenced by the idea of "parity of esteem" for the modern schools ; and indeed, he was in favour of raising the minimum age to seventeen as soon as possible. Under his regime the Ministry of Education enforced the minimum age provision even more rigidly than the examinations council had intended, applying it not only to the general certificate but also to other examinations, such as those of the Royal Society of Arts and the chambers of commerce.

That rigidity is now happily at an end. The council saves its face by still insisting that the general certificate should normally be taken at not less than sixteen years of age, and by imposing conditions for taking it earlier. These are that the head of the school must certify that it is "educationally desirable" and that the candidate is likely to pass. It is claimed that the new system will give them some protection against the pressure of parents who think their children are cleverer than they are. But it is annoying for headmasters and headmistresses to have yet another form to fill in, particularly such a silly one. At least, however, their discretion is restored to them.

The council has also partially dealt with the other main flaw in the general certificate—the concealment of intellectual differences by making candidates either pass or fail, without grading. This was all part of the levelling process and it is good that distinctions are in future to be awarded at the Advanced level. But why not at the Ordinary level also ? The council's motive was presumably that this would encourage children to take their best subjects at Ordinary level instead of by-passing it to take them at Advanced level ; the council is opposed to the same subjects being taken at different levels. This is altogether too subtle. What harm can it do? The possibility of distinction is a spur, and many benefit by some practice in external examinations. Surely the case against external examinations rests on their effect of forcing the pupil to take uncongenial subjects, not his best ones.

There is another problem to be solved. What is the proper standard for the examination ? The intention is that the Advanced level shall correspond roughly to the

For the Information of Overseas Readers—

Secondary schools in England are those that cover the ages of 11 or 12 to 18. **Grammar schools** are those secondary schools giving an education (literary or scientific) designed to lead on to the universities or the professions ; they include the great majority of children staying at school after the minimum legal age for leaving of 15. **Modern schools**, which have by far the greatest number of secondary schoolchildren, and **technical schools** are the other varieties of secondary schools.

The **sixth form is**, by tradition, the highest. Under the system that existed until last year, the **School Certificate** examination was the entry to the sixth form. To gain a certificate, a candidate had to pass in each of a relatively wide range of subjects, and success carried with it exemption from the universities' entrance examinations, provided that the subjects taken met the universities' requirements. School Certificate was normally taken at 15 or 16 and, with this behind him, the sixth-form pupil concentrated on a narrower range of subjects of his or her own choice.

The main changes introduced by the new General Certificate of Education in 1951 were (a) that a certificate would be given in any number of subjects, from one upwards, without any "required subjects" ; and (b) that no candidate under the age of 16 could take the examination.

old Higher certificate, and that the Ordinary level shall be roughly that of the old school certificate but at "credit," not "pass" level. This may seem rather high; credits in school certificate papers were obtained by, on ne average, only half of the candidates. But it must be emembered that the general certificate is now taken not s a group, but in the subjects in which the pupil is likely o pass, and therefore a much higher proportion than 50 per cent should get through. They will not get hrough, however, if the practice of at least one of the ight examining boards is continued—the fixing of a pass nark that fails about half the candidates. There was a great outcry from the grammar schools taking this board's examination when they found that candidates whose success they regarded as certain had failed. This, however, is something that will be put right in the light of experience, and council and boards are giving it their attention.

One criticism remains. Why should not the new regulations have come into operation this year instead of waiting until 1953? It is impossible to believe that the entry of some extra names would have placed too heavy a burden on the administration of the examining boards. It is true that the schools are more than half way through the course and that an immediate change in the age limit would be hard on those who could now take the examination but have not done the necessary work; but it is harder still now that the principle has been conceded to hold back those boys and girls of 15 who have done the work and are ready to take the examination. Is the machine of educational administration now so very cumbrous that it cannot adjust itself to this small change? If it be insisted that the summer examination is too early, why should not the change be made in time for December? Why should it be any answer that the December examination is merely supplementary? In whose interests are these delays imposed? The children's? Or the administrators'?

Apart from this delay, the council's recommendations and the Minister's acceptance of them are very welcome. However good the intentions that prompted the setting of a minimum age, they were academic in the worst sense—that is they were based on theoretical reasoning, and were at variance with public opinion, whose support was necessary to make them effective; and indeed they were contrary to common sense. The removal of the offending regulations leaves the general certificate, if properly used, as an examination that measures a child's capabilities without forcing his education into a mould that may not suit him at all. But it will not be that if the universities and others—and more particularly, the faculties of universities—insist on using it as they did the old school certificate: if they insist, for example, that arts students should have a qualification in mathematics and scientists in French. They have indeed a right to insist that those whom they admit shall give evidence of breadth of mind as well as depth. But what real good does it do to insist that the aspiring undergraduate shall have passed an examination in a "required subject," at a low level and several years before—and forgotten all about it by the time he reaches the university? As everybody knows, these requirements are generally regarded as irritating technical obstacles to be surmounted as early and as indifferently as possible, having little in common with education in any true sense. If the English educational system is to reap the full benefit of the elasticity that the general certificate is designed to foster, the next move clearly lies with the universities.

NOTES OF THE WEEK

Dr Dalton Helps Moscow

It does not seem to be generally realised that the issue in Germany is no longer between rearmament or continued demilitarisation, but between German troops in a European army and German troops in the *Bereitschaften* created by the Russians. The alternatives changed when the last Soviet Note offered Germans unity, free elections, a peace treaty which would break all links with the Atlantic community, and a national army. If the word "national" were translated "people's" the full implications of the Soviet offer would, perhaps, be clearer. A people's army, such as the *Bereitschaften*, has the task of defending a people's democracy, and is packed with officers and NCOs who are politically indoctrinated for the purpose.

The manifesto of the British Labour Party Executive, calling for talks with the Soviet Union, "without further delay"—presumably before anything further is done to set up the Defence Community—is a particularly striking example of the confusion surrounding this matter. It was issued after Dr Dalton had conferred with the German and French Socialists in Bonn. For once, the British Labour party is not leading them. A party which has not been noticeably ready to support plans for consolidating Western Europe in the Atlantic community is now helping a narrow-minded doctrinaire party of Nationalist Marxists, whose eyes are fixed on Eastern Germany. Dr Dalton, who has been bitterly opposed to rearmament of Western Germany, even in the framework of the European community, is now advocating a policy which might well end in the establishment of a new German National-Communist Reich, defended against democrats (in the western sense of the word) by its people's army.

New Treaties in Danger

Clearly the British, American, and French governments must agree to yet another conference with the Soviet Union. Dr Adenauer himself is quite right to advocate a Four-Power meeting; but the final negotiations on the EDC and the contractual agreements to replace the occupation statute should not, as the Labour party and the German Social-Democrats demand, be held up for that purpose. The only good ground for delaying the new treaties would be if ratification by the various parliaments were more likely to be secured in this way. That is a debatable point. Dr Adenauer thinks not, and he has shown himself a skilful politician who knows his people. In a recent broadcast on the alternatives facing the Germans, he once again made clear that he believes the only chance of achieving unity in freedom lies in first of all concluding the EDC treaty and the new contractual agreements. And when the western and eastern representatives finally meet, must be to discuss elections and not in the first place the terms of a peace treaty to be presented to the future all-German government. On this point all Western German parties—and the Labour party—agree.

The most telling criticism made by Dr Adenauer's opponents is that the new treaties with the West will close the door to the reunion of Germany. The Chancellor has replied by pointing out that the treaties can be revised by an all-German government. He appeared to be speaking only of the contractual agreements and not of the Defence Community; but the same argument must hold good for the latter. The outcry which this statement raised in France is hardly justified, for it is clearly impossible for the present government of the Federal Republic to commit the future government of a new German State to any treaties. There would be little hope of securing ratification of the contracts if the Chancellor were to attempt to do so. Only a British and American guarantee could deter an all-German Government from repudiating the EDC.

Dr Adenauer is now in even greater need of all the support he can be given from outside. To the general astonishment, the new coalition government in the South-West *Land* has been formed without the Christian-Democrats, even though they won the elections. As a result, Dr Adenauer has lost his majority in the upper house, which votes on the most important legislation. This fact could prove fatal to the new treaties.

* * *

Ridgway Succeeds Eisenhower

Europe has been paid a notable compliment by the appointment of General Ridgway to succeed General Eisenhower. That the outstanding American field commander should be moved from the United Nations to Shape, from a hot to a cold war front, is an act of political significance which can be interpreted in different ways by different people. General Ridgway will command great respect from the growing forces that he will take over next month, and his record in Korea as leader of an international team should inspire confidence in the thirteen governments with which he has to deal. As for relations with the United States Government, it will be remembered to his credit that he served its chiefs of staff with conspicuous loyalty and has largely restored the confidence in Washington's control of military events that was weakened by General MacArthur.

General Gruenther remains as his chief of staff to carry on the stripling traditions of the headquarters, and doubtless many non-political matters that fell within General Eisenhower's purview will be directed towards the permanent Nato organisation directed by Lord Ismay. It is, perhaps, a little early for a new broom to get to work among the European commands, but General Ridgway will arrive just at the right moment to ensure that the first full-scale exercise of Nato forces in the autumn will have the full benefit of Korean experience.

* * *

Government by Public Relations

It is the modern fashion among politicians, when things begin to go wrong, to blame faulty public relations for their failures. Labour Ministers were able to put more conviction into this self-consolation by abusing the press. Though that resource is denied to the Tories, they do their best, in this as in so much else, to do as their predecessors did. Since the fright of the county council elections, the rank and file has been muttering angrily about the party's publicity; at Westminster, at least two meetings of the 1922 Committee have shown a widespread belief among Conservative backbenchers that the Government's case is being badly presented.

There is danger that this will be allowed to distract attention from the real issue. Mr Churchill himself has fostered an exaggerated idea of the importance of public relations. He has reacted to the criticism from behind by appointing another "overlord." Lord Swinton, Chancellor of the Duchy of Lancaster, now has the duty of supervising the Government's relations with the press. From all accounts, he is tackling his job with vigour, but it will be surprising if he finds much that is useful to do. A government is made or unmade by its policy, not by its publicity. Where this Government has proved to be weak has been not in presenting its case badly but in not having a case. When the policy has been firm and coherent—as, on Budget day at least, for the subsidies—there has been no complaint about the way it was put. Indeed, smaller subsidies have caused less uproar than the far smaller burden of higher fares—because Mr Butler in his speech grasped the nettle firmly. Similarly, Mr Eden has succeeded to a considerable degree in taking foreign policy out of the sphere of party controversy, at any rate for the time being, because he (and, in this matter, Mr Churchill) have not been afraid of making the policy—and that of their predecessors—reasonably plain.

The things that have made the Government unnecessarily unpopular have been its sudden lurches and swerves, the decisions taken precipitately and without forethought, the failures to make plain at an early stage how Ministers' minds were working. To a small extent, the weaknesses are simply in the tactics of government. The long delay in preparing and presenting the Steel and Transport Bills has dismayed the Tories and delighted their opponents. Faults of leadership in the House of Commons have put the Government in a position of humiliation. But these are symptoms. Good public relations consist in keeping the public in the picture, and the only important barrier to doing so is that the picture is blurred in Ministers' own minds.

* * *

Deflating the Overlords

Whatever may be true of the Government as a whole, Lord Woolton's curiously inept speech in the House of Lords on Wednesday leaves no doubt that he is rattled. It has set off a new controversy about the activities of Mr Churchill's "overlords"—the cabinet ministers he made responsible for broad matters of policy affecting two or more departments. Lord Woolton claimed that in his role as a co-ordinating minister he has no responsibility to Parliament but only to the cabinet. His task was not to formulate a general policy for food but simply to replace a cabinet committee as the

ADVERTISING WISDOM . . .

Advertising pays . . . whom?

Would it pay me to advertise? Can I handle my own advertising? What does it cost to employ an agent? What do I get from an agent? Is it true that once you start advertising you have to keep it up? Can I advertise in overseas publications? How much advertising can I do for two thousand pounds? What are the pros and cons of direct mail advertising in my business?

These are only a few of the questions you are likely to want answers to before you know exactly what to do about your advertising.

Through the post it would take you about twelve months to arrive at the answers to these questions. No business with an advertising problem can afford to wait as long as that. But you could settle the thing in an hour by talking it over with somebody who knows—or can get you—all the answers. So why not come along for a chat when you are next in London?

SAMSON CLARKS

means of ironing out differences between the ministries of food and agriculture. And since he also implied that those differences are few, his post certainly merits his own description of it as "a minor job."

This may accord with the facts. It hardly bears out the picture painted before the election of Lord Woolton as the leader and inspirer of a co-ordinated drive to cure the country's food shortages. Still less does it fit the defence of the appointment of overlords that the Government made last November. It was then said that Mr Churchill would answer in the House of Commons on broad matters of policy for which the overlords were responsible. Plainly they were intended to have the responsibility that Lord Woolton now disclaims.

It would be a pity if this confusion—besides the obvious difficulties into which the Government has got itself over both food and the nationalised industries—were allowed to discredit what was potentially an important experiment in the machinery of cabinet government. Admittedly, it has worked badly so far. Lord Leathers—perhaps more by force of circumstances than by inclination—has recently concentrated on the specialised field of transport rather than on general policy for the nationalised public utilities; it is not clear that an extra Minister of Transport has helped either the minister or the smooth functioning of the ministry. Lord Woolton, on his own account, has carried less weight—though he seems, nevertheless, to have made the two departmental ministers uncommonly hesitant. Mr. Churchill once attacked the idea of "ministers without portfolio brooding over problems over which they have no control." Much worse, however, would be a situation in which ministers with portfolio brooded over problems over which they had no control. There is now serious danger that the overlords will in practice either produce that situation or do nothing at all to justify their places in the cabinet.

But that would be the consequence of personalities, not of the system. If the experiment is to be given a fair trial, its basis must be clearly understood. The case for co-ordinating ministers is that, freed from detailed departmental duties, they can formulate broad policies involving more than one department. If, as Lord Woolton says, that is not so, they should go. If it is so, they must be responsible to Parliament and not merely to the cabinet—which means that most of them should be in the House of Commons, where the broad policies receive their most public debate.

* * *

Competition in Hypocrisy

The debate in the House of Commons on Monday threw no light on the confusion over the suspended increase in railway fares. Indeed, without the White Paper on transport policy that is to be published next week, it was largely meaningless. Both sides were disingenuous. The Government had to avoid awkward questions about dates which might seem to confirm the Opposition's charge that their precipitate intervention in the fare-fixing procedure laid down under the Transport Act was done with an eye to checking the anti-Tory drift at the forthcoming municipal elections. If this was not so, why was the standstill debated separately this week, instead of waiting for the White Paper? The Opposition, on the other hand, was not going to make itself unpopular by standing for full fares, and avoided voting either for or against the Government's motion. It was content instead to try to add some words of regret about the confusion and about the denationalisation of road transport.

In the absence of Mr Maclay, the Minister of Transport, who had fallen a victim to exhaustion in the progress of this battle, the Government's case was presented by Sir David Maxwell Fyfe, the Home Secretary. No one can be more lucid than Sir David when he has a strong case, and no one can achieve a more diplomatic obscurity when he is defending a weak one. The technique is simple. It is to retreat into a smokescreen of legal phraseology, from the midst of which he proclaims that he has made his case crystal clear and left nothing to answer. On Monday Sir David was very obscure—particularly about the charge that, for provincial fares, the Government took the very action which Mr Maclay had declared to be illegal for London fares. Mr Morrison, on the other hand, was at his best. For a day at least the ghost of the fumbling Foreign Secretary was laid by the figure of Mr Morrison the confident expert on transport and local government; he deployed brilliantly the speeches made by Lord Swinton and by Sir David himself five years ago when they had moved an amendment to the Transport Act to make doubly sure that no future Government should overrule the commission on fares. It was a speech which merited a better occasion—and a better cause. Mr Callaghan, too, in a good speech asked awkward questions to which the Parliamentary Secretary gave no clear answer.

But both sides were playing at nothing but politics, and the moral of the episode is plainly that politics should not be mixed with business in running the nationalised industries. It was precisely to prevent this happening that independent corporations were set up. That independence has proved to be a sham. A Conservative Government has settled the issue for no stronger motive, as far as it is able to show, than that holders of season tickets should have guaranteed to them any relative standard of living they have once enjoyed. It is not only the independence of the public corporation that is destroyed by such insistence on protecting special positions. A prescription for rigidity of this kind is a prescription for economic stagnation by Government order.

Deadlock in Korea?

On Monday the truce delegates at Panmunjom met in plenary session for the first time since February. This was a special meeting at which the United Nations put forward a fresh general plan to break the deadlock in Korea; after they had done so, the Communists asked for an adjournment, presumably to consult their governments. The essence of the plan is that a compromise should be reached on the three main points that have held up progress during the past few months: the Communists' right to build airfields in the north during the proposed armistice; repatriation of prisoners; and nomination of the Soviet Union as a member of the Commission to supervise the armistice. On the first point, the United Nations are said to have given way; on the second, they are said to have proposed that approximately three out of five Communist prisoners should be returned; on the third, they are adamant that the travesty of nominating the Soviet Union as a neutral cannot be condoned.

In spite of recent public optimism and the probability that the Kremlin now favours peace in Korea, there seems to be no firm reason for believing that the Chinese and North Koreans will accept the new proposals. They have always acted as if the return of all prisoners is for them a vital matter of prestige, while on the UN side exhaustive discussion has produced the predominant view that to return unwilling prisoners at pistol point is wrong and is out of the question, whatever the consequences. This view has been maintained against arguments which, if accepted, would sweep away what little is left of international conventions for humane behaviour in wartime. It is, for example, suggested that UN refusal could be used by the Communists in future to obstruct the return of any prisoners they might take. They could simply say "Your men refuse to return." It is also pointed out that under the Geneva Convention no prisoner of war shall divest himself of his right to repatriation.

Never yet has optimism about Korea proved well grounded, and the predicament of the UN forces is as baffling as ever. So great has been the enemy's build-up that a return to full-scale operations would settle nothing. If the

The Templer Touch

General Sir Gerald Templer has been giving the British community in Malaya some old-fashioned advice. It is refreshing to hear a British administrator taxing consciences and appealing to public spirit in Victorian tones and vivid modern language. "The Communists work," said General Templer in Kuala Lumpur recently. "They seldom go to races, give dinner parties, cocktail parties or play golf. They work. How many people on our side do the same thing?" He has doubtless received many indignant answers from those who already work to the limits of their time and strength; and by now some people will have grasped that he was deliberately using shock treatment. Few white men and women could or would stay in places like Malaya if it were all work and no play; not everyone is endowed with the gift of leadership that General Templer is looking for; many British people of excellent qualities are uncertain whether their government's policy in dependent territories makes it worth while for them to try to strike deep roots there. But when all this has been admitted, there remain certain things that need saying from time to time, both at home and abroad.

Some officials, business men and other persons in British communities abroad—whether in Asia, Africa or the Middle East—still seem blankly unaware of what is going on around them. They understand neither the political awakening of those among whom they live nor the extent to which individuals and their families are regarded as representatives of British ways and ideals. Like royalty, they are always under scrutiny. To take notice of these facts is often regarded as rather "leftish"; to seek opportunities of service beyond the limits of official duties may be regarded as excess of zeal; to whittle away racial and social barriers can look like disloyalty to fellow-Britons. Because it is easier and more convenient to live apart, the case for doing so becomes convention.

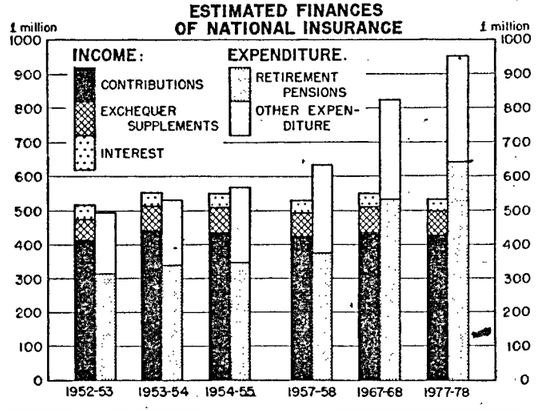
There are plenty of honourable exceptions who have taken abroad with them British ideals of public service, toleration and Christian fellowship; but the Templer touch is needed from time to time for the rest. In Malaya the contrast between the front line of plantations, mines and railways and the rear of offices, clubs and golf-courses must often be painful, especially to a soldier fresh from Britain. But General Templer has drawn attention to something of more general importance—the need for dedicated men and women wherever the struggle with Communism is waged.

* * *

Not Everybody's Business

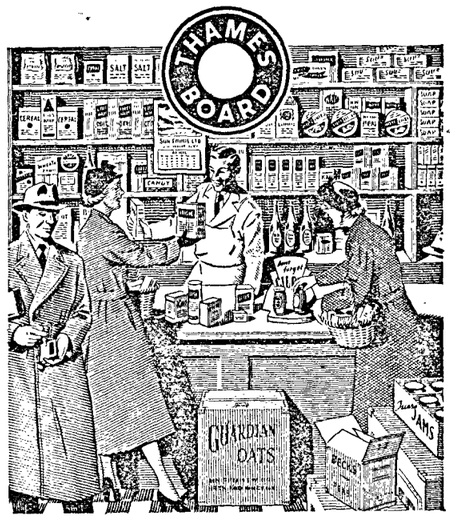
At the end of last week the Indian delegation to the United Nations threw down a challenge which cannot be ignored. In a letter to Asian, African and Latin American countries and to some of the members of Nato its leader, Rajeshwar Dayal, issued a warning that, if the Great Powers make a practice of refusing a hearing to disputes brought before them by the smaller countries, Uno may fall into disrepute and go the way of the League of Nations. Bitter remarks in the same vein had been made by Mr Nehru when the complaint of certain Tunisians against France failed to reach the Security Council's agenda. The letter says that India still hopes to secure a hearing for the Tunisian dispute, and encourages the Asian-Arab bloc either to renew the application to the Security Council or to ask for a special session of the General Assembly, or to propose the question for inclusion in the agenda of the next session.

It is true that nothing could do more harm to the United Nations than to make it a pawn of the Great Powers. The Russians tried to do just that and a similar tendency has been noticeable in American policy. Indeed, every government would like to see its own point of view prevail in this forum of world opinion. But there is no good reason why smaller nations should have the right to a special hearing whenever they have a grievance, just because their own sense of injustice is highly developed. Uno's prestige would soon touch bottom if it allotted time automatically to every complaint put up to it. Already its work is badly congested, in spite of the specific attempt made in its Charter to define and limit the type of disputes with which it is competent to deal. If blocs of powers now try to coerce Uno for their own purposes, they will defeat their own ends; and there is no doubt at all that some questions become more, not less, intractable when they are treated as everybody's business.



* * *

The New Costs of Welfare



The Government has saved some parliamentary time by rolling up into one bill all the higher social payments announced in the Budget speech—with the exception of the new national assistance scales, which were given parliamentary approval this week.

Family allowances are dealt with in the first clause of the new Bill. According to the financial memorandum the cost of raising the weekly allowance for each eligible child from 5s. to 8s. will be £39 million in a full year, less a saving of about £1,250,000 in national assistance. In the present financial year, during which the new allowances will be in force for seven months, the net cost will be about £22 million.

The rest of the Bill is taken up with the higher benefits and contributions in the national insurance and industrial injury schemes. Raising the basic industrial injury benefit from 45s. to 55s. a week—probably from the end of July—and the other changes will cost an extra £3,500,000 in a full year, which will be met by small additions to the contributions for men and boys and an increase of £600,000 in the Exchequer supplement. The national insurance clauses provide, as proposed by Mr Butler, for a uniform benefit of 32s. 6d. for a single person and 54s. for a married couple. It will require higher contributions from all classes of insured and an additional Exchequer supplement, which will cost the taxpayer £4 million in 1952-53 and £8 million in a full year.

But the Exchequer's liability does not end there. Once again, the Government actuary sounds a warning about the mounting cost of retirement pensions, shown in the accompanying diagram. Compared with a year ago, his estimates of the finances of the national insurance scheme shows a slightly higher rate of expenditure in the next three years because, it is interesting to note, he has been instructed to assume a slightly higher rate of unemployment: 2 per cent

Indispensable cardboard

We all use board. It is part of our modern way of living. The man in the street calls it "cardboard" and takes for granted the ubiquitous cartons and fibreboard packing cases which play so vital a part in protecting and delivering his food and other necessities. Similarly he ignores the binding on his books and the wallboard in his home. But where would he be without these things?

Making "THAMES BOARD"—and "FIBERITE" packing cases—is the business of Thames Board Mills Ltd. This unique organisation—the largest of its kind in the British Empire—has increased its productivity fifty times in fifty years. Half the immense quantity of packaging board made in this country comes from the two mills of Thames Board Mills Ltd—a worthy example of essential service to the nation.

Careers for able Advertising men in Unilever

THE Unilever business offers opportunities to advertising men because of the continuous need to solve the selling problems of more than a thousand products in over fifty countries.

In Unilever the competent advertising man is a key figure, because this a business where the techniques of advertising march with those of production and distribution. The problems he faces are often new, complex and difficult, but in dealing with them he commands resources which could hardly be matched elsewhere. A Unilever advertising job is harder and more exacting; but it is also more rewarding to the capable man who enjoys getting advertising to work harder.

Continuing expansion is creating such jobs faster than they can be filled by promotion from within the organisation. Shortly, Unilever will be picking new men for a number of interesting positions in the U.K., in Continental centres, South Africa and other overseas countries. These jobs carry high starting salaries.

Men chosen for these jobs must be between 25 and 40 years old, with a successful background in first-class agencies or in the advertising departments of national advertisers. There must be no doubt of their executive ability, their technical knowledge of the advertising business, and their capacity to hold much bigger jobs.

Applicants, who will be interviewed in London, should write in the first place to Personnel Division, MWG/AT1, Unilever House, Blackfriars, London, E.C.4.

up to 1953-54 and 3 per cent for 1954-55, compared with 1½ per cent and 2½ per cent, respectively, which he was told to assume a year ago. The long term average of 4 per cent has not, however, been altered. In spite of this, after 1955 the finances of the scheme alter radically. If the balance in the insurance fund is not to be run down, large extra sums will have to be found, either by the Exchequer or by the contributors, to enable the fund's total expenditure to be met.

* * *

Federation Fears

The conference on Central African federation has now been in session for a week, in the middle of which the Opposition took the unusual course of initiating a debate on the subject in the House of Commons. The reason for its action was made clear by Mr Griffiths, Secretary of State for the Colonies in the Labour Government, in his opening speech. Two Africans from Southern Rhodesia, nominees of Sir Godfrey Huggins, are attending the conference; but the Africans from Northern Rhodesia and Nyasaland, although they have had talks with Mr Lyttelton, have refused to take any part in the conference or even to attend it as observers. They are afraid that attendance would appear to commit them to acceptance of the principle of federation to which there is a deep-seated and universal opposition among the Africans of the two protectorates. Mr Griffiths's main fear was that the African delegations would return to Africa while the conference was still on, with the Governors and their own European representatives attending it, and report that the British Government was intending to push ahead with federation in spite of the African opposition. This might have led to serious trouble on the copper belt. He asked, therefore, that the Africans should be invited to remain in London until the conference ended and perhaps have more discussions with the Secretary of State on its results.

Mr Lyttelton agreed to the suggestion that the Africans should stay on, although saying that this was hardly a substantial point to hold a debate about. Yet the debate was worth having, because it did provoke some assurance, though not very definite, from the Government that the holding of the present conference does not by itself mean that federation will be pushed through, willy-nilly. Its purpose is to provide a draft constitution which will then be subject to discussion and criticism. There is now no question, Mr Lyttelton said, of having the next conference as early as July. Before it is held either he or Mr Lennox-Boyd will visit Central Africa and form first-hand views on the state of public opinion; and no final decision will be taken—nor will the proposed referendum in Southern Rhodesia be held—until after the next conference. African fears have grown so intense in recent months that they will not be entirely dispelled by Mr Lyttelton's cautious remarks. But the imminent prospect of violence on the copper belt has receded.

* * *

The Right to Idleness

Industrial relations in the welfare state have taken many queer turns, but it is a new and astonishing demand that has been made this week by the workers of the Smith clock company at Cricklewood. It is that redundant staff should be paid full wages to do nothing "pending suitable alternative employment." Their strike committee has declared that "our members demand the right to work. Until the management or the Ministry of Labour can offer suitable alternative employment they insist on remaining paid employees of S. Smith and Son, Ltd." The company naturally rejected this preposterous request—and 1,200 workers therefore went on strike.

The dispute began on Monday when the company informed the shop stewards that it would have to dismiss 200 or more production workers because foreign importers had cancelled their orders for £300,000 worth of clocks and watches. One of the company's factories is therefore being re-tooled in readiness to execute Government contracts in the autumn. In the meantime not even the Smith group, one of the largest clock and instrument manufacturers in the world, can afford to keep between 200 and 400 skilled men in idleness. The shop stewards' reply was to call a mass meeting of the workers, who resolved to stop working until their leaders' demand for continuous employment had been met.

On Tuesday officials from the local employment exchange, summoned by the management, told the strike committee that other jobs were available; but the strike committee continued to insist that the company must recognise, as a "basic principle," its obligation to retain and pay redundant workers until they have found other jobs. This demand, as the Federation of British Industries assured the Smith company, has no known precedent. It will no doubt give great satisfaction to the editor of the *Daily Worker*, who told the Communist party congress at Easter that declarations of redundancy should be answered by strikes. It will also please the Sheffield Action Committee, whose conference of engineering shop stewards on March 2nd resolved that shop stewards everywhere should "fight every case of redundancy, thus frustrating the Government's plan to force workers into the arms industry regardless of its effects on the workers or their families or the economy of the country." Actually it was the Australian rather than the British Government that deprived the Smith company of its orders, but to those who sympathised with the Sheffield resolution that would seem an unnecessarily subtle distinction.

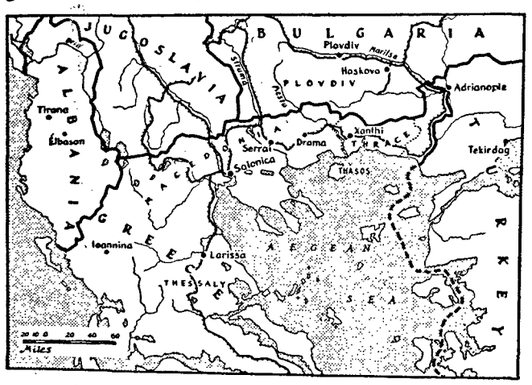
London Talks on Trieste

The London talks on Trieste are taking too long. The risk is that all this labour may in the end produce something that looks like a mouse. What is required of the present negotiations between Britain, America and Italy is a clear cut decision to hand over to the Italians a clearly defined part in the day to day administration of Zone A. That was the understanding on which the talks were held; if after all this time anything less emerges they may do more harm than good. Already it looks as if bargaining and hesitation may be holding up the type of agreement in principle that Italian public opinion has been led to expect.

That being said, it is clear that when the results of the talks are announced—which may now be very shortly—they must be judged only within the limits of what it is practicable for the British and Americans to give and in the light of Italy's best interests. It cannot be too strongly stressed that the danger of holding the talks at all has always been that they may make an ultimate settlement between Italy and Jugoslavia over the whole Free Territory more, not less, difficult to achieve. That is why it is arguable whether the Italians would be wise to press for the early transfer to themselves of full military responsibility in Zone A. While to do so might give them a more equal bargaining position with Marshal Tito, since he is in full control of Zone B, the attainment of actual Italian sovereignty would render invalid the whole constitutional structure on which the Free Territory rests. Jugoslavia could then say with some justification that, since the relevant clauses of the Italian peace treaty had been torn up, there was no obligation for it to embark on any further negotiations at all.

In practice, the new arrangements made as a result of the London talks are unlikely to prove more than another provisional stage on the road to the wider agreement which must still be the aim of all the powers concerned. This means that Signor De Gasperi is in the difficult position of being unable to accept as large an Italian role in Zone A as that for which the extreme Italian nationalists are pressing. It will, consequently, be most important, if the new agreement is to be a success, that the Anglo-American authorities on



the spot in Trieste avoid interpreting it in anything but a generous spirit.

Greeks, Turks and Thrace

This week's visit to Athens by the Turkish Premier and Foreign Minister and the invitation to King Paul to visit Ankara are the latest signs of the determined effort that Greeks and Turks are making to bury their old animosities. The talks now in progress are the sequel to the visit that Mr Venizelos paid to Turkey last February, when it was agreed to set up a mixed commission in Ankara to study problems of common concern. The first fruits of this commission's labours have just been announced in agreements to abolish visas between the two countries, and to carry out a common export policy for tobacco and raisins. The commission has yet to tackle successfully the vexed question of Greek fishing activities.

Mr Mendères and Mr Köprülü have been accompanied to Athens by General Kanadli, the Commander-in-Chief of the Turkish land forces. It can therefore be assumed that common defence problems, which have provided the main impetus to the present *rapprochement,* have been high on the agenda. The two countries have been brought together by their common desire to secure admission to Nato, and by their common determination, now they have achieved this object, not to place their armed forces under an Italian general. But if their professions of the closest co-operation

are to have any reality they must clearly work out joint plans for the defence of Greek Thrace. Otherwise a Communist attack across the narrow strip of land separating Bulgaria from the Aegean could completely disrupt the land communications between the Greek and Turkish armies. Although the Turks must think first of the defence of their Asian frontier with the Soviet Union, there is no reason to suppose that they are not fully aware of the danger in Thrace. Both governments are gravely handicapped by uncertainty over Jugoslavia's attitude. A firm commitment from Marshal Tito to counterattack on Bulgaria's flank if it attacked Thrace would have an invaluable strategic effect. Unfortunately, although the Jugoslavs are markedly more co-operative than they were, they still profess to be firmly opposed to any regional alliance. The Greeks and the Turks therefore can only hope that, if a crisis arose with the Cominform, Marshal Tito would be neither neutral nor hostile.

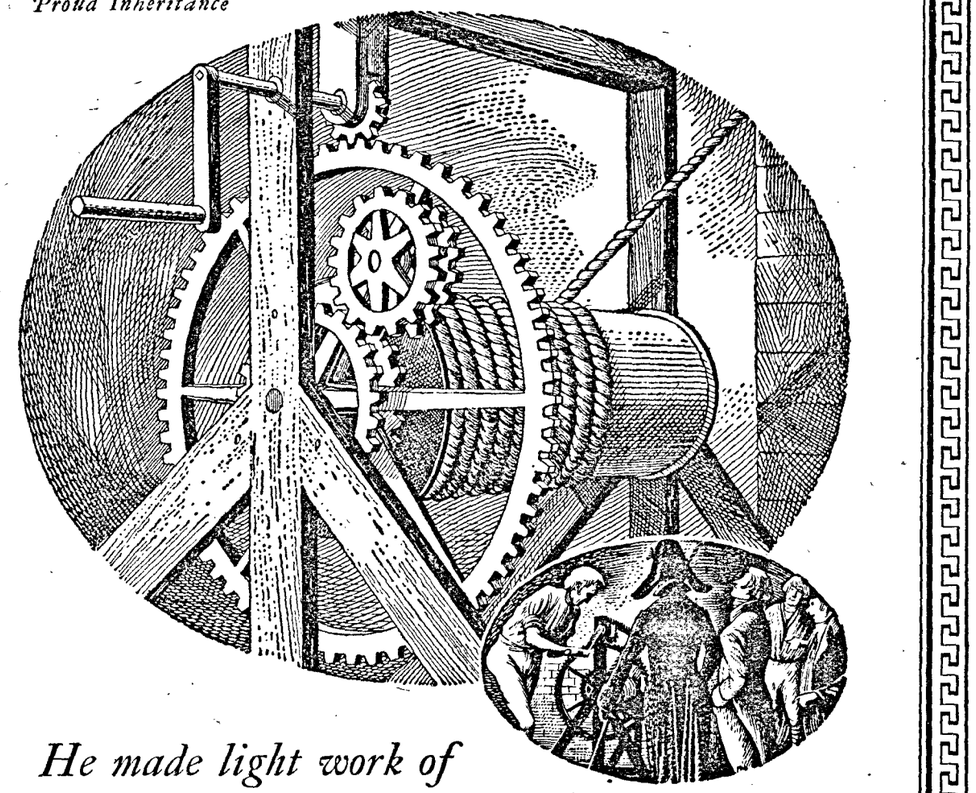
Education for Industry

A very full report on further education was produced recently by the National Advisory Council for Education in Scotland.* It goes back to first principles with a discussion on the aims of further education, which ideally are no less than the full development of the individual (even of the illiterate and semi-illiterate) and not merely the teaching of useful skills. Unfortunately, many of the council's recommendations to this end are incompatible with the prescribed economies in education; broadly speaking, only the utilitarian kinds of further education go forward unchecked. The chapter in this report which has the greatest practical significance is therefore that which concerns technical education.

At the lowest level of technical education, the council thinks that the whole system of apprenticeship ought to be reviewed by a body representing all the interests concerned. In many industries the rules for apprenticeship have become inappropriate, mainly because the need for craftsmanship has declined; and at the modern speed of production it is difficult to train people on the production line. The council was favourably impressed by the state-financed schools of apprenticeship in France. Experiments along those lines will have to wait for better days, but at least the subject could be reviewed meanwhile. Many of the council's recommendations involve no extra spending, but merely a better use of facilities that are already provided. Continuation classes, for example, show a very high rate of wastage. Many students give up because they find the courses they have chosen too difficult—mistakes that might be avoided by routine consultation between the teachers at continuation classes and those of the day schools which the pupils attended.

At the highest level of education for industry, the council carries a long standing argument a stage further by opposing the proposal of its opposite number in England and Wales for a Royal College of Technology. It is true that technology as such is not a profession, like medicine or architecture; it is likely also that a mixed body representing universities, technical colleges, employers, employees and local authorities will never have the status and prestige of a major professional institution. Scotland can afford to take this attitude because three of its four big technical institutions are linked with its universities, and all four have courses comparable with degree courses. But in England and Wales, where technological education is less advanced, the proposal might lead to an improvement in standards and should not be dismissed.

* Further Education. A Report of the Advisory Council on Education in Scotland. Cmd. 8454.



Tax on Knowledge

We are rather shy of writing about the taxes on knowledge, because we have a professional interest in them, and may be suspected of delivering a biased judgment. Moreover, we do not like the name, for nearly all taxes are taxes on knowledge. . . . It is not, therefore, on any of the usual or professional grounds, but on financial and economical principles, that we are about to advert to that branch of Mr Milner Gibson's motion which referred to the paper duties. Of the stamp duties on advertisements and newspapers we shall not say a word. . . . Our readers are aware of the contest now going on between certain classes of booksellers; the whole of which arises from a felt necessity to cheapen books, that the trade may flourish. Mr Ingram's plan will effect that to a very great extent. If it be well founded, it must promote the success of the cheap booksellers, and effect a revolution in the book trade. It may be inferred, therefore, as that is a probable consequence of abolishing the excise on paper, that the old system of bookselling has been kept alive by the tax. If, as we believe, and as the cheap booksellers assert, this system adds from 20 to 30 per cent to the cost of books, a very large reduction, indeed, in the selling price would be the consequence of abolishing the excise duty on paper. The tax impedes, to a great extent, home industry and foreign trade. It checks the diffusion of knowledge, cherishes ignorance, keeps up the price of articles indispensable to civilisation, and forces business into putrifying heaps, instead of allowing it to be equally and healthily diffused throughout the land.

Proud Inheritance

He made light work of the way to lift weights

So fertile was the mind of Henry Maudslay, and so quick was his mechanical perception, that at the turn of the eighteenth century his inventions were following each other in rapid succession. When in 1806 he patented a differential motion for lifting weights (British patent No. 2948—the forerunner of the differential pulley we know today), he had already produced the slide-rest, perfected his micrometer, made the first screw-cutting lathe and remodelled the Royal Navy's blockmaking plant. Soon his attention was to turn to marine engineering, and he became a pioneer in the new era of steam.

Maudslay's genius lay in the simplicity of his technical approach, for he was a craftsman himself and he retained the uninhibited approach of the practical man throughout his life. The principles he made available to mankind are found in many of the machine-tools now in use—basic principles which are nowhere more brilliantly applied to the technique of modern production-methods than in the fine Warwickshire plant that bears his name today, and which produces passenger and commercial vehicles worthy in every way of the tradition begun by Henry Maudslay more than one and a half centuries ago.

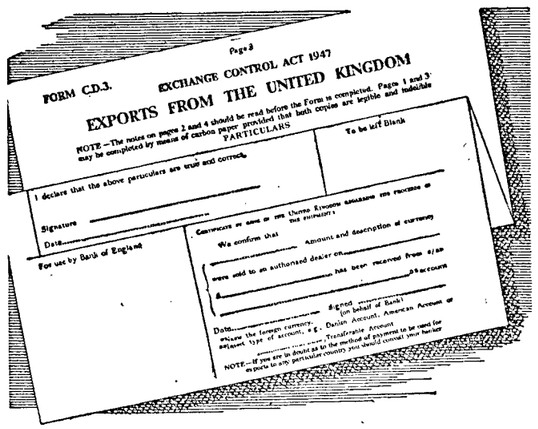
BRITAIN'S COMET

—a new era in world travel

AN entirely new form of world travel is offered by the jet-propelled Comet airliners of the British Overseas Airways Corporation. A degree of steadiness and smoothness, an independence of changing weather, quite unprecedented in the history of travel, are combined with a speed which would have seemed fantastic only a few years ago.

With a feeling of being poised literally motionless in the heavens people may now traverse the continents and oceans at nearly five hundred miles an hour, covering almost a fiftieth part of the world's circumference in that time. The journey from England to the Middle East now occupies an evening; one may dine between the Alps and the Greek Archipelago.



It is Great Britain that introduces this new facility to mankind.

The achievement results from a close working relationship and understanding between the aircraft builder and the operator. The gap of several years in that essential partnership was one of the costs which Britain had to bear in the second great struggle to defend her sovereignty. It was almost enough to eliminate this country as a builder of airliners. The Comet, however, by the sufficiency of its technical advance, has closed the gap at a single stroke.

On this historic day the de Havilland companies, designers of the new aircraft and its gas turbine jet engine, and the British Overseas Airways Corporation, whose foresight has hastened them into public service, recognise together the great importance of pursuing Britain's new opportunity to become a supplier of mainline aircraft to world operators. No such opportunity has presented itself hitherto.

The hopeful outlook is endangered by the fresh threat to world security. Those responsible for the Comet are among the first to recognise the importance of the civil element in Britain's air strength and the need to consolidate the advance which has been made.

Letters to the Editor

The Strain and its Sources

Sir,—There is no need for any such mysterious explanation as Sir Frederick Leith-Ross suggests for Australia's substantial visible trade surplus with the United States in 1951. United States and Canadian figures for their trade with Australia tally very closely with those given by Australia. But balance-of-payments figures recently released by the Commonwealth Statistician show that Australia's total dollar surplus of $97 million in the first half of 1951 was almost exactly balanced by a deficit of $95 million in the second half. Australia ran a very large dollar deficit on services and on investment account. Surely the only assertion on this matter made by any responsible person is that Australia ran a very large overall deficit in 1951? The latest figures show that the overall current account surplus in the first half of 1951 was dwarfed by a deficit of some three times that amount in the second half.

This illustrates one answer which should be made to Sir Frederick Leith-Ross. The objection is not to the banker's customers making use of their balances, but to certain among them drawing them down inconveniently quickly whilst the equal or superior claims of other customers go unsatisfied. In particular, of the increase of some £500 million (not £800 million, as printed in Sir Frederick's letter) in the United Kingdom's sterling liabilities to other sterling countries over the last four years, only £38 million was to the independent group (the Dominions, etc.); the vast majority was to the colonies. In view of the enormous flow of lending by the United Kingdom to the Dominions in this period, the rise in their balances seems remarkably small. The £2,000 million or so now held by the independent group really represents what they accumulated during the war (when the moral rights of the matter were certainly on the side of the United Kingdom). By the end of 1951 the United Kingdom's liabilities to them were actually lower than at the end of 1945.

It would seem difficult for the Dominions in general to level criticism in this matter at the United Kingdom: honours (or dishonours) seem to be about easy. But the figures underline the moral obligation to pay more attention to the needs of the banker's least vocal customers—the colonies. The recent import cuts by the Dominions provide the ideal opportunity to divert our energies to satisfying some of the claims the colonies have been building up over the last few years.—Yours faithfully,

J. O. N. PERKINS
St. Catharine's College, Cambridge

New Zealand and Perón

Sir,—Your note of March 29th, "Like Peter, like Paul—like Perón," dealing with the New Zealand Government's farm prices policy, is much below your usual standards of accuracy and fairness. The facts concerning the payments in the current meat season are set out in a statement by Mr. Holyoake, the New Zealand Minister for Agriculture, published on April 1st. They show that only about £900,000 of the amount paid by the United Kingdom for this season's New Zealand meat is not being paid out to producers.

You say: "Peronistic autarky has become a contagious disease in the southern hemisphere. The two latest victims are Australia and New Zealand." This conveys the false impression that the policy of basing payments to farmers on internal costs rather than on export proceeds is of recent origin. In fact, it began in New Zealand with the dairy industry stabilisation scheme of 1937, was extended to other industries during the war, and has been continued in the postwar period, though with a growing tendency to bring farm payments up to the level of export prices. Whether the policy will be continued is perhaps doubtful: in most industries opposition by producers appears to be increasing.

The question which merits serious consideration is whether the movement away from stabilisation schemes is in the best interests of the British consumer or the New Zealand producer. In your note you say: "This technique of exacting higher prices from its buyers and refusing to let those higher prices encourage an increase in output has been used by Argentina ever since the end of the war." The implication appears to be that if New Zealand had, since the beginning of bulk purchase contracts, paid out full export proceeds to producers, New Zealand's meat production would be substantially higher than it is now. To judge by your article of February 9th, "Incentives for Farmers," you are well aware that, in the farming industries, increased prices do not necessarily bring increased production.

New Zealand's original dairy stabilisation scheme was designed to save the industry from economic collapse, and in its earlier years the payment to producers was substantially higher than the export return. During the war, farm stabilisation schemes were extended as part of a general scheme of economic stabilisation whereby wages, costs in industry, and the cost of living were held at levels below those obtaining in any other part of the Commonwealth. I do not think it can be shown that this general stabilisation policy reacted unfavourably on the volume of farm production or that it resulted in a stimulus to local manufacturing industries. The stimulus to manufacturing came from the reduction in imports caused by the war.

New Zealand's policy for primary industries, as well as her wartime and postwar record of economic co-operation with the United Kingdom, deserve something better than the offensive and wholly misleading label of "Peronistic autarky." It is vitally important to the

Wages and Unemployment

Sir,—In your regrettably churlish note on Sir Stafford Cripps you call the policy of voluntary wage restraint a "crazy improvisation" which "ought not to have lasted longer." Surely your own eloquent description two pages later of the present hopeless drift towards open inflation accelerated by the misguided Budget gives a shattering answer to this charge. If Sir Stafford was amiss he was amiss in that he weakened the policy of income and wage stabilisation, and this paved the way to our present discomfitures. No doubt, however, mass unemployment could cure the evil of the wage spiral without voluntary restraint. If that is *The Economist's* view it should be stated without circumlocution.—Yours faithfully,

T. BALOGH

Balliol College, Oxford

[It is not.—EDITOR.]

European Realists

Sir,—In reply to your statement that the advocates of Federal Union "have done their cause harm by neither examining nor admitting the serious sacrifices it would demand from individual nations," let me emphasise that the economic changes brought about by federation cannot be estimated until it is decided which countries are forming a federation and to what extent, if at all, the federal authority would have economic powers. The first and only essential for any federation is the merging of sovereignty as regards foreign affairs and the control of armed forces. If this were done today between the western nations there would be very little sacrifice from any of them, for those nations are forced by events to pursue similar foreign policies within a vague framework of alliances and treaties. But the only way in which they are able to exert their own wishes and influence is to strain the ties they already have as far as they can without, they hope, snapping them.

If the federal authority were to be given economic powers, it would be the duty of the federal authority to protect the economic well-being of the whole and therefore of the parts, though not necessarily the individual interests in the parts. It is obvious that there would be no sudden removal of tariffs. There would be a gradual change and adjustment over a period of years. There would be compensatory funds and schemes similar to those allowed for in the Schuman Plan. It might be that the federal authority would slowly free trade by commodities through a series of "Schuman Plans," though the wider the field of economic changes, the greater the possibility for give and take and balancing one loss against another gain.

It is unlikely that a federal authority could ever completely free trade. But it should control all tariffs and subsidies. The decisions would be taken by the federal authority and not by the national governments—a system which is producing economic anarchy even within the Commonwealth. As long as the changes are made slowly there would be no greater sacrifices (a word often used to disparage change) from individual nations than are being demanded today by events beyond their control.—Yours faithfully,

J. KEITH KILLBY
Secretary, Federal Union

London, W.C.2

Is Beer Output Falling?

Sir,—While I am almost entirely in agreement with the views expressed in the Note in your issue of April 26th, there are one or two points which I think might be amplified.

In dealing with the time which must elapse between the output and consumption of beer it must be remembered that the Excise figure of the monthly "beer output" is rather misleading. It is really "wort output"—that is, the output of the liquid (which contains sugar but no alcohol) from which beer is produced by fermentation. This fermentation, which breaks up a large proportion of the sugar into alcohol and carbon dioxide, continues for about a week; therefore, a brew which the Excise includes in the last days of a month is not "beer" until some seven days later.

You are correct in saying that draught beer is more perishable than bottled beer, but what is more important in considering this problem is that the period which must elapse between the date of the "brew" and the earliest date at which the beer is ready for consumption is much longer in the case of bottled beer than in draught. A draught beer may be racked into cask within a day or so of the completion of fermentation and may be consumed within the following few days. A bottled beer, however, is usually conditioned, sometimes for weeks, before being bottled, and some beers are stored in bottle for a period before being sent out into the trade. Again, owing to the fact that some bottled beers are pasteurised it is quite usual for a brewery to spread the deliveries of these over two or three weeks before a bank holiday in order to ease the transport burden, and this puts back some of the brewings of beer for bottling.

Easter Monday this year fell on April 14th, compared with March 26th last year—a difference of nineteen days—and it is therefore obvious that a portion of the beer for bottling for the bank holiday trade, which was brewed in March this year, was brewed in February last year. The last occasion when an early Easter was followed by a late one was in 1948-49. Easter Monday in 1948 fell on March 29th and in 1949 on April 18th, a difference of twenty days, and the Excise figure for February, 1949, was approximately 14 per cent below that for February, 1948. Of course, many other factors upset comparisons between individual months; for instance, there was a fall of nearly 40 per cent in the output figure for February, 1947, compared with the previous February, probably due largely to the very cold weather in January and February of that year. It cannot, I think, be too strongly stressed that no reliance should be placed on month to month comparisons; they mean very little.—Yours faithfully,

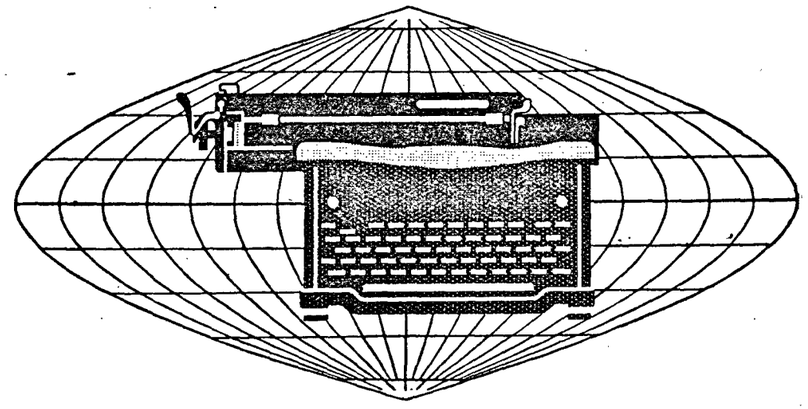
V. E. ROBERTSON

London, W.2

[Some of the bottled beer for the Easter trade was probably brewed in February in both 1951 and 1952; but it seems clear that the proportion of all beer for Easter brewed in February was higher this year than last.—EDITOR.]

From Suvorov to Rokossovsky

Sir,—While agreeing with the main trend of the article in your issue of March 15th, may I take the liberty of calling your attention to a few details.



(1) You adopt a rather severe view of the "traditional constitution of the old Polish Commonwealth." In fact this constitution was a *sui generis* federal constitution. The local government was so highly developed that the central parliament was a body composed of envoys (*nuntius*) of the local diets. Every bill was sent to all the local diets in advance, and only if one of them considered the adoption of the bill prejudicial to the interest of Poland did they have the right to instruct their envoy to veto it. Doubtless such a system can be criticised, but it was not so absurd as the propaganda of Poland's enemies makes it look.

(2) You qualify the 1935 Polish constitution as "fascist." Owing to the success of the British constitution, most of the continental nations modelled their constitutions on it, in spite of the fact that their characters greatly differed from the British. Moreover, there is a marked tendency in this country to have only two parties, while on the Continent the number of parties often exceeds twenty. This creates extraordinary difficulties in forming anything like a stable administration. The Polish constitution of 1935 was an attempt to combine the principles of the British constitution with the American presidential system in order to counteract the tendency towards frequent changes of government. Whether it would have been a success nobody can tell. You maintain that it was "carried by a trick of procedure." Unfortunately in every country there is something called "parliamentary tactics." Is it not a fact that those who are outmanœuvred by such tactics have a tendency to complain of a "trick"?

Anyhow, the constitution became law, and why should you think it surprising that it is upheld by all parties and that even Mr Mikolajczyk "felt unable to repudiate" it? But Mr Mikolajczyk was Prime Minister and was sworn in as such according to the formula prescribed by this constitution. It is true that later he did repudiate it. It was, however, not "after his experience in postwar Poland" (1947), but at the moment when, in 1945, he accepted the post of Vice-Premier in a "Government" appointed for Poland by Mr Stalin with the concurrence of the American and British Ambassadors, a fact which cannot be discussed by any constitutional standards.—Yours faithfully,

LUDWIK RUBEL

AMERICAN SURVEY

How Corrupt is America?

Washington, D.C.

WHETHER the corruption issue is going to figure prominently in the forthcoming presidential elections in the United States is a question to which the political prognosticators tend to return either a clear-cut "Yes" or a clear-cut "No," depending on their party affiliations and sympathies. Good Republicans, asked for an opinion, usually exhibit signs of pleasurable indignation and say "Yes." Good Democrats generally frown and say "No."

This is because "the corruption issue" has taken on by now a curiously narrow meaning. Those who talk about it publicly—the politicians, the press and the radio orators—have slipped into a sort of tacit agreement that the phrase applies to wrongdoing for personal profit by officials of the present Democratic Administration. Only in exceptional cases does anybody point out that no man is an island and that, if any substantial number of federal government employees has been infected by corrupt practices, the disease is most unlikely to be occurring in a moral vacuum that has somehow been created in government offices alone. The tendency is to accept the view that corruption prevails and is centred among Administration officials, and spreads out from them.

The Administration—any Administration—is, of course, both the most compact and the safest objective that the righteous can attack. The President bears a clear responsibility for the behaviour of those whom he has appointed to posts in the executive branch of the government. If an unduly large proportion of them turns out to be corrupt or to have permitted corruption among their subordinates, there is no difficulty about assigning the blame. It would be a far more complicated thing to try to demonstrate just who should be brought to judgment for corruption in, say, the Congress, or the ranks of what is imprecisely called "business." And the consequences of assaults on such alternative objectives might be much more unpleasant.

The attack has been upon Mr Truman's Administration; and though no good reason has yet been produced for doubting that, as the President has said, the vast majority of government employees are honest people trying to do their duty, it is beyond dispute that some unlovely behaviour among officials has been brought to light. From the tax collectors in the Bureau of Internal Revenue who have been convicted of enriching themselves in return for dishonestly granted concessions to firms or individuals owing income tax, and from those who have taken well-paid jobs in private firms in return for loans or other benefits engineered while they held official posts, to those who accepted lesser favours for unrightful benefactions at the public expense, the evidence that there has been some thoroughly dirty work within the Administration's broad territory has become too comprehensive to ignore. It is still true, however, that the charges of corruption have been levelled at those of lower rank and appear to have involved lesser depredations than in the famous scandals of the past.

It has been the probing committees of the Congress that have exposed most of the suggestions of wrongdoing by employees in agencies run by the Administration. The Congress at this politically favourable moment is playing the honourable and popular role of prosecutor. It has not always been as favourably placed. Within the last three years one Congressman has been sent to prison for accepting money from the operators of a munitions business in return for favours he secured for them from the War Department; a second has been convicted of collecting pay from the government in respect of persons he had fraudulently represented as bona-fide employees; and a third has lost an appeal against a conviction for talking illegal "election campaign contributions" from an employee. It is a little over two years ago that a news agency, recalling that each Congressman was allowed up to $20,000 a year to spend on office assistance (in addition to his salary of $12,500 and his annual tax-free $2,500 for expenses), had the curiosity to examine the lists of office employees and found that ninety Congressmen had placed a relative—most often a wife—or more than one relative on their payrolls.

But at this moment the Congress is on the attacking end. At this moment, too, not very much is being said in criticism of business. It has been abundantly clear from much of the testimony the Congressional committees have heard that the federal officials under fire were usually men who had been unable to resist the handsome bribes offered by business firms, sometimes firms with what have been regarded as highly reputable names. But it is the Administration, and not business, that is considered to be at the centre of the corruption issue.

*

Many months of headlines, millions of words of testimony and reports, have now satisfied a large part of the American people that there is much corruption in the government (meaning in the party in power). And several persuasive explanations of how it has come about have been offered. The most charitable is that something of the sort is inevitable at a time when the government is spending money on such a scale as rearmament and foreign aid are now dictating. When there is so much wealth about, so the argument goes, when the taxes which must provide most of it are so high and when the number of federal government employees has climbed to such a peak, decisions affecting large sums of money—sums large enough to make great differences to the annual profits of firms dealing with the government—have to be taken by low-salaried officials with a longing for more rapid material advancement. "How," it is asked, "can you expect a hundred per cent honesty?" The least charitable explanation is that the corruption is mainly a result of Mr Truman's system of appointing mediocre people to big jobs, and then taking the view that loyalty requires him to defend and retain them while they dispense patronage to, and allow themselves to be bamboozled by, a still greater number of mediocrities in lesser jobs.

In the speech Mr Truman delivered to his Democratic friends on March 29th—a speech which, because it contained four sensational sentences announcing his decision not to accept renomination, never got the attention it deserved—he sketched out the Democratic counter-attack on the Republicans who are hoping to whip the Administration on the corruption issue. Mr Truman reminded his followers of the "scandals and corruption of the Republican office-holders in the nineteen-twenties," of Teapot Dome and Muscle Shoals and of Republican legislation that "favoured the greed of monopoly and the trickery of Wall Street." While the Democratic Administration had fought against the efforts of the special interests to corrupt the government, said Mr Truman, the Republican party had consistently fought for the special interests.

And that is probably the most effective way for the Democrats to deflate the corruption issue during the election campaigns. For it would be very hard to get a hearing for the more complicated truth that the whole responsibility for corruption in America, a nation of 156 million people, cannot rest on 2 million federal employees, or even on the Administration which controls them. It would be hard to make it plain that the whole nation has a responsibility and that the true reasons for the slackening of moral standards which has made so many Americans so uneasy will not be found in the behaviour of some government officials, but will merely be reflected there. Not many popularity contests will be won by a politician who invites the voters to consider whether the standards of behaviour in business, as distinct from the standards in personal relationships, which have been set since America's industrial beginning, have been all they should be.

An election year during a cold war is unlikely to be the most promising time to preach the doctrine that whatever corruption there is can most profitably be considered the collective fault of every voter and every office-holder together—a product of every slightly dishonest advertisement, every "fixed" parking ticket, every railway carriage argument that "you-can't-afford-to-be-honest-these-days" and "what's-the-use-anyway?" Yet anyone who did preach thus could end his sermon on a note of hope. He could point out the essential requirement for reform is that an evil should be widely recognised; and he might go on to quote Mr Lindsay Warren, head of the General Accounting Office, who said in a recent interview published by *U. S. News and World Report*:

> The General Accounting Office has been a voice crying in the wilderness since as far back as 1942. The situations now coming to light are not any surprise to us. We knew of similar situations in the past and pointed them out. . . . Our reports received practically no attention during the war years. For the last six years we have been getting a lot more co-operation.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Taft Country

[FROM A CORRESPONDENT IN OHIO]

IF most party primary elections are "eyewash" as President Truman remarked in an unguarded moment, the Ohio primary on May 6th might be described as an acid bath. Several of the contests to determine the parties' candidates and preferences reveal a bitterness unusual even in this politically doubtful state. The most important function of the primary is the election of pledged delegates to the two presidential nominating conventions in Chicago. Ohio's favourite son, Senator Taft, seems bound to corral most of the 56 Republican delegates, thanks to solid support from the state party organisation and the lingering glow of his 430,000-vote majority in the senatorial election two years ago. His only opponent on the ballot—in a state which does not permit additional names to be written in on the voting paper—will be Mr Harold Stassen, whose anti-Taft campaign has grown more intense as his own chance of securing the nomination has faded. In 1948, Mr Stassen managed to win nine delegates. On his own he could hardly do so well this year; but, as leader of a stop-Taft movement, he has hopes of being supported as "the Eisenhower candidate." One wag suggests that Mr Taft's opponent will be "Stassenhower." The General's supporters in Ohio, however, are chary of such tie-ups, having noted the failure of a similar manœuvre in Wisconsin. There Mr Stassen offered to share any delegates he won with General Eisenhower, but failed to secure a single one.

On the Democratic side, former Senator Robert Bulkley originally offered himself as a "stand-in" for President Truman and as such won the support of the state organisation. The President's withdrawal from the race pulled the rug from under Mr Bulkley and vastly encouraged the hopes of Senator Kefauver. That amazing Tennessean has been campaigning vigorously and hopes to capture 33 of the state's 54 Democratic delegates. He has the advantage of being a serious candidate, whereas Mr Bulkley is only a figurehead.

*

The senatorial race this year is for the seat now held by Mr John Bricker, who looks like a copy-book version of a Senator, speaks with old-fashioned eloquence and espouses a rockribbed Republicanism which makes Senator Taft seem a liberal. Mr Bricker has no rivals for the Republican nomination. Less fortunate in the Democratic camp is Mr Michael DiSalle, a former mayor of Toledo, who resigned as federal Price Administrator in order to try to unseat Senator Bricker. Mr DiSalle is a genial roly-poly figure of a man, who never permitted his mountainous task in Washington to spoil his temper or weaken his popularity in Ohio. His decent, intelligent campaign will probably win the Democratic nomination. But then Mr DiSalle's real troubles will begin: 1952 looks very much like a Republican year in Ohio.

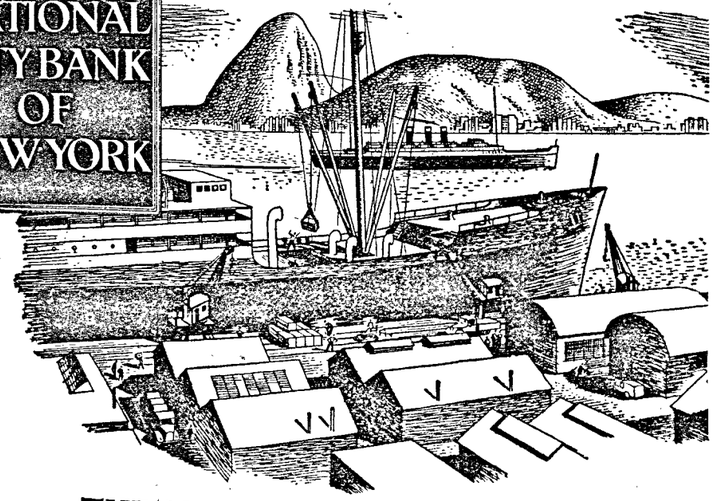
The bitterest contest this year is over the Republican nomination for Governor. Mr Charles Taft, the Senator's younger brother, finds himself opposed by State Senator Roscoe Walcutt and Mr Thomas J. Herbert, a former Governor of Ohio. The Taft brothers differ markedly in temperament and in their conception of what Republicanism should stand for. While Mr Charles Taft supports the party in state and national affairs, and was one of Governor Landon's campaign managers in the 1936 presidential race, his dominant political interest has been governmental reform in his native, and Republican, city of Cincinnati. A past president of the Federal Council of Churches, he shares the broadly international views of that group. Nobody has ever accused the younger Taft of being an isolationist. Several of Ohio's big county Republican organisations support him, but he is passionately opposed in his own city.

This opposition is based on two counts. The first is that for more than twenty years he "has served the New Deal and Fair Deal Democratic organisations." Actually, he held more than a dozen wartime posts in Washington, the most

important being Director of Wartime Economic Affairs in the State Department. Previously, in 1937, he served as federal mediator in the violent "Little Steel" strike. It is a record of which many a Republican, and any number of Democrats, might be proud.

The second charge—of anti-Republican activity in Cincinnati—cannot be denied. Indeed, Mr Taft admits it with pride. As a leader of the "City Charter Committee" (a fusion of Democrats and "independent" Republicans), he has been a thorn in the flesh of Republican regulars, in the interests of good government. They regard a strong organisation in Cincinnati as the wellspring of party strength in state and national politics. While serving as a "Charterite" councilman, Mr Taft also allied himself with the Political Action Committee of the Congress of Industrial Organisations. This is anathema to orthodox Republicans, who denounce the younger Taft as a turncoat.

*



The intra-party feud has not marred the family relations of the Taft brothers, who respect each other's opinions. Indeed, Mr Charles Taft actively supports the Senator's presidential campaign, and appreciates why the latter must remain neutral in the contest for the Republican nomination for Governor. But many Ohio Republicans fear that the entry of the younger Taft into state politics may harm his brother's national chances. The appearance of the two names at the top of the Ohio ballot on Election Day might strike the voters as "too much Taft." Besides there is a strong American prejudice against political royal families. To all this, Mr Charles Taft's supporters retort that his influence might help the Senator among religious and reform groups.

The Taft brothers symbolise the conflict between the liberal and conservative elements within the Republican party. The Senator is the traditional Republican, suspicious of foreign entanglements, dedicated to public economy, anxious to limit wherever possible the powers of central government. Mr Charles Taft is an experimenter by nature, deeply interested in foreign affairs, acutely aware of social problems, and quick to adopt Senator Kefauver's personal approach to the voters. He feels a special effort must be made to attract the young, and quotes, as a warning, the recent Gallup Poll in which voters between the ages of 21 and 29 listed themselves as 24 per cent Republican, 41 per cent Democratic and 35 per cent independent. Evidently he does not agree with his brother that all the party needs to win in 1952 is to arouse the 40 million members of the electorate who failed to vote in 1948.

In any event, 1952 is likely to be a year of much crossing of party lines in Ohio. To compute all the possible combinations is a mathematician's task. Many Republicans favour Senator Taft, but not his brother. A lesser number take the opposite view. The Democratic Governor, Mr Lausche, who is hoping for an unprecedented fourth term, is liked by many Republicans and disliked by many orthodox Democrats, who object to his unconcealed coldness toward the Truman Administration in Washington. With the strongly conservative Senator Bricker and a contrasting pair of Tafts on the ballot, the Republican ticket in November would run the national gamut of Republican sentiment. That possibility should help to bring a heavy turnout at the primary polls on May 6th. In any event, the variety of its political complexions, the sharpness of its rivalries and the eminence of its contestants should make this Ohio contest one of the most interesting of the sixteen state primaries of 1952.

BUSINESS AROUND THE WORLD

THE NATIONAL CITY BANK OF NEW YORK

For a hundred and forty years, The National City Bank of New York has been developing a world-wide service for businessmen.

Today the Bank has fifty-six overseas branches in the principal centres of commerce, and is in direct touch with nearly 1,000 correspondent banks around the free world.

The London branches of The National City Bank have long experience of both British and international banking. They are uniquely equipped to advise on trade with the dollar areas, and they can command the resources of a global organization.

Whatever your problem and wherever your business, The National City Bank of New York can assist you.

The President's Powers

Judge Pine's decision that the inherent powers of the President do not include the right to seize the steel industry in peacetime has precipitated the strike staved off for four months and has posed a constitutional issue of the first importance. The Administration at once sought and obtained a stay to permit it to apply to the Supreme Court, but the steelworkers have refused to wait upon the courts and the mills are now idle.

In the Judge's view, this is a lesser calamity than the injury

> which would flow from timorous judicial recognition that there is some basis for this claim to unlimited and unrestrained executive power

and he is widely applauded for his courageous stand. This is the first time an injunction has been granted, in effect, against the President, although technically it is directed at the Secretary of Commerce. The Administration itself seemed almost to invite the judicial lightning. The Assistant Attorney General, in answer to the Judge's questions, made claims of unlimited powers for the President in an emergency, which he later attempted to withdraw, and earlier Mr Truman had made a poor impression when he attempted to justify the steel seizure by hazy references to a non-existent "*ultimatum*" *sent to the Soviet* Union in 1945.

Judge Pine relied, for his interpretation of the President's powers, upon a statement of a former President and Chief Justice, Mr Taft, that the President can exercise no power which cannot be reasonably traced to some specific grant of authority or justly implied in its exercise. This is not an interpretation which has appealed to the strong Presidents of the past, who believed they had the power and the responsibility, in the interest of the national welfare, to do anything not specifically forbidden, and who on occasion defied the Supreme Court. But Mr Truman has made it clear that he is a "constitutional President" and will abide by the decision of the courts. He has no intention, as the steel companies have suggested, of setting aside Magna Carta or claiming the divine right of Kings.

It is now up to Congress, which has been so critical of the President, to prevent a prolonged steel stoppage, which would have a damaging effect upon the rearmament programme. So far Mr Truman's critics have been able to indulge in the luxury of investigating and obstructing the President, and talking wildly about impeachment. Many would be delighted to see the President forced to invoke the Taft-Hartley Act, which he has so far successfully avoided. But even if he did, it would be at least ten days before an injunction against a strike could be obtained, and there is no guarantee that the union, which has held its hand for longer than the "cooling-off period" prescribed by the Act, would obey a court order. The idleness of half the oil industry underlines the need for Congress either to improve the Taft-Hartley Act or to authorise some form of seizure, if the defence of the Constitution against executive usurpation is not to leave the government unarmed to deal with emergencies.

* * *

Stabilisation After Steel

Administration supporters, piloting the renewal of the economic controls Bill through the Senate, prudently put back to port when the steel storm broke. To have pressed on, in the face of the angry Congressional suspicion that the Administration was scuttling its own stabilisation programme, would have invited shipwreck. A month ago the Senate Banking Committee tentatively voted a year's renewal of the Defence Production Act, which authorises controls over wages, prices, rents, credit, and materials and which is due to expire on June 30th. Now the Senate Bill will not emerge from committee until the middle of May at least; hearings have just begun in the House.

Any hopes the Administration may have cherished of stronger powers are now dead. Instead, both the Senate and the House are thinking of weakening the Wage Stabilisation Board, which many Congressmen feel was unduly generous to labour and which most observers agree exceeded its authority in prescribing the union shop for the steel industry. One suggestion is that a panel representing only the national interest should be substituted for the present system of equal representation for labour, industry and the public.

The demand for a wage board composed only of public members may seem strange in view of the steel industry's campaign against the present public members of the board. Steel spokesmen have charged that public members in fact were labour members because in the past they had been in the employ of the trade unions. In fact, most of them had been equally in the employ of industry, having acted as arbiters in labour disputes, with their fees met by both sides. Critics of the tripartite make-up of the WSB believe that, if public members were in a clear majority, they would not have to compromise with either the unions or industry and could act more boldly in the public interest.

On prices, the steel dispute has strengthened the convictions of those who believe price controls should be abandoned. But even in industries whose market prices are today far below the ceilings, Congressmen are not all anxious, in an election year, to expose themselves to the charge that they destroyed safeguards against inflation. Many would be happy to let the Administration take the responsibility, if they felt sure it would relax controls wherever possible. Mr Arnall, the Price Stabiliser, who is anxious to keep the controls intact for an emergency, has just offered proof of his good intentions; he has suspended price controls on sixteen commodities, including wool and some fats and oils. Raw cotton, textiles and apparel are next on his list for consideration. He has reserved the right, however, to re-impose controls if prices reach a certain level.

* * *

Delegates *versus* Popularity

Tuesday's primary election in Massachusetts was the first occasion since the original contest in New Hampshire that General Eisenhower and Senator Taft had competed directly on equal terms for the support of Republican voters, and the result was the same—a clear triumph for the General. Admittedly he had much in his favour in Massachusetts: it is the home of Senator Lodge, his leading champion; the other Massachusetts Senator, Mr Saltonstall, is also on the General's side; and his main strength has always been in New England, as Mr Taft's has always been in the Middle West. The official Republican organisation in Massachusetts was, however, neutral and for once there was no suggestion from Senator Taft that he was not being given a fair chance.

In the popularity contest, no names of candidates were printed on the ballot paper for the guidance of the voters, who had to remember their preference for themselves: 246,000 Republicans wrote in the name of Eisenhower, and only 106,000 that of Taft; even more striking, 16,000 Democrats spontaneously chose the General compared with 27,000 for Senator Kefauver. The General received a clear majority, over all the other possibilities in both parties, of the record number of votes cast. And 29 of the 38 delegates picked to represent Massachusetts at the Republican nominating convention support General Eisenhower. Senator Taft hoped for at least ten from this State, but he obtained only three.

The Senator, whose approach to political life is more practical than is the General's, attaches more importance to delegates than he does to popularity and he is claiming that at the Republican convention in July he will have 650 votes; 603 are needed for the nomination. This is not yet whistling in the dark, but it is certainly wishful guessing. Detached observers give the Senator and the General about 270 dele-

gates each at this moment, with over 100 unpledged to either and nearly half of the 1,205 still to be selected. Most of these, like many of those already appointed, will be chosen not by popular vote but by the party organisations in their states, many of which are in Senator Taft's pocket, especially in the South.

Even party officials, however, are not impervious to popular feeling and there are few state delegations so deeply committed to Senator Taft that they will be unable to climb out on the winning side, even if it turns out to be General Eisenhower's. For example, Governor Fine, who controls most of the huge Pennsylvania delegation and is understood to prefer Mr Taft, has no intention of promising his support until he is sure that, by so doing, he can have a decisive effect on the outcome of the convention. What the convention will want is a candidate who can secure the Presidency and it is that which makes General Eisenhower's victory in Massachusetts so important. Not only has he once more proved that he is a vote getter, but he has also proved that he can get the votes of Democrats and independents—and without these the Republicans cannot win.

* * *

Riots and Reforms

The three prison riots that took place last week, two in New Jersey and one in Michigan, were the worst such outbreaks in twenty years, and have focused public attention on the urgent need for reform in prison administration. These riots were all in state prisons; of the 148 prisons housing 170,000 adult convicts in the United States, 126 are state institutions, the rest federal. The most spectacular revolt—and it was significant that these disturbances were not attempts to escape but fights for better conditions within the prisons—was the one at Jackson, Michigan, where 6,500 convicts are enclosed in buildings meant for a maximum of 5,000. More than $2 million worth of damage was done during the riot, which was started and finally ended by a nucleus of 171 prisoners in the disciplinary isolation block, graphically described by its inmates as "The Hole" because it is always kept dark. The convicts seized a group of guards as hostages, lived off food hidden during weeks of preparation, and surrendered, after five days, when the Governor of the State, Mr Williams, agreed to the eleven reforms they demanded.

While the Governor declared he acted to save the hostages, an assistant warden, since relieved of his position, said the complaints were justified. The principal protests were against brutal treatment, lack of proper segregation, lack of hospital and psychiatric treatment, and parole procedure. Parole methods were also one of the chief targets of the rioters at the Trenton and Rahway prisons in New Jersey. Here the "strikes" were shorter and less violent, and the wardens succeeded in inducing surrender without the complete loss of face suffered in Michigan—or the dinner of steak and ice-cream which had to be provided there. In New Jersey the complaints are simply to be investigated by the Osborne Association, a private group concerned with penal welfare, which has also been called in for counsel in Michigan.

It should not be difficult for the association to find the causes of the riots. The growth in population, and with it the rise in the number of prisoners, has not been accompanied by an expansion of corrective institutions; on the contrary, too often state legislators have cut funds for prisons to the bare minimum. The association's difficulty will come when it tries to convince the states, whose budgets are often drawn up for two years in advance, that the rising cost of living affects prison life too. A lack of sufficient funds inevitably means a decrease in the amount and quality of trained personnel, of recreational and educational facilities and of food. This is true also of other state institutions such as mental hospitals and juvenile reformatories, but improvements in prison management seem to be the most difficult to attain. Economising legislators find it cheaper and easier to cry out against "coddling" prisoners and "making a country club" out of what they regard as a punitive rather than a reformative institution—and one where the residents do not vote.

Foreign Aid on the Move

This year's foreign aid programme has got over its first obstacle, the Senate Foreign Relations Committee, with the least that had been expected, $1 billion, shorn off the $7.9 billion requested by the President. The cut is to applied to all sections of the programme alike, if the committee's proposals are approved, instead of being taken mainly, as had been feared, from economic assistance. In the House, if not on the floor of the Senate, more is likely to be heard of the alleged unsuitability of Mr Averell Harriman, the Mutual Security Director, remaining in charge of this supposedly bipartisan programme while he is running for nomination as Democratic candidate for President. Mr Harriman has no intention of resigning, and there seems little, if any, reason why he should before he is nominated. The suggestion came from Mr Richards, chairman of the House Foreign Affairs Committee, whose affection for Senator Russell, another Democratic aspirant, may have something to do with his fear that foreign aid will be adversely affected by Mr Harriman's political activities.

Not Mr Harriman, but the job he holds, is, however, once more under attack from those who feel that the foreign aid programme needs a central organisation rather than a co-ordinator. Mr Harriman's appointment was the compromise by which this same controversy was settled last year. The Committee on the Present Danger, a private but influential organisation, believes that administrative confusion is responsible, amongst other things, for failure to make best

In the unremitting struggle to expand British exports, a vitally important part is played by the men who travel all over the world to the various markets — surveying, supervising, organising and, above all, *selling*.

These representatives of British Industry include Hoover executives who, between them, visit every country in which export business can be done — from Finland to Siam, from Pakistan to Chile — at least once every year. Their sole object is to maintain and increase Hoover exports — Electric Cleaners, Washing Machines, Polishers, F.H.P. Motors, etc. — and some measure of their success is indicated by the fact that shipments of Hoover products are now being despatched regularly to 66 countries in all parts of the world.

It is encouraging to note that during 1951 Hoover exports were about two and a quarter times as large as in 1950, which was itself a record year. Indeed, during 1951, Hoover Limited exported nearly 50% more electric cleaners and 50% more electric washing machines than all other British manufacturers combined.

Backroom Boy with a bucksaw Although his name never appears Halloran is one of the most important contributors to the newspapers. In fact, it is on his bucksaw that the publication of the newspaper depends. For Barney Halloran* is a Newfoundland logger, on the pay roll of the largest paper mill in the world — Bowater's at Corner Brook. His job is to fell and cut the trees into four foot logs, using the length of his bucksaw as a measure. They are then ready for the journey to Corner Brook by sleigh, truck, train, ship or most usual of all, floating down by river, there to be pulped and processed into newsprint. Halloran stands five foot eleven in his socks, and weighs 200 pounds, according to the Medical Officer who runs the foot rule over every logger at the start of the season. According to the camp cook, his appetite is built in proportion! "He'd eat a cow between two biscuits." But Barney just smiles tolerantly, knowing that a logger without an appetite is as useless as an axe without a handle.

THE WHOLE WEALTH OF BOWATER CRAFTSMANSHIP, EXPERIENCE AND RESEARCH IN THE ART OF MAKING PAPER — THE 'KNOW-HOW' IN SHORT — IS FREELY AT YOUR SERVICE.

STARCH PRODUCTS

AMONG the problems that oilwell drillers have to solve are the cooling of their drill (which may be three miles or more below ground, at the bottom of a hole only a foot or two wide) and the removal from the hole of the earth and rock that the drill cuts away. The surprising answer to these problems (and to one or two others as well) is — mud. It is special mud, of course — a thick and sometimes rather milky fluid which costs just about as much as milk. It is pumped continuously down the slender, jointed steel tube that drives the drill; it flows through the drill itself, fills the hole outside the tube, and so flows back to the surface, carrying the drill-cuttings with it. The returned mud is sieved, to remove the cuttings, and used again. But if the earth round the hole is porous, as it usually is, the mud may lose so much water by seepage that its circulation cannot be maintained.

Starch for sealing a porous surface

A common way out of this difficulty is to add to the mud some substance that will blanket the porous surfaces of the hole with a more or less waterproof coating. A substance that is widely used for the purpose with ordinary clay muds is common starch. The effect of the starch is to bind particles of clay from the mud into an impervious plaster on the porous surfaces.

The provision of starch in large quantities for the use of oilwell drillers is one example of the kind of service that the Brown & Polson Group performs for many widely different industries, and is ready to perform wherever opportunity exists. Enquiries will be answered by responsible experts. They should be addressed to:

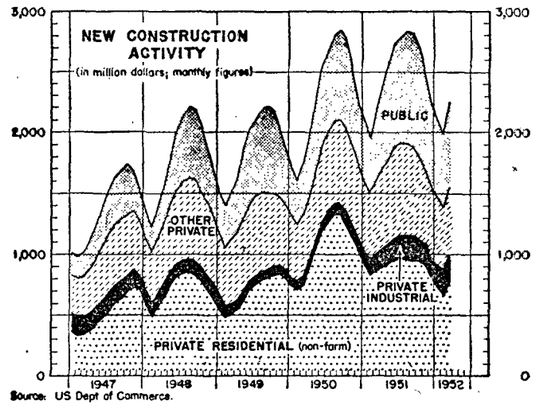
use of the European economy in the common effort and for the delay in placing arms orders, to be paid for in dollars, in Europe. And Mr Nelson Rockefeller has again demanded an overseas economic administration, to deal with all foreign aid apart from purely military assistance.

He was speaking at a conference called in Washington to encourage private American investment in underdeveloped areas. But the doubts of private investors will hardly be stilled by Mr Justice Douglas, another speaker at the conference, who insisted that the main object of this Point Four programme should be to foster peasant revolts, instead of protecting feudal landlords, in underdeveloped areas. Nor will this speech be helpful to the American officials who are trying to induce the governments of these areas to accept aid in spite of their suspicions of American interference. However, the new head of the Point Four programme, Mr Stanley Andrews, is a man who should be able to convince Middle Eastern leaders and others that the programme is indeed a technical assistance scheme and nothing more. He is also well qualified to make best use of its limited funds—$656 million was requested this year, but will not be received. Mr Andrews comes from the Office of Foreign Agricultural Relations, which was working on schemes of the Point Four type long before the programme was officially born.

* * *

Stay-down Strike



The Air Force, on second thoughts, has dealt leniently with its "mutiny." Two reserve officers have been court-martialled for refusing to fly, but they probably will not serve their prison sentences, and an administrative discharge without dishonour probably awaits the other twelve, who seemed likely to be court-martialled, as well as some 35 other reserve officers who, without refusing to obey orders, have pleaded "fear of flying." Most of these men saw combat during the war and have fine records. That is the root of the trouble, not the high number of deaths from accidents, or suspicion of the B-29's efficiency. When the war broke out in Korea, regular officers of the strategic bombing command were carefully withheld, lest the war suddenly spread. Other regulars were kept at home for training purposes. The reservists, not unnaturally, resent having to undertake, for the second time, risks that others have escaped altogether, though their retention of a commission after the war—and the pay that went with it—clearly made them subject to combat if needed.

Eighty per cent of the Air Force's pilots are reservists, their average age is over 30, and most of them have families, businesses, and homes to pay for. Involuntary recall of reservists ceased five months ago, but for a long time reservists will be the backbone of the Air Force. This is because hasty demobilisation after 1945 slowed down training, while the attack in Korea and the rapid expansion of the Air Force put a premium on anyone with flying experience. Hardship cases are inevitable, though they would be fewer if Congress had authorised the reclassification of the reserves.

Flying, however, cannot be taught by order. The Air Force would be less worried about its reluctant reservists if new recruits were coming along satisfactorily. But this is not the case. For the first time this year fewer than the allowable 25 per cent at Annapolis and West Point volunteered for flying training. Of the 6,700 to be commissioned this year from the air training programme in the colleges, only 750 are fit and willing to fly. Flying seems to have lost its glamour, even for the young, and the call of patriotism is weaker, when it is to an undeclared and apparently unending war in Korea, than it was a decade ago. For this reason the services exerted all their influence to persuade Congress not to accept Senator Douglas's suggestion—which had both democracy and economy in its favour—to reduce all "hazard pay" to a private's $30 a month. They consider that an earlier reduction contributed to the present difficulties.

Housing Prospects

It is a happy coincidence for the Democratic Administration that the growing availability of building materials is permitting last year's restrictions on construction to be progressively relaxed as the election campaign gathers speed. By autumn, unless there is a prolonged steel strike, the building industry should have returned to business as usual. Already in March the amount spent on new construction was higher than in March, 1951. This was explained by the large sums paid out by both the government and private firms for industrial expansion and defence facilities. A substantial part of these programmes will be completed before long, but some at least of the slack will be taken up by public works which have had to be deferred because of shortages of materials.

These shortages have, however, affected the building of private houses little, if at all. Here the limiting factors have been the same reluctance to buy that has been noticeable in other consumer goods markets and, even more, shortage of mortgage credit. If the March rise in spending on residential construction is maintained, nearly 1,000,000 new non-farm units should be built this year. If buyers are not found for these houses, the Administration will hardly be able to resist some relaxation of the terms on which mortgages are granted. These terms are now too stiff for many potential borrowers, but even those who could meet them have not always been able to find a lender. Conditions on the money market are now becoming more favourable, but even so the government guaranteed loans, with interest rates at only 4 and 4½ per cent, are not very attractive.

These are the types of loans which are taken out for the low-cost houses, at under $12,000, which are still easy to sell. The poor demand for more expensive houses is perhaps in part an indication of the coming exhaustion of the postwar demand for homes. It is true that the Federal Reserve Board's latest survey of consumers' spending plans found just as many people who definitely intended to buy a new house this year as it did last—but there were fewer who thought that perhaps they might. More significant is a study by the Department of Commerce, which puts the average annual demand, in times of prosperity, for new dwelling units at about 750,000, exclusive of replacements. Since 1947 over 1,000,000 new units have been provided on an average each year, and this has done much to meet the extra demand resulting from lack of building during the depression and the war. It is thought that there are still enough married couples living "doubled up," and wanting their own houses, to sustain a high rate of building at least until 1953. But after that, it can only be maintained at its present level by replacing existing houses; it is encouraging for builders, at least, that the 1950 census found nearly 3,000,000 dwellings in a dilapidated state.

THE WORLD OVERSEAS

Solvency without Tears

(From Our Paris Correspondent)

NOTHING at all startling has happened in France since Christmas: but a person returning to the country after some months' absence is obscurely aware of a difference not wholly attributable to the splendid spring weather. It seems as if the French public had switched from sterile theoretical thinking about affairs to something more like genuine policy. To say this is not to hail M. Pinay as the national saviour. His government has achieved hardly anything yet and his programme is highly contentious; but there is a deeper change which may lead to better government. It is as if the grim period which ran from about 1934 to about today were at last ending. This was an essentially ideological phase in French public life—if one may call "ideological" the state of democratic politics in which philosophic formulae assume a greater importance than urgent tasks.

Post-war France has experienced not only its normal "structural" struggles—rich versus poor, town versus country, Catholic versus *laique*. It has been bedevilled by bitter short-term quarrels—resistance against non-resistance; right resistance against left resistance; and, in foreign policy, neutralism against membership of the Atlantic Pact. It seems at last that the resistance is falling into its true place, as a chapter of military history; for, whatever moral renovation it achieved, neither its leaders nor its constituent groups will, severally or conjointly, rule France. De Gaulle's RPF has not made the grade; the Communist party is slipping; the bloom of youth is gone from Socialism: the MRP, middle-aged from birth, is now thoroughly decrepit. The initiative—or, at worst, the power of inertia—seems again to lie with a broad, hardly definable national mass which is old, conservative and non-ideological.

M. Pinay faces in aggravated form the problem which tormented his predecessors of the left and centre; how simultaneously to wage war in Indochina; build a metropolitan army; modernise French industry and agriculture; and maintain purchasing power. He inherits an industrial situation in which France's costs are some 15 per cent higher than those of its trading competitors and a budget which can be balanced only by raising a loan of 100 billion francs. (Preceding coalitions have not been able to borrow.) In addition M. Pinay must sometime repay to the OEEC the emergency loan of 100 million francs which was granted to France. In the opinion of many the currency is so overvalued at the current exchange rate as to be undefendable. This school concedes that M. Pinay, if all goes well, may bring about a five per cent price reduction by his appeal to entrepreneurs, but it denies that the country will thereby regain external solvency: whereas, on this view, a prompt devaluation would gain time in which to introduce conditions of competitive production. In spite of the stabilisation or fall in the price of many raw materials, the Government is already operating cruel import cuts, which are themselves inflationary in effect. Another deadly feature of the import controls is the growing inability of French manufacturers to choose the favourable moment for the purchase of their raw materials.

However this may be, the franc is not to be devalued at present and M. Pinay is staking his all on the success of his price-cutting campaign and his loans. The campaign, which was given impetus by the Prime Minister's speech at Lyons, a resounding profession of the liberal faith, is going better in the towns than in the countryside. The farmers have already protested against the anticipation by one month of the normal seasonal reduction in the price of milk; and they are more interested that M. Pinay should decree a higher price for wheat in July than in lowering their own prices for him now. It is probable that not much response will come from the country until the town sells it more cheaply the goods, and especially the capital goods, which it must buy. After gaining the support of the big stores the Prime Minister has continued to convene businessmen, working through such modest organisations as "the federation of small and medium businesses." M. Georges Villiers, chairman of the *patronat*, has also publicly supported price reduction, and the tentative principle of voluntary cuts is gaining momentum; but it is far too soon to speak of success. The crux of the matter will be M. Pinay's handling of the meat market.

Can M. Pinay Survive?

The government-inspired *baisse* has one excellent tactical advantage. It enables M. Pinay to stave off wage increases for a while. Some kind of sliding-scale seems to be politically inevitable. Two lethal bills to this end have already been voted by the Assembly and returned radically amended by the Council of the Republic. On the return of the second amended bill M. Pinay ducked, saying that he would himself present a third bill after a month's delay during which the *baisse* would have had time to take effect. The point at issue is whether the sliding-scale is to be based on a new minimum wage incorporating the 12 to 15 per cent price rise that has occurred since the last statutory minimum of October, 1951, or whether the October minimum can be retained as a base. Fortunately for M. Pinay the Communist union (CGT) is weak, and the other unions are willing to give the Prime Minister a few weeks' respite, for he has it to his credit that in February the cost of living fell by 0.4 per cent, a reversal of an upward trend that had persisted for twenty-two months. If he can cut prices a bit during May before the parliament reassembles, M. Pinay will probably be able to survive the summer on the wage-price front.

Far more uncertain is the outcome of his bid for public credit. His problem is to squeeze out of the public's homes some of its gold and banknotes and make it lend them to him. The main enticement offered (which is an enticement only if there is a general atmosphere of economic confidence) is the waiving of penalties for tax-evasion. This concession will cease punctually on July 1st. After that date all accretions to bank balances will be taxed as income and future evasion will be subjected to far heavier penalties than under the present "transactional" system. M. Pinay's own solvency will therefore depend purely upon the public reaction to his cane and candy. The Government must first choose the precise type of loan from the samples that the financiers are offering. Even if the tax-amnesty brings funds to light it is not certain that a large part of them will not be used for investment in private businesses. Therefore a real counter-attraction is needed. French solvency is in the lap of the gods. All that can be said for the moment is that the conservatives are in and seem bent on at least a limited financial patriotism, a sort of solvency without tears.

Soviet Germans Prepare for Victory

HERR ULBRICHT, head of the German Socialist Unity Party, has made it plain that the Soviet government seriously intends to hold all-German elections. Speaking to a delegation of Western Germans last week, he said:

> All-German elections alone can prevent Western Germany's integration into the Atlantic Pact. This is the basic issue. The fact that we hold different views about the structure of the new Germany to emerge from elections is immaterial. Adenauer and his associates know very well that there would be no Adenauer government left after such elections.

Preparations are now being made in the Soviet zone to ensure that this prophecy comes true. Elections, when they come, are to bring victory for the joint lists of Communists, Social-Democrats, candidates put up by the Communist-dominated organisations, and anyone else who supports the terms of the Soviet draft peace treaty recently presented to the West. The Soviet government, it seems, envisages elections that will be "free" according to the letter of the law, but which will not be fought on the issue of Communism or non-Communism but of "peace, unity, free trade, a people's army, and the withdrawal of foreign troops." As Bishop Dibelius has said: it would need the equivalent of 15 divisions to supervise the voting. The Communists are ordered to collaborate with the Social-Democrats, and the Socialist Unity Party has even made an approach to the Social-Democrat Party Executive. In recent local elections in the Federal Republic, Communists have already begun to support Social-Democrats. Evidently Moscow intends a national front government to be the outcome.

Human Touch Ordered

Administrative reforms are being introduced in the Soviet zone as preparations for the test to come. The present over-centralised system is being broken down in order to bring the Communist bureaucrats more directly into touch with the public. Hitherto the "bosses" have simply issued orders from central offices that swarmed with officials who cared little whether they were unpopular or not. Leipzig is now the first large city in the zone to start a far-reaching process of decentralisation. The borough staffs will be greatly increased, and will include honorary district councillors—presumably politically reliable individuals who will "nurse" the constituency for election day. The best men must go into the local administrations, according to orders, and "must turn every German into a true and active friend of the great USSR." At the same time, the pernicious system of house and street wardens is to be overhauled. These petty spies and tyrants are told to become the trusted friends of the people whose private lives they dominate. They will know how every occupant of a house intends to vote, or—still more important—every occupant will think they know.

According to one report, the Socialist Unity Party secretariat has recommended that the Soviet zone parties and Communist-dominated mass organisations should at first exert only a moderate influence over the inhabitants in local elections. Herr Ulbricht is said to have ordered that the new urban district committees should be genuinely elected, in order to test the "democratic awareness" of the population. The elections of SED executives are for the first time being held by genuinely secret vote. There have been a large number of attempts to evade this order by distributing voting slips before discussion of the candidates to be nominated. All along the line, promises have been made to examine grievances, and see why social welfare regulations have not been carried out.

These attempts to popularise the Communists are going hand-in-hand with terrorism. Herr Ulbricht has warned that there will be intensified activities by West German "saboteurs" in the immediate future and SED party members must be prepared to frustrate them. Efforts are being made to intimidate listeners to the western radio. It is evident that the Soviet German leaders are in earnest with the assurances they are giving that the new Germany which emerges from elections will be "peace-loving and democratic," in the Communist meaning of the phrase.

In the meantime the Communists are indulging in a new bout of wishful plotting. Urgent appeals to overthrow the Adenauer government and begin all-German talks on elections are being made. After official announcements that "the hour for action has struck," Herr Ulbricht told the Western German delegation last week:

> A force expressing the people's will must be created against Adenauer. His preparations for a *Putsch* must be countered by mass demonstrations and mass strikes. There is no other alternative. If the people gains in strength, the Adenauer government will be forced to resign and power will pass into the hands of politicians willing to negotiate. . . . Men anxious for East-West talks must be helped to assume leadership in Western Germany, regardless of their party ties. I leave this question quite open for the moment.

The accusation that the Chancellor intended to enforce the treaties with the western powers by means of a *Putsch* appeared to be due to fear that Western Germany would be told by the Allies to make use of its freedom to rearm without waiting for the Bundestag to ratify the new agreements. It also serves to excuse the Communists' call for a *coup* against the Bonn regime.

Herr Ulbricht's talk to the West German delegation stressed the Communist policy of appealing to nationalism. "We believe national feeling must be strengthened," he remarked. He went on:

> At the moment, the Adenauer government is supported by US, French and British bayonets. By fighting for its overthrow the people will be fighting also for the isolation of the American interventionist enemies in Western Germany.

In the Cominform Journal of April 25th Jacques Duclos, the French Communist leader, elaborated this theme further:

> The Soviet proposal [i.e., for a German peace treaty] is aimed at ensuring peace by means of eliminating the division of Germany into two parts and by creating conditions for the withdrawal from Germany of foreign troops—which would also lead to the withdrawal of the American occupationists from France and from the other countries in which they have entrenched themselves.

Nobody could put the Russian aim more plainly than that.

Egypt's Economic Troubles

[FROM A SPECIAL CORRESPONDENT]

THE preoccupation of the Egyptian Government and press with Anglo-Egyptian relations has diverted public attention from the grave economic crisis which threatens the country. The pasha's 1953 limousine and the fellah's new *galabiya* depend on the export of the cotton crop, a considerable part of which remains unsold; at this late stage in the season, large-scale foreign buying is unlikely. Egypt's postwar economic policy, which has been based on the export of a single crop, has temporarily broken down because in 1951 and again this year the merchants have been unable to sell their cotton abroad, and as a result the country is short of the foreign currency urgently needed to buy foodstuffs, petroleum, fertilisers and agricultural machinery.

Thus the Government has recently been forced to draw sterling from the unblocked No. 1 account at the rate of £500,000 daily to pay for imports, and when the British Government released £10 million from the blocked account on April 5th the free balance had sunk to *£E7 million.

*£E1 = £1.026.

Egypt's bankers and government officials had grown accustomed to a balance of around £E60 million in the free account, which at the present rate of spending will be entirely exhausted within two months. In Egypt the change from a strong to a weak financial position coincided with the Wafdist period of office. Nahas Pasha, however, and his cabinet cannot be blamed for the fall in the world price of cotton, but they are responsible for the "erroneous policy" (to quote the present Minister of Finance) which artificially bolstered the price of Egyptian cotton to the advantage of a few Wafdist speculators but contrary to the interests of the country as a whole. Egyptian cotton constitutes about 80 per cent of the country's total exports, but in 1951, owing to the high minimum prices which it had imposed, the Wafdist Government was obliged to buy 1,250,000 cantars* at £E35 million in Treasury bills. This stock if sold today would entail a loss of about £E12 million to the Egyptian Treasury.

The Governments of both Aly Maher Pasha and Hilaly Pasha attempted to break the power of the speculators in the Alexandria futures market, but minimum prices have again been imposed. Cotton exports today are over two million cantars less than they were during the corresponding period last year, and the Government will once more be forced to buy heavily at the end of the present season. The result of this internal spending has contributed to a rise in the cost of living which has occurred despite the fact that rents are lower.

There are, however, other factors which have an adverse effect on the country's economy today. Perhaps the most important of these arise from the wave of postwar xenophobia and the increasing difficulties experienced by foreigners who live and conduct business in Egypt. Many companies chose to establish regional offices in Beirut rather than in Cairo immediately after the war, but the movement to leave Egypt has been further accelerated by the events of January 26th and the fact that the British Middle East Office, American Point Four Organisation and the United Nations Relief and Works Agency have now made the Lebanon their headquarters. The new airport at Beirut provides an excellent Middle Eastern alternative to the Farouk airfield for long-distance airliners and one where there are fewer and less irksome delays for the traveller.

Fortunes Move Westward

The Egyptian authorities are aware that much of the postwar legislation controlling the work of foreign companies was hasty and frequently ill-advised, but politicians of all parties have lacked the courage to introduce amendments. To quote but one example, as a result of the mining law passed in 1948 the petroleum companies operating in Egypt have announced their decision to cease exploratory drilling operations in the Red Sea area, where they hoped to strike new petroleum deposits. Successive governments have vainly promised to amend this and other laws which they admit are unwise and a grave hindrance to the economic development of the country.

Political instability since the abrogation of the Anglo-Egyptian Treaty in October last has caused a serious flight of capital from Egypt which is now in progress through the free market of Beirut. This movement began when the Jewish community felt their fortunes inside Egypt to be insecure during the Palestine war. But since that time several banks have been established in Beirut which specialise in the transfer of large capital sums from Cairo to the West at a discount of from 12 to 15 per cent These services are extensively used by the European communities of Cairo —British, Italian, Swiss and Greek—and the rich Egyptians —Moslem as well as Copt—are now anxious to transfer at least a part of their fortunes to the United States, Switzerland or Britain.

* 1 cantar = 99 lb.

Internal trade is almost at a standstill. The riots of January 26th destroyed a large part of the European shopping centre in Cairo, causing considerable unemployment and a slump in the luxury trades. Those stores which have managed to reopen in temporary premises have, so far, done so with small stocks and they have few customers. There is but little business activity even in the Musky (bazaar), where all Egyptian merchants complain of a bad season. Egyptian firms lost their profitable contracts with the British Army at the time of the abrogation of the Anglo-Egyptian Treaty. The smaller merchants are suffering not only because the British soldier has been spending no money, but because the 70,000 Egyptians employed by the British forces have lost their well-paid jobs and are either unemployed or working for a much lower wage.

Tourist traffic has almost ceased. After the destruction of Shepheard's Hotel few new visitors were likely to be attracted to Egypt this spring. In any case travel agencies felt they were unable to guarantee the safety of prospective clients. Those few tourists who have ventured to come to Cairo were carefully guarded by the special tourist police, but, despite this, two gentlemen who photographed their hotel were arrested by a diligent police sergeant who thought the pictures had a military value. The Department of Tourism, which has during the past few years spent over $10,000 monthly in the United States in their efforts to attract tourists, has never received the co-operation of the Ministry of the Interior and this lack of co-ordination has caused constant difficulties for the visitor over visas, censorship of mail and telegrams and other tiresome police formalities.

The Minister of Finance must face great difficulties in the near future; he has admitted that there is a serious decrease in customs dues this year. This can partially be accounted for by nervousness on the part of merchants who do not wish to build up large stocks in Cairo and by the cessation of shipping in the Suez Canal zone ports, where, despite the apparent return to normality, the docks are idle and shippers are still apprehensive of consigning goods there. The drop in revenue from customs is a serious blow to the Ministry of Finance, who now anticipate that receipts will be £E25 million (Aly Maher's estimate) in deficit of the budget estimate of £E107 million, and in a country where the few rich are but lightly taxed on their incomes or land. The receipts from customs form the largest and the most important item of revenue in the 1952 budget. It amounted to £E217 million.

Only a strong united and courageous cabinet in Cairo can avert a dangerous economic crisis in Egypt. Hilaly Pasha has now a great opportunity to amend existing laws and introduce new legislation by decree which could enormously benefit Egypt and the West.

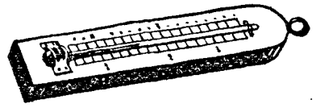
Jugoslavs and Trieste

[BY OUR SPECIAL CORRESPONDENT]

FOR the first time since the Cominform break, possibly since the end of the war, Tito has the whole Jugoslav people behind him on a major issue. They are backing him up to the hilt over his attitude towards a settlement of the Trieste dispute with Italy. Even Jugoslav Catholics support the Marshal on this issue. Jugoslav Catholic priests from the disputed territories have given evidence in support of Tito's policy, and though the Church would not be averse to receiving concessions in return, yet the support itself is quite genuine.

Both politicians and people in Jugoslavia were shocked by what appeared to them to be the success of the organised Trieste demonstration in influencing Anglo-American leaders to give way to Italian pressure. In spite of assurances on the limited nature of the London talks, Jugoslav pride received a severe blow and a number of arguments were

THE BANK TELEVISION LINK WAS DEVELOPED AND MANUFACTURED BY PYE LIMITED



The new camera for industrial and commercial purposes, used by Glyn Mills & Co. for their TV link between Osterley and Whitehall, can be used for many practical applications in industry and commerce besides banking. Enquiries should be sent to Pye Ltd., Cambridge.

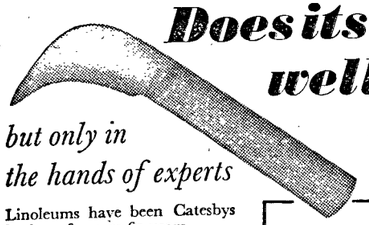
VAUXHALL ★ SQUARE ENGINES

- More power
- Less petrol
- Longer life

More power.. greater verve.. more m.p.g. . . . longer life . . . from the new "Square" engines in the famous Vauxhall Wyvern and Velox. Top speeds now 70 m.p.h. and 80 m.p.h. respectively, petrol consumption better by 3 to 4 m.p.g. Here is new efficiency and economy with all Vauxhall's famous comfort and reliability. See your local dealer for details. Wyvern, 4-cylinders 1½ litres, £495 plus £276.10.0 P.T. Velox, 6-cylinders 2¼ litres, £535 plus £298.14.5 P.T. Similar in size and styling, both are full five-seaters with space for a sixth.



VAUXHALL MOTORS LTD ▪ LUTON ▪ BEDS.

★ "Square" is the engineer's term for the new high-efficiency engine with equal bore and stroke. The new Vauxhall engines (Bore 3¼" Stroke 3") are "better-than-Square".

And SQUARE DEAL SERVICE *from 665 authorised Vauxhall dealers. Factory trained mechanics . . . specialised tools and equipment . . . charges based on standard times.*

Does its job well...

but only in the hands of experts

Linoleums have been Catesbys business for over 60 years . . . . . small wonder then that they know so much about it! In most fields of endeavour it is experience that counts above all. Catesbys possess the largest stocks of finest quality linoleum in the country. The great thing about linoleum is that it doesn't crack in use, is germ proof, has a long life and—last but not least—it is so easily cleaned. Fine quality linoleum deserves careful laying and fitting, especially where pattern is concerned, and the skill of Catesbys team of expert fitters is without equal.

advanced in Belgrade to show that the talks were not strictly legal according to international law. The demonstration in Belgrade on Easter Monday of 300,000 people was admittedly officially organised, but it was the biggest demonstration seen in Belgrade since the famous *coup d'état* of 1941. Many people who took part have never before been seen on the streets shouting for Tito. For many others it was a nice change to be shouting for something about which they felt genuinely moved.

It has been suggested by some foreign observers that Tito was quick to see the advantages to the regime of making the most of an issue on which the whole people were so unusually united; that the Jugoslav Communist party was beginning to lose the fire of its enthusiasm and that this proved an excellent method of reinvigoration. But in fact there was little evidence of any frenzied government attempt to whip up popular enthusiasm. It was already there.

Most Jugoslavs are not interested in the town of Trieste. With its predominantly Italian population it has never been considered as "South Slav" territory. Slovenes, and to a less extent Croats, feel strongly about the parts of the disputed zones where there are Slav majorities, and all the country has been roused to fury by extremist Italian claims to former Italian occupied places like Rijeka (Fiume), Zadar and parts of the Dalmatian coast and islands. Some Jugoslavs think that these claims were put forward with official Italian connivance as a kite to test western reactions. Jugoslavs nowadays do not talk much about their horrifying wartime experiences, but this issue has naturally aroused bitter memories of the harsh and often brutal Italian occupation during the war, and many people ask if Tito, a wartime ally, is to be treated worse by the West than Italy, the wartime enemy.

The French in Algeria—II

The Pull of the East

[FROM OUR SPECIAL CORRESPONDENT]

An article in the last number of *The Economist* described the arrangements whereby representative government in Algeria has, at least for the moment, lulled the fears of the million European Algerians while affording the Moslem majority some of the sweets of popular representation. At present, this system covers the three northern departments of Algeria only; these have for decades ranked as an integral part of France. A bill to include within its range sections of the southern areas beyond the Atlas mountains has passed through the Algerian Assembly and awaits endorsement by the French Parliament. If it becomes law, it will increase the preponderance of uneducated Moslem voters, though it will add voters who are accustomed to do what their sheikhs say and are therefore more biddable than the Moslem proletariat in and near the northern towns.

Of the four local parties which sway the Moslems, the Communists are neither numerous nor influential. Since the war, they have split off from the Communist party in France on issues connected with separatism and religion. Intermittently, they give and withdraw their support from the MTLD (Movement for the Triumph of Democratic Liberties) which is potentially a far more important group because it has a leader with a capacity for making an appeal to the crowd. This leader, Messali Hadj, at one time led the Algerian Populist Party (PPA). The PPA is now banned, but in 1945 was responsible for the serious rising in the department of Constantine which was put down by the French military authorities with draconian severity. Messali is, today, a figure familiar to anyone who knows the left wing parties of Iraq or Syria. His programme is nebulous; his theme song is destructive criticism of the West. France has but to give him the reins of power and all will be well. A soberer and more interesting figure, though one with the capacity for firing an ignorant public to shout slogans is Ferhat Abbas, the leader of the UDMA (Democratic Union of the Friends of the Manifesto). This party wants to retain the link with France by means of a federated republic.

More Islamic Schools

The fourth group—at one time unimportant but now worth watching—is that of the *Ulema* (the word means pupils) which bases its appeal upon religion and is the only party which publishes its newspaper in Arabic. Its campaign for education in the vernacular fell on deaf ears because there are so few careers open to men educated in Arabic. But the present *Ulema* leader, Sheikh Bachir Brahimi, is largely by force of personality at present increasing the number of Islamic primary schools, which now cater for 50,000 pupils. During the United Nations Assembly, Sheikh Brahimi spent a month in Paris and made his mark farther afield. The Egyptians invited him to preach at a service commemorating the "martyrs of Ismailia." He also founded and presided over a co-ordinating committee of all the Algerian, Tunisian and Moroccan independence parties. And the Pakistanis have entertained him in Karachi.

Too Many Mouths to Feed

Political influences are not the only pull against the link with France. Unfairly, since such prosperity as Algeria enjoys is owed to Frenchmen, certain economic and social influences militate against the tie. Conditions of poverty and overpopulation, some of which are the fruit of heedless development carried out by Europeans, are splendid breeding grounds for anti-French propaganda. It is easy to forget that Moslem health conditions have so greatly improved that the Moslem and French rates for infant mortality are now almost the same, and to remember only that the population is therefore rising so fast that the cultivated land per Moslem inhabitant was 83 acres in 1872 and is only 24 today. As in Egypt, the amount of local production per hungry Algerian mouth to feed is falling not rising. The establishment of new industries has not solved and cannot solve the labour problem; industries created between 1946 and 1951 employed 12,000 pairs of hands, but hands are simultaneously being turned off farms by the introduction of agricultural machinery. As in all countries, the government is blamed; in Algeria, therefore, the whipping-boy is France.

One labour outlet that might, at first sight, seem to increase the link with Europe may in fact have the opposite effect. Now that all Algerians are French citizens, they are crowding to France in search of a job, better pay and better family allowances than they can earn at home; 400,000 men in their prime are said to have gone last year. The extraordinary social effects of this migration will be described in another article; its political effect seems, at present, to be to increase rather than decrease the nationalism of the migrant. Messali Hadj is said to derive the larger part of his party funds from groups in France.

Siren calls, political and economic, therefore reach the Algerian Moslem from two quarters—one French, the other Arab and nationalist. Quite erroneously, he believes that the independent countries of the Middle East, and Egypt in particular, suffer from none of Algeria's social ills and are havens of admirable administration. He writes off any information to the contrary as a piece of prejudice. The call of the east reaches him in accents which may be religious or nationalist or communist. The call of Europe makes its appeal to intellect and to material advantage; it therefore attracts only the educated bourgeoisie. Yet all young people of this class are nevertheless ready to demonstrate their sympathy with the Tunisians or Moroccans.

All told, France is still obviously in a position to exercise the greater of the two pulls upon Algeria by means of policy.

But achievement of this result depends on three conditions. The first—simple but expensive—is provision of French primary schools at an increased rate; the Moslems are asking for them; if they do not get them they might turn elsewhere. The second is the invention of political developments sufficiently imaginative to afford the Moslem some outlet for his pride of race, since most Algerians are also nationalists; this job is difficult to combine with the perpetual task of allaying the fears of the European minority, and of the pressure group at its command in Paris. The third is the pursuit both in Tunisia and Morocco of a policy sufficiently liberal to furnish the pro-French section of Algerian Africans with proof that they have made a satisfactory choice.

(Concluded)

Israel's Birthday

FOUR years have now passed since the Palestine war came to an end; and Jews and Arabs are not perceptibly nearer the peaceful coexistence which both need so badly. Of all the futilities to which the quarrel has led, the economic blockade of Israel by the Arab States is perhaps the most futile. Four years should have been long enough to show Arab politicians that it is they, not the Israelis, who have suffered from it. Israel—expanding, industrialising, selective in its agriculture—promised to be the perfect complement to Arab farm economies. It offered a guaranteed and growing market for their chief exports and the opportunity of a permanent trade surplus with a country trading in acceptable currency. In 1947, the year before the Arabs changed the half-serious embargo that had existed since 1936 into a rigid boycott, Arab exports to Israel amounted to £7½ million and their imports from Israel to little more than £500,000. Between 1926 and 1947 Palestine had had to finance a cumulative deficit with its Arab neighbours of £60 million. Since the boycott, in spite of the rapidly swelling Israeli market, Arab exports to Israel have never been worth more than £200,000. As most of the goods involved are perishable, the difference is a total loss to the Arabs. Israel has had no difficulty in finding other sources of supply. As it had already been running a deficit with the Arabs, it was not disturbed by having to take its custom elsewhere.

Israel's recovery, it is true, has suffered from the economic warfare on the Suez Canal, on the Haifa refinery and on the Jordan water supplies for the potash works; but its losses have been nothing to the Arab losses. These are growing so painful that traders are taking matters into their own hands by running the blockade. It is time this economic lunacy stopped, even if the grand political settlement is still impossible. If there is any basis for the Arab belief that Israel is dangerous because it can survive only by expanding, is it sensible to hinder its attempts at survival within its present borders?

British Firms in China

[BY A CORRESPONDENT]

THE trade discussions between British and Chinese delegates at the recent Moscow conference have drawn attention to the position of the British business houses still remaining in China. When the Chinese Communists gained power three years ago, most British firms did not put up their shutters; they stayed on in the hope that once the dust of revolution had settled, it would be possible to re-establish sound and profitable trading relationships. Although most of these expectations have been disappointed, their activities have never been brought to a complete standstill. They have, for instance, acted as intermediaries for the Ministry of Food in its regular purchases of eggs and egg products. British fertilisers have been, and still are being, sold in substantial quantities; British tea exporters are still active; and British ships still call at those ports which are safely accessible and which it is worth their while to visit. There is no reason why these activities should not be expanded to cover any business which the Chinese want and which British export controls allow.

It is, however, true that the number of British firms in China has shrunk considerably during the last two years (there are now only about 600 British people in China compared with some 10,000 before the war); and if conditions do not improve, it seems certain that still more firms will feel compelled to pack up and go home. These deteriorating conditions are, of course, largely the result of the Korean war. The United Nations have imposed rigid controls on exports to China. The Chinese, for their part, have for more than a year insisted that all imports must have actually arrived before they will grant permits for the compensating exports. This regulation, apparently dictated by the Chinese fear that a complete UN blockade might suddenly stop all exchanges, has a stultifying effect on trade. Moreover, during the past year the Chinese have directed more and more of their exports towards the Soviet Union and its satellites in order to pay for the metals and other strategic materials which they can no longer obtain from the West.

But even if the Korean war and all its consequent restrictions were ended, there now seems small cause for optimism over the probable position of the remaining British merchants in China. Apart from trade restrictions they are faced with a number of formidable difficulties—such as punitive taxation, the arbitrary cancellation of contracts by Chinese Government trading bureaux, and the inability of senior British representatives to obtain exit and entry permits without endless delays. All this, in addition to the Chinese activities in Moscow, would seem to indicate that the Chinese have a settled policy of squeezing the remaining British firms out of China, however great the loss to themselves.

BRITISH BUSINESS MEN SEEING FOR THEMSELVES

Special Concessions to Continental Exhibitors

The search for trade outlets in France and other Continental markets is bringing business men abroad in increasing numbers. Continental trade fairs and exhibitions in particular offer a good starting out point for many British enterprises.

French Railways offer special concessions to business houses in the form of reduced rates for the transport of exhibition merchandise, etc. Both exhibitors and buyers will find that fares too are frequently subject to special concessions. Details from French Railways Ltd., Freight Dept., Room 118, Victoria Station, London, S.W.1.

Official encouragement is expressed on this side of the Channel in the form of special currency allowances. Your bank manager will be able to give you full details.

SPEED AND COMFORT

Modern methods have made French Railways a revelation of smooth organisation. Even the longest journeys pass swiftly and enjoyably. To quote the *Manchester Guardian* of January 15th—"Travel is improving every year. Great progress has been made in building a new railway system from the ruins left by the war;' and what is more they make a fetish of running trains to time."

EXHIBITION PROGRAMME

All events well served, in whole or part, by French Railways.

JUNE—JULY

Milan Traffic and Safety Exhibition—*June* 1-30. **Padua Samples Fair**—*June* 7-22. **Bordeaux Fair**—*June* 8-23. **Barcelona Samples Fair**—*June* 10-30. **Casablanca Fair**—*June* 14-20. **Lille Fair**—*June* 14 - 29. **Trieste Fair**—*June* 29-*July* 13.

MAKING DOODLES WORK

Pass the rough outline of something new and how it must perform to Plessey, who will develop, test, and produce a prototype—your idea brought to life with shrewd refinements. *And* it will be easy to manufacture, in quantity, cheaply. That is Plessey design and development in simple terms. It can also be expressed in figures—more than 10,000 workers, over twenty acres of design offices, laboratories and production equipment. Or, if you remind us that capacity needs to be mental as well as physical, take this example: the Electronic Revolution Counter at the Royal Aircraft Establishment, which measures the speed of jet engines with an accuracy of one in a thousand, was developed in collaboration with RAE and produced throughout by Plessey. Now you have some idea of the unique combination of technical brain and mechanised brawn at your command. Executives in industry or Government service may like us to explain how...

SIMON ENGINEERING GROUP

A *sulphur famine* is not the least of the many threats that confront British industry.

Much of the energy and experience of Simon-Carves is being devoted to building plants to produce sulphuric acid from pyrites. Most of them embody a pyrites "flash roasting" system which (besides many other advantages) on large plants enables enough power to be generated from waste heat recovery to run the pyrites-burning and acid-producing units, thus avoiding any demands on Britain's already overtaxed resources of coal and electricity.

It can be done

Vacuum Oil Company's new refinery at Coryton will draw its cooling water—45 million gallons a day—from the lower Thames. A reinforced concrete caisson forms part of the intake jetty and houses the pumps and machinery.

Conditions prevented building the caisson in position within a cofferdam in the usual way. How else could it be done? "Mulberry" harbour suggested an answer. The unit was partly constructed in a dry dock at Gravesend. It was then towed—its topsides bristling with reinforcing rods—across to Tilbury and berthed among astonished ocean liners. Here the walls were concreted up to their full height. Then the whole structure—4,200 tons of concrete and steel with a draught of 29 feet—was moved again, under escort of four tugs, eight miles down river to Coryton; and there it was carefully sunk in position offshore. This epic voyage took place on March 6th 1952. Not even the Thames has ever seen a stranger craft. The operation, so far as is known, is unique in history. Design and construction were carried out in conjunction with the Lummus Company Limited, London.

The Retreat From Social Radicalism

Political Philosophy Since the War

POLITICAL philosophy has traditionally had four main functions: describing and classifying political institutions; formulating and assessing political ideals; drawing the political consequences held to follow from some system of philosophical ideas; and analysing political concepts. This last function is in any case performed if the first three are carried out as they should be; but it has sometimes been particularly emphasised, as in Cornewall Lewis's "Use and Abuse of Political Terms."

The first of the four functions is now being detached from political philosophy and, with the name of "political science," tends to be grouped with other social studies like economics or even with history. In the last twenty years this separation has been encouraged by philosophers themselves; for they have come more and more to the view that, while it is the function of the empirical sciences to investigate matters of fact, it is the function of philosophy to analyse the language in which matters of fact are reported and reasoned about. Thus, a philosophical theory—the view that logical analysis is the essence of philosophy—has encouraged a separation of political science from political philosophy that might well have happened in the ordinary course of the subdivision of intellectual labour.

According to this same view of the nature of philosophy, it is for philosophers to show what it is to have or to advocate ideals, but not for them, as philosophers, to discuss or advocate them. In this way the second of the departments of political philosophy is denied its traditional home, though in this case no new one appears to have been found for it. Again, for various reasons philosophical systems are today much despised by the disillusioned debunkers who predominate in philosophical circles, so that there is little encouragement for anyone to work in the third department of political philosophy. One is therefore left with the analysis of political concepts. But it is obvious that some of these, such as "rights" and "obligations," really form part of ethics. The task of political philosophy, therefore, would be reduced to the analysis of such specifically political concepts as "sovereignty" or "legislation." But a discipline of this sort, even if it were distinguishable from jurisprudence, would merit the description that Kant applied to traditional formal logic—"short and dry." Shrivelled by the blasts of a dogmatic philosophical empiricism, political philosophy in this country had, by the forties, entered upon a Bleak Age.

Some authors, however, have braved the postwar cold spell to the extent of writing about political ideals and their connection with philosophical outlooks. The most notable contribution to political philosophy that has appeared since the war is undoubtedly Professor Popper's "The Open Society and its Enemies" (1945. Second, enlarged edition, 1952). This learned and comprehensive work can be said to formulate the political philosophy of undogmatic empiricism. It is thus primarily a contribution to the third department of the subject. But a large part of it is given over to criticism of the political ideals of Plato, Hegel and Marx, and it therefore belongs to the second department also. Mr Popper holds that these three thinkers have in common the mistaken belief that the history of mankind follows a predetermined course that can be foreseen and perhaps delayed, but not prevented. This belief he calls historicism. In criticising it he distinguishes between the large-scale but quite unwarranted prophecies made by confessed speculative philosophers like Hegel, or by disguised ones who, like Marx, use pseudo-scientific language, and the limited predictions which are made possible by an empirical and piecemeal study of human society. In the manner of Kierkegaard (whom he quotes with approval) he argues that such grandiose prophecies of an inevitable social future serve as excuses for evading responsibility for the personal decisions on which the future of mankind really depends.

Once it is seen that man's future is largely in his own hands, the choice has to be made between a radical policy of large-scale social reorganisation, which he calls "Utopian social engineering," and a gradual policy of mitigating particular evils, which he calls "piecemeal social engineering." Mr Popper rejects the first course because of its adherents' unscientific claim to know infallibly the total workings of society; and he accepts the second as being analogous to the tentative methods of the empirical sciences. Just as science advances by rejecting false hypotheses rather than by continually finding support for allegedly true ones, so society will be improved by removing particular and admitted evils rather than by pursuing some uncertain and abstractly conceived good. Thus Mr Popper thinks that liberal democracy, with its ideals of freedom, humaneness and rational criticism, can be shown to be intrinsically superior to the narrow "tribalism" that still fascinates a superficially scientific age.

Mr T. D. Weldon, in his "States and Morals" (1946), is, like Mr Popper, undogmatic; but, unlike him he carries his lack of dogmatism to the point of scepticism. Like Mr Popper again, he prefers a democratic system of government by consent, but, unlike him, he thinks that totalitarian "organic" ideals (what Mr Popper calls "tribalism") are not likely to be upset. He points out that it would be inconsistent with the very nature of liberal-democratic ideals to endeavour to spread them by force, and that, in any case, they are quite unsuitable for unsophisticated peoples. The most, therefore, that a liberal-democrat can look forward to is the survival of his own type of society in a world where adherents of different ideals are too intelligent to risk everything in a conflict that might destroy them all. We might say that, in Mr Weldon's view, safety lies, if anywhere, in a

sort of Armed Lucidity. According to his pessimistic unbelief, reason can operate diplomatically to secure accommodation, but not morally to secure a community of aims.

Those who feel drawn towards this relativism might nevertheless hesitate to fall in with it if they first read Mr J. D. Mabbott's "The State and the Citizen" (1948). For Mr Mabbott argues that some things are valuable quite independently of the society in which they exist. Some of these non-social values, like beauty and religious worship, might, in spite of his arguments, be shown to get their essential features from the particular society they arise in, but others, notably freedom and scientific inquiry, seem to spread over from one society to another and thus to be ends that any state might reasonably be expected to promote.

What of the issue between liberalism and collectivism? This is a matter that we should expect to find most profitably discussed by those who approach political philosophy from the standpoint of economics and political science, and in fact certain of the issues were admirably formulated during the war by Professor Hayek in his "Road to Serfdom" (1944), and by the late Professor Laski in his "Reflections on the Revolution of our Time" (1943) and "Faith, Reason and Civilisation" (1944). If one now looks back to Laski's wartime publications, the striking things are, on the one hand, his clear perception that a centrally planned society requires agreement on a system of social priorities, which in its turn implies a system of moral valuations; and, on the other hand, his failure to see that voting at a general election could not possibly settle the question of morals, though it might settle the question of power. Mr Hayek's book emphasised what Laski missed: that large-scale planning could —Mr Hayek says "must"—involve the attempt to impose a moral code on the whole population.

Laski's published writings in the post-war period have been about such topics as trade unionism and reform of the constitution, and we do not yet know what final compromise emerged from the life-long struggle between his Marxist head and his liberal heart. Mr Hayek, however, in the lecture entitled "Individualism: True and False" (1946), maintains that institutions that arise spontaneously must be greatly superior to anything consciously designed by individual men or governments. His main argument is that the knowledge at the disposal of any single man or group is necessarily inferior to the knowledge diffused throughout a free and inquisitive society. Mr Hayek, therefore, advocates "an attitude of humility towards the impersonal and anonymous social processes by which individuals help to create things greater than they know." He quotes Burke with approval, and the kinship of ideas is obvious. Mr Hayek attacks the pride of planners, just as Burke attacked the "sophisters and economists" of the French Revolution who presumed to remake the constitution of their country.

It is, no doubt, a significant fact about the political thought of the past decade that a liberal like Mr Hayek agrees with a traditionalist like Mr T. S. Eliot ("Notes towards the Definition of Culture," 1948) that the conscious planning of a whole society must lead to something monstrous. Perhaps Prometheus is losing some of his popularity, and the unseen forces are regaining some of theirs.

Literary Reformers

The Victorian Temper: A Study in Literary Culture. By Jerome Hamilton Buckley. *Allen and Unwin.* 282 pages. 30*s.*

This book presents the brilliant panorama of Victorian literary England as seen today from Madison, Wisconsin. The author acknowledges the support received in this project by the John Simon Guggenheim Memorial Foundation and the help given him in his researches by the Graduate School of the University of Wisconsin. There are moments when Mr Buckley reminds one of Macaulay's New Zealander sketching the ruins of St Paul's, but his sympathy with his subject, though detached, is eager.

His study shows how the main social, political and moral currents of the Victorian age were influenced by its writers. Carlyle, Dickens and Mrs Gaskell were reformers who gave great stimulus to those liberal and humane movements which ameliorated the cruelties of the Industrial Revolution. By mid-Victorian times the author had become the conscience of the age. Through the period when national wealth, power and pride reached their unexampled peak, the major and minor prophets of literature were crying out against a hundred evils and abuses. The Victorians were never allowed to enjoy the complacent possession of their souls. Mr Buckley describes the waning of the moral and reformist influences of the writer when the theory of art for art's sake became fashionable in the "aesthetic eighties." Wilde and the decadents provide a shoddy antithesis to Dickens and Tennyson, but Mr Buckley handles his contrasts with artistry.

The book is easy to read. But only those who have ever laboured in the vast fields of Victorian literature can appreciate the extent of the author's reading among the minor writers. Everybody knows about W. S. Gilbert of the Savoy Operas, but how many are aware that his father, William Gilbert, a retired naval surgeon, was a writer of grim novels of social protest as long ago as 1858. Mr Buckley abounds in such erudition. His book is one more example of the devoted thoroughness of modern American research in the by-ways as well as the main roads of English literature.

The Gentlemen in Whitehall

How the Civil Service Works. By Bosworth Monck. *Phœnix House.* 258 pages. 25*s.*

Too few people will read this book. It could help to remove much misunderstanding and plain ignorance, for it is a significant and thought-provoking essay, written by a man who has enlarged his experience of the civil service in wartime by careful research and reflection.

The book is ambitious in scope, and discusses not only the working of the civil service but also the background of its work. There are sections on financial procedures, on the "processes of Government"—from the voter at an election to what is done for, and to, the voter—and on the relations between civil servants and the Government of the day. It is right that the work of the civil service should be seen in this full setting. But the result is that the book tends to be too comprehensive for its size. It abounds in acute observations on the chief problems of the central machinery of Government; but the problems are not always clearly identified, or more than slightly discussed.

Mr Monck's criticism, summarily expressed, is that the service is over-departmentalised, fussy about detail, overworked at the top, and underworked lower down; that there is insufficient understanding, down the line, of aims and purposes; and that the Whitehall system may produce good conclusions but not, necessarily, speedy and effective action.

It is a virtue in Mr Monck that his consideration of remedies goes wider than the civil service itself. He suggests that Parliament should itself decide to be less exacting in its demands on the service; and that there should be a realistic review of "the almost fantastic mumbo-jumbo of the state's accounting procedures." Mr Monck would do a service if he would also consider, as a major contributing factor to the creakings of Whitehall, the volume and complexity of the work thrust upon it by the international issues, political and economic, which so greatly influence policy and administration today. On the major question—the general structure of the machine of government—Mr Monck rejects as impractical a functional organisation on the lines of the Haldane report, and would rely on *ad hoc* adjustments and regrouping; but he gives an edge to this opinion by proposing regular and comprehensive reviews by a procedure like that which produced the Beveridge report.

Within the civil service Mr Monck would have no official stay for more than five years in one department. He favours "age zones" for promotion, and premature retirement with proportionate pension (but seems to be unaware of recent legislation which goes some way in that direction). He is concerned about the separation, which he tends to exaggerate, between "policy" and "finance"; and about the desirability of giving the official outside experience. He draws the vital distinction between "thinkers" and "doers," whom he would separate between grades. Is there not something to be said also for an early identification of the types within the administrative class?

But criticism does not alter the fact that this is a worthwhile book which should realise Mr Monck's own ambition—to stimulate further thought and discussion. The public should be grateful for it. So indeed should the civil service, to which Mr Monck is generous in praise. But no doubt some senior servants of the Crown will be surprised to find that they belong to a class "addicted to jokes of a literary rather than a music-hall turn . . . whose principal common failing is a sense of superiority to humanity at large."

Outside Ike

Eisenhower. By John Gunther. *Hamish Hamilton.* 184 pages. 10*s.* 6*d.*

Mr John Gunther, who has explored so many dark continents, never seems to get quite "inside Ike." It is amazing that so friendly a character should remain so featureless under Mr Gunther's shrewd if hurried scrutiny. Part of the trouble is that the General is so admirable, and that Mr Gunther admires him so much, for his ability, his incorruptibility and his sense of duty.

This is not quite a campaign biography, though its timeliness is suspicious and some of its speculations, such as whether the General is a Democrat or a Republican, are out of date. Mr Gunther does not attempt to gloss over the unpopularity of General Eisenhower's absentee presidency of Columbia University, or to pretend that he is an intellectual. He gives a fair hearing to the objections against General Eisenhower as a potential president: his political inexperience; the prejudice against soldiers in politics; the reactionary Republicans he might sweep into power; his own extremely right-wing views on domestic policy. But he quotes approvingly the unnamed liberal who said that General Eisenhower could not turn the clock back on progress and that he was absolutely sound on the two things that matter today, foreign policy and civil liberties.

The book is full of details—many interesting—about General Eisenhower's background, his friends and his staff, culled from the Eisenhower literature and Mr Gunther's own meetings with the General. It casts very little light, however, on his supreme achievement as the most successful chairman of committee the western world has known. If General Eisenhower were able as president to do the same for the warring elements in the United States, it might be an even more notable achievement. Mr Gunther's penetrating sub-title is "The Man and the Symbol." General Eisenhower's strength is that he is a symbol of peace, unity and integrity.

Moderation in Power

The Problem of Power. By Lord Radcliffe. *Secker and Warburg.* 110 pages. 8*s*. 6*d*.

Rejecting the British "legend" that power is necessarily evil, Lord Radcliffe prefers to ask what prevents men who have authority from abusing it. With this question in mind, he examines some aspects of the theory and practice of philosophers and statesmen to see what light they throw on present problems. The result is seven stimulating lectures, broadcast as the Reith Memorial Lectures in 1951 and now printed.

Lord Radcliffe considers the scheme set forth in Plato's "Republic" for granting to a carefully selected and educated ruling class complete and unrestricted power—a conception which would, by contrast, have been something of an impiety to the medieval mind with its strong belief in political authority as circumscribed by custom and by a universal moral order. Locke's doctrines of the social contract and natural rights are criticised as an unreal basis for the modern state, and the classical Whig theory, devised to resist the Crown, turns out to be little more than "Parliamentary absolutism tempered by revolution." Turning to more concrete examples, Lord Radcliffe presents the American constitution as a successful experiment in the limitation of power; this case is balanced by a finely drawn study of the administrators of British India in the early nineteenth century, who exercised unfettered authority but did so with great restraint and a strong sense of duty. Finally, after examining the ethical status of majority decision as treated in the works of Rousseau, Bentham, Bagehot and John Stuart Mill, he concludes that there would not appear to be only one possible attitude towards power. Power is not a thing in itself; we are confronted, rather, with the conduct of men in authority, and attitudes towards that authority change with the social conditions surrounding it.

In the lectures devoted to Platonic and medieval thought, a fuller account of their bearing on contemporary society would have been justified; a juryman considering the evidence of a professional psychiatrist, for example, or a parliamentary voter that of a professional economist, cannot escape the problem of what respect is to be paid to knowledge and what is the price of that respect. And the theories of Locke—more nearly exemplified in American than in British government—are discounted unduly. But in general Lord Radcliffe does excellent justice, in the restricted space at his disposal, to his selected themes. He offers no final answer to the contemporary problem of power. At times he is inclined to rely upon the British character as singularly fitted to exercise authority; at other times, he questions whether we can always count on its moderation and tolerance or whether they were just "the hall-mark of a particular class" and of special economic conditions. The historical studies he presents point different ways. But his lucid analysis will be an important aid to understanding of the problem.

Soul and Soil

Community Farm. By John Middleton Murry. *Peter Nevill.* 255 pages. 16*s*.

Mr John Middleton Murry is the latest of our intellectuals to experience a mystic affinity with the soil, and to find balm for his soul in a return to the land. The opportunity to own a farm, a goal to which he had long aspired, was thrust upon him by wartime circumstances. Mr Murry was then both a pacifist and a socialist, and he was inspired with the ideal to create on the land a model community which would transcend the traditional "capitalist" relationship between master and man. He bought a derelict farm in the eastern counties and settled on it a group of pacifists with whom he was connected.

It is not the first time that this particular ideal has been cherished, nor the first that it has met with disillusionment. Much of the book tells of the disputes and difficulties which occurred when the ideas of "community" held by Mr Murry and his fellow pacifists quickly diverged. The author was understandably incensed by the unbusinesslike methods of some of the "communiteers," as well as by the procession of eccentrics who arrived on the scene.

Community farm, in its original form, quickly collapsed. Many of the pacifists were there for ephemeral reasons, and soon departed (or were ejected); while Mr Murry himself clearly lacks the monumental patience, the Tolstoyan self-abnegation, which is necessary for the uncompromising pursuit of this brand of ideal. By the end, Mr Murry is heartily sick of the woollier versions of "community." His farm prospered eventually, but by methods that are not distinguishable from those of an enlightened capitalist. A parallel evolution seems to have taken place in the author's ideas.

The latter part of the book contains an amusing account of village feuds and the operations of the parish council together with some interesting reflections on the ills of modern society. The author believes that "an urbanised machine-civilisation tends to dissolve away the stuff of experience out of which religion is made," and that a wholesome awe before nature has been an essential ingredient of traditional religions and moral attitudes. He views "service to the land" as being an "unconditional good," even a religion. It is at least certain that there are today many who feel likewise.

This is not really a book about farming as such, on which the author has little of interest to say. It is primarily a personal document. Mr Murry chews over his views on life, the soil, and human relations, in a suitably bucolic way, so that the reader is taken through the whole process of thought formation. It is sometimes irritating to find the author's opinion of some person or subject (especially persons) shifting from page to page, but the book does not lose in readability thereby. This is an interesting book for what it tells us, not about the soil, but about Mr Murry.

Quest for an Ideal

The Wisdom of the Sands. By Antoine de Saint-Exupéry. *Hollis and Carter.* 350 pages. 21*s*.

Saint-Exupéry wished that this book should be published posthumously, since it is the crystallisation of his experience into a credo and was continually growing until death ended it. It is a pity that Stuart Gilbert was not able, in his excellent translation, to use the author's own title, "*Citadelle*," which is appropriate to the consideration of an ideal state. The word "wisdom" is a challenge which arouses wary resistance against the pompous, the facile or the banal. We are soon conquered, however, and under the spell of poetic cadence, vivid imagery and shrewd insight, suspicion is disarmed into fascination and we willingly co-operate in the quest for a civilisation "built on what is required of men, not that which is provided for them."

The author was in love with austerity—with the need for men to "barter themselves for that which is more precious than themselves"—and he sets his citadel against the continual unseen menace of the desert, in the conviction that no just form or proportion is possible without an enemy to shape it, as the force of the wind conditions the wing of a bird or the buffeting of the sea the prow of a ship. In the meditations of his Prince his own philosophy is declared.

His Utopia is not a mirror of perfection but a reflection of the human struggle. The Prince's concern is for the inherent possibilities of the individual: "He who instils the sense of human greatness into his people is tempering an instrument which will serve him in tomorrow's need." His faith is in the continuity of growth which is nourished by endeavour and the rare understanding that comes from shared tasks and dangers—"the fertile collaboration of one man with another." He dreads the decay that is bred by the inertia of achievement—the decrepitude of routine. "Civilisation does not rest on the using of its inventions but solely on the fervour that goes to the making of them." He is not interested in the freedom, happiness or success of his people but in the quality of the individual who experiences these benefits. Equality disgusts him; true charity is co-operation and only to be found in a hierarchy in which the diversity of sundry things is closely bound instead of being effaced for the sake of a sterile symmetry. Nothing must be free of effort; a poem is a challenge to the reader to scale the heights; the view from the mountain-top enchants because it is the meed of the climber's weariness, built up by his struggle.

The book is astringent without hardness, compassionate without mawkishness, authoritative without arrogance. It was written in love and sincerity and a deep anxiety to reach the hearts of men in their modern dilemma, and whether one reads it as the romance and adventure of a desert empire or for its deeper intention it would be difficult to do so without benefit.

Women at Work

Women's Life and Labour. By Dr F. Zweig. *Gollancz.* 190 pages. 13s. 6d.

Any community aspiring, as a modern industrial nation must, to exert collective control over its own economic destinies, is confronted by a certain danger having both practical and spiritual aspects. The first essential of collective control is collective knowledge; knowledge not only, or even mainly, about things and institutions but about people and their past, present and possible future behaviour. The law of large numbers, giving confidence to actuaries and statisticians, bestows on the numerical aggregates which are the planners' or politicians' essential raw material a fallacious appearance of sufficiency. The statistically insignificant becomes the absolutely insignificant; what is incapable of being reduced to statistical terms at all appears a mere unwelcome disturbing factor.

Here is, surely, the justification of the kind of social research in which Dr Zweig has made his name. It is not, perhaps, "scientific." This small scale, highly personal, inquiry, among a few hundred working women and non-employed working class wives, is akin rather to the reporter's work than to the sociologist's or economist's. It is concerned, overwhelmingly, with intangibles; what is the working woman's attitude to her work, to its rewards, to her workmates and superiors, to the unions? How does her status as a worker affect her home life as wife and mother, her leisure, her psychology in general? Absenteeism, incentives, supervision, are considered by Dr Zweig from their psychological aspect; and one of the most interesting and valuable elements in his book is its perceptive discrimination not merely between men and women workers but between women workers themselves according to their different situations—between the young girl fresh from school and the older girl looking forward to marriage; the childless wife, the woman with a normal family, and the deserted or widowed mother; the spinster of forty or sixty; the worker by choice and the worker by necessity. His conclusions throughout are put forward with due consciousness of possible error. Yes, the sample is small; yes, it may be biased; yes, in this realm of intangibles one cannot be certain of having in every case got at the truth—does the invariable assertion of the working mothers, for instance, that their children are on balance the gainers from their work, reflect real conviction or an uneasy rationalisation?

Correspondingly, Dr Zweig's conclusions are hedged about with reservations. "Most women like their jobs in industry . . . to a much greater extent than men do"—but industry gives them a raw deal, the most urgent need for reform being in the direction less of equal pay than of shorter hours. ("Absenteeism," he acutely remarks, "is frequently the only answer of a married woman to the unsuccessful quest for a part time job.") Home, he concludes, is apt to give them a raw deal too, though here he pleads rather for further investigation—"the whole labyrinth of housekeeping money needs careful study and reviewing." And both at home and in industry, he feels, women are apt to undervalue themselves, and to get taken at their own unduly low valuation. "Women's Life and Labour" is both an absorbing "human document" and a valuable piece of documentation—the two are not necessarily the same thing. No doubt the impressions it conveys need to be set against the wider background provided by orthodox statistical research; but, equally certainly, orthodox statistical research needs to be corrected and enriched by such works as this.

Gangster Background

Murder Inc. By B. B. Turkus and S. Feder. *Victor Gollancz.* 350 pages. 16s.

This book is an account of the prosecution by Mr Turkus, then an assistant District Attorney in Brooklyn, New York, of a number of gang leaders in 1940. Mr Turkus has been assisted by a journalist, Mr Feder, who is responsible, no doubt, for the lurid style. Readers who can put up with this will find here a more coherent and detailed account of gangster activities on a large scale than that presented by Senator Kefauver and his Senate Investigation Committee. There is nothing quite so chilling in the Senator's pages, for instance, as the description here of how to tie a man "like a little ball." Specialists in crime fiction should find the book a mine of information and of gangster jargon.

The close-knit organisation of crime into a "cartel," the authors believe, began in 1934. It was then that the gangs abandoned their anarchy and formed crude caricatures of business and political organisations with boards of directors, courts of a kind, and the use of assassination as a way of building up good will. In this strange world, the denizens are not above talking of the merits of "majority rule" and exalting their peculiar vision of "the democratic way." By federating, and also by cultivating, political connections the crime networks have usually been able to escape effective prosecution in the courts in spite of the recurrent public outcry against them.

The book provides an extensive background for Senator Kefauver's revelations; the authors insist, rather disquietingly, that the Senators were merely tracing the later activities of national crime organisations that had long been established. Mr Turkus and Mr Feder feel that the remedy lies, not so much in the "moral crusade" advocated by the Kefauver Committee, as in closer co-operation among law enforcement bodies and less headline-hunting. They urge the Senate to give up "investigating abuses long since exposed" and occupy itself with finding ways to keep people who are likely to "do business" with criminals out of official life.

HOLLIS & CARTER

Tee and Green

A History of Golf in Britain. By Bernard Darwin, H. Gardiner-Hill, Sir Guy Campbell, Henry Cotton, Henry Longhurst, Leonard Crawley, Enid Wilson and Lord Brabazon of Tara. *Cassell.* 312 pages. 42s.

Every golfer, tiger or rabbit, will love this book. History indeed it is, and much amiable scholarship has been devoted to it. But it is so beautifully written and illustrated, so full of enthusiasm without a moment's boredom, and so handsomely produced that it will be the British golfer's companion. Good golf and good writing are often found together; here are eight virtuosos of the double art, as dextrous on paper as they ever were on the greens.

The captain of the Royal and Ancient in 1950-51, Sir George Cunningham, records in a graceful foreword his opinion that this book will be a classic in the literature of golf. Mr Bernard Darwin, doyen of golfing writers, raises the curtain with an essay of great charm and distilled experience "Then and Now." "Then" was the middle 'eighties when at the age of eight he had just begun to play golf; "now" is for him the middle 'seventies, not able to get easily about but with a pen as nimble as ever. Mr Gardiner-Hill contributes a study of the development of the rules of the game. The wells of golf law were first struck, not at St. Andrews, where in 1754 twenty-two noblemen and gentlemen met "to draft certain Articles and Laws in playing the Golf," but at Leith ten years earlier. The regulations of 1744 are the foundations of the rules today, and law that commands respect and obedience two centuries later must evidently be sound.

On the broad shoulders of Sir Guy Campbell has fallen the main weight of the historical chapters—the early history of the game, and the development of implements and courses. It may be possible to trace the origins of the game to Roman times; it is certain that by the middle of the fifteenth century the game was interfering so much with the poor Scottish infantry that James II ordered "Fute-ball and Golfe [to] be utterly cryed downe, and not to be used." From that time, in reference and illustration, evidence about the game abounds. A dozen and a half golf balls cost £Scots4 7s. in 1672; any economist knows that the £Scots was worth 1s. 8d. sterling before 1707, or if he does not, Sir Guy will tell him.

He also records the grant in 1618 by King James VI and I of a monopoly for making and purveying golf balls. Here the economist may feel on more familiar ground; he will note a little wryly that the recipients of the grant undertook to make better and cheaper balls "provyding that the saidis patentaris exceed not the pryce of four schillingis money of this realme for everie ane of the saidis golfe ballis." Four shillings for a golf ball has a familiar sound; it is remarkable how many makers today have hit upon that price for their best

balls. Can there still be traces of monopoly in the golf ball industry?

The game of golf gets no easier and no cheaper. Perhaps the nearest approach to economic dissertation in this admirable compendium comes at the end of Lord Brabazon's lively speculations on the future of golf. He admits that costs are high and increasing, and suggests ways of reducing them; but he ends on an optimistic note, chronicling the virtues of the game. To which all golfers, good or bad, will agree—and particularly those whose friends are so discerning as to buy them this history of a fascinating and infuriating game.

Meditation on Society

In an Age of Revolution. By Cyril Garbett, Archbishop of York. *Hodder and Stoughton*. 318 pages. 20s.

There is a portrait of Bishop Westcott sitting in a black gown against a black background, a portrait from which the observer receives little of the person except a sense of dark brooding. This is how the Archbishop of York's new book affects the reader.

He seeks to analyse the social changes during his own lifetime, the alternatives to religion now offered, the medicine prescribed by the Church. Not pretending to specialised knowledge, this wise and experienced Christian leader publishes a meditation upon society. Part I describes the main technical and educational changes during the last half century, the effects upon faith and the altered standards of morality. Part II criticises the substitutes for Christianity —humanism, capitalism, the state, communism. And Part III, entitled "The Answer of the Church," discusses the new methods which the Church should adopt if it is to bring its Gospel to an industrial and careless society.

The backcloth is dark. If Dr Garbett has a failing, it is the selection of the most extreme illustration that he can find. It may be true that Belsen and Buchenwald are connected with the decline of faith, but this is an argument which should be used sparingly; it is hardly fair to choose Judge Lindsay's plea for the "Companionate Marriage" of young people as an illustration of the change in a social attitude towards divorce; the judgments formed from a mass observation poll are not usually regarded as an accurate criterion of the social influence of religion. Chapter III is entitled "Moral Chaos"—a phrase redolent rather of prophetic exhortation than of accurate diagnosis. Perhaps the intention was to illumine the Christian white with a nimbus of non-Christian black; but the nimbus has cast its shadow across what was intended to be light.

Yet his comments are always worth reading. He has travelled far and read widely, (astonishingly widely for so busy a person), has talked with everyone from Stalin to dockers, and is still learning and thinking at a time of life when many men have become fossilised. Gaiters have never buttoned his spirit nor hampered his outspokenness.

Pageant of Arabia

Arabian Jubilee. By H. St. John Philby. *Robert Hale*. 280 pages. 30s.

Mr Philby, whose supremacy as an authority on Arabia is unchallenged, commemorates in this book the lunar jubilee of King Ibn Saud. In a preface he asks the reader to consider his book rather as a pageant of his hero's achievements than an historical record of his life and reign. This disclaimer is timely as the earlier chapters of "Arabian Jubilee," leading up to Ibn Saud's final conquest of the Hedjaz, present chronologically a somewhat confused sequence of events.

Partisanship and indiscretion may be faults in historians and statesmen, but they lend much attraction to this book and it is refreshing for readers accustomed to Hashimite history to read the story as presented by a champion of the other side. The author in his account of the political and military exploits of Ibn Saud is sincere and for the most part uncritical as befits an encomiast. In any case the outstanding courage, energy and rightmindedness of the King make him a character whom one can praise without misgiving.

The chapters on the Court at Riadh, Taif and Mecca are full of interest and entertainment and we are indeed fortunate in having an Englishman to draw from experience and not from hearsay a picture of the life behind a hitherto impenetrable curtain.

The humour, good humour and humanity of this masterful, uxorious autocrat are sympathetically depicted by the King's good friend and counsellor. One cannot, however, read Mr Philby's description of his patron's hunting expeditions without distaste. The destruction of whole herds of gazelle and oryx by the royal "sportsman" armed with "magazine shotguns"—whatever such weapons may be —and driven across the desert at top speed in a high-powered car can only be considered sporting because the car might have skidded and turned over at any moment. Otherwise it is comparable with the inglorious murder at close range of the ibex in a desert sanctuary in another land not so many years ago. Mr Philby's passion for metaphors drawn from cricket, football, golf and rowing, with which his pages are larded, may indicate a lack of understanding of huntin' and fishin' that would account for his tolerance of the King's methods in the hunting field.

One would gladly have read a fuller account of the exploitation of Arabian oilfields which have altered the whole economic and probably also the moral aspect of Saudi Arabia. Many readers of "Arabian Jubilee" would have been glad to know exactly where the oilfields are situated. The tiny map facing page 1 does little to satisfy the reader's curiosity on this and many other matters.

A curious chapter is devoted to the Palestine problem. Mr Philby, who is careful to say that, in his view, the Jews have no standing whatever in Palestine, describes a plan conceived by himself in 1939 for handing over the whole of Palestine to the Zionists in return for

THE BRITISH TARIFF SYSTEM

E. B. McGUIRE

A description of the United Kingdom collecting machinery, with an historical account of the tariff since 1914 and its political objects. 2nd edition, revised and enlarged. 21s.

METHUEN

a payment of £20 million to King Ibn Saud with various conditions attached, including the settlement in Arab countries of the displaced Arabs. This plan, the author declares, was approved in principle by Mr Churchill, Mr Roosevelt and Dr Weizmann and was communicated unofficially by Mr Philby to the King, who waited in vain for official proposals. So nothing came of it. As it is described by Mr Philby, nothing was likely to come of it.

Descriptions of administrative problems in Arabia and of the effect of newly discovered mineral riches on the morale of the Government and the formerly austere inhabitants make good but gloomy reading, and the book ends with the cheering statement that the venerable monarch considers the world quite ripe for the Day of Judgment.

Prototype of A Few

The White Rabbit. The Story of Wing Commander F. F. E. Yeo-Thomas, GC, MC. By Bruce Marshall. *Evans*. 262 pages. 16s.

Le petit lapin est rentré au clapier. Thus the BBC French service advised his colleagues of the Resistance that Wing Commander Yeo-Thomas, alias Shelley, had safely returned from an investigation into their activities. His friend, Bruce Marshall, pieces together the story, from the fall of Paris—when *Monsieur Thomas*, a veteran of 1914-18, was manager of the Molyneux dress salon, struggling to re-enlist in the air force for which he was over age—through the maddening delays and misemployment of his special aptitudes of knowledge of France and perfect command of the language, to his acceptance at last in February, 1943, into a special mission to investigate the potentiality of resistance groups in the *Zone Occupée* and to finance and co-ordinate their activities in order to weld them into a secret army for D Day.

The next section reads almost like a blue book of resistance groups in all their manifestations—political, masonic, journalistic, intellectual, civil, military and communist. It is an ungarnished account of the training of special agents; the endless and complicated precautions against discovery; the disagreements about procedure and jealousies over promotion; the sickening danger of careless or treacherous colleagues; the difficulties of financing the able-bodied men who evaded conscription into the German compulsory labour service and later became the Maquis; the constant pleading for essential supplies from unenthusiastic government departments; and the final Churchillian gesture which gave Yeo-Thomas the equipment he needed.

Almost immediately after this triumph he was captured by the Gestapo, imprisoned, tortured and sent to Buchenwald. The detailed account of brutal interrogations and savage punishments makes survival a miracle and endurance unbelievable—yet Yeo-Thomas didn't tell and he did escape. The reaction of an average, uncourageous, dentist-dodging, peacetime citizen on reading

this book is one of homage to a fortitude so vast as to be unimaginable. How could a man endure so much for so long? What can he think of ordinary people who moan about the weather, the queues and the rations? Back in his manager's office *chez Molyneux* does he sometimes wonder if we were worth it? Or is he only thankful that he kept himself his own man, and that through the medium of Bruce Marshall he can offer himself to us as a prototype of others who suffered and died unsung?

Man and Novelist

Hugh Walpole. By Rupert Hart-Davis. *Macmillan.* 503 pages. 25*s.*

No one should be put off this biography because he has not read any of Hugh Walpole's books or because he dislikes what he has read or because he disliked or is uninterested in the man himself. For the book teems with the literary personages of a whole generation. Here is the ageing Henry James writing to Walpole long letters in long involved sentences which even his adoring protégé confessed were sometimes a little difficult to understand. Here is Arnold Bennett whose unrestricted admiration for his novels Walpole could never obtain. He would write hurt, defensive letters to Bennett and get back aloof bantering, though friendly, replies. Writing to reviewers was one of Walpole's weaknesses. But the reader of this biography will thank him for it, because it often provoked such memorable answers: a scathing retort from Rebecca West on one occasion; on another an analytical description by Katherine Mansfield of the "mysterious" and "miraculous" creative act in writing a book.

Other writers who reveal themselves and are revealed in these pages include "Elizabeth" of the German Garden, Hardy, Kipling, Galsworthy, Conrad, and Virginia Woolf—an admirer of Walpole's novels who became one of his most loved friends and whose infinite superiority as a writer he was always acknowledging. He was jealous of his place in English literature and sensitive to a fault when he thought he was unjustly criticised. But he was conscious of his limitations and always ready to help younger writers with money, encouragement and advice.

Few subjects of a biography can have been so well documented as Walpole. Besides all the correspondence to him and from him, there are his diary and a more elaborate, self-conscious, journal in which from time to time he attempted some introspection into his own character. Mr Hart-Davis makes ample use of all the documents. But what distinguishes his biography is its uncommon restraint. He does not attempt a balance sheet of Walpole's character; nor does he attempt a psychological study in the modern manner, although the publishers' claim that the material provides a perfect case history is justified. He sets down with admirable objectivity Walpole's faults and virtues and leaves the reader, if he wants to, to form his own judgment.

The Irish Capital Grows Up

Dublin 1660-1860. By Maurice Craig. *Cresset Press.* 362 pages. 42*s.*

Cities have lives of their own and form the proper subject of biography. Mr Craig, in this beautifully produced and richly illustrated volume, has told the life of Dublin through two centuries. The period he covers includes the great Georgian years, which have attracted the attention of many earlier writers. But he covers also the less known periods that preceded and followed the classical era of Dublin architecture. His chapters on the nineteenth century are particularly valuable. In spite of the degradation suffered by Dublin as the result of the Union, considerable building activity continued. The place occupied in the eighteenth century by private mansions and public buildings was taken by churches, institutions and railway stations. But the inspiration of the Georgian century survived, and the tradition of beauty and grandeur still flourished.

Mr Craig traces, with a rich knowledge and deep love of his subject, the gradual evolution of Dublin from the small community which huddled round Christ Church in the seventeenth century. The city grew in an eastward direction. Two enlightened schemes of private development, north and south of the Liffey, were integrated by the far-sighted activities of the Wide Streets Commissioners. After the Union the suburbs continued to extend east. Throughout the Regency period, architectural fashions were absorbed in the local tradition. Strange exotic intrusions were made by John Hungerford Pullen, who built University Church, and Woodward and Deane, who built Kildare Street Club. Broadstone Railway Station, "the last Dublin building to partake of the sublime," was erected in 1861. In the following decade the great Georgian tradition "ran out in the sands."

Although Mr Craig's main interest is in architecture, his book throws light on many other aspects of Dublin history. He traces the relation between the buildings of the city and the lives of its inhabitants. The struggle for supremacy between Catholics and Protestants, the decay of the aristocracy after the Union, the social habits of the professional and commercial classes, all receive attention. The growth and decline of many intellectual, literary and artistic movements of the period are shown against the background of political, economic and social change. But the emphasis is on the city rather than on its people. The author is concerned with individuals "only so far as each one has given something—it may be a building, it may be a legend, or it may be only a bad example—to Dublin or to Ireland." Judged by this test, Mr Craig is entitled to be included among the city worthies.

The Long View

The Story of Language. By Mario Pei. *Allen and Unwin.* 493 pages 25*s.* net.

In this age of specialism run mad, it is good to find a book that takes, historically, the long view and, linguistically, the broad view. It is perhaps relevant to be indirectly reminded that no philologist can write a thoroughly dependable book on a small subject unless he has a sound general knowledge of the big one. Language forms by far the most important means both of expression, whether to others or to oneself, and of communication; and, on the literary plane, of conveying beauty and affording delight, a delight resulting not only from aesthetic appreciation but also from intellectual pleasure in masterly persuasion, lucid exposition, unmistakable description, unencumbered narrative.

Without some such attitude towards language, a philologist tends to write, if not in a vacuum, then at least from a bookish tower; and without some such understanding of what is involved, the general reader will fail to do justice to "The Story of Language," unless he happened to have read the late Otto Jespersen, that learned Dane's "Language: Its Nature, Development and Origin," first published about a generation ago and still extremely readable and helpful.

Mario Pei, Italian by birth and American by nationality, professes in the Romance Languages department of the Columbia University of the City of New York. He has written several impressively erudite books on Old French and Medieval and Modern Italian; a few years ago he published "The World's Chief Languages," comprehensive, very well arranged, convincingly illustrative; and he has, one understands, completed a work to be called "The Story of English." Like Jespersen, he writes a clear, leisurely English, well suited to his matter.

In "The Story of Language" Professor Pei covers more ground than was covered by Jespersen's Language work, and he shows an even more alert awareness of the best way in which to overcome the difficulties of the general intelligent public. (Not that scholars can afford to ignore his book.) He is a master of the truly apposite example, illuminating and precisioning whatever theory or "law" or tendency he is, at any moment, expounding or relating. His book falls into the following parts: The History of Language; The Constituent Elements of Language; The Social Functions of Language; The Modern Spoken Tongues; Problems of Language Learning; and An International Language. Each of these parts contains a number of brief yet adequate chapters. We have, for instance, not merely the inevitable Language and Literature but also the important, often disregarded, Language and Science; not only the Evolution of Language but also the History of Writing.

It is refreshing and delightful to meet a scholar at once erudite and readable, instructive and entertaining, expository and thoughtful, thorough and human. Deliberately, Mario Pei has exhausted nobody—and nothing. To have given less would have been discourteous; to have given more, perhaps inhumane. Although "The Story of Language" may, one fears, irritate a philologist or two, it will certainly please the public at which it has been aimed.

Gallery of Eccentrics

The Scandalmonger. By T. H. White. *Jonathan Cape.* 223 pages. 18*s.*

It is improbable that many twentieth-century Englishmen would really like to go back to the Good Old Days of Mr White's Age of Scandal, the eighteenth century. Even were they given the option of belonging to the privileged classes, or at least the certainty of not finding themselves among the dispossessed peasantry of Goldsmith's Deserted Village, the pauper children in the earliest Satanic mills, or the victims of current criminal law, they would have noses too sensitive for the smells described by Smollett, nerves too sensitive for contemporary dentistry—let alone surgery—and a degenerate modern preference for seeing their children grow up.

Mr White is an exception. He really, thoroughly, whole-heartedly loves and prefers this rumbustious age, at once elegant and unbelievably squalid; he revels in the eccentrics and freaks who supplied the scandalmonger's topics, from Beau Brummel to the ambiguous Chevalier d'Eon. Bullies and duellists, courtiers and lunatics, highwaymen, quacks, and demagogues; dear Parson Woodforde and yet dearer Horace Walpole, Fanny Burney and her Nemesis Mrs Schwellenburg, Earl Ferrars, Sheridan—there is no summarising Mr White's *dramatis personæ* or their foibles. Incongruously enough, one would think, he rounds off his scandalous chronicle with a portrait of Queen Victoria, whom he sees as a "prodigious old Tory" who "gathered into her own reactionary character nearly all the traits of Walpole's period . . . a survival, not a pioneer." And indeed some of the anecdotes which he culls from Sir Henry Ponsonby's "Life" are in refreshing contrast to one's usual mental picture.

This is a vastly entertaining book, not the least of whose merits is that it will send many of its readers to dig for themselves in the inexhaustible mines from which Mr White has selected his shining nuggets of scandal. One may not, perhaps, find for oneself anything quite so beautiful as Lord Glenbervie's story of Lord and Lady Lavington and the unaccustomed double bed, or of the "young gentleman of small fortune" whose presence of mind, equal to his chivalry, saved the Duchess of Marlborough from an embarrassment and won him a commission; but what fun to try!

A lively and comprehensive survey

BOSWORTH MONCK'S

How the Civil Service Works

The only book on this subject

How does the great system of Government Offices operate? What do the various Departments do? What is their relation to each other and to society as a whole? What reforms can be made to the general advantage? This book—the first on the subject—seeks to answer these and related questions. By analysis of the parts it builds up a clear picture of the whole. It is assured of a welcome from Civil Servants and all bodies who deal with Government Departments.

The book has been under preparation for three years and has been submitted in proof to the Departments concerned. The publishers believe that they have here a book which will be regarded as a standard text. It will certainly create a new understanding of the complex organism which now touches the lives of us all.

Inquisitive Genius

Eugenics: Galton and After. By C. P. Blacker. *Duckworth.* 349 pages. 25*s.*

Anyone attempting to write a biography of Francis Galton has a formidable difficulty to surmount. Almost all that could be said about him has already been well said by his disciple and friend, Karl Pearson. Dr Blacker does not attempt the task; instead, after a survey of Galton's life, beliefs and discoveries, he devotes the major part of this book to an account of the development of eugenic science and creed since the great man died.

The biographical chapters describe most enjoyably this energetic and inquisitive genius whose life spanned the gap between the reigns of George IV and George V. His range of interests was immense, and those readers who are well aware of his pre-eminent researches into inheritance and his eugenic beliefs will be surprised to encounter him exploring in South-West Africa, testing the dogs of Berne with a high-pitched whistle in the end of his walking-stick, counting the fidgets of the audience at a Royal Geographical Society lecture, or conducting a statistical inquiry into the efficacy of prayer. His work on fingerprints and his invention of the mathematical technique of correlation are among his more solid achievements, and he can claim too to have originated the term anticyclone.

The remainder of the book is an attempt to say what Galton's views on eugenics would be now if he had had access to the new knowledge amassed in the last forty years. Dr. Blacker discusses population trends, mental testing and selection procedure, modern developments in genetics, the spread of contraception, the Lysenko controversy and social policy. It was perhaps inevitable, with such great changes to discuss, that some of his chapters should read like a review of the year, and the author is at his best when dealing critically and at length with a single book or topic of controversy.

Since Galton died new knowledge of genetics has shown that human inheritance is far more complex than was at one time thought. It has become plain that "negative" eugenic policy—sterilisation and other methods of preventing the transmission of undesirable traits—is only likely to be successful in a very limited number of disorders. In so far as poor intelligence, most varieties of mental disorder and defects of character are inherited, their elimination by such means would be slow and incomplete and would involve compulsion on the widest scale. But eugenics has hardly yet recovered from the bad name foisted on it by Nazi racial policy and Dr Blacker firmly rejects compulsion.

"Positive" eugenic measures to encourage sound physical health, high intelligence and moral qualities remain. In much recent legislation, in population and economic policy, and in movements widespread in civilised countries for family planning, Dr Blacker sees much evidence that eugenic ideals are being pursued, albeit haphazardly. In an egalitarian age, however, the belief that all men are created unequal and that some should be encouraged to procreate and others discouraged will meet hostility. This book should go far to overcome any prejudice.

Lord Tedder

Tedder. By Roderic Owen. *Collins.* 320 pages. 18*s.*

The air arm has had less than its due share of postwar controversy and reminiscence. Though libraries could now be filled with books on the actions of the land commanders, relatively little has been written of the main campaigns in the air. Of the few air leaders whose names are widely known, one is certainly, however, Marshal of the Royal Air Force Lord Tedder, and a biography of him has long been needed. He won one of the crucial air battles of the war—in the Middle East, where victory was essential for success on the ground.

Mr Owen's book, however, hardly meets adequately the lack of books about the air arm. His study of Lord Tedder as a man is marred by a naïveté of approach, and his study of Lord Tedder as a leader and strategist is too limited to be fully satisfactory. The Air Marshal, naturally quiet, reticent and unspectacular, is admittedly a difficult figure to portray. Even Mr Churchill in 1941 seriously misjudged him as being merely "a man of nuts and bolts." Why, in fact, did he come through to the top? His virtues of determination, thoroughness, tact and high professional skill are not a complete answer. Probably the real reason, at any rate for the success in the Middle East which laid the basis of his reputation as a commander, was the single minded way in which he gave expression to the fundamentally sound concept of strategy with which the RAF entered the war—that its first and main duty was to secure command of the air. Lord Tedder enforced this by a ruthless concentration of his aircraft for decisive battles with the enemy, and set his face calmly against the clamour for dispersion of the RAF to give local protection to the hard-pressed ground troops.

Once superiority had been achieved, however, and the air war entered its second phase, RAF opinion was sharply divided on the way in which this command of the air was to be exploited. Lord Tedder became, as much by reason of his duties as General Eisenhower's Deputy as by any deep theoretical conviction, the exponent of the use of air forces to help win the immediate land battle, as opposed to Sir Arthur Harris's view of victory by destroying the enemy's industrial potential. The issues involved in this dispute are fairly, if not profoundly, set out by Mr Owen. It is a controversy which has been sharpened by the addition of the atom bomb to the airman's armoury.

Augustus John

Chiaroscuro. Fragments of Autobiography. By Augustus John. *Jonathan Cape.* 285 pages. 30*s.*

This delectable book has, from the reviewer's standpoint, a grave disadvantage. It is not meant to be read, as a reviewer must read, consecutively from start to finish; it is a succession of conversations, not a discourse. It has no single connected theme; it follows no connected chronological order; it suggests indeed less the chiaroscuro of its title than an incomplete collection of *tesserae,* brilliant constituents of a grand mosaic whose composition and balance cannot be inferred. "Fragments of Autobiography," says the sub-title; from almost any of these fragments there could be reconstructed, *ex pede Herculem,* a character, but an orthodox biographer using "Chiaroscuro" as his only source would, whatever his detective ability, soon be reduced to despairing fury.

It is not, however, as a source-book for orthodox biographers that "Chiaroscuro" has been written. Its aim, one would guess, is purely to give pleasure and entertainment, not least to its author. And how brilliantly and entirely does it succeed! The reader's enjoyment springs from many sources. It springs from the consciousness of a personality gloriously out of the ordinary and at the same time gloriously in the great human tradition. (Composed predominantly of Augustus Johns, modern society would explode and sink without trace. This is chiefly a criticism of modern society.) It springs from the vividness with which scenes, landscapes, atmosphere and above all individual characters, celebrated or obscure, are brought to life; here the seeing eye of the artist is turned to account in a new medium, triumphantly. (Could one infer, from the gusto, unsentimentality, affection and occasional wickedness of the writer's character sketches and anecdotes, the quality of the painter's line and colour? Hardly; but there is an unmistakable kinship.) Not least among the sources of enjoyment is Mr John's style; free-running, vigorous, sometimes hyperbolic, sometimes, on the other hand, expressing a take-it-or-leave-it objectivity as effective in its own way as the perfectly straight face of an outrageously funny *raconteur.* There are moments, particularly where affairs of the heart are concerned, when one is irresistibly reminded of Kai Lung; there are others which recall the Ruthless Rhymes for Heartless Homes.

It is not, however, possible entirely to analyse the delight which Mr John bestows. It is rather like the pleasure of sunshine, a pervasive sense of heightened vitality, a conviction that life is more fun than one had supposed. Not that he is by any means a Mark Tapley or a Pollyanna. He has some lively hates, including—a fairly massive inclusion—the entire modern economic order and the entire apparatus of the coercive state; he ends on a note of misgiving, a warning that humanity is on the wrong track. Nor is he complacent about his own achievement. "Foresight, calculation, patient planning," he says, "have not been within my grasp. I was never apprenticed to a master whom I might follow humbly and perhaps overtake." But he has what is better than complacency, an undimmed sense of "that more than real Presence . . . to be traced in trees, rocks and pools, in earth and sky and everything that lives." In this least didactic of books there is not only delight but wisdom.

Junior Wranglers

Mathematics at the Fireside. By G. L. S. Shackle. *Cambridge University Press.* 156 pages. 16*s.*

"Did you enjoy this book?" asked Gillian. "Well," said her father, looking at her a little sheepishly, "I certainly enjoyed it, but I'm not sure that I understood it all. And I'm not certain whether I was meant to, because the publishers say that if the book can be left about in houses where the unsophisticated live, sooner or later the persons for whom the book is written will find it, and begin it and read it through." Gillian found this puzzling. "Do you mean," she asked, "that you are sophisticated, or that you know nothing about mathematics? It's a very different kind of maths book from the one we have in the Upper Fourth, and I would rather have George and Lucy's father teach me than old Miss Carpenter."

"So you liked the family?" asked Gillian's father. "I found them a bit tiresome occasionally. Particularly Lucy, who seemed to know all about complex number vectors and was better at the differential calculus than ever I was. How would you like it if every outing we took turned into a maths lesson, with me doing most of the talking?" Gillian shook her head. "Not at all, but they're not really a make-believe family, are they? And the book is jolly nicely printed by some people I never heard of called Syndics. I don't think I understand the preface, though I expect you did. That part about Lucy's necklace was interesting; I shall see if mine is the same shape as hers when I put it on, but it will be a long time before I learn how Lucy's father drew the line of her necklace by mathematics."

Gillian's father nodded. "Me, too. I have a lot to do with figures, but I have never been any good at maths. But I might have been a lot better if I could have studied this book when I was a boy, because I could never understand what dear old Ben, as we called our maths master, was trying to teach us. I think those Syndics of yours are right when they say that some lucky children will really learn mathematics from this book."

Gillian looked pensive. "Well, I'm not sure, but I'd like to keep it on my bookshelf; it might be jolly useful when I'm in the Upper Fifth."

THE BUSINESS WORLD

Profits Too Low

ONE of the main reasons for last year's balance of payments crisis was that industrial profits were too low. This is not a contentious political opinion. It is a sad statistical fact. According to the preliminary estimates of the national income statisticians (published in Cmd.8486 and unamended in the Economic Survey), wages, salaries and forces' pay rose by £838 million in 1951, but all other incomes, before including stock appreciation, fell by £331 million. Although full estimates are not yet available, it is clear that the main brunt fell on company profits and within this heading—since dividends increased by £78 million—with even greater weight on additions to free company reserves, which had been a principal component of saving in 1950 and previous postwar years.

The impact on Britain's balance of payments was dramatic and direct. Although most other forms of saving rose slightly in 1951, the squeeze on companies' free reserves caused total domestic savings (including depreciation provisions and additions to tax reserves) to fall by nearly £400 million in the year, while gross domestic capital formation (partly because of Government re-stocking) rose by over £350 million. This shortfall of £750 million between domestic savings and investment could only be financed by running down external capital and by borrowing abroad—in other words, it had its direct arithmetical counterpart in the turn round in the balance of payments from a surplus of £244 million in 1950 to a deficit of £521 million in 1951.

Some politicians choose to ignore these statistics, but most, of course, have simply not heard of them. This is not surprising. The profits figures that attract most attention—those that induce indignant thunder from left wing platforms and expostulatory clucking from right wing newspapers—are the unamended figures in company profit and loss accounts. In a year of inflation these include—indeed under British tax law have to include—a large element of "profit" that arises purely from the appreciation of stock values—an appreciation that inevitably carries with it a contingent need to strengthen stock replacement reserves. A tolerably fair analogy, on the plane of personal incomes, would be if a rise in fares were held to increase the taxable wages or salaries of holders of unexpired season tickets, bought at the old rates. The national income statisticians estimate that total stock appreciation in Britain last year amounted to no less than £1,200 million, and it is only when a large portion of this fortuitous element is included in company profits that the estimate published and publicised in last week's "Economic Survey" is arrived at—namely, that the total income of companies and public corporations rose by just over £500 million last year, or by more than 20 per cent.

★

The average increase of over 20 per cent in such "profits" was the result of a much bigger proportionate increase in the first half of the year and a much smaller one in the second half. The 475 companies that published accounts in the first three months of 1952 showed an increase in total income including stock appreciation, of £41½ million, or 16 per cent. The majority of these accounts referred to financial years that ended between early September and late December of 1951, and many of the companies concerned had therefore begun to feel the first effects of sagging consumer demand and falling raw material prices (but still rising labour costs) in the last few months of their trading years. The increase of 16 per cent in the total income of these 475 companies compares with an increase of 32 per cent in the total incomes of the 564 companies that published accounts in the last quarter of 1951 (excluding the exceptional experience of three oil companies), and of 24 per cent in the total income of the 515 companies that published accounts in the quarter before that. As the rate of profit expansion, even as thus illusorily measured, passed its peak (and as earnings on both ordinary capital and net worth actually declined), caution clamped down in company board rooms. As a result only £584,000 of the £41½ million increase in total company income reported last quarter was passed on in increased dividends to ordinary shareholders; the tax collector took over £29 million of the increase and most of the rest was added to various sorts of much needed reserves.

The full statistics for the latest quarter, published in last week's issue of the *Records and Statistics* supplement, show the differential impact on the various groups of industries of last year's first downward flicker in demand. The results were not, perhaps, precisely those that a casual observer of the current scene would expect. The groups from which the loudest complaints are now heard—retail stores, cotton, clothing and footwear—all showed a slight increase in profits on the year here analysed, either because they had not worked through the existing backlog of their orders or because a ruddy glow was imparted to their accounts by their happy experience in the first half of the year; with the writing on the wall before them, however, each of these groups slightly reduced its ordinary dividend payments. The biggest declines, in both income and dividends, were shown by wool and other textiles; some other small groups, such as tea plantations, also showed small declines in income but their dividends were usually at least maintained. The biggest proportionate increases in income were shown by rubber companies (whose accounts chiefly reflect sales before June of last year) and newspaper, printing and paper companies (whose bumper "profits" were associated with an increase of no less than 68 per cent in stock values). Engineering and electrical manufacturing also enjoyed an increase in income slightly above the average. There was some sign here, though only a faint one, of profit increases pulling resources the way they ought to go. Unfortunately, the excess profits levy will from now on be pulling lustily at the other end of the same rope.

★

The third of the accompanying tables shows the balance sheet movements in what, for most of these companies, was the last full financial year before the sea change in credit policy. The total assets of these 475 companies ran up by £218 million, of which no less than £109 million was due to a change in the value of stocks and £62 million to an increase in the value of fixed assets, but £39 million in sums due from debtors. These increases were absorbed with only a small fall in cash and gilt-edged holdings, but bank overdrafts increased by nearly £29 million (or 47 per cent) and other current liabilities and creditors by £81 million; borrowing on debentures ran up by another £19 million and ordinary capital increased by just over £20 million (though bonus issues no doubt played some part in this). The average increase in stock values was some 26 per cent. This increase was spread widely across the different industrial groups, though the newspapers, printing and paper group (up by 68 per cent), chemicals and paint (58 per cent), warehousing (43 per cent), cotton (42 per cent), and clothing and footwear (31 per cent) are worthy of note.

The 475 profits statements analysed here represent a snapshot taken across a period of violent change. Any detailed conclusions based on them might therefore be badly out of focus. But one thing is clear. When the profits statements published in the last quarter of 1951 were commented on in these columns on February 9th, it was pointed out that they mirrored a period when sales were much too easy for economic flexibility but profits still too low for national stability. In the following three months the first fault was slightly corrected, and the latter made grievously worse. In a year of inflation such as 1951, industry had to make high "profits" on the appreciation of its stocks; it needed those profits to finance stock replacement at higher values, but the tax collector prevented it from using sufficient of them for this purpose. This nibbling into industry's free reserves, urged on by a farrago of political malevolence, was a recipe for balance of payments crisis so long as the high tide of inflation lasted. It may prove to have been a recipe for something worse if the tide ever turns round to full ebb.

IN GERMANY

The latest report by The Economist Intelligence Unit reviews economic affairs in Germany, and analyses prospects for production, exports to the dollar countries, the likely effects on trade of sterling area cuts, and much more which may concern business people in other countries. There is a valuable statistical appendix.

The Unit now reports on nearly 40 countries every 3 months. These reports may be obtained by annual subscription, or singly.

Record Roundabout

ON April 10th Electrical and Musical Industries sent a letter to EMI record dealers telling them that the company would start production of long-playing records in October. This puts an end to nearly four years' speculation about EMI's attitude to LP records. These have been on sale in the United States since 1948 ; in this country they were put on the market in 1950 by the Decca Record Company, EMI's principal British competitor. Shortly after the introduction of the LP record by Decca, EMI stated that the company would continue for the time being to issue all its work on standard records, but promised that dealers would be given six months' notice of any change in this policy. This notice has now been given, but with no indication of the type of long-playing record that EMI intends to adopt.

Until 1948, all recordings were made on standard discs that played for less than five minutes a side, and revolved at a common turntable speed of 78 revolutions per minute. In that year, the Columbia Record company in America began to issue discs with a playing time of approximately 25 minutes a side. This they did by placing the grooves more closely together and reducing the turntable speed to 33⅓ rpm. The records themselves were no bigger than the standard 12 inch 78 rpm record which had up till then been the main medium for recording classical music. The LP records presented an immediate challenge to the 78 rpm record for the reproduction of major works, for they provided a performance without interruptions every five minutes for record changing. Many such works fit into one or sometimes two sides of a 33⅓ rpm long-playing record while a number of well-known operas fit on two records involving only three breaks in the complete performance. The long-playing records have several incidental advantages ; they are unbreakable, easy to store and are cheaper per playing minute than the 78 rpm recordings. It is questionable, however, whether these features alone would have turned the scale in their favour.

Shortly after the 33⅓ rpm record was introduced in the United States, Columbia's principal rival, RCA-Victor, introduced a second type of record which ran at a speed of 45 rpm. Strictly speaking, this is not a long-playing record, for the discs are 7 inches in diameter, and play for the same time as a standard size 78 rpm disc ; they were really designed to operate with a highly efficient changing mechanism incorporated in the turntable spindle. They have never become serious competitors of the 33⅓ rpm record for the standard classics, but they appear to meet a definite need in the American market. An element of uncertainty about the future of these three speeds, 78, 45 and 33⅓ rpm, has been kept alive by the knowledge that Victor has done some experimental work on a 12 inch 45 rpm record that would play almost as long as the 33⅓ rpm record, and companies in Europe have toyed with the idea of a long-playing 78 rpm disc.

Given the success of LP records in the United States, where the catalogues now list 5,500 different recordings, EMI's delay in introducing them is not easy to explain. Between them, EMI and Decca are responsible for the great bulk of the records produced in Britain, sold under their own trade-marks or pressed for the smaller record companies. Home sales have become fairly stable at between 15 and 20 million records a year, several times larger than before the war. There was, in addition, an export business of nearly 18 million records last year, worth £2 million, and exports in the first quarter of this year reached nearly £600,000. Import restrictions in Australia, New Zealand and South Africa, three of the leading foreign markets, will cut these sales during the rest of the year, and the slump in the American record market may cut them further. Last year a quarter of Decca's £1 million exports went to the United States: EMI's exports sales were smaller because the company does not distribute its own records in the United States. Almost from the start Decca has been pressing long-playing records for export to America, and in 1950 began to sell them in this country, too. In the past two years, during which it has been in sole command of the British LP record market, Decca has built up a catalogue of 550 long-playing records which includes most of the popular classics and many modern works, while EMI has continued to record on the standard 78 rpm discs.

For a number of reasons, it was probably easier for Decca to take the decisive step to LP records two years ago than it is now for EMI. Long-playing records are admirably suited to classical works, which never formed as big a part of Decca's business as they did of EMI's. Even with its present leadership in LP records, Decca's sales of major works may not represent more than 20 per cent of the total value of its sales, whereas the corresponding proportion for EMI might be at least 40 per cent. Classical and near-classical works are kept in the catalogues for a longer time than popular music, and the companies and their dealers are obliged to hold stocks of such records dating back for some years. This represents a vast amount of locked-up capital. Nor can recordings be easily transposed from 78 rpm to 33⅓ rpm. The unsatisfactory quality of some earlier long-playing records was due to attempts at direct transposition. Only a small proportion of the performances sold on 78 rpm discs were originally recorded on magnetic tape, but it is only from these tape recordings that long-playing records can satisfactorily be made. For most of the works on 78 rpm discs it would be necessary to make new recordings with new artists.

Any company with a big classical catalogue might well dislike the prospect of having to re-record a considerable proportion of its stock and of scrapping or duplicating its own and its dealers' stocks of the same work on 78 rpm discs. Dealers who are carrying 66⅔ per cent purchase tax on their existing stocks and who are understandably short of cash would find it no more agreeable. EMI's agreements with the two rival American companies also made a decision difficult. The relations between the British and American companies are difficult to follow, for while the financial ties that existed between them have been dissolved, they retain rights to a common trade-mark in certain defined areas. The clearest case is that of British and American Decca. The English company set up an American subsidiary in the 'thirties which, as it grew, became more interested in pressing its own records and less in distributing those from the English company. After the war the two companies gradually separated, leaving American Decca with the American rights to the Decca trade-mark. The English Decca company, which retained world rights outside the American continent, sells its own records in the United States as London Records, and sells American Decca records here as Brunswick ; it also has the British rights of the Capitol catalogue and has now an interest in the German Telefunken group. The British Columbia company severed relations with its American parent in the early thirties and is now owned by EMI. But EMI has continued to distribute the American Columbia catalogue, using American "masters" and making pressings from them in this country for sale here and abroad. EMI has a similar agreement with Victor which distributes EMI records in America. Victor has the right to sell under the His Master's Voice trade-mark but does not do so. A third agreement exists with Metro-Goldwyn-Mayer, who supply film sound-track from which EMI makes direct recordings.

At one time, the competition in America between Columbia's 33⅓ rpm long-playing record, and Victor's 45 rpm, threatened to be mutually destructive. With EMI distributing the catalogues of both companies in Britain, a choice between their two long-playing systems would be certain to give sore offence to the other. But EMI's neutrality has not pleased either of them. Both American companies are anxious to see their own long-playing records sold in competition with Decca's in the British and Commonwealth markets. Whether because of dissatisfaction or not, the American Columbia company has made new arrangements for the distribution of its catalogue outside the United States, and from the beginning of next year this will be done not by EMI but by the Dutch company Philips.

This is a serious blow, for at one stroke it deprives EMI of access to Columbia's extensive long-playing repertoire, just when EMI is entering the LP business, and offers it instead to a competitor new to the industry. Philips has not pressed records on any scale before ; since EMI has the rights to the Columbia trade-mark (as distinct from the American Columbia catalogue) in this and in other countries, Philips will presumably have to distribute American Columbia records under a different name, and to avoid the British import restrictions, the records might have to be pressed here rather than in Holland. In this case Philips might find it easier to arrange for, say, Decca to press records for it in this country rather than install complete new plant here.

Although it seems certain that EMI will sell 33⅓ rpm records, the loss of the Columbia catalogue and the conclusion of a new agreement with Victor may lead the company to press a number of 45 rpm records as well. Even among the classics, some of the EMI's best selling records are short pieces—single movements or arias—which do not play for more than four or five minutes. There is no point in recording these on LP 33⅓ rpm records, but recorded on 45 rpm records they would have a better tone than the standard 78 rpm disc, take up less space and also be unbreakable. Without the need for the elaborate record changer that now makes it impossible to play Victor 45 rpm records on a turntable with a normal-sized spindle, such 7 inch discs might be built up as serious competitors, not to the 33⅓ rpm long-playing record, but to the 78 rpm recording of the short classics and of popular music.

EMI's plans in this direction will not be known until later in the year, when the first long-playing catalogues are sent to the dealers. But a bold step seems to be needed to make good the leeway that the company has lost by its late entry into the LP market. Any move towards 45 rpm would shortly be followed by a similar move by Decca, which is pressing 45 rpm records for the American market ; but Philips might not at this stage be able to do the same, since Columbia in America make no 45 rpm pressings. There is also a possibility that EMI may have been able to use the intervening years to develop a better material for the records than the standard polyvinyl chloride available here. This is not as good as the vinylite used for long-playing records in the United States but careful mixing and blending can improve it. EMI is not, however, alone in this work.

Although the market for classical music is more stable than that for popular recordings, its ability to absorb the output of two new producers in addition to Decca may be open to question. Decca, with most of the popular classics already on sale, must have skimmed much of the cream of the long-playing market. But there are indications that the 33⅓ rpm record need not be limited to classical works. Some of the best selling records in America are long-playing selections by popular bands. A larger market on these lines will have to be developed, especially by Philips, if the capital investment in long-playing records is to be justified.

Business Notes

Big Borrowers' Turn

It is difficult to say exactly what "success" means for such an issue as the £150 million of British Electricity 4¼ per cent stock, 1974-79, which was offered on Friday last week at a point discount. The terms were geared to attract the ordinary investor on interest considerations alone, but he can hardly be expected nowadays to be able to produce £150 million over three months and the departments have no doubt taken a major part of the issue—though perhaps, it would be plausible to guess, a smaller stint than they took of the 1950 issue. At any rate, applications up to £100,000 have been allotted in full, and over that figure at about 90 per cent ; the dividing line in 1950 was £250,000 with allotments at the rate of 84 per cent for applications above that amount.

The new stock opened at ⅛ discount—an inevitable recognition of the fact that the existence of a departmental "tap" may favour those buyers who are prepared to wait while the loan is being digested—and by mid-week was no better than 5/16 discount. No doubt this somewhat inauspicious start to dealings will not greatly disturb the authorities at this stage, for they had a major success in peddling out the 1950 issue. But a similar success on this occasion would raise pointed questions of monetary policy—or alternatively would flow from the conviction on the part of the investing public that the foreign exchange crisis was well on the way towards solution. The behaviour of the gilt-edged market this week does not suggest that investors generally have reached any such firm views, and the weight of the electricity issue must be expected to have its effect on the normal course of gilt-edged prices in coming weeks.

The placing of a further *tranche* of Tanganyika 3½ per cent stock 1970-73 offers an unwonted opportunity to the life insurance funds and the surtax paying investor. The new issue of £2,280,000 stock is on identical terms with the £1,750,000 issue made nearly two years ago; some £1,500,000 is being placed with the institutions at a basic price of 88, resulting in an inviting gross yield to redemption approaching 4½ per cent.

* * *

Points on Distillers

The Distillers Company is developing something of a flair for the unconventional in its capital financing methods. The company was one of the first to exploit the issue of unsecured loan stocks; it placed two serial issues with the institutions in 1950, for a total of £10 million with annual repayments extending to 1960, side-stepping the market and seeking no quotation for the stocks. This week brings the expected announcement of further financing, in a totally unexpected form. The company is raising £10 million 5 per cent unsecured loan stock, repayable in 1964, but convertible into 4s. ordinary shares between November 1st this year and November 1, 1957, at varying rates—116 shares for each £100 stock at first date, 112 shares at November 1, 1953 and 1954, 108 shares at November 1, 1955, 104 shares at November 1, 1956, and 100 shares in 1957. The first year option implies a price of 17s. 3d. per share, compared with 18s. when the announcement was made.

An interval for reflection now presents itself before the publication of the prospectus on Thursday next week and the opening of the lists on the following Tuesday. Without doubt, this is not a method that could be adopted by more than a small proportion of industrial borrowers, for the conversion option, to be of attraction, presupposes solid worth and expanding possibilities for the existing equity capital. That a 5 per cent stock with a life of no more than twelve years should require such an additional inducement is no doubt a disagreeable discovery to those prospective borrowers who only a short time ago were thinking in terms of a 5 per cent basic rate for first-class debentures. Inside the Distillers' boardroom, the alternatives were presumably a higher coupon rate or an equity issue. With the 4s. ordinary shares standing at the time of the announcement at 18s. to yield £5 per cent how much would have had to be conceded in the price of a rights issue? And what then would have been the feelings of holders in balancing the value of the rights against the fact that their existing shares had been thoroughly "banged"?

On the assumption that a rapid flow of conversions is aimed at, Distillers have ingeniously avoided this quandary, which has led to much disturbance of particular share values in the last six months. But there is a wider question apart from the mere mechanics of issue that then arises. If it is true that the effect of the Distillers issue is to increase the equity capital by taking two stages instead of one, how do the existing holders of Distillers ordinary stand? They have no say in the terms of the issue, and have no rights though they are promised special consideration. In saluting the ingenuity of the Distillers issue, therefore, it is still proper to call attention to the fact that it involves an alteration of the participation of the existing ordinary shareholders without formal consent on their part.

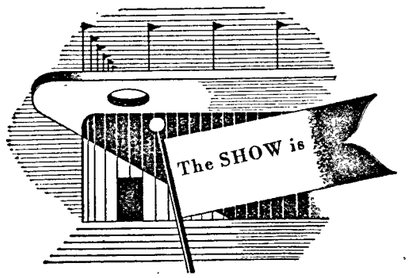
Bank Deposits and Government Borrowing



It is evident from the figures of the clearing banks for April that the effectiveness of the new monetary discipline is being fully maintained. Bank advances, which rose by £13.6 million in the previous month, increased by only £6.7 million in the four weeks to April 16. Some decline in demands for additional advances is a normal feature of the first month of the nation's financial year, after the heavy pressures of the tax-collecting season; and this latest increase is appreciably less than that for any previous postwar April since 1948—the 1951 movement was £12 million. It is understood, moreover, that it was wholly represented by additional loans to public utilities—including, apparently, the BEA, whose floating indebtedness, as shown in last week's loan prospectus, was £121 million at end-March. Evidently, the banks are succeeding in holding the position disclosed by the latest of the full quarterly analyses of advances: between November and February, it will be recalled, aggregate advances to the private sector of the national economy were approximately stabilised. During the past month, too, there was a sharp decline in the volume of credit extended by the discount and purchase of commercial bills: clearing bank portfolios shrank from £176 million to £133 million. To some extent this contraction merely reflects the increase in the proportion of such bills retained in portfolios by the Eastern and other overseas banks and by discount houses, but there is no doubt that it also results from a genuine decline in the volume of bill finance—in response to the increase in London bill rates, the ban on refinance credits and the cuts in sterling area imports.

For these reasons, it is apparent that the month's upturn in bank deposits, after their three months of seasonal decline, is wholly attributable to Governmental demands upon the banks. Net deposits rose during the four weeks by £31 million, to £5,715 million—not a large increase for this season, but one that cannot fairly be compared with the £111 million increase shown for April, 1951, since the movement then was distorted by fortuitous influences (and was, indeed, largely offset by an abrupt fall in the following month). The rise in Governmental demands, arising from the opening of the phase of Exchequer deficits and from the reduction in the flow of external finance as the external deficit narrows, is reflected in an expansion of the banks' holdings of Treasury bills by nearly £72 million—a movement that is offset only to the extent of £5½ million by a net decline in call money and cash. Despite the expansion in the total of liquid assets, the liquidity ratio has declined further, to 31.6 per cent, but this movement is wholly due to the fact that gross deposits (on which the ratios are customarily computed) were raised sharply by an abnormal growth of items in transit. Partly for the same reason, the ratio of "risk" assets (advances plus investments) dropped by a full point, to 64.9 per cent. This month will bring a more genuine relief to this ratio, as the first proceeds of the BEA loan are used to reduce bank advances. Moreover, the financing of the "departmental" share of the loan will augment the Treasury's borrowings on bills, and thus will help to raise the banks' liquidity ratio—unless the monetary authorities take countermeasures to reinforce their discipline, for example, by trying to speed up the flow of the new stock through the "tap." The particular tactics they choose to adopt in this context will obviously be a major influence upon the gilt-edged market for some time to come.

Australia Draws from the Fund

Australia is to purchase $30 million from the International Monetary Fund. This is the first transaction of any sterling country with the IMF since 1949. In that year Australia purchased $20 million and India $31.7 million. The sale of dollars to Australia is the third transaction of the IMF this year, the others being sales of $37.5 million to Brazil and of $2,200,000 to Iran. The loosening of the Fund's purse strings follows the recent directive on its operations issued under the authority of Mr Rooth, the new managing director. Australia has a quota of $200 million with the IMF. In accordance with the articles of agreement any member may purchase currencies from the Fund to finance temporary deficits in its balance of payments provided that the Fund's holdings of its currency does

THE BRITISH INDUSTRIES FAIR

Exhibitors and visitors to the Fair are cordially invited to make use of the complete banking service provided there by Barclays Bank. The staff at our stands given below will be pleased to help you in any way possible.

In selecting desirable trade relations for exports and imports with Pakistan, Habib Bank Ltd., with 45 branches spread over West and East Pakistan, can prove to be most helpful and you are invited to use our services.

The Bank is fully competent to handle all foreign exchange business, including opening and advising of commercial letters of credit, collection of documentary bills, remittances, etc.

FOREIGN BRANCHES: Bombay, Calcutta and Colombo.

CORRESPONDENTS & AGENTS at all important cities of the world.

Shell Chemicals

The chemicals-from-petroleum industry is now helping in yet another way to meet this country's urgent need of raw materials. A shortage of sulphur means a severe drag on production. Rubber, rayon, steel, paper, dye-stuffs, many essential chemicals—even more homely things like starch and gelatine—all utilise sulphur at some stage of their making. In this country most sulphur is used for producing sulphuric acid, a vital need in literally hundreds of processes, not least in the manufacture of the super-phosphate fertilisers so important in present-day farming. Though Britain's sulphur is mainly imported, plants have been established to produce it here—plants very different from the traditional kilns. The first of these new plants to come into operation is at Stanlow, where rock sulphur, 99.9% pure, is now being produced by Shell from petroleum.

SHELL CHEMICALS LIMITED, Norman House, 105-109 Strand, London, W.C.2.
(DISTRIBUTORS)

not increase by more than 25 per cent of its quota in any twelve months' period. Since no other member is likely to buy Australian pounds from the Fund this means that in any one year Australia may buy dollars up to $50 million. The $30 million purchase announced this week will be drawn between now and the end of next September. The dollars will be drawn from the Fund as they are required by Australia to meet part of its dollar deficit. They will not be paid into the sterling area dollar pool, but will reduce by an equivalent amount the drawings which Australia will be making on the gold and dollar reserve.

The question that Australia's action inevitably raises is whether this breaking of the ice is to be followed by an approach to the Fund by other members of the sterling area. If Australia is deemed a suitable purchaser of dollars the eligibility of other sterling area countries, who have a combined quota of nearly $2,000 million with the Fund, can be taken for granted. These quotas are fully available in the sense that no utilisation of these facilities with the Fund have taken place over the past twelve months. In case of need, therefore, and assuming the IMF were willing, the sterling area could mobilise close on $500 million from this source in the coming twelve months.

Petrol Tax in Committee

On Wednesday of this week the Finance Bill started what threatens to be its long and tortuous journey through committee. The first day's debate was devoted to the petrol tax, a subject on which both parties are inhibited—by their past records and present political manœuvring—from talking any great deal of sense. The most serious reason for doubting the efficacy of the petrol tax is the fear that the force of the new duty may be largely absorbed by the undistributed profits of public and private companies; it is only to the extent that the increase in costs is passed on to the public that the tax can have its full and desirable effect of cutting back consumption in general. In the present political conjuncture, however, no member of Parliament is very willing to point this out—and Wednesday's debate therefore tended to lapse into a farcical situation in which members on each side were expressing fears that the tax would work, and the Chancellor seemed intent on issuing assurances that it probably would not. Mr Butler estimated the increase in cost for users of small cars doing 30 miles per gallon at ¼d. per mile, for users of larger cars doing 20 miles per gallon at ⅓d. per mile, and for commercial users at 3¼ or 4 per cent. He did not believe that this would mean an automatic increase in fares, and he welcomed "the statesmanlike approach of the Road Haulage Executive, which has promised to keep the position as stable as possible and has stated that it does not intend to increase its rates, at any rate for the time being."

In the course of the debate, the Government announced small compensatory grants to disabled servicemen using invalid chairs and to flying and gliding clubs; it also promised to consider the difficulties of other users of invalid chairs and taxicab drivers. An opposition amendment to exempt white spirit and light oils used in the paint and other non-transport industries was, however, resisted on the grounds that all imported oils contained some dollar element. The real battles on the committee stage of the Finance Bill lie ahead. They are likely to be fought on EPL, where concessions would accord with justice and the need for economic flexibility without encouraging any increased demand for resources; and on purchase tax where the Financial Secretary to the Treasury promised this week that the Government would give the "fullest and most careful consideration" to all suggestions that it should flutter away from its present anti-inflationary stand.

Textiles and Tax

Tuesday's debate in the House of Commons on the removal of purchase tax on textiles was, not surprisingly, an inconclusive affair. Naturally the idea of lifting the tax finds favour in Lancashire and Yorkshire, but it is no longer—if it ever was—at the root of the textile industry's trading difficulties. Even if the Chancellor was prepared to forgo an estimated £100 million tax revenue, large sections of the cotton and woollen trade would still be no better off than they were before. The Financial Secretary to the Treasury estimated that only 30 per cent of the textile industry's output attracts any tax; under the new graduated system of tax, at least two-thirds of this escapes extremely lightly. In short, the tax has no marked effect on retail selling prices except in the case of high quality goods which represent only ten per cent of the industry's output. There is certainly an argument for a greater measure of tax relief for quality goods, but this was not what the Labour speakers had in mind when they asked for the total abolition of purchase tax on textiles.

Some speakers made a point of the psychological effect on the market of lifting the tax. The market is, however, suffering at this moment from the much stronger psychological effect created by continued uncertainty about future tax levels. The Government bears some measure of responsibility for this by its well-meaning undertaking to consider amendments to individual tax exemption levels at the committee stage of the Finance Bill. When the rate of purchase tax is reduced on any item, retailers cannot claim a rebate on the tax already paid on goods in stock, and usually have to stand the loss themselves. Many retailers were waiting for the budget before placing orders for summer stock, but since then the continued agitation for alterations in the individual "D" levels has impelled them to restrict their buying to the minimum while there was any possibility of revised "D" limits. This uncertainty has tended to make home trade slacker than it need have been. The completion of the committee stage of the Finance Bill and with it the end of the argument, should help the textile industry quite as much as any tax concessions that may be made. The hardening of raw wool prices should do the same, since many orders have been withheld in the hope of further price falls.

The industry's long-run difficulties may now lie less in the home market than abroad. In its Monthly Record, the Manchester Chamber of Commerce calls the Australian import restrictions a "major blow" likely to cost £20 million a year, while continuing import restrictions in South America keep British textiles out of some of their most promising markets. If, however, the Government finally decides to impose similar restrictions on the import of foreign textiles into the colonial markets, an increase in British sales to these markets may offset some of the effects of the Australian cuts.

* * *

ICI Does It Again

For the second successive year the directors of Imperial Chemical Industries have been able to recommend an increase in the ordinary dividend, this time from 12 to 13 per cent. They have also been able to announce that the group's profits have more than doubled in the last two years. Group profits in 1951, before depreciation and taxation, amounted to £48,950,393, or just over £9 million more than in 1950 and just under £25 million more than in 1949; group net profits in these two years have risen from £10.8 million to £23.5 million. All these figures, however, are profits as the accountant and the tax collector, not as the economist and eventually the shareholder, sees them. In real terms the picture is not so heartening. The increases in profits in both the last two years have been largely swallowed up in reserves for the replacement of fixed and working capital. Last year £7 million (against £4 million) was set aside for stock replacement and £5 million—as in 1950—

for obsolescence and the replacement of fixed assets. Increased earnings from a remarkable expansion in business have been swollen disproportionately by the inflation of prices, but real or illusory increases in earnings are both treated alike by the tax collector, who took £16.6 million from profits last year, against £12.5 million in 1950.

The constant need to provide for the cost of replacing and expanding capital, while the burden of taxation has grown heavier, has meant that the growth in gross profits has not been accompanied by a similar expansion in freely distributable earnings. The ordinary dividend, however, has been allowed to reflect some of the increase in profits. In 1950, when profits increased by £16 million, the dividend was

Years to December 31	1949	1950	1951
	£	£	£
Group profit	23,984,131	39,713,280	48,950,393
Depreciation	6,660,622	8,694,823	8,892,892
Taxation	6,496,828	12,455,692	16,557,129
Group net profit	10,826,681	18,562,765	23,500,372
Retained by subsidiaries	554,977	1,113,033	2,356,237
Net profit	9,791,503	16,843,912	20,382,548
Central obsolescence, etc.	3,000,000	...	...
Deferred tax reserve	2,215,000	2,960,000	2,944,000
Obsolescence and fixed assets replacement reserve	...	5,000,000	5,000,000
Stock replacement reserve	...	4,000,000	7,000,000
Ordinary dividends	3,330,697	3,860,581	4,133,092
Added to carry forward	318,814	96,339	420,060
Ordinary dividends (per cent)	*10*	*12*	*13*

raised from 10 to 12 per cent; for 1951, when the rate of expansion in profits slowed down, the year's distribution has been raised from 12 to 13 per cent. The recently issued new ordinary shares do not rank for this payment, but a similar 13 per cent dividend will be confidently expected on the new capital of £70,651,162 this year. If this proves to be the case then the yield on the new £1 shares at the issue price of 40s. 6d. is 6.4 per cent; the old shares at the current price of 43s. 1½d. x.d. yield 6 per cent. With an unfavourable EPL standard added to ICI's other problems, however, shareholders might be wise to assume that the phase of expanding dividends may now be temporarily coming to an end—even if, thanks to the capital development programme, the phase of expanding profits is not.

Healthier Film Finance

Mr James Lawrie, managing director of the National Film Finance Corporation, was this week able to give British film production a somewhat cleaner bill of health for 1951-52 than he had been able to present in previous years. Of the films released in 1951 that were backed with public money by the Corporation, a rather higher proportion seem likely to cover at any rate 70 per cent of their costs than did in earlier years—thanks largely to the operation of the "Eady plan" by which a small proportion of box-office takings is siphoned off and distributed specifically to the producers. In the corporation's annual report for 1951-52, the effects of the Eady levy, which was considerably increased in amount last summer, are examined. Out of 34 films backed by the Corporation and released in 1951, distributors guaranteeing 70 per cent of the production costs would probably, without the levy, have lost money on 21; now lose on 9; and would lose on only 6 if the higher levy had been in operation throughout the year. Moreover, the distributors' share in the profits of the successful films now covers their aggregate losses two or three times over. Though only three or four films seem likely to be converted from loss to profit by the levy—about 16 or 17 may be profitable as against 13 if there had been no levy—the aggregate figures of cost and producers' receipts show that 106 per cent of the total cost was recovered, against 73 per cent without a levy; had the higher levy been operating throughout 1951, as it will be in 1952, 115 per cent of the total cost would have been recovered.

The distributors, on this showing, would have done considerably better than the NFFC, which puts up mainly "end" money—all or part of the 30 per cent remaining to be found after a distribution guarantee has been obtained for the film. The Eady levy, even increased in amount, has not removed the risk of such financing, though it has lessened it. What it has done, says the report

> is to reduce to small proportions the risks of distributors if they guarantee only 70 per cent of the budget or cost of production . . (and to make) it possible to invest end money with profit, provided the investment is spread over a fairly large number of films and provided an arrangement is made for setting off losses against profits.

These are the methods on which the Corporation has recently concentrated in its "group" production schemes; and this confidence is presumably the source of the Government decision that the Corporation should be empowered to borrow in addition to the £6 million of public money it has been guaranteed, £2 million from "non-governmental sources." It expects to be able to obtain such advances "through normal banking channels" and since a Treasury guarantee for such advances can be had if required, it presumably will be able to. In fact it has laid out in film production about £5,200,000 of the £6 million of public money, and expects to be repaid more than £1 million by producers this year; so it may not have to look for such extra funds for some time. The accounts for the first time show an item for a share of profits on five successful films—£32,996; after making provision for losses on loans of £110,000, the Corporation made a net profit of £10,891, against a loss of £675,850 last year.

* * *

Cheaper and Better British Films?

During the three-and-a-half years that it has thus been on public assistance, British film production does appear to have carried through some belated reform of its earlier extravagances. Among films backed with public money in 1951-52, there was on the average no excess of expenditure over the budget figures estimated in advance; this now applies to the British Lion group, which still owes the NFFC £3,000,000, and in which expenditure remained excessive up to a year ago. Another index of efficiency in the studios is the amount of "screen time" shot in a "camera-day"; this rose by 40 per cent in 1951-52 to 1.66 minutes, the average number of camera-days taken in making a film having been halved in four years. On the other hand, the number of films made without public money—apart from films largely backed by American companies with sterling "frozen" in Britain—would seem to have fallen. Last year Ealing Studios, the one important British studio that had managed in earlier years to stand entirely on its own feet, joined the queue at the NFFC for assistance on certain films.

The Corporation considers that "the saving in cost has not been achieved at the expense of quality." But success at the box-office demands an intangible blend of qualities that few in the industry would care to define, and it cannot yet be said that a sufficient proportion of British films have it. In recent years the British exhibitor, whatever his regard for the native product, has still been incurring a larger risk by exhibiting a British film than by showing an American. In 1949-50 and 1950-51 many exhibitors were unwilling to take that risk as often as the law demanded. During 1949-50 the quota of British films they were called upon to show was quite certainly too high, but in 1950-51 nearly 800 exhibitors failed to fulfil even the reduced quota—30 per cent of the films shown—that has operated since 1950. None have yet been prosecuted. Much political play has been made with this figure in recent weeks; spokesmen of the film workers have pointed out that members of the Films Council, which advises whether quota defaulters should be prosecuted, include directors of companies some of whose own cinemas failed to fulfil the quota in the years concerned. The innuendo is neat but not really very effective; it might be hard to find major

I used to be the office typist

. . I'm the OFFICE TYPE COMPOSITOR!

You could call me a 'one-girl department,' really. With my electric Varityper I produce master copies of all my firm's stationery—from routine forms and circulars to the latest issue of our monthly catalogue. I prepare the 'galleys' of the house magazine, and set the type for our advertising literature. I can change my style of type in literally two seconds, and line spacing, leading, column width and margin justification are all automatically controlled.

My finished copy is the reproduction copy, ready for printing by direct plate, photo-offset or stencil methods.

My Boss says—"Printing is the life blood of our business. We don't cut down on its supply*—we cut down on its cost with the Varityper."*

But that's only half the story. I'd like to tell you more about my Varityper and the work we do. Then you'll realise why so many 'one-girl' departments like mine are being set up in businesses large and small throughout the country.

Drop me a line or ring me at

Decisive stroke solves knotty problem
In Gordian Knots or Heavy Duty Cooking

ZEUS had spoken. The oracle was quite definite. Whoever could undo the knot that bound King Gordius's chariot-pole on to its yoke, would be the master of all Asia.

Alexander (whom some talk of) had ambitions that way — but the knot was a really knotty problem. So he smartly drew his sword and slashed the Gordian knot through. In the ancient world, this was good evidence that Alexander must be irresistible.

Time and again, he who hesitates is lost. For instance, if you order Falkirk Cooking Equipment *now*, then you will get it now — and at the very reasonable *current price*. Just think what a decisive stroke that would be for your budget!

Decisive Facts about Falkirk

- Equipment for Gas, Electricity, Oil, Steam and Solid Fuel
- Really tough cast-iron construction—will last for years
- Efficient modern equipment means less work for small staffs
- No weak links, a complete and balanced range of equipment
- Specially designed installation and plans for each customer
- Price most competitive
- If you need new kitchen equipment, *now* is the time to buy

WINDOW

ON THE FUTURE

A great new oil refinery with a projected capacity of 4,000,000 tons a year is being erected by Anglo-Iranian on the coast of Kent, at a cost of some £40,000,000. By 1953 the Company's four home refineries will have a total output of 10,500,000 tons—the largest contribution to the country's planned refining capacity of 26,000,000 tons.

In many other countries the refineries operated by Anglo-Iranian and its associated companies are increasingly contributing to the world's supply of petroleum products.

THE BP SHIELD IS THE SYMBOL OF BP THE WORLD-WIDE ORGANISATION OF

Anglo-Iranian Oil Company

LIMITED

figures in film exhibition who could prove complete fulfilment of the quota, particularly in 1949-50. The trades unions are understandably anxious to assist their members, many of whom have had irregular employment in recent years, while others have drifted out of films. But it is still to be demonstrated that setting the exhibitors a high quota and ordering them by hook or crook to fulfil it would bring about the production of sufficient British films worth making or seeing.

* * *

Best Face on Coal

Coal output so far this year is about 740,000 tons higher than in the same 16 weeks of 1951, but deep-mined output is only about 435,000 tons higher. In a statement "at the end of the coal winter" this week, the National Coal Board has analysed this bare and not too favourable comparison a little further, with rather more reassuring results. The tonnage obtained during the five-day week, it shows, increased by more than a million tons during the four months; but the output from shifts worked on Saturdays fell by 670,000 tons. During the last 34 weeks, which, it now seems to be implied, constitutes "the coal winter" output from the mines rose by some 3,200,000 tons over the figure for the 1950-51 winter, about 2,000,000 tons of the increase being won in the normal week's working and the remainder on Saturdays. This improvement in the five-day week, which seems to have been general in all areas except Durham and Scotland, is an important and encouraging trend, since this is the only output that can be counted as permanent, for the miners will not work on Saturdays for ever. Nevertheless, the figures illustrate what Sir Hubert Houldsworth said at the beginning of this (calendar) year—that with the main increase from Saturday working now spent, output from the mines cannot be expected to rise this year by anything like the 7 million ton increase achieved last year.

The industry has now 713,600 men on colliery books, more than at any time since September, 1949, and the steady increase in manpower should contribute some increase in coal output later this year. But the main increase is in juvenile recruiting; though this is what the industry needs in the long run, the youths cannot contribute to productive output for at least six months. The same applies to untrained men entering the mines. The effect of training these young and older newcomers will probably be a temporary fall in output per manshift: apart from the fact that new face-workers take time to increase their pace of coal-getting, some experienced men will be taken from production to develop new faces.

Coal stocks at the end of the winter appear to be about 13 million tons, 3½ million tons higher than at the same time last year. Good weather and industrial recession have combined to reduce inland consumption this winter, and it has probably been less than in 1950-51; this is the real reason why there are hopes of "no coal crisis next winter." But if industrial production is to rise this year, home consumption of coal must be expected to rise as well. So far this year the Coal Board has managed to export 2,800,000 tons, compared with only 1,600,000 tons in the same period of 1951. This suggests that in practice it may better the Government's undertaking to increase coal exports this year by two million tons; any further increase will certainly assist Britain's bargaining capacity in world trade.

* * *

Exports Still Rising

To judge from the official figures, the export drive is keeping up its momentum. Exports in the first quarter of this year reached £718 million and were £138 million or 24 per cent above the figure for the corresponding period of last year. On the face of it, this rise is impressive, but there

are two reasons for caution. First, the import cuts imposed by many of this country's biggest markets have still not had any effect on the export figures; and secondly, the first quarter's exports in 1951, on which the comparison above is based, were far below the level for the remainder of the year. If the current level of exports can be maintained, the total for 1952 would be some £170 million above last year's figures, but it remains a big "if."

Machinery exports in the first quarter of 1952 have shown the biggest increase on the year; they amounted to nearly £113 million and were £34 million larger than in the first quarter of 1951. The value of exports to Australia—Britain's largest market for machinery—was doubled at £18 million. In part, this must presumably reflect hasty shipments to avoid the Australian import cuts. Vehicles remained the largest single group of exports and at £139 million were £33½ million more than in the corresponding period of last year. Australia and New Zealand were still the two largest

UNITED KINGDOM EXPORTS

Total	**516,037**	**580,263**	**718,425**

markets and shipments to them were larger than twelve months ago; exports to Canada on the other hand were down, though there are signs that this market is recovering once more. Other metal-using industries (principally iron and steel manufactures and electrical goods) and the chemical and drugs industries also increased their exports. Among the smaller consumer goods, domestic pottery exports continued to rise partly because of abnormally heavy shipments to Australia. Textiles provided a sharp contrast to the general expansion; wool manufactures alone fell by nearly £13 million to £34 million, but this decline was to some extent offset by rises in other textiles, notably cotton goods.

Re-exports during the first quarter of this year were much larger than in the first quarter of last year. They amounted to £55 million compared with £33½ million in the first quarter of 1951, and this increase was almost entirely due to rubber and tin. More than 70,000 tons of rubber were re-exported compared with 7,500 tons in the same period last year; 43,000 tons went to Soviet Russia, and 22,450 tons to the United States (valued at over £7 million). In March there were also very heavy shipments of tin to the United States; £4 million worth of Malayan tin (probably about 4,000 tons) were re-exported together with 1,925 tons of tin refined in this country valued at £1,925,000. These commodity transactions are converting physical stocks into a welcome addition to the country's dollar reserves.

* * *

Bigger Imports

The import side of the trade picture shows a much less cheerful prospect. For the first quarter of this year imports were £984 million compared with £851 million for the same period last year. Over the whole of 1952, Mr Butler hopes

to save about £300 million on the import bill; if he is to succeed, imports for the remainder of the year will have to be about £150 million a quarter below last year's level—and so far there is little sign of any fall in import prices to ease the burden. Admittedly, the latest quarterly total is lower than that of the last three quarters of last year, but imports are normally smaller at the beginning of the year.

Larger supplies of industrial raw materials and machinery account for about 40 per cent of the increase in total imports. Many raw materials, for instance lead and zinc, are now being imported under contracts placed during the height of the materials shortage last year. Non-ferrous metals imports increased from £31½ million a year ago to £53½ million in the first quarter of 1952. Imports of iron and steel manufactures, principally from Belgium and the United States, rose from £6¾ million to £24 million over the same period. The increase in machinery imports from £10 million to £27 million was almost entirely concentrated on machine tools—largely for the rearmament drive. Food, drink and tobacco imports at £339 million were £54 million larger than for the same quarter a year ago, but most of this increase is probably due to higher prices. For instance maize cost £25 million—more than twice the total for the first quarter of 1951—but the tonnage received only increased from 8,300,000 cwt. to 13,000,000 cwt. Grain supplies as a whole cost £26 million more than a year ago and included more wheat from Canada and substantial shipments of wheat and maize from Soviet Russia and the satellite countries. The other major items in the increased food bill were tea, raw cocoa and sugar.

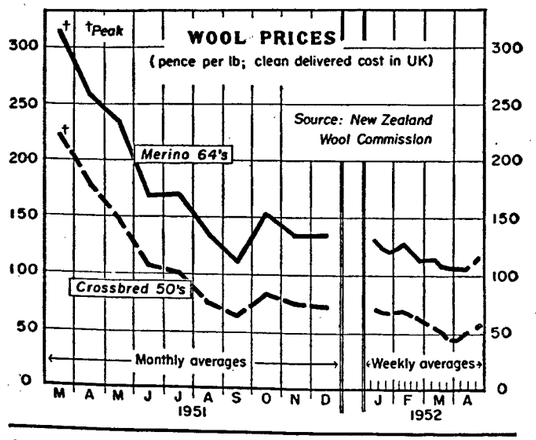
The terms of trade continue to move in this country's favour, but the movement is still very slow, and it depends entirely upon the increase in the price of exports. Import prices have remained completely steady for the last four months—the rise in food prices in March being offset by a fall in raw materials prices. The export price index has increased by one point a month this year. The fall in export prices of textiles has continued and there was a further sharp drop between February and March; but prices of metals, engineering and other manufactures more than made good this fall.

* * *

Co-operation in Raw Materials

The first task of the International Materials Conference in Washington has been completed. Within a signally short time its various committees had assessed the supply and demand of the materials within the purview of the conference and had introduced allocation schemes for eight of them. The IMC was perhaps fortunate to start after the general level of commodity prices had reached its peak and when the scramble for all commodities had become a scramble for one or two metals. Some consuming countries then began to wonder whether booming prices and shortages might give way to freer supplies and more reasonable markets. In this atmosphere, caution was beginning to temper the feverish need to amass supplies. To say that this changed atmosphere helped the IMC is not to belittle its achievements; the IMC would be justified if only because it taught the world that international co-operation does not involve a grandiose institution or large secretariat. Co-operation depends on the will to work together, not on legal instruments of association. Undoubtedly the IMC was given a good start by the readiness of the United States to hand over its export allocations of sulphur to the conference and even to accept the recommendation that total exports for a particular quarter ought to be larger than the quantity that the United States was at first ready to provide.

The immediate task of the IMC was to share out supplies of those materials that were inadequate to meet the full or reputed requirements of the free world. This task was carried out first by allocating supplies for the rearmament programmes, for stockpiling and for essential civilian needs, and



then by distributing the remainder proportionately among all consuming countries of the free world, whether members of the IMC or not. A description of the setting up of the conference, its membership and method of working is given in its first annual report* published this week. The report also contains statistics of production, consumption and trade of the various commodities covered by the conference, many of them new. These tables will be reprinted in the *Records and Statistics* supplement.

The conference's next task is to study longer term problems that may well test the will of member countries to continue to work closely together. The IMC expects to continue allocating copper, tungsten, molybdenum, nickel, cobalt and sulphur during the current year ; it expects to drop the allocation schemes for zinc and newsprint. But its study of various projects to increase production of scarce materials is bound to raise the question of some form of price stabilisation. It can hardly encourage producers to expand output unless it gives some guarantee that the extra output will be needed for current consumption and, further, that the large stockpiles built up during recent years will not eventually be used to force down prices.

* * *

Wool Prices Recover

During the past week wool prices have risen quite sharply by 10 to 12½ per cent. The price of merino wool had fallen almost continuously, though not drastically, from January until the middle of April ; during these three months merino 64's dropped from 131d. a lb to 105d. Last week they jumped to 116d. and recovery has continued on a more modest scale this week. Prices for crossbred wools have followed a very similar trend ; they fell particularly sharply between the middle of February and the beginning of

April, but they recovered before merinos. At the beginning of January crossbred 50's stood at 70d. a lb ; in mid-February they were 68d. and in the first week of April 44d. By last week they had risen to 57d. a lb.

This change in the raw wool market has not been accompanied by any marked increase in retail sales of wool textiles, though sales during the past few weeks have shown some improvement. But it suggests that the fall in world consumption of wool has been arrested. By the last quarter of 1951, indeed, consumption of wool in France, Italy and Germany had begun to revive and in recent weeks Bradford has shown a much more optimistic tone. There is no risk of another wool boom, for, as a note on page 250 of last week's issue pointed out, world output this season may be some 250 million lb larger than the current rate of consumption, and large stocks of unsold wool are held by both Argentina and Uruguay. Admittedly manufacturers' stocks are still low and some wool has to go into strategic stockpiles, for which Britain itself is buying 50 million lb. Despite the present uncertainty about retail sales, 105d. a lb for merino wool may well be sufficiently low to entice manufacturers to buy. On the other hand recent experience has shown that a rise to much above 135d. a lb tends to discourage re-stocking.

* Report on Operations of the International Materials Conference 1951/52.

* * *

The Prudential in 1951

The substantial depreciation of stock exchange securities that all insurance companies had to face last year makes the 1951 accounts of the Prudential of special interest. The statutory certificate that the value of the assets is "in the aggregate fully of the value shown in the balance sheet" is given this time, unlike previous years, after taking into account the branch contingency funds ; since the branch contingency funds at the end of 1951 amounted to £16¼ million and total assets to £645½ million, this suggests that the cushion remaining against further depreciation after December 31, 1951, was less than 2½ per cent of total assets. It should be noted, however, that the actuarial valuation of liabilities has been maintained on the stringent basis adopted in recent years ; it is still assumed that only 2 per cent and 2½ per cent net will be earned in the ordinary and industrial life branches respectively, despite the sharp rise in the rate of interest last year. When this cautious valuation is taken into account, it is clear that the Prudential has come through a difficult year comfortably. Total assets rose last year by a further £37.3 million ; the new money was chiefly invested in mortgages (£5.5 million), debentures (£12.9 million) and property (£5.8 million). British Government securities now account for 45 per cent of total assets compared with 47.4 per cent in 1950 and 49.8 in 1949. The continued movement out of gilt-edged into mortgages and debentures is in line with the general trend of life office investments.

New business in both the ordinary and industrial life branches was broadly in line with the experience of other offices. The new ordinary sums assured rose from £94.4 million to £107.6 million, and those in the industrial branch from £74.3 million to £77.9 million. Once again over one-third of the new business in the ordinary branch was transacted overseas (£39.4 million compared with £32.1 million in 1950). Premium income in the general branch (fire, accident and marine insurance) rose by £1,300,000 to £9,577,000, of which over £4,900,000 was in overseas business ; the premium income of the American subsidiary, which is not included in the consolidated accounts, rose by nearly £500,000 to £1,468,000. However, fire underwriting profits and accident profits were both slightly lower than in 1950—a loss of £34,637 was incurred on motor insurance business.

The dividend on the "A" shares for 1951 is 20s. per share net, rather more than the 19s. 6d. per share net forecast when the new articles were adopted earlier this year. It will be remembered that these new articles laid down that a minimum of 90 per cent of the surplus in the ordinary and industrial branches should be allocated to policy holders. The allocation has been made at this minimum rate and is expected to remain at it for some time ; reversionary bonuses in the ordinary branch for 1951 are thus at the rate of 30s. per cent of the sum assured, compared with 28s. for 1950 and 26s. for 1949, while in the industrial branch they are at 26s. per cent, compared with 24s. and 22s. in the two preceding years.

Free Gold Boomerang

The free market price for gold in terms of United States dollars has weakened further this week and has now broken

through the $37 line. Towards the close of the week the quotation in the most important continental markets was $36⅞-$37⅛. The softness of this price is the combined result of a rapidly dwindling demand for hoarding purposes, especially in the French market which in recent months had provided the main single source of support, and of steadily expanding offers of newly mined gold coming to the premium market. West Africa has now followed Rhodesia in lifting restrictions on sales in this market. Last November, following the new dispensation of the International Monetary Fund on sales of gold at a premium, the producers on the Gold Coast were given permission to sell up to 40 per cent of their output in the free market provided such sales were made against US dollars ; the balance of 60 per cent or over was sold to the United Kingdom Treasury at the official price of 248s. per ounce. From now on West African producers will be free to sell the whole of their output on the premium market, if they deem it profitable to do so. At the present free market price this margin of profitability is becoming decidedly tenuous.

In selling gold on the premium market, certain formalities have to be honoured. Affidavits purporting to show that the gold is required for industrial purposes must be obtained or the gold in question must be fabricated. In either case an expense is incurred that must bite deeply into the existing premium of $1⅛ per ounce that the seller can secure. But the flow of gold to the free market continues, as is made clear by the behaviour of the free market price. Thus the flow of gold going to monetary channels is correspondingly reduced. For the United Kingdom gold and dollar reserve this is a double blow. Much of the gold which was automatically forthcoming under agreements with the authorities in the producing countries—Australia, Rhodesia and West Africa—is no longer arriving. At the same time the dollars paid out for gold sold to hoarders in the sterling area (mainly in India, Pakistan and Ceylon) are dollars that have escaped the net of exchange control and that after being converted into gold are finally lost to the dollar reserves of the sterling area. The International Monetary Fund, for its part, must be looking back with some satisfaction on its abandonment last October of the fight against the premium market. By giving the producing countries the freedom for which they clamoured it has gone a long way towards destroying what they wanted to get and what it wished to abolish. Gold producers can ruefully reflect that there has seldom been a clearer illustration of the dangers—and the potency—of a boomerang.

Outlook for International Nickel

International Nickel celebrated its half centenary in 1951 by setting up new records in production, in profits, in dividend payments—almost everywhere, in fact, except in nickel deliveries ; deliveries, at just under 244 million lb were 12½ million lb less than in 1950 when the company had been able to draw down inflated stocks. But 1951 proved to be a year not only of records but also of radical changes in methods of production and in patterns of demand. The conversion from surface to underground mining is taking place at a time when rearmament, which since the middle of last year has pre-empted "somewhat less than one half" of the company's nickel supplies to the United States for direct defence or atomic energy requirements, has disturbed the normal ratio of distribution between primary nickel and nickel in other forms. United States Government controls have led to a reduction in the consumption of primary nickel in engineering alloy steels, while the demand for high temperature nickel alloys—particularly from the aircraft industry—has been growing.

In his address to shareholders the chairman, Dr John F. Thompson, indicates some concern about the size and shape

On the completion of fifty years service in the financing of Empire development we send greetings to our friends at home, in Canada and elsewhere. At the commencement of our second half century we look forward with every confidence in the future of the Commonwealth and Empire and with every intention of participating in the development of their resources.

52-60 Bishopsgate in the City of London

of the market for nickel when defence orders wane. He estimates that when the development programmes to increase production in Canada, Cuba, and elsewhere mature, annual world production of nickel—outside Russia where production is of the order of 50 million lb a year—will be roughly 375 million lb, an increase of more than 150 million lb above annual production before the war. At the moment Canadian production is rather more than 275 million lb a year, of which over 90 per cent comes from International Nickel.

Flying Tourists

At one minute past midnight on May 1st, a BOAC Constellation took off from London Airport on the first air tourist flight from this country. Last December the airlines operating the North Atlantic route finally reached agreement on the rates and conditions covering these flights. The fares show a reduction of 30 to 40 per cent on the standard rates, and the operating economies which make the low fares possible are being achieved by carrying more passengers per aircraft (with more frequent re-fuelling stops), by reducing the free baggage allowance and by charging for meals.

The idea behind these cheap flights was to broaden the basis of air travel by bringing it within the reach of those who could not afford the standard fares for what is coming to be known as the first class service. The standard return ticket to New York costs £254, the tourist flight under conditions of less luxury, £173 13s. It was first intended to operate these flights for a trial period of six months, limiting their frequency to four a week per operator; in the final agreement any restriction on frequency was dropped. This led to doubts about whether the traffic would be forthcoming to fill the extra number of seats offered without at the same time doing serious damage to the first class service. BOAC is using five Constellations for its tourist services, carrying up to 68 passengers. By June, these will be operating eight round trips a week, two of them between London and Montreal, the rest to New York. These services could carry more than 540 passengers a week. By running daily tourist flights between London and New York using DC6Bs capable of carrying 80 passengers, Pan-American will add another 560 seats a week.

The weight of advance bookings suggest that these original doubts were groundless. By the beginning of April, BOAC had taken 17,000 advance tourist bookings for the summer season May to September, apparently at no cost to first class bookings. Pan-American is already over-booked on the flights from America to Europe, but less heavily the other way. This company expects to carry between 25,000 and 30,000 air tourists during the summer, again without any noticeable effect on its first class traffic. Even the optimists have been surprised at these figures; perhaps there is a lesson in them for other forms of transport.

Shorter Notes

Lord Radcliffe, a Lord of Appeal in Ordinary, has been appointed chairman of the Royal Commission on Taxation of Profits and Income. There have been no public sittings of the commission since November, but it is expected that they will be resumed in a few weeks' time.

*

The Governor of the Bank of Japan and the Japanese Finance Minister are now seeking to formulate some "flexible principles" as a basis for negotiation on the problems of the prewar bonded debt, the postwar debt to the United States and reparations. A Japanese spokesman has declared, however, that it would be impracticable to suppose that negotiations can start before the German debt negotiations re-open on May 19th.

*

The first fall in American base metal prices since the start of the Korean boom occurred this week when the price of lead on the New York market fell from 19 cents a lb (£152 a ton) to 18 cents (£144 a ton). The Ministry of Materials accordingly reduced its selling price for lead by £8 a ton to £155. This is the fourth reduction in the British price since it reached a peak of £180 a ton in the middle of last year.

*

Another sign of the opening up of western Canada as a major oil producing area is contained in the news that Hudson's Bay has extended for another 34 years its agreement with Hudson's Bay Oil and Gas for the exploration and development of all Hudson's Bay's oil and gas rights acreage. In return Hudson's Bay will receive another one twelfth interest in the oil and gas undertaking and an increase in the rate of royalty, so that Hudson's Bay will now own 25 per cent and the Continental Oil Company of Delaware 75 per cent of the interest in the oil and gas company.

*

Although the official EPU figures for April are not due to be revealed until the week after next, it is already known that France's trade balance with Europe improved further during the month; for the first time in a year France is believed to have balanced its trade with Western Germany.

*

India's trade deficit in the financial year to March 31st last amounted to £117 million, excluding the deficit on land trade with Pakistan. The economic pressure towards further cuts in imports of manufactured goods is being strengthened by mounting complaints against foreign competition by domestic producers, who are caught in the vice of a buyers' market.

Company Notes

De Havilland.—With £85 million of orders on hand, de Havilland's main problem this year may be that of finding the finance to gear up production sufficiently to meet the booming demands of rearmament and the export trade. This problem of finance had already cast its shadow across the balance sheet made up on September 30th last. The issue of 1,644,547 new £1 ordinary shares at par (which ranked for a quarter—that is, 1⅞ per cent—of last year's distribution of 7½ per cent) enabled the company to reduce its bank loans from £2,091,911 to £430,964; at the same time, however, cash balances were drawn down from £1,080,805 to £484,951, and the growth in production led to an increase in the value of stocks and work in progress, after the deduction of progress payments, from £9,360,956 to £12,592,224. As the peak of production still lies ahead, investment in working capital is sure to increase in the months to come, and this, in the chairman's words, "will be bound to involve the company in substantial temporary borrowings." Progress payments and deposits by customers, which totalled £4,289,769 at the end of the financial year, will lead to only a slight easing of the strain.

* 7½% on £2,740,912 ordinary stock and 1⅞% on £1,644,547 new ordinary stock.

Taxation, which gives no relief for the high costs of replacement, makes the financial problem more difficult to solve, and the company will have to bear the additional burden of EPL, which in de Havilland's case is more a tax on enterprise than on the fortuitous increase in profits arising from rearmament. Increased costs and taxes may well prevent the increase in output from being reflected in equity distribution. Last year's advance in group trading profits, from £1,601,612 to £2,297,293, encouraged the directors to increase the distribution slightly above the level at which it has been maintained for some years past. The new dividend of 7½ per cent on the rearranged capital represents a small increase over the previous dividend of 10 per cent on the old capital; the latter is equivalent to 6¾ per cent on the capital as increased by the one for two scrip bonus. The directors' traditional conservatism and the company's financing problems suggest, however, that this 7½ per cent dividend may be all that shareholders can reasonably expect this year—in spite of the company's full order book.

*

Leyland Motors.—The absorption of Albion Motors into the Leyland group has been greeted, rather surprisingly, by what is in effect a cut in Leyland's ordinary distribution. The ordinary dividend has been maintained at 25 per cent, but in 1950 shareholders also received a tax free bonus of 2½ per cent from a surplus arising from the sale of fixed assets. No such payment has been made for 1951 and the balance of £324,042 arising from the surplus has been transferred to a reserve for the replacement of fixed assets. Shareholders will remember that when the tax free bonus was reduced from 5 to 2½ per cent in 1950 the ordinary dividend was raised from 20 to 25 per cent, and they may well wonder why similar compensation was not given last year. The fall in trading profits cannot be regarded as a complete answer to this puzzle, for it has been accompanied by an increase in freely distributable earnings. The decline in profits has been more severe in the parent company's accounts (where trading profits have fallen from £2,081,260 to £1,693,484) than in the group accounts, where profits, which have fallen from £2,178,360 to £2,026,907, have been swollen by two months' earnings by Albion Motors. The increase in distributable earnings arises from the directors' decision to transfer £500,000 to a general reserve, whereas a year ago they appropriated

a similar sum to a capital—and therefore non-distributable—reserve for the replacement of fixed assets.

It is obvious from Mr C. B. Nixon's review, however, that Leyland Motors faced considerable difficulties of supply last year, and that it expects even graver difficulties of demand this year. The output of vehicles fell by 6 per cent, owing to a serious shortage of materials last year, although the value of turnover increased by 7½ per cent. Costs, particularly wages, seem to have risen steeply last year and the company was forced to increase selling prices last July and then again—after the end of the financial year—in February this year. At present the problem of steel supplies persists; when that is resolved, as it might well be by the end of the year, there may be the problem of contracting markets. Mr Nixon points out that overseas markets are rapidly becoming "more difficult and risky" and that in Leyland's trade in commercial vehicles the home and the export markets are two distinct entities; models designed for one market cannot be automatically switched to the other "as complete units or even as semi-manufactured material." Moreover, any further increases in selling prices to offset the rise in costs would raise prices "to such a level as would exclude the company from most export markets and constitute a most serious sales resistance at home." The increasing tempo of rearmament, the growth of production generally, and the denationalisation of road transport may ultimately increase the demand for commercial vehicles, but clearly shareholders' hopes this year should not be directed towards anything better than maintenance of the dividend of 25 per cent.

*

Elder Dempster.—Towards the end of last year Elder Dempster was chiefly concerned with laying in cash for the recent purchase of British and Burmese Steam Navigation. By December 31st it had realised almost the whole of its holdings of quoted investments, whose book value fell from £3,745,598 to £171,570 in the year, and had augmented its cash balances from £3,083,663 to £6,134,811. Further finance for the purchase had to be found from outside the group's own resources, and £1,030,723 was therefore raised by the issue of 687,149 new £1 ordinary shares at 30s. The company's ability to finance the purchase largely from its own resources was due to persistent ploughing back of profits in the past, as last year's increase in capital reserves from £10,739,355 to £11,805,877 bears creditable witness.

The acquisition of British and Burmese Steam Navigation is perhaps a suitable climax to Elder Dempster's efforts to rehabilitate its fleet after the ravages of the war years. Further additions, notably the 14,000 gross ton motor vessel "Aureol," were made to the fleet last year and more are to come. At the end of the year the net book value of the fleet had risen from £7,392,878 to £9,525,417 and the group were committed to spend another £3,150,000 on new tonnage. Moreover, British and Burmese Steam Navigation has five "K" class cargo ships on order, the first of which will be delivered in September. The chairman, Mr. A. C. Tod, once more draws attention to the slow turn round at the docks, both at home and overseas. These delays are expensive; Elder Dempster's cargo ships are now taking 25 per cent longer on each trip than they did in prewar years, which means that the company is losing the equivalent of 30 round voyages a year. Last year's profits were discussed in a note in these columns on April 12th and the full accounts strengthen the impression given by the preliminary statement that the company should have no difficulty in redeeming its promise to maintain a dividend of 15 per cent on the new ordinary capital of £3,435,745.

Union Castle, which, like Elder Dempster, derives much of its earnings from the African run is raising its dividend from 10 to 12½ per cent, reflecting an increase in its profits from £1,578,641 to £1,783,039; this is to be followed by a 100 per cent ordinary scrip bonus. The increase in the dividend is smaller than some market quarters had expected, and Union Castle shares opened weakly on Wednesday, though they recovered later when the implications of the scrip bonus had been weighed.

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 26, 1952, total ordinary revenue was £67,165,000, against ordinary expenditure of £67,622,000 and issues to sinking funds £230,000. Thus, including sinking fund allocations of £1,331,000 the deficit accrued since April 1, 1952, was £74,907,000 compared with a deficit of £861,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE UNITED KINGDOM PROVIDENT INSTITUTION

LIFE ASSURANCE STILL EXPANDING

TODAY'S CHALLENGE TO THE CITY

MR JOHN BENN'S SPEECH

The one hundred and eleventh annual general meeting of The United Kingdom Provident Institution was held at the Incorporated Accountants' Hall, London, W.C.2, on April 30, 1952.

Mr John Benn, the chairman and managing director, in the course of his speech, said:—

The board is gratified to report that the new sums assured have exceeded £7 million for the second time in the history of the Institution. As this fine total comprises individual assurances only, and does not include any group business in which the risk element is greater, the solid character of our progress will be evident. The increase in the fund last year amounted to £1,386,925, while the premium income rose by £163,000 to £2,628,000.

Further progress is also reported by our subsidiary, the United Kingdom Fire and Accident Insurance Company Limited.

NEW TRIENNIUM OPENS WELL

The new triennium has opened well in terms of claims by death, which were again well below expectation in 1951, so continuing the favourable experience of the previous three years. The new rate of interest earned on the fund is also extremely satisfactory, amounting to £5 13s. 6d. per cent gross, or £4 3s. net. Although the rise in the gilt-edge rate has contributed to the improvement of no less than 7s. per cent gross over the 1950 earnings, this improvement is mainly due to the better yields received from our high-class ordinary stocks, which also served to cushion the funds of £34 million, against the general fall in Stock Exchange values. Compared with the position at the end of 1950, our undisclosed reserves against our Stock Exchange securities fell during 1951 by not much more than £250,000, a remarkable proof of the strength of our investments in a period which so fully justified Sam Weller's definition of shares as "things that go up and down in the city."

Expressed as a percentage, the fall in the twelve months represented only one per cent of the market value of these securities at December 31st last, which was again greatly in excess of the balance sheet figure. Thus the funds have been maintained in a year of heavy losses, a tribute to the solid worth and distribution of our investments, including our holdings in real estate.

PUBLICITY FOR THE CITY

At the present time, the British public is confused and divided about economic issues, which call for a wider understanding if we are to avoid violent fluctuations in our national fortunes.

At our meeting two years ago I suggested that the City of London should make its services better known to the public. Since then further payments crises and two general elections have served to underline the gravity of our overseas trading position. Yet the man in the street, whatever his politics, still fails to grasp the fundamental issues, largely because political strife continues to obscure the great danger that faces sterling and hence our daily bread.

There is a new opportunity and a challenge to the City of London, with its unique position in the economic life of the nation and of the world, to render an urgent service by publicising its activities, which so well illustrate the extent of our dependence as an island people on overseas trade.

The issues at stake transcend party differences, yet some of those responsible for the City's business feel that, as their shareholders or members doubtless include those of all party persuasions or none, a company cannot rightly spend their money in supporting "one side." It is just this limited idea of "one side" which needs replacing by an appreciation that all political programmes are equally subject to the necessity to pay our way as a nation. And unless we can pay our way there can be no reasonable standard of living for any of us.

For centuries the world-wide activities of the City have depended on personal character and initiative, which have been its driving force in the service of the private firm, the public company and latterly of the state undertaking. The City is accustomed to take the long view and is acutely aware that this driving force must be preserved and actively encouraged, whatever the colour of the government or the structure of an industry may be.

During the past few months efforts have been made to arrange collective publicity for the city's many functions and services. If such a scheme were well supported and wisely directed, I am confident that it would serve an extremely useful purpose, and would point the way for similar publicity in our other great cities engaged in overseas commerce.

British insurance is already showing the way by some striking illustrations of its work in foreign markets now appearing in the press, and our members will have observed that the life offices have also enlisted the powerful aid of newspaper advertising. The United Kingdom Provident Institution is giving full support to this valuable campaign, which promotes saving on such a large scale.

INSURANCE PIONEERING

I am happy to report that we have reduced our terms for non-profit assurances, and as the office which pioneered in the temperance field, we are able through our subsidiary company to offer new and favourable terms to motorists who are total abstainers, thus playing our part in the campaign to make known the dire relation of alcohol to road accidents.

The case for life assurance is as strong as ever. Opinion differs widely on the remedies for our present discontents, but happily there is general agreement on the value of saving, to which life assurance contributes in such high degree.

STRONG POSITION

Sir Alan Rae Smith, the directors' auditor, said that he wished to refer to one very outstanding feature of the year's operations, which had been touched upon by the chairman.

The fact that the market value of the institution's quoted securities when valued at the Stock Exchange prices ruling on December 31, 1951, showed to all intents and purposes the same excess over book values as at December 31, 1950, was a very remarkable result.

The report was adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY

YEAR'S PROGRESS REVIEWED

INCOME - - - - - £15,900,000

TOTAL ASSETS - - £98,370,000

The ninety-first annual general meeting of The Royal London Mutual Insurance Society Limited, was held on April 29th in London.

Mr C. H. Shuttleworth, FCII, chairman and joint managing director, who presided, said:—

The fall in security values, combined as it is with increased interest yields, is very welcome to an office such as the Royal London, which has year by year large amounts of the policyholders' funds to invest.

The improved opportunities for investment are already reflected in the yield on the Society's funds. The interest yield on the industrial branch fund was £4 4s. 5d. per cent, an increase of 4s. 5d. per cent over that for 1950, while the yield on the ordinary branch fund (excluding the auxiliary fund) was £3 6s. 8d. per cent after deduction of income tax, being an increase of 4s. 10d. per cent.

The only way to secure a large volume of saving is by personal calls at the homes of the people for this purpose. This is why the funds of industrial assurance companies, which represent the savings of millions of policyholders, continue to grow steadily when other forms of saving stand still. The periodical call of the insurance agent is a regular reminder and encouragement to save money that would otherwise go to increase the pressure on the limited amount of goods and services available.

The present high taxation of incomes has made it difficult for any class of people to accumulate a substantial estate for the protection of their dependants, and the question of providing for wife and family in the event of early death has become a source of great anxiety to many. Life assurance is the only solution to this difficulty, for on the payment of the first premium on a life policy an estate is immediately created which would otherwise take many years of saving to build up.

ORDINARY BRANCH

The premium income in the ordinary branch (including consideration for annuities granted) amounted to £3,624,000, an increase of £208,000 over the previous year.

Interim bonuses will be maintained in respect of the current year on policies becoming claims, etc., at the rate of one pound ten shillings per cent per annum.

INDUSTRIAL BRANCH

In the industrial branch the premium income for the year amounted to £8,529,000, an increase of £180,000 over the previous year.

Interim bonuses will be continued during the ensuing year at the same rate as the reversionary bonus declared for the period 1946-1950, namely, one pound per cent per annum upon the sum assured.

The distribution of surplus amongst the policyholders of the industrial branch makes the industrial branch contracts which participate very attractive.

GENERAL BRANCH

The premium income in this branch, amounting to £528,000 for the year, shows an increase over last year.

To sum up the Society's position I would

point out that during 1951 the total income amounted to nearly £15,900,000 per annum, while the funds at the end of the year had grown to nearly £98 million. During the year benefits amounting to £6,583,000 were paid.

The report and accounts were adopted.

W. WOOD AND SON, LIMITED

INCREASED GROUP PROFITS

The forty-second annual general meeting of W. Wood and Son, Limited, was held on April 30th at Kelvin Works, Power Road, Chiswick, Mr Alan H. Wood, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year ended November 30, 1951:—

The trading results of the parent company are substantially the same as in the previous year. In the consolidated profit and loss account, however, it will be noted that the group profits before charging taxation have risen by £4,289 to £42,441 and that the amount carried forward has been increased by £3,105.

During the year the group has taken the opportunity to augment stocks which, mainly as a result of recent restrictions, are in short supply. This policy has fully utilised your company's liquid resources and has necessitated the use of temporary bank finance. The reserve against price fluctuations and other contingencies has been further increased by £2,000 and this item now stands at £17,000. An interim dividend of 7½ per cent has already been paid and your directors now recommend a final dividend of 15 per cent, making 22½ per cent for the year.

NEW MODELS

Your directors are fully aware that changes in the company's general policy must be made to meet the re-distribution of spending power and to make Revelation luggage available to a much larger public. Accordingly, a great deal of attention has been given to the design and production of attractive luggage at competitive prices. In spite of heavy purchase tax, it is now possible to buy a Rev-Robe wardrobe case either for men or women for as little as £5 12s. 6d., and a Revelation suitcase for only £3 19s. 6d. We have also developed the modern trend for sets of matching luggage to even a greater degree than in the past. Our new models have been very favourably received by the trade, and provided that general trade conditions do not deteriorate to any marked extent, it is reasonable to hope that future results will reflect the benefits we anticipate from this policy.

In conclusion, it gives me pleasure to take this opportunity, on behalf of the board, of thanking the staff and employees for their loyal support and assistance during the year.

The report and accounts were adopted.

SOFINA

Translations of the report and of the essay, entitled "Better Housing—A Contribution to the Peace of the World," as also of Mr. D. N. Heineman's address, are obtainable on application to Electric and Railway Finance Corp., Limited, Claridge House, 32, Davies Street, London, W.1.

An abridged report of the directors was advertised in last week's issue.

NORWICH UNION INSURANCE SOCIETIES

ANNUAL MEETINGS

Speaking at the Life Society's one hundred and forty-fourth annual meeting on April 29th, the president, Sir Robert Bignold, said the net new life business for 1951 at £44,100,000, an increase of over £8,600,000 on 1950, constituted another record in the society's history. In addition to these figures policies were issued providing pensions of approximately £900,000 per annum, representing a capital value of about £10 million. The mortality experience had again been very satisfactory, whilst the expense ratio showed an increase of only .7 per cent, despite the continued rise in costs of every kind.

Having regard to the heavy fall in value of Stock Exchange securities, the society was fortunate that these represented only 26 per cent of the total assets; despite the depreciation the securities still stood in the balance sheet below their market value.

It was particularly gratifying to be able to record once again that, while saving in many directions had been on the wane in recent years, the representatives of the life offices had been able to convince the public of the special advantages of saving by insurance.

Of the new investments of over £12½ million made in 1951, approximately £8¼ million was placed in first-class mortgages, including house purchase loans.

Total funds increased by £6,389,342 during the year to £86,650,481, the net interest return being £3 17s. 8d. per cent, an increase of 1s. per cent.

While their business at home, which formed the largest part of their activities continued to increase, he was pleased to be able to report that their business overseas was also expanding.

THE FIRE SOCIETY

At the one hundred and fifty-fourth annual meeting of the Fire Society, the chairman, Sir Robert Bignold, said the total 1951 premium income at £12,964,208, had advanced by £2,138,185, and was the highest in the society's history. Fire premiums increased by £803,127 to £6,451,903, the resulting profit being £666,820.

The accident income had increased by a record figure of £1,020,729 to £5,324,933, but owing to adverse experience in the motor and employers' liability sections this account showed a loss of £81,296. Premiums in the marine department increased by £314,329 to £1,187,372 and £75,000 had been transferred to profit and loss.

Net interest totalled £217,173. Income and other taxes absorbed £379,302 and the balance for transfer to the appropriation account was £486,421. Appropriations from profits include the net dividend (paid to the Life Society) of £161,700, £52,000 to the pension fund and £271,895 to the investment and contingency reserve, leaving a balance carried forward of £328,747 against £327,921.

Total assets had increased by £1,668,174 to £18,024,246.

From the accounts it would be seen that they closed the year with their financial resources strengthened. Building up a strong financial position was always very much a long-term operation. The society had attained it and today was in the forefront of British insurers.

At both meetings Sir Robert referred to the forthcoming retirement of the general manager, Mr W. W. Williamson, on December 31st next, after nearly 50 years' wholehearted devotion to the interests of the Norwich Union.

INTERNATIONAL NICKEL

JUBILEE YEAR—A RECORD

The fiftieth annual meeting of the International Nickel Company of Canada, Limited, was held on April 30th, at Toronto.

Dr John F. Thompson, chairman and president, in the course of his address to shareholders, said:—This meeting marks an auspicious occasion in the history of our company. It is our fiftieth annual meeting since the formation of International Nickel.

The company's fiftieth year, 1951, was outstanding, with new high records for net earnings and dividends. Wages paid and capital expenditures reached new all-time highs, and income taxes, which registered much the sharpest increase of all, were larger than in any preceding year. The net earnings of $62,875,000, or $4.17 a share on the common, compared with the previous peak in 1937 of $50,299,000, or $3.31 per share. Production of nickel was further increased and more ore was mined from underground than in any previous year.

NICKEL

Although our production of nickel was increased, our deliveries of 243,800,000 lb were some 12,500,000 lb less than in 1950. In that year the company was able to draw on stocks of refined nickel accumulated from operations in 1949 when demand was slack and governments were limiting their purchases for stockpile.

Deliveries to the trade in 1951 in the form of primary nickel increased almost 8,000,000 lb, while nickel in our rolling mill and foundry products decreased over 20,000,000 lb as our mills in England, Scotland and the United States progressively converted to defence production at the expense of peacetime alloys and certain end-uses of high nickel alloys were suspended or officially prohibited.

Nickel alloys were used in all jet and reciprocating airplane engines produced in 1951. Our plants and research organisations in Birmingham, England; Glasgow, Scotland; Bayonne, New Jersey; and Huntington, West Virginia; have been devoting much effort to meeting the demands of the builders of gas turbines and jet engines. Greater efficiency, measured in power output per pound of engine, has required materials which will perform reliably at high temperatures under mechanical stress. Included in the materials developed by our company for these purposes are the Nimonic and Inconel groups of high nickel alloys, and other special purpose compositions.

CAPITAL EXPENDITURES

Capital expenditures in 1951 were the highest for any year in the company's history. They totalled $23,700,000 and compared with the previous high of $21,400,000 in 1929. The principal expenditures were $15,880,000 for our Canadian programme of major expansion in the mining and treating of undedground ores plus $3,090,000 for the building of homes for our employees in the Sudbury district, required by our expansion programme.

It is estimated that capital expenditures for 1952 will exceed $20,000,000.

Distributions on the common shares totalled $37,900,000, or $2.60 per share, and were larger than in any previous year. In each of the four preceding years dividends of $2.00 per share were paid. Four regular quarterly dividends of $1.75 per $100 of par value were paid on the preferred shares.

The reports and accounts were adopted.

GLENFIELD AND KENNEDY, LIMITED

RECORD RESULTS OF CENTENARY YEAR

MR HUGH COWAN-DOUGLAS'S STATEMENT

The fifty-third annual general meeting of Glenfield and Kennedy, Limited will be held on May 16th at Kilmarnock. The following is an extract from the statement by the chairman, Mr Hugh Cowan-Douglas, which was circulated with the report and accounts for the year ended December 31, 1951.

One hundred years ago a small group of men established a little meter works in the town of Kilmarnock. A few years later the same people opened an iron foundry nearby. Eventually these two companies joined up to form the present company of Glenfield and Kennedy, Limited.

Our founders "builded better than they knew." By hard work, technical skill, business enterprise and financial prudence, they laid the foundations of the considerable business that we know today. Through easy and difficult times the company has been able to give good and steady employment to many Kilmarnock people. At the same time they have the proud record of having always given a reasonable return, by way of dividend, to those who invested their savings in the company. Let me add that our shareholders, at least in my experience, have been equally consistent in supporting the board's policy of ploughing profits back into the business. Our steady accumulation of reserves has enabled us to develop and expand, while our dividend record has enabled us to raise fresh capital whenever the need has arisen.

It is gratifying to submit to you, in this our centenary year, results which, I am sure you will agree, are highly satisfactory and indeed constitute a record in our long history.

We must not, however, be misled by the large figures of so-called profit. It is, I think, generally accepted by everyone, except the Inland Revenue, that there is no true profit until provision has been made, firstly for the upkeep and replacement of fixed assets, and secondly for the maintenance of adequate working capital to support the volume of business which the fixed assets are designed to produce.

PLANT REPLACEMENT

It has been a matter of concern to your directors that the normal wear and tear allowances fall far short of what is required to provide for replacement of plant and buildings at current ruling prices. We, therefore, instituted an inquiry with a view to estimating, on this basis, the shortage in our annual provisions for depreciation. We have also made a calculation as to the amount by which our past appropriations to plant replacement, etc., fall short of what is really needed on the same footing. As a basis for our calculation we used the indices compiled by *The Economist*.

Following on this investigation and in order to raise our annual charge for depreciation for 1951 to a realistic figure we have charged against the year's trading surplus of the group a sum of £59,516 by way of supplementary depreciation. Furthermore, we have ascertained that our deficiency for past years, after setting off the total sum standing at the credit of our replacement reserves, amounts to the formidable figure of £520,000. It is our intention gradually, so far as we can out of surpluses available after tax, to wipe out the deficiency. This explains the substantial appropriations we propose to "Increased Cost of Replacement of Fixed Assets," the new name we have given to this reserve.

There remains the problem of financing the large increase in our stocks, work-in-progress and debtors. Five years ago—on March 31, 1947—these items in our group required £1,501,322. At December 31, 1951, the sum involved was £3,673,163. Fortunately our strong cash position has enabled us to take much of the increase in our stride. For the rest one might say that the new capital raised in 1946, and our allocations to general reserve, have been adequate to keep us going without recourse to heavy borrowing.

In these circumstances our shareholders and, I hope, others, will appreciate what a serious matter it is when, with the introduction of excess profits levy, a further heavy burden is placed on our industry, thereby making it more difficult to remain competitive and to improve conditions in our works. It is my earnest hope that the Government will, at an early date, be able to abolish the levy, which to a great extent seems to have been introduced for political reasons, rather than from the standpoint of equity or commonsense.

ACCOUNTS

Dealing first with the balance sheet, you will appreciate that the issued share capital and the reserves have been affected by the issue of £1 new ordinary stock for every £1 held, following resolutions passed at our last annual meeting.

Our capital expenditure during the year for the group amounted to £237,333. The greater part of this was incurred by our subsidiary companies—particularly at Brighouse, Polmadie and in South Africa. Stocks, work-in-progress and debtors have risen by a total of £559,038. Stocks, etc., at Kilmarnock were slightly reduced, but debtors are up by about £200,000 owing to completion of some large contracts at the end of 1951. In addition there are increases in stocks, work-in-progress and debtors at Blakeboroughs, and Alley and MacLellans. It follows that the parent company has had to find substantial sums to finance the subsidiaries, and this accounts for the rise in the advances to subsidiary companies as disclosed in the legal balance sheet.

The profit and loss account shows an improvement of over £200,000 in the group trading result. Once again Kilmarnock has made the largest contribution to this increase. There we continue to enjoy the benefits of the rebuilding and re-equipment of our machine shops. Our output of standard sluice valves constituted a record, and we have reduced our delivery dates to a more reasonable level. Both Brighouse and Guisborough have more than held their own during 1951. The profits at Worcester were not up to those of 1950 owing to the introduction of new designs of cast steel valves to comply with British Standards Specification. That change-over is now complete and results in recent months have been excellent. The Polmadie Works have shown gratifying progress.

I have already dealt with the new method adopted in dealing with depreciation. Apart from that the outstanding feature of the profit and loss account is the very large sum we require to set aside for taxation.

Our board will, I know, continue to direct this undertaking on sensible and economical lines, but it is clear that, when such a proportion of profit is taken away by taxation, it becomes increasingly difficult to resist claims for any form of expenditure chargeable to revenue for tax purposes. In my view the excess profits levy will in many cases tend to reduce the powers of resistance to extravagance of those responsible for the conduct of business enterprises.

The sum available for appropriation is £438,973. We recommend the transfer of £100,000 to the reserve for increased cost of replacement of fixed assets, and of £113,777 to round off the general reserve at £350,000.

You will remember that for 1950 we paid a dividend of 25 per cent. The ordinary capital has subsequently been doubled, and we now recommend a dividend for 1951 of 15 per cent, of which 5 per cent has already been paid as an interim. In addition, as a modest celebration of our centenary year, we recommend a special bonus of 2½ per cent. These appropriations leave us in a position to raise our carry forward from £61,290 to £88,134.

I trust you will support our recommendations. They might be criticised as overconservative. However, in view of our large capital commitments, of the increased cost of replacements, of the extra tax burdens that are being placed on our shoulders, and of the somewhat less assured future of trade generally, I feel that a policy of prudence is the right one to follow.

GENERAL

Your company supported the proposal to send a team from the valve industry to the United States of America under the auspices of the Anglo-American Council on Productivity, and I am pleased to say that a member of the staff of each of our three major companies was included in the visiting party. Several of the recommendations in their report have already been adopted.

STAFF AND EMPLOYEES

I am sure it will be the wish of all our shareholders that we should place on record our sincere appreciation of the work of our executives, staff and employees throughout the Group for all they have done throughout 1951. Obviously the results now being presented to you would not have been achieved without their whole-hearted support and co-operation. It is my sincere conviction that we shall continue to enjoy that collaboration, and that the company will prosper in the second century of its existence, to the benefit of shareholders, staff and employees alike.

ALBERT E. MALLANDAIN

INCREASED EXPORTS

The fifteenth annual general meeting of Albert E. Mallandain, Limited, was held on April 30th in London, Mr Albert E. Mallandain, chairman and managing director, presiding. The following is an extract from his circulated statement:

Your company has again achieved a record turnover—partly due to inflationary trends during the year as well as to the continued satisfactory demand for its products. The aggregate net profit for 1951 amounted to £126,978, compared with £102,382 for 1950. After deducting the net provision for taxation, £73,572, compared with £55,187 for 1950, the aggregate net profits amounted to £53,406, compared with £47,195 for 1950.

The directors recommend a dividend of 50 per cent, less tax. The balance of the net profit for the year has been added to the balance carried forward on profit and loss account, which now stands at £23,037. These proposals will mean that 58 per cent of the company's profits go in taxation, 20.6 per cent reaches the shareholders, and 21.4 per cent is ploughed back into the business.

The company's export trade figures were further increased during the year, both in volume and value. We are constantly striving to extend our export business, despite increasing competition in the markets open to us and import restrictions, which still prove a barrier in others.

While it may not be possible to maintain the 1951 level of profits, our order book is in a satisfactory state, and I have no reason to think that the current year's results will be unsatisfactory compared with those of the last few years. The report was adopted.

I. GRIEW AND CO.

(Furniture Manufacturers)

SATISFACTORY TRADING RESULTS

The sixteenth annual general meeting of I. Griew and Company, Limited, was held on April 30th in London, Mr Louis Samuels (the chairman) presiding.

The following is an extract from his circulated statement:—

The combined trading profits for the year amounted to £111,360, and show an increase of £35,573 over the figure of £75,787 for 1950. There is a net profit of £32,747, which compares with £20,350 for 1950, but taxation takes £49,384, which is over £17,000 more.

Your directors propose that £20,000 be transferred to general reserve and that a final ordinary dividend of 17½ per cent actual be paid, making 25 per cent for the year, the same rate as for 1950, leaving a balance of £13,924 to be carried forward.

I. GRIEW AND COMPANY, LIMITED

Trading conditions during the greater part of the year were satisfactory, but, unfortunately, during the latter part of the year the demand for furniture was at a much lower level throughout the country. The substantial improvement in profits resulted from the increased volume and improved methods of production.

Although at the present time there are signs of improvement in trade, it is extremely difficult to forecast the immediate future. I do not anticipate, therefore, that the trading results for the current year can be as satisfactory as those now under review.

DAVEY AND ARMITAGE, LIMITED

The volume of business done by the subsidiary company showed a substantial improvement, and the trading profit for the year amounted to £41,390. The net profit, after providing for all outgoings, including depreciation and taxation, was £16,023, and compares favourably with £11,437 for 1950. The accounts also provide for a dividend of 30 per cent on the share capital, the same as for the previous year.

Since the end of 1951 the quota system has been restored and purchases of softwoods during 1952 will, therefore, be on a much lower basis. Although the stocks held are higher than at this time last year, both in the company and in the trade generally, we are dependent almost entirely on foreign imports and it is, therefore, not easy to assess the prospects for 1952, which may prove to be a difficult trading year.

The report was adopted.

UNITED GLASS BOTTLE MANUFACTURERS

A RECORD YEAR

MR L. A. ELGOOD'S STATEMENT

The annual general meeting of the United Glass Bottle Manufacturers, Limited, will be held on May 22nd, at 8, Leicester Street, London, W.C.

The following is an extract from the statement by the chairman, Mr L. A. Elgood, OBE, MC, DL, JP, CA, circulated with the report and accounts:

I am in the happy position of being able to present to you figures denoting further improvement in the development of your company and in fact from every aspect it has been a record year.

The consolidated profit and loss account opens with the group trading profit for the year £1,562,923, which exceeds the comparable figure for 1950 by £564,483. The year's provision for depreciation computed on our normal basis is higher by £41,773 at £366,889. The increased group trading profit should, however, be considered in relation to the net group profit, which amounts to £634,012, exceeding that for 1950 by £154,622. It is then evident that the charge of taxation on profit for the year £888,511 has absorbed the larger part of the increased earnings.

An indication of the additional drain on the finances of the group which would be caused by the proposed excess profits levy can best be given by informing you that the provisions of the Finance Bill, 1952, applied to profits at the level of those earned in 1951, would result in additional taxation liability amounting to £120,000.

CONSIDERABLE EXPANSION IN PRODUCTION AND SALES

All companies in the group have contributed to the increased earnings, which result largely from a considerable expansion during the year in the volume of production and sales of glass containers and of closures.

The holding company profit for the year amounted to £544,559, an increase of £129,333 over 1950. From that profit your board have transferred to reserves the amount of £373,500. A final distribution at the rate of 10 per cent, less income-tax, is now recommended. This will maintain the rate of 17½ per cent for the year, established for 1950.

The resultant balance available to carry to the holding company's balance-sheet is therefore £321,394, compared with £300,265 last year. After dealing with the holding company's interest in subsidiary companies, the corresponding balance carried to the consolidated balance-sheet is £417,269.

The glass container manufacturers were compelled to increase the selling prices of their products in January and May, 1951, by 5 per cent on each occasion, since when there have again been very substantial increases in manufacturing and distribution costs, foremost among which have been an increase in wage rates and in addition an agreement by the employers to grant this year a second week of paid holiday to their hourly paid workers.

Your company have been able so far partially to offset these heavy additional costs by increased production stemming from technical advances and, in order to sustain their policy of retaining the glass container as the cheapest form of package for the many purposes to which it is suited, will aim to minimise any price advance this year.

I am confident that you will agree that the state of your company at the close of 1951 was satisfactory and reasonably assured against whatever difficulties the future might hold. Business so far this year has been generally well maintained, but there are undoubted signs of diminution of demand in certain directions.

RAW MATERIALS

It is natural that you should desire to be apprised of our position in regard to the supply of the raw materials from which our glass is made. In the main we anticipate little difficulty in obtaining these in sufficient quantities by regular deliveries and it is our policy also to maintain stocks to tide us over temporary interruptions. There is, however, one exception: this is in the case of selenium. This element enables us to produce colourless glass without disagreeable tints arising from the presence of unavoidable impurities. Continuity of the supply of selenium is essential to the maintenance of the standard of quality our customers, in particular those exporting their products in our bottles, have come to expect from us. There is no substitute for it known to glass manufacturers anywhere in the world, but in spite of this we are in constant danger of reduction in the supplies available to us. Your company is foremost in promoting economy in the use of this essential material.

During the year direct export sales provided a new high record in the history of your company, and I am pleased to be able to add that sales promise to be substantial in the present year. Overseas markets, however, show signs of contraction: Australia has imposed drastic reductions upon her imports and fewer import licences are being granted in South Africa. Your company have, however, a comprehensive overseas sales organisation built upon foundations laid even before the First World War, and can face the situation with a degree of justified equanimity. It is essential that the flow of exports should be accelerated and the cost of exporting thereby be reduced.

This subject would not be fully covered were I to omit mention of indirect exports. From Customs returns it has been calculated that glass in some form or another was associated with the export of goods to no less a value than £430 million in 1951. Of that enormous figure goods valued at £100 million were exported in glass containers. Your company had by a great deal the largest share in providing the containers for those exports.

The difficulties attending the supply of machines, spare parts and moulds under existing conditions have been considerably alleviated by the acquisition of Messrs Dilworth and Carr, Limited, and the Lunn Engineering Works.

Our subsidiary company, Kork-N-Seal, Limited, with works at Charlton, London, and Bridge of Allan, Stirlingshire, have been working to full capacity producing all types of metal and moulded bottle closures, stoppers, capsules and lever caps.

The output of containers and domestic glassware during the year under review represents in terms of both tonnage and gross a 68 per cent increase over the last full year before the outbreak of war. We are not, however, content with even this contribution to the trading needs of our customers, and during the current year plans in operation or nearing fruition will result in a further substantial increase in production.

TELEPHONE AND GENERAL TRUST

SCOPE FOR EXPANSION IN PORTUGAL

SIR ALEXANDER ROGER ON INVALUABLE ASSISTANCE

The twenty-sixth annual general meeting of Telephone and General Trust Limited was held on April 29th in London.

The following are extracts from the speech by Sir Alexander Roger, KCIE (chairman and managing director):

The accounts again show satisfactory results. The profit at £87,339 for 1951 after charging £94,200 (against £87,400 in 1950) for taxation was up by £1,502. Profits tax and income tax absorbs nearly 52 per cent of our gross profit. This percentage of taxation is on much too high a scale and it is devoutly to be hoped that at no far distant date it will be much lower so that enterprising business can again venture and expand with some safety.

The loan to associated company—£208,829—is money advanced to The Anglo-Portuguese Telephone Company since the issues of capital by that company in 1950, and demonstrates the necessity for a continuous flow of new capital by a successful and ever-expanding public utility.

As announced in the circular letter to stockholders dated April 12, 1952, the Trust has issued 373,000 new ordinary shares of £1 each at 23s. per share, and I am glad to be able to say this was a complete success. It was essential for us to broaden the base upon which to carry the initial financing of the overseas Telephone Operating Companies and so enable the Trust to continue to play its full part in their further development.

The substantial group reserves—capital and revenue amount to £992,141, an increase of £78,347 over 1950.

DEVELOPMENTS IN PORTUGAL

The Trust holds a substantial investment in The Anglo-Portuguese Telephone Company Limited.

The Group through the medium of the Trust has provided and it continues to provide financial, manufacturing, engineering, advisory assistance and invaluable help at all times to that important company, The Anglo-Portuguese Telephone Company, Limited.

Following upon the introduction of new tariffs in Portugal in May, 1950, the development and expansion of the telephone service there has proceeded apace. The addition of 8,296 new stations to the system during 1951 brought the total number of telephones in operation to over 109,000 at December 31st last, and further solid progress is being made in 1952.

The company was able to reduce the list of waiting applicants during the year but the demand for telephones is unceasing and there is great scope for expansion in Portugal for many years.

OTHER ACTIVITIES

The expansion and modernisation of Caracas and all important towns in Venezuela continues at a rapid pace, creating great demands on the public services. Further telephone expansion and development programmes have been prepared and are being submitted shortly to the Venezuelan authorities, and it is hoped that a final plan to meet the modern requirements of the service over a number of years will be approved in the near future.

West Indies.—The boards and managements of our associated telephone operating companies in Jamaica, Trinidad and Barbados continue their policy of expanding and improving the telephone services to the public in their respective territories. In this they were fully supported by the Trust with its technical, research and manufacturing associates.

During the year the Trust advanced on temporary loan to these West Indies companies an additional £225,000 towards their capital development programmes, upon which collectively they expended some £388,000, having provided the balance from their own resources.

Jamaica.—The hurricane which struck Jamaica on August 17, 1951—one of the worst in the island's history—prevents me reporting another year of uninterrupted progress in the Jamaica Telephone Company. Despite the stoppage of normal development from August onwards, the company expended some £120,000 on capital works and added 969 stations during the year, making a total of 14,406 in service at December 31, 1951. The gross plant assets of the company now exceed the £1 million mark, amounting to £1,153,000 at December 31st last.

Trinidad.—At December 31, 1951, Trinidad Consolidated Telephones Limited had 16,170 stations in service, a substantial gain of 1,376 stations. Nearly £200,000 was expended upon additional automatic exchange equipment, and the extension of the cable network throughout the island.

Barbados.—In Barbados additional exchange equipment enabled 525 stations to be added to the 'Telephone Company's system, making 4,855 in service at December 31, 1951—an increase of over 12 per cent.

The telephone companies with which the Trust is actively associated added some 18,500 telephones to their systems during 1951, increasing the total in service to nearly 217,000. The value in sterling of their gross telephone plant, land and buildings amounts to over £15 million and the replacement value at today's prices would be very considerably higher.

THE NATION'S PROBLEMS

Overshadowing the country's economy today is the rearmament programme. A necessary evil—but one to be faced and dealt with as expeditiously and effectively as is within our power. Indeed, under present world conditions there is the possibility of this becoming almost a permanent feature of our financial problem, yet we must not lose sight of the fact that industrial and social advance must go on, albeit on a reduced scale. Accepting this, the challenge for all to meet is how best to utilise our resources to improve our way of life side by side with the drive for arms.

Whilst fully recognising the high standard of achievement of industry since the war one is forced to repeat what has so often been said that only by dint of harder work by all of us will we achieve real progress and avert an economic collapse which has come closer to us than most people will admit. It is essential for our political and industrial leaders constantly to bring home to all and every one of us the seriousness of the country's position and by every practical inducement encourage real effort to be made to stem the adverse economic tide.

The report was adopted and the ordinary dividend of 8 per cent was approved.

HOFFMANN MANUFACTURING COMPANY, LIMITED

RECORD PRODUCTION

The annual general meeting of this company was held on May 1st in London, Mr J. W. Garton, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts:

The year 1951 was one of continued progress. The trading results reflect the high volume of sales, consequent upon a new record in production.

The net profit of the Hoffmann Group for the year 1951, after taxation, amounts to £470,668, and compares with £382,297 for the previous year. During 1951 there were advances in the cost of materials and in wages and these charges have been carried in part by increased productivity.

Your directors agree that there should be moderation in dividend policy, but regard the circumstances affecting this company as exceptional in view of the very careful distribution made during the rehabilitation period, and consider that they are justified in recommending a further 2½ per cent, free of tax, making a total of 12½ per cent, free of tax, for the year.

SUBSIDIARY AND ASSOCIATED COMPANIES

Hoffmann Gloucester Limited has had a very successful year and by its increased output made a valuable contribution to the group result. Part of the output of this factory is work of very high precision and plays an important part in the defence programme.

Hoffmann Tweedales Limited, in which Hoffmann Gloucester Limited has a 50 per cent holding, has again had a very satisfactory year and continues materially to assist the textile machinery export trade which is of great help to the country.

Norma-Hoffmann Bearings Corporation, of America, has had a very busy and successful year and has paid one year's dividend on the preference stock, although it has not been able to make up the arrears. This situation would have improved considerably but for the fact that, owing to adversity, the standard years for taxation gave the Corporation such a low average that it had to adopt the capital employed basis for computing its liability, which has resulted in very heavy payments for taxation.

DEMAND AT HIGH LEVEL

The demand for our products remains at a very high level. At the moment we are under constant pressure for bearings for the defence programme, and in a short time certain disorganisation, on account of the increased change from civil to defence needs, will be experienced. Your company has tried to give to each of its customers a fair share of its output and will continue to do so in the future.

For security reasons, it is obviously not possible to quote here examples of the important part played by the company's products in defence equipment, but Hoffmann bearings continue to be used in an ever-widening variety of machinery in the air and on land, such, for instance, as the engine of jet-propelled civil aircraft and axle-boxes of the first gas turbine locomotive built in this country.

Your company is now deriving benefit from the training schemes inaugurated in recent years and every encouragement is given to employees to make use of these facilities. Research and experimental work continue to have every priority and enable your company to maintain a leading position in the industry.

The report was adopted.

MAPLE AND COMPANY, LIMITED

ALL PREVIOUS RECORDS EXCEEDED

The sixty-second annual general meeting of Maple and Company, Limited, was held on April 24th in London, Mr Charles Clare Regnart (president of the company) presiding.

The following is an extract from his circulated statement.

The turnover for the past year has again exceeded all records, an increase in fact of more than half a million pounds, in itself a very gratifying statement, but as I have previously stated overheads have continued and are still continuing to rise, while profit ratios remain static. In spite of the difficulties and a shrinkage in the purchasing power of the public, encouraged by the advice given by Mr Hugh Dalton, I think the results may in the circumstances be considered satisfactory.

As you will have heard, the Douglas Report proposes to abolish the Utility Scheme, but the conditions relating to furniture have been deferred. It does seem, however, that the great gulf that has existed between Utility and non-Utility furniture will be closed, which will encourage the production of better class furniture without the penal difference of 33⅓ per cent on the total cost being charged; the proposal being that purchase tax should apply to the cost after allowing for the tax-free margin. This scheme should not only encourage export, but give more scope to the designers and craftsmen of our industry, who have been so discouraged for more than a decade by unnecessary restrictions.

All branches continue to give satisfaction and seem to gain in popularity year by year. Your subsidiary companies have all had a busy year.

As far as exports be concerned, our record is even better than last year and we have flown representatives to obtain valuable orders to the Americas, Asia and Europe, while overseas inquiries in general are larger than I can ever remember. Every effort will be made even to improve this very satisfactory position, especially in view of the nation's need for exports.

I think it is plain that our world-wide reputation remains supreme and the volume of our export trade seems to be expanding yearly in spite of serious tariff and currency difficulties.

Providing there are no further international eruptions, I view the future with a degree of quiet confidence.

CHAIRMAN'S ADDITIONAL REMARKS

The chairman, addressing the meeting, said:—Ladies and gentlemen, the report and balance sheet, with my statement, has been in your hands for some weeks, but before formally moving their adoption I imagine you would like me to refer to the effect the Finance Act, now before Parliament, is likely to have on the immediate future of your company—I refer, of course, to the Excess Profits Levy and the Douglas Report or D Scheme as it is called.

Fortunately we have a very good standard of profit so that we should not be adversely affected by the alterations in the tax position.

The D Scheme, however, if passed in its present form, will have various repercussions, as many cotton fabrics now sold as Utility and free from tax will have to carry tax over and above the free margins, which, in my opinion, have been placed at too low a figure for furnishing fabrics; I hope in this respect there may be some adjustments.

As regards furniture, the application of the D Scheme is deferred, but as the Utility Scheme is to be scrapped in the near future, it will apply to furniture and it seems likely that all better class Utility furniture and upholstery will be subject to a small degree of tax, so that my advice to all those likely to be requiring this type of furniture and furnishings in the near future is that they should buy now and not miss the present opportunity which may not come again for some time, having regard to the fact that purchase tax is now regarded by the Chancellor of the Exchequer as a revenue tax in spite of the late Sir Stafford Cripps's assurance that it was not to be so regarded, but imposed purely to stop inflation.

EXPANSION OF EXPORT BUSINESS

I am pleased to tell you that export orders and enquiries continue to expand, and it is gratifying to know that the name of Maple is still recognised the world over to be synonymous with all that is best in the realm of hotel and household equipment.

The home trade has been, I think for the time being only, slowed up by the uncertainty of the immediate future and the fluctuations in the price of raw materials and the consequent anxiety as to whether prices of goods are likely to become cheaper or not. As soon, however, as the Government restores confidence, I think we shall see a marked increase in public demand, in which case this company should be one of the first to benefit. I was very pleased to learn this morning that all controls are to be taken off carpets.

The report was adopted and a dividend of 10 per cent, together with a bonus of 2½ per cent, was approved.

CROFTS ENGINEERS (HOLDINGS)

CONTINUED PROGRESS

The fourth annual general meeting of Crofts Engineers (Holdings) Limited, was held on April 25th in Bradford, Mr Arthur Croft (chairman and managing director) presiding.

The following is an extract from his circulated statement:

I have pleasure in presenting accounts which again reflect the continued progress of your company, although the profits show a slight reduction on the previous year's high standard. Trading conditions have been difficult during the year; we have had to face increased costs, part of which we decided not to pass on in our selling prices.

The trading profit for the year amounts to £630,707, compared with £659,462 for the previous year. Income tax and profits tax absorb no less than £375,953 (59½ per cent), together with an amount of £9,431 in respect of the previous year, leaving an amount of £245,323, representing the net profit of the company and its subsidiaries so far as concerns the members of Crofts Engineers (Holdings), Limited. The directors propose a final dividend of 25 per cent, making a total distribution of 40 per cent, less income tax, for the year.

The group balance sheet again discloses a strong financial position, the fixed assets (excluding trade investment) having been increased by £41,588.

Last year I referred to the extensions which were then under consideration at our Dudley Hill works. These are essential for expanding our export markets, but unfortunately we have not been granted the necessary building licences. The increase in fixed assets mentioned above refers to additions in the main to our plant which is being increased, and kept in an up to date and efficient condition.

Our order book still maintains a high level, although our turnover has increased during the year under review. As with all concerns in the engineering industry, the difficulty of obtaining adequate labour and raw materials is a problem which faces us every day. We are very fortunately placed in having our own iron, steel and non-ferrous foundries, but coke, scrap and pig iron are in very short supply. The effect of these shortages on the company, has, to a large extent, been reduced by the invention by myself, Mr M. Goff and Mr D. Hammond, all members of our company, of a process for melting cast iron borings in iron foundry cupolas. We are using all the borings we produce with great saving to the company, and we have already taken steps to exploit this process throughout the world. We can look forward to the future with confidence.

OVERSEAS SUBSIDIARIES

Canada: Our Canadian subsidiary—Crofts Canada, Limited—has had a successful year's trading, and steps have been taken to develop still further the business in that country. Unfortunately, the selling organisation—Britenco, Limited—is not yet on a profit earning basis, although the loss incurred in the current year is negligible. We have made arrangements to appoint to the company in Canada a fully trained technician from these works, and I hope very shortly to pay a visit to Canada and the United States of America to examine further our prospects in these countries.

South Africa: I have recently returned from a visit to South Africa, and am most satisfied with the results so far achieved in that country. Both the companies in which we are interested have had satisfactory years. Further extensions to the buildings and additional plant are necessary to achieve our objects, and during my visit I made the necessary arrangements with the directors to carry out these new projects as quickly as possible.

The report was adopted.

SAPONG RUBBER

In his statement which accompanies the directors' report and the annual accounts for 1951 of the Sapong Rubber Estates, Limited, the chairman, Mr W. Percy Pinckney, says: The crop of rubber harvested in 1951 was 1,536,000 lb. I have said on previous occasions that the Estate is easily capable of producing 2 million lb a year, which has been unattainable because of the shortage of labour. This is a feature which has become unpleasantly familiar to all concerned with productive enterprise in North Borneo.

The substantial increases in salaries and wages which followed on the rise in the price of rubber late in 1950, as I reported in my last statement, remained in force throughout the year. The period of high prices produced a very keen demand for goods and labour of all kinds, and particularly for those required for erection of buildings.

The increase in the cost of production was, fortunately, not so great as to absorb the increased receipts resulting from the unusually high prices realised for our produce. The gross profit of £141,287, though £85,001 of it is subtracted by income taxes in North Borneo and the United Kingdom and profits tax, enables the directors to recommend that the interim dividend of 15 per cent already paid should be supplemented by a final dividend of 25 per cent, making in all 40 per cent for the year, and to allocate £10,000 to dividend equalisation reserve, £10,000 to the reserve for replacement of planted areas and £7,240 to a special depreciation reserve.

In November last the company made two forward sales for 1952, covering 180 tons of rubber: 10 tons per month to be shipped during January/June at 3s. 5d. per lb c.i.f. European port and 10 tons per month to be shipped during January/December at 44.5/16 USA cents (equal to 3s. 2d.) per lb c.i.f. New York.

DERBYSHIRE STONE

FACTORS AFFECTING TRADING RESULTS

MR JOHN HADFIELD'S STATEMENT

The sixteenth ordinary general meeting of Derbyshire Stone Limited was held on April 29th in London, Mr John Hadfield, MSc, ARIC (chairman and managing director), presiding.

The following is an extract from his circulated statement.

The directors' report shows that the provision for depreciation has been lifted from £60,800 in 1950 to £69,536 in 1951. Taxation amounted to £76,676, as compared with £63,075 for the previous year. The trading profit was somewhat higher than that of the preceding year, although a number of factors combined to affect the profit adversely.

Derbyshire Stone Limited is a very large producer of ground limestone for use in agriculture, and although, due to heavy rainfall, 1950 was not a good year for agricultural business, 1951 was much worse and the company's sales of ground limestone to farmers were less than half those of 1950.

During the year successive increases in road and rail haulage charges had the effect of increasing the delivered prices of our products, at the same time restricting our radius of operations and reducing the tonnage of materials which the funds available to our customers would purchase.

Although your company has a large range of products, the principal output is still coated macadam for use in roadworks and surfacing generally, and in those areas of the country in which our coated macadam is normally used, the demand for road materials has been relatively low. Your directors think it pertinent to indicate some of the problems which affected your company in particular and in some cases no doubt had a bearing on other industries in Great Britain, and in view of the whole of the circumstances they feel that the results of the year's trading can be regarded as satisfactory.

Your directors recommend the payment of 15 per cent, less income tax, on the ordinary stock.

One of the most important developments during the year was the conclusion of negotiations with John Summers & Sons Limited, Shotton, near Chester, in connection with the blast furnace slag which will be produced from the new two-blast furnace plant now being erected there. It is expected that the first of these furnaces will come into production in 1953.

Last year at the annual general meeting reference was made to the joint activities of Johannesburg Consolidated Investment Company Limited and Derbyshire Stone Limited in connection with the large-scale programme of prospecting for lead in Derbyshire, and it was intimated that the discoveries to date had been sufficiently encouraging to warrant a continuation. Since then boring operations have been continued, the results of which were sufficiently satisfactory to lead Johannesburg Consolidated Investment Company Limited to undertake the sinking of a 500 ft shaft 9 ft by 8 ft in cross-section, upon which work has recently commenced, for closer and more detailed exploration of the veins.

Your company now has a wide range of products which enter many industries, and in consequence its fortunes are not inseparably associated with any one market. The programme of road construction and maintenance must surely be at the lowest possible level, and with any improvement your company would expect to achieve proportionate benefits. Your directors have great confidence in the long-term prospects of the company.

The report was adopted.

CAMP BIRD, LIMITED

A JUBILEE BONUS

The fiftieth annual general meeting of Camp Bird, Limited, was held on April 29th in London.

Mr F. C. Heley, the chairman, said: The profit for the year amounted to £259,000, an increase of £62,000 over 1950. Of this sum £100,000 is required to meet taxation, £25,000 has been added to our general reserve, bringing the total sum to £200,000. £65,000 has been transferred to investment reserve, bringing the amount of that reserve to £81,500 and providing £49,500 for depreciation of certain of our investments, and leaving a balance, including that brought forward from last year—£49,000—of £118,000.

In considering the amount of the dividend to be recommended, we had before us the specific request of the Chancellor of the Exchequer. In view, however, of the fact that we are now holding our fiftieth annual general meeting, your directors felt that some special recognition should be made to the consistent support given by the shareholders to the board over the long term of years, and they therefore recommend that in addition to the usual dividend of 10 per cent, which has been maintained for six years past, there should be a Jubilee bonus of 2½ per cent, both subject to income tax.

The categories of our investments are substantially the same, namely, 66 per cent Gold and Platinum mining; 19 per cent Silver and Base-metal mining; and 15 per cent Miscellaneous. The geographical distribution is: South Africa and Rhodesia, 66 per cent; Australia, 12 per cent; America, 11 per cent; West Africa, 1 per cent; and elsewhere 10 per cent. All these percentages are based upon book values.

The report was adopted.

RAND MINES, LIMITED

(INCORPORATED IN THE UNION OF SOUTH AFRICA.)

BALANCE SHEET, 31st DECEMBER, 1951.

CAPITAL AND LIABILITIES.

Share Capital—Registered 2,200,000 Shares of 5s. each, £550,000. Less 49,005 Shares of 5s. each in reserve, £12,251.	
Issued—2,150,995 Shares of 5s. each	£537,749
Investment Reserve—As per Balance Sheet, 31st December, 1950, £4,648,615. **Add**—Amount realised by the sale of investments during the year ended 31st December, 1951, less book value thereof and amounts written off Investments and Freehold Properties, £310,133	4,958,748
Shareholders—Dividends declared but unpaid, £464,411. Contingency Reserve pending claims for dividends forfeited since September, 1939, £105,500. **Trustees of the Corner House Pension Fund,** £834,000. **Creditors and Provisions,** £282,766	1,786,677
Exploration Reserve—As per Balance Sheet, 31st December, 1950, £337,197. Less—Expenditure on Ventures charged thereto, £40,524—£296,673. **Add**—Transfer from Appropriation Account, £50,000	346,673
Appropriation Account—Balance Unappropriated	1,743,566
Contingent Liabilities. There are Contingent Liabilities as under, viz. :—I.—To finance and to subscribe for shares in certain undertakings. II.—To guarantee housing loans to employees. III.—For contracts open for the supply of Stores, etc. IV.—To guarantee commitments of associated Companies.	£9,373,413

PROPERTY AND ASSETS.

Freehold Properties and Ventures at cost *less* depreciation	£2,421
Shares, Debentures, etc., at or below cost, but not exceeding market value, or Directors' valuation, where not quoted	5,525,614
Shares in Subsidiary Companies, at or below cost, but not exceeding Directors' valuation	42,888
Plant, Stores, Vehicles, Furniture, etc., at cost *less* depreciation	30,509
Advances to Subsidiary Companies	39,900
Debtors, Loans and Payments in Advance, etc.	237,832
Deposits, Fixed and on Call	2,086,129
Government Stocks, etc.	850,645
Cash at Bankers and in Hand	111,205
Dividends to be received on Shareholdings	446,270
	£9,373,413

APPROPRIATION ACCOUNT.

Taxation	£44,075	**Balance Unappropriated** — As per Balance Sheet, 31st December, 1950	£1,640,937
Forfeited Dividends Account	27,261	**Balance of Profit and Loss Account**—For the year ended 31st December, 1951	949,513
Transfer to Exploration Reserve	50,000	**Transfer from Shareholders' Contingency Reserve**	27,300
Dividend Account—Dividend No. 96 of 3s. 6d. per share, declared 12th June, 1951, £376,424. Dividend No. 97 of 3s. 6d. per share, declared 13th December, 1951, £376,424	752,848	NOTE—The Accounts have been drawn up in accordance with the normal practice of the Company; an amount of £310,133 realised by the sale of Investments during the year, less book value thereof and amounts written off Investments and Freehold Properties having been dealt with through the Investment Reserve shown in the Balance Sheet.	
Balance Unappropriated—31st December, 1951—Carried to Balance Sheet	1,743,566		
	£2,617,750		£2,617,750

The full Report and Accounts may be obtained from the London Secretaries, A. Moir & Co., 4, London Wall Buildings, London, E.C.2.

DOMINION STEEL & COAL CORPORATION, LIMITED

RECORD EARNINGS

The annual meeting of Dominion Steel & Coal Corporation, Limited, was held on April 25th in Montreal.

Mr L. A. Forsyth, the president, in the course of his speech, said: For the fiscal year which closed on December 31, 1951, the results of operations of the corporation and its subsidiary companies, when translated into net profit figures, show earnings which substantially exceed those of any previous fiscal period in the history of the corporation.

Net profits for the year at $5,453,832.51 exceed those for 1950 by $972,798.52 and are greater by $201,769.44 than those of 1949, the previous record year. Operating profits for the year 1951 were $17,187,722.10 and miscellaneous income $527,976.37. These figures show total net profits before depreciation and taxes which exceed those of 1950 by $5,326,054.53. Dividend declarations during 1951 amounted to $1,611,263.65. Two quarterly dividends totalling 75 cents were declared on the Common Class "B" shares. The conversion and subdivision of those shares into ordinary shares without nominal or par value was effected in July, 1951. Two quarterly dividends, each of 20 cents per share, were declared on the new shares. Since the close of the year 1951 one quarterly dividend of 25 cents, or at the annual rate of $1.00 per share upon the presently outstanding ordinary shares, has been declared and paid.

Production of steel ingots at Sydney and Montreal reached 768,417 net tons, an increase of 6.55 per cent over the production of 1950. At Montreal the furnaces of Canadian Tube & Steel Products, Limited, produced over 60,000 tons, an increase over the previous year of some 62 per cent.

Total sales of our products increased by approximately 20 per cent in dollar volume over those of 1950.

CURRENT OUTLOOK

So far as current business is concerned we can observe no appreciable diminution in demand for our products. It is true that in certain lines where acute shortages have been the rule supplies appear to be becoming sufficient to bridge the gaps, but not to such an extent as to indicate an early surplus.

Looking at the picture of Canadian steel production from as detached a point of view as a party so deeply interested can assume, I note that the pressure of the demand upon the industry experienced during the past two years has, and it is not a matter to occasion surprise, resulted in an expansion of facilities more than sufficient to meet what we might, five years ago, have been delighted to consider the normal increase in Canada's steel requirements.

It is, I think, impossible to appraise our future without some consideration of the world situation. If, as I believe, is the case, a supply of basic raw materials is becoming more readily available, and essential reconstruction abroad has reached a point where local efforts are adequate or nearly adequate to the necessities, the consequent lessening of the strain upon the resources of the western world cannot be without its effect on the industrial economy of this continent.

In the result, the conclusion must be that for the future we must rely more and more upon our domestic market and must prepare to meet in that market competition which has not been evident during the past eighteen months.

The report was adopted.

THE RHEOSTATIC COMPANY, LIMITED

ORDERS EXCEED PRODUCTION

The fifteenth annual general meeting of The Rheostatic Company, Limited, was held on April 29th at Slough.

Mr M. J. Gartside, BSc(Eng), AMIEE, MAmerSocH & VE (chairman of the company), in the course of his speech said: Once again it is my pleasure to report to shareholders very satisfactory trading results. Both in the home and export markets sales were appreciably higher. The profit before taxation was a record at £98,542. This attracted a record taxation of £60,800, leaving a net profit of £37,742 only. The board recommends a final dividend of 12½ per cent, making a total of 16½ per cent as last year payable on the increased capital.

EXPANSION OF PRODUCTION CAPACITY

During the past year orders have exceeded production capacity. Further expansion has now been made possible by the completion of extensions at the Frimley works and the leasing of additional premises to serve as a machine shop at Farnham, Surrey, but these are adequate only to meet current demand.

The necessity for thermostats, motorised valves and other equipment for the control of central heating, air conditioning and automatic firing equipment such as coal stokers, oil and gas burners, etc., is stressed by the Government's recently announced additional support of fuel economy measures and gives us reason to believe that in spite of the curtailment of some building programmes, the demand for our products will continue to be well maintained. Recent developments in specialised safety and control equipment for gas and oil firing are attracting much interest in these markets. Some recession exists in the home market for domestic controls for electric cooking which, although not welcomed, enables us to make some improvement in general delivery times.

INCREASED EXPORT SALES

Despite recent import restrictions in Australia, which has always been a valuable market to your company, the total export sales continue to increase and for the first six months of the current financial year average monthly despatches overseas were 20 per cent higher than for the previous year. The interest in our new design of resistor, referred to a year ago, has resulted in substantial orders destined for traction undertakings in Australia and South Africa.

Referring now to the current financial year, results so far indicate to your board that with continuance of present trading conditions, the profit should not be less than that for the year just passed. We have a new form of tax before us by way of the Excess Profits Levy, this being in such a form that, in general, efficiency and enterprise are penalised. However, we are fortunate in that so far as can be judged at the present time the Excess Profits Levy will not appreciably change the level of taxation on results such as those before us today.

With rise of wages in the engineering industry and higher costs of materials, increase of price levels has been necessary on all our products. We have been able to keep this increase to a minimum by the co-operation of our employees throughout the organisation in maintaining a high standard of productive efficiency. Keen prices in export markets where severe competition has to be met both from the United States and Europe must be quoted.

The report was adopted.

CROWN AGENTS FOR THE COLONIES

PRODUCE OFFICER required by the Government of Nigeria for the Department of Marketing and Exports for one tour of 18 to 24 months with prospect of permanency. Commencing salary according to qualifications and experience in scale £711 rising to £1,290 a year, including allowances. Outfit allowance £60. Free passages for officer and wife and assistance towards the cost of children's passages or their maintenance in this country. Liberal leave on full salary. Candidates, under 40, should have had a good education and preferably hold a University Degree in Commerce, Economics or Agriculture, or a Diploma of an approved Agricultural College. Experience in the inspection and grading of agricultural products an advantage.

Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting on letter M.25572C. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

ADVERTISING of technical products calls for specialised knowledge and experience—which is why so many famous industrial concerns have learned to value the services of Geoffrey Dadd Ltd., Technical Advertising Practitioners, of 90, Epsom Road, Sutton, Surrey. Derwent 4444 (4 lines).

WHY do so many businessmen, economists, accountants, subscribe to the INCOME TAX DIGEST AND ACCOUNTANTS' REVIEW? It is because this monthly journal is practical, authoritative, and a real help to those who have to deal with Income Tax, and Trustee or Funds administration, etc. Annual Subscription 21s. post free; overseas 23s. Specimen current copy 2s. on application to The Secretary, The Fiscal Press Limited, P.O. Box 45, St. Albans, Herts.

SENIOR BUSINESS EXECUTIVE with world-wide experience, fluent French, German, Spanish, available for executive position entailing business journeys abroad.—Box 914.

INSTITUTE OF STATISTICS

Applications are invited for the post of Assistant Research Officer on the salary scale £350—£550. Applicants should have qualifications in Economics and Statistics, and will be required to work on problems of applied economics within the Institute's research programme. Applications should be received by May 19, 1952. Forms may be obtained from the Secretary, 13, Norham Gardens, Oxford.

THE CUNARD STEAM-SHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the TRANSFER BOOKS for ORDINARY STOCK and PREFERENCE STOCKS will be closed from May 14th until May 27, 1952, both dates inclusive.

By Order of the Board,
H. EAVES, Secretary.

Offices: Cunard Building Liverpool. May 1, 1952.

REQUIRED for Trading Department of leading London firm of international commodity merchants, young man of good education and presence who has completed his military service. Some business experience is essential and experience of international trade, preferably in commodities, desirable. While preference will be given to candidates of under 30 years of age, applicants of slightly over that age will be considered if they have experience of commodity dealing. Salary will be dependent on qualifications and experience. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.—Applications, giving age and full particulars of education, business experience and any other relevant information, should be addressed to Box 915.

FELLOW or Associate, Institute of Actuaries, required in Mauritius by important company with large sugar and other interests. The appointment will be as an Actuary for the Anglo-Mauritius Assurance Society Ltd., and other statistical work for the company in question. Good salary and allowances, Pension Fund, free accommodation and periodical home leave.—Apply: Clough, Empire House, St. Martins-le-Grand, London, E.C.1.

Markets Abroad

Information on markets and sources of supply in Canada, the West Indies, Central and South America is available through the Royal Bank, with over 750 branches in these areas.

UNIVERSITY OF LONDON

A lecture on "The Role of Political Bosses and Machines in the United States" will be delivered by Professor H. Zink (Ohio) at 5 p.m. on May 12th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2.
ADMISSION FREE, WITHOUT TICKET.

JAMES HENDERSON,
Academic Registrar.

THE UNIVERSITY OF LEEDS
DEPARTMENT OF GEOGRAPHY

The Council invites applications for two Assistant Lectureships on the salary scale £450—£25—£500, according to qualifications and experience. For one post, preference will be given to those having special qualifications in Geomorphology, and for the other, to those having special qualifications in *either* Economic Geography *or* Climatology. The appointments will be effective from October 1, 1952. Applications (three copies) should reach the Registrar, The University, Leeds 2 (from whom further particulars may be obtained), not later than June 9, 1952.

APPLICATIONS are invited for the post of INVESTIGATIONAL OFFICER/CLERK ACCOUNTANT in the Department of Economics (Bristol Provincial Agricultural Economics Centre, Newton Abbot, Devon). Candidates should possess a Diploma in Agriculture or an equivalent qualification. Salary scale:
Men: £325 x £20—£505 by £25—£650.
Women £300 x £15—£345 x £20—£505 x £25—£530.
Applications, stating age, qualifications and experience, accompanied by not more than three recent testimonials, should reach the Registrar, The University, Bristol 8, not later than May 19th.

12.48 PER CENT simple interest p.a. offered for trade bill discounting facilities. Large and small bills available with a supporting guarantee. Particulars from the company's accountants.—Box 908.

GOOD FOOD

We specialise in catering for industrial canteens, offices, and luncheon clubs. Our organisation is not too large or unwieldy and we can give personal supervision to all our contracts. Write for testimonials from our clients; addresses given on application to:-

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar ($1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable June 16, 1952, to shareholders of record at the close of business May 15, 1952.

Toronto, April 28, 1952.
By Order of the Board,
C. H. WINDELER, Secretary.

THE ALEXANDRIA WATER COMPANY, LIMITED
PAYMENT OF DIVIDEND

At the Annual General Meeting of the Company held on April 23, 1952, the dividend of Fifteen Shillings per £5 share proposed by the Directors was declared but it was decided that only Ten Shillings of this amount should be paid as from May 1st, leaving payment of the balance in abeyance until the position regarding the effect of the Public Utilities Concessions law (law 129 of 1947) is clarified with the Egyptian Government. *In accordance with this decision notice* is hereby given that a dividend of Ten Shillings per £5 share on Coupon No. 125, less Egyptian Government and Alexandria Municipal Taxes amounting to 1s. 11.37d. will be paid on and after May 1, 1952, at the National Bank of Egypt in Alexandria at Rue Toussoun, or in London at 6 King William Street, E.C.4.

United Kingdom tax at the standard rate will also be deducted from Dividends paid in London except when coupons are accompanied by an affidavit of non-residence in the United Kingdom.

Net profits for the year ended December 31st, 1951, £168,000 (last year £168,000).

Dated, Alexandria, Egypt, April 23, 1952.
By order of the Board,
ROBERT WALTON, Managing Director.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 52-54, High Holborn, W.C.2.

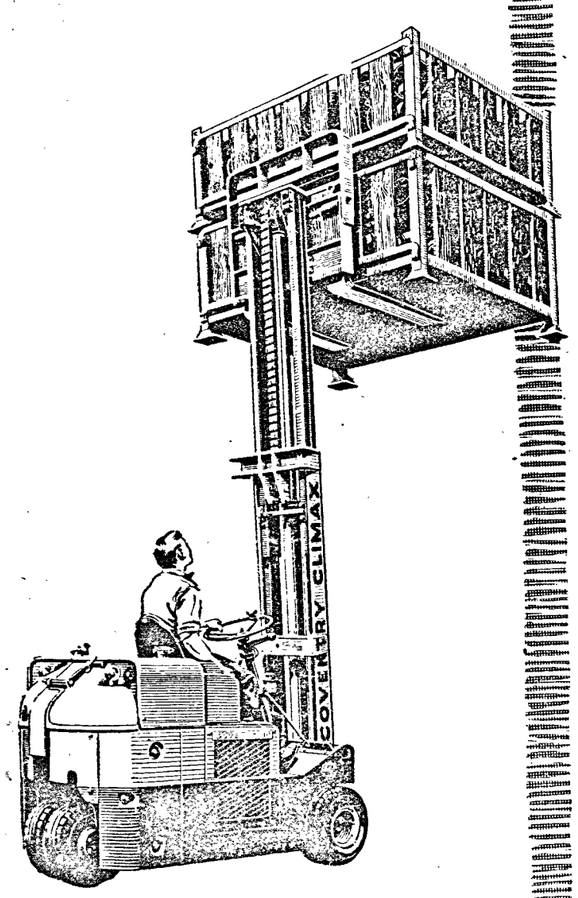
SHERRY-TASTING! York has been a sherry city since the XVI Century and we have *sold fine sherries there since 1664. Send 20/-* for a case of four quarter bottles—one of each of our most popular wines (Cloister Cream, Cloister Fino, Old Bridge Amontillado and Mirador Dry S. African) carriage paid.—J. & G. Oldfield Ltd., Bin 207, St. Sampson's Square, York.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations; B.Sc. Econ., LL.B.; and other external London University Degrees. *Civil Service, Local Government and Commercial* Examinations, &c.

Also expert postal tuition for Prelim. Exams. and for the professional exams. in Accountancy, Secretaryship, Law, Sales Management, &c., and many intensely practical (non-exam.) courses in commercial subjects.

More than 50,000 POST-WAR EXAM. SUCCESSES.



Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request, mentioning exam. or subjects in which interested to the Secretary.

Carried unanimously

Some 50 Anglo-American Productivity Council Reports are unanimous in drawing attention to the importance of mechanical handling of materials.

To quote from one:

"We believe that substantial increases in production from existing plant and manpower in industry can be achieved by relatively little capital expenditure . . . . . by the current application of handling devices."

which echoes the statement of Mr. Cloud Wampler, President Carrier Corp as quoted in "Factory," Oct. 1950:

"If I had just one choice as to technological improvements that could be adopted practically overnight to boost productivity, I'd take materials handling."

Pioneers of the small diesel fork lift truck— most versatile material handling machine available to industry.

Transport Policy

IT is difficult to discover from the White Paper on transport policy why the Government decided to give precedence to transport rather than steel. There is no dispute that radical changes are needed in transport, and if the White Paper presented a convincing set of principles, outlining the things that need to be done to make transport as cheap and efficient as possible, it would be thoroughly welcome. But instead the White Paper might not unfairly be described as a set of contrivances to make the resale to private bidders of lorries now owned by the Transport Commission look respectable. It has little to say about the machinery for fixing fares and charges, now wrecked by the Prime Minister's spanner. It offers no study of any of the serious issues on transport—the terms on which rail and road transport can live together, the public obligations each should assume, the nature of their costs and the best way in which they should be organised and managed. We have it on the Prime Minister's authority that transport is a matter for which the whole Cabinet has become responsible. Neither the Government as a whole, nor Lord Leathers as the particular "overlord" for transport, can take any pride in this attempt at collective thinking on transport.

In detail, the White Paper closely accords with the obviously inspired forecasts that appeared nearly a fortnight ago. All road haulage vehicles owned by the Transport Commission will be offered for sale to any bidder, and will be free to operate over any distance. These assets total 40,000 vehicles, for which the Commission paid about £80 million, including £30 million for goodwill. Secondly, the White Paper proposes that a levy designed to yield £4 million should be raised on road transport (including traders' own vehicles operated under "C" licences other than local delivery vans). This levy seems to be a mixture of two ideas—a part payment for goodwill, which the White Paper says has "substantially disappeared" and part compensation for loss of railway traffic to the roads. The method by which the levy is to operate is described most vaguely in the White Paper and requires much fuller explanation.

For the railways, there are two main proposals. First, it is proposed to decentralise the railway system, giving local management greater independence. This is the only change in organisation that is proposed for those parts of the transport system that are to remain in public ownership. Secondly, the Transport Commission is to be given greater latitude to vary its charges "so as to improve the ability of the railways to compete with other forms of transport." It is proposed, quite sensibly, to allow the Commission to raise or lower its charges within given limits, seeking subsequent approval from the Transport Tribunal.

When the Labour Government nationalised public inland transport in 1947, it justified its action almost solely on the grounds that this was what the trade unions wanted, and what the mandate of 1945 demanded. Transport is fundamentally a matter of efficient manage-

ment and wise policy, and if public ownership ensured wisdom and efficiency, nationalisation would be abundantly justified. Equally, if private ownership guaranteed an acceptable half-way house between all-in competition and the waste of transport resources on the one hand, and a private cartel of the owners of the different forms of transport on the other hand, the public might expect to be well and economically served. Neither of the political parties has ever talked in terms of the principles of transport economics; each assumes that ownership is fundamental, and that mere changes in ownership are likely in themselves to increase efficiency.

*

It is when it is judged by this broadest criterion that the White Paper is such a disappointing and inadequate statement of transport policy. The Socialists, six years ago, nationalised transport without saying, or knowing, why. The Conservatives are now partially denationalising transport with equally little attempt to give a convincing reason why. Both actions are about equally rooted in doctrinaire politics, and the outside observer who wishes to form an opinion for or against the Government's proposals is compelled, now as in 1946, to form his own idea of the reasons for which they are brought forward and of the results they are likely to have.

It was not impossible in 1946 to find a coherent chain of reasoning that led to the Labour Government's conclusion. The basic difficulty of transport policy arises from the fact that on top of a railway system designed to do virtually the whole of the nation's transport business (and still capable in a high degree of doing so), the last generation has superimposed a whole new system of public and private transport by road. As a result, the nation's transport potential is a long way in excess of the demand for it. If the two systems compete freely, the danger is that they will ruin each other. If, while remaining separate, they are held back from the ultimate consequences of competition, the transport-using public will have to support far more transport overheads than it needs. The solution is to create a financial community of interest between them (for which a common ownership is much the most effective method) and then proceed to a thoroughgoing pruning of overhead and rationalisation of functions. If this were done effectively, it would yield economies that would far outweigh the diseconomies that are the inevitable price of public ownership and giant size. It was this reasoning (of which, it should be observed, public ownership is the conclusion and not the starting point) that led *The Economist*, six years ago, to give the Labour Government's proposals the benefit of the doubt.

The experience of the intervening six years has, beyond much question, reversed the balance of doubt. The diseconomies of public ownership and giant size have certainly been forthcoming in greater measure than could have been foreseen in 1946. But a real rationalisation of transport seems quite as far off as ever. Not only has very little been effectively done towards co-ordination —which is, in any case, only the first chapter of rationalisation—but the real obstacles to doing anything effective have become much more apparent. The argument for a single ownership is still good in theory. But perhaps that is all that it will ever be.

Basically, therefore, it is possible to endorse the

wisdom of the Conservative Government's decision to retrace some of the steps that were taken in 1946. But once again the onlooker who is trying to found his views on the principles of transport finds himself compelled to address the Government as Coleridge addressed one of his importunate admirers: "Young woman, I will accept your conclusion provided you will let me state the reasons for it." Once again, the doubt rises in the mind whether the Government has realised the logical consequences of the steps it is proposing and is determined to ensue them. If single ownership and nationalisation are rejected as a means of pruning the excessive overhead of transport, and if there is to be a return towards competition, it must be with the intention of making it serve the same purpose. Public ownership has been a failure because it is clearly not going to be allowed, under any government, to lead to a real rationalisation; it has turned out to be merely a means of retaining the whole costly apparatus and making the public pay for it. One fears that the Conservative alternative will turn out to be merely another means of perpetuating the same basic inefficiency.

*

If, contrary to these gloomy forebodings, Conservative transport policy is to demonstrate that it sees the goal and means to reach it, it will have to provide answers to two questions which the White Paper leaves aside—one of economics, the other of management. The economic question is concerned with the nature of "competition" in transport. Both road and rail haulage have—and are bound to have—many aspects of monopoly. No one is free to enter road haulage without a licence, though until 1947 road haulage enjoyed with this element of monopoly a wide degree of freedom to choose traffics and name its own charges. "Freedom" for road haulage therefore implies restoring an important private monopoly, and the White Paper has nothing to say about imposing any corresponding public obligations on road hauliers. If road haulage is to be "freed" on these terms, and the railways left under their present forms of control, there will be no competition between the two that will serve the public good in the long run. The railways would be left with public obligations as common carriers, subject to close political control, required to provide some services below cost, and impeded from altering their charges as their costs change.

If the railways are to have a chance of competing with road haulage, let it be on terms that leave them less hampered by restrictions applying to them alone, and more free to run their affairs as an independent business. Because in the last resort the railways are monopolies effective public supervision is needed over what they do; the same principle is true equally of road transport. But the wider the area over which both can compete on equal terms with each other, the greater will be the relaxation of public control that can safely be allowed.

If the railways are given the chance to act less as public carriers and more as providers of such transport as can be made to yield a reasonable return over the cost of carrying, there is no reason to suppose that they would necessarily come off worse in competition with road haulage; the result would no doubt be cheaper service but certainly less comprehensive service for all forms of traffic at all hours. Those are broadly the terms on which road haulage and long-distance road passenger services

pay so well and with such apparent efficiency. They have not been the conditions under which the railways have ever been allowed to operate in this country. But they are the only conditions on which "competition" between the different forms of transport has any meaning. The result would certainly be a pruning of overhead and a reduction of the total real cost of transport to the nation—but it would be pruning on the sole basis of competitive profitability, and the results might not be at all to the public's liking.

*

The second main question unmentioned in the White Paper concerns the future organisation of publicly owned transport. Road haulage will be back in private hands; road passenger transport, whether it be publicly or privately owned, is still decentralised for management; and London transport, the canals and the docks are special problems. There remains only the railways. The Transport Act in 1947 introduced new methods of organisation with the Transport Commission at the head and its operating agents or executives below. This form of organisation was criticised at the time, in these columns and elsewhere, on the ground that it failed to make enough distinction between the functions of broad direction, and the functions of detailed management. Mistakes were also made in the adoption of a functional method of organisation for the Railway Executive, and later modifications to this method have conceded the truth that it grossly exaggerated the need for central decision and left quite inadequate responsibilities in the hands of the officers running the separate railway systems.

If co-ordination now has to be written off as a blessed word, the character of the organisation responsible for publicly owned transport should clearly be radically revised. It will now be more difficult than ever to see good reasons for the steady centralising of management functions in the Commission that has taken place since 1947. It will instead be obvious that new opportunities for restoring the function of broad direction—a function that was flung out of the window in 1947—now present themselves. A radical revision of the Commission is necessary. A full-time chairman and a part-time directorate with a small secretariat and accounting unit is probably the limit of what is required. As for the Railway Executive, there are certain central duties that it must fulfil—such as labour relations and wages, charges, and some (though not all) technical services. For the rest, the greater the degree of effective decentralisation, the better service are the railways likely to provide for the public. With all this, there should go greater commercial freedom, greater flexibility to adjust charges (in either direction) and greater independence and incentives for railway staffs. If co-ordination in a single ownership is now to be ended, it must be on terms that will enable the separate sections of the industry to work efficiently without mulcting the public or destroying themselves. The White Paper is not even the end of the beginning of the process by which this will be made possible.

One Question to Moscow

THE affairs of Germany now demand from the western powers the utmost resolution, skill and boldness. This was to have been for them a decisive month, in which Dr Adenauer would initial the instrument giving the western republic a new independence and the treaty bringing it into the European Defence Community. Instead, it threatens to become a decisive month for the Russians, whose object is what it has been for the last thirty years, to prevent Germany aligning itself with Western Europe. If their offers of unity and free elections for an all-German government succeeded in holding up western plans, then Mr Molotov and Mr Vyshinsky could claim a diplomatic success of the kind that has eluded them in the last five years. So far their tactics have usually united the western allies; now they threaten to divide them. They have made France so nervous that many Frenchmen are ready to abandon their whole policy of an integrated Western Europe and to return to pure obstruction. They have made Americans more impatient for German rearmament, and Germans more stubborn in raising their price for a defence contribution. Not least among their feats is to make Dr Dalton and his friends sound the retreat from positions once taken up by Labour foreign policy. These Bevanite bugles in the rear have added to the confusion on the western front.

The most useful thing that can now be done is to ascertain and reflect on the secret of Russian success. It does not lie in any eagerness of Germans to live in a unified Communist Germany; it lies rather in their feeling that to enter into partnership with the West is to lose the opportunity, which Moscow appears to offer, of uniting now without risks and long struggle. Dr Adenauer stands for unity in freedom, and argues that an armed western republic aligned with the Atlantic powers will one day draw the eastern republic to it. The Communists of Eastern Germany stand for what they call unity and peace, which means unity achieved by the western Germans turning their backs for good on the Atlantic powers. To many western Germans peace, even in this sense, seems more attractive than freedom. But this is not the end of the story. To the West German politician who is thinking of next year's elections, the Soviet offers give a heaven-sent opportunity to bargain with the Atlantic powers. When he discovers, as he has lately, that the new contractual agreements would not give complete sovereignty to the Bonn Government and that the European Defence Community could mean conscription and increased taxation, he is impelled to patriotic protest. He finds he can obstruct integration with Western Europe by demanding German unity and so turning Soviet pressure on to the Americans, British and French. They are in a hurry to win Western Germany; the Russians are in a hurry to prevent them; the obvious tactic for the Bonn politician is to mark time and play one off against the other.

None of these various people who, for their different reasons, are nibbling at part of the Russian offer, want to swallow the whole—not even Dr Dalton and the Bevanites positively wish to assist in the creation of a Communist Germany. But all of them think that they can use part of the Russian proposals—usually the offer of immediate German unity—as a lever to secure some particular end of their own. That the Russian offer presented so many temptations to so many

people to play with fire is a measure of its cleverness.

The central problem of allied policy is to deal with this mood and the Soviet handling of it. Tactical moves against Russian efforts to delay the contractual agreements and the European defence treaty are insufficient; because even if Russian tricks are frustrated there is still the resistance of the Bonn Parliament to overcome. Recent events have demonstrated to everyone, what should have been obvious last February, that the coalition parties on which Dr Adenauer depends for a slender majority in the Bundestag would join the opposition in protest if he had presented these arrangements for ratification. They would argue that Western Germany should and could get out of the allies full sovereignty and better terms in the defence community just because they are afraid of the Russians. They would argue, too, that arrangements so binding—and, some would say, so provocative to the Russians—must not be accepted until it is clear beyond doubt that Moscow's terms for unity are unacceptable; when the western allies insist that those terms are in fact unacceptable, it is not so much because they want German freedom as because they want German divisions. That is how the argument runs in Bonn; and it is inspired by motives ranging from sheer political opportunism to genuine fear that West Germans should be led into fighting East Germans.

★

If this analysis is correct, then the immediate aim of American, British and French policy should be clear. It is to demonstrate by every resource of diplomacy and propaganda that the Russians' terms for free elections, unity and a peace treaty in reality open up a prospect that most West German politicians would not dare to defend before the electors. It is not sufficient to say, as some do, that the Russian bluff in offering elections all over Germany should be called. It may not be bluff. There is every sign that Eastern Germany is already being prepared for a perfectly cooked "free" election by methods described in last week's issue of *The Economist* (page 299). The Russians might well concede free elections in the knowledge that the eastern Germans are better organised, both to vote correctly and to take part in a national government, than the western Germans will be. If they are to regain the initiative, western governments must go to the heart of the matter and challenge the Russians with the question: How free will Germans be in a united Germany?

That is a question that every man and woman in free western Germany should be asked to face. Awaiting them in the Soviet Zone is the whole apparatus of the Nazi regime, restored in its Communist form: the secret police and the ruthless sentences for "sabotage" and political offences; the street and block warden who spies on his fellows; the party bosses in the factory and in the trade union; the SS of indoctrinated and trained young men in the *Bereitschaften*; the pressure of school and youth organisations on the children; the censorship of press and books. The evidence that these things exist is overwhelming. How and when are they to be abolished? That is the question the Russians must answer. If they are not abolished before the elections, the votes of Eastern Germany will mean nothing; after the elections neither Western Germany nor the western allies would have any power to get them abolished. An all-German government with, say, 25 per cent representation of east German Communist or Communist controlled parties, sitting in Berlin and dependent on the good behaviour of the "People's Police" and the *Bereitschaften*, would be in no position either to restore civil rights in Eastern Germany or to maintain them in Western Germany.

It is sometimes argued that allied troops would still be there to defend civil rights in the western part of Germany. But to say that is to overlook the next and most important step in Soviet policy. After an all-German government had been installed, it would be immediately under pressure from the Russians and the German Communists to negotiate a peace treaty with the four occupying powers; and the Russians would then insist—they have said so repeatedly—on the withdrawal of all foreign troops. How could any German Government resist such a demand? Those that did so would be accused of being traitors to their country and the accomplices of warmongers. Sooner or later the Americans and their allies would have to choose between staying in Germany in the face of a Communist-led resistance movement and withdrawing westward while the Red Army moved a short distance across the Polish frontier. Once the allied troops had left Germany—and perhaps Europe—the Communists would be free to begin open and surreptitious attack on civil rights in free Western Germany.

What then should the action of the western governments be in this matter? At the moment they are preparing a Note to Moscow which is said to contain some frank statements and some searching questions. First among those questions should be the essential challenge. Are the Russians ready to abolish immediately all restraints on civil rights within their zone? Will they allow West German parties to campaign for elections in the East? Will they order Grotewohl to release political prisoners from concentration camps and prison? In fact, will the Russians raise the iron curtain that divides the free world from a population that has lived seven years in a police state? It is by such questions that the dishonest bluff at the root of the Soviet-German flirtation could be revealed.

★

To do this would, of course, take time. It would not at once ensure that the Bundestag would grasp eagerly at the limited sovereignty and conditional partnership offered by the West. It would not at once save the European Defence Community. Moreover, it is not at all certain what the Russian reply would be. The dangers of such a challenge would be at once seen in Moscow and all the resources of propaganda might be used to evade it. But it is impossible to believe that the Russians would concede the essential point—real freedom for German men and women. If they refused or hedged, Dr Adenauer's hand would be greatly strengthened, for honesty and realism would have returned to German discussion about unity. So long as that is not done, so long as millions of Germans feel they ought to want what the Russians appear to be offering, the allies in Western Germany will be struggling vainly against the charge that they are disregarding the legitimate aspirations of all patriotic Germans. It should be their main purpose to force the Russians now to reveal how much freedom they offer with unity.

Chairmen or Overlords?

IT was evident from the start of Mr Churchill's government that the appointment of "overlords" was the most controversial aspect of its structure; and now the indiscretions of Lord Woolton and the vagaries of transport policy, which lies within Lord Leathers' overlordship, have exposed the Prime Minister to positive attack on this front. Unfortunately, the statement he made to the House of Commons on Tuesday, in spite of (or perhaps because of) its deliberate drafting, has served to confuse rather than elucidate the matter.

No very useful purpose is to be served, however, by attempting to disentangle its incongruities, some of which are almost contradictions. The basic principle of British constitutional practice is and remains the collective responsibility of ministers for all of each other's acts. Provided that this principle is observed—and nobody suggests that the existence of overlords has infringed it—then it is right to leave every Prime Minister relatively free to decide how he shall organise his government. The political scientists may record that experience tends to show one method to be more effective than another; but there should be no constitutional principles involved. Indeed, nobody would have supposed there were if Lord Woolton had not clumsily suggested that he had no responsibility to Parliament for the performance of his ministerial duties.

The Opposition, of course, makes the most of these *contretemps;* that is its privilege and duty. But there is no reason why unattached public opinion should excite itself about the matter. There is, nevertheless, one distinction that is worth making, and that is between the purpose that Mr Churchill's appointment of overlords was intended to serve and the details of the particular method that he chose to serve it. However questionable it may be to appoint none but elderly peers to perform these functions, and however much the particular personalities may have laid themselves open to attack, it still remains desirable and essential that some arrangements should be made for co-ordination within groups of cognate departments.

The Cabinet has always been the co-ordinating body within the British Constitution. But with the growing complexity of modern government, it began to be clear more than thirty years ago that the task of co-ordination was becoming too great for the ordinary cabinet. The horns of a dilemma emerged even more clearly from the twilight in which the administrative practice of a British government is shrouded. Either the number of separate departments grew monstrously large, with the cabinet resembling a public meeting with an intolerable agenda, or else the traditional departments grew so big that no minister could be responsible for, or even know about, all their actions. The resolution of this dilemma can only be by way of some devolution of the Cabinet's co-ordinating functions, and between 1940 and 1945 the practice grew of regarding several of the standing committees of the cabinet as virtually performing its functions for a defined range of subjects.

Cabinet committees require chairmen; and it will usually (though not always) be convenient for the chairman to hold no departmental office. If Mr Churchill's overlords were, as in one passage of his statement on Tuesday he asserted, no more than chairmen of standing Cabinet committees, then there is nothing either new or objectionable in their existence. But the case is different if they are, in any degree, supervisory ministers, empowered to give instructions to the departmental ministers or of their own authority to decide disputes between them. The difference between a co-ordinating chairman and a directing super-minister lies precisely in the doctrine of collective responsibility. A departmental minister is responsible to Parliament for the conduct of his department, and he can bear that responsibility only if he himself has voluntarily accepted the policies on which it is based. He has the right, so to speak, to be tried by his peers, and he must accept the verdict or resign his office. If the device of standing committees of the Cabinet is to relieve the Cabinet of its burden, then ministers must be prepared, in all ordinary instances, to accept the verdict of the committee; there must, that is to say, be some restriction of the right to appeal from committee to full Cabinet. But this does not vitally affect the principle; a minister has discussed his policy with other ministers and they are all bound by the decision they have all accepted. The chairman of the committee has no more "instructed" the departmental minister, or come between him and his responsibility to Parliament, than the Prime Minister "instructs" his colleagues, or gathers all responsibility to himself in the fashion of a President of the United States. (This, presumably, is what Lord Woolton meant by denying that he had any responsibility to Parliament.)

★

What is extraordinarily hard to tell from the growing number of conflicting statements is whether or not Mr Churchill's overlords stray over this boundary line between co-ordination and supervision. The general sense of his statement was that they do not. But, as Mr Attlee was quick to point out, the conferment upon them of titles that appear to mark out a range of territory (Lord Leathers is Secretary of State for the Co-ordination of Transport, Fuel and Power) or the announcement (as in Lord Woolton's case) of what they are to co-ordinate, at least suggests that they have some powers of decision within those frontiers. Moreover, Mr Churchill himself said (in the unprepared part of his statement) that he had entrusted "the general supervision" of transport matters, "including initiative in many ways," to Lord Leathers, and there is much more than a suspicion (which many people will think confirmed rather than denied by the terms of the correspondence between Mr Churchill and Mr Maclay) that the Minister of Transport had found himself overruled—and not by the collective vote of all his colleagues—in the matter of fares. In Lord Woolton's case, he can hardly be represented as no more than the chairman of a committee, since he himself says that the Labour Cabinet's committee on food and agriculture was abolished when the new government took office; "instead," he said, "ministers are good enough to confer with me, bringing their departmental staffs with them." This is a very different picture.

It is, indeed, a little disingenuous to pretend that the overlords are a mere variant of the cabinet committee system. They may have become no more than that; but that was not the original intention. Indeed, they tended to be regarded, at the start, as a deliberate alter-

native to the system of standing committees of the Cabinet. Most of the committees, it was understood at the time, had been abolished, and report has it that Mr Churchill took a great deal of persuading to resuscitate them. It is difficult not to believe that the overlords were intended to be super-ministers. The Chancellor of the Exchequer said at the time (November 28, 1951) that "there must be some element of supervisory functions as well as co-ordination."

There is, to repeat, nothing constitutionally wrong in having super-ministers. It is what Lord Haldane suggested a generation ago—though presumably it was not Haldane's intention that all the super-ministers should be in the Lords. The political scientists could not condemn Mr Churchill for wanting to have super-Ministers. But they could warn him that super-ministers would be exceedingly hard to fit into the British constitution indeed, they would inevitably tend to collect super-ministries around them, in which the present departmental ministers would sink to the level of Parliamentary secretaries. That would be perfectly constitutional ; but it is certainly not desirable.

In any case, Mr Churchill seems to have changed his mind—though the process is evidently not yet quite complete. In this, as in other respects, the Conservatives seem to be settling down to a continuation of the Labour Government's practices, with quite minor variations. Now that the Prime Minister has declared the overlords to be no more than committee chairmen, it is to be hoped that they will in fact be no more. Thus, by the practice of both parties, another most promising precedent will have been written into the British constitution.

Colombo Plan's First Year

THE Colombo Plan has suffered from a curious lack of publicity ever since it started. Apart from a burst of interest stimulated during the Commonwealth Conference of September, 1950, and then again when more details were published last year, this great enterprise has been largely wrapped in silence. This air of mystery adds both interest and importance to the first annual report of the Consultative Committee of the Colombo Plan, published last week after being prepared at the committee's fourth session and first annual general meeting, held in Karachi during March. It deserves to be widely read, both for the information it contains and for the questions it raises.

In opening its report the committee has wisely seen fit to review the historical background of the plan. It reminds readers that its object is to

> raise the standard of living by accelerating the pace and widening the scope of economic development in the countries of South and South East Asia by a co-operative approach to their problems, with special emphasis on the problem of the production of food.

An outline is then given of the present economic and financial state of the area, followed by a series of studies of those member countries that have received help under the plan during the past year: Ceylon, India, Pakistan, the British territories of Malaya and Borneo, and Vietnam. Newer members, in whose territories organised planning has not yet been possible for one reason or another, are Burma, Cambodia, Laos and Nepal. At the end, there is an assessment of the positive contributions so far made by recipient members such as India, and by Australia, Canada, New Zealand, Britain and the United States, which is advancing large sums to southern Asia, but not directly through the Colombo Plan.

The project has been launched at a moment not only of widespread political disturbance but of rapid swings of the economic pendulum. The dominating factor in the situation has been the war in Korea. During the last few months of 1950, and in the first half of 1951, this brought a substantial improvement in the terms of trade of most of the countries in the Colombo Plan area. The prices obtained for rubber, tin, jute, cotton, tea, and other primary products sent their exchange earnings soaring, and turned deficits into surpluses. This also made possible several steep increases in export duties. The result was that many of the plan's original estimates were shown to be too pessimistic, and the area was on the whole able to finance its own development programmes for 1950-51. Indeed, extra foreign aid—assessed for the first year at £206 million, of which £50 million was to come from sterling balances—could not be readily absorbed because of the difficulty of speeding up the tempo of expenditure.

Since the latter part of 1951, conditions have again radically altered. The cost of existing development schemes has risen, on account of worldwide inflation, and capital equipment has become more, not less, difficult to obtain owing to rearmament. At the same time the prices of raw materials have fallen sharply over a wide range. The result has been to make the terms of trade of both India and Pakistan, which together account for over two-thirds of the Colombo Plan, even less favourable than when the original estimates were drawn up, and virtually to offset the improvements in the other countries. In addition, the general position of the sterling area, to which most members belong, has deteriorated.

Taken as a whole, however, these past eighteen months have seen this great project get off to a good start. In spite of rising costs, real public investment is rising. The actual expenditure in India, Ceylon and the British territories, for instance, was £226 million in 1950-51, compared with revised estimates of £312 million for 1951-52, and estimates of £475 million for 1952-53. In India, progress is being made on important power and irrigation schemes such as the Nangal barrage, the Bokaro power station and the Tungabhadra irrigation project, which should be finished next year ; the great Sindri fertiliser factory is contributing to the drive for higher food yields, and the Chittaranjan locomotive works are almost finished. In Pakistan the first stages of the Thal irrigation scheme and the Lower Sind Barrage have nearly been completed, and in Ceylon the main dam of the Gal Oya Scheme is all but built.

*

This, then, is the relatively favourable background of progress with some of the more spectacular projects incorporated in the plan. Against it, however, many other problems must be assessed. For the venture will succeed or fail according to its ability to affect the living standards of many millions of people ; and this depends not so much

on a few large-scale enterprises, but rather on the degree to which general methods and yields of agriculture can be improved. It is no use advancing a great deal of money if it cannot be invested wisely and employed at the right place at the right time. One of the main administrative problems so far thrown up has been the apparent inability of many Asian government officials to decide on a realistic appraisal of priorities. There has been a feeling that the flow of money and technicians can be repeatedly diverted hither and thither. In some cases there has been quite unwarranted procrastination: technicians have been asked for and then kept kicking their heels ; capital equipment has been ordered for schemes before buildings have been provided to house it ; and expensive machinery has been left in the open to rust and disintegrate. Attempts have been made to play the British and Americans off against one another: for instance by cancelling orders for carefully considered and proven British equipment in favour of the latest gadget from the United States, regardless of its suitability either for the job or to the technical standards of those who will operate it. One of the plan's most important functions is to help countries to learn the technique of planning. These abuses are natural enough at this stage, but every effort should be made to overcome them as the plan gathers impetus. At Karachi governments showed they at least recognise the existence of this problem.

Among other specific questions discussed at Karachi were those of forming a permanent secretariat, obtaining a flow of the right kind of technicians, and enlarging the membership of the plan. Further consideration of a secretariat was postponed until next year ; for the work can be done by individual governments, and Asian members are rightly chary of constituting any body with what might look like an overriding authority. The problem of getting technicians was not, however, fully solved. The real need at the higher level is for governments to assess and describe their requirements more exactly, and at the lower level for far more properly trained foremen. The turnover of technicians is too rapid ; men come but do not stay. To meet this difficulty, it would probably be wise to increase the employment of firms of consulting engineers rather than the recruitment of individuals. And to do this satisfactorily there is much to be said for opening a permanent Colombo Plan bureau in London, able to give the fullest information. The Karachi meeting made no new decisions about adding new members. The question of the role that Japan might play has, however, only been postponed until next year. By then, too, it is to be hoped that Indonesia will have decided to participate ; there seems little chance of Siam and the Philippines coming in.

*

The Karachi meeting did not formally re-examine the main premises on which the Colombo Plan rests. Yet the more the progress is made with the existing concept of co-operative effort within severely practical limits, the more the question presents itself whether the project goes far enough. In India, for example, the aim is to increase the national product by 10 per cent in five years' time. Yet, with population increasing by between three and four million a year, these plans are barely enough to do more than prevent the present low standards of living from falling. It is already a high achievement to have set on foot a practical scheme to hold the present level, but the ultimate needs go far beyond the scope of present plans. Not only must the present work of increasing the yield of peasant agriculture be coupled with a more intensive land reform and the extension of education in co-operative principles ; but some means must be found of offsetting the constantly increasing gap between birth and death rates, as, for instance, by subsidising birth control propaganda.

Time is desperately short, and this effort to raise economic standards comes on top of the effort to fight the Communists with arms. In the long run, a rise in living standards is essential if South and South East Asia are to be saved from Communism, and a start must certainly be made now ; but in the short run, it is the fighting in Indo-China, Malaya and Burma that matters most. Unless the threat from Communist armies is first sealed off, every penny put into the Colombo Plan will be lost to the free world. Yet even those battles cannot be won without either the promise of a better future or a vigorous belief in the human values for which the free world stands. While rearmament claims priority, it is the function of the Colombo Plan to lay the foundations for the constructive work of the future. Growing understanding of this fact made the recent Karachi meeting an important and successful occasion.

New Zealand's Constitution

Sir John Pakington has shown a great deal of alacrity in complying with the desire of some gentlemen connected with New Zealand, and has introduced a measure for conferring a Constitution on that settlement. From recent experience abroad and in some of our own colonies, we thought constitution-making had rather fallen out of favour ; but it seems to be still held in high honour at the antipodes and at Westminster, and to be of such urgent importance that to make a Constitution for New Zealand is a part of the business which the Parliament must perform before it can possibly die. To settle the just limits of legislative and executive authority was thought an extremely difficult task by the most profound of modern political philosophers. Sir John Pakington, by the help of his New Zealand friends, has mastered the subject in a few weeks, and defines with the utmost nicety all the functions of an executive, a general legislature, and six subordinate and separate legislatures which he is to confer, one for each province, on New Zealand. We raise no objections to his scheme. . . . With our convictions, however, all on the side of *laisser faire*, we have a kind of logical repugnance to issuing minute directions on the banks of the Thames how our expatriated countrymen are to comport themselves on the other side of the globe. We have a pretty strong conviction, too, that if a body of men be selected to make regulations, they will, as a matter of duty, set about making some, whether they be wanted or not. . . . If not too minute, the Constitution, being demanded by gentlemen from New Zealand, may be useful. . . . The substantial practical objection to it was suggested by Mr Gladstone and enforced by Sir W. Molesworth. Both deprecated the idea of having a second chamber, the members of which are to be nominated by the Crown. . . . Probably, in a young colony, where ranks are not very distinctly defined, whither men go, in the majority of cases, to avoid the restrictions of a long peopled country, one chamber would be quite sufficient. If it were based on a wide suffrage and renewed frequently, so as to be always identical with the bulk of the people, there could be no apprehension of its establishing a crude despotism.

NOTES OF THE WEEK

Prisoners of Korea

A new stage opens in Korea with the statement that Mr Eden made in the House of Commons on Wednesday. After ten months of most painful negotiation the division between the two truce delegations has been reduced to one matter of substance—the return of prisoners. The struggle over this is unlikely to be ended quickly, for moral principle on the United Nations' side and prestige on the Communist side are in deep and direct conflict. And the Chinese attitude will not be softened by the fact that the whole world now knows that three-quarters of the Chinese prisoners and nearly half the North Korean prisoners refuse to return voluntarily to the Communist side of the front. On the other hand it is something gained that the Communists have made concessions that they are now hardly likely to withdraw.

The fact that negotiations are again at deadlock should not obscure this important exchange of pieces: the Communists have given up their demand that the Soviet Union should be a "neutral" member of the armistice commission and the United Nations have given up their demand—which they could not have enforced—that the Communists should build no new airfields. This was brought about by the United Nations' proposal for a settlement of all outstanding issues in one effort, a method that Communist diplomacy generally rejects. This provides yet another reason why the effort at negotiation should not be given up, exasperating though it is for the delegates and harrowing though it is for the relatives of prisoners in Communist hands. It might yet be possible to break the deadlock over prisoners by getting a neutral commission of inquiry appointed.

Meanwhile the eagerness of propaganda organisations to exploit the refusal of Chinese and North Koreans to return home must not be allowed to make negotiation more difficult. Peace in Korea is more important than points scored over the radio.

* * *

Admirals and Admiralissimos

The visit to London of the United States Chief of Naval Operations, Admiral Fechteler, has caused inaccurate and undignified comment. It is not the case that the British, out of pride and pique, demand for themselves a supreme command in the Mediterranean; nor are they jealous of the special position given to the Americans in those waters by the carrier strength of the Sixth Fleet. Lord Alexander and others have insisted on a weighty and much pondered question: is it right to give control of all naval forces in the Mediterranean to the man directing the Supreme Commander's forces in southern Europe? He would be bound to think first of the defence of Western Europe, which is Nato's direct concern; he would not be directly concerned with the defence of the Middle East and the communications that lie across it, for that is not Nato's concern. That job falls to the British, for whom the Mediterranean is not so much the flank of land operations in southern Europe as a corridor from this country to Commonwealth countries, from the Atlantic to the Indian Ocean.

It is reasonable for the Admiralty to argue that no commander—whether he is Admiral Carney or Lord Mountbatten is irrelevant—can look at the Mediterranean simultaneously from a European and a Middle Eastern standpoint. So long as there is no clear American or Nato commitment in the Middle East, naval forces in the Mediterranean for its defence should be allocated separately and should be under British command. The division of command at points where Nato's powers end and national responsibilities begin should be clearly drawn, even though it is in peacetime.

Next Stage in Egypt

The speech delivered on the sixteenth anniversary of King Farouk's accession by the Egyptian Prime Minister, Hilaly Pasha, is tacit proof that recent consultations in London with the British Ambassador in Cairo and the Governor-General of the Sudan brought little progress on the Sudan. The purpose of all the recent talk has been to produce a preliminary statement on the basis of which formal negotiations could open. In preparing this, it is known that the British are ready to go far towards meeting Egypt's aspirations with new arrangements in the Canal Zone. They are also ready to recognise in principle the Egyptian King's sovereignty in the Sudan, on condition that the Sudanese, after consultation, consent. But how is the consulting to be done? The representative bodies that it would be normal to consult are regarded by the Egyptians as too much under British influence. In their eyes the Sudan is part of Egypt; as a broadcast put it this week, they "do not oppose the principle of self-determination," but "insist on the principle of unity between the two countries." That is to say, they accept self-determination but only if the Sudanese determine themselves in Egypt's favour.

What more can the British Government do? Outsiders, such as the Americans or the Pakistanis, recognise that it has gone as far as can be expected; many Asians and Africans are just as concerned about the maintenance of British promises to the Sudanese as about satisfaction for Egypt. Yet, if the Egyptians insist that "negotiation" means one hundred per cent concession to their view, it is difficult to see how the desired preliminary statement can be secured.

If it cannot, there are ways around the *impasse*. One would be to separate the matter of the Canal Zone and the matter of the Sudan, so enabling Hilaly Pasha to score a considerable personal triumph in the former; but his latest speech makes this look unlikely. Another would be to start formal negotiations without a preliminary statement, which would be unpromising. A third would be to tackle the Sudan problem from the angle that really matters to Egypt: its concern lest an independent government in Khartoum should one day tamper with the vital Nile water. To create an international Nile Valley Authority would be to bring Egypt the longest-term measure of security, and here the British could take the initiative.

* * *

The First Shuffle

The minor reshuffling of Ministers carried out by Mr Churchill this week followed the expected lines. It has been clear for some time that the double post of Minister of Health and leader of the House of Commons was too much for Mr Crookshank, as it probably would have been for any man. The only surprising reflection is that six months ago Mr Churchill thought that Mr Eden could combine the leadership of the House with the office of Foreign Secretary. Mr Crookshank will certainly need every ounce of skill and energy he has to lead the House effectively in the next few months, and he rightly gives up the Ministry of Health and takes over the sinecure post of Lord Privy Seal.

The tribute that may fairly be paid to Mr Crookshank's successor is to say that the appointment is no surprise. Mr Macleod's abilities have made him the obvious choice—although he is only 38, although he not merely comes straight from the backbenches but has been there only since 1950. As Minister of Health he combines the two qualifications of knowing his subject and of being both willing and able to stand up for himself in Parliament against Labour's assumption of proprietary rights in the social services. He has demonstrated that quality most plainly in the debates on the Health Service Bill in recent weeks. Mr Churchill's other changes are routine enough.

Lord Salisbury relinquishes the post of Lord Privy Seal which he had kept after becoming Secretary for Commonwealth Relations, but continues to lead the House of Lords. The appointment of Mr Lennox-Boyd to succeed Mr Maclay as Minister of Transport confirms the impression that what Mr Churchill seeks in this post is an exponent rather than an originator of policy. Mr Maclay, whose ill health and resignation are widely regretted, has been the victim of unfortunate circumstances. Mr Henry Hopkinson, who takes Mr Lennox-Boyd's place as Minister of State for the Colonies, was formerly a professional diplomat and became a research worker for the Conservative party after the war—as did Mr Macleod. It seems that the party bureaucracies are increasingly becoming a training ground not merely for the backbenches but for ministerial office.

Mr Lennox-Boyd will have only a short time in which to brief himself to steer the Transport Bill through the House of Commons. This bill, giving effect to the proposals in this week's White Paper, will be published shortly. Labour has a powerful team—Mr Morrison, Mr Barnes, and Mr Callaghan—to lead the opposition to the bill, and the rank and file of the party will want to fight at every point to delay the return of road haulage to private ownership. Mr Churchill may have reason to regret that Lord Leathers cannot himself champion the bill in the House of Commons. It is the more important to make a political success of this bill because the denationalisation of steel is apparently to be delayed for its sake. Mr Churchill promised in his broadcast last weekend that the Steel Bill would be introduced "this year"—not "this session." Though the hint is obscure, there is little doubt that it is only by postponing the Steel Bill that the Government can make its life in Parliament tolerable.

* * *

Constitution for Central Africa

The full details of the draft constitution for Central Africa, which was agreed at the London conference, will not be given until the White Paper is published. But the main amendments to the proposals put forward by the officials last summer have been made known. Of these, the most important concern the safeguarding of African interests. The officials proposed not only an African Affairs Board but a seat in the federal cabinet for a Minister for African Interests who would be responsible to the Governor-General. Objection was taken to this because it would have made government unworkable, and the draft constitution relies instead on a strengthened African Affairs Board, composed of a nominated European and African from each territory and an independent nominated chairman. It will have the power to veto any legislation that it considers discriminates against the African. The protectorate status of Northern Rhodesia and Nyasaland is confirmed in the constitution, and earlier assurances on African land rights are written into it. Even more important is the proposed establishment of a federal Supreme Court to protect these safeguards for Africans, from which appeal will lie to the Privy Council.

On what has been made known it seems fair to say that the draft constitution goes further than the officials' scheme in protecting African rights. But that does not make the next steps any easier. The next conference will be held in about six months' time, by when the commissions appointed to consider fiscal affairs, the public service and the police will have reported, and the draft constitution can be completed. After that it will go before the legislatures of the three territories. The Government's difficulty is that if it tries to explain the new proposals to the Africans in the meantime, it may intensify their suspicions that federation will be forced upon them. If, on the other hand, it takes no action, it will be accused by the Rhodesian Europeans of allowing the whole scheme to go by default. It is thus particularly unfortunate that Mr Lennox-Boyd should have been promoted to the Ministry of Transport just now and his place taken by someone whose interests have not hitherto lain in colonial affairs.

* * *

The Young and the Old

There was virtually no political sparring in the second reading debate of the Family Allowances and National Insurance Bill. For once, almost all members on both sides of the House of Commons showed themselves aware of the shadow overhanging social security in this country—the shadow of age—and addressed themselves to the best means of dispelling it. This awareness is particularly welcome when shown on the Labour benches, for it is the generosity shown by the Labour Government to retirement pensioners that is largely responsible for the liability that will eventually be placed on the national insurance fund. Both parties have now evidently woken up to the fact that it is not some distant government that will have the responsibility for meeting this liability, but the government that is elected at the next general election. In five years' time, according to the government actuary, the expenditure of the national insurance fund will exceed its income by £100 million.

Some members, particularly Mr Angus Maude, wanted to relieve the burden placed by the old by more generous family allowances, in particular by increasing the allowance for the third or fourth child. This, he argued, would encourage larger families and therefore increase the ratio of workers to retired in twenty-five years' time when the insurance fund's excess of expenditure will have grown to £400 million. But this policy would imply a steadily increasing population, and it is by no means certain that that is desirable on other grounds.

The best course would seem to be to extend the working years of elderly people by raising the minimum pensionable age. Here Mr Peake, Minister of National Insurance, gave some interesting facts and figures. Because of their earlier retirement and longer life, two-thirds of the amount spent on pensions goes to women and one-third to men. The increments to pensions earned by postponing retirement, he also pointed out, have been increased to a point that brings no saving to the insurance fund from delayed retirement. They would also involve a higher basic pension if the pension age is raised. Raising the age would not of itself help the fund's finances; but by setting an example for later retirement in industry generally it would help the country to support the pensions burden. There is, he emphasised, no easy way out of the financial difficulties of the national insurance scheme. Anyone who faces them must admit, he said in effect—and it is a welcome change for a Minister to say it—that in future retirement pensions must take second place to provision for the sick and unemployed.

* * *

Europe's Economic Dilemma

The boom and slump controversy has now reached the Organisation for European Economic Co-operation. One group of national representatives still regards inflation as the main danger, and the OEEC is forming a small committee of experts to review once again the internal financial stability of countries; the other is more worried about deflationary tendencies and rising unemployment. These views are not contradictory, for the essence of economic policy is to maintain a delicate balance between inflation and deflation—or to maintain expanding output while keeping the value of money relatively stable. No government can afford to allow

large-scale unemployment, and Britain's present difficulty reflects the European problem before OEEC. There is a race between rising unemployment and the effort to increase gold and dollar reserves. If Britain's present dose of disinflation can adequately increase reserves before unemployment rises above the politically acceptable maximum then all is well for the moment.

The OEEC finds that the main obstacle to its programme of expanding Europe's output by 25 per cent over five years is not lack of equipment but decline in demand. Last September all depended on whether there would be sufficient coal, steel and other raw materials. Now manufacturers are not so sure of a continuing large demand, and are less eager to extend investment and increase output. In a fully controlled economy the authority would push on with its investment policy in the belief that it could expand demand later. In free European countries, industrialists need something more than exhortation and reports of experts.

The OEEC's new study of internal financial stability will, apparently, not deal with this question of how to maintain financial stability and an annual rise in output of five per cent. Yet this is what Europe wants to know. Continued inflation, or even "creeping" inflation, is no solution because the day of reckoning must come, when it may be impossible to prevent large-scale unemployment. The answer may be to try to imitate what has happened in the United States since the war. There the economy has expanded for a period, then there has been a modest recession, then expansion has resumed. The catch is that this may have been far more the result of pure accident, or the working of "blind economic forces" than anyone is prepared to admit.

* * *

Less Need for American Coal

Western Europe has become accustomed to sudden changes of economic prospect, but few governments could have hoped to reduce this year their imports of American coal. Coal has become a major item in their dollar expenditure and some 35 million tons were to have been imported from the United States in 1952. Early in January the Council of OEEC formed the Ministerial Coal Production Group with the task of increasing production so as to dispense with these dollar imports by the end of 1953. Now, four months later, it looks as if they will be less than half what was forecast.

WESTERN EUROPEAN COAL PRODUCTION
(Million metric tons)

	First 16 Weeks			Full Year		
	1951	1952	*Percentage Change*	1951	1952 Estimate	*Percentage Change*
United Kingdom	71·1	71·8	+ 0·92	226·4	229·4	+ 1·32

TOTAL	143·4	146·3	+ 2·01	458·1	473·6	+ 3·38

Source: Organisation for European Economic Co-operation.

European production, it is true, has risen, though by less than was planned. The figures so far available (released after the meeting of the Ministers' deputies in Essen last weekend and shown in the accompanying table) refer to the first sixteen weeks of this year and are not directly comparable with the same period of 1951. Last year British production jumped ahead in response to Mr Attlee's plea, while in Germany and the Netherlands miners worked longer hours because of special arrangements no longer in force. In total, output has gone up by two per cent compared with the planned increase of 3.38 per cent; but the ministers' deputies were confident that the planned increase would be obtained over the year as a whole.

The main reason for the decline in imports of American coal is the fall in consumption. The mild winter has left most countries with much larger stocks than they expected. This, coupled with manufacturers' fears of a slump and the effects of restricting credit, has caused a significant decline in the demand for coal.

The Ministers' deputies have set up a working group to study various projects to increase output next year put forward by countries which claim that their domestic resources are inadequate to finance their own investment. The chief claimant was Western Germany, despite the fact that it is known to have made very large "hidden" investment in its coal industry during the past two years. If price is at long last to bring supply and demand into equilibrium, then it would seem unfair—indeed unwise—to encourage investment (with the help of dollar gifts or loans) that the producing countries are not willing to finance themselves.

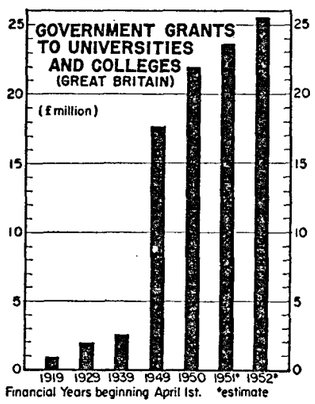
Camouflaged Communists

"Invisibles" are playing an increasingly important part in the Soviet Union's political balance of payments. Wherever Soviet agents have a hand in organising disorder, the local Communist parties form only one of Moscow's assets. Political parties, organisations and individuals, all variously camouflaged, make up the rest. In Western Germany nearly eighty different crypto-Communist bodies, all subsidised from the Soviet Zone, have been counted, and they are growing. If four power talks on all-German elections are held, the Russians will doubtless demand for these "parties" and "mass democratic organisations" the right to put up candidates.

At the famous meeting of the Far Eastern branch of the World Federation of Trade Unions in November, 1949, one Chinese Communist leader frankly explainly that allegedly non-Communist parties had been formed to attract the Chinese bourgeoisie. They were included, for the sake of appearances, in the government set up after the Communist victory, and some European correspondents praised Mao Tse-tung somewhat ingenuously for refraining from establishing a single party regime in Peking. Their members, however, were bluntly told that the Communist party would give the orders.



Latterly some of Moscow's invisible exports have revealed their hall-marks too plainly for Soviet liking. The World Peace Council, for example, which thinks out new propaganda stunts, dropped quietly out of the Moscow economic conference after proposing it. At its latest meeting the Council framed the allegation that the Americans have been waging bacteriological warfare in Korea, and it has since sent instructions to Communist parties and camouflaged organisations to exploit its material on the subject.

Crypto-Communist organisations are comparatively easy to recognise, but the growing Communist practice of infiltrating genuinely non-Communist bodies is much more difficult to combat. Few remember the part played in the Communist coup in Czechoslovakia by Fierlinger and Erban, who posed as good Socialists until "the day" came. The libel laws and the distaste for witch-hunting felt by most western liberals make it almost impossible to expose such individuals in time. Moreover, in most countries of Western Europe, they have the easy task of persuading the public that rearmament is unnecessary, and that all their worries are due to the Americans. Except in Federal Germany, Europeans are not being urged by agents to go to the barricades, but simply to do nothing. This is as beguiling as the fanatical nationalist role played by disguised Communists in Asia and Africa.

Academic Freedom and Accountability

One of the wisest features of educational policy was the decision to leave the universities free from detailed parliamentary control. But when, in 1919, the University Grants Committee was appointed to advise on, and later to carry out, the allocation of the grant in aid, the decision was more obviously wise than it is today. The total amount of the grant was then £916,000; last year it was £23 million, and for 1952-53 it is £25 million. That is a very large sum to dispense without any obligation to account in detail for the way it is spent. It is over ten times as large as any other grant in aid made under the same conditions, and the Select Committee on Estimates, in its fifth report, was right to re-examine the problem of reconciling the independence of the universities with adequate control over the use of public money—particularly as the Committee of Public Accounts has also implied that the independence was now too great.

The Select Committee is satisfied, in the main, with the present system. It does, however, recommend that the use of non-recurrent grants—the grants made for building and other capital expenditure—should be subject to more detailed control: the books and accounts should be open for inspection by the Comptroller and Auditor-General. The present arrangements are that the universities are bound to accept the lowest tender, and their plans are considered by a subcommittee of the University Grants Committee, which is attended by representatives of the Ministry of Works. The safeguards against extravagance are thus fairly strong already.

A serious encroachment on academic freedom is the practice of earmarking part of the recurrent grants to finance particular developments—for example to meet the need for more doctors or more technologists. This practice is strongly disliked in the universities, and the University Grants Committee also, in its latest report, expressed disapproval in principle. The select committee agrees that these grants should not be used beyond the period necessary to establish a new school or faculty, but thinks they may still be needed for that purpose. The University Grants Committee is about to start on the allocation of this year's grant in aid, and it is for it to decide whether any of it should be earmarked. While certain professions—for example, dentists and technologists—are still so understaffed, it sounds reasonable to insist that public money shall be used to produce them; but much the same result could no doubt be obtained without compulsion and rigidity by simply asking the universities for their co-operation.

Labour's Health Service Pledge

The final stages of the National Health Service Bill in the House of Commons were notable for a declaration by Mr Marquand when making the last speech for the Opposition. He said that when the Labour party was returned to power it would take steps

> as soon as parliamentary opportunity permits, to bring all these charges—charges for drugs, medicines, dentures, dental treatment and spectacles—to an end.

He thus in effect repudiated two Labour measures, the Act of 1949 imposing the charge on prescriptions, which was not put into operation, and the Act of 1951 imposing the charges for spectacles and false teeth, for which he was personally responsible as Minister of Health.

Conservative backbenchers, including the new Minister of Health, Mr Iain Macleod, were quick to seize upon the significance of this declaration. Taken in conjunction with some of Mr Marquand's earlier remarks, it means that the Labour party has abandoned all idea of a fixed ceiling on health service expenditure. The money to be saved by the new Bill, he said, could have been found by not giving relief to income taxpayers. It is true that in the 1951 Act a clause was inserted limiting the duration of the charges imposed to 1954, thus linking the need for them to the period of rearmament. The new Bill abolishes this time limit, and the Government resisted attempts by Labour to reintroduce it. But it was not in Mr Marquand's original Bill; it was put in at a later stage to pacify Labour backbenchers. Moreover, the Central Health Advisory Council, of which a Labour member of Parliament is chairman, in its report for 1951 says that it advised the Minister to consider measures to limit the demand for dentures, suspecting that some of it was unreasonable.

Tht fact is, as Mr Marquand and his colleagues on the Opposition front bench know full well, that there is no limit to the amount that could be spent on the health service if demand were the only criterion. The particular ceiling of £400 million that has been enforced by two Governments is not necessarily final. Nor are the charges necessarily being imposed in the best way. Clearly there is need for a thorough reorganisation of health service finances, which it is hoped Mr Macleod will undertake. But Mr Marquand's return to the carefree, irresponsible days of 1946 was as foolish as any pledges of red meat.

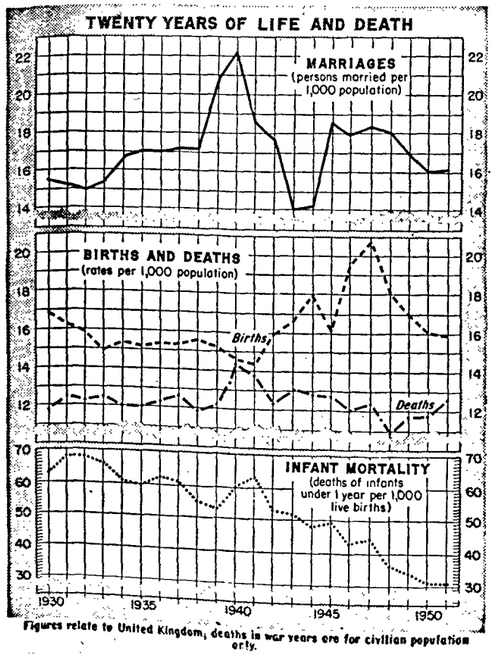
Mr de Valera Against the Tide

After an unusually prolonged debate the Irish *Dail* has passed the last of the Budget resolutions by three votes. No doubt the political temperature will now fall, but it is unlikely to remain at the lower level for long. Mr de Valera's slender majority of two has been reduced by the death of a *Fianna Fail* deputy. This untimely vacancy occurs in a constituency where last June the opposition parties, taken together, had a clear majority of votes over the government candidate. It is generally taken for granted that the government will not only lose the seat but will also receive so reduced a poll that it will be forced to go to the country. To those who think so, the only question is whether the by-election will be held before or after July 1, the date on which the reductions in the food subsidies come into effect. This, however, seems to ignore two points that may turn out to be of considerable importance. The constituency is in Mr de Valera's own part of the country; and it remains to be seen if the opposition parties can in fact act and vote together.

Although the tide seems to be flowing in favour of the opposition parties, they have yet to set a course. *Fine Gael*, the principal opposition party, is gathering fresh strength and self-confidence. It is unlikely, and it certainly would be most unwise, to tie its hands by promises to repeal the entire budget if returned to office. Its late allies in the inter-party government may not be so restrained. This confused situation is one after Mr de Valera's heart; and a dissolution may be further off than is thought at present.

* * *



The Struggle in the Union

The High Court of Parliament Bill, designed by the Malan government to override the entrenched clauses of the South African constitution, has come up for its second

reading, and the campaign against it throughout the Union has been intensified. In the House of Assembly the Speaker had already been challenged by Mr Strauss, the leader of the opposition, to rule the Bill out of order on the legal principle that parliament cannot, as ordinarily constituted, do indirectly what it cannot do directly; the Speaker refused. Outside in the streets of Capetown extra police have been drafted in from all over the Union to guard, as Dr Malan claims, against possible unconstitutional pressure from the Torch Commando. And in Natal the United Party provincial councillors have met at Pietermaritzburg to propose a national convention of South Africa's four provinces to reaffirm the constitution; in Durban they have since had the backing of the Natal branches of the Labour Party and the Torch Commando.

It is a reflection of the atmosphere in which tempers are now rising that Dr Malan should have taunted Mr Harry Oppenheimer, who is the brains of the United Party, with the epithet "arch-Liberal." Even in South Africa, where much of the white community feels it is fighting with its back to the wall on racial questions, such an attitude will get no response from the majority. There are reports that Dr Malan's marginal adherents are questioning the wisdom of the government's present tactics, and that Dr Malan himself may just be beginning to hint at compromise.

More important than the legal issue is the moral one. It is one thing for the government to push its *apartheid* policy to the limits allowed by the constitution, but another that it should seek means of overriding the constitution. On this point the Dutch and British are not divided racially. The leadership of the United Party rests in Afrikaner hands, and the moderate Afrikaner is now quite as worried and incensed by the flagrant illegality of Dr Malan's intended programme as is his British neighbour. The traditions of Botha and Smuts are not dead and it is possible that Dr Malan has started something that could bring down his government at the next election, if he pursues his present course.

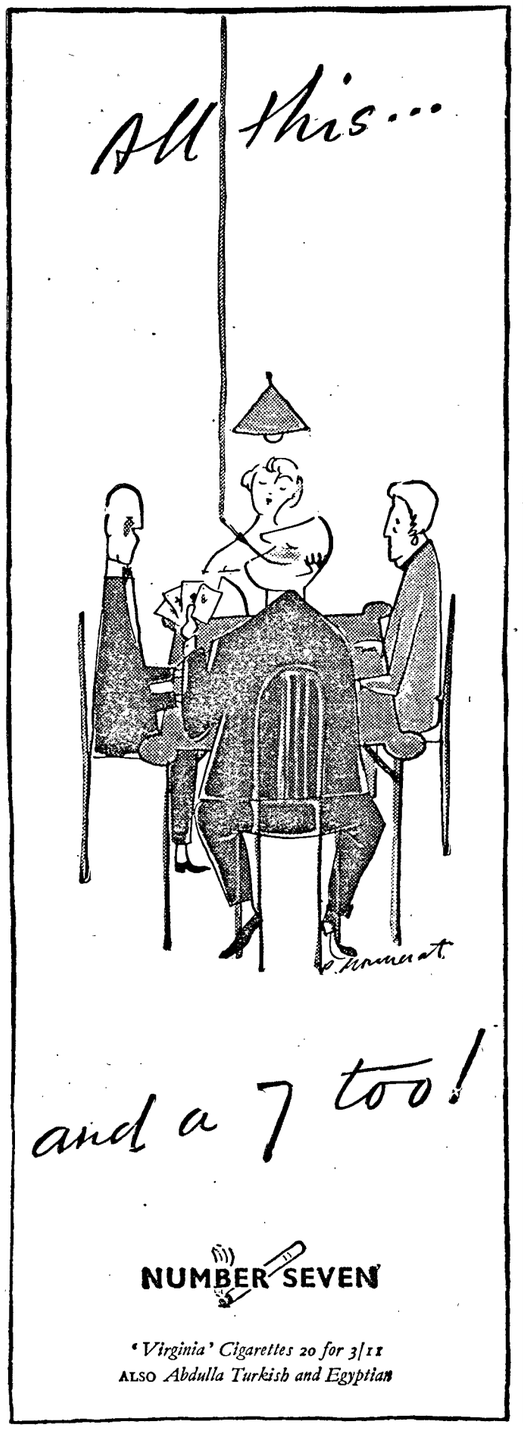
Figures relate to United Kingdom, deaths in war years are for civilian population only.

Franco and Islam

The Middle Eastern tour of Spain's Foreign Minister, Señor Artajo, is paying a dividend only a week after its conclusion. The Regent of Iraq and his Prime Minister, General Nuri Pasha, are visiting Madrid. Further outpourings of bouquets and banquets, cultural conventions and treaties of friendship are bound to follow. It suits both parties to extol the success of their relations: the Arabs in order to show their British and French adversaries that they are not friendless, the Spaniards in order to impress the Atlantic community with Spain's uses as a go-between, or even as an influence in Uno upon the Arab-Asian bloc of voters.

Beyond these frills there is little evidence of substantial agreement. The parties' economies do not dovetail. Some Arabs feel that to fraternise with a power that is still sovereign in an Arab territory—Spanish Morocco—is a negation of a longstanding doctrine of the Arab League. Others know the military futility of General Franco's assertions that Spain is "guardian of the unity of the Mediterranean."

From an Anglo-American standpoint it is no bad thing that a country that belongs to the western world should be on good terms with eastern peoples; opposition to this state of affairs comes only from Communist circles, which hissed Señor Artajo as he went on his way, and from France. For the French are inconvenienced by the quickened pace set by this spurt in Spanish policy. One part of it is to introduce in the Spanish zone of Morocco methods more liberal than anything the French can afford in their own zone because of the diehard views of the European population in French North Africa.



Lately, Madrid has, in the Spanish zone, authorised political parties, introduced a five-year economic and educational plan costing £7.5 million, appointed a well-known Islamic specialist as chief of staff, dismissed an officer for not giving an order through the Sultan's representative; Señor Artajo was asked in Cairo whether the liberation of Spanish Morocco lay ahead, and gave the sybilline reply that "Spain could not unilaterally break its international engagements on the subject." What he did not say was whether Spain was glad or sorry to be thus hampered. For the moment, anomalously enough, General Franco is made to look the champion of Arab rights to liberty, equality and fraternity, and France the stodgy reactionary withholding them.

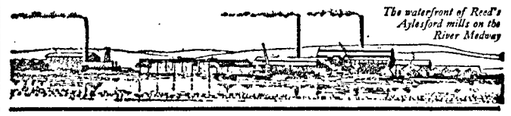
New Ambitions for Bulgaria

A recent cabinet decree demanding in urgent terms the speedy completion of Bulgaria's first major iron and steel combine suggests that this backward country will not escape the extensive industrialisation now being carried out all over Eastern Europe. Although Bulgaria, like the other Soviet satellites, has been fitted out with a five-year plan (now in its fourth year) some observers have surmised that it was still destined to play a primarily agricultural role in the Soviet scheme of things. It has some coal and iron ore, as well as hydro-electric resources which are being steadily developed; but, generally speaking, it has usually been considered poorly endowed with mineral and other natural resources. The Communists think otherwise. At the National Day celebrations last September the Prime Minister, Mr Chervenkov, said that the geological research now being carried out, "which could be only dreamed of before 1944," was "opening up great prospects for the extraction of iron ore, non-ferrous metals, coal and many other useful minerals."

The new iron and steel combine under construction at Dimitrovo, not far from Sofia, will no doubt be able to



TO THE MECHANICALLY MINDED, 1895 was an exciting year. In spite of stringent Highways Acts, people were driving the first few horseless carriages on the public roads—frequently without the man with a red flag who should have preceded them and exceeding the speed limit of 4 m.p.h. British engineers were building their first cars; a new industry had been founded. And that same year the foundations of another great enterprise had been laid. At Tovil, Albert E. Reed had begun to make super-calendered newsprint at his first paper mill acquired the previous year. Successfully reviving other mills, he was soon to be known as "the Wizard of the South" and to build up an unrivalled reputation as a manufacturer of super-calendered printing papers, including newsprint. From this beginning, not sixty years ago, has grown the vast paper-making enterprise of the Reed Paper Group, producing today an ever-increasing tonnage of British newsprint and the largest output of Kraft paper in the whole of Europe.

Sea of oil under Canada

A FEW YEARS AGO oil gushed in western Canada. Two thousand million barrels of oil are known to be available and, say experts, that's only a fraction of the oil-sea that lies beneath. It is a vast oil land with natural-gas pools, to be used for great mills that industry has already planned.

In addition, tar sands in the north hold in their frozen embrace 200,000 million barrels of oil, it is estimated — more than twice the world's known reserve.

Oil is indeed adding to the wealth of Canada — where one of the world's highest living standards already exists. Canada's power to buy British goods is high—and going up.

Fly to Canada by TCA and you can be in Montreal tomorrow. You travel in the complete comfort of fast TCA Skyliners, at the lowest fare ever for trans-Atlantic flying. TCA services link all the industrial centres of Canada and the United States.

supplement domestic sources of iron ore from the Krivoi Rog ores of the Donetz basin, although these must already be in great demand to feed both Russian and satellite industries. It is, indeed, hard to understand the extreme urgency attached to the completion of the new combine which it is hoped will be producing at an annual rate of only 10,000 tons sometime next year. The Bulgarian Ministers call it a task of "paramount and nation-wide importance" and demand what amounts to a compulsory levy of whatever material, installations, specialists and workers may be necessary for its building.

* * *

Durham Again Closes Shop

The "closed shop" dispute in Durham is like a toxic condition which, suppressed in one form, reappears in another. The county council's capitulation to doctors, dentists and teachers did not end the matter. They are no longer asked, when applying for a post under the council, whether they belong to a trade union or professional organisation, but members of some other professions still have to answer that question. And in the autumn a new and subtle way of pursuing the closed shop policy was found. The council decreed that any of its employees who wished to apply for extended sick leave—that is, beyond the normal maximum of six months—must do so through his trade union or professional organisation.

The professional organisations of doctors, dentists, engineers, teachers, midwives and nurses then joined together to form an emergency committee. This committee met an emergency committee of the Durham county council, and they evolved a proposal—which is accepted practice with other local authorities—that the application for extended sick leave should be sponsored, not by a union, but by another employee of the council belonging to the same profession as the applicant and nominated by him: a doctor, for example, would normally apply through the Medical Officer of Health. This proposal was referred back to the county council itself, which rejected it. The joint emergency committee of the professions has now asked the professional journals of its constituent organisations to publish no advertisements of appointments under Durham county council. It has also asked the Ministers concerned—the Ministers of Health, Education, Transport and Housing and Local Government—to intervene in the dispute.

Applications for extended sick leave are made but rarely, and the effectiveness of using them to enforce the closed shop may seem too slight to call for the sledgehammer of ministerial intervention. But the principle of professional freedom is important. When the previous Minister of Education issued his directive against the closed shop for teachers he did so on the ground that the county council's attitude was jeopardising educational services in Durham. With members of several professions boycotting appointments under the council, the Ministers concerned would certainly be justified in intervening on similar grounds.

* * *

Reasonable Arrest

The word "reasonable" is so enshrined in English law that every fresh decision seems designed to add to its lustre as a guiding principle of conduct. It is a symbol of the lawyers' distrust of the absolute, of any rule which makes no allowance for common sense and practical convenience. Judge and jury are asked to consider what a reasonable man would do. Though the economic man has long since died and the truly reasonable man has not been born, it would be doctrinaire to criticise, for the conception has many negative virtues. It may lead to litigation, for a court can only say what is reasonable in the circumstances of the case when it has heard all the circumstances of each case, but that is no longer a hardship since poverty has ceased to be a bar to the law.

The word appeared again last week, when the House of Lords discussed the rights of a reasonable shopkeeper, and his employees, to detain those whom they suspect of shoplifting. In December, 1948, the detectives of an Oxford Street store detained a mother and daughter on the suspicion of shoplifting. The two suspects were followed out of the shop, challenged in another shop and brought back for interrogation by the chief detective and the managing director, all of which took some time. The store's officials decided to make a charge and the suspects were then taken to a police station. A day or so later the charge against the mother was withdrawn. Her response was to sue the store for damages under various heads, only one of which had survived by the time the case reached the House of Lords.

The issue there was, had the lady been falsely imprisoned? In other words, had the delay between the first detention and the final journey to the police station been long enough to convert an originally justifiable arrest into an unlawful detention? In the Court of Appeal, the Lord Chief Justice had said it had. His view was that it was the duty of the person making an arrest to take the accused to the police station, or before a magistrate, forthwith (an uncomfortably absolute word). Lord Porter, in the House of Lords, disagreed. The test, in his view, was this: had the accused been taken to the station or before the magistrate within a reasonable time? In this case, yes. So relativity is restored. Since the right to arrest is not confined to the police but may be exercised by any citizen who sees a felony committed, it may, however, be as well to repeat Lord Porter's last sentence: "Reasonable time" should be as short as is reasonably practicable.

Shorter Notes

Sir Alan Anderson, who died last weekend, was a shipping magnate. But the son of Elizabeth Garrett Anderson could never be content to be that alone, and service to the community was the guiding principle of his life. In his later years, he served as Member of Parliament for the City of London and for five years of the war as Controller of Railways—a strange position for a shipping man, but one in which he won unquestioning respect. He had since 1929 been a Trustee of *The Economist*, and the strength and wisdom of his counsel will be long remembered.

*

In last week's debate on the Health Service Bill, some MPs were indignant because hospital outpatients, awaiting the delivery of national health appliances, have been asked to sign a declaration that they realise that a charge will be payable should the National Health Bill become law before the date of delivery. The declaration is open to criticism: It does not mention the exception in favour of national assistance beneficiaries; the relevant provisions of the Bill itself—which are another matter—may seem harsh in that they impose a financial penalty on the very persons who have already suffered a long wait for essential appliances. But Opposition criticism was chiefly based on a different principle: that any warning or guidance to persons affected by pending legislation is an unwarranted prejudgment of Parliament's decision. The greater and more immediate the impact of legislation on the ordinary man, the more nonsensical is this argument. Socialists surely should be the last to use it.

Letters to the Editor

Food Without Thought

Sir,—With much of what you write concerning the Agricultural Price Review I agree, but I am surprised to see you endorsing fertiliser and ploughing up subsidies, the calf rearing subsidy, and the virtually blank cheque which has been given to imported feeding stuffs to stabilise their prices at present levels. Surely farmers by now realise the value of the proper use of fertilisers and feeding stuffs, and of ploughing up suitable grassland, without having to be bribed to follow such practices. As a farmer, I don't feel that I shall produce more if my costs are reduced by means of indirect subsidies by £1 a ton, or 6d. a gallon, than if I were to receive a similar amount for the end product.

But it is not only the arguments in support of these indirect subsidies which are, to my mind, illusory: there are two strong arguments against them. In the first place, as you yourself have often and rightly pointed out, it is essential for the country to realise the true cost of the food it consumes, whether home produced or imported. The more the issue is confused by *ad hoc* subsidies, the harder it is to know what the food does in fact cost. Who, for instance, could calculate with any accuracy the true cost of a cut off the joint from a bullock who at birth received the calf subsidy, was weaned on oats grown on former pasture on which the ploughing up subsidy had been paid, grew to manhood on grass, the growth of which had been stimulated by the application of subsidised fertilisers, and received his final bloom from subsidised linseed cake? Surely our aim should be to pay the producer the price that he requires to enable him to produce what the country needs; and if it is then found that this price is higher than the consumer can afford, to give a direct subsidy to the consumer.

In the second place, feeding stuffs and fertilisers are both to a large extent imported, and it surely cannot be in the national interest to encourage a greater consumption than there otherwise would be, of materials which can only be acquired by expenditure of foreign exchange, when this is being done to the detriment of home produced alternatives. A far greater quantity could be produced than at present of dried grass, which offers a satisfactory substitute for imported protein, but if imported protein is subsidised the production of this home-grown rival will suffer. Home-grown silage, too, can in many instances replace imported feeding stuffs, but the lower the price of the latter, the fewer farmers will bother to produce the former. Even with fertilisers we have domestic alternatives—old fashioned dung, sewage sludge and compost. All of these, it is true, are expensive to use, but the higher the price of artificial fertilisers, the more farmers will turn to domestic sources of fertility. Here, too, then, it seems that the present price policy is deliberately encouraging the expenditure of foreign exchange rather than the development of domestic resources.—Yours faithfully,

H. D. WALSTON

Newton, Cambridge

Devil's Advocate

Sir,—In observing, in your issue of April 26th, that economists of all persuasions "speak in unison" of the evils of private monopoly, you list me in the distinguished company of Sir Henry Clay as a voice of dissent. The state of agreement on this point is, indeed, formidable but in placing me in flat opposition you make me both more of a hero and more of a heretic than I can claim to be.

I do argue in my recent book that the industry of small numbers, or oligopoly, is likely to be technically more progressive than the more purely competitive industry (in the manner of agriculture, cotton textile manufacture, boot and shoe manufacture or, with us, bituminous coal mining) and that there are good reasons why this should be so. But I also argue that oligopoly has some very considerable advantages over monopoly. Again it may be more progressive and its positions of strength, because of uncertainty and the possibility of playing one firm off against another, are much more likely to be invaded by the countervailing power of strong buyers or sellers.

The trend of economic theory has been toward identifying the market results under oligopoly with those under monopoly. In arguing that there is a difference I do something to rehabilitate the case for the Antitrust Laws for these, while they may have prevented the control of industries by one firm, certainly have not prevented their division between a few. With tolerant men this should still qualify me as a defender of the faith.—Yours faithfully,

J. K. GALBRAITH

Cambridge, Mass.

European Realists

Sir,—There is an important point not mentioned by the secretary of Federal Union in his letter concerning your comment that "federal union may well be the *ultimate* destiny for Western Europe." It must be the immediate aim: time is not on our side. Unless Western Germany is quickly offered a form of partnership in Western Europe which both satisfies her demand for equality and allays French fears of German nationalism, and which produces a framework for the mutual settlement of such problems as that of the Saar, then Germany will either set off down the road of chauvinistic independence or enter the Soviet embrace. Federal union is the only form of partnership which meets these needs, and it should be one of the brightest spots among our postwar disappointments that both M. Schuman and Dr Adenauer, along with other European (and American) leaders, support the federal idea; but no time must be lost in turning this idea into reality. You lend your own support to this proposition in your current article on the Saar, in which you say:

> Five years hence . . . if the Schuman Plan pool became a reality and the European Defence Community produced the beginnings of federal institutions, it might be possible to reconcile French economic interests and German political interests in a manner that is now impossible. If, on the other hand, the European idea had by then died, nothing short of force could prevent the return of the Saar to Germany. . . .

To hasten the federation of Europe is so patently in the interests of the whole western world, including Britain and the Commonwealth, that one might have supposed the ambition of the British Government would have been to play the role of pacemaker. But if we are too spiritually exhausted to do this, let us at least encourage as best we can, and with good grace, the other members of our western team who are giving the lead in the race to help win some chance of peace and ordered economic progress.—Yours faithfully,

MARTIN MADDAN

West Malling, Kent

Displaced Persons

Sir,—May I draw your attention to the fact that since the liquidation of the International Refugee Organisation the various religious societies, the British Red Cross, the International Guides, etc., have been compelled to cease their welfare work in the camps and hostels for displaced persons and that there is now no international body to whom these people can appeal. The organisation of a High Commissioner to look after the legal rights of displaced persons is, indeed, under way, but it is by no means certain that the functions of his organisation will embrace welfare activities in the camps and in the meantime there is no one to whom they can turn. The majority of those that remain are people who cannot emigrate for reasons of health, age, or disability of one member of the family, but are prevented from returning to their former countries for personal or political reasons. It is imperative that some international welfare committee should have free access to every person.

It seems incredible that the new organisation should not have been formed before the IRO was disbanded; but since this has not been done, then at least it must be possible for the governments who contributed and staffed IRO to make finances available either to an interim committee, or at least to those voluntary societies who formerly worked at these camps.

England has given a lead by finding homes for an enormous number of displaced persons and also "hard-core" cases. I hope that it will also lead the way, in conjunction with other countries, in lightening the lot of those tragic cases that remain.—Yours faithfully,

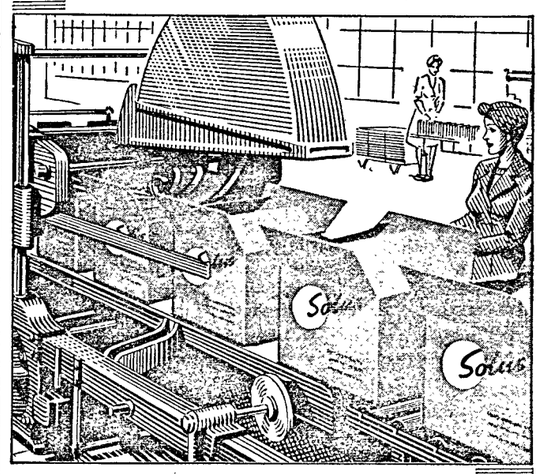
H. W. ROTHSCHILD

London, S.W.10

See twice as much

BCPA-BOAC-QANTAS

on your flight to and from Australasia



Fly to Australia and New Zealand by one British air route, return to London by another. Actually *see twice as much* for just over £500—it may even cost you less than by going and returning the same way! B.C.P.A.—in co-operation with B.O.A.C., Qantas and TEAL—offer you a special round-the-world concession ticket. Whether you fly West or East from London, you cross the Atlantic, North America, the Pacific, Australasia, the Middle East and Europe. Liberal stopover privileges enable you to break your round-the-world journey where you wish, for as long as you wish—provided it is completed within 12 months.
You fly *above* the weather in fully pressurized 4-engined aircraft. And always you enjoy the same high standards of British service, hospitality and world-wide flying experience.

Consult your local Travel Agent or any B.O.A.C. or Qantas office.

Prelude to War

The Challenge to Isolation, 1937-1940. By William L. Langer and S. Everett Gleason. New York ; *Harper Bros.* London ; *The Royal Institute of International Affairs.* 794 pages. 60s.

The Council on Foreign Relations have put us all in their debt by launching a full history of American foreign policy in the years before Pearl Harbour so soon after the events it describes. And the authors of "The Challenge to Isolation" are greatly to be congratulated on the celerity, dexterity and clarity with which they have executed their large assignment. To the classic virtues of the historian they have added many of the welcome attributes of the journalist. Their narrative, though compendious, is neither dull nor clogged. They have given American policy a full and ample diplomatic setting, and described in almost equal detail most of the background of great power relationships during 1939 and 1940 (the years to which seven-eighths of this volume are devoted). Thus, for example, the negotiations leading to the Nazi-Soviet pact and the ensuing partition of Poland are analysed afresh and in full. Clear signposting enables the selective reader to arrange his own *détours*, but in fact such excursions amply justify themselves on their own merits. (They may even, incidentally, lure a few *savants* whose habitual focus is European to see their subject in a somewhat wider setting.)

But the book's central theme is, of course, the development of American policy, and its distinctive and most welcome contributions are twofold. First it makes a synthesis, superlatively deft and thorough, of the very great mass of material already published in America and elsewhere on American policy during these years. Whatever further material may appear, the general lines of this synthesis are unlikely to be seriously modified, and for a long time to come all scholars of the period will find it an indispensable aid. Second only to this is the value of its new source material, drawn from the files of American officials and their departments, particularly from the State Department. Little of this is sensational, but much is interesting and valuable.

It is indeed the files of the State Department which provide the book with its centre of gravity—and at the same time, perhaps inevitably, with its limitations. For valuable as it is to have the policy of the State Department documented in this way, there are certain drawbacks to making it the backbone of such a history. First, the State Department is not the sole organ for the conduct of American foreign policy. Under President Roosevelt, who often distrusted it, it was repeatedly by-passed by the White House itself or its other agents. Of course the authors know this, but their material, one feels, has often overborne them. For nearly everything done or said in that extraordinary wedding cake of a building on Pennsylvania Avenue there is documentary evidence—the sort of evidence so dear to a historian's heart. For much of what was done and said in the White House next door (and how much of it was *said*—and never written down—by F. D. R.) there is no evidence at all, or only evidence at one remove, in the erratic columns of the press or the faulty memories of the survivors. Yet who can doubt that Roosevelt, and not Hull or Welles, was the hero of this play ?

Perhaps an even graver consequence of this State Department bias is that, by comparison with the skilful and detailed analysis of the diplomatic documents, the authors' handling of public opinion is perfunctory and superficial. They pay verbal tribute to its importance, but it receives neither the space nor the careful examination it deserves. The genesis of isolationism, the composition of the isolationist forces in Congress, the finances and affiliations of both the isolationist and the pro-ally associations in the country, the nature of the news and the comment reaching the American public through their press and radio—where all these are not ignored they are passed over lightly. Such omissions must seriously detract from the book's claim to completeness. It must also reduce its usefulness, particularly for British readers, whose knowledge of the American background cannot be taken for granted. It reflects, one is almost tempted to say, an old world attitude towards new world history.

Economic Warfare

History of the Second World War: The Economic Blockade, Vol. I. By W. N. Medlicott. *HM Stationery Office* and *Longmans.* 732 pages. 35s.

Such official history of the Ministry of Economic Warfare as is now to be published has been assigned to the United Kingdom Civil Series. Professor Medlicott deals principally with the blockade rather than with the whole range of economic warfare but his volume has, nevertheless, a wider scope than traditional histories of blockade.

The first volume covers the prewar planning of the Ministry and many parts of its activities from September, 1939, to the middle of 1941. Despite its length it has a single theme: that traditional blockade was not and could not be enough when any of the principal belligerents were totalitarian and did not accept the distinctions between public and private property upon which the classical doctrine of extended blockade rested. The judgment of Lord Eldon and Chief Justice Marshall, Part II of the Treaty of Paris and the Hague conventions of the early years of the present century were largely irrelevant in the later stages of World War I and were, even before the collapse of French military resistance in June, 1940, largely inapplicable in World War II.

Professor Medlicott's study is likely to be the swan song of traditional blockade. Its objectivity, clarity and masterly arrangement of very intractable material will give it an honoured place in the literature of the subject. At a later date when the closely inter-related activities of the Foreign Office and Service Departments have been told, it will make its own contribution to the ultimate evaluation of the direction of British policies in World War II.

In arranging his volume, Professor Medlicott has had to contend with the same difficulties of organisation as beset the planners and directors of the Ministry. Should emphasis be placed upon the particular neutral or group of neutrals whose activities the Ministry had to influence, or upon the many different and not readily reconcilable techniques which had to be employed ? The author introduces his volume and each of its two main parts with a general description of policy and of the techniques employed to implement the policy. He then recounts the story of the application of the policy to countries and groups of countries. This involves some repetition but enhances the value of the volume to other students of his subject matter. It also enables him to weave into the story of the activities of the Ministry a reasoned and comprehensible account of its several reorganisations and redeployments to meet major changes in the war situation. THE SOCIAL FRAMEWORK

An Introduction to Economics

By J. R. HICKS

Second edition 12s. 6d. ***net***

A new edition of this standard work which was first published in 1942. This second edition has been revised and brought up-to-date and contains three new chapters entitled: The Social Accounting System ; The Social Accounts of the United Kingdom ; 1938 and 1949 ; and a new appendix "On the National Balance-Sheet."

By the same Author:

A CONTRIBUTION TO THE THEORY OF THE TRADE CYCLE **12s. 6d.** ***net***

VALUE AND CAPITAL. Second edition 1946 **18s.** ***net***

OXFORD UNIVERSITY PRESS

most cases his evaluation of the changes shows a remarkable appreciation of the issues involved. At one point he does produce an error of fact. On page 463, describing the radical changes in the organisation of the Ministry that were made in June, 1940, he says that the basic structure remained unaltered and that there was an operational and an intelligence side each under a Joint Director. His own list of divisions under the two directors shows that both the intelligence and the operational sides were in fact divided. The organisation reverted after the United States had entered the war to the plan which he attributes to June, 1940.

The author very properly limits himself to describing policies, and the hopes and fears upon which they were based. He attempts no final appraisal of the work of the Ministry. His manuscript was completed before the end of 1950. Since then material has become available from the German archives and from Mr Churchill's history that fortifies such judgments as he makes. He distinguishes between the considered advice of the Ministry as shown in its documents and the public use that was sometimes made of this advice. He has examined the assumptions about German policy upon which the Ministry had to work and concludes,

> We know now that the real source of error in the Ministry's calculations was not so much an underestimate of German material resources as an over-estimation of Germany's seriousness of purpose.

A NEW LIBRARY SERVICE

Harrods Library, which covers every available book in print, now offers to you the new 'Knightsbridge Service' . . . bringing within the 'guarantee' novels up to 15/- and non-fiction up to 30/-.

Each librarian attends to a limited number of subscribers only, ensuring a personal service to each.

The subscription includes free delivery within the area or postage anywhere.

Analysis of Peoples

Portrait of Europe. By Salvador de Madariaga. *Hollis and Carter.* 204 pages. 18s.

This is a stimulating, interesting and amusing book. But it should be read primarily for entertainment; if taken too seriously it might produce reactions which Sr de Madariaga, himself a strong and faithful supporter of the idea of European union, would certainly deplore as much as anyone. The author's intentions are excellent. He wants to help his fellow Europeans to "see the other fellow in a better light" and to realise that all his differences "are not necessarily due to his depravity." He therefore devotes much of his book to a study of the national characteristics of the peoples of Europe, their similarities and, above all, the "tensions" that make them get across each other. He hopes that the public airing of these tensions will reduce them to proper proportions.

This is an ambitious task. The psycho-analysis of an individual character is hard enough; but psycho-analysis of collective national characters must be even more beset with pitfalls, and it says much for Sr de Madariaga's sympathetic insight that he avoids so many of them. But sometimes he does come rather a cropper. In view of the present and past vicissitudes of Franco-German relations, it is odd to be told that Europe is nearly dying of the consequence of the "tragic tension" between England and Germany which is due principally to the inferiority complex felt by the Germans towards the English. Again, most English people will be surprised to learn that the buccaneering activities of their ancestors, which were largely at the expense of the Spaniards, have made "the mere existence of Spain a tacit reproach to the English." Sometimes, however, Sr. de Madariaga hits the nail properly and delightfully on the head, as, for example, when discussing English snobbery, he remarks that "nothing [is] more flattering to the English wearer than a French name, particularly if slightly corrupt." But the conclusions he draws from his excursions into etymology are sometimes too far-fetched to carry conviction. And his use of a rather whimsical symbolism is not always very successful; to compare for instance, the English, the French, the Germans and the Spaniards to earth, air, water and fire respectively, would seem to invite invidious comparisons rather than encourage mutual understanding.

Consolations of Age

Commentary on Age. By Kenneth Walker. *Jonathan Cape.* 192 pages. 12s. 6d.

In the last five years something up to ten books on old age must have been published for the English-reading public; but few have been as agreeable as this. "Commentary" is an apt title. Mr Walker, a surgeon with a knowledge of the literature of many times and places, touches genially on economics, medicine and philosophy, ranging from the advantages of "plus-Granny flats" to Nietzsche's belief in "eternal recurrence," and humanising all with pleasant little self-revelations.

Not that the book is all surface lightness. Tables are given to show how the population is ageing; the problem of how a decreasing number of young are to support an increasing number of old is seriously considered. There are chapters (expert but comprehensible to the general reader) on the physical and psychological changes of old age and on the experiments at rejuvenation which have not yet succeeded. The conclusions of a number of other studies of old age are summarised, and there are quotations from the great men of the past. But all is made palatable by an easy style and occasionally gentle humour, as the comment that the enforced retirement from business life and the lack of retirement from Parliament is "an inexplicable anomaly, or else an aspersion of the art of government."

The theme of death naturally intrudes. Mr Walker adopts a consoling attitude; he insists that it brings many reliefs and that when it comes it is not feared. Survival itself can neither be proved nor disproved by science which is limited to the experience of this world; "in the end a man has to put on one side his clever thinking and listen to a faint stirring within him." For this, the author thinks, we are singularly ill-fitted by the bustle of the western world; the east is wiser.

There are two other main points. One is that age is a biological process, not a sickness; that it is being prepared for in middle age and that as a man is then so will he be later; and that it has a number of consolations (chiefly that of standing back from the racket of the world) as well as disadvantages. The other point is that it is economically necessary to use the services of the old. The book is short (the price is perhaps rather large for its size), but with a suave touch it raises the problems of soul and body, life and death.

Watchdogs of Diet

Townsman's Food. By Magnus Pyke. *Turnstile Press.* 212 pages. 15s.

There are two kinds of food technologist. Some are employed by private firms to find out how to give the public what it wants—how to satisfy its desire for lighter, whiter bread, for example; others, mainly employed by public bodies, have to find out how to give people what is good for them and prevent them getting what is bad for them. The second set of technologists are partly engaged in keeping an eye on the first—in watching, for example, the chemicals they use to get this lighter, whiter bread. Mr Pyke's book has a chapter on each of the principal foods, and shows the increasingly important part that all these food technologists now play in determining the nation's diet.

The author himself was a principal scientific officer at the Ministry of Food

at a time when the state's function in relation to the national diet was being greatly extended. Until the second world war this function had been regarded largely as the negative one of protecting the public from harmful food; but the shortages of the war and postwar years have obliged the Government to make more and more detailed decisions about what the nation shall eat. These decisions affect more than the rationed foods. It is by deliberate policy, for example, that poultry remains more or less crossed off the menu of the average household, for the small allocation of feeding stuffs for hens is largely responsible for their high price. (This decision appears from Mr Pyke's account to be a little hard on the hen, which as a converter of feed into human food puts up a better performance than sheep and cattle kept for meat; but her tendency to gravitate towards the black market was against her.) The Government even alters the composition of foods; for instance, when it ordered that chalk should be added to bread and that margarine should be enriched with vitamins A and D. Yet in spite of this active role in determining the nation's diet, the state still lags behind in some of its original protective functions. The compulsory pasteurisation of milk is still far from universal, although the deaths from bovine tuberculosis in this country are estimated at about 2,000 a year; and more could surely be done to secure clean food.

Mr Pyke's style is sometimes rather wordy and repetitive, but it is not too technical for the layman; and with a subject matter that is of personal importance to everyone, the reader's interest is assured.

Austrian Scholasticism

Conditions of Full Employment. By Karl Gruber. *Hodge.* 141 pages. 12s. 6d.

This book is presented as a contribution to the theory of full employment by a modern member of the Austrian school. While the Austrian tradition commands respect, the present volume cannot be described as a contribution to anything unless it be confusion. The concentration on the circulation of purchasing power, its division into saving and consumption purchasing power, and the relation of this to the division of production between producers' and consumers' goods, is a fruitful source of fallacy. It underlines at every crucial step the superior analytical power and precision of the concepts of effective demand and social accounting employed by modern economists of the English tradition. In fairness, it must be added that this is the fault of the approach rather than the analyst; the author is, so to speak, crippled by his crutches and when he discards theory for common sense he has some useful things to say.

Dr Gruber sees the problem of maintaining full employment solely as that of overcoming the trade cycle. The trade cycle starts with a "disturbance" to the circulation of purchasing power, but its central (and unexplained) feature is the emergence, in the upswing, of disproportion between the saving-consumption ratio and the producer-consumer goods ratio—usually in the form of over-saving—associated with a failure of wages to keep up with prices. This disproportion is alleged to precipitate the crisis, while recovery begins with the replacement of worn-out capital.

The chief new proposal which emerges from this analysis is that the wage-price ratio should be regulated by arbitration or other means. Most of the other policy proposals are familiar, with variations attributable to a different political background and the author's fear of the inflationary results of monetary expansion. The discussion of policy, however, is distinguished by the author's recognition that full employment costs some loss of efficiency, and his insistence that the more flexible the economy the more easily full employment is attained.

COLLINS

A Dim Prospect

The Next Million Years. By Charles Galton Darwin. *Hart-Davis.* 210 pages. 15s.

On the face of it, a forecast of humanity's probable condition over the next million years looks much more rash than one extending merely over a decade or two; too rash, in fact, to be worth making at all. On the contrary, says Sir Charles Darwin. The ten-year prophecy may be unreliable, the hundred-year prophecy even more so; but over a million years the law of large numbers will have its way and the observer, armed with comparatively few reliable data, can draw from them conclusions as valid as those which the physicist—however incapable of assessing the effects of every molecular collision in a vessel containing gases under pressure—derives from the application of Boyle's Law.

The conclusions drawn by this observer, however entertainingly arrived at, are extremely depressing. On the million-year scale there is, he is convinced, no getting away from Malthus. All that today's spread of contraception can do is to weed out, by degrees, the less philoprogenitive human strains; the more philoprogenitive will, by similar degrees, inherit the earth and fill it as full as its resources permit. Those resources themselves — again in the million-year perspective—will be less than those of today, since the entire capital of energy represented by coal, oil and uranium will be exhausted in the first of his thousand millennia, and man must thereafter live on income. While that income (wind, water-power, sunshine) need not prove actually inadequate, to realise it will make a heavy call on resources urgently needed, in a philoprogenitive world, for food.

On the whole, the best notion of humanity's long-run prospects can be derived from China. A permanent "starving margin" with intermittent general famines; a low value set on human life, with infanticide and slavery both common; oligarchic government in a system of loosely connected provinces occasionally, but never lastingly, united; from time to time, perhaps over a century or so, a "golden age" as the balance between population and resources tilts momentarily the right way; such is the forecast. (Mankind is today enjoying a "golden age.")

Most of the book's argument stands or falls by Sir Charles's long-run Malthusianism, whose premises fortunately seem less than adequate. It may be true today that "only prosperity produces childlessness"—or for that matter a net reproduction rate of one or less. But today's correlation between prosperity and (relative) childlessness is very much a matter of today's contraceptive techniques; and when to a virtually certain improvement, and cheapening, of these is added the possibility of a deliberate biological modification of the instincts themselves—far from unlikely in the time perspective concerned—a population near the optimum seems quite as probable as one pressing on the means of subsistence. (An intervening catastrophe, however possible and even probable, hardly affects the argument; what is one Dark Age, even of a thousand years, in a thousand millennia?) "The Next Million Years" is less to be regarded as a balanced forecast than as a brilliant and entertaining exploration of a single hypothesis.

INTERNATIONAL ECONOMIC CONFERENCE
Moscow 1952

COINCIDING with the opening of the Moscow Economic Conference the Soviet journal *Problems of Economics* published a special issue in English in which leading Soviet economists discuss the main themes of the conference. The articles include:

● *For all-round development of International Economic Co-operation.* ● *The effect of the expansion of world trade on unemployment in the capitalist countries.* ● *Normalisation of world trade and the monetary problem.* ● *What the trade rupture with China costs Britain.* ● *The foreign trade prospects of China.* ● *Intra-German commerce.* ● *Ways and means of consolidating international financial relations.* ● *The expansion of international trade and the economic development of the underdeveloped countries, etc., etc.*

AMERICAN SURVEY

Steel Puts the Question

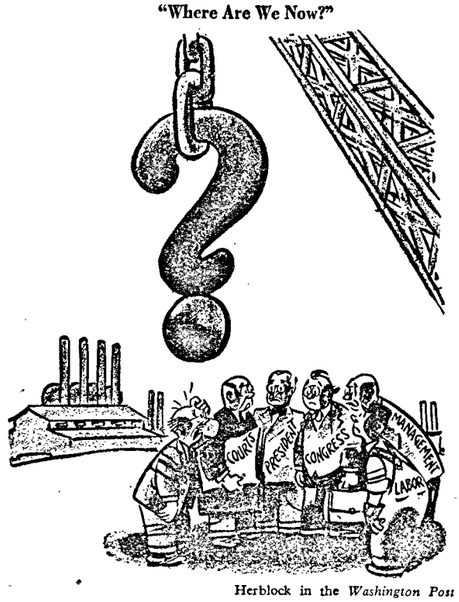
Washington, D.C.

AT the first sound of a new argument over the United States Constitution and its interpretation the hearts of Americans leap with a fearful joy. The blood stirs powerfully in their veins and a new lustre brightens their eyes. Like King Harry's men before Harfleur, they stand like greyhounds in the slips, straining upon the start.

Last week the old bugle-note rang out, clear and thrilling, calling Americans to a fresh debate on the Constitution. From the bench of the United States District Court in Washington a judge said that Executive Order 10340, by which the President of the United States had taken technical possession of the steel plants in order to head off a strike that would otherwise have begun on April 9th, was illegal and invalid. Up to that moment only a minute part of the population had ever heard of Judge Pine, though there were many lawyers and others in Washington who knew him, or knew of him, and held him in respect. But overnight his place in the history books became secure.

The opinion of Judge Pine, as printed verbatim and four columns long in newspapers from coast to coast, was that President Truman had improperly issued and acted upon Executive Order 10340 because:—

> There is no express grant of power in the Constitution authorising the President to direct this seizure. There is no grant of power from which it reasonably can be implied. There is no enactment of Congress authorising it.



Now here, directly and unmistakably, was a constitutional issue which went to the very heart of the modern American controversy. The sanctity of private property and of the free enterprise system in the face of the alleged "creeping socialism" set in motion by the New Deal and the Fair Deal, the question whether powers belonging to Congress were being dangerously usurped by the executive, the extent to which a President might go to safeguard the national interest in a time of emergency and the precedents which for good or ill he might create—all this and much more was, or could be, involved in Judge Pine's decision.

An ecstatic cry broke at once from a large part of Congress and the press. The applause for Judge Pine was almost deafening. He was "courageous" and "audacious"; he had re-established the great principle of a government of laws and not of men; he had driven back the spectre of dictatorship. While the loudest applause came from the conservative camp there was no lack of liberal encomiums for Judge Pine.

He had cited as his outstanding guide and mentor on the question of the limits of presidential powers an authority infrequently numbered among the heroes of American liberals—the late Chief Justice William Howard Taft, father of the President's implacable Republican foe, Senator Robert Taft. Chief Justice Taft, Judge Pine recalled, had written that

> the President can exercise no power which cannot be fairly and reasonably traced to some specific grant of power or justly implied and included within such express grant. . . . There is no undefined residuum of power which he can exercise because it seems to him to be in the public interest. . . .

"Where Are We Now?"

Herblock in the *Washington Post*

Judge Pine had dismissed as irrelevant all the precedents for governmental seizure mentioned by the government's counsel, saying that he could not agree that "several repetitive, unchallenged, illegal acts sanctify those committed thereafter." This was not a reference to the railways, of which the United States Army has been in nominal possession since August, 1950. This is a wholly different kettle of fish. The railways were seized under a statute relating to transportation facilities in time of war first devised in 1916 and later revived and extended by Congress. The seizure of the steel plants, for which there is no statutory authority, was held by the government to have been made lawful by reason of the "inherent powers" of the President in time of emergency.

It is possible that Judge Pine's opinion would not have been quite so rapturously received if the Administration had shown any signs of being able to settle the steel dispute. Instead the evidence was that almost everyone concerned—the President, his Director of Defence Mobilisation (Mr Charles Wilson, now departed and uttering bitter criticisms from the sidelines), his Economic Stabiliser (Mr Putnam), his Price Stabiliser (Mr Arnall) and the Wage Stabilisation Board, not to mention the thunderous Mr Philip Murray, the steel workers' leader—had contrived by prejudice, bull-headedness or sheer inefficiency to obstruct what chances there were of a settlement. They had reduced the dispute to so tangled a mess that the big steel companies were able to present themselves in the unwonted role of under-dogs. This sorry record was then topped off by the Assistant Attorney-General, Mr Baldridge, who made such high, wide and handsome claims for the President's inherent powers in

Judge Pine's court that Mr Truman himself had to correct them.

Against this background, the Judge's opinion that the President had no power to seize the steel plants, and would have none unless and until Congress expressly gave it to him, had a contrasting clarity that added to its attractiveness. But it was its constitutional implications that imparted the real excitement and dominated the debate. Rapid and confused manœuvres followed: the steel workers' walk-out, the stay granted by the Court of Appeals in order that the issue could be presented intact to the Supreme Court, the agreement of Mr Murray to order his men back to work at the President's request, the resumption, and then the breakdown, of negotiations on wages and steel prices between the union and the companies at the White House. But, although everyone conceded that, as the Administration's spokesmen kept insisting, the vital thing was that there should be the least possible interruption of the production of steel, there was never any doubt what the big argument was about.

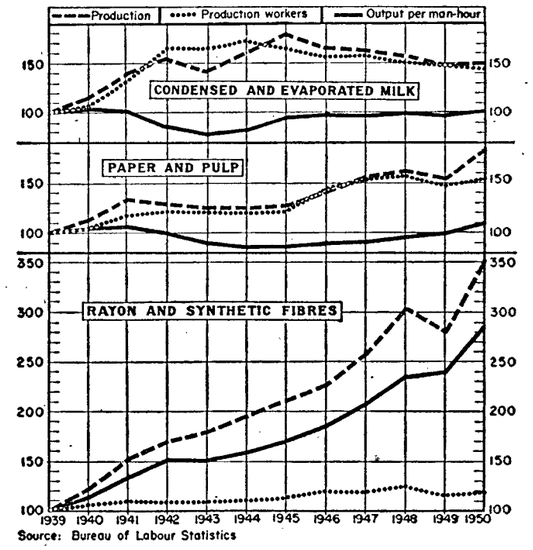
★

The fundamental question debated off and on since the American Republic was founded was topical once more. It was true, was it not, that the supreme peril was political power which the people might not be able to control? And yet, in the air-and-atom age, must not the President be able to act swiftly and drastically for the nation's safety? The first wide assumption that Judge Pine's opinion was legally unassailable was shaken by a memorandum in which the five-to-four majority of the Appeals Court noted a Supreme Court decision in 1871 which conceded that private property might be impressed into the public service "in cases . . . of immediate and impending public danger." The majority on the Appeals Court found a "serious question as to the correctness" of Judge Pine's ruling.

The Supreme Court halted everyone in his tracks. The government's request that the Court should review the case would be granted, it said; but the industry's request that in the meantime there should be no raising of steel wages by the government would also be granted. In effect, the situation was frozen until the nation's highest judges should hand down their ruling, which is expected in two or three weeks.

A strange twilight interval has thus descended. Committees of Congress are furiously at work hearing evidence and considering whether the powers the President has claimed or some substitute for them should be granted by new legislation. Mr Murray and the lesser chiefs of the steelworkers' union are preparing to hurl recriminations at the steel companies from platforms furnished by their biannual convention at Philadelphia. The spokesmen of the steel companies, mounting whatever platforms present themselves, are flinging back recriminations no less bitter.

But all observers of the American scene should have noticed, with respect, the most impressive fact. This is that the Supreme Court, although it does not possess and never has possessed any means of enforcing its decisions, has once more brought to heel the mighty: the President, the union, the industry, and Congress. All that was needed to produce this effect was the knowledge that the Court had seen and was ready to do its constitutional duty.



"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

No Limits on Productivity?

[FROM A CORRESPONDENT IN NEW YORK]

IN 1951 production per man-hour in the United States was, on an average, 7 per cent higher than in 1950, according to the Congressional Joint Committee on the President's Economic Report, and it is expected that in 1952, when more new factories come into use, productivity will go up again. These figures are still tentative and, since manufacturing records show no such sharp rise, the sceptical doubt whether the estimates will be confirmed. However, in 1951, productivity certainly kept up with the increases to which America has become accustomed, at least during the present century. The rate of growth for these fifty odd years is usually put at somewhere around 2 per cent a year, compounded. Small as this figure seems, there is room in it for battles among experts to whom the difference of a fraction

INDUSTRIAL PRODUCTIVITY
1939 = 100

Source: Bureau of Labour Statistics

of a per cent one way or the other spells success or failure in their business forecasting.

To the average American such an increase seems entirely reasonable. In his philosophy it is as natural that industrial productivity should rise each year as that trees should grow taller each spring. The United States' budget, the national tax estimates, the plans for economic and military expenditure at home and in allied countries, are all based on the assumption that the American working man will turn out perhaps 2 per cent more goods this year than last. What an American finds surprising is that anyone should say, as did Mr Aneurin Bevan, that

> one way out of the dilemma of what to do without, when a sudden additional demand is made, as in the case of the arms programme, is to meet it by increased production.

To the American increased production is the only way worth talking about, and he does not understand why the Bevans of this world consider any other.

This belief in the inevitability of growth as part of the destined pattern of American life was somewhat shaken

during the depression of the nineteen-thirties, but it has been reinforced in the last decade. It draws its strength from the fact that since 1900 American output per man-hour has been multiplied 2.6 times, which means that in each generation the physical volume of goods produced by a man working an hour has doubled. However, the increases have been more selective and less steady than such a gross figure might suggest. Between 1918 and 1949, for example, there were four clearly marked periods. In two of them productivity went up, in the other two it went down. Between the end of the first War, in 1918, and 1924 output per man-hour increased nearly 4 per cent a year, double the average for the half century. Again, between 1932 and 1941 (the depression decade), the rate of increase of productivity per worker was more than 3 per cent a year, even though total output fell catastrophically. But on the other hand, from 1924 to 1932, the net gains fell below 1 per cent a year and from 1930 to 1932, and again from 1941 to 1943, there appears to have been an actual drop in productivity.

Variations occur not only in time, and with little apparent relation to the country's economic health, but also between industries. In the rayon industry, where output per man-hour had already increased 140 per cent in ten years, a figure which reflects lively growth and profitable research in a young industry, it jumped again between 1949 and 1950. On the other hand, in the condensed and evaporated milk industry, production per man-hour was slightly lower in 1950 than it was in 1940, and in the paper and pulp industry it was only 4 per cent higher.

*

It is these differences, and the reasons for them, which interest students of industrial productivity in government, business and the academic world. In the nineteen-twenties stress was put on the then new experiments in scientific management, the assembly line techniques, the greater power available to workers, the improvements in capital equipment. In the nineteen-fifties it is put on the pervasive effect of competition which spurs people on all levels to seek new and improved methods; the improved handling of labour relations; the emphasis on trained skill, both in management and in workers; and the continuous stream of new techniques and devices which comes under the general head of technological improvement, and is in turn fed by increased facilities for scientific research.

Some of these techniques, like the attention paid to plant layout and the automatic serving of skilled workers with the materials they need, have permeated most levels of American industry. Some of the devices, like the electronic gadgets lately introduced to speed work in the lagging white-collar trades, are, so far, economical only for large-scale operations. The United States Government can afford to instal electronic computors which make it possible to compile in thirty minutes a wholesale price index which used to take the equivalent of a hundred days each month. The great insurance companies can afford to instal complicated and expensive equipment which photographs their vast series of records on to tape, places them under the continuous review of scanning devices that keep them up to date, and delivers required information to the requirer in a matter of seconds. Electronic devices are also said to make it possible for the managers of chain stores to push a button and take an instant inventory of the amount of pink nylon ribbon of any width on hand at any moment in any one of a hundred stores. In all these operations the saving of time and labour is the chief argument for installing these expensive devices.

At the same time they tie the users even closer to a power-driven economy, and make them more vulnerable to central accidents. A more important objection for the medium-sized and small plant is the cost of electronic wage and labour savers. They may eventually be made in smaller units adaptable to smaller operations and costing less. By that time the bigger factories may have reached complete "automation"—the heaven of self-operation to which some managers look forward.

Attempts to improve the production rate by better management of human factors are not so popular in a country which prefers to manipulate machines. Yet there is a trend toward what might be called psychological engineering, and part of it touches the problem of incentives, for management as well as for workers. Wage rises alone have lost some of their glitter, partly through the corrosive effect of high taxes and partly because, in a period of full employment, there seems to be a limit beyond which higher wages mean merely that people can afford to take more time off to go fishing. Less obvious methods of persuasion are being incorporated into new plants. Lever Brothers' new glass office building in New York, for example, has fitted the height of its desks to the height of its workers, and invested heavily in light and colour in decoration to make work a pleasure.

Incentives for management are even more subject to the law of diminishing returns when wage increases may be nullified by the next rise in taxation. There is a growing belief that new lures must be invented if the necessary number of university graduates are to submit each year to the rigorous discipline required to create a manager who can keep up with the speed and competition of modern industry.

Doubters, who wonder whether the limits of expansion in man's capacity to produce are not in sight, are rebuked with a fervour which tells of emotional involvement in the problem. Already the United States, possessing only 7 per cent of the world's population, is turning out 40 per cent of the world's goods. Yet men familiar with the scientific and technological work now in the laboratories insist that the surface of possible achievement has barely been scratched, and that man's productivity is limited only by his own free capacity to invent and contrive.

Meanwhile, however, the field is littered with victims of the attempt to carry methods of industrial productivity into non-factory fields. The small business can neither afford to pay an inefficient clerk the wage he demands nor to operate an electronic book-keeping machine to keep track of his accounts. The small landowner can neither pay a jobbing gardener modern wages nor face the hourly rate demanded by the gang of men with power mowers who will shear his lawn in fifteen minutes, and who recommend the abolition of flower beds because they cost too much to keep up.

American Notes

Florida's Choice

Florida is not a State entirely typical of the South but this week's primary election there was a perfect microcosm of the Democratic dilemma in that area. The State's voters were asked to choose a possible Democratic candidate for the Presidency from between Senator Russell of Georgia and Senator Kefauver of Tennessee, both Southerners. Mr Russell's hat was first thrown into the presidential ring as a possible rallying point for southern rebels against the present Administration. Although Mr Truman is now finally determined not to run again, Mr Russell still wants to control a sufficiently large number of delegates at the

Democratic Convention to be able to influence decisively his party's choice of platform and candidate. He may possibly get the vice-presidential nomination for himself, but he has little chance of the northern support without which no one can hope to be the presidential candidate.

Mr Kefauver, on the other hand, entered the ring not to save the South from the Administration, but to give Democrats everywhere a genuine choice of candidate. Even before Mr Truman's withdrawal, this early bird was doing well and since then he has collected further successes in primary elections in the North, in Ohio this week for example. But to his native South he seems a renegade and, while southern support is not an essential condition for the Democratic presidential nomination, it is most unlikely that a Southerner who could not carry the South would be chosen. That he could carry the South was therefore what Mr Kefauver had to prove in Florida, the only southern presidential preference election and the only primary in which he faces Senator Russell.

Mr Kefauver met the challenge progressively, campaigning on a national rather than a regional basis and thus pinning Senator Russell, one of the most able and far-seeing Democrats in Washington, to a platform narrower than he would have liked. For example, Mr Russell's Achilles heel, as far as northern Democrats are concerned, is his fixed opposition to equal employment rights for Negroes. Mr Kefauver probably lost votes in Florida, and the South generally, by promising that he would abide by the decision of the Democratic Convention in this matter, but he made Mr Russell, by contrast, seem far more conservative than he really is. Senator Kefauver entered Florida with a bang last year with his Crime Investigating Committee; this not only earned him widespread sympathy among reforming elements in the state, but also weakened Senator Russell. For Mr Russell had the support of all the State's Democratic officials, including the Governor, who had been linked with gambling interests by Mr Kefauver and was therefore hardly an asset. Nevertheless, with the help of the party machine, and of his own high reputation, Mr Russell managed to get some 300,000 votes in the primary, compared to the 260,000 which Mr Kefauver won by his unprofessional approach. This was, however, hardly the knockout victory for which Mr Russell had hoped. Mr Kefauver is still definitely a presidential possibility, and the Democrats of Florida have done little to make it easier for their party to choose its candidate.

Oil Strike

As *The Economist* goes to press it seems likely that the refinery, pipeline and other oil workers who have been striking for over a week will return to their jobs while negotiations go on. In this case little harm will have been done by a stoppage which has been threatened for some time and which might have affected the defence effort and the economy more quickly and more severely than even a steel strike. For the United States depends on oil to drive its trains as well as its ships, motor cars and aircraft; power for factories frequently comes from oil and chemical, synthetic textile and other industries get their raw materials from oil; homes are not only heated by oil, but their gas is often piped directly from the oil fields.

Luckily less than half the industry has so far been closed down and supplies of oil were so plentiful that the stoppage may not have been entirely unwelcome to the companies. It is estimated that the country has enough oil in stock for many weeks, but it is not equally distributed either among areas or among products, and it will be difficult to remedy these maladjustments as long as the strike lasts. Aviation spirit is so scarce that all unnecessary military flights, including training, have been stopped and airlines have been ordered to cut their services. In the middle west, especially in Chicago, there has been a shortage of petrol for private cars and public transport, and in Texas synthetic rubber operations have been curtailed.

There are 22 trade unions containing nearly 90,000 oil workers involved in the strike, but they have set up a co-ordinating committee and one of the aims is to get the 70 or more companies concerned also to co-ordinate their bargaining in some way. The trade unions' ideal would be to make one wage agreement for the entire industry, but they would be satisfied if they could make one settlement with each company. The companies, however, insist on bargaining plant by plant, as has always been the custom in the industry; they even refused to allow the Wage Stabilisation Board to consider a few test cases and set a pattern for individual settlements. At this the WSB decided the dispute was more than it could cope with and returned it to collective bargaining. But now that the strike has begun, the WSB has taken charge again. The average wage in this highly paid industry is over $2 an hour; the unions were asking for an extra 25 cents and increased shift differentials, but there is hope that they will settle for an increase of about 18 cents.

Republicans in the South

It is a paradox, and some think a scandal, that the South, where Republicans are few and far between, should send nearly 200 of the 1,205 delegates to the Republican Convention. Georgia and Louisiana, which have never voted Republican in an election, dispose of nearly as many votes in the Convention as Oregon, and more than Vermont, a rock-ribbed Republican state. The southern Republicans, tiny islands in a Democratic sea, come into their own every four years at the Convention; if a Republican were elected, they would come in for more—a fat share of federal patronage. This is what they live for, and why they are more interested in

THE HANOVER BANK
FIDE ET FIDUCIA
NEW YORK

Located in the heart of the City, the London office of this old established bank offers its services to those interested in trade with countries in the Americas and throughout the world.

maintaining their own tight control over the Republican organisation in their states than in striving to win converts who in time might swamp them.

Most of the southern delegates lie in Senator Taft's pocket and provide a useful counterweight to delegations from northern states which may be inclined to stray. This year, however, General Eisenhower's supporters have been making an assault on the South, pointing out that the General stands a chance, which Senator Taft does not, of detaching one or more southern states from the Democrats, and that an Eisenhower victory might be the foundation of a real two-party system in the South.

This is a dismal, rather than an attractive, prospect to long-entrenched Republican bosses and, in states where the choice of Republican convention delegates has been the prerogative of tiny exclusive clubs, new barriers against a free choice have been thrown up. Meetings have been packed, or held in private houses, or held without advance announcement. In Mississippi, the Eisenhower forces retaliated in kind: the General's "lily-whites" invaded a meeting of Taft "black and tans" and elected their delegates to the state convention before the astonished Negroes had realised what was happening. The credentials committee at Chicago will have to choose which of the rival delegations it will seat from at least two southern states, Georgia and Louisiana.

The first real victory of the Eisenhower forces has, however, been the General's sweep in the preliminary voting in Texas, where he once lived. Just in time, the General's supporters had extracted from him an assurance that on the tidelands oil issue he favoured, in principle, a return of these resources to the ownership of the states, although the Supreme Court has ruled they belong to the nation. Not long before, the general had returned a cool and non-committal answer to a question about where he stood on Negro rights. Such conservatism on domestic issues will stand the General in good stead in the South, and perhaps at the convention. But a high price will have been paid if it cools the enthusiasm of independent voters in the North, where the balance of power lies.

Closer Look at the Atom

For the first time since 1946 the Atomic Energy Commission, which hopes Congress will authorise a $6 billion expansion of its facilities, has held open house for the atomic bomb. Newspapermen, photographers, civil defence officials and state governors were invited to watch, from News Nob, ten miles away, the explosion at Yucca Flat of the fifteenth, and largest, atomic bomb let off in the United States. For the first time ever television carried the live spectacle into millions of homes, though what appeared on the screen did less than justice, because of a power failure, to the ingenuity and energy which had linked together several snow-capped mountain tops to carry the picture 300 miles to the nearest transcontinental cable in Los Angeles. But larger bombs have been exploded at Eniwetok, where in the autumn a "souped-up" fission bomb—not the hydrogen bomb—may release more than ten times the explosive force dropped over Hiroshima.

What was unique about the last two explosions at Yucca Flat was the presence, dug in four miles or so away, of troops, there to take part in a simulated battle manœuvre. The main purpose was to give them a chance to see the bomb at close quarters and to allow their reactions to be watched; many found the bomb less terrifying, on closer acquaintance, than they had been led to believe. Another aim was to see how high an atomic bomb would have to be exploded if radioactivity was not to prevent troops from taking immediate advantage of the shock and confusion caused to the enemy. The first was exploded at 3,000 feet, the highest level ever chosen, the second somewhat lower. But if the radioactivity was slight, the damage supposed to have been done to the imaginary enemy also appeared limited. Many dug-outs and much equipment were not seriously affected. Moreover, under war conditions, the troops involved might not have felt a similar confidence in the ability of the aircraft dropping the bomb to discriminate between friend and foe. The atomic bomb has made its long-heralded entrance upon the battlefield, but there are few who believe it is yet in a position to affect the outcome decisively, either in Korea or in Europe.

The steady march toward a plentiful supply of atomic weapons of varied sizes, shapes, power and uses contrasts painfully with the dimming of prospects, once held so bright, for atomic power for peaceful purposes. The Commission, some of whose members are visibly restive under the present security restriction, is doing its best, under the law, to enable industry to share in its secrets. It has set up a new office for closer relations with industry, and has approved the first industrial report on the possibility of privately financed reactors to produce fissionable materials and electric power. The Dow Chemical Company and the Detroit Edison Company believe the prospects are sufficiently promising to continue their investigation. Another organisation, however, has already taken the plunge: without any government funds, the Walter Kidde Nuclear Laboratories have announced a plan to design and build single-purpose plants for the production of electric power from atomic energy.

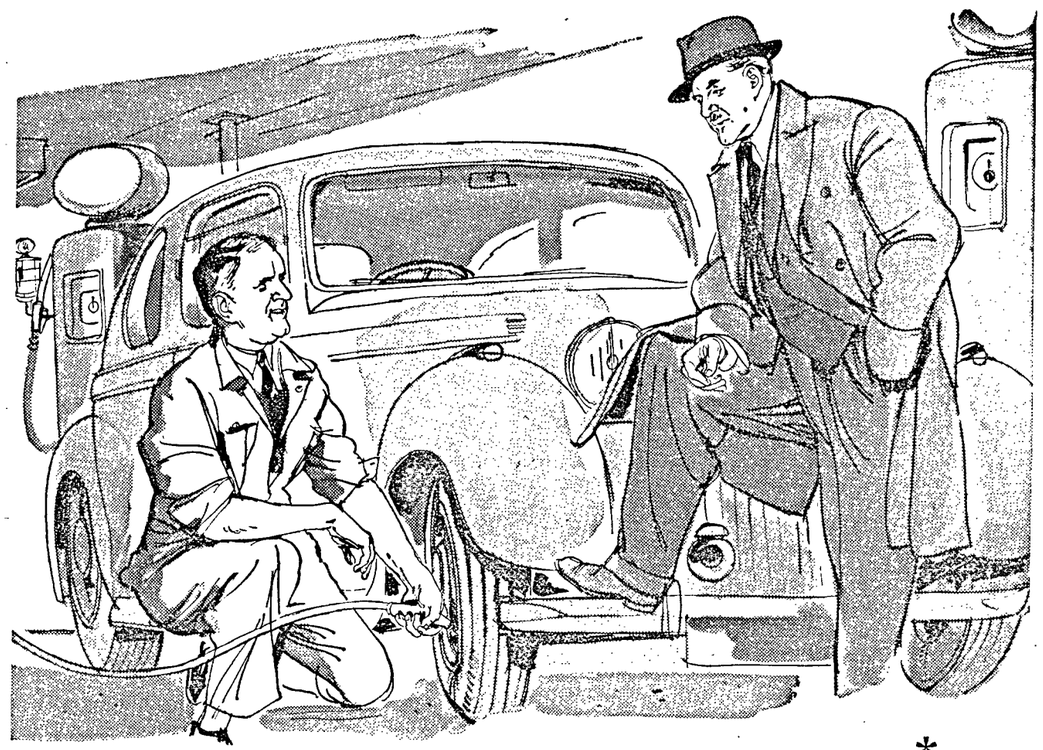
Hour for Religion

The Supreme Court, in a 6 to 3 decision, has upheld the constitutionality of a New York law which permits children to be released for one hour a week from the state schools to attend religious instruction of their parents' choosing. Under the First and Fourteenth Amendments to the Constitution, neither Congress nor the states are allowed to make any law concerning an establishment of religion. In 1948, in the McCollum case, the Supreme Court ruled, 8 to 1, that the system of released time practised in Illinois fell squarely under this ban. In Illinois religious teachers came into the state schools and used class-rooms and other state property. In New York, children, on the written request of their parents, are allowed to leave the schools for religious instruction elsewhere.



The majority decision, written by Justice Douglas, while not retreating from the McCollum decision, held that this was a significant difference and that the First Amendment did not require separation of church and state in every respect, or hostility on the part of the state to religion. If coercion had been used, or state-employed teachers were persuading or forcing their students to accept religious teaching, the case would, the majority considered, have been very different. But it found no coercion.

It was on this point that the three dissenting justices parted company with the majority. Justice Black considered that New York

> is manipulating its compulsory education laws to help religious sects get pupils. This is not separation but combination of church and state.

Justice Frankfurter pointed out sharply that, on the crucial question of coercion, no evidence had been heard in the lower court. He suggested that the preference of religious bodies for "released time," as opposed to "dismissed time"—when the whole school shuts down to permit those who wish to seek religious instruction—showed that they relied on compulsion.

In New York City 105,000 of 600,000 children have taken advantage of "released time." Throughout the country, about 2,000,000 do so. But not all systems are precisely the same, and the Supreme Court is likely to have new opportunities to redraw a realistic frontier between state and church.

"All right for Cyclohexyl-Benzothiazyl-sulphenamide, Sir?"*

Don't worry if you can't answer. Few people could. Yet tyres and tubes couldn't possibly give the extra miles of wear you expect of them without the addition of these and other chemicals. Tyres and tubes, floor mats, windscreen wiper blades, engine mounts, clutch and brake pedals are all improved with Monsanto rubber accelerators and antioxidants. They speed up "curing" time of rubber products, add miles and years of service when rubber is exposed to air, sun, ice and snow. You'll find Monsanto making important contributions in hundreds of other industries, too—performing hundreds of different services. Thus does Monsanto serve industry which serves mankind.

*Chemical name for a group of rubber accelerators produced by Monsanto. Used in the vulcanisation of natural or synthetic rubber.

THE WORLD OVERSEAS

Mr Yoshida Raises a Storm

(From Our Tokyo Correspondent)

THE Communist-incited May Day rioting in the imperial plaza in Tokyo will provide much-needed help to the Japanese Prime Minister, Mr Yoshida, in his task of pushing the Bill against subversive activities through the Diet. Although he was prepared for stiff labour and socialist opposition, he (as well as many others) has clearly been surprised by the storm of criticism from more "honourable" quarters which has burst around this attempt to deal with the problem of internal security which now confronts the Japanese Government now that General MacArthur's stern Organisations Control Ordinance has lapsed.

To block this gap, Mr Yoshida presented this piece of new and controversial legislation. Briefly, this seeks to control organisations which "commit or instigate violent and subversive activities against the Government," and supplements and unites other scattered laws and regulations for punitive treatment of such activities. These punitive methods include the right to suspend "group movements," to suspend publication of offending papers and organs, to ban "the group activities" of the officers and officials of such organs and to "dissolve forcibly such organs." Disciplinary action will be taken by a public security review commission on request from the Director-General of a public security investigation board.

Labour Against the Cabinet

Japan's trade union leaders did not wait for final details of the bill (which reputedly has been revised 23 times) before blasting it with denunciations of "union-breaking." They connected it with other Yoshida plans for "revision" of "excessively democratic" occupation labour standards, which the Government—in perhaps ungracious and certainly unwise haste—had rushed forward weeks before the occupation had had time to make its almost apologetic curtain bow. Vainly the Attorney-General, Mr Kimura, asserted, emphasised and repeated that the law was not aimed at the control of freedom of thought, speech, public assembly or union activity. The more he protested the louder the unions objected. The Socialist Party, split politically into so-called "rightist" and "leftist" factions, closed its ranks against the legislation. So did the divided Japanese unions, at present split into jealous federations although indistinguishable in real policy and aims. The largest federation, Sohyo (the General Council of Japanese Trade Unions), which is three to four million strong, took the initiative in organising a series of regular daily strikes.

Perhaps scenting popular votes, the middle-of-the-road Progressive Party—whose still vacant leadership is now attracting the speculative eye of depurged wartime leaders like Mr Mamoru Shigemitsu—also became fearful that the proposed law might be used by an unscrupulous government against the democratic liberties of a parliamentary opposition. Then, to the consternation (one suspects) of the Prime Minister, the Japanese press, the universities, certain eminent judges and anti-socialist intelligentsia, while deploring the unions' strike threats, threw their solid support behind labour and against the conservative cabinet. All Tokyo professors and newspaper proprietors were in strong opposition, and High Court judges allowed their criticism to be quoted anonymously.

The legislation was described as a resurrection of the old Public Order Conservation Law, which suppressed civil liberties before the war and prepared the way for totalitarian rule. The Security Investigation Board was dubbed "the dangerous thoughts police in dangerous disguise." Demanding that the Diet re-examine and rewrite the bill, the leading Tokyo daily, the *Asahi*, said in a leading article that the vague definition of "violent and subversive activities" might prove the means of suppressing free speech as well as the normal labour movement.

The first 24-hour walkout of protest called by Roto, the joint "struggle committee" of unions, was a sobering success. There was not a full response, but nearly 200 unions involving 300,000 members struck for varying periods of the day, causing, in particular, a complete disruption of public transport. Communist influence could in no way be blamed for the strike, which was the largest in Japanese history since the so-called "general strike" organised by Sanbetsu (the Congress of Industrial Unions of Japan) on February 1, 1947, which was outlawed and ended by a personal directive from General MacArthur to the Government. Regular repetitions on a wider scale are threatened by Roto, which has been encouraged by the angry reaction of the powerful 270,000-member Tanro (Coal Miners' Union) against the last-minute decision of its executive to refrain from joining the first 24-hour walkout. The Tanro executive had been impressed by the offer of the Attorney-General, Mr Kimura and the Labour Minister, Mr Yoshitake, at a desperate eleventh-hour conference, to include union representatives in the public security review commission. However, at an extraordinary convention, the rank and file passed a vote of no-confidence in the executive for its "weak-kneed betrayal" of the "struggle committee" and proceeded to elect "more sincere" representatives.

Threat of Violence

All this background detail is significant because the surprise revolt against Mr Yoshida's anti-subversive legislation suggests a much wider and deeper potential of Japanese support for the new ideas of human rights than had been suspected, and portends the beginning of a prolonged and bitter union struggle to uphold and improve working standards in the new Japan. It may be freely conceded that the Prime Minister had no option but to submit this legislation, that he himself has no wish or intention to use it to destroy incipient unionism, and that he is already confronted with a serious and growing threat of violence by a reorganised Red underground. It may be insisted that fundamentally this is only the old problem of how much power can be safely entrusted to any government to meet a given peril, which may prove less dangerous in the long run than the arrogation of that power by the government. All the same, cautious Western observers in Tokyo are still impressed by the swiftness with which forces not normally or necessarily champions of Japanese trade union aspirations or methods rallied to support the unions against even a conjectural assault and to denounce a potential threat to civil liberties. In the atmosphere of confusion, nationalism and change-for-change's-sake now prevailing in independent Japan, this liberal reaction can be interpreted as a healthy and encouraging omen.

The Government must take most of the blame for the unions' immediate conviction that the anti-subversive legislation was aimed at their fledgling movement. The bill followed close on the heels of the impatient provisional legislation to restrict the right to strike and to "review" occupation labour standards. Belatedly the Government has recognised how ill-timed was this earlier labour legislation and has tacitly decided to drop these bills from the present session. But this long-range issue has merely been postponed. Mr Yoshida will push his anti-subversive powers through the Diet—although probably further modified. In addition to providing union representation on the review commission, the legislation will specifically prohibit restriction or interference with the "justifiable activities of trade unions" and will probably set up some form of independent appeals body. While these modifications may not satisfy the unions, they will be a tribute to the real existence, however flickering, of a flame of liberal sentiment and action in the new Japan.

Revolt in Bonn

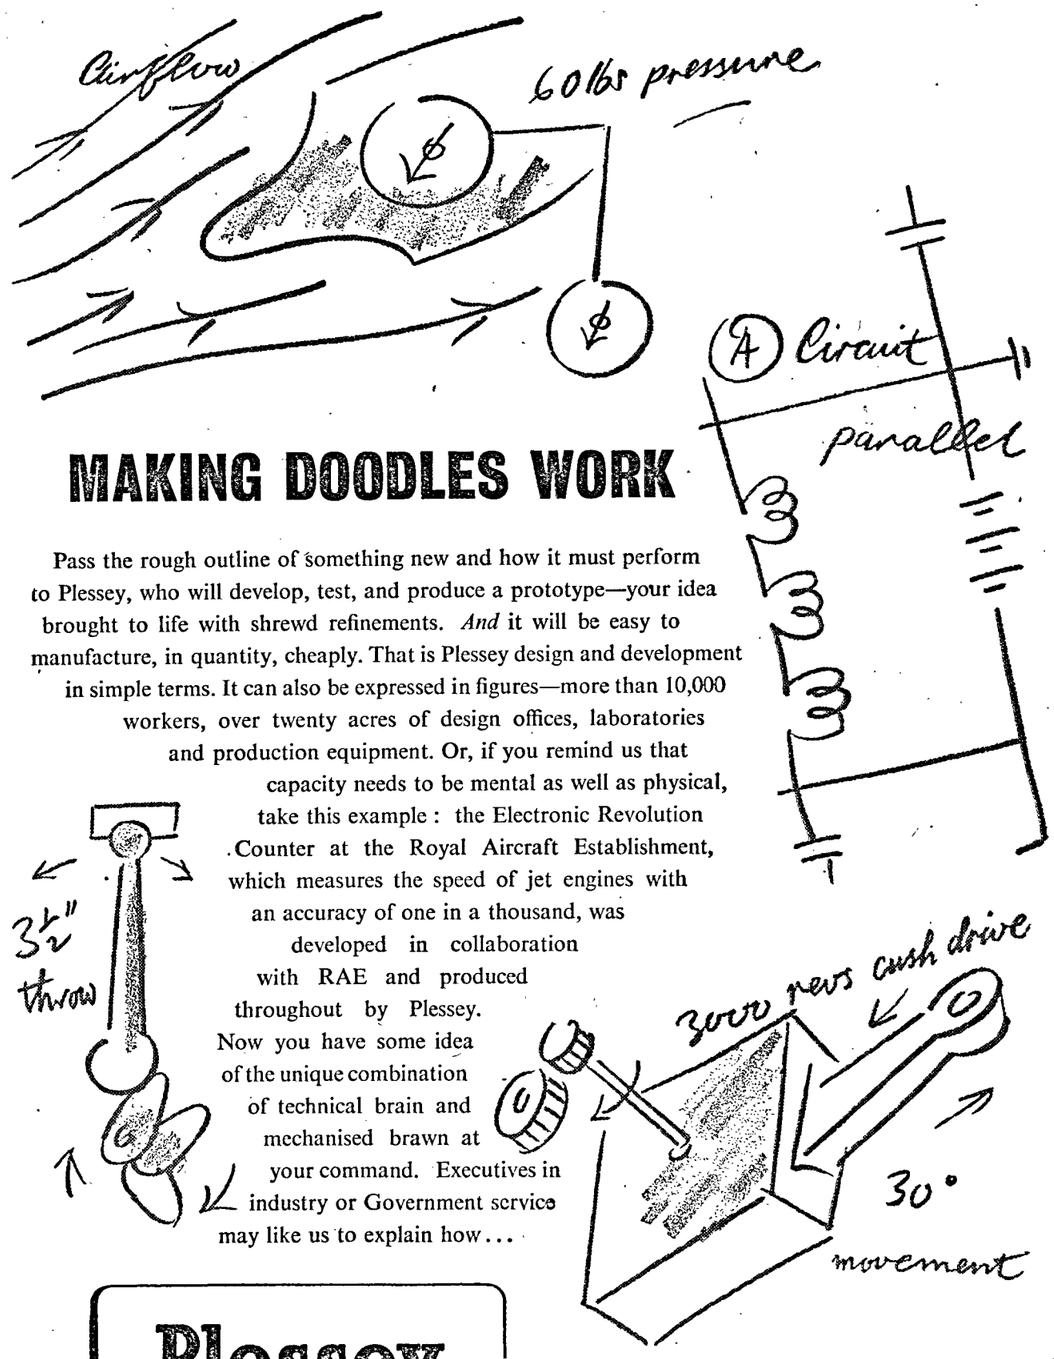
FROM the cantonments in which the High Commissioners have enclosed themselves in the environs of Bonn measured optimism continues to emanate. No more concessions, say the British, will be added to the hundred which have already been granted to the Germans in the last six months, but there is no breakdown in the negotiations on the interim peace treaty known as the "contractual agreements." The drafts must be ready by May 20th. Congress is waiting and the Russians are pressing alternative offers.

Down in Bonn itself, however, it appears that Dr Adenauer and the treaties are *en pleine crise*. A revolt of the Chancellor's coalition partners, and even of some of his own party has broken out. It began last February, when the *Bundestag* adopted a series of stiff demands drawn up by the government parties. At that time, it was evident that the Free Democrats and the German Party—partners of the Christian-Democrats in the government—had moved very close to the Social-Democrat opposition. Now the parliamentary groups of the coalition parties have been shown the drafts of the "contractual agreements" (as the interim peace treaty is named) and find they do not meet all the demands laid down in February. There is much indignation at the fact that negotiations on the agreements have been kept secret. This made it impossible for the Chancellor to win public support, and in turn led the Allies to over-estimate his backing in the country. But it is difficult to see how the long tussles that have been going on over the treaties could have ended in any sort of agreement if they had not been negotiated behind closed doors. As it is, leakages in Germany have been frequent.

The essence of the German objections to the interim peace treaty is that it does not give the Federal Republic complete sovereignty and equality. It is claimed that the drafts do not fulfil the promises made in the Washington declarations of September last. These declarations, rather misleadingly, stated that Germany was to be included in a European community on a basis of equality, and that "in the light of a German participation in western defence," the Allied governments would renounce their power to interfere in German domestic affairs. It was made clear, however, that the occupation powers would retain rights which would enable them to deal with the Russians and to stay in Berlin.

German protests are concentrated on the extra-territorial rights which the Americans, British and French are retaining, and on the demand that the Germans should continue to pay for the maintenance of the non-German troops in Germany after the European army is set up. Specifically, the clauses rejected are those which permit the future Council of Ambassadors (which will replace the High Commission) to suspend the constitution and take over command in times of emergency, with the consent of the Bonn Government; the demand that the Government implement and maintain occupation legislation on decartelisation and other economic and financial matters; the special status outside the German law of the non-German forces stationed in Germany and the limited offer to review sentences on war criminals.

The financial demands made by the occupation powers are the most fiercely contested. Dr Adenauer is not even supported by his own Minister of Finance over the question whether Germans should pay for the non-German troops. Dr Schaeffer is in fighting mood. He has publicly repeated that not a pfennig shall go to occupation costs in their future form. "Occupation luxury" must end, he maintains, and, as a detail, the Americans must stop depriving the Bonn treasury of several hundred million marks a year by selling the coffee and cigarettes they buy tax-free at their PX stores. The business world has entered the field against the provision in the contractual agreements which would for six years exempt foreign-owned firms from contributing to the capital levy which is to be imposed, for the benefit of refugees and persons who have suffered war damages. Germans who are extremely indignant at the seizure of their private assets abroad as reparations for the German war cannot see why British and other foreign capital should not be used as reparations for Germans. A fresh outcry has also started against the confiscation of German patents in 1945. This "cold dismantlement," as it is called, is said to mean the loss of one billion marks a year to Germany.



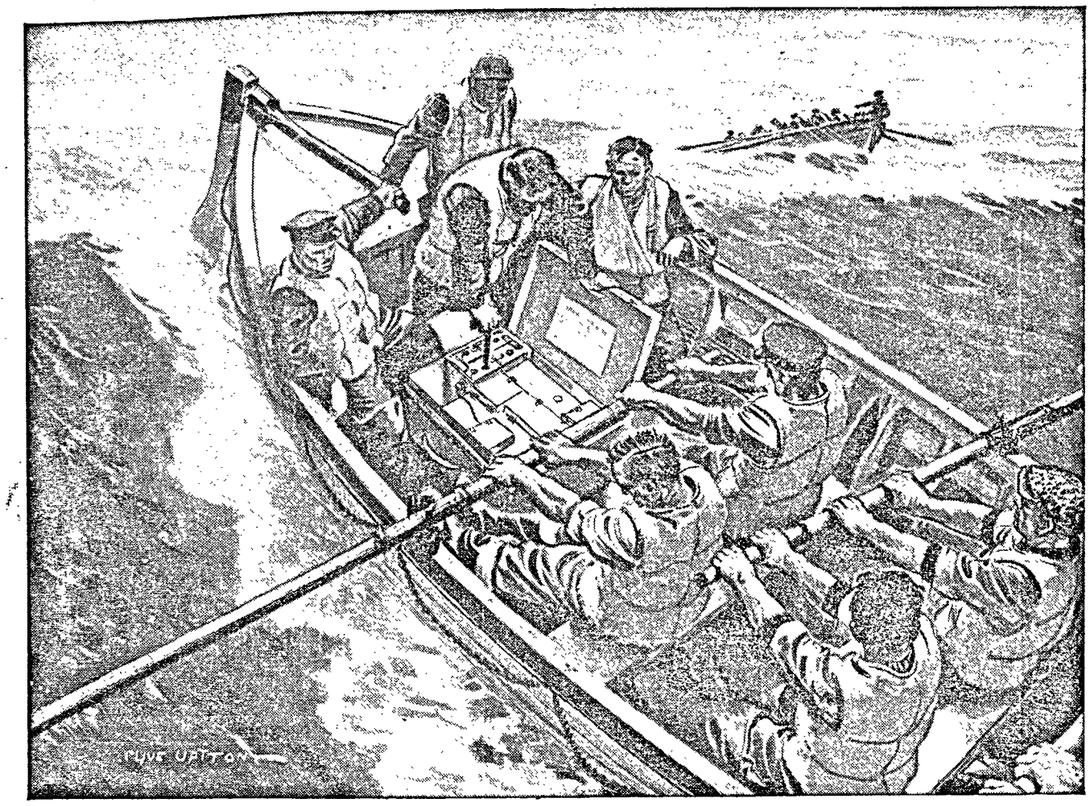
So the tale of grievances goes on. "A new Versailles," "a treaty of subjection" and other fantastic and exaggerated epithets are being used about the new treaties by the more irresponsible spokesmen of the Free Democrats and the German Party. The Social-Democrats' comment is "we told you so" and they add that they do not really believe that Dr Adenauer's coalition partners are doing more than stage a token revolt. This may be so. An element of blackmail certainly enters into the present campaign. But, in any case, the public is now convinced that the western powers intend to continue trampling on German national rights. The mischief, in other words, has been done.

Progress with the Soviet "Great Projects"

A SHORT section of a navigation canal linking the Volga and the Don rivers below Stalingrad was opened this week. This and other canals not yet built, together with vast schemes of irrigation and the expansion of hydro-electric power are the central parts of the "great projects" which, according to the Soviet press, should "pave the way from Socialism to Communism.

The plans for electric power development were described in an article in *The Economist* of January 19, 1952. Soviet propagandists claim that the internal waterways system will be completely overhauled in the next five years or so and that the linking up, by new canals, of all the main rivers, and indirectly all the chief seas, will enable a large part of the internal freight burden to be shifted from railway to water transport. Finally there are vast schemes to irrigate during the same period 28 million hectares of land, which will help to bridge the vast gap still separating Soviet development in industry and in agriculture. To boost the morale of the population and create a mood similar to that which reigned during the early period of Soviet construction Russian propaganda describes these projects as the prelude to an ideal communist society. But how novel are these plans and what role are they likely to play in the Soviet economy during the next five years?

The programme of canal building is the more modest of the two. In a country of vast distances, with an overloaded



MAKING DOODLES WORK

Pass the rough outline of something new and how it must perform to Plessey, who will develop, test, and produce a prototype—your idea brought to life with shrewd refinements. *And* it will be easy to manufacture, in quantity, cheaply. That is Plessey design and development in simple terms. It can also be expressed in figures—more than 10,000 workers, over twenty acres of design offices, laboratories and production equipment. Or, if you remind us that capacity needs to be mental as well as physical, take this example: the Electronic Revolution Counter at the Royal Aircraft Establishment, which measures the speed of jet engines with an accuracy of one in a thousand, was developed in collaboration with RAE and produced throughout by Plessey. Now you have some idea of the unique combination of technical brain and mechanised brawn at your command. Executives in industry or Government service may like us to explain how...

Plessey PUTS IDEAS INTO PRODUCTION

THE PLESSEY COMPANY LIMITED • ILFORD • ESSEX

We've solved some problems in our time!

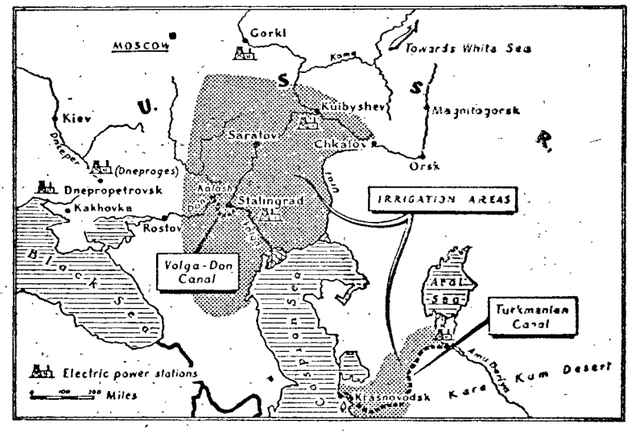
In 1942, peak period of Hitler's submarine campaign, came a request for batteries to operate wireless transmitters in the ships' boats of the Merchant Navy. Batteries that could be relied upon to give immediate service when needed, even if they had been standing by unused for as long as two years.

¶That was a problem. No such battery existed. Normally a filled battery progressively loses its power when idle and needs periodic recharging; an unfilled battery needs a lengthy first charge before it can be used.

¶Our answer was to produce the Exide self-priming battery. Its plates were *dry* charged, and sealed in a compartment separated by a thin diaphragm from another compartment containing acid. When the diaphragm was pierced with a punch attached to the battery, the acid ran on to the plates, and within a few minutes the battery was working at full strength—even after 2 years or more of inactivity.

¶Thousands of these batteries were supplied; and many a seaman owed his life to them.

¶We have been solving battery problems for over 50 years. Wherever batteries are used today you will find Chloride, Exide and Exide-Ironclad batteries giving good service in jobs for which they were specifically designed at a user's request. Our battery research and development organisation, the largest and best equipped in this country is now, as ever, at industry's service—ready at any time to tackle another problem



CHLORIDE

BATTERIES LIMITED

Makers of Exide Batteries

EXIDE WORKS · CLIFTON JUNCTION · NR. MANCHESTER

railway system but an important river network, it is only natural to make these waterways as navigable as possible and to connect them by canals. This was realised in Tsarist times, and the Soviet authorities themselves have already done a good deal to improve the internal navigation system. Thus in 1934 a canal nearly 150 miles long was opened linking the White Sea with the Baltic and indirectly with the Volga and the Caspian Sea. Subsequently a canal was built linking Moscow with the Volga and making the Soviet capital into a harbour with outlets into three seas. The launching of the Volga-Don Canal should raise this number to five, since all the seas of European Russia (the White Sea, the Baltic, the Caspian, the Azov, and the Black Sea) will finally be interlinked.

Canals to be built around Stalingrad and Kuibyshev should improve considerably the navigation on the Volga, which already carries half the total Soviet water transport.

Hitherto river transport accounted for about 9 to 12 per cent of the total freight carried. The proportion should now rise substantially. The new canals should enable the Donbas (Ukraine) coal to be shipped through the Don to the Volga Region and the ore from the Urals to be sent to the Donbas. All this will be a great relief to harassed transport chiefs. Yet, as far as can be ascertained, these plans do not seem to mark any novel departure.

The irrigation scheme appears more impressive. Mr Beria recently said that the irrigation of 28 million hectares should bring about in some five years' time the doubling of the raw cotton output, an increase of 8 million tons in the grain crop, of 150,000 tons of rice, and of 6 million tons of beetroot. Horned cattle numbers should rise by 2 million and sheep and horses by 9 million.

However, here once again the plans are no novelty but a continuation of past policies on a larger scale and at a quicker pace. Soviet agricultural output must increase to feed the growing urban population. The grain crop is probably sufficient for the moment for internal needs (though even this is always threatened by the danger of drought), but there is probably a shortage of meat and dairy products. A steadily increasing supply of cotton, the growth of livestock and exports of grain are all dependent on the protection of drought-ridden areas and the reclamation of desert land. The cotton-growing areas of Central Asia (the Tadjik Republic and the Fergana Valley) are examples of what had already been done before the "great projects." Now, the increasing demand requires plans of greater scope.

To combat drought, it was decided in 1948 to set up tree-shelter belts and to build 44,000 special ponds. But the chief part in this "struggle against Nature" is to be played by irrigation itself. For instance, in the Volga region which is one of the exposed areas, a network of canals will bring water from the reservoirs to be built in the middle and lower part of the river to the neighbouring steppes. According to Soviet sources the network centred on the Stalingrad canal alone should allow the irrigation of 13 million hectares during the next five years.

Southern Ukraine, which suffered 22 droughts in the last 65 years, as well as Northern Crimea, are to get water from the Dnieper. The land thus reclaimed will be put mainly under cotton. The chief area of cotton expansion is, however, to be in Central Asia, in the Turkmen Republic. The Turkmen Canal, nearly 700 miles long, is to run from Takhia Tash across the Karakum Desert to Krasnovodsk on the Caspian Sea. With the assistance of the Amu-Darya river, now partly drying up, about 1,300,000 hectares of desert should be gained for cotton growing and 7 million for pasture.

All these schemes for the development of hydro-electric power, water transport and irrigation will certainly be of great assistance to Soviet planners. Should they be fulfilled they will mark an important step forward for the Russian economy. Yet, despite the fantastic advertising of these "great projects of Communism" in the Soviet press and radio, one may safely conclude that they play only a secondary role in the economic effort of the Soviet Union. Some guesswork on the cost of the irrigation scheme, the most ambitious of the plans, points clearly into this direction. The Russians give no estimates of the cost of the new scheme. Yet it is known that before the war over 4 million hectares had been irrigated at the cost of 2,000 million roubles. True, the rouble has depreciated in the meantime. On the other hand the cost of canal-building has also been reduced. Before the war the White Sea-Baltic Canal was built by thousands of unskilled camp inmates who did at least need to be fed. The Fergana Canal was built by 150,000 collective farmers. Now the Russians claim that the "walking excavators" used for this task can accomplish the work of 5,000 to 7,000 people. Yet, even allowing for the depreciation of the rouble total annual expenditure on irrigation should be somewhere between 1 and 2 per cent of the Soviet budget.

This is a fair amount and it confirms the view that as secondary objectives fuel saving through water-power, transport economy through improved waterways and an increase in agricultural output due to irrigation are quite important. But behind the smoke-screen of the "great projects of Communism" the Soviet Union—logically enough—still concentrates its forces on the development of coal, pig iron, steel and other basic industries.

Election Vigil

[FROM OUR ROME CORRESPONDENT]

THE municipal election campaigns in southern Italy are now well under way. Although the proceedings remain noisy and colourful, it is clear that the centre parties are definitely on the defensive. In the big towns the Christian Democrat, Social Democrat, Liberal and Republican parties have joined in what can perhaps best be described as "constitutional associations," so that, under the new electoral law, the votes amassed by their several and separate lists of candidates are pooled in order to compete more successfully for the first place in the poll. This first place wins for the victors two-thirds of the councillors' seats and thus the Mayor's office and effective control of the town. Will it be won in Rome, Naples, Bari and other places by this constitutional association or by other competitors?

In some three hundred of these big mainland towns (including a few in the north) elections will take place on May 25th. They are of particular public interest because associations (*apparentamenti*) of parties are not allowed either in Sicily or in places of less than 10,000 inhabitants. In these smaller towns, where the top place wins four-fifths of the votes, parties anxious to combine to secure it are obliged actually to combine their lists. Thus it is impossible to discover the political lesson the results in these smaller places.

In almost all of the big municipalities competition for the first place lies between a constitutional association, an extreme left association, and an extreme right association. Considerable spasms have accompanied the formation of these associations, which had to be completed by noon on April 25th. In Rome the constitutional association was nearly wrecked at the very last moment; and at Naples its more conservative constituents were only just induced not to associate instead with the extreme right. At the big market town of Frosinone the elements have got all jumbled up so that Communists, Social Democrats, and Liberals of some sort find themselves associated; but this is quite exceptional. In Trieste, where there will be contemporary elections, local particularities have caused a failure of association on the extreme left between the Communists and the "Nenni" Socialists; these are, however, a small persuasion since most of the local Socialists have, for Italian patriotic reasons, gone "Saragattian." (The local Nennians are now also shifting into line with the "bourgeois" parties on the issue of Trieste's return to Italy.)

When last summer it was the north and centre which had to elect municipal councils, Christian Democracy went forth with a cheerful slogan: "Win back the cities for Italy." This slogan was possible because in most of the big northern cities a Communist coalition had captured the Councils in 1946, under simple proportional representation, and the new electoral law gave promise of recapturing these "from Russia," even if Communism lost no votes. In fact, Genoa, Turin, Florence and Venice were among the towns "won back for Italy," and this in spite of an appreciable loss of votes by the constitutional parties, while the extreme left apparently held its voting ground.

In the south much is different. The extreme right runs a real chance of winning the top of the list in Naples where (as all over the Southern mainland) it represents an association between Monarchists and so-called Neo-Fascists. There are no conspicuous citadels to be won back from Russia because in the south the extreme left in 1946 was weak. There is, on the contrary, a danger of the most glittering citadel of all, Rome, falling to an association (or strictly speaking a local fusion) of the Communists with "independent" elements led by the embittered octogenarian, Nitti, who not so long ago was regarded by them as a virulent reactionary. The results are therefore awaited in governmental and friendly circles, already in somewhat dejected array, with a good deal of misgiving.

Capital Replacement Costs

This service, prepared jointly with the Association of Certified and Corporate Accountants, provides indices of changes in the replacement cost of industrial plant, and is being steadily expanded. We have recently added new indices covering the following types of equipment:

Mechanical Handling Equipment.
Foundry Plant.
Tanning Machinery

These are in addition to our indices for factory buildings, agricultural machinery, electrical equipment, chemical plant, machine tools, textile machinery, food processing machinery, office equipment, and commercial vehicles.

Other indices can be prepared on request. For further particulars please write to:

Kashmir Speaks Up

[FROM OUR CORRESPONDENT IN INDIA]

DR GRAHAM'S Report has been received in India with the respectful indifference due to good intentions which are producing no obvious concrete results. India will not accept any scheme which gives Pakistan's troops the same moral right to be in Kashmir as its own, for it is as much the foundation of India's attitude to Kashmir that Pakistan is an aggressor as it is of Pakistan's that the Kashmiris are Muslims. But, short of that, India is eager to see as much demilitarisation as possible as soon as possible. India is feeling sincerely peaceful, and public opinion would more and more welcome a quick plebiscite.

Certain recent developments within India and Kashmir are, therefore, of great importance. Sheikh Abdullah, the Kashmir Premier, and his National Conference have always been, like all Kashmiris, Kashmiris first, whose reason for accession to either India or Pakistan is only that they recognise that it is impossible for Kashmir, in its geographical situation, to stand alone. They have chosen India partly because India gave them protection from the tribal raiders of 1947, and partly because they see India as a secular and progressive state, which is abolishing zemindari and creating a citizenship common to all faiths, while they see Pakistan as theocratic, mullah-ridden and too much controlled by the large landlords of West Pakistan. Their preference is, however, a strictly limited one. They wish to lean on India, but they do not wish to become merely part of India. They are only willing to accede for the original Mountbatten subjects of defence, foreign affairs and communications (which hardly arise in Kashmir which has none).

The meeting of the Kashmir Constituent Assembly has brought this attitude sharply to the notice of the Indian public; and the reaction has, on occasions, been equally sharp. The function of the Constituent Assembly is, of course, to make a constitution for Kashmir. This, in itself, is different from the rest of India, where the constitutions of the States are included in the constitution of India as a whole; and the difference has been emphasised by the talk in the Assembly of Kashmir as an autonomous republic within the Indian Republic, and by Sheikh Abdullah's own repeated insistence in recent speeches on Kashmir's special position, and its refusal to sacrifice its independence beyond the three subjects. There is, moreover, an important and immediate practical issue involved. The Indian constitution prohibits the acquisition of property without compensation. The Indian zemindars are being paid for their zemindaris. But Sheikh Abdullah's programme of land to the tiller admits of no such compromises, and there has been unfavourable comment in many quarters in India on the Constituent Assembly's decision that landlords should get no compensation at all. People asked why a principle that was accepted in India should be ignored in Kashmir. The Kashmir reaction was a fierce reassertion of autonomy. Indians reacted in their turn by wondering why the integration with India which had proved so beneficial for the other ex-princely states was unsuitable for Kashmir; and also why

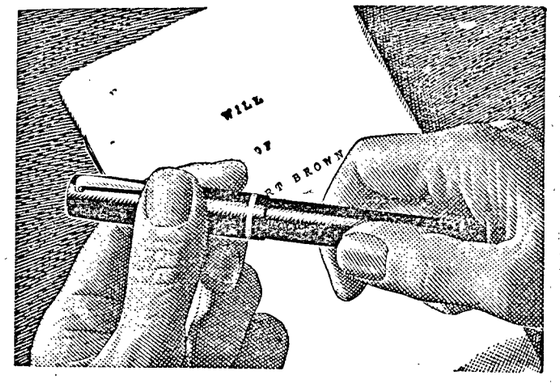
all the obligations—such as the loans to meet Kashmir's budget deficits, and the £5 million a year Kashmir adds to the defence budget—should be India's.

The question has been further complicated by the special attitudes of the people of Jammu and Ladakh. The Ladakhis are Buddhists, the people of Jammu mainly Hindus and Sikhs; more important still, neither are Kashmiri speaking, and neither have the nationalism of the Kashmiris of the valley, whether Hindus or Muslims. Jammu is little more than an extension of the Punjab, with which it is closely related linguistically, economically, racially, and geographically. The Ladakhis would like to be left alone in their remote mountains, but they have already made it clear that, if they cannot be attached to India, they will prefer Tibet to Pakistan. The people of Jammu, and even those of Ladakh, would welcome full integration with India, and, indeed, another of the sources of the recent controversy was the riot in Jammu City when some students objected to the flag of Kashmir being flown side by side with that of India. Over Jammu and Ladakh, however, which are not for him the core of the issue, Sheikh Abdullah has found it possible to be generous; he has recognised the right to secession.

It is unfortunate that Sheikh Abdullah should in one speech have spoken of the risk of Indian communalism, were Nehru to go, for Indians consider that they have shown themselves surprisingly non-communal under the stress of these last two years, and that the electorate has finally dealt its *coup de grâce* to the communalists in the recent elections when they got only 5 per cent of the vote. They have therefore been bitterly hurt, and their hurt has given this one remark, and its subsequent explanations and counter-explanations, a quite disproportionate importance. Nationalism, not communalism, is the real issue. The argument has indeed cleared the air, and perhaps prepared a return to Sir Owen Dixon's suggestion that a plebiscite should be held regionwise: this would narrow the problem down to the Kashmir Valley—the real bone of contention. It could then be treated as the special case which it is.

The Church's Resistance in Poland

[BY A CORRESPONDENT]



THE first copy of a pastoral letter distributed at Easter by Archbishop Wsznyski, the Roman Catholic Primate of Poland, has just leaked across the iron curtain. The letter, which is an obliquely worded message of hope for Polish Catholics, is a reminder of the extent to which the Polish hierarchy has maintained its unyielding attitude to Communism over the last seven years. Today it is the sole remaining outpost of the Vatican in Eastern Europe. But the provisions governing the separation of church and state in the new Polish constitution indicate that the Bierut regime is hoping to deal a final blow to ecclesiastical power in Poland. The provision which declares that "the legal and patrimonial position of the religious bodies is determined by law" is, no doubt, designed to bring the Church administration entirely under state control.

The object of the Polish Communists, of course, is to produce, as in the Soviet Union, an acquiescent priesthood and a Church which is the instrument of the regime. But there are vast differences between the Orthodox Church in Russia and the Roman Catholic Church in Poland. While the Russian Church leaders have always been more or less ready to serve the powers-that-be, the Polish episcopacy has a long record of stubborn resistance to authority, both that of the Czars and of their own rulers. Moreover, unlike the Russian, the Polish Church has the enormous support of the parent church outside, and inside the country, of a congregation which remains unshaken in the faith.

There was striking proof of this devotion last Christmas. For the first time the occasion was officially ignored and strenuous efforts were made through propaganda and organised activities to play up the New Year—linked to the Six Year Plan—instead. Nevertheless, it is known that on Christmas Day all the churches were crowded to overflowing and that people, including Party members, stayed away from work. A Party circular is reported to have been sent round early in January admonishing members for this lack of discipline.

It is also significant that among the organised nation-wide demonstrations praising the new constitution, there has been no radio or press mention of clerical participation, except by the pro-Government "Union of Patriotic Priests." This Union is the regime's one achievement in its effort to undermine the Church's power; it is the result of promoting a schismatic movement among the ill-paid lower clergy. But the Government itself does not claim more than some few hundred members out of a total Catholic priesthood of about 9,000. The group has lately been strenuously employed by the administration in noisy support of certain of its policies, particularly over the Western Territories, and the peace campaign, and to bring pressure on the peasants to hasten grain deliveries because of the present food shortage. More than anything else these efforts of the Union have served to bring into relief the silence of the hierarchy and vast remainder of the priesthood, with the tacit opposition which this implies.

For the Church in Poland today is carrying out the doctrine of non-co-operation. If priests are forced to be circumspect in the pulpit, in the confessional it may be a different matter. Whether or not it is a peasant's duty to deliver his grain to a Communist Government can be treated as a question of conscience. To what extent priests encourage or take part in any active resistance it is hard to say. Many gained considerable experience resisting the

Germans during the occupation and many of the more fanatically anti-Communist played some part in the postwar underground movement against the Bierut regime. Foreign correspondents who toured the Polish countryside at that time could quite often find some priest or curate who knew a good deal about the local opposition.

From time to time priests have been tried for allegedly anti-state or treasonable activities. In October, 1951, four Bernardine monks were among the defendants found guilty by a Lublin military court on this score. At a similar trial, in January, 1951, accused members of the Catholic Works Party, a political organisation, implicated the imprisoned Monseignor Kaczynski, editor of the organ of the Warsaw episcopacy, *Tygodnik Warszawski*. In 1950 two parish priests, Fathers Oborski and Gadomski, received life sentences for allegedly conspiring with young Polish nationalists who had murdered Communists and committed other terrorist acts. While it is impossible to tell how much is propaganda and how much truth, the evidence seems to have left little doubt that the acts had in fact been carried out —all the accused confessed, of course—and that the priests had at least been on familiar terms with the gang. But these and similar cases must be accepted as individual acts, for there is no evidence that subversion is part of the Church's policy in Poland. It prefers to rely on non-co-operation and the preservation of a moral ascendency over a simple people.

Material Resources

From a material point of view also, the episcopacy's resources are still not inconsiderable. It has been estimated that the 1950 law expropriating ecclesiastical estates of more than 250 acres still left an aggregate of some 400,000 acres in its hands. There were in 1949—the last year for which official figures are available—1,724 monastries and nunneries. The innumerable seminaries then contained 18,000 theological students. Today the attendance at the University of Lublin, the Catholic academic stronghold, has reached the record number of 6,000. In 1949 there were 6,300 priests working as paid religious instructors in Polish schools. Many hundreds of these have since been dismissed in spite of the Hierarchy's vehement protests. With the legal separation of church and state under the new constitution, it can be presumed that the rest of these priest-instructors will disappear along with the last vestiges of ecclesiastical authority over Polish education.

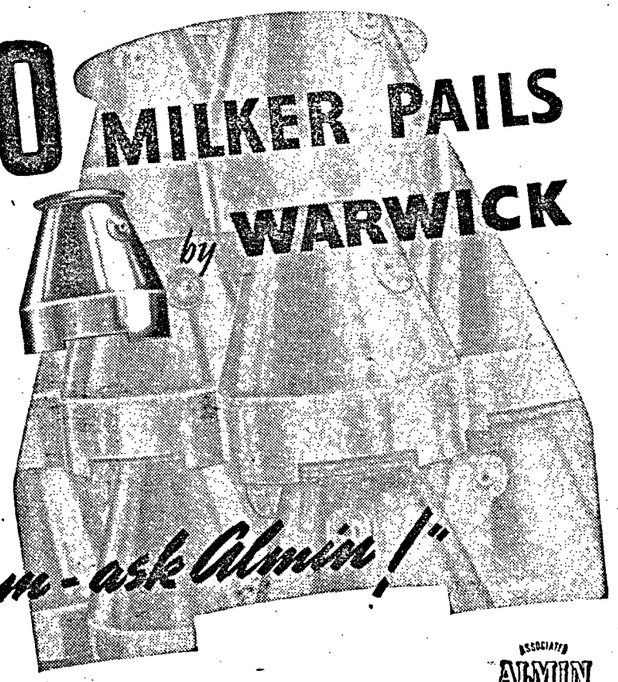
But for another generation at least the dominating role of Catholicism in the ordinary lives of the people will continue. Poland is an agrarian country and life in the villages is still primitive. Radios are few, television unknown, and the cinema is limited to the larger towns. The Church and its ritual is still, as it has been for centuries, the sole amenity and the sole consolation. Despite the propaganda and the frowns of the Party, the great pilgrimages to Czestochowa still stream out over the highways in summer and when Christmas and the feastdays come round fields and factories are deserted and churches filled.

Presidential Race in Chile

[BY A CORRESPONDENT]

THE domestic political implications behind Chile's decision last weekend to abrogate its copper agreement with the United States are as yet obscure. But with the presidential elections less than five months away, the government coalition parties may well have been glad to demonstrate their ability to take a tough line with foreign capitalists. The Radicals who form the largest single party have supplied presidents for the past thirteen years. They might well continue in their dominating position but for dissension, not only within the centre-left coalition which they dominate, but also among themselves. Dissatisfaction with the mounting economic difficulties caused by the great inflation, and the unwillingness or inability of the administration to take firm measures to deal with the social unrest arising from it, may cause a swing to the right from those who would like to see a firmer hand at the till and a return to more orthodox finance and economic discipline. The convention called by the government coalition last January to nominate an agreed presidential candidate failed to do so, as the left-wing of the group would not agree to Pedro Enrique Alfonso (who is now supported by the present Government), and the Social Christians would not accept the leftist candidate, Alfredo Duhalde. The Radical Party, in spite of its great tradition, has in recent years run the danger of degenerating into a machine to be used by place—and profit—seekers for their personal ends.

Arturo Matte Larrain is of the Liberal Party, but has also the support of the traditional Conservatives and other smaller right-wing parties. He is backed by commerce, industry and the Church—the Radicals being anti-clerical—and indeed by many elements which oppose the furtherance of the welfare state at the expense of abandoning traditional economic habits. His prestige was enhanced when last year he defeated by a large majority the government candidate in the election to the seat in the Senate made vacant by the death of ex-President Alessandri. At present there are short odds on a presidential victory for Matte, provided the election is completed constitutionally.



Socialist Disunity

Salvador Allende, supported by the Socialists, is the weakest of the candidates, as the Socialist Party, which was previously of considerable strength, has lost much of its influence in recent years owing to dissension and its splitting into two groups which are at present united in a "socialist front." If the breach in the centre-left coalition over the choice of candidate is not healed, he may receive many votes which would normally go to the Radical candidate, but which will not go to Alfonso; he may also receive some support from the erstwhile powerful Communists, whose party has been outlawed since 1947 by the President, although he had achieved office only with their support.

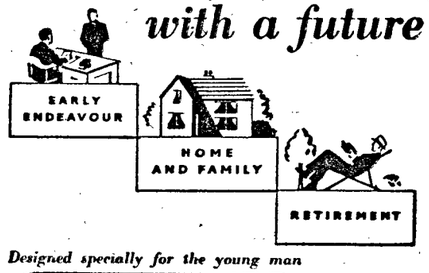
General Carlos Ibañez del Campo was President of Chile from 1927 to 1931, during which time he was called by his enemies a dictator. He may be expected to draw the votes of those who would like a return to "strong" government after the vacillations of the past few years, as well as of the extremes on both the right and the left. He is now well over 70, and this will presumably be his last chance of constitutional election as president. His appeal is similar to that of Perón in Argentina, from whom, it is widely said, he has received both moral and material support—a fact which may lose him the votes of those who resent the suggestion of outside interference. While it is impossible at this stage to assess his chances of success, it is tempting to draw an analogy from the 1950 elections in Brazil, when another ex-president and strong man was swept to power by constitutional means, in a situation which can be compared in more ways than one with that of Chile today.

Much may still happen before September, and there is another new and unpredictable feature in that women will vote for the first time in a presidential election. The coalition now in power seems weak and divided both internally and in its handling, or lack of handling, of the economic situation. The Radicals, however, have held the presidential reins now for a long time, most of the bureaucracy are their supporters and they possess a powerful and well-organised party machine. Moreover, President Gonzalez Videla is a politician of no ordinary skill, and it may well be within his abilities to produce among his supporters a show of unity before the date of the election.

100,000 MILKER PAILS by WARWICK

The large-scale introduction of strong, light *hygienic* aluminium to the food industries has been the main preoccupation of the WARWICK PRODUCTION COMPANY since 1945. One hundred thousand milker pails for the dairy industry is a typical effort.

ENTERPRISE IN ALUMINIUM



Warwick Production Co. Ltd., of Saltisford, Warwick, is one of the manufacturing companies of the ALMIN GROUP; a sister company to SMD Engineers of Slough, who recently built the Aluminium Structure of the Dome of Discovery and the World's first All-Aluminium Aircraft Hangars at London Airport.

NEWS FROM THE FISHING INDUSTRY

Ceaseless efforts to improve quality

Any measure that might conceivably raise the quality of fish is most carefully studied and tested by the Fishing Industry. During the last two years great strides have been made, and there can be scarcely a housewife who has not noticed the general improvement. But there is no slackening in the Industry's efforts to bring the public still finer, fresher fish. For instance, at this very moment, scores of trawlers are using and reporting on a new fish-washing machine invented by a Trawler Skipper.

This machine consists of a metal bath that runs on tramlines along the trawler's deck to whichever hatch is being used. Powerful jets play into the bath to maintain a depth of some 15 inches of violently agitated sea water. The fish are tossed in the instant they are gutted and are thus washed more speedily and more effectively, both inside and out, than would otherwise be possible.

British trawlers know their job!

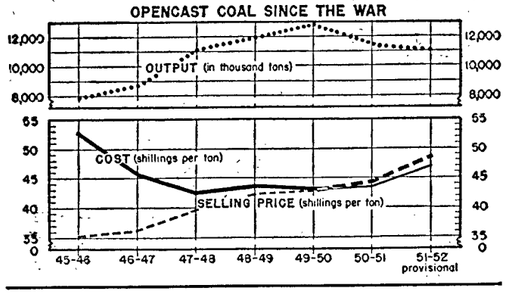
Opencast under the Coal Board

UP to the time that the National Coal Board took over opencast production of coal at the beginning of last month, about 90 million tons had been excavated in this way in just under ten years. The Board has owned this shallow-lying coal, in common with deeper seams, since the vesting in 1947; but the Ministry of Fuel and Power, which had had the responsibility for opencast working since 1945, retained control until the end of March this year. Opencast working is essentially a job of civil engineering, and has little in common with deep mining; private contractors have always carried out the actual work for the Ministry, and will continue to do so for the Board. Nevertheless, the main reason why this logical transfer of control to the Board did not take place earlier seems to have been what a Ministerial spokesman in 1948 called the "uncertain economic future" of the opencast programme. At that time opencast was unprofitable, as well as bitterly unpopular with the farming community, and even with the general public; moreover, it was due to tail off within a few years. At least some of these good arguments for not transferring control have lost force during the past two years: opencast is now a much healthier commercial proposition, while an improved code of restoration and compensation has perhaps very slightly mollified the farmers and has removed the subject from public attention. Whether any change has taken place in the expected duration of the opencast programme is less clear.

In the past two years the production of opencast coal has yielded the Ministry an average profit of about a shilling a ton, and the National Coal Board can hardly help doing better than that this year. These profits, of course, are only a part of what is earned on opencast. Contracts are let for an agreed tonnage of coal either at a fixed price per ton or at a price varying with the proportion of earth that has to be shifted in order to get at the coal; and the contractor's profit on opencast depends mainly on the speed and efficiency with which he digs the coal out. The Ministry, after years of losses (which in 1945-46 amounted to 17s. 8d. a ton), expected at least to break even by 1950-51. In fact, in that year it made a profit of £480,000 on an output of about 11½ million tons of coal; and in 1951-52 it made £601,000, on an output of just over 11 million tons. Its production costs, which had changed little in the three years up to March, 1951, rose last year by about 10 per cent, on account of a special *ex gratia* payment to contractors to cover the rise in their dollar costs for American equipment and spares following devaluation. The Ministry's Directorate of Opencast Coal Production had worked its passage out of the red largely by holding total costs fairly level during four years in which coal prices climbed steadily past them; even last year, when its total costs rose by 8½ per cent, coal prices rose more. Most of the coal that will be won opencast this year will be paid for at prices fixed under contracts made before the beginning of the year. The February increase in the price of coal should thus ensure the Coal Board a larger margin over opencast costs during the calendar year 1952 than the Ministry made in 1951-52; a large proportion of opencast coal is of the low qualities supplied to power stations, but even this rose in price by about 3s. a ton. The diagram showing disposals of opencast coal, it should be noted, excludes 800,000 tons of anthracite sold with deep-mined anthracite and not recorded separately. The Coal Board used to act as selling agents for the Ministry at a fee, shown in the table of opencast costs as "selling expenses." This will presumably still be debited against opencast; but the sum of about 8½d. a ton that the Ministry used to pay the Board for royalties and loss of profit (included in the item "Compensation") may disappear from the charges, improving the appearance of the opencast revenue accounts correspondingly.

But the Coal Board may have to reckon in future with a fairly considerable increase in the costs of restoration and compensation. These costs include the physical restoration of the land and services such as drainage, as well as payments made to the tenants of requisitioned land in respect of rent and partial compensation for loss of income and payments to the landowners of terminal compensation for residual damage. An improved code of restoration was agreed last year between the Ministries of Fuel and Power and of Agriculture, and its conditions are being embodied in all new contracts. The contractors have the job of removing and segregating topsoil, removing overburden, excavating the coal, putting back the overburden and spreading the soil above it; and the new contracts lay down in volumetric terms that can readily be checked the amount of soil that must be put back properly. Recently the Ministry has tended to hold the land longer, cultivating crops and restoring services itself before handing it back to its owners; as, under statutory terms of compensation, such services are likely to be paid for at well below their present cost, this method can have some advantage for the owner. When existing contracts are worked out and all the coal is won under contracts embodying this new code, restoration costs will rise. An estimate last year of the total costs of restoration suggested perhaps £250 an

acre, or considerably more than the open-market value of the land. With the current yield roughly 1,500 tons per acre, that would mean about 3s. 4d. a ton of coal.



These costs will presumably affect the length of time that opencast working of coal will continue. Under the Ministry, opencast production was planned to continue until about 1955, taking out about 50 million tons of coal between 1950 and 1955. The Coal Board may perhaps consider it necessary, practicable and profitable to carry on opencast for somewhat longer. In profitability, opencast already compares well with much deep-mined coal. Its final profit of about a shilling a ton (over and above whatever profits the contractors make) cannot be compared directly with the average "operating profit" of 2s. 5d. a ton made on all the coal the Board mined in 1950, since colliery profits are calculated before paying capital charges on the £166,400,000 at which the Board's collieries are formally valued. This average, in any case, was derived from a range of collieries within which the profitable ones made £45 million and the unprofitable ones lost £21 million; and the indications are that the average operating profits on deep-mined coal may have been lower in 1951 than in 1950. Labour is a far smaller element in the costs of opencast workings than in those of the mines; with miners' financial aspirations continuing to mount, it may be that mining costs will rise more sharply than opencast costs for some time. It is significant that on assuming control the Board made no such specific estimates about the probable duration of the programme as the Ministry had done: it merely remarked "Because of the present urgent demand for the greatest possible output of coal, the Board will continue to carry on opencast production at full pressure."

Quantity produced (tons)	11,115,000	11,917,000	12,786,000	11,529,000	11,100,000
Total Net *Deficiency* or Surplus	£1,430,000	£740,000	£50,000	£480,000	£601,000

Two technical factors, however, mainly govern the duration of opencast working: the plant capacity that sets the pace at which coal can be cut out of existing sites, and the amount of coal found on further sites that can be worked opencast. The plant capacity that is being brought to bear upon present sites—126 are being worked today—has remained fairly constant for some years. Its mainstay is a park of about 300 large "walking draglines" totalling about a thousand cubic yards of bucket capacity; these machines do the main job of shifting about 100 million cubic yards of earth and rock "overburden" in a year. The other equipment—mechanical shovels to cut the coal, bull-dozers, and scrapers—depend upon their work. When bought, these dragline machines cost about £30,000 each; for the contractors, who took over nearly all of them from the Ministry with the contracts, they represent an investment of about £10 million. Almost all are American, so that a large part of their maintenance costs, which with amortisation make up the largest item in a contractor's costs, is reckoned in dollars; hence the special payment made to contractors to offset the effect of devaluation. New machines cost £40,000 each; about 30 of them were ordered last year after imports had ceased for two years, and most of these have arrived. On the deeper sites, some with workings as much as 170 feet below ground, the draglines are now often fitted with shovels instead of buckets and are used in conjunction with Euchid dump trucks that carry away the burden; this has permitted the working to be deepened without causing any significant addition to costs. The Euclid truck is now being made in Britain, and the Lima Hamilton dragline most generally used on opencast is also to be made here under licence. British manufacturers are still cautious about making large earth-moving equipment, and some of them appear to have missed valuable opportunities. An outstanding exception is the new Vickers crawler tractor, of which about 100 are expected to be working on British opencast sites within the year. About 30 contractors are engaged on the work, with a dozen of them producing about three-quarters of the output. The labour force numbers roughly 11,000, and output per man-year is thus about 1,000 tons, compared with the miner's 300 tons.

OPENCAST COAL SINCE THE WAR

Since 1942 about 66,000 acres of land have been requisitioned for opencast working, and about 46,000 are still held: of this about 19,000 acres are under cultivation or restoration, and the remainder is "coaling or preparing to coal." Production is now following hard upon the heels of prospecting; some of the sites that will be "coaling" in the second half of this year have not yet been fully drilled and proved. The most important factor limiting the extension of opencast working to new sites has always been the shortage of high-grade prospectors, trained geologists with sufficient field experience to find coal 50 feet underground partly by "hunch"; the elaborate testing that precedes final selection of sites has to follow the choice made by these first prospectors. The days are long past when the opencast prospectors could follow the Geological Survey; they have now to be well in advance of it. Such men are rare, and to secure them the opencast planners have had to compete with the oil industry, with overseas mining companies, and, until recently, with the Coal Board itself. This is one sphere in which control by the Board may assist; it may be able to offer these geologists some general security of employment, even though opencast must eventually come to an end.

Your Continental Holiday starts in London

The EPICUREAN

London-Paris Air Restaurant

An unforgettable experience which cannot fail to give your holiday a flying start. The finest champagne luncheon between London and Paris in a truly Parisian atmosphere is included in the fare.

I.C.I. Technical Service

THE chemical industry's ability to satisfy the needs of its customers at home and to succeed against competition abroad is determined largely by the efficiency of its technical service—that is, the expert advice and assistance it gives to those industries that use its products. The man who buys heavy chemicals is not persuaded to do so by high-pressure salesmanship or intensive advertising. He buys them because they are the necessary raw materials of his business, and he tends to go to a concern which not only enjoys a high reputation for quality but supports its products with technical service.

Technical service works in two ways. It confers obvious and direct advantages on the consumer, and the chemical industry also benefits. Out of the experience of its technical service are born new products, and new techniques, to improve efficiency in many trades. I.C.I. employs hundreds of qualified men in this specialist organisation, which covers nearly every branch of Industry and Agriculture at home and abroad and costs over £1,000,000 a year. Such an organisation can only be maintained by a large scale enterprise. This series of announcements, citing examples from I.C.I.'s casebook, is intended to show the importance of its technical service to the efficiency of British industry and, therefore, to the wellbeing of the community.

Bombay asks for a Credit

It is a simple matter for the Westminster Bank to establish local credits anywhere in the world, for there is no town of commercial importance in which it is not represented. Equally, the collection of funds due to you from foreign buyers presents no difficulties. The comprehensive service of information and advice which the Bank provides for those who trade abroad is fully described in a booklet called 'The Foreign Business Service of the Westminster Bank'. We shall be glad to send you a copy on request.

Whether that end is to be postponed now rests formally with the Board. It is doubtful whether it can, in any case, be postponed for long. The industry's long-term plan assumed that supplies of opencast coal would have ceased before 1960; and although the total coal supplies envisaged in that plan are now argued to be inadequate, the Board will presumably base its hopes of still bigger output upon new mechanisation underground rather than upon more extended efforts to seek shallow coal opencast. Moreover, it is hoped gradually to take out of production more and more of the uneconomic mines, and this must eventually reduce any financial advantage in opencast working. If the shallowest seams of coal are to be worked at all, it is arguable that opencast working does the land less harm than shallow mining; but there are limits to the depth that it can go, and to the amount of overburden worth removing for a given thickness of coal seam. It is still broadly true that, but for opencast working, Britain could not have exported any coal since the war. Equally, nothing in the current trends of production and consumption encourages any confidence that within the next few years the economy will be able to accept with safety the loss of about 10 million tons a year that will follow when opencast output declines to nothing. That is, nevertheless, the prospect that the Coal Board has to face and to prepare against.

Business Notes

Warnings from the Chancellor

The gilt-edged market this week has shown an unexpected indifference to the prospect that, for some time to come, a tap will continue to flow with the new electricity stock. Influenced by a renewal of small buying orders from private investors (but with the big institutions keeping aloof), gilt-edged have resumed their buoyancy; despite some easing on Thursday, the longer dated stocks have gained up to ⅛ point since the beginning of last week, and the new scrip has moved to a premium of ⅞. In these days, however, the behaviour of the market defies detailed analysis or prediction. A conceivable influence this week may have been Mr Churchill's remark, in the course of his party political broadcast, that the figure for April's gold loss would be "better still" than that for March, and that "if our present progress continues we ought by the end of the year to be paying our way." But if these were heard by the general public as reassuring indications, the tone of the speech as a whole was far from cheering: "we make no promises of easier conditions in the immediate future" and "it will take all our national strength to avoid the downhill slide."

Meanwhile, three speeches from the Chancellor of the Exchequer were evidently designed to dispel false optimism and to explain to the wider public the realities of a crisis that have never been fully grasped. If people supposed the Government to have been crying "Wolf, wolf," they should reflect that half the gold reserves were lost in eight months, and that if the rate of drain of last February had continued we should by now be facing cuts in rations and in imports of industrial materials. The wolf, Mr Butler said, can still be heard snuffling around the house. (As a demonstration of that, he might have pointed to the disappointing results of the EPU settlement for April, the preliminary figures of which are discussed in a subsequent note.) While welcoming the rise in British exports in the first quarter of this year, Mr Butler pointed out that the gain (at least in the first two months) had been largely confined to sterling markets. In January and February, sterling exports, which had risen by 21 per cent between the first and second halves of 1951, rose by a further 11 per cent; yet dollar exports dropped by 13 per cent, and other non-sterling exports rose by only 2 per cent. The engineering industries, upon which the main hopes are now based, achieved a better non-sterling sale than this; but the hopes will not be realised unless output can be substantially expanded—especially as "we dare not for very long sacrifice the future to the present, as we are at the moment compelled to do." That reiteration is welcome; if the Government could keep this crucial need for expansion of these industries (and therefore for contraction of others) in the forefront of its mind as an overriding objective, it would be better able to withstand the political temptations to yield to the continuous pleas for further softening of its policies.

* * *

Britain Exhausts EPU Quota

Preliminary indications of the European Payments Union compensations for the month of April suggest that the United Kingdom has now exhausted its quota. The United Kingdom deficit for April was not much smaller than the figure of $64,200,000 for March and will involve a further gold payment of around $50 million to EPU. Given the continuing deficit of the whole sterling area's balance of payments with Europe, it may be assumed that the May figures will cause the United Kingdom quota to be exceeded (there can have been only about $7 million in hand at the end of April). The May deficit will, therefore, have to be met in gold for virtually the full amount. This will be the first occasion on which a member of EPU will have had to pay its deficits wholly in gold. In other instances in which members have approached or exceeded their quotas as debtors they have been helped by special credits from EPU. There seems to be no suggestion of similar assistance for the United Kingdom. One reason why this must be ruled out is that, given the present impoverished state of the EPU's reserve of gold and convertible assets, any such assistance would deprive EPU of gold income urgently needed to meet its obligations to creditors. For the time being British gold payments are keeping the EPU afloat. France, which has in recent months made substantial gold payments to the Union, is at long last putting its balance of payments with other members on an even keel. The French deficit for April is estimated to be well under $10 million, and first indications suggest that the May figure will show France to have returned to the ranks of the creditors.

The problem of the gold and dollar reserve of the EPU has been under further discussion by the Management Board of that organisation; its recommendation will be considered at the next meeting of the Ministerial Council of the Organisation for European Economic Co-operation. The hopes of extracting more dollars from the United States through direct allocations to the Union have by now been abandoned. Some dollar help may come indirectly through American military off-shore purchases financed by EP units or by the flow to the Union of special dollar help to such countries as Greece and Turkey. But direct reinforcement of the reserves will have to be made by the member countries if it is to be made at all. The most likely machinery for providing such help would be to change the sliding scale on which debtors have to pay gold to the Union, making the gold payments larger in the early stages of the cumulative deficits and smaller in the later stages, though leaving the total ratio of 40:60 between gold and credit unchanged.

In this way, and by making the adjustment retrospective, additional gold payments could be extracted from debtor countries that have not yet exhausted their quotas. It could not extract more gold from Britain. But, since the new scale would apply to the repayment of gold as former debtors become creditors with EPU, it would have the effect of delaying somewhat the reimbursement of gold to Britain if and when this country succeeds in converting its deficit with EPU into a surplus.

Productivity after the Teams

This week's full meeting of the Anglo-American Council on Productivity was the last to be held by the Council in its present form: on this side of the Atlantic, a British Productivity Council is to take its place. There are three reasons why the council is not retaining its present Anglo-American structure. Most of the British industries that might be expected to benefit particularly from exposure to American practice have now sent teams across the Atlantic and in some, at least, of the remaining industries it seems unlikely that a team visit could be arranged—in all, 66 teams have gone and 46 reports have already been published. The funds from Marshall Aid that have been made available to cover the dollar expenses of the visits are coming to an end, and the Mutual Security Agency that now dispenses such aid requires that industries to be assisted in this way must be of some direct or indirect importance to mutual defence. On the American side of the Council, too, there is a feeling that any continuing body could not remain so tightly linked with Britain alone, but would have to offer equal facilities to other nations of Western Europe. Productivity centres of various kinds have been set up in some other European countries, and are arranging visits, though generally on a more limited scale. What became the main work of the Anglo-American Council—sponsoring the teams—will in a sense thus be completed by about this autumn; though the work of completing publication of the reports, selling them, and assessing the progress made in some industries, will presumably keep the British section of the council busy for some months.

It is probably fair to say that the future activities of the new British Productivity Council are not yet mapped out very clearly in its convenors' mind. That need not detract from its real value. The team technique, after all, was merely one of several ideas with which the original Anglo-American Council began; its value, and the impact it has gradually made upon thinking in British industry, could not have been foreseen. There may well be equally valuable work—not now being done elsewhere—for the new body. Once again it is being formed by the Federation of British Industries, the Trades Union Congress, and the British Employers' Confederation—though its scope and membership is to be somewhat widened. Its funds may be of the order of about £20,000 a year, with part being provided by the three trade organisations and any new members and the remainder from public funds, though this government contribution will be much more modest than was afforded the Anglo-American Council. The Council is to hold a conference later this year to discuss some of the general lessons for British industry that may follow from the more general conclusions of the many productivity teams: after that, more detailed lines of activity may be announced. It is probably too early to ask for detail: it is indeed something to have induced these industrial bodies to continue to spend their own money to promote their common interest, rather than simply to protect their members.

*

The sponsors of an independent "Scottish Productivity Panel" that was also discussed this week appear to have acted without any consultation with the British section of the existing council. Some of the Scottish ideas, moreover, sound more ambitious—and more controversial. One that has been mentioned is the provision of a cheap industrial consulting service for small companies in Scottish industry. If such a service were to be launched by a body backed partly with public money, it would inevitably arouse bitter opposition from established consultants. These at present perhaps do not do much work for the smaller firms in Scotland or Britain—but there is no evidence that if the demand exists they could not meet it commercially.

* * *

Labour on the Move

In the first four weeks after the Notification of Vacancies Order came into operation, just under 294,000 people were placed in jobs through the employment exchanges, compared with 171,000 during the four previous weeks. This does not, of course, necessarily indicate any increased flow of workers between jobs. It means that all workers changing jobs now pass through the exchanges: the increase of 71 per cent shows that in recent months far more had been finding employment privately than anybody suspected. By channelling these extra workers through the turnstile of the exchanges, the order does enable the persuasive powers of the employment officials to be brought to bear on all of them; and Lord Swinton, in a debate on manpower in the Lords this week, was able to report that in the period following the order, 38,000 "first preference" places were filled as against 21,500 in the four previous weeks. He was also able to argue that in thirteen visits to factories in the Midlands by the Ministry's Labour Supply Inspectors, whose efficacy has been questioned in these columns and elsewhere, original demands for 620 skilled men had been reduced, with the consent of the employers, to 332 skilled workers and 99 semi-skilled workers suitable for training and up-grading.

It would be easy to question the real significance of these figures: the value of the Order can probably never be established statistically. But this evidence, like that of the general trends in labour statistics during recent months, does suggest that labour is moving in the right direction, and everything that the new powers of the exchanges can do to facilitate that flow will be valuable. The general figures, unfortunately, do not indicate that skilled labour is moving into defence work as fast as is needed; Mr Sandys's remarks to the Engineering Industries Association this week indicate added disquiet about this in the Ministry of Supply. His desire that all engineering capacity—and in particular the new specialised machine tools arriving from the United States—should be used on double shifts is understandable, but once again this comes back to engineering manpower. One way of increasing defence output without transferring labour is to sub-contract as much defence work as possible to engineering factories where tools and skilled men are becoming idle, and more must be done in this direction. But the demand for skill in aircraft and other defence industries, even allowing for the extension of sub-contracting, remains unsatisfied.

* * *

Textiles at the BIF

In the opening days of the British Industries Fair this week, the main centre of interest at Earls Court appeared to be a scale model of Mount Everest. Earls Court includes the textile sections of the BIF, and although this is not a "textile year," the industry is still the largest single exhibitor at the London end of the Fair. Even so, it cannot be said to have made any very strenuous effort to counter the present slump by going all out for what custom there is to be found at the BIF. Only a handful of Bradford mills, and hardly any cotton manufacturers, had troubled to take stands. The big rayon producers were also missing. In the circumstances, this policy of abstention seems both surprising and shortsighted. In spite of a slight increase in wool consumption in March, wool cloth deliveries reached

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Musical accomplishment

We recently had a call from a manufacturer who had heard that Argentina, after a lapse of nearly two years, was again ready to grant import permits covering certain goods from Britain. "Are musical instruments among these goods?" he asked. Within a matter of minutes we were able to give him chapter and verse of the relevant Argentine Central Bank Circular. This invited applications for foreign exchange to pay for the import of, among other things, musical instruments from Britain provided that payment was made at the free market rate and that applications to import were lodged within a specified time. From few other sources could this information have been obtained so quickly, and our client was at once able to make arrangements with his agent in Buenos Aires.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

— ESTABLISHED 1835 —

48 Gracechurch Street, London, E.C.3

SPEED THE SCRAP

Almost every steel-using firm possesses scrap iron and steel in the form of old plant, redundant buildings, machinery and spares. Every ton of it is wanted back in the steelworks to make the supplies of new steel that your own and other factories need so urgently.

Have a search made on your premises. Make prompt decisions to turn in all the old iron and steel you can find. Scrap merchants are glad to help with dismantling and collection.

THE RAILWAYS GET A MOVE ON

The amount of salvage by the staff of British Railways is enormous and the quantity of iron and steel scrap which they rounded up in 1951 was 644,000 tons.

SPEED THE STEEL

Issued for the STEEL SCRAP DRIVE by the British Iron & Steel Federation, Steel House, Tothill St., London, S.W.1.

only 31 million yards compared with more than 37 million in March, 1951, and nearly 2,000 workers left the wool industry during the month. The latest returns of cloth production from the Cotton Board show that 66 weaving mills, employing a total of 7,000 workers, were closed down for the last week in March. Weekly output during the month averaged 53 million yards of cotton and rayon cloth compared with 55 million in March last year, when production was reduced by an early Easter.

In the rayon industry there was a 9 per cent fall in yarn output. A total of 29.7 million pounds of yarn was produced compared with 32.7 million in February and 28.7 million in March, 1951, when the sulphur shortage was at its height. In the early winter, production was running at 36 million pounds a month and Courtaulds Limited has accumulated such large stocks of yarn that only three of its plants are still working a full week. Two big plants, one in Ulster and the other in North Wales, are to be completely closed down for "at least" a month, and half of the Greenfields factory is closing. This affects between 5,000 and 6,000 workers. Courtaulds' sales have been hit in two ways, by the retail slump in textiles, and by the reduced demand for tyre cord that has followed a reduction in tyre output that began last summer and has since continued. British Celanese is still working short-time in a number of departments. Indeed, among the textile industries, British Nylon Spinners alone appears to have been unaffected by the fall in consumer demand. The number of stocking exhibits at the BIF shows, however, that this lucrative market is proving less easy; for the first time companies are showing silk and nylon mixtures designed to meet some of the objections to pure nylon. This indeed is a sign of the times.

* * *

Wholesale Sales Improve

The figures for wholesale textile trade in March afford some evidence that the textile depression, in so far as it arises from the home market, may have passed its trough. The sales index (1947=100) showed its biggest seasonal rise for several years, rising from the February level of 112 to 142. An improvement in sales was to be expected after the budget, since the majority of retailers had kept their purchases to a minimum until the new tax arrangements were known. Indeed, the recovery in sales might have been even more marked if the possibility of further tax modifications had not been raised immediately after the "D" scheme was published.

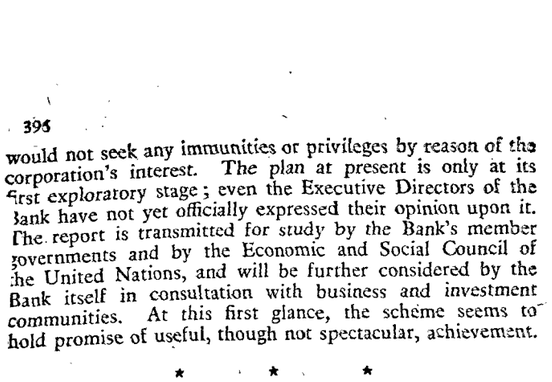
The effects of this continued uncertainty should be borne in mind when drawing conclusions from the fact that the March sales were, in value, below the level not only of March, 1951 (the boom phase, when the index reached 189), but also of March, 1950, which for purposes of comparison might be regarded as a "normal" trading period; sales then reached 160. Price changes during the year tend to conceal changes in the actual rate of turnover. Prices have fallen by approximately 25 per cent since March, 1951, while the value of the transactions has fallen by 26 per cent, so that the volume of trade may have been little changed. The same difficulties arise in comparing the size of stocks. Wholesale stocks are slowly coming down, from a level of 212 at the end of February to 203 at the end of March. But it is quite impossible to tell what proportion of the remaining stocks consists of goods bought at peak or near-peak prices, and how much represents goods costed on the basis of the much lower prices at which manufacturers are offering them today. The index is still 40 per cent higher than it was a year ago when heavy retail buying ran stocks down to a figure of 145 and it is evident that the decline in stocks will need to go very much further before the apparently improving trend of sales can be expected to have any significant effect on textile employment.

Stimulating the Private Investor

A novel scheme for the promotion of private investment, both internationally and within national boundaries, is examined in a report prepared by the staff of the International Bank at the request of the Economic and Social Council of the United Nations and submitted to the Council last week. Stimulation of private foreign investment is, of course, one of the underlying purposes of the International Bank itself, but in fact nearly all the loans the Bank has made so far have been for the financing of government projects, especially for the provision of basic services and public utilities. This concentration upon public enterprise is not attributable—or, at least, is not mainly attributable—to a lack of credit-worthy private projects; it arises inevitably from the terms of the Bank's constitution, which precludes it from embarking on equity financing and requires its loans to be guaranteed by the government or monetary authority of the country in which the project is located. This second condition, though it does not absolutely rule out finance to private enterprise, is apt to be unacceptable to precisely the types of borrowers whom it may be most desirable to encourage—those of sturdy initiative who will most fear the political conditions or government interference that may accompany a guarantee. Yet the Bank finds it to be "generally acknowledged," even in most countries where public utilities are state-owned, that in broad sectors of any economy private enterprise "is the most effective agent" and that the pace of economic development largely depends on the degree of private initiative and private investment.

The question to which the Bank's report is directed is whether desirable private investment could be best stimulated by the establishment, as an affiliate of the Bank, of an international finance corporation whose function would be to furnish, on commercial principles, equity finance or unguaranteed loans to private enterprises—in cases where the private finance obtainable without such aid would not suffice to allow the projects to proceed. Since operations of this kind would be "predominantly speculative," they would be inappropriate for the International Bank itself, even if its constitution could be amended to permit them. The scheme envisages, therefore, that the affiliation to the Bank would not carry with it any financial linking or any commitment of the Bank's own resources. The Bank would be able to share with the Corporation its own technical and administrative services (whether by virtue of a management contract or by a common board of Executive Directors), and it is suggested that the Corporation's voting stock should be allotted to the Bank for only a nominal consideration. Apart from this, the Corporation's resources available for financing would be provided by governments of the countries in which it would function, the total capital suggested being $400 million, with perhaps a third of this called up in the first instance. The capital would be mainly or wholly subscribed in local currency, usable without restriction in the subscriber's country but not necessarily being fully convertible.

There is no suggestion in the report that a scheme on these lines could have massive or rapid results, given the many obstacles to private investment and shortages of available risk capital that exist even within national boundaries. But it is felt that the prestige of a corporation attached to the Bank should give private investors confidence in projects it is prepared to sponsor; that the Bank's fast-growing experience of the investment communities of the world and its recurrent discoveries of worthwhile projects that lie beyond its own province should enable it to bring investors and entrepreneurs together; and that the financial structure proposed should divorce the governmental funds from the projects financed sufficiently to minimise investors' fears of political interference. Since the object is to demonstrate that private investment can be both privately profitable and socially advantageous, the projects



would not seek any immunities or privileges by reason of the corporation's interest. The plan at present is only at its first exploratory stage; even the Executive Directors of the Bank have not yet officially expressed their opinion upon it. The report is transmitted for study by the Bank's member governments and by the Economic and Social Council of the United Nations, and will be further considered by the Bank itself in consultation with business and investment communities. At this first glance, the scheme seems to hold promise of useful, though not spectacular, achievement.

Fall in Rubber

The rubber market has suffered a severe jolt during the past eight days. The price in London has fallen by 4d. and closed on Thursday at 27½d. a lb. It will be recalled that there was an even sharper fall in the first half of February—from 41d. to 33d. a lb., but thereafter, until the end of April, the price had remained fairly stable around this lower level. The market took the first fall in its stride, for it still left producers with a more or less adequate margin of profit. Now the margin is being seriously threatened. It was doubtless a coincidence that the further recent fall occurred just as the Rubber Study Group was meeting in Ottawa; but it will sharply remind the various national delegates that the rubber market is highly volatile and that it plays an important role in the political and economic life of South East Asia.

The immediate cause of the weakness is said to be a realisation of stocks by the up-country dealers in Malaya. These dealers had been holding back in the hope that the abolition of controls on consumption of natural rubber in the United States would lead to an increased demand. So far, this has not materialised, while American stockpile purchases appear to have declined recently. In the absence of bigger support from the American stockpile authorities, there was no reason to expect the price of rubber to remain around its recent level of 2s. 9d. a lb. World consumption has been falling for some time and last year production exceeded it by 385,000 tons. Commercial stocks, however, increased by only 55,000 tons, the difference being largely accounted for by an increase in

government stocks. This year production has declined but so, too, have both commercial and official purchases. Now that natural rubber can compete freely with synthetic rubber in the United States, the present price of 23 cents (20d.) a lb. for general purpose synthetic establishes, in effect, a "floor" price for natural rubber as these two are for most purposes interchangeable. But at that level many producers of natural rubber will be facing a loss.

This question of the price of synthetic rubber is among those under discussion by the Rubber Study Group in Ottawa. Nobody could object to the present price if the United States Government could prove that it is an effective commercial price—in the sense that it allows adequately for all the various amortisation costs and a reasonable level of profit. But the United States has never proved that, and various statements made in the U.S. Congress have suggested that 23 cents is in fact a subsidised price. The importance of this for Malaya and for other producers of natural rubber lies in its effects upon the long-term trend of production—quite apart from the possible political effects of a reduction of wages of workers on the rubber estates without any corresponding reduction in their cost of living. Many of the rubber trees in Malaya are some twenty to thirty years old and need to be replanted with high-yielding stock if output is to keep pace with the long-term trend of consumption. But replanting will take place only if producers can see the possibility of a reasonable return. At present, there is no such prospect.

* * *

The Copper Wrangle

This week the Chilean Government has ended its year-old agreement with the American copper companies by which 80 per cent of the Chilean output was sold to the United States at a fixed price of 27½ cents a lb. It has announced that in future the whole of its copper production will be sold on the free market—unless the United States will agree to pay a higher price. Under last year's agreement Chile was free to sell the remaining 20 per cent on the free market, but in the last few months it has not found this arrangement profitable. Last year the "free" price was around 55 cents a lb; now it is below 40 cents a lb. Chile has been unwilling to dispose of the whole 20 per cent at this lower price and some 40-50,000 tons of copper have accumulated in government hands. This situation prompted the Chileans a few weeks ago to offer the whole of their copper output to the United States at a new fixed price of 33½ cents a lb. The Americans have not accepted this offer and in the meantime the Chilean copper workers went on strike for higher wages.

Chile provides about one third of America's copper supplies, and copper is still one of the scarcest of the major metals. It is true that the worst of the American shortage appears to be over—production is increasing and the demand for some copper products is easing—but civilian consumption is still rigidly controlled. The real question is whether Chile can sell the whole of its copper output (about 420,000 tons a year) to other countries at above the American official prices level. It already holds quite sizeable stocks. In any case, the sale of copper to the United States has provided 70 per cent of the dollars Chile needs to buy essential foodstuffs and machinery. On economic grounds the balance of the bargaining power seems to lie with the United States. But political reasons may prompt the Americans to treat the Chilean demand more generously.

Britain will not be greatly affected by the outcome of the tussle—at least not directly. Last year Chile provided only 738 tons a month out of this country's total copper imports of nearly 30,000 tons a month, the bulk of which come from Rhodesia. But if the United States raised its official price to meet the Chilean request, then Britain would presumably have to pay correspondingly higher prices for Rhodesian copper.

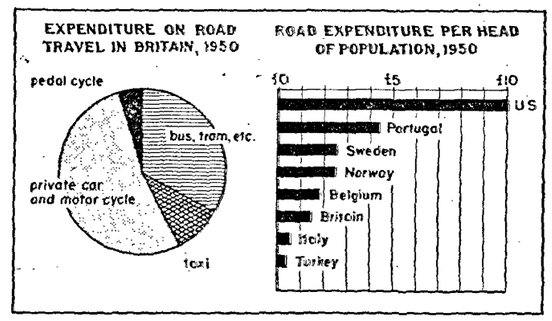
* * *

Lead Sets the Pattern

The base metal market has been sagging for some months, but until a few days ago this tendency was reflected in prices except on the so-called "free" The first real break occurred last week, in lea American producers reduced their prices twic 19 cents (£152 a ton) to 18 cents (£144) and then to a lb (£136 a ton); in Britain, the Ministry of cut its selling price by a corresponding amount. for lead has been weak throughout the world, as buy

been expecting a fall in official prices. More recently there has been a temporary lull in American stockpiling; the US Munitions Board, after buying 100,000 tons of foreign lead (53,000 tons from Britain) in the last few months, has for the moment run out of funds. Despite the weakness in the market, quite large quantities of lead have been shipped to the United States in recent months and further shipments are expected during June. If the price remains below 18 cents, it would not be surprising to see some move in the United States in the near future to re-impose the import duty of 1½ cents a lb.

In Britain lead is now down to £147 a ton, compared with £175 a ton at the end of January. But, it is still £11 a ton above the official American price, and British manufacturers are apparently having to bear the cost of the high-priced lead bought by the Ministry during the shortage last year. In the circumstances, it is not surprising that consumption of virgin lead has been small since the end of last year. Purchases have declined even more sharply, as manufacturers have been using up their stocks. Last December, when total stocks in Britain amounted to 77,000 tons, manufacturers held 24,000 tons, and the government 53,000 tons. By the end of March total stocks had risen to 110,500 tons and, after allowing for substantial shipments to the United States, government stocks had increased to 93,000 tons while manufacturers' stocks dwindled to 17,500 tons. In effect, industry is forcing the government to shoulder almost the whole of the risk of falling lead prices. It is surprising that the government has not taken the chance of shifting the burden by agreeing to reopen the lead market.



Zinc prices show every sign of following the trend set by lead. In certain foreign markets zinc is being offered at £150 a ton, compared with the official United Kingdom price of £190 a ton, but demand is slack even at this low level. In the United States trading is taking place on the basis of the average price during the month of delivery rather than at the currently fixed level of 19½ cents a lb East St. Louis (£156 a ton). American consumption of special high grade metal has declined recently because of the cut in motor car production, and although galvanising is absorbing record amounts of zinc, there may be a considerable increase in stocks this year even after the 15,000 tons borrowed from the stockpile is repaid. It may not be long before the American government removes the remaining controls on consumption.

Strain on the Road System

In a lecture to the Town Planning Institute* this week, Mr Christopher Brunner, in association with Mr James Drake, returned to a subject on which he has already delivered several broadsides—Britain's laggardliness in road development. He had some statistical refinements to add. He put expenditure on road transport and travel in 1951 at £1,400 million, or some 12.5 per cent of the national income (this is broadly though not strictly comparable with Mr Rudd's recent estimate of £1,220 million, or 11.5 per cent, for 1950). Since the war, the most marked development in road transport has been the increase in the volume of goods traffic. The number of goods vehicles licensed has almost doubled since the war, some 70 per cent of all inland freight traffic goes by road, and the growth in the number of "C" licences shows a growing desire on the part of manufacturers and traders to keep the carriage of pres... goods under their own control. All this has increased which in on a road system upon the improvement of which still 40 atively little has been spent since the war: a Ministry tail buy... sport census in August, 1950, showed that between ident th

rther be... Rees Jeffreys triennial lecture, Town Planning ... expec... "The Place of A Modern Road System in the National nploym...," by Christopher T. Brunner in association with James 1938 and 1950 goods vehicle traffic on trunk and first-class roads increased by 59 per cent, and bus and coach traffic by 34 per cent. Expenditure upon roads remains a favourite with Chancellors forced to decree cuts in capital investment;

but a fairly limited amount spent on certain urgent improvements and extensions of trunk roads might do more to save man-hours, equipment and resources than investing the same amount in almost any form of manufacturing industry. The ten-year plan for road development produced in 1946 has still not been implemented, and no alternative plan has been adopted.

Small Change in Entertainments

Mr Butler kept his end up fairly well against a wide variety of bowling when he defended his new scales of Entertainments Duty—which will impose a higher levy upon cricket and football—in the committee stage of the Finance Bill this week. He finally conceded that the introduction of the increased scale should be postponed so as to leave cricket on the present scale during the whole of the present season—and incidentally to exempt football from the increase in duty for the first Saturday of its 1952-53 season. He undertook to watch carefully the gates and the fortunes of the cricket clubs—which have recently become parlous—before the next season opens: and to consider evidence from football clubs of the effect that the increase would have upon their financial positions. Mr Butler estimated that the changes in duty as originally timed would cost £250,000 in a full year (but £500,000 in 1952-53, because the reductions in duty took effect before the increases). The reductions in duty on racing would cost rather more than £1,600,000 in a full year, and the increases on cricket and football yield an extra £1,500,000 a year; the remainder of the net cost of £250,000 is accounted for by reductions in duty on such entertainments as mannequin parades and bathing beauty contests.

No concessions were forthcoming upon cinema duty, concerning which the exhibitors had submitted yet another proposal for a revised and more flexible scale. This latest proposal seems to have been prepared rather more hurriedly than earlier revisions; it suffered from this and from not very effective presentation in the House. Too much play was made with the need to give relief to the owners of the smallest cinemas, though the concession would have assisted all cinemas alike. The poverty of the small exhibitor was dwelt upon without much evidence—the last figures produced by the Cinema Exhibitors Association suggested that in fact some of the medium-sized halls were probably the worst off. Finally, the proposal was put forward as likely to cost the Exchequer some £500,000 a year, which would be a reasonable price to pay for a better-designed tax scale that would permit flexibility of pricing; but Mr Boyd-Carpenter held that it would in fact cost not £500,000 but £2 million a year. Estimates that depend upon guessing how many people might buy seats at an altered price are notoriously shaky, and the exhibitors may be almost as

likely to be right as the Customs and Excise on this point. But the case for a better design of cinema tax—which remains a good one—is not being assisted by presenting it ill-prepared.

Changes in Steel Finance

Belatedly, Colvilles has added its report to the batch of accounts that have been recently issued by the nationalised steel companies; they are summarised in the accompanying table. Apart from requiring that these accounts should be struck on September 29, 1951, the Iron and Steel Corporation seems to have allowed its subsidiaries fair latitude in drawing up accounts. The common accounting date results in varying periods between the last pre-nationalisation accounts and those now published; this obscures the comparison of profits, though the trend—except for Dorman Long—seems to be clearly upward. The increases reflect in part the fortuitous profit that accrued when the prices of steel and materials were raised last year; Richard Thomas and Baldwins specifically states that £820,000 of the £5.3 million earned in the six months ended last September represented such a windfall gain, compared with £120,000 of the profits of £7.3 million earned in the last full year to March 31, 1951.

Changes of particular interest are to be found in the balance sheets rather than in the profit and loss accounts. Companies in need of finance have been able to borrow from the corporation at a low (though presumably now a higher) rate of interest. Some concerns have quickly seized the opportunity offered by nationalisation to reorganise their loan and share capital structures. Dorman Long has made a clean sweep by paying off its debenture stocks and by converting its high dividend preference capital into ordinary shares; both revisions appear to have been made without assistance from the corporation. Stewarts and Lloyds, on the other hand, has apparently borrowed from the corporation in order to repay its debenture stocks; the consolidated balance sheet shows that mortgage debenture and secured loans have fallen in nine months from £3,594,537 to £30,131, while amounts owing by Stewarts and Lloyds to the corporation and its subsidiaries are shown at £2,215,978. Similarly, the accounts of United Steel reveal that mortgages and secured loans, which totalled £568,000 at the end of 1950, have disappeared and have apparently been replaced by a loan of £500,000 from the corporation. With no debenture stocks or mortgages outstanding, Colvilles has not become a debtor to the corporation and its capital structure has remained unchanged; indeed, the company has lent £3,500,000, at call, to the corporation. The Hadfields balance sheet shows that the company has used a loan of £2,174,000 from the corporation to repay its indebtedness to the banks and to finance its capital development; the chairman, Lord Gordon, adds that the balance sheet figures make it evident that "a reconstruction of the capital of the company will have to be undertaken."

These various changes in financial structure raise interesting questions about the selling back to the public of an investment participation in the industry. They will make possible, for instance, free resort to new prior charge finance in cases where debenture and preference issues have been paid off. Such repayments may well prove to have been of timely assistance to the marketing of steel securities, though on a wider view it may be that only a state corporation, financed on government guarantee, could afford to hold steel equities and no prior charges.

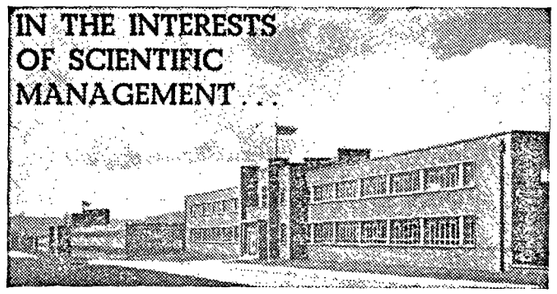
Cargo Liner Prospects



The published accounts of liner companies for 1951 reveal a year of profitable trading, although liner freight rates do not fluctuate so rapidly as tramp freight rates. The liner freight conference system acts as a brake on the upward or downward movement of rates, so that liners did not share in the freight boom to the same extent as the tramps. In fact, liner companies that were obliged to charter extra vessels to supplement their services were to some extent victims of the freight boom, although the demands of shippers were so insistent that the liner companies were often able to pass a large proportion of the high rates they had to pay for extra tonnage over to the shippers in the form of a special surcharge. Nevertheless, the liner conferences did increase their freight rates in successive stages, and the delayed action of the conference system means that these higher rates carry over for a few months after the break in the tramp market. The earnings of most cargo liners during the first quarter of this year have thus been maintained at about the highest level of 1951. But now reductions in conference rates are coming into force, and the situation was described this week by the chairman of the Cunard group as "loose."

Import restrictions imposed in Britain and in Australia affect the liner companies more directly than the tramps, for two reasons. In the first place, the commodities restricted

. . . Castlereagh's production lines move into top gear

The latest addition to The British Tabulating Machine Company's group of factories is at CASTLEREAGH, near Belfast. Planned and equipped in the finest traditions of modern precision engineering, Castlereagh's 250,000 square feet is being geared to meet increasing demands from all parts of the world for Hollerith ancillary machines. Castlereagh's output will make a major contribution to the nation's productivity.

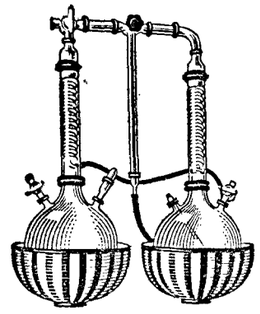
JOBLINGS OF SUNDERLAND

versatility in glass

Glass was first made in the Sunderland district over a thousand years ago. Today, and for some generations, the works of James A. Jobling and Co. Ltd. have been producing an ever increasing range of articles and instruments from a variety of glasses including the famous 'Pyrex' brand, the original heat resisting glass in the world



FOR 'LOCAL' USE
—the 'barrel' pint beer mug seen in bars from Sunderland to Singapore. Made in the Flint Glass section of Joblings

FOR LABORATORIES
—a graduated beaker, one of a range of many different shapes and sizes. Made of 'Pyrex' glass to resist heat and thermal shock

FOR FOOD AND DRINK
—a protein hydrolising plant used in 'patent food', soft-drink and chemical manufacture; for example to make protein more digestible or more soluble. This Unit is made of Joblings 'Pyrex'

AND FOR THE HOME—THE GENUINE
original oven-to-table glass

CARRON THE ROYAL CHARTER COMPANY FOUNDED IN 1759

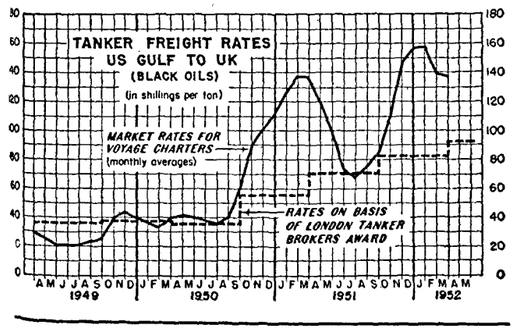
Would a better Canteen help production in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

Carron HEAVY DUTY COOKING EQUIPMENT

COAL · COKE · STEAM · OIL · GAS · ELECTRICITY

CARRON COMPANY · CARRON · FALKIRK · STIRLINGSHIRE & LONDON, MANCHESTER, LIVERPOOL, NEWCASTLE AND GLASGOW



are for the most part normally carried in liners and not tramps. In the second place, tramps displaced from one trade can look for alternative employment in other trades. Liners cannot do this to the same extent, particularly in the case of specialised vessels, and regular services have to be maintained regardless of empty holds. The commercial outlook for the rest of the year, therefore, remains obscure for the cargo liners, particularly in view of their increased operating costs —which in the case of Cunard, for example, were responsible for a fall of 12 per cent in operating surpluses. Seafarers' wages have been increased twice in twelve months, and port charges are continuously rising, while fuel bills are now enormous. Whatever the course of cargo liner earnings, however, provision for replacement remains essential. The Cunard, Brocklebank and Port Line group is to spend more than £15 million over the next four years on normal replacement, despite the fact that it has only recently completed its abnormal postwar replacement programme.

* * *

Tanker Freight Rates

Like tramp and liner freight rates, tanker rates have been at peak levels, but a sharp drop occurred in March and April. In January charterers were paying 310 per cent above the old Ministry of Transport controlled rate for single voyages from the Persian Gulf area to the UK/Continent. But by the end of March this rate had declined to about MOT plus 250 per cent; and at the end of April vessels were being fixed for June loading at about MOT plus 85 per cent. This level is about the same as the lowest prevailing in 1951, before the Persian oil dispute brought about a sudden acute demand for tanker tonnage. That demand has now abated, and the normal summer seasonal influences are again making themselves felt.

The major oil companies have practically withdrawn from the spot market, although they are still prepared to consider tonnage on a consecutive voyage basis for 12 to 24 months. A recent fixture of this type was that of a handy-sized tanker at MOT plus 150 per cent for 1952 voyages, with a reduction to MOT plus 100 per cent for 1953. The time charter market has not been active, but one large tanker that will not be built until the end of 1955 has been taken for five

years' trading at 24s. 6d. per ton per month. This compares with the current award of 52s. per ton by the London Tanker Brokers' Panel, but this award is set for a notional small tanker (about 12,000 tons dw) for a period of two years. The accompanying diagram shows how this award compares with spot market rates over the last three years. The graph of rates on the basis of the brokers' award irons out the violent fluctuations of spot voyage rates, and successfully underlines the prevailing trends. The increases have been continuous, but the rate of increase has been declining.

Next Steps in Cotton Buying

The first steps are now being taken to implement the decision to restore to Lancashire freedom to buy its own raw material. The new scheme, discussed in an article in *The Economist* of April 26, 1952, was announced by the Government a fortnight ago. Spinners have now been given until June 14th to decide whether they wish to buy their cotton privately or through the Raw Cotton Commission, and they can exercise this option for American-type cotton, Egyptian-type cotton or sea-island cotton. The fourth group of cotton (Peruvian and Californian) will not be reopened to the trade until September because its buying season opens later. An advisory panel has been set up to assist in working out the details of the scheme and to supervise its operation. The chairman is the deputy-secretary of the Ministry of Materials and the other members include the presidents of the Liverpool and Manchester Cotton Associations and of the Master Spinners' Federation, the chairman of the Raw Cotton Commission and the secretary of the Operative Spinners' Amalgamation. A second body is also being set up—the Cotton Entitlement Organisation—to look after the interests of those spinners who decide to import privately. It will ensure that these spinners get the same proportionate share of the different grades of cotton as the Commission and it will also keep a check on the transfers of entitlements and on import licences. The Commission is offering complete cover facilities to all spinners who contract out, provided that they undertake to keep fully covered at all times; hedging operations will be based on either the Commission's current standard price or on the sterling equivalent of the New York futures. Similar arrangements will be made for the Alexandria market so long as no maximum or minimum prices are imposed in that market.

The stage, then, is set. It now remains to be seen how many spinners will favour freedom. In the initial stages marketing operations are bound to be complicated and it may take a season or two before judgment can be passed on the scheme. It is no more than an experiment in a new form of private trading—a form that is prescribed by entitlements, currency restrictions and import licences. If it works satisfactorily, it might be applied to other commodity markets that have not yet regained their freedom.

Shorter Notes

Last August, Albright and Wilson raised £2,500,000 by placing privately an unsecured 4½ per cent loan, repayable 1957-66; in 1951 its subsidiaries raised another £933,932 by secured and unsecured loans. Almost the whole of the proceeds of these loans seemed to be held in liquid balances at the end of last year; the new money should soon be absorbed by this year's capital expenditures, outstanding contracts for which at the end of the year were estimated at £5 million. The chairman points out that the £2,500,000 loan "does not necessarily constitute a precedent for the raising of further cash which the company will need for its future capital programme."

This week the Indian Government has made further heavy cuts in the export duty on jute goods. The duty on hessian has been reduced by £36 a ton to £20 12s. a ton, bringing the duty on 10 oz 40 inch hessian down from 30s. to 10s. 6d. per 100 yards. The duty on sacking has been cut by half to £13 a ton. In February the duty on hessian was halved, but as trade did not recover, further cuts were inevitable. The new rates will enable the Indian mills to undercut the European manufacturers, and the market is now waiting to see

Company Notes

Dunlop Rubber.—As more and more of Britain's industrial giants announce their 1951 trading results, it becomes increasingly clear that the rate of expansion in profits is slowing down. The boom year for profits was 1950, reflecting the immediate fillip given to earnings by devaluation and to prices by rearmament and the Korean war. Since then the upsurge in costs has gradually whittled down profit margins. Clear evidence to substantiate this contention is to be found in the recent profit experience of Dunlop Rubber. In 1950 the group's trading surplus jumped by over £8 million to nearly £17.6 million; last year, when the value of turnover almost certainly increased once again, the group's trading surplus increased by less than £290,000, from £17,580,500 to £17,869,124. Taxation has therefore risen only slightly, from £8,691,890 to £8,915,898; but as in addition to the normal depreciation allowance of £3,969,596 (against £3,754,947) a further £470,000 (against nil) has been set aside for the replacement of fixed assets, group net profits have fallen, from £5,062,863 to £4,607,413. As the appropriation of £470,000 can cover only a very small part of the eventual cost of replacement, it is not surprising that the directors have decided to maintain the ordinary dividend at 17½ per cent and have concentrated on reinforcing reserves. Profits retained by subsidiaries have been increased from £1,259,760 to £1,732,295, while £960,000 (against £1,915,000) has been transferred to a general reserve.

Consolidated earnings :—	Years to Dec. 31, 1950	1951
	£	£
Trading profit	17,580,500	17,869,124
Depreciation	3,754,947	3,969,596
Replacement reserve		470,000
Taxation	8,691,890	8,915,898
Group earnings for ordinary stock.	*4,875,115*	*3,875,132*
Ordinary dividends	1,180,958	1,180,958
Ordinary dividends (per cent)	17½	17½
Retained by subsidiaries	1,259,760	1,732,295
General reserve	1,915,000	960,000
Added to carry forward	19,397	1,879

£1 ordinary stock at 55s. 6d. yields £6 7s. per cent.

The maintained ordinary dividend is well covered by earnings if retentions by subsidiaries and the appropriation to general reserve can be regarded as freely available for distribution—but this is a big assumption to make once the high costs of replacement and the decline in liquid resources throughout the industry are taken into account. The odds therefore seem to be against any dividend increase in the immediate future. EPL will cut into earnings and the directors will probably insist that the maintenance of the group's capital intact has priority over any claims for increased equity payments.

★

Vickers.—Vickers' experience last year provides a clear example of the difficulties that have arisen from the Government's attempt to carry through the rearmament programme without cutting back civil consumption. Throughout the chairman's review the theme recurs that the whole of Vickers' productive capacity could not be utilised last year owing to a shortage of materials and labour. In shipbuilding steel was the chief limiting factor on output. Sir Ronald Weeks reports that this and other shortages "made it impossible for full advantage to be taken of the productive potential at the two modernised shipyards." In aircraft production the limiting factor was the shortage of labour. In an attempt to remedy this shortage, both the Weybridge and Supermarine works are resorting to a substantial amount of sub-contracting; at Weybridge, where the shortage of labour is especially acute, efforts are being made to disperse small manufacturing units into areas where pockets of labour are available.

In the business of Metropolitan-Cammell Carriage and Wagon, a shortage of shipping as well as of steel prevented the full use of manufacturing capacity; as a result deliveries fell below the record level set up in 1950. The company has made strong representations for sufficient allocations of steel to enable it to meet present orders for railway rolling stock, seventy per cent of which are for export. In the heavy and light engineering divisions the increase in the volume of armament work has led to a gradual reduction in commercial output but sales of established commercial products have been well maintained. Some of the biggest increases in output were achieved in those divisions manufacturing specialised products, where it was possible to recruit more labour.

£1 ordinary stock at 44s. 3d. xd yields £5 13s. per cent.

Since Vickers was already handicapped by shortages of labour and materials before production was fully geared to defence orders, the group could hardly have been expected to report any startling increase in earnings. In fact, as noted in these columns on April 26th, group trading profits rose only slightly, from £7,461,333 to £7,596,310, while net profits fell from £2,838,074 to £2,072,872. The ordinary dividend was maintained at 12½ per cent and £1,021,365 (against £1,668,662) was ploughed back into the business. Profit retentions and the surplus of £8,950,808 arising on the nationalisation of English Steel have enabled the group to carry increased investment in fixed and working capital—the book value of stocks and work in progress, for example, rose from £46,588,901 to £59,252,719 last year—without imposing too great a strain on liquid resources. The group should not have much difficulty in meeting its immediate commitments for capital expenditure, estimated at £2,500,000 at the end of last year. Labour, rather than steel, may become the major problem towards the end of 1952, but if costs can be kept down defence contracts should ensure an increase in earnings. It remains to be seen how far EPL may prevent such an increase from being passed on to equity shareholders.

★

Vauxhall Motors.—Mr G. N. Vansittart's statement accompanying the 1951 accounts of Vauxhall Motors does not wholly conceal a certain sense of frustration. The number of cars and commercial vehicles produced fell from 87,454 to 77,877 and the number exported from 61,471 to 53,271. Demand remained high throughout the year but "erratic deliveries of steel caused many costly dislocations and interruptions of production flow." Because of shortages, particularly of steel, the export orders that the company were unable to fill were at least equal to the number of vehicles actually shipped; Mr Vansittart describes this as "a truly ironic situation in a country that must live by exports." This, however, is not the end of the difficulties that Vauxhall experienced last year. The company's postwar development programme—which to date has cost over £10 million, of which £4 million was spent in 1951—is now nearing completion at a time when the newly installed plant and equipment cannot be fully employed. In fact, material shortages are so severe and allocations so inadequate that the volume of production is now actually lower than when these extensions were put in hand. Output fell so sharply last year that the company was forced to place a large number of its labour force on a four day working week and later in the year to dismiss about 250 of its employees. It is more than 14 years since the company was confronted with a similar situation. It is a sad commentary on Britain's effort to expand exports that, through a shortage of materials, this important company has to make the same decisions that it had to make in the 1938 slump.

Earnings :—	Years to Dec. 31, 1950	1951
	£	£
Trading profit	4,532,410	5,052,338
Total income	4,618,372	5,095,121
Depreciation	539,619	934,833
Taxation	1,690,417	1,782,679
Net profit	*1,101,495*	*942,935*
Ordinary dividends	165,000	157,500
Ordinary dividends (per cent)	6	6
Added to carry forward	934,095	783,260
Balance sheet analysis :—		
Fixed assets, *less* depreciation	6,011,595	8,382,237
Net current assets	8,663,485	7,593,470
Stocks	2,702,012	761,890
Cash	5,242,268	6,493,477
Revenue reserves	5,000,000	5,000,000
Ordinary capital	5,000,000	5,000,000

The value of net sales, including those of spare parts, increased from £31,637,999 to £35,927,153 and the value of exports from £17.5 million to £18.5 million. As a result trading profits jumped from £4,532,410 to £5,052,336; but net profits fell from £1,101,495 to £942,935. The main reason for this decline was the increased provision for depreciation, from £599,619 to £994,833, reflecting the increase in investment in fixed capital. Increased investment in plant and equipment and in working capital—the value of stock and work in progress has jumped from £5,006,777 to £7,438,602—has made further calls on liquid resources. Cash balances have fallen from £2,702,012 to £761,890 and bank advances have risen from £600,000 to £1,500,000. Production has not yet started on defence work, but the company is tooling up for a special military vehicle and Mr Vansittart expects the new models to start rolling off the assembly line "in good volume in the early part of 1952." The big question for Vauxhall—as for the rest of the motor industry — is whether once steel supplies are adequate the export markets will still be eager to take its products.

★

Guest Keen and Nettlefolds.—The £1 ordinary stock units of Guest Keen and Nettlefold merit the ranking of an expanding equity on at least three counts. First, there are the prospects of the long-term development schemes, particularly in Australia, which the company has put in hand since the nationalisation of its steel interests. Secondly, the directors have recognised advances in profits by increases in ordinary dividends. Thirdly, prudent allowances have been made against the costs of plant replacement. The preliminary statement for 1951 throws light on the last two points, and a most welcome light it is. The group's trading surplus has risen from £7,682,098 to £11,271,030 and the ordinary dividend has been raised from 14 to 15 per cent. Net profits show a fall from

Consolidated earnings :—	Years ended Dec. 29, 1950	Dec. 30, 1951
	£	£
Trading surplus	7,682,098	11,271,030
Total income	8,839,455	12,045,908

Ordinary dividends	844,775	833,930
Ordinary dividends (per cent)	14	15
Retained by subsidiaries	1,429,925	1,015,539
General reserve	900,000	1,000,000
Added to carry forward	84,695	719

£1 ordinary stock at 51s. 3d. yields £5 17s per cent.

£3,671,147 to £3,334,388, but this decline is due to the increased provision for taxation, from £3,749,770 to £6,059,782, and to a fall in investment income from £880,191 to £419,827, following the vesting of the group's steel interests in the Iron and Steel Corporation. As a result profits retained by the holding company and its subsidiaries have fallen from £2,414,620 to £2,017,258.

The directors demonstrate their prudence by allowing for the "reduced purchasing power of money" in calculating last year's provision for depreciation. This provision has been made on the basis of current values instead of book values of fixed assets. The total provision against profits has therefore been raised from £1,534,391 to £2,488,072, of which £1,055,236 has been transferred to a capital depreciation reserve and £1,432,836 (against £1,534,391) has been written off the book value of fixed assets. The directors seem to regard the additional depreciation provision as a direct charge against profits and not as an appropriation from them; the tax inspector, of course, takes a different view and will make no allowance for the additional provision in arriving at taxable profits. Guest Keen is only one of a long list of companies that have made provision against the increased cost of replacement, but the company deserves the thanks of shareholders for showing the basis on which the appropriation has been made; too often appropriations to replacement reserves seem to be little more than inspired guesses.

★

Cunard.—It is an interesting commentary on the strength of Cunard's reserves, hidden or revealed, that since the 1948 issue of ordinary shares the company has been able to rehabilitate its fleet after the wartime ravages without raising any more new capital in the market, and that the chairman can announce plans to build eleven new ships between 1952 and 1956, which will cost about £15,325,000, without any suggestion that the company will need to raise new money from the public. Within the last four years the reserves of the group, excluding the share premium account, have risen by about £11.5 million to just over £29 million. The official depreciation allowances, which amounted to about £9.5 million over the same period, are not high enough to meet the present-day costs of renewals, but only the future will show whether Cunard's fleet can be renewed and maintained indefinitely from the company's own internal resources. The company's financial strength owes a great deal to the high level of shipping earnings since the end of the war. The chairman, Mr F. A. Bates, remarks that the operating surplus in 1951 of £9,445,590 was well in line with the recent trend in profits, if the exceptional earnings in 1950 are excluded, and that the company has done well to hold profits at this level in view of the recent increases in operating costs.

Consolidated earnings :—	Years to Dec. 31, 1950	1951
	£	£
Operating surplus	10,780,750	9,445,590
Total income	11,005,688	9,745,675
Depreciation	2,512,776	2,475,930
Taxation	4,918,238	3,693,027
Net profit	*3,477,619*	*3,351,937*
Ordinary dividends	516,638	614,125

Cons. balance sheet analysis :—		
Fixed assets, *less* depreciation	31,602,893	32,954,783
Total current assets	31,914,293	36,386,400
Debtors, etc.	3,947,079	5,503,447
Investments	11,227,325	11,225,036
Cash	10,662,587	14,402,019
Reserves	27,473,600	30,574,343
Ordinary capital	7,798,346	7,798,346

£1 ordinary stock at 30s. 6d. yields £8 4s. per cent.

The increase in the ordinary dividend from 12½ to 15 per cent in the face of a decline in the operating surplus, from £10,780,750 to £9,445,590, and in the net surplus, from £3,477,619 to £3,351,937, appears to hold out fair prospects for the current year. This receives some confirmation in the chairman's review. Mr Bates believes that in the absence of international tension Cunard's earnings this summer should be in line with earnings in 1951. But he does not venture on any more distant forecasts, as much will then depend on the Government's import and export policy. At present profit levels, there will be no serious liability for EPL.

★

Hudson's Bay.—Over the last year or so speculation has given Hudson's Bay's equity the appearance, if not the status, of shares in a developing oil company and not of shares of an established trading concern. Buying of the shares by North American investors and speculators has also given colour to rumours that the company intends to transfer control to Canada; the governor, Sir Patrick Ashley Cooper, in his report, once again denies any such intention. In his review of the company's operations, Sir Patrick points out that Hudson's Bay is still a company of merchant adventurers. The bulls might do well to remember this: whatever the eventual returns from the Alberta oilfields may be, dividends in the next few years will depend upon profits earned by the company's activities in the retail, wholesale and fur trades. After the end of the Korean war boom in the spring of 1951 Hudson's Bay was faced, as were the majority of trading concerns, with a decline in sales, intensified competition and a sharp rise in costs; there seems to be no likelihood that this trend will be reversed this year. In all three main divisions of the company's activities the value of sales increased last year, but only in the fur trade was this increase accompanied by an advance in profits. In the company's retail stores a new record in sales was set up, but the general rise in commodity prices cut into profit margins and earnings declined. Similarly, costs were higher and profits lower in the company's wholesale trade; the increase in the value of sales stemmed almost entirely from price increases and higher excise duties on tobacco. The fur trade is now experiencing one of its periodic slumps, which was not reflected in last year's figures but which will have a marked effect upon this year's results.

Consolidated earnings :—	Years to Jan. 31, 1951	1952
	£	£
Retail sales	24,338,668	27,971,893
Retail profits	1,190,170	927,781
Wholesale sales	10,036,996	11,518,731
Wholesale profits	322,870	305,136
Fur sales	19,154,341	22,730,688

Net current assets	9,338,203	10,235,538
Stocks	7,790,184	9,471,406
Cash	1,528,647	1,217,236
Reserves	12,127,598	12,885,155
Ordinary capital	2,492,224	2,492,224

£1 ordinary stock at 10¾ yields £2 6s. per cent.
* Excludes 5 per cent tax free distribution from land sales.

For the fur trade is now experiencing one of its periodic slumps, which was not reflected in last year's figures but which will have a marked effect upon this year's results.

Development of the company's oil interests continues apace; in 1951 Hudson's Bay Oil and Gas Company spent $5,113,000 on development, almost double the sum spent in 1950, and while Hudson's Bay received £142,258 (against £94,029) in royalties, it had to increase its cash advances to the Oil and Gas Company from £203,333 to £462,500. Receipts are not yet sufficient to cover outgoings; and while the long-term prospects are good, "large immediate returns" cannot be expected. Immediately, therefore, dividends will depend on the prosperity of the company's established trading activities and, discounting last year's increase in equity payments which was discussed in these columns on April 19th, the decline in profits suggests that here the prospects are none too favourable.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 3, 1952, total ordinary revenue was £104,716,000, against ordinary expenditure of £76,194,000 and issues to sinking funds £730,000. Thus, including sinking fund allocations of £2,061,000 the deficit accrued since April 1, 1952, was £47,116,000 compared with a surplus of £37,054,000 for the corresponding period of the previous year.

COMPANY MEETINGS

CANADIAN PACIFIC RAILWAY COMPANY

RECORD TONNAGE CARRIED

INDICATIONS OF FURTHER EXPANSION

PLANS FOR ENLARGEMENT AND IMPROVEMENT

MR W. A. MATHER'S ADDRESS

The seventy-first annual general meeting of the Canadian Pacific Railway Company was held on May 7th at Montreal, Mr George A. Walker, QC, chairman of the company, presiding.

Mr W. A. Mather, the president, addressing the meeting said: Since I last spoke to you, nothing has more deeply moved and grieved the Canadian people than the sudden death of His Majesty King George VI. After he had endured so much suffering, we had hoped that he would regain his health to permit him to be with his people for years to come. Her Majesty The Queen, who has succeeded him, is already known to and beloved by the people of this and other countries of the Commonwealth. We know that devoted service to her subjects will be given in the selfless manner characteristic of a British Sovereign. It is no empty form of words to say that the lamented death of our late Sovereign, and the accession of his beloved daughter, have brought to us all a sense of something stable, something lasting in a changing world.

REMARKABLE GROWTH OF CANADIAN ECONOMY

It was during the reign of Queen Victoria that your company was incorporated. In that year, 1881, there were many who viewed with gloom the prospects of this country. Today, a lifetime later, there is abroad a realisation of the remarkable growth that has already taken place and a sense of great destiny which lies ahead of Canada. Perhaps the measure of growth of which Canadians are most conscious is that of population. While there is still need of a larger population, the number of people in Canada, over 14 million, has trebled in the years since your railway forged the link between its eastern and western extremities, however, growth in terms of the production of goods and services has been even more marked, particularly since the end of the 1930s. During the past 12 years, a period in which population increased by 25 per cent, the physical volume of production of goods and services has nearly doubled, this growth has, in the main, been based upon the development of Canada's most abundant asset—her vast and varied wealth of natural resources.

Since the war, this has taken place at an unprecedented rate. Some of the present projects—notably iron ore in Quebec and Labrador, oil in the Prairie Provinces, and the production of minerals in British Columbia—are among the largest in our history. It is upon such an ever-widening base that many industries of Canada are being built. The rapid growth of Canadian industry is indicated by the increase of approximately 90 per cent in employment in manufacturing since 1939. This marked expansion is diversifying and strengthening our economy.

SUBSTANTIAL EXPENDITURES

These great elements of strength would not, however, have been possible but for the many who, through their faith and by the investment of their savings, have financed the substantial capital expenditures necessary to develop them. Such capital expenditures were essential in the past, and a stream of new capital is imperative to ensure continued growth in the future. The extent of capital investment currently being made in this country is probably not generally realised. During the past six years, capital expenditures for structures (including housing), machinery and equipment totalled more than $19 billion. Expenditures made during 1951 were the greatest on record and equalled in volume more than one-fifth of the gross national product of Canada. By far the greatest part of this investment was financed out of the earnings of the Canadian people and Canadian corporations. An important contribution, however, came from foreign investors and is a reflection of their confidence in the future of our country.

RAILWAY CAPITAL REQUIREMENTS

The role of transportation in an expanding economy has been well illustrated by Canadian railways. The integration of Canada as a vigorous nation, the growing forestry and mining activities of Quebec and Ontario and the expansion of agriculture in the prairies were made possible only by the construction of railway mileage. In the era which ended in the 1920s, the construction of new lines proceeded rapidly, and subsequent betterment and improvements have been directed to provide efficient low cost transportation. The railway systems of Canada were built, in large part, in anticipation of the traffic needs of the country, while there are still some lines where the expected volume is no longer in excess of needs. The development of Canada has, in fact, caught up with railway construction. As the productive capacity of the nation increases, an increase in the capacity and efficiency of transportation facilities is essential. Railways provide the cheapest method of mass transportation on land and, as such, it is vital that their facilities should be expanded and improved in anticipation of the expansion of the economy.

During 1951, traffic volume on your railway amounted to almost $27 billion revenue ton miles, a level exceeded only in two war years. Tonnage carried, at over 60 million tons, made a new record. There is every indication that in the future traffic will reach much higher levels. Plans for the enlargement and improvement of your properties to meet this situation have been made. There is also a concurrent need to increase efficiency in order to move the present volume of traffic expeditiously, and large expenditures will be required to replace present equipment and facilities as they must be retired or become inadequate.

HOLDING DOWN RISING COSTS

These replacements offer the best prospect for holding down rising costs of operation, the long range programme presently contemplated includes examination and reconstruction of terminal facilities in order to expedite the flow of traffic; improvement of track standards by laying heavier rail; the restoration and strengthening of embankments to permit heavier loads and higher train speeds; passing track extensions to avoid delays in meeting and passing trains; further installations of automatic signals and the introduction of centralised traffic control to increase the capacity of congested lines; the introduction of new methods of communication to expedite train movements and terminal handling; and the greater use of diesel-electric locomotives. These are the basic requirements of your railway to meet the inevitable future growth of Canada. Conversion to diesel-electric power has taken place on certain lines of your railway, and studies are continuing to determine further territories when conversion would be advantageous. As savings from the use of this type of power arise, to a large extent, from intensive utilisation on lines where there is a heavy density of traffic, it is unlikely, because of the many light traffic branch lines of your railway, that it will be desirable to change over entirely to diesels for some years.

The capital programme needed for your railway was carefully studied in 1949, and it was then estimated that an expenditure of about $80 million annually over a period of five years would be required. The urgency of these requirements reflects in part the interruptions to normal capital work which occurred both during the depression of the 1930s and the war years of the 1940s. However, acceleration of the growth in the economy which has occurred since this programme was drawn up, as well as the increase in the level of prices, indicates that even larger annual expenditures may be necessary.

Your directors, in their report which is now before you, stated that the rate of return on investment earned by your railway enterprise in the year 1951 was at the low level of 2.4 per cent. They gave you, on a conservative basis, an intimation of the future capital requirements of your company and expressed the view that "adequate rail earnings will be necessary to enable your company to finance these expenditures." Because railway mass transportation is such a vital necessity to the continued growth of Canada, as it was proven to be in the war years, the railways must be placed in a position to finance their requirements of capital on a sound basis.

OIL

The development of oil resources in Western Canada is of importance to your company. The postwar discoveries and the increasing production of oil are broadening and accelerating the development of that area. Increases in railway traffic are resulting tion of oil. Your directors have considered directly engaged in the discovery or production of oil. Your directors have considered that the best interests of your company would be served by granting reservations and leases to those willing to undertake exploration and drilling over the wide areas involved. Reservations for exploration are granted at a nominal acreage fee, requiring certain exploratory work to be undertaken. When exploration indicates favourable prospects, part or all of the reservation is placed on a lease basis embodying specific drilling commitments and providing for an appropriate rental and a percentage royalty to your company. It is considered that these arrangements have encouraged exploration and drilling on a widespread basis with optimum long term benefits to your company.

The production of the entire area is limited by Government "allowables" set from month to month, and based on the relationship of the aggregate amount of oil that can be brought to markets to the total potential of producing wells. Permissible production will vary as additional pipe lines are constructed and new wells are completed. Local demand and refining capacity may be expected to show a gradual increase.

BRITISH COLUMBIA COAST STEAMSHIPS

From early days your British Columbia Coast Steamships have served the traffic needs of Vancouver Island. Last summer, a new passenger and automobile ferry, the "Princess of Nanaimo," was placed in operation on the Vancouver-Nanaimo route. In view of the traffic potential of this route, consideration is being given to the provision of an additional unit capable of handling freight cars and trucks.

OCEAN STEAMSHIPS

Your Ocean Steamship operations in 1951, on the basis of return on investment, were most satisfactory. The outlook for 1952 is for another year of substantial traffic volume. More intense competition and higher costs of operation are to be expected.

Negotiations just concluded with the British Iron and Steel Corporation have resulted in the sale of the *Empress of Australia* to that company for breaking up. This vessel had been under charter to the British Ministry of Transport since 1939, and was 38 years old. The relatively high prices presently being paid by the steel industry for scrap metal resulted in a fair sale price being realised.

While North American trade with the Orient has been practically at a standstill, virtually all of the shipping companies which traded in the North Pacific prior to the war have re-established service to Japan, Hong Kong and the Philippines. Your officers have concluded studies which indicate that the restoration of trans-Pacific operation with freight-carrying units of the fleet would be justified. Arrangements are being made to transfer two of the so-called "London" Beaver ships from the Atlantic to commence the proposed service. Schedules and ports of call are under consideration and are expected to be such as to provide a monthly service from the Port of Vancouver, scheduled cargo service on the Atlantic, an additional vessel of approximately the same capacity and speed as those remaining in this service will have to be acquired.

AIR LINES

Much of the development of natural resources at present taking place in Canada is in the areas serviced by the domestic routes of your Air Lines. Examples are the development of iron ore in Labrador, served from Seven Islands; nickel and copper at Lynn Lake, served from Flin Flon; uranium at Goldfields; lead and zinc at Pint Point; oil in the Peace River Country; lead, zinc and silver at Mayo Landing; the aluminium development at Kitimat; the Celgar Activity near Castlegar; and the very heavy development programme of Consolidated Smelters at Trail and Kimberley. The prospect for increased domestic traffic for your Air Lines is accordingly good. Application has been made to the appropriate authorities to permit an extension of existing Pacific Services to provide a through route from the Orient to South America.

The enlargement of your Air Fleet has been restricted owing to the difficulty of procuring equipment. However, it is expected that, during the next year, capacity will be materially increased by the delivery of six Douglas DC-6 B's and two De Havilland "Comet" aircraft. When this equipment has been delivered, your air lines will have fast passenger service to both Australasia and the Orient, and will develop freight services over the Pacific which, because of lack of aircraft, have not been undertaken to date. With the entry into Pacific service of these high speed transports, aircraft at present in this service will be available for use on domestic routes. To meet the increasing demands of these routes, it is also intended to acquire five additional planes at an early date.

WAGE NEGOTIATIONS, SETTLEMENTS AND LABOUR PROBLEMS

The principal features in connection with the various wage negotiations occurring in 1951 are referred to in the annual report. Negotiations commenced in February of this year for new contracts with most of the organisations representing employees engaged in train operations. Following a number of conferences with the representatives of the locomotive engineers on the prairie and Pacific regions a settlement was reached providing for an increase of 11½ per cent in wage rates together with a rule change favourable to your company.

The negotiations leading to this settlement indicated a sincere desire to conclude the matter by recognised processes of collective bargaining. It is a source of satisfaction that the new contract was signed and made effective on April 1, the date on which the then current contract expired. The new contract is to run for eighteen months.

Preliminary discussions were also carried on with other operating groups but as yet there are no developments to report. The proposals submitted by them for acceptance appear to be considerably in excess of those which might be justified by existing conditions. It is to be hoped that it will prove possible, as in the case with the engineers on the western regions, to reach agreements.

I think it appropriate here to remark that much has been accomplished since 1939 to improve the economic position of Canadians. That is as it should be, and no one can offer serious objection providing the betterment is supported by an improvement in productive effort. History records several instances where the effects of great prosperity in a country have resulted ultimately to the great detriment of its people. I suggest to you that the time has arrived when Canadians should sit back and consider their position. There is no question in my mind as to the future of this country but there is a doubt as to whether the continuation of what appears to be the present policy of decreasing the hours of work without a compensating increase in production will not have an effect on the future prosperity of Canadians directly contrary to our hopes.

FIRST QUARTER FOR 1952

In the first quarter of this year gross railway earnings were up by $9.6 million over the same period of 1951, largely reflecting the increase in freight rates. However, working expenses, which included the costs of the 40-hour week, increased slightly more, being up by $10.6 million. Freight traffic volume, in terms of gross ton miles was 13.5 per cent greater than in the first quarter of last year. Grain traffic has been substantially above the corresponding period of 1951 reflecting last year's large wheat crop, but carloadings of many other classes of traffic have not been as great as in the corresponding period of last year.

IMPORTANT PUBLIC SERVICE

Your company, through its railway, steamship and air transportation facilities, and its many and varied ancillary operations, renders necessary and important public services extending across the Continent and spanning the Atlantic and the Pacific. A large segment of the manpower of the country is directly employed in providing these services. Last year, more than 90,000 employees in Canada were on your payrolls. In addition, employment was provided for the vast numbers engaged in the production of the goods and services purchased by your company. In 1951, total purchases by your company exceeded $192 million. Of this amount $174.2 million was bought in Canada, $12.4 million direct from the United States and $5.8 million in the United Kingdom.

It will be of interest to you to know that of these amounts $50 million was spent on fuel and petroleum products; over $20 million was spent on steel products; $8 million on ties; $2.8 million on electrical material, and $2.3 million on the purchase of stationery. These, of course, are in addition to the large amount spent on rolling stock, motive power, and other requirements.

Your directors are confident that there is a full and vigorous part for Canadian Pacific to play in the future development of Canada, and are firmly resolved that this will be fulfilled with the same careful consideration for the best interests of the nation that has been evident in the policies of your company throughout the 71 years of its existence.

MUAR RIVER RUBBER COMPANY, LIMITED

POSITION IN MALAYA

SIR JOHN BARLOW'S SPEECH

The thirty-second annual general meeting of the Muar River Rubber Company, Limited, was held on May 6th at Plantation House, Mincing Lane, London.

Sir John D. Barlow, Bart, MP, the chairman, in the course of his remarks, said:

The profit for the year was £106,234 compared with £91,341 in 1950. Two interim dividends for 1951 have been paid amounting to 15 per cent, and it is not proposed to pay a final dividend. Taxation is estimated at £65,000 and it is proposed to place £20,000 to replanting reserve leaving a carry forward of £23,547.

Shareholders have been kept informed of our interest in Chamek Rubber Estates, Limited, a wholly budgrafted property giving satisfactory yields at reasonable costs. Last year Chamek was liquidated and reconstructed so that we now have invested £25,000 in a new company called "Chamek Plantations, Limited," and in addition we have received to date £100,000 from the liquidator. Under the circumstances the board decided to pay a capital cash distribution of 2.4d. (10 per cent) per share, which will not attract income tax from recipients.

The situation in Malaya has not improved after nearly four years. Murders and shootings are a frequent occurrence. Rubber planters live in defended compounds and move about in armoured vehicles accompanied by special constables. If it had been for the planters' determination to stay at their jobs, there would have been little hope of holding Malaya against the Communists.

GENERAL TEMPLER'S APPOINTMENT

General Sir Gerald Templer's appointment as High Commissioner is an encouraging sign that the British Government are determined to put an end to present conditions in Malaya. The "emergency" has not been treated with the energy that a virtual state of war should be treated. Government in Malaya and the United Kingdom must be ruthless in their determination to rid the country of Communists. Unless we show the peoples of Malaya that we can and will bring peace and security to their country we will not receive their support and co-operation, which is essential if we are to suppress the bandits.

Instead of trying to force down the price of rubber our friends in the United States should realise how much the economy of South East Asia depends on rubber. A fair price for rubber will ensure economic prosperity to many millions of Asiatic peoples and stop the spread of Communism.

In conclusion I should like to send a message of thanks to our staffs in the East.

The report and accounts were unanimously adopted.

MANGANESE BRONZE AND BRASS

HIGH LEVEL OF TRADING MAINTAINED

HEAVY COST OF PLANT REPLACEMENTS

ENCOURAGING RESULTS FROM DEVELOPMENT OF "NIKALIUM"

MR J. C. COLQUHOUN ON THE CONTINUED PROGRESS

The fifty-third ordinary annual general meeting of the Manganese Bronze and Brass Company, Limited, was held on May 8th at 63 Grosvenor Street, London, W1, Mr J. C. Budd presided in the absence abroad of the chairman and managing director, Mr J. C. Colquhoun, MBE.

The secretary (Mr W. K. Gibb, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:—

The profit for the year 1951 before providing for taxation and dividends was £327,292. This was after providing £82,926 for depreciation. The comparable profit figure for the previous year was £201,935 after providing £70,598 for depreciation. The charge for taxation of £200,000 is about £84,000 more than last year. Thus although the net profit before taxation is up by £125,357, the increase remaining after taxation is only £41,465.

Your directors recommend that a final dividend of 7d. per share be paid on the ordinary issued capital, making 9d. per share for the year. This compares with 7d. per share for the previous year if calculated on the same share capital.

In submitting the accounts this year we have added a separate statement under the title of "Financial Highlights," which shows the accounts in summarised form with a brief financial statement. I believe you will find that this makes the accounts more informative and more interesting. It shows, for example, that the year's earnings, after providing for taxation and preference dividends, were equivalent to 16.55d. per 5s. ordinary share and that the net cost of the year's ordinary dividends was 4.72d. per share. It also shows up the more important financial movements which I deal with briefly here.

The year 1951 had the same characteristics as 1950, namely, a high rate of trading accompanied by a high level of earnings, continuing inflation with still higher replacement costs and still more finance required for working capital.

HEAVY CAPITAL EXPENDITURE

Dominating all the figures is the amount of additional finance required—£581,817 over the two years and £240,117 last year. That includes the cost of replacements and improvements, alike necessary, and a very modest amount of expansion. This capital expenditure amounted to just over £100,000 in each of these years. The balance of additional finance required was needed to cover the higher price of stock-in-trade, where price increases more than offset a reduction in physical quantity, and also to cover debtors, which increased both with higher prices and with larger turnover.

I see no lightening in the heavy annual cost of plant replacements. On the other hand, the rate of increase in the amount of capital tied up in stocks and debtors—which drained our resources dry and led to the present overdraft of £178,131—has eased up considerably and should be negligible in the current year provided the prices of copper and zinc do not resume a major upward movement. Should metal prices drop to the end of 1949 level the capital released should amount to about £350,000. While metal price movements have a large effect on our cash resources, they have not so far and are not likely to have any large effect on profits. The accounts require no special treatment for that reason.

BALANCE SHEET FEATURES

In the balance sheet you will notice that net current assets or working capital for the first time exceeds the half-million figure at £549,086, an increase of £116,760 over the previous year. Current assets, consisting almost entirely of stocks and debtors, amount to £1,121,595 and current liabilities, including bank overdraft, amount to £572,509. Fixed assets have a gross value of £850,061, and it would, of course, cost considerably more than that to replace these fixed assets today. Therein lies one of the perplexities of accounting, that depreciation provisions can never in the end exceed original cost. The accumulated depreciation provision appearing in the balance sheet of £529,098 must inevitably be inadequate to meet replacement costs in this inflationary period, but we have in recent years increased the annual provision so as to make it appropriate to price levels ruling at the end of the year so far as it was possible to assess these. On that basis we increased the provision last year by over £12,000 to £82,926.

DEVELOPMENT OF "NIKALIUM"

On the marine propeller side of your business, situated at Birkenhead, I referred for the first time two years ago to the development of an alternative to manganese bronze which we originated many years ago, namely, "Nikalium," a nickel aluminium bronze. Though slightly more expensive than manganese bronze, this alloy has the advantage of greater strength and superior erosion-corrosion resistance. When I first mentioned this development to you we had used this alloy in twenty-five propellers of the smaller size, none larger than about three tons in weight. Our policy has been to increase the sizes gradually as we gained experience. We have now made, or have on order, 77 larger size propellers up to 10½ tons, in addition to a very substantial number of the smaller sizes, and I am pleased to say that the results to date are entirely satisfactory and very encouraging. An interesting sideline development in this alloy which has a promising future is in the manufacture of water turbine runners for hydro-electric schemes.

The total output of propellers showed a slight improvement over the previous year. The order book for propellers improved steadily during the year from the equivalent of a little more than one year's work to two years' work with deliveries spread over three to four years. The bookings have been predominantly for propellers to our "Scimitar" design, and in this connection I might add that we are now getting the full benefit of tests made for us with model propellers in the large cavitation tunnel at Durham University to which I referred last year.

Your Handford Works in Ipswich surpassed all expectations, especially in view of the fear at one time that the output of the extrusion and rolling mills would be seriously curtailed by metal shortages. As it turned out the earnings from this works actually showed an improvement on the previous year. The tonnage of orders in hand shows virtually no change since the beginning of last year, but there are indications that the demand for these products may ease up during the current year or that shortages may still have their effect. The main developments here have been and will continue to be in our special bronzes.

SUCCESS OF ELTON PARK FACTORY

The new Elton Park factory at Ipswich, with works sports fields adjoining, has proved a great success, but although output and earnings already show a substantial improvement we have not yet had the full advantage of added capacity on account of delayed deliveries of new equipment. We are, however, getting the benefit of better layout and better working conditions. This factory is devoted exclusively to the manufacture of "Oilite" self-lubricating bearings and other parts, continually increasing in variety, and all made from metal powders. There is every indication that this section of your business will be kept running to capacity at least for some months.

THE FUTURE

In regard to the future, there is very little I can add except in regard to the Excess Profits Levy, and other tax changes proposed in the latest budget. You will not, I know, expect me to give an estimate of their effect on this company until we have had an opportunity of studying the detailed proposals which, in due course, will be disclosed in the Finance Bill. It will, of course, inevitably add considerably to our difficulties of maintaining the company's real resources and of carrying out the capital expenditure programme which we believe is so necessary.

On your behalf I should like to extend our grateful thanks to the staff and work people who together have contributed as a team so effectively to the success of your company.

The report and accounts were adopted and a final dividend of 7d. per share, making 9d. per share for the year, was approved.

The retiring directors, Lt-Col S. J. M. Auld and Mr J. C. Budd, were re-elected and a special resolution amending the articles of association having been passed, the proceedings terminated.

THE CUNARD STEAM-SHIP COMPANY LIMITED

£15,325,000 FOR NEW SHIPS

STATEMENT OF THE CHAIRMAN

Mr F. A. Bates, chairman of the company, in a statement to stockholders for submission at the seventy-fifth annual meeting to be held on May 28th says:

In a sense, a Cunard chapter closes at the end of 1951 and a new one opens in 1952. The end of the war left the Cunard and associated lines with pressing needs to renovate ships which had survived the war and to invigorate our peacetime services with new tonnage to replace ships lost. A six-year programme of renovation of Atlantic ships was completed last summer and a number of new ships, both passenger and cargo, have been brought into the Atlantic schedules during the past five years. The Port Line have entered in the Australian and New Zealand trades thirteen new refrigerated ships; the Brocklebank Line, serving India, Pakistan and Ceylon, have added ten new ships. All are fast modern ships, splendidly equipped.

With the close of 1951 there pass into the next chapter contracts for three Mediterranean ships, two ships for Canada, three Port liners and three Brocklebank ships. Spread over 1952 to 1956, construction of these eleven ships is estimated to cost about £15,325,000. This is a considerable programme, but the contracts and building of specialised ships are unavoidably long-view projects.

Turning to the 1951 accounts, the operating surplus at £9,445,590 is in line with the run of recent consolidated years except for the peak year of 1950, which was subject to exceptional and complex factors. The surplus for 1951 at £3,351,937 is less than 1950 by £125,682, but the difference is no greater than might have been expected, and it is reasonably near the level of previous years. Bearing in mind the increase in operating costs, 1951 has done well to hold its own, but with tax computations such a heavy and intricate factor their incidence in any year makes real comparison ineffectual.

Income tax and profits tax at £3,693,000 for 1951 on top of £4,918,000 in 1950 are causing large sums to be paid out of the company when the computation on which the tax figures are based has no regard to the current cost of renewing ships. Outgoings on this scale without sufficient provision for renewal could endanger the company's replacement future. It is not the rate of tax, a heavy burden enough, that is injurious under present national circumstances, but the form of computation that is reckless of the continuing renewal of shipping assets whose life cycle it has been customary to reckon at twenty years.

DEPRECIATION ALLOWANCES INADEQUATE

No consideration in the accounts of a shipping company is more important than provision for wearing-out of tonnage. Official depreciation in 1951 at £2,475,930 is again notional. Depreciation allowances are out of line with the current price of renewing the tonnage of which the annual wearing-out should by sound principles of accountancy be charged against the annual voyage accounts. In consequence the computation of profit for tax purposes opens a tax drain-cock through which capital assets are irretrievably lost, instead of being conserved for building new tonnage to the company's and Britain's lasting benefit. A business could founder with a tax leak of this magnitude and so it remains an urgent matter to increase the reserves.

Reserves during the four consolidated years to 1951 have increased by £1,532,000. Reserve accretions of this magnitude reflect the inadequacy of the official depreciation allowances for the same period totalling £9,489,000. How far reserves on this scale will serve for renewal and maintenance of tonnage only the future can show. In the Cunard accounts estimated shipbuilding liability at £9,350,000 covers the two Canadian and three Mediterranean ships.

Excess Profits Levy remains an uncertain factor, but if the 1952 profits are on the level of 1951 the Cunard Group should not attract a serious liability for EPL.

The aim of the directors is to continue watchful of the needs of pension funds—in 1950 £350,000 was set aside, this year £300,000.

Recommended is a final dividend for 1951 of 12½ per cent, making 15 per cent for the year. An interim dividend of 2½ per cent is again declared for 1952.

The times are uncertain like the hazards of the sea. If the Cunard Company did not rate financial caution high in its navigation of the years it would not have left its century ten years or more behind it.

THE STOCKPILE MOOD

During the early months of 1951 there were rather lean voyages in the North Atlantic passenger trade, and the popularity of holiday cruising from New York was affected by the Korean war. Gradually the tension lessened, and later in the year the numbers of travellers in all classes were satisfactory. Under the same influence, for cargo it was the "Stockpile mood" from early year into the autumn. The stockpile mood exercises profound effects not always beneficial. It fills the ships for the moment, but like any control unregulated by the laws of supply and demand it has consequences that are unforeseen and detrimental to commerce.

By December last falls in most market prices had become definite or were forecasted and significant changes in the demand for general cargo space were evident ahead. In the case of the liners delay action has kept freight earnings good for the first quarter of 1952 but the situation is loose and with "Stop-Go" controls at each end of most trade routes the outlook for commerce is obscure. Too frequently the Export "Go" of one country is met by the Import "Stop" of the other. It is really a new "mood" the breeding of which might good-humouredly be called "By Stop and Go out of Control."

Passenger and cargo earnings in the first quarter of 1952 have improved on the corresponding period a year ago and cruising has also done better, but the rising cost of operation has to be met before an increased surplus is registered.

In the absence of any international complications, Cunard trial estimate for 1952 may be assessed as on the 1951 level during the summer season but thereafter it would be unwise to venture an opinion.

FAITH IN CANADA'S FUTURE

Our ships have long been in Canada's service and thousands of Canadians now engaging in her unbounded development may remember some early voyage in a Cunard or White Star ship. The expansion now in progress is offering opportunity for many more to make their homes there.

There is no better evidence of Cunard service to Canada than that in the five years ended December 31st we have carried 253,780 passengers to or from Canada and 2,143,587 freight tons of cargo.

With faith in Canada's developing trade contracts have been made for the building of two new ships, each about 20,000 tons gross, with service speed of 20 knots and designed to carry first and tourist classes of passengers.

Sir Ashley Sparks has announced his wish not to submit for re-election to the board. His hand has been a guiding influence in Cunard affairs in the USA for 35 eventful years in the company's history. As a senior member of the board his ready advice in our problems will be greatly missed.

Mr W. H. Brown, who retired from the executive post of deputy general manager at the end of 1951, has also signified his retirement from the board.

Mr John M. Brocklebank is a member of a family which has long figured in shipping history. Appointed a Cunard director in July, 1951, he now retires and submits himself for confirmation.

HIGH TRADITIONS OF SERVICE

Atlantic and Mediterranean—to visit the ships or sail in them—to meet the captains and ships' companies and to see their care for the successful performance of our company's service gives me much personal pleasure. They have all put in a hard year's work, maintaining the high traditions of the Cunard Company at sea, whether on the transatlantic service or cruising. On shore in our offices in the United Kingdom and Europe the management, technical superintendents and staffs equally spare no pains to give service to passengers and shippers, ably backed up as they always are by our passenger and freight agents. Last autumn I visited the company's American and Canadian organisations. Their enthusiasm is boundless and their efficiency has to be experienced to be realised.

Australia and New Zealand.—Mr R. H. Senior, deputy chairman of Port Line, has recently returned from an extended tour of the Port Line organisation there. He reports the managements, staffs and all agents are imbued with the desire to give satisfaction to all the trades for which their ships are so well equipped.

India, Pakistan and Ceylon—the Brocklebank Line, under Colonel D. H. Bates, the chairman, have been fortunate in their long history in their managements, superintendents and staffs. They are fortunate, too, in their agents at home and abroad and very experienced and skilful are their masters, officers and engineers. To all I send the company's greetings and thanks for their continuing support. There are no ventures to rival those of the sea and by the Grace of God no course is sounder than the compass setting to the Cunard horizon of joint endeavour.

"We are a friendly people" were the words used by His Late Majesty King George VI in his last broadcast on Christmas Day, 1951. It is this friendliness which is the essence of British trades and service of the seas. There is a goodly measure of it in all ships of Her Majesty Queen Elizabeth II's Merchant Navy and not least in the Cunard, Port and Brocklebank ships and in their offices. It is well stowed and carried ready for all our friends around the world whom we strive to serve.

CAMMELL LAIRD AND COMPANY, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

INCREASED DIVIDEND

MR J. C. MATHER'S REVIEW

The eighty-eighth annual meeting of Cammell Laird and Company, Limited, was held on May 5th at the registered office of the company, New Chester Road, Birkenhead, Mr J. C. Mather, the chairman, presiding.

The chairman, in moving the adoption of the report and accounts, said:

Ladies and gentlemen,—Before proceeding to the business of our eighty-eighth annual general meeting, I want to refer to the great loss which we have suffered by the death, on August 28, 1951, of Sir Robert Stewart Johnson, chairman and managing director of the company. Sir Robert came to Cammell Lairds in 1920, and rendered outstanding service to the company for 31 years. He was appointed managing director in 1922 and chairman in 1940, and in both these capacities steered the company through many difficult times to the satisfactory position in which he left it at his death. He was a man of great strength of character and tremendous energy, and was never afraid of saying or doing what he believed to be right. His knowledge of shipbuilding was unsurpassed and that, combined with a personal example of hard work and great charm of manner, earned the respect and affection of all with whom he came in contact. The memory of his selfless devotion to the company's interests will be an inspiration to us all in our attempts to follow his great example.

Your board has appointed Mr Robert White Johnson, who had served as assistant managing director for two years, to succeed Sir Robert as managing director. He has had the great advantage of several years of intensive training under his father, and brings to his task many of the qualities inherited from him. He will, I am sure, prove a worthy successor to Sir Robert. My colleagues have done me the honour of appointing me chairman, and I shall do my best to justify their choice.

I would like to extend a welcome to Mr P. J. D. Toosey, who has recently been elected to the board and therefore comes before you for re-election. Mr Toosey is a member of the firm of Baring Brothers and Company Limited and a director of several important companies, and brings a wide experience of business and finance which will be of great help to us in our deliberations.

I am glad to be able to report that we have again had a busy year in our shipyard, and in view of the many difficulties which we have had to face, I hope you will agree that the results are satisfactory. I would like to take this opportunity of congratulating the management, staff and workmen and thank them, on your behalf, for all the good work they have done to produce these results.

THE ACCOUNTS—ASSETS

I will now turn to the accounts for the past year, of which you will have received a copy. Dealing first with the assets, you will see that we have spent approximately £95,000 on additions to buildings, machinery and plant, and increased the valuation of loose tools by about £9,000. We have, however, written off the sum of £95,000 in order to provide adequate depreciation, so that the total book value of these assets has been increased by rather less than £9,000.

Investments in associated companies show a radical change in comparison with those of last year, our shareholdings in English Steel Corporation Limited having been taken over by the Iron and Steel Corporation of Great Britain, under the provisions of the Iron and Steel Act, 1949, and these no longer appear in our balance sheet.

The loan of £250,000 to Metropolitan-Cammell Carriage and Wagon Company Limited, which appeared in last year's balance sheet was repaid during the year.

Under current assets, stock-in-trade and work-in-progress are £2½ million higher than a year ago, and reflect not only the expansion in trade, but also the very considerable increase in costs with which the shipbuilding industry, in common with all other undertakings, has had to contend. A corresponding increase is shown in the amount of instalments received on account of work-in-progress.

The large increase in our holdings of British Government stocks is almost entirely due to the receipt of 3½ per cent British Iron and Steel Guaranteed Stock, 1979-81, in payment for our English Steel Corporation interests. During the year we have sold about £1 million worth of undated stock and invested the proceeds in a medium-dated security. This has resulted in a book loss (referred to in Note 1), but most of this loss will be recovered at the maturity of the dated stock if, as anticipated, the stock is held until that date.

Our bank balance at the end of the year exceeded £3 million, and you will be interested to know that we have since invested £1 million in a careful selection of short-term gilt-edged stocks and insurance, bank and industrial equities, which will add to our investment income for the current year.

LIABILITIES

Turning to the other side of the balance sheet, you will notice that the board proposes to increase the general reserve by the allocation of £200,000 from this year's profits, which, together with the £200,000 previously provided for taxation, but no longer required, as mentioned in Note 2, brings the total to £2,025,000.

Under other revenue reserves, your directors have deemed it advisable, in view of steeply rising costs, to increase our reserve for depreciation in the value of trading stocks by £60,000.

PROFIT AND LOSS ACCOUNT

In the profit and loss account, the increase of £227,000 in trading profit is principally due to the inclusion of a proportion of profit on work-in-progress. Although it is not intended, as a general practice, to vary the normal basis of accounting, you will have noticed from Note 6 on the accounts, that a change has been made this year. Your board feels that in the case of contracts which have been extended over an unusually long period, it is right and proper to bring into account a small proportion of the profit which has already been earned. The amount which has been brought into the present accounts is £150,000.

You will have seen from Note 7 that we have a claim against English Steel Corporation Limited for additional dividends for the period January 1, 1950, to February 14, 1951. This claim arises on the technical interpretation of the 1949 Iron and Steel Act. The amount claimed is a sum exceeding £1¼ million net, and we are advised that we have a good case. The claim has been disputed by the English Steel Corporation, and the question of pressing it depends on the larger policy decision to which I will refer later.

PROFIT AND DIVIDEND

The ever-increasing burden of taxation takes £777,000 (£211,000 more than last year) and represents over 60 per cent of our profit. The net profit for the year, after appropriating £60,000 to reserve for depreciation in the value of trading stocks and allowing for the increased profits tax on the proposed distribution, is £463,550, slightly less than last year. Your directors feel, however, that although the government has taken a larger share of the profits, which would otherwise have been put to general reserve, a transfer of £200,000 is reasonable on this occasion, and that the shareholders should derive some benefit from the increase in trading profit. They therefore recommend the payment of a final dividend of 11 per cent, making 14 per cent for the year, less tax.

I think you may be interested to know what happens to each £1 of revenue earned by the company, and I give you the following figures. Materials required for the carrying out of our work take 8s. 10d., which leaves 11s. 2d. to pay those engaged in the business, to put something to savings and to give the shareholders a fair return on their investment. Of this 11s. 2d., wages takes 6s. 3¼d., or 56.3 per cent and overhead expenses and depreciation 2s. 5¼d. or 22 per cent. That leaves 2s. 5d. out of each £1 as profit, but of this taxation takes 1s. 6¼d. and the remaining 10¾d. is divided between savings (4¼d.) and dividend (6d.).

ENGLISH STEEL CORPORATION LIMITED

As you are already aware, the company's holdings in the English Steel Corporation Limited were transferred to the Iron and Steel Corporation of Great Britain in exchange for British Iron and Steel 3½ per cent stock to the value of £6,827,396 15s. Our original investment was a valuable one, not only from the point of view of dividends received but also because of the many advantages arising from close association with an important steel producer. It now seems probable that we shall shortly be afforded an opportunity of re-acquiring our interest in the English Steel Corporation Limited, but you will not expect me to anticipate what our decision will be.

METROPOLITAN-CAMMELL CARRIAGE AND WAGON COMPANY, LIMITED

The Metropolitan-Cammell Carriage and Wagon Company Limited, in which your company owns a half interest had a satisfactory year, though shortage of steel and shipping prevented full use of its manufacturing resources, with the result that total deliveries were less than the record high level reached in 1950. While exports of railway vehicles to Commonwealth countries and Crown Colonies represented the greater part of the company's output, large deliveries were made to British Railways.

Deliveries of the latest design of light alloy coaches for the surface lines of the London Transport Executive have commenced, and further orders are anticipated for coaches built in this material.

Further export orders having been secured against increasingly severe competition from the Continent and elsewhere, the company has an extensive manufacturing programme for the present year including passenger coaches and goods wagons for railways in Africa, India, Ceylon, Malaya, Australia, New Zealand, Argentina and for British Railways.

Having regard to the essential need of railway rolling stock not only for the transport requirements of normal trade but also for defence purposes, the company has made strong representations for sufficient allocations of steel under the new distribution scheme for fulfilment of these important orders, seventy per cent of which are for export.

Large deliveries of 'buses were made to some of the principal operators in this country during the year. Shipments also commenced against contracts totalling 450 "Olympic" integral vehicles for Argentina, and output at an increased rate is planned to continue this year concurrently with 'buses for the home market where competition is increasing owing to a reduced demand.

The company's managing director, Sir Archibald Boyd, has recently made an extensive tour of Australia and New Zealand, a visit which will undoubtedly have a beneficial effect on Metropolitan-Cammell's business with those countries: and I would like to take this opportunity of thanking him and his colleagues for all their efforts on your behalf.

SHIPYARDS AT BIRKENHEAD

At our shipyards here in Birkenhead, we launched six ships totalling 69,100 gross tons and delivered six ships totalling 59,062 gross tons, including ships for the British Tanker Company Limited, Ellerman Lines Limited, the Booth Steamship Company, the Isle of Man Steam Packet Company, Lamport and Holt Line Limited and the Argentine Government.

Our ship repairing department has had a very busy year, carrying out repairs and refits on a total of 114 ships, which included the reconversion of the Festival of Britain ship "Campania" back to her original role of aircraft carrier. Conversion work on T.S.S. "Gothic" for the royal tour of Australia and New Zealand, which was referred to by my predecessor last year, was completed, and I am pleased to report that this work won favourable comment from the royal household.

GOOD PROSPECTS—FULL ORDER BOOK

We have a larger order book than ever before, and this includes orders from old friends and new customers both in this country and overseas. We have also been entrusted by the British Admiralty with a number of contracts in connection with the defence programme. Prospects must therefore be regarded as good, but the successful fulfilment of our contracts will be dependent on the receipt of regular and adequate supplies of raw materials, particularly steel.

Earlier in my speech, I conveyed our thanks to the employees of this company for the work which they have done during the year. This was not by any means a formality, because I know that the vast majority of our employees, both in the offices and in the yard, have worked hard and done a thoroughly good job. We want them to be well paid for this work and to look forward to a continually improving standard of living, but I feel that I must strike a note of warning. Any further increase in wages and salaries, without at least a corresponding increase in production, can have but one result and that is to put us out of the market. The only way to ensure continued prosperity and full employment in our industry, is to lower the cost of the ships which we build. I believe that we have already reached the point where our customers are beginning to wonder whether they can afford the prices which we are compelled to charge today.

EXCESS PROFITS LEVY

We cannot say yet what will be the effect of the Excess Profits Levy on next year's results. Whatever the effect, I think it is a bad tax, because it makes it still more difficult for industry and commerce to put to one side the savings which are essential to meet the inflated cost of maintaining and replacing their assets. We have in this company accumulated substantial reserves, but it would be a bold man who dared to say that they were adequate. We have a heavy programme ahead of us in the maintenance of our plant and the modernisation of our equipment, particularly in the ship repairing department, and the management is giving much time and thought to this problem. But many concerns, and particularly our customers, the shipowners, however large the so-called "profits" which they make (I prefer to call them "savings") are not allowed to keep enough to meet the cost of replacing their fleets. So much has been said on this subject that the Government must be well aware of the problem and we can only hope that they will do something about it. The country is in difficulties today because we are spending more than we earn and have virtually spent our savings as well. The Government has taken steps which we all hope will bring earning and spending into closer relationship, but the most important thing for the long-term welfare of the country is the building up of substantial savings to carry us through the difficult times which will certainly come.

The report was adopted.

HAMBROS BANK LIMITED

STABILITY DESPITE DIFFICULTIES

MR R. O. HAMBRO'S STATEMENT

The fortieth annual general meeting of Hambros Bank Limited will be held on Thursday, June 5, 1952, at the offices of the Bank, 41, Bishopsgate, E.C.2.

The following is the statement of the Chairman, Mr R. O. Hambro, circulated with the report and accounts for the year to March 31, 1952:—

The twelve months which have passed since I last addressed you have been full of difficulty for a business such as ours. The general depreciation of our currency throughout the world during the latter part of the late Government's term of office affected all classes of international trade and the necessary restrictions since imposed to try and rectify this have added to the problems which we and our customers abroad have had to face. The present Government is now applying the orthodox remedies of the use of the bank rate, cutting down subsidies and the operation of a sterner credit restriction policy, the effect of which is already becoming apparent and will in the long run restore confidence in our currency.

On the other hand, the deflationary effect of all this is bound to be hard on business at home, with the consequent danger of unemployment and industrial distress which are the inevitable results of deflation. However, of the two evils it must surely be wise to take the road of sound money where savings can be assured and where, though less money is earned, the income available can buy more of the necessities of life.

IMPORT RESTRICTIONS

It is unfortunate that, co-incidental with our present difficulties, drastic import restrictions are of necessity being imposed also by other members of the Commonwealth, which will mean a serious loss of markets to important branches of industry here, many of which are already beginning to feel the pinch.

The ultimate effect also of EPL cannot be overlooked, as, although this is a measure avowedly intended to restrict rearmament profits, it must in its present form inevitably affect to a greater or lesser degree all progressive sections of the country's commerce and industry.

SATISFACTORY POSITION

It is, therefore, very satisfactory that the figures of the balance sheet of the Bank show such stability in spite of the difficulties which I have mentioned. There has been a slight falling off of our acceptance business during the year but the previous year's figure was exceptional by comparison with that of the year immediately preceding it. The deposits are slightly up on last year and the liquidity position is very favourable. Altogether I have no hesitation in saying that the overall picture is one of strength and shows a sound and active business.

There has been no great change during the year in the geographical source of our activities. As always, our chief customers continue to be our Scandinavian friends and our business of long standing with our banking connections in Italy has been maintained. As a result of the new regulations for dealings in foreign exchange we have been able to give some activity to our accounts with American banks from whom we receive very friendly reciprocity and, naturally, it will be our endeavour to extend this branch of our activities in other directions as circumstances permit.

LARGER PROFITS

Since the last balance sheet we have added to the capital employed by the issue of 1 million new fully paid shares of £1 each the benefit of which has been available during the latter six months and this is reflected by the increased profit figure for the year of £382,106. This will allow us to recommend the same final dividend on the increased capital as was paid on the old.

The year ahead of us is obviously full of difficulties but with the support of our good friends at home and all over the world and the help of our staff, who have continued to give that loyalty and devotion which they have always shown, we are confident that the bank can not only maintain but increase its activities.

HAMBROS BANK LIMITED

Liabilities of Customers for Acceptances	18,032,899

COLVILLES LIMITED

INCREASED PRODUCTION OF PIG IRON

SHORTAGE OF SCRAP

SIR ANDREW McCANCE'S REVIEW

In the absence of the chairman, Sir John Craig, who is abroad on business, the following statement was made by the deputy chairman, Sir Andrew McCance, at the annual general meeting held in March, 1952:—

On former occasions when the accounts were published, it has been customary to make some comments on the results obtained and to record the progress and development of the company and its prospects. These are still matters of general interest and it is hoped that a few words of explanation on the balance sheet and accounts may be helpful.

ACCOUNTS

On February 14, 1951, the shares of the company vested in the Iron and Steel Corporation of Great Britain. In consequence of this change in ownership, the balance of profits unappropriated at the date of vesting and the surplus arising from the revaluation of the opening stocks, have been transferred to general reserve increasing that reserve from £1 million to £2,459,359. The unappropriated profits carried forward to next year have arisen from the results of trading since that date.

The close of the financial year of the company has been changed following a request from the Iron and Steel Corporation of Great Britain. It now ends on the Saturday nearest to September 30th in each year instead of December 31st as formerly. The accounts for 1951 therefore cover a trading period of only nine months instead of twelve months as in previous years.

INCOME TAX PROVISION

In such circumstances, comparison of the results with the previous year's trading is not easy. In particular, the amount carried forward to next year has been reduced by the decision to provide twelve months income tax from the profits of the nine months period, but the directors considered such a step necessary in view of Inland Revenue practice governing changes in the accounting period. The reduction in respect of the additional three months is shown separately in the accounts, and it is estimated in the case of Colvilles at £302,000 and of the group at £500,500. A better comparison is provided by the fact that the average gross trading profit earned each month during 1951 (£316,718) has been very similar to the average gross trading profit (£303,042) for each month of 1950.

I would ask you to note that the company have over £3,500,000 on loan at call to the Iron and Steel Corporation of Great Britain. This explains the difference in the cash position in comparison with that of last year.

It might be asked why the additions to the fixed assets shown in the accounts of Colvilles Limited during the year (£1,279,629) are more than those shown in the consolidated accounts of the group (£1,263,088). This difference is due to writing off the value of the melting shop at Blochairn Works in the books of the Steel Company of Scotland, as this shop was closed down during the period and will not again be brought into production.

Capital commitments for the group (£1,873,950) include the amount required for the completion of the new coke ovens at Clyde Iron Works and schemes of improvement mentioned later.

PRODUCTION AND RAW MATERIALS

Production from the Colville Group for the calendar year has been as follows:—

	1951	1950
Pig Iron	546,335	488,303
Steel Ingots ...	1,664,922	1,887,170

The output of pig iron increased over that of the previous year because all furnaces at Clyde Iron Works were continuously in blast throughout the period. Had it not been for a shortage of iron ore during the first half of the year and a continuous shortage of coke received from outside sources—a shortage which still persists—an even greater tonnage of pig iron could have been obtained. When the new coke ovens are in operation, the blast furnaces will be independent of outside supplies of coke and a definite benefit should be obtained from improved quality and from the fact that all our requirements will then be produced under the control of the company.

During the first half of the year steel ingot production at all the works of the group was well maintained, but an increasing shortage of raw materials, particularly scrap, began to be noticeable during the summer months. These shortages greatly reduced our steel production and increased our costs, and the use of stocks was forced to such an extent that by the end of the period they had been reduced to abnormally low levels.

SCRAP SITUATION

A shortage of scrap throughout the whole world has been a striking feature of postwar conditions. Britain has always been a large importer of scrap, and prior to the war no great difficulty was experienced in obtaining all that was required. Ships that carried our exports of steel and machinery to other lands found scrap a very suitable cargo to bring back on the return journey. North and South America and our Colonies contributed the major share of this trade.

The war interfered seriously with this exchange for two reasons: firstly, through attacks on our mercantile shipping and, latterly, through our inability to export civilian goods during the course of a struggle that was taxing our total industrial strength. Deprived of steel supplies from us, other countries began to promote schemes to make themselves self-sufficient in steel production, with the result that they now require for their own steel industries the scrap they formerly exported to us.

POSITION IN UNITED STATES

Perhaps the major change, however, took place in the United States, which in prewar times was a scrap exporting country. There, the rapid extension in the use of oil as fuel allowed American steelworks to melt a larger proportion of scrap in their open hearth furnaces than they had hitherto regarded as practicable. As a result, the United States is no longer an exporter of scrap. Indeed, American supplies are barely sufficient now for American needs, and in times of high demand imports are required to make up the difference. Since the war, supplies from Germany have met the demand in this country, but with the reduction in supplies from this source which is taking place the difficulty of finding alternative sources is becoming more pronounced. Scotland has traditionally been a large user of scrap, and this adoption of the technique of high scrap usage by other steel-producing countries has naturally been to us a matter of importance and concern.

The directors had foreseen that such trends were inevitable and for some years they have promoted plans to increase the production of pig iron so that a larger proportion of the ingots produced by the company could be made by the use of hot metal practice. The growth of Clydebridge and Clyde Iron Works has followed naturally as a consequence of that policy. A further extension of this line of development is more than ever necessary today, but postwar conditions have created new and unforeseen problems. The expansion of pig iron production requires more coking coal, and the production of coking coal in Scotland might well become a limiting factor if the development of available Scottish resources is not pursued with determination and urgency.

WORKS AND PLANT

The new coke ovens at Clyde Iron Works are nearing completion, but it will be a few months yet before they are in operation. The order for these ovens was placed 4½ years ago, and this illustrates the length of time now required for the construction of plant of this kind. The Clydebridge Melting Shop extension, agreed at the same time, is in full production and has proved of great benefit to the output at these works.

The second stage in the reconstruction of No. 4 Melting Shop at Dalzell Works is well under way, and it will constitute when completed a first-class and efficient modern unit for the manufacture of special quality carbon and other steels. The Bar Mill associated with this Melting Shop is also being rearranged after a most detailed study of its possibilities, and a very substantial increase in its capacity will be achieved with a minimum capital expenditure. A similar type of reconstruction is also in progress at the Merchant Mill at Motherwell, devoted to the rolling of light sections, whereby the judicious replacement of some plant units and the alterations of others the capacity will be increased and the rolling cost substantially reduced.

The high cost of new plant under present-day conditions makes it very necessary to study with care the possibilities of existing equipment. In some instances such plant can be effectively modernised to give greatly improved results for an expenditure which is low compared with the cost of a new installation. Low capital cost combined with a production cost which compares favourably with that of a new plant offers advantages that are likely to be even more important in the future than they are today.

The necessity for economy in fuel has been emphasised in previous statements on more than one occasion and a further step towards this end has been taken with the decision to electrify the 36-in. section mill of the Lanarkshire Steel Company.

Power will be supplied mainly from the enlarged power station at the same works, which utilises steam generated from waste heat. This station will ultimately absorb all

the production of such steam from both Dalzell and Lanarkshire works.

SUBSIDIARY COMPANIES

Our investment in subsidiary companies has been increased and now stands in the balance sheet at £2,549,356 against £2,061,856 last year. This increase arises from the purchase by the company from the Iron and Steel Corporation of Great Britain of the 6 per cent preference shares of the Lanarkshire Steel Company and the 5 per cent preference shares of Smith & McLean. Colvilles now own all the issued share capital of these companies.

All the subsidiary companies have been actively engaged throughout the year. Rearmament has made heavy demands on their capacity and there is every indication that this will continue during the present year.

The Blossend Engineering Works, which is run as a separate division of the Colville group, has now been fully equipped as a centre for the reconstruction and erection of the engineering plant required by the parent company and its subsidiaries. As an example of what this works can undertake, during the past year the cogging mills at Clydebridge and at Lanarkshire have been entirely reconstructed and they are now giving an excellent account of themselves in operation. These engineering facilities have proved of the greatest service in overtaking the repairs which were of necessity deferred owing to the conditions existing during the war.

STAFF

For many years the company has had in existence a superannuation scheme for the benefit of the staff and from time to time contributions have been required in order that the benefits which the staff could expect might be brought into line with the changing conditions of the day.

With the lowering in the value of money in this country, which has taken place since the war, the directors considered that a re-examination of the whole scheme was again due and this was carried out. They have made the changes recommended with special pleasure as the loyal assistance of the managers and staff in achieving the successful results of the company is a contribution which the directors gratefully appreciate.

The report and accounts were adopted.

POWERS-SAMAS ACCOUNTING MACHINES

CONTINUED EXPANSION

The annual general meeting of Powers-Samas Accounting Machines, Limited, was held on May 5th in London, Col. A. T. Maxwell, TD (the chairman), presiding.

The following is an extract from his circulated statement:

Trading conditions have not been easy in 1951, and we have had to contend with our fair share of problems, including shortages, both of manpower and materials. Nevertheless, these difficulties have been largely overcome, and results have been achieved which in the circumstances can be considered satisfactory. Both at home and abroad, the company's business continued to expand, and the total volume of orders received during the year attained an all-time record. In addition to a substantial increase in the business done in existing overseas markets, Powers-Samas equipment was available for the first time in the United States of America, Western Germany, Holland and Finland, all of which resulted in the quantity of our export orders in the period under review being 23 per cent greater by volume than in the previous year.

While the gross trading profit at £1,047,875 shows a slight increase against £1,040,401 in 1950, the profit available for appropriation and taxation is £49,203 less than the previous year. This is mainly due to the increase in the provision for depreciation arising out of the greater volume of machines on rental.

The taxation provision for 1951 absorbs £344,200 of the profit of £652,234, leaving available for distribution £308,034 against £361,437 for 1950.

The report and accounts were adopted.

THE ENGLISH ASSOCIATION OF AMERICAN BOND AND SHARE HOLDERS, LIMITED

PROGRESS IN ALL DIRECTIONS

The sixty-seventh annual general meeting of The English Association of American Bond and Share Holders, Limited, was held on May 1st at 5 Great Winchester Street, London, EC, Mr J. F. A. Swanston (the chairman) presiding.

The secretary (Mr C. R. Hardy) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—Unless any shareholder signifies to the contrary, I will assume it to be the wish of the meeting that the annual report be taken as read. (Agreed.)

It has been a source of great satisfaction to all in these islands to watch the splendid progress of our sister country in the Commonwealth, Canada. The phenomenal development of her oil resources and of her minerals has filled us all with pride. Our keen regret is that circumstances have prevented this country from taking part in this work; and it has been left to that great and enterprising company, The Standard Oil Company of New Jersey, to be the pioneer in the development of the oil industry. With her great natural resources, and the wise statesmanship shown in the management of her finances, Canada's future is indeed an enviable one. The *Financial Times* issue of April 18th published an article on this subject, which we recommend to the attention of any interested person. American citizens are becoming increasingly interested in Canadian enterprises.

IMPORT TARIFFS

A section of manufacturers in the United States has recently endeavoured to popularise a movement for increasing import tariffs on British manufactures, which offer serious price competition with American products. Secretary of State, Mr Dean Acheson, has spoken very strongly to his countrymen against such action, damaging as it would be to Britain's efforts to close the dollar gap. Mr Acheson pointed out that such efforts, if successful, would inevitably have serious repercussions in the United States inasmuch as if Britain could not sell to America she could not buy from her. He has also pointed out if countries were to lessen their dependence on American Grant Aid, and to carry their share of military burden, it was necessary that they earned more dollars.

If we and our partners in the free world are to build the kind of economic and military strength we need for our security, we must all co-operate to reduce and minimise barriers to trade between us.

This may seem elementary, but it would appear that it cannot be too often stressed both here and in the United States.

"SPECIAL" CERTIFICATES SYSTEM

I have made a reference in most years to our system of "special" certificates as we call them, and may I, once more, explain this system. The original dollar share certificates, either Canadian or American, are registered in this association's name and endorsed in blank; they are then deposited with the Westminster Bank Limited. Against these deposited share certificates we issue our own certificates, bearing the counter-signature of the bank as custodians. Our own "special" certificates are issued in any name or names desired, and dividends are paid to the first name in an account or to any designated bank or other agent. The advantage of this system is that this association is in direct touch with the owner, whose interests are watched over. Thus in the event of new issues with prior subscription rights to shareholders, the association takes care that shareholders are promptly communicated with and their wishes as to selling subscription rights promptly dealt with. At the moment there are restrictions on subscribing for new dollar issues. Sometimes these rights have a high saleable value. If no instructions are received from holders of our certificates the rights are sold and the proceeds are paid to the certificate holder. Holders of our "special" certificates are entitled to any information derivable from our constantly revised records, free of charge.

Well, gentlemen, if I were to repeat the observations I ventured to make a year ago as to the prospects of the British investor purchasing dollar stocks I fear it would fairly represent the present situation; though those fortunate individuals who have been in a position to control a certain amount of dollars have been able to profit by that fact.

It is a satisfaction to place on record, in our annual report, our high appreciation of the work of our officers and staff, which has so materially contributed to the success of your association.

You will have seen from a perusal of the annual report that progress is shown in all directions, and that our reserves now exceed our issued capital. There is every indication that this progress will continue. The figures given in our report are so plain for all to see that I do not think any purpose would be served by my commenting thereon. I will therefore proceed to the formal business.

I beg to move:

"That the report and statement of accounts for the year ended December 31, 1951, be received and adopted, and that a final dividend of 10 per cent, namely £1 per share, be distributed, making with the interim dividend of 10s. per share, already distributed, a total of 15 per cent, less income tax, on the paid-up capital of the company."

Mr Leslie W. Farrow, CBE, seconded the resolution and it was carried unanimously.

The chairman proposed the re-election of Mr Hubert Smithers, OBE, the director retiring by rotation.

The Rt. Hon. Lord Ritchie of Dundee seconded the resolution and it was carried unanimously.

A cordial vote of thanks was passed to the chairman, which he suitably acknowledged.

The proceedings then terminated.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

CONTINUED PROGRESS

LT.-COL. JOHN LESLIE'S REVIEW

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held on May 26th, at the head office, 24, Cornhill, London, E.C.

The following is an extract from the review by Lt.-Col. John Leslie, the chairman, of the report and accounts and balance-sheet for the year 1951.

Our results for the year 1951 have again proved satisfactory, although there have been some variations in the incidence of profit amongst the various sections of the business. It is perhaps desirable to remind the stockholders that a true picture of insurance results can only be obtained by looking at the figures for a minimum period of, say, five years, and it may be convenient to take a brief look at the progress of our company during the period since the ending of the war. During these years we have made consistently good profits, but in retrospect a more remarkable feature has been the great increase in the premium income.

I will now turn to the departmental accounts.

FIRE DEPARTMENT

Net premium income, 1951 ...	£21,270,843
Net premium income, 1950 ...	18,769,329
Increase	£2,501,514

The ratio of claims paid and outstanding was 41.44 per cent, commission absorbed 19.84 per cent, and expenses of management accounted for 22.23 per cent. After adjustment of the reserve for unexpired risks, there was an underwriting profit of £2,506,603, or 11.78 per cent of the premium income. The sum of £1,850,000 has been transferred to profit and loss account and the fire fund now amounts to £18,402,493 or 86.52 per cent of the premium income.

The premium income at home continues to grow and the results have been satisfactory. This expansion in premium income is, however, in part a reflection of inflationary conditions. Under-insurance, on the other hand, is still a feature, particularly in the case of householders, and I would take this opportunity of drawing their attention once again to the necessity for adequate insurance in view of the continuous rise in values in recent years.

We have constantly kept in mind the importance of our operations in overseas territories; we have endeavoured everywhere to maintain the standard that the world has come to expect of British insurance, and we have been gratified by the considerable expansion during the year of our business in many of these territories.

LIFE DEPARTMENT

	New policies No.	New policies Net sums assured	Annuities No.	Annuities Amount p.a.
1951	12,503	£16,664,048	4,959	£304,500
1950	12,081	17,002,441	3,306	197,394
	+422	−338,393	+1,653	+107,106

The gross sums assured totalled £17,443,069, compared with £17,712,084 in 1950, the slight drop from the record 1950 figure being due entirely to one very large group life assurance which appeared in the 1950 total. The average gross new sum assured per policy of £1,395 compared with £1,466 in 1950 and £1,152 in 1949, but owing to the increasing practice of issuing one master policy to cover a number of lives, average sums assured have less value as a method of measuring the improvement in life assurance cover. Substantial business was written during the year by our specialised pension schemes department, and the company's excellent terms attracted many inquiries for "top hat" arrangements for directors and senior executives.

During the year the life fund increased by £1,341,710 to £42,368,499, after making a tentative provision of £1,100,000 to cover depreciation of investments on a strict market price valuation, though it should be noted that by far the greater part of this special provision is necessitated by the fall in market value of our holdings of dated stocks of gilt-edged class For the first time in the company's history the net premium income in respect of life assurance policies has exceeded £4 million, the exact amount of £4,063,126 being £435,943 in excess of the 1950 figure.

MARINE DEPARTMENT

Net premium income, 1951 ...	£2,549,701
Net premium income, 1950 ...	1,761,329
Increase ...	£788,372

The claims paid and outstanding, after deduction of reinsurances and salvages, amounted to £1,558,463, and out of the profit of the 1949 underwriting year now closed the sum of £500,000 has been transferred to profit and loss account. The marine fund is increased by £212,767 and now stands at £3,665,831, or 143.77 per cent of the premium income.

ACCIDENT DEPARTMENT

Net premium income, 1951 ...	£20,440,921
Net premium income, 1950 ...	18,308,511
Increase	£2,132,410

The ratio of claims paid out and outstanding was 57.74 per cent, commission 18.10 per cent, and expenses of management 17.62 per cent. After adjustment of the reserve for unexpired risks, there remained an underwriting profit of £483,810, or 2.37 per cent of the premium income. The sum of £300,000 has been transferred to profit and loss account, and the accident fund now amounts to £13,665,597, or 66.85 per cent of the premium income.

With a full realisation of the importance to the company of restraint in dividend declarations, particularly at a time when we may be approaching more difficult trading conditions, the directors have reached the conclusion that a modest increase would be no more than consonant with the satisfactory state of the company's business and the strength of its reserves. Last year the total dividend was 8s. 6d. per unit of stock and an interim dividend of 4s. per unit of stock has already been paid in respect of 1951. The directors recommend that the final dividend for 1951 be 5s. per unit of stock, making a total for the year of 9s. per unit of stock.

The assets show expansion in all sections and reflect the world-wide growth of the business.

CALEDONIAN INSURANCE COMPANY

SATISFACTORY RESULTS

The one hundred and forty-seventh annual general meeting of the Caledonian Insurance Company was held on May 8th, at Edinburgh.

The following are extracts from the circulated statement of the chairman, Mr Henry J. Ross:—

LIFE DEPARTMENT

Our new business for the year was a record in the history of the company. The net sums assured amounted to £3,019,036 and deferred annuities for £106,120 per annum net were issued. These figures compare with £2,312,830 and £73,900 per annum respectively for the previous year.

The premium income increased by £61,009 and our net interest income at £349,102 was greater by £35,828 than the amount for 1950. I am pleased to report that the net rate of interest for the year was £3 9s. 3d. per cent, as compared with £3 3s. 11d. per cent last year.

Death claims showed a slight increase, which reflects the trend of our business, but our mortality experience was again favourable. Surrenders showed a slight decrease for the year. The ratio of commission and expenses to premium income was 16.2 per cent, as compared with 16.1 per cent in 1950.

The life assurance and annuity fund at £10,421,479 increased by £353,997 during the year.

FIRE DEPARTMENT

The premium income for 1951 was £3,304,365, an increase of £285,480 over the figure for 1950, which was the previous record for the department.

Our fire underwriting at home was again very successful, and in a year when unsettled conditions prevailed in many areas throughout the world it is satisfactory to know that our overseas department had a particularly profitable year's trading. Our results in the United States and Canada, however, were disappointing. After increasing the additional provision by £100,000, the sum of £307,461 has been transferred to the profit and loss account.

ACCIDENT DEPARTMENT

The premium income for the year showed further increase and the figure £2,451,725 is a record for the department,

Our underwriting in all sections other than motor was successful, but I regret to state that, owing to the heavy claims in that department, the account as a whole showed a loss of £37,546.

MARINE DEPARTMENT

The sum of £75,000 has been transferred from the account to the profit and loss account. The fund at £950,923 represents 165.5 per cent of the premium income, which percentage is very satisfactory.

TOTAL PREMIUM INCOME

The total premium income for all departments for 1951 was £7,255,211, which reflects the steady and continued development of our business.

PROFIT AND LOSS AND APPROPRIATION ACCOUNTS

The amount of interest, dividends and rents (less tax) not carried to other accounts was £116,632.

The balance for the year transferred to the appropriation account was £169,363 after providing for taxation and bad and doubtful debts.

THE EMPLOYERS' ASSURANCE

STEADY DEVELOPMENT

The seventy-first annual general meeting of The Employers' Liability Assurance Corporation, Limited, will be held on May 28th in London.

The following is an extract from the statement by the chairman, the Rt. Hon. Lord Courtauld-Thomson, KBE, CB, circulated with the report and accounts for 1951:—

The combined premium income of our group of companies for 1951 was £23,463,885, an increase of £2,533,155 on that for 1950. The results of our underwriting have again, on the whole, been satisfactory, except in the United States, where the outcome of the operations of the year was unfavourable. The result of our trading for the year was a loss of £335,332. This is reduced by a net credit for United Kingdom taxation and by the release of taxation provisions no longer required so that we have available, with the balance brought forward from last year, an amount of £792,753. The dividend for the year costs £161,604, leaving the carry forward at £631,149.

We again show a good increase in the premiums in the fire account, from £1,519,228 to £1,812,320 and the total profit rose from £147,712 to £165,184. Our overseas business continued to do well, while the results in the United Kingdom were again most gratifying. Our fire business in the United States is increasing steadily and shows every sign of developing satisfactorily.

Our premiums in the accident and general account have increased by over £2 million to £19,176,466. Our total motor premiums have increased, but our experience has been unsatisfactory, and the United States has provided us with the worst results of all.

WORKMEN'S COMPENSATION

In workmen's compensation insurance we show an increase from £4,493,589 to £5,032,765 in our premium income. In the United States this class, which has been profitable for us in recent years, took an unfavourable turn. In spite of these difficulties, it is satisfactory that we have, over the last three years, made about 5 per cent profit. This class has continued to be profitable generally in territories overseas other than the United States, but the unfavourable experience of employers' liability business in the United Kingdom has necessitated an upward revision of premium rates by the companies.

The rest of our premiums in the accident and general account amounted to £5,891,682, an increase of £462,311. These classes have, overall, continued to show substantial and profitable development.

In the United Kingdom we increased our total premiums by a further 12 per cent on those of 1950, but owing to the adverse motor experience the percentage of profit on the whole business was considerably lower. Our business in territories overseas, other than the United States, has again grown appreciably and produced a satisfactory margin of profit.

The Corporation's total investments at £27,755,525 show an increase of over £1 million on the year, and their market value at December 31st was in excess of their book value.

Although from time to time we are bound to pass through periods when even the care and skill of management and staff cannot avoid a disappointing result—as in 1951—insurance, and particularly British insurance, must remain an essential and, consequently, a live and developing factor in world trade and commerce.

ALLIANCE ASSURANCE COMPANY, LIMITED

FURTHER EXPANSION

The annual general meeting of this company will be held in London on June 4th.

The following are points from the review of the report, accounts and balance sheets for the year 1951 by the chairman, Mr Anthony G. de Rothschild:—

Life Department.—The net new business completed during the year amounted to £7,774,286, compared with £6,264,563 in 1950. The purchase money for immediate annuities amounted to £56,923, as against £54,860 in the previous year, and deferred annuities were issued for £147,682 per annum, as against £123,538 the previous year. Claims by death amounted to £692,690, as compared with £575,097.

Fire Department.—The net premiums amounted to £5,456,725 or £317,774 more than those of 1950. The claims, paid and outstanding, amounted to £1,621,084. The surplus amounts to £1,252,381.

Accident Department.—The net premiums amounted to £4,412,058, which is £536,094 more than the income for 1950. The result is a surplus of £362,227, compared with £443,934.

Marine Department.—The net premiums amounted to £2,519,892, an increase of £522,733 on 1950. The underwriting account for 1949 has now been closed, with a balance of £403,904, and after utilising £205,389 for claims falling on previous years, the remaining surplus of £198,515 has been transferred to profit and loss, compared with £131,312 last year.

Trustee Department.—The fees received by the trustee department for 1951 amounted to £16,500.

Investment Department.—The depreciation in the whole of our Stock Exchange securities was less than might have been expected, and in the case of the members' funds was amply covered by the previous margin existing between book and market values. In the case of the Alliance life and annuity funds however, where the previous margin was smaller, the book values at the end of the year exceeded the market values by a comparatively small amount. Nearly two-thirds in value of the portfolio consists of securities with definite dates of redemption and that over a period these will automatically increase in value by very much more than the amount of the present depreciation.

DIVIDEND INCREASED

Turning now to the profit and loss account, the following appropriations have been made:—£200,000 to the staff pension trust funds, of which £25,000 relates to the fund of a subsidiary company, £22,000 to the widows' and orphans' fund, and £105,279 to writing down the book values of Stock Exchange securities held by subsidiary companies. In addition to these appropriations, £200,000 has been transferred to the additional reserve in the marine department.

The board also feel that in view of the general uncertainty of the present times, it would be desirable to set up a contingency reserve which could be used for any particular purpose which time may show to be necessary. They have accordingly decided to appropriate £500,000 for this purpose.

Finally, it has been decided to increase the dividend to 22s. per share, less income tax, An interim dividend of 10s. per share, less income tax, was paid in January last and the balance will be payable in July next.

GENERAL ACCIDENT

The sixty-sixth annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, will be held on May 28th. The following is an extract from the circulated address by the chairman, Sir Stanley Norie-Miller, Bt, MC, JP:

Once again there is impressive evidence of continued vigorous progress. The net income from all sources amounted to £35,169,541, an increase of £3,675,872. The balance for the year was £1,165,929 as compared with £1,265,422. The directors recommend a final dividend of 3s. per share, making the total dividend 5s. per share as against 4s. 6d. The net new life business completed during the year passed the four million pound mark.

In the accident and general account the premium income at £28,776,652 shows a further substantial increase of over £3 million. The transfer to profit and loss of £266,950 is a considerable diminution on the figure of £843,559 for 1950. Motor business, which is preponderant in this account, continues to give cause for anxiety, and in most parts of the world where we operate has failed to produce even a modest return. In the fire account the year has again been most satisfactory. Our net premiums have trebled in the past six years, and in 1951 exceeded £3 million.

The development of the marine account has been continued on conservative lines. The fund at the close of the year represents 124 per cent of the premium income.

PROFIT AND LOSS ACCOUNT: After making reserves, pension funds and dividend appropriations, the balance carried forward is slightly increased at £449,812.

The balance sheet clearly demonstrates the solid strength of the Corporation, and we can look forward to the future with every confidence.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY LIMITED

CONTINUED EXPANSION

Record Fire, Accident and Marine premiums, at £26,174,680, and record new life business at £7,268,722, were figures given in a statement issued by the chairman, Col. A. C. Tod, CBE, TD, DL, with the one hundred and sixteenth annual report and accounts of The Liverpool and London and Globe Insurance Company Limited.

Underwriting profit, £1,079,238, or 4.12 per cent, was not so favourable as in 1950 (£1,206,236, or 5.33 per cent) but the result was satisfactory and had been bettered only twice in 115 years.

The profit, impressive in total, was less than 2d. for each £1 of premium received after payment of taxes and other outgoings.

More than three-quarters of the premiums came from abroad, emphasising the tremendous value to Britain of the company's overseas' operations. The chairman stressed that this business was based on confidence. It was disturbing to find in many lands a lack of confidence in Britain's financial state, arising very largely from the inconvertibility of the £ sterling. To set this right, he trusted the country would not flinch from trying to follow the hard course. Failure to do this, it seemed to him, would inevitably reduce still further the invisible exports upon which the country's trade balance so much depended.

A final dividend of 17s. 6d. is recommended, making 35s. for the year.

BABCOCK AND WILCOX, LIMITED

RECORD TURNOVER AND TRADING PROFIT

MR W. LIONEL FRASER'S REVIEW OF WIDESPREAD INTERESTS

The fifty-third annual general meeting of Babcock and Wilcox, Limited, will be held on May 29th, in London.

The following is an extract from the statement by the chairman, Mr W. Lionel Fraser, CMG, which has been circulated with the accounts:

After setting aside sums for depreciation, providing for UK taxation and making other adjustments, the balance standing to the credit of profit and loss account is £2,059,103. Your directors now recommend that a final dividend of 7½ per cent, less tax, plus a bonus of 3 per cent, less tax, be paid on the ordinary stock, absorbing £276,521, making 18 per cent for this year.

Your board also recommend that the sum of £800,000 be transferred to general reserve, making this £5,672,586, and that £150,000, as last year, be transferred to research and development reserve.

In addition, it is recommended that an amount of £291,461 be appropriated to contingencies reserve, to cover a possible fall in the value of stock of merchandise. This reserve will then stand at £1 million.

Your directors have given special attention to the subject of replacement costs of plant and machinery and a sum of £659,253 is therefore shown on the balance-sheet as a capital reserve.

EXCESS PROFITS LEVY

I will make only a general reference to the proposed excess profits levy, as it is obviously impossible at this time to give any indication regarding its effects on the profits of your company. Suffice it to say, the levy is, in my opinion, a bad tax for many reasons, particularly in its incidence. We are all fully conscious that the country needs additional revenue if the present level of expenditure is to be maintained, but we hope that eventually some equitable means will be found of raising it. If the Government intend to encourage industrial efficiency, as I am sure they do, the Finance Bill will call for considerable amendment in the forthcoming committee stage.

The past year has again been a successful one, both turnover and trading profit showing handsome increases over the previous period, and those themselves constituted a record in the history of the company. The production facilities of your various works have been still further developed during the year and your board are encouraged by the increasing productive capacity, proving that the long-term plans which were put into operation immediately after the war have been fully justified. To-day our rate of output has increased to a point where we shall be able to manufacture plant far more quickly than has been the case since the end of the war. This is vital, not only on account of the necessity of meeting demands at home, but also to compete even more successfully in the export markets of the world. As is well known, our export business has always been considerable, but it is of supreme importance to expand it to the utmost in view of the nation's present economic troubles. We are confident that continued improvement in efficiency of manufacture will enable us to meet increasing world competition, both in regard to price and delivery.

INTERESTS IN THE COMMONWEALTH

Australia.—In spite of the difficulties which have been encountered in Australia in recent years, and which the Dominion is still facing, your company there, Babcock and Wilcox of Australia Pty., Limited, has extended its activities, and the works at Regents Park, Sydney, are being re-equipped and expanded to meet present day demands. They have a substantial order book.

New Zealand.—Since the war we have continued to receive valuable orders from this Dominion.

Canada.—Your company's interests in Canada are maintained by its associated company, Babcock-Wilcox and Goldie-McCulloch, Limited. This company, with its works at Galt, Ontario, has made great progress in the past few years, and I feel sure will continue to assist the economic growth of Canada.

Union of South Africa.—Babcock and Wilcox of Africa (Pty.), Limited, have almost finished the construction of a manufacturing plant in the township of Duncanville, Vereeniging, and it is expected that manufacture of component parts for boiler plant will commence by the middle of 1952. These works will undoubtedly play a considerable part in the industrialisation of Africa. The African company is also responsible for the sales, erecting and service organisation in Northern and Southern Rhodesia, Nyasaland and Kenya.

India.—Babcock and Wilcox of India, Limited, continues to show progress.

Pakistan.—In Karachi we have a branch office which supplies the necessary sales, erecting and operating services in that territory.

HOME SUBSIDIARY COMPANIES

The subsidiary companies at home continue to work well. In particular, let me again underline the success of the "Oldbury" Stoker, manufactured and marketed by Edwin Danks and Company (Oldbury), Limited, the demand for which has grown so much that it has been found necessary for the company to open a new works at Dudley.

GENERAL REVIEW AND PROSPECTS

Nobody who has any experience of administering a big, world wide, industrial company, calling for highly skilled engineering and most careful planning, can deny that the task is formidable in existing circumstances. In this country, we are, at this moment, in an economic crisis which threatens our very livelihood, and perforce industry and commerce are faced with immense problems, complications and drawbacks. Our own main obstacles at present are shortages of raw materials and delays in delivery of key components. Strenuous efforts are being made to meet this situation, and I can assure you that the management is inspired with an absolute determination to overcome all seeming difficulties and to press onwards to greater achievements in the future. I am glad that we are catching up to some extent on our order book, and this can only be in the national interest. As far as we are concerned, it will certainly act as an incentive and stimulant to our whole organisation. I am satisfied that your company is in a thoroughly sound condition and I promise that we shall be relentless in our endeavours to keep your company where it at present is—in the forefront of the steam generating plant section of industry, upon which in its turn a great proportion of industry is so much dependent. If we proceed in this way, I do not doubt that we shall render useful service to the community, and be able to report good progress next year.

BLAW KNOX LIMITED

CONTINUED WORLD-WIDE DEMAND

The annual general meeting of Blaw Knox Limited was held on May 8th in London, Mr J. Theodore Goddard (the chairman) presiding.

The following is an extract from his circulated statement:

The profit for the year after providing for taxation is £121,028. During the year under review progress was maintained in all departments of the company, unfilled orders being greater than at any previous time.

The "B.K. Fifty" excavator and "B.K.12" motor grader have continued to win favour, particularly in overseas markets, and these new products increasingly contribute to the company's turnover in construction machinery. Important contracts have been placed with the company for the supply of its regular products for rearmament and a high proportion of unfilled construction machinery orders are for export.

The company's transmission tower department continues to make a substantial contribution to electric power schemes both in this country and overseas. Contracts have been secured from Canada, New Zealand, India, Pakistan, South Africa, Uganda, Columbia, etc., and, in addition, valuable orders have been obtained from the British Electricity Authority for transmission towers for their 132,000-volt lines as well as towers for their 275,000-volt lines from Clyde's Mill to West Melton, Tilbury to Elstree and Staythorpe to Elstree.

Our steelworks department maintains its high reputation in the industry both at home and abroad. The substantial orders which the company has in hand rank high for priority of materials. This is important in present conditions.

EXPANSION OF MANUFACTURING FACILITIES

We have substantially completed the installation of a gear cutting section and heat treatment plant at our Rochester Works. These additions will contribute to an improvement in production as gear cutting has been one of our more serious bottlenecks due to the limited gear cutting capacity in the country.

While we had hoped to extend the workshop space at our Watford Works to expand our Excavator production, the Town and Country Planning Authority has withheld permission. The necessity, however, for expanding production remains, and ways and means for achieving this are under consideration by your board.

The delay and difficulty in obtaining materials during the year under review and the consequent unbalanced position of our manufacture has resulted in output being curtailed with adverse effect on our costs of production. The position today affecting the supply of materials is very little better. You may be sure that your board will see that the best use is made of the materials available and thus keep production at the highest possible level.

The world-wide demand for the products of the company continues and it is regrettable that material shortages should so decisively limit the company's progress.

A feature of our accounts is the reduction in our cash resources. A year ago our cash and tax reserve certificates amounted to £459,888, whereas at December 31, 1951, they were £180,259, a reduction of £279,629. All this has been used in financing capital expenditure and stock-in-trade.

The report was adopted and a dividend of 30 per cent was approved.

RALLI BROTHERS LIMITED

RECORD TRADING RESULTS

MR JACK VLASTO ON AN EXCEPTIONAL YEAR

The annual general meeting of Ralli Brothers Limited will be held on May 30th at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the President, Mr Jack Vlasto, which has been circulated with the report and accounts:—

Sir Strati Ralli has, unfortunately for us all, carried out his intention of retiring and since January 1st we have been without his invaluable services. He is greatly missed by directors and staff alike, especially by those in London. At a memorable office gathering in December we all endeavoured to convey to him our appreciation and gratitude for all he has done for the company and for those who serve it, and we expressed our warmest wishes for a long and happy retirement.

Our secretary, Mr J. H. Johnson, will, I am sorry to say, also be retiring shortly. He has filled his arduous office with distinction since the company was formed in 1931, and leaves with our best wishes. Fortunately he will still be available to us in a consultative capacity.

By necessity the directors' report on this occasion is somewhat lengthy. The many changes reflected in the company's balance sheet and the consolidated accounts of the group require the amplification which it provides.

THE YEAR'S RESULTS

In view of the optimistic forecast which I made on this occasion last year, you will have been expecting to see exceptional results in the accounts now presented. The consolidated trading profit of £3,166,533, before tax, is not only a record to date, but one likely to take a lot of beating in the future. Our 1950-51 year covered a period of great activity and rising prices for most of the commodities we handle. The opportunities presented by these conditions were successfully grasped, almost all sections of our business giving good results. The strain imposed on our financial and especially on our physical resources by a £65 million turnover was considerable. The greatest credit is due to our managers and our staff of all categories, here and overseas, for the efficient and indefatigable manner in which the large volume of work of all kinds was smoothly accomplished.

At August 31, 1951, when our year closed, commodity prices stood at inflated levels and were very vulnerable. In dealing with the profits for the year we have, therefore, been mindful of the need for caution and of the difficulties with which we would be faced in a period of falling prices. We have accordingly strengthened our reserves, in particular our stocks valuation reserve, which now stands at £550,000, and on which we will not hesitate to call should the need arise. It is pleasing to note that our specified revenue reserves now total £2,600,000 and that "other capital reserves" at £620,479 have been free, some of our trading profits having been used for eliminating the tag previously attached. The £520,000 taken from share premium reserve in November for the issue of 520,000 new Ordinary shares has thus been virtually replaced.

A SPECIAL DISTRIBUTION

In view of the favourable results, our staff received certain exceptional bonus payments during 1950-51. In addition, as you will notice from the directors' report, £75,000 has been earmarked for the benefit of existing provident funds and other retirement arrangements. This sum will be disposed of in due course as the executive committee may decide. We do not feel, however, that the interim dividends already paid are an adequate return to our equity shareholders from this bumper year despite the fact that the ordinary dividend, after the one-in-ten bonus, really represents 12.1 per cent as compared to 11 per cent previously. A special distribution of 2½ per cent on the Ordinary and of 7.6 per cent on the "A" shares will, therefore, be the subject of a special resolution and is intended as an exceptional payment to mark an exceptional year. The £53,200 involved by this payment to shareholders will be taken from "other capital reserves" and from that portion which consists of the accumulated surpluses over cost from sales, made over many years, of redundant fixed assets. These payments, we are advised, will therefore be free of liability to tax in the hands of the recipients.

CURRENT YEAR'S PROSPECTS

In venturing to comment on the prospects for our current year 1951-52, I cannot, unfortunately, continue so cheerfully. Thanks to a good volume of satisfactory forward business on the books at September 1st and, subsequently, to excellent earnings from one of our major artiles, the year began well. Until the end of December, in fact, our merchanting profits and turnover made a brave effort to keep within reasonable distance of the figures for the corresponding periods in the previous year. In February the recession in world trade made itself felt very abruptly and, since then, commodity prices have been declining sharply in the absence of demand. In certain cases we have been unable to escape heavy loss on our working stocks and this has eaten deep into our earlier profits. While, for the main part, the reliability of our buyers is not in question, we are still shipping goods which we sold—and bought—at prices far above current levels and some anxiety is inevitable until all this business is worked off.

Our subsidiary companies, as a whole, look like having very favourable results for 1951-52.

Shareholders will shortly be receiving a copy of an illustrated booklet which we have prepared with the object of giving them an impression of the nature of our business. I hope it will be found interesting.

MAJOR NEW DEVELOPMENT

This year we are embarking on one major new development. In association with the Industrial Development Corporation of Pakistan, with His Highness the Aga Khan and members of his group in Pakistan, and with James Mackie and Sons, Limited, of Belfast, we are participating to the extent of Rs. 43 lacs (£465,000) in The Crescent Jute Mills Company, Limited, a Rs. 1¼ crore company (£1,625,000) formed to own and operate a 500 loom jute mill to be erected at Daulatpur, near the new port of Chalna, in East Pakistan. The mill should be in full production in 1954 and, with its strong and widely experienced backing, should have a successful future.

OLDS DISCOUNT

EXTRACTS FROM THE CIRCULATED STATEMENT OF THE CHAIRMAN, MR W. A. OLDS

The accounts for 1951 again show a further advance. Assets now total over £5¼ million and reserves together with issued capital £1,377,771.

We have a wide range of methods for providing facilities in non-luxury trades which will assist in countering falling sales and dwindling employment. By these methods our resources have been kept fully employed and this appears likely to continue.

Our association with the "Tube Investments" Group has proved highly satisfactory, and a large turnover has been established by the jointly owned company, "T.I. Cycle Credit Facilities Limited."

We are anticipating other forms of development, and hope in due course to extend our activities overseas.

RECORD OF PROGRESS OVER LAST 7 YEARS

	Profit before Taxation	Ordinary Dividend Paid (Net)	Profit Retained after Taxation
	£	£	£
1945 ...	53,873	15%10,100	15,273
1947 ...	121,169	20%20,832	37,562

The 20% Ordinary Dividend paid for 1951 represents 7.36% (gross) on the Ordinary Stock and Reserves.

BIRMINGHAM RAILWAY CARRIAGE AND WAGON COMPANY, LIMITED

RECORD RESULTS

The ninety-eighth annual general meeting of this company was held on May 6th at Birmingham, Sir Bernard D. F. Docker, KBE, JP, chairman, presiding.

The following is an extract from his statement circulated with accounts for 1951:—

The results for the year constitute a record. The balance of £396,149 from the trading account reflects an increased sales value and the benefit from the work of earlier years.

The achievement of our company in 1951 which gives me greatest pleasure is that the value of our output exported created a fresh record, export sales exceeded home sales and by a very substantial amount. The countries to which we exported in 1951 were Argentina, Australia, Ceylon, Egypt, Hong Kong, India, Iraq, Malaya, Mauritius, Nigeria, South Africa and Tanganyika. A very impressive list I am sure you will agree.

At home, in addition to carriages and wagons for the British Railways Executive and carriages for the London Transport Executive, we delivered the new Golden Arrow train for the Pullman Car Company's special Festival service.

For the immediate future the difficulty with metal supplies will have its effect upon results, but I am hopeful that the trouble will be steadily overcome, and I have every confidence in the longer term prospects.

The report and accounts were adopted and the proposed dividend of 10 per cent less tax, on the Ordinary shares was approved.

THE TELEGRAPH CONDENSER COMPANY

ALL PREVIOUS RECORDS SURPASSED

The nineteenth annual meeting of The Telegraph Condenser Company Limited was held on May 1st in London, Mr P. V. Hunter, CBE, Hon. MIEE (the chairman), presiding.

The following is an extract from his circulated statement:

In my last statement I indicated that the prospects for 1951 were reasonably satisfactory; I was not able, however, to anticipate the unprecedented demand for our products which developed during the year. Incoming orders, both in volume and value, were the highest ever recorded in the company's history. Fortunately, due to the progress of the development and expansion programmes, the company was once again able to exceed, by a substantial margin, all previous output records. Thus we were able to satisfy, in the majority of cases, the greatly increased requirements of our customers.

SALES

The company's turnover exceeded that for the previous year by a very substantial amount, in spite of an acute shortage of certain important raw materials. Every effort was made to make good deficiencies of home produced materials by purchase abroad, and the consignments which overseas supplies made available to us, contributed in no small measure to providing peak production in our factories, but was insufficient to permit of any substantial stockpiling.

Sales to overseas customers were higher than in 1950, itself a record year, notwithstanding increasing international competition and restrictions upon imports imposed by various foreign governments. Conditions have steadily become less favourable, however, and, in spite of all our efforts, it may not be possible to maintain our export turnover at the same level during 1952.

Despite substantial increases in direct and indirect costs of manufacture, the increased turnover, both at home and abroad, which once again broke all previous records, enabled the company to achieve the highest trading profit in its history.

During the last quarter of 1951 and during the first few months of the current year there has been a marked falling off in requirements for our products within the radio industry. The substantial increase in the rate of Purchase Tax, imposed upon radio and television sets by the April, 1951, Budget, was a severe blow to manufacturers in this highly competitive industry.

Although we have started this year with a reasonably satisfactory order book, I hesitate to forecast what effect the inflationary trends in the country may have upon the turnover and profits of this business, which caters largely for a semi-luxury market. The likelihood of profits being maintained at the 1951 level is remote, since this was an exceptional year in all respects.

In conformity with your board's policy of bringing issued capital more into line with capital employed in the business your directors propose that £50,000 of the undivided profits of the company should be capitalised, such sum being applied in paying up in full 100,000 new ordinary shares of 10s. each which would be issued credited as fully paid up to ordinary shareholders in the proportion of one new ordinary share for every four ordinary shares held.

It is hoped to hold the necessary extraordinary general meeting to effect such proposal early in June next.

The report was adopted.

JOSIAH PARKES AND SONS, LIMITED

(Manufacturers of Union Locks and Builders' Hardware)

FURTHER SUCCESSFUL TRADING

The annual general meeting of Josiah Parkes and Sons, Limited, was held on May 2 at Willenhall, Staffs, Mr C. W. Parkes, JP, chairman and joint managing director, presiding.

The following is an extract from his circulated review: The accounts for the year ending December 31, 1951, reflect another successful year's trading in the course of which the company has earned considerably higher profits than in the previous year. During 1951 we reaped a full year's benefit from the extensions and reorganisation referred to in my last review, and in addition the South African subsidiary company has, for the first time, contributed towards the group profits.

The net profit on trading was £198,681, which is again a record, compared with £119,601 earned in the previous year. Taxation absorbs £97,149, leaving a net retainable profit of £101,532, as against £46,082 in 1950.

We have spent a further £6,280 on buildings and £30,219 on plant, a total of £36,499, but we are also committed for further expenditure of £54,000 in this direction. Among current assets, stocks are higher by £96,402 and debtors by £37,658, reflecting the higher turnover and in the case of stock, higher price levels. In current liabilities the amount due to creditors is up by £25,785 and taxation provision is £21,499 higher. The surplus of liquid assets is £306,635, compared with £213,660 a year earlier, an increase of £92,975.

DIVIDEND AGAIN 15 PER CENT

We are again recommending a final dividend of 10 per cent, making a total for the year of 15 per cent, the same rate as was paid in 1950. Having regard to the cash position and our future commitments the board felt that no change should be made and the opportunity has therefore been taken to plough back a substantial portion of the year's profit. The effect of this decision is shown in the balance-sheet by the increases in the general reserve, now equal to the paid up capital, and in the carry-forward on profit and loss account.

During the year it was considered desirable to increase the paid up capital of the South African company by transferring £30,000 from the balance outstanding on the loans and advances account and applying this amount in payment for shares.

IMPROVED EFFICIENCY

In the Willenhall factory there has been a continued improvement in efficiency. Greater use has been made of the very extensive facilities for manufacturing provided during the past five years, which has enabled us considerably to increase our output. The increased profit earned by the parent company is almost entirely due to these conditions, the ratio of profit to turnover being practically unchanged from earlier years.

The international situation is still very obscure, and overseas trading, which bulks large in our economy, is extremely difficult in many markets.

During the past year material supplies have been very difficult, but while the restriction on steel supplies may affect us to some extent, we do not anticipate any serious repercussions on the output of the factories because of material shortages.

The report was adopted.

BRITISH ENKA LIMITED

RECORD YARN PRODUCTION

MR A. D. CARMICHAEL ON TRADING CONDITIONS

The twenty-seventh annual general meeting of British Enka Limited was held on May 2nd in London, Mr A. D. Carmichael, CBE (the chairman), presiding.

The following is an extract from his circulated statement. The net profit for the year 1951 amounted to £419,415, compared with £300,241 in 1950. The directors recommend a dividend on the stock of 10 per cent.

The satisfactory profit for the year results from higher operating efficiency, from a substantial increase in production, and from the use of lower-priced raw materials bought earlier in a rising market. Throughout the year we were able to operate to full capacity and to sell all our production.

As reported last year, in view of the severe cuts in supplies of sulphur from dollar countries, in order to assure our future supplies, we joined with several other large producers of rayon and other chemical users, in a project for the production of sulphuric acid from anhydrite, which is indigenous. We have agreed to take up 81,081 shares of £1 each at par in the United Sulphuric Acid Corporation Limited, a company with a subscribed capital of £1,200,000. We have also agreed to take up to a further 81,081 shares of £1 each at par, if the cost of the undertaking should exceed the initial share and debenture capital raised. Production is due to start in 1954-55, and, when the plant is in operation, we should receive at reasonable prices excellent quality sulphuric acid entirely from home sources independent of imports of sulphur.

Although it does not affect the year under review, it is appropriate to mention that early in 1952 the company acquired the whole of the issued capital of Breda Visada Limited, of Littleborough, Lancs.

TRADING

In my speech a year ago I referred to the curtailment of supplies of sulphur and its derivatives, so vital to our production. The allocation granted to us by the Board of Trade was insufficient for our requirements and for a short period we were compelled to curtail yarn production. We were, however, able to make limited additional purchases of sulphur and acid at very high prices. This enabled us to restore the cuts and thereafter we increased our output, so that over the whole year we produced more yarn than ever before in the history of the company.

A severe recession, affecting the entire textile industry, spread in the autumn from the USA to the Continent and is now affecting this country seriously.

It is impossible to forecast how long this state of trade will last. We have maintained our production to capacity for the first quarter of 1952, although conditions have forced us to put some yarn into stock.

The directors' prudent policy of creating substantial reserves and building up the strength of the company has been justified by recent events and has helped us to stand the stress of the present days.

Rayon yarns provide a raw material, of excellent quality, at an outstandingly cheap price. They can be manipulated with great efficiency and provide the masses of the people with good quality, attractive clothing and fabrics at moderate prices. For industrial purposes, particularly for the tyre trade, rayon has become well established and has proved its worth.

The report was adopted.

INSTITUTE OF CHARTERED ACCOUNTANTS

CHANGING PRICE LEVELS IN RELATION TO ACCOUNTS

The seventy-first annual meeting of the *Institute of Chartered Accountants* in England and Wales was held on May 7th in London

Mr C. W. Boyce, CBE, the president, in the course of his address, said:

I need hardly remind you of the differences of opinion among business men and among accountants—and indeed among members of the Council—on the subject of accounting in relation to changes in the purchasing power of money. While not wishing to embark on a controversial discussion today, I would like to say how glad I am that this important matter is to be on the agenda of the International Congress. It is fitting that it should be so, for this problem affects all countries at the present time in greater or lesser degree and is, perhaps, the subject which is most frequently debated among accountants of all nationalities.

The Institute Council was one of the earliest bodies to examine and give its views upon the matter in the much discussed Recommendation XII published early in 1949. This complex subject has been under close review by the Council and in committee for many months past and, at its meeting today, the Council has authorised the publication of a further statement on the subject for the benefit of members. The statement is being printed and should be ready for issue to members in the very near future.

HISTORICAL COST BASIS LIMITATIONS

It cannot be emphasised too strongly that the significance of accounts prepared on the historical cost basis is subject to limitations, not the least of which is that the monetary unit in which the accounts are prepared is not a stable unit of measurement; in consequence, the monetary results shown by accounts prepared on the basis of historical cost are not a measure of increase or decrease in wealth in terms of purchasing power. Nor do the monetary results necessarily represent the amount which can prudently be regarded as available for distribution, having regard to the financial requirements of the business.

At the same time, the alternatives to historical cost which we have so far examined appear to be full of serious defects and the logical application of some of them would have social and economic repercussions going far beyond the realm of accountancy. We do not, therefore, feel justified at this stage in advising that a departure from the historical cost basis should be made in preparing annual accounts for shareholders, though we consider that fuller information should be given to the shareholders as to the estimated effects which changes in prices have had upon the affairs of their businesses, and we recommend the building up of reserves to reflect those changes. We also recommend experimenting with methods of measuring the effects of price changes on profits and financial requirements and the inclusion of a statement of the basis of the calculations if the results of these experiments are published as part of the documents which accompany the accounts. We have stated in our memorandum to the Royal Commission that if it were decided to give some measure of taxation relief to businesses in respect of the financial effects of rises in prices, the method we would favour for doing so would be to give relief on retained profits.

As I have said, the defects in the alternative proposals so far examined are serious and we should not minimise them. At the same time, they should not deter us from further study of the problem. The International Congress in June will give us the opportunity of hearing the results of experience and research in the various countries from which delegates are coming to the Congress from overseas, and after it is over the Council proposes to invite other professional bodies to join with it in such a further study.

BRITISH ALUMINIUM COMPANY LIMITED

INCREASED DEMAND

The annual general meeting of the British Aluminium Company Limited was held on May 6th, in London.

Mr R. W. Cooper, OBE, MC (the chairman) said that while the profit represented an increase, the net profit after taxation did not provide a sufficient margin for the maintenance and normal expansion of their capital assets. The overwhelming burden of taxation which had to be borne by industry in this country at the present time was placing them at an ever increasing disadvantage in relation to their competitors in many countries overseas where more generous and often special depreciation allowances made it possible for profits to be ploughed back into industry in the form of new plant and equipment.

PRICE VARIATIONS

During the year the fixed Government price for virgin aluminium had remained at £124 per ton, but had been increased to £148 per ton on January 1, 1952, and again to £154 per ton on April 1st last. Apart from the inevitable variations in price of their semi-fabricated products made necessary by those changes in the price of ingot, they had been able to retain a very great degree of stability in the price of such products, although minor adjustments had had to be made to cover increases in wages and other materials and services outside their control.

The demand for their products, particularly sheet and strip had increased greatly throughout the year quite apart from defence requirements and it was disappointing that they should be so heavily restricted in metal supplies at a time when so many new uses for their material were taking such promising shape. They had, however, a picture which gave them great confidence in the continued development of the use of their metal after the completion of the current rearmament programme and they looked forward to the day when they could turn their whole resources to the service of normal progress. They also looked forward to the day when they could direct more of their efforts to the building up of their export business which had of necessity been curtailed at the Government's request owing to the shortage of ingot metal and to defence requirements.

LARGER INCOME

The total consolidated income for the year was £3,445,871 which was an increase over the previous year of £1,254,375. The fixed assets amounted to £18,099,110 as compared with £17,437,113 a year ago. The sum of £538,324 had been set aside for depreciation reserve and after adjustments the reserves now stood at £5,532,530. The excess of current assets over current liabilities was now at the very satisfactory figure of £8,640,278 which was a further increase over last year of £2,061,616. The total amount of the revenue reserves was £7,358,768 as compared with £6,455,239 a year ago, an increase of £903,529.

The directors recommended a final dividend of 6 per cent, which made 10 per cent for the year, and a cash bonus of 2 per cent on the ordinary stock.

He had informed the directors that he felt he must retire at the end of the current year. Viscount Portal of Hungerford had agreed to succeed him as chairman.

The report was adopted.

THE SEA INSURANCE COMPANY LIMITED

PROGRESS IN ALL DEPARTMENTS

The seventy-sixth annual general meeting of The Sea Insurance Company Limited, was held on May 6th in Liverpool. A statement by the chairman, Major A. Harold Bibby, DSO, DL, had been circulated with the report and accounts for the year ended December 31, 1951.

The total premium income for the year amounted to £3,859,887, of which £1,841,794, or 48 per cent, was derived from the non-marine departments.

The marine, aviation and transit account for 1950 has been closed by a transfer to underwriting suspense account of £548,075, leaving a profit of £205,979, which has been transferred to profit and loss account. Claims due to theft and pilferage have shown little or no reduction over the previous year and cargo rates are still weak.

The fire department has increased its premium by £317,227 and now stands at £1,198,532. A profit of £71,992 has been transferred to profit and loss account. Fire losses were substantially heavier than in the previous year.

The accident department premium income totalled £643,262, on which a small profit of £7,004 was transferred to profit and loss account. Motor business continues to be unprofitable, and the high cost of repairs and court awards to third parties combine to obliterate the profit in this department.

While all sections of our business have increased in volume, the highest increase has arisen in our American agency under the progressive management of our old friends, Messrs Chubb and Son.

WHY do so many businessmen, economists, accountants, subscribe to the INCOME TAX DIGEST AND ACCOUNTANTS' REVIEW? It is because this monthly journal is practical, authoritative, and a real help to those who have to deal with Income Tax, and Trustee or Funds administration, etc. Annual Subscription 21s. post free; overseas 23s. Specimen current copy 2s. on application to The Secretary, The Fiscal Press Limited, P.O. Box 45, St. Albans, Herts.

CANADA.—Top executive (40) seeks responsible post in Canada. Exceptional experience in engineering industry including finance, administration, factory organisation, sales and service. Adaptable to any type of business.—Write Box 931.

MARKET RESEARCH.—Ford Motor Company Limited of Dagenham, Essex, require man aged not more than 30 as Assistant. At least two years' experience, preferably in motor industry. Economics degree a strong advantage. Good starting salary and prospects; non-contributory pension. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.—Reply to Salaried Personnel Department, quoting reference EMR.

EFFICIENCY IN BUSINESS.—An Exhibition of the latest books on all aspects of business administration and management is open until June 6th, from 9.30 a.m. to 6 p.m. daily, at C.B.C. LONDON BOOKSHOP 6, VICTORIA STREET, S.W.1. Tel.: WHI 4011.

Honeymoon Over

THE borough elections have confirmed the county elections. Between them they have left very little room for doubt that the Conservative party has lost popularity among the voters since it won the parliamentary election last autumn. The significance of these local elections can easily be exaggerated; the poll was everywhere light, and the seats that the Conservatives were defending were those they won three years ago, when it was a Labour government that was suffering unpopularity. The *shift in public opinion* since last autumn is probably small. But a small shift would be enough, if there were another general election today, to put Labour back in power. Mr Churchill and his colleagues must be regarded, at least for the present, as a minority government.

When it is formulated in words, their answer to this demonstration is as firm as could be desired. They always knew that the original measures forced on them by the state of the country would be unpopular; they have a mandate to govern for the life of this Parliament; and they will be judged by the state of affairs that their policy brings about after it has been fully developed, not in its opening stages. That is the true doctrine of parliamentary government. The logic of it is that Ministers, so far from being daunted by evidence of their unpopularity, should seek to make themselves still more unpopular—that is, they should hurry on with their unpopular measures, since time is the only enemy they fear.

But logic has never counted for very much in politics, and it is not counting for very much today. When it is formulated in actions, the answer of the politician in power to an election lost is to falter and to compromise. The concessions that Mr Butler has made this week on the purchase tax show the principle at work. They are not very large concessions; they will not cost him very much, and by the same token they will have very little effect (except to impose inventory losses on the retail trade). But they show how a government that is conscious of weakness has to give way to pressure. And, in their small way, they show how a government that is diverted from its policy now weakens the chance that the policy will pay off—electorally or in any other manner—in three or four years' time. For the purpose of bringing the British economy back to health and strength, Mr Butler's Budget erred on the side of weakness and his surplus was too small. If he believes in his own principles, he must know that to court a little popularity now by giving away a little revenue is to reduce the chances of winning the general election when it comes.

There is another reason for doubting whether the doctrine, so firmly proclaimed, that the Conservatives mean to stay in office for several years and to shape their policies towards vindication at that time, will in fact be carried out. The physical strain upon them is very great. One Minister has already resigned on grounds of health; and several back-benchers have already, at this early stage in the Parliament's life, announced that they will not seek re-election. The Government, it is

true, has not once been in real danger in the House of Commons and from the technical point of view it could no doubt live through a number of sessions as it is living through this one. But the human strain is great. It is still the presumption that the Tories will stay the course; but it is still only a presumption.

*

This is unfortunate. It would be unfortunate in any case, since the country has lived in an electioneering atmosphere for the best part of three years and a sense of stability is badly needed. But it is doubly unfortunate because of the behaviour of the Labour party since the election. Readers of *The Economist* will know that we never regarded the conduct of the Socialists while in office as being perfect; but it was a great deal better than their behaviour since they shed their responsibility. They display an arrogance, a consciousness of superior intelligence and virtue, far exceeding the self-praise normal to political life; it would be painful to watch even if the bystander could discern any justification for it. Not only in their speeches for the gallery but in their inmost thoughts (so far as they can be guessed from the revelations that peep out in speech and conduct) they are unwilling to concede any honesty of purpose or any competence in execution to the half of the nation that differs from them. They have made it clear that they will not give the Government a fair chance. It may be said that the Tories started the game of obstruction in the last Parliament. But there is a vital difference between a five-year-old administration which by its own confession has exhausted its programme, and a party coming newly into office with a list of publicly announced measures to carry through.

Moreover, the Socialists' attitude in opposition in this Parliament goes much further than anything the Tories did in the last. They threaten total repeal of everything the Conservative government enacts. It is, of course, the right of every incoming government to repeal such parts of its opponents' legislation as it finds, on experience, to be really obnoxious. Hitherto in British parliamentary history that right has been exercised with moderation; and it is essential that it should be so. The Tories are certainly exercising moderation in this respect; they are not proposing to alter very much of the mass of legislation that Labour piled up between 1945 and 1951. Yet on each issue that has yet come up, the Socialists have said that, when they come back to power, they will restore every word and comma that the Tories repeal; and they accompany the declaration with threats of reprisals against citizens who venture to deal upon the basis of an Act of Parliament or co-operate with the Queen's Government. In the present electoral state, these threats may be effective; but they are no less monstrous for that. This sort of attitude is not fair play. If it is persisted in, the British Constitution will become unworkable. If anything would justify the Tories in giving the House of Lords back its powers of veto, this would be it. Those who value the traditions of British parliamentary life cannot but be appalled by the present attitude of Labour.

Furthermore, it is not only in its parliamentary tactics that the Labour party is laying itself open to criticism. The extent to which its policies have, in six months, degenerated into irresponsibility is equally alarming. The two men who injected some content of realism and responsibility into Labour's policies in office were Ernest Bevin and Stafford Cripps. If their respective teachings can each be summed up in a single phrase it would be that British foreign policy must be based on the unity of the free western world and specifically on common action with the United States, and that there are limits to the extent of the welfare state that present-day Britain can afford. Both these principles are in process of repudiation by Labour. The Cripps principle has already gone. However skilful the dialectics with which Mr Gaitskell attempts to reconcile the decisions forced upon him by his back benchers with the policy that he and his predecessor followed in office, the fact remains that Labour has nailed to its mast the flag of unlimited welfare. Mr Marquand, himself the first to impose charges in the health service, has promised to repeal all charges; and there has been no hint in the budget debates of any willingness on Labour's part to consider any total of food subsidies lower than the sacred figure of £410 million. As for the Bevin principle, it has not yet been formally thrown overboard; the Labour front bench contrived this week to avoid the division that would have proclaimed the break. But since the national executive of the party has adopted a policy which, in its effects, would be plainly contrary to the policy hitherto consistently pursued by every Foreign Secretary since the war, it is only a matter of time until Bevin is repudiated as openly as Cripps. Mr Crossman boasted, immediately after the general election, that within six months the official policy of the Labour party would be Bevanite. He was only a few weeks out.

These antics in the Labour party cannot be said to be losing it votes—though that may be merely because the Government is losing votes faster. But they are certainly costing Labour heavily in respect among those thinking people who belong to no party. Many of them, in fact, must for the first time in their lives be praying to be delivered from a return of Labour to power.

*

Less and less, however, does Mr Churchill's government look to be the answer to anybody's prayer. Allowances should always be made for a new government—but Ministers have been in office for more than six months, and the honeymoon is over. Allowances must also be made for the difficult parliamentary situation, to which Ministers' ill fortune has contributed much more than their lack of skill. But what is beginning to emerge is that they do not really know what they want to do with parliamentary time even if they had it.

This is an indecisive government—and indecisiveness is the one quality that could be fatal. Ministers, no doubt, will resent the word; they are conscious of all the decisions they have taken. But it is the decisions they have not taken that prove the case—the great areas of policy that somebody will have to take in hand but which are still slumberously waiting for the touch of the master that will awaken them. When one asks where the blame for the lack of decision is to be found, the only possible answer is to point to 10 Downing Street. It was Mr Churchill who, in opposition, would never consent to any precise policies being worked out by the Conservatives. It was Mr Churchill who formed his Cabinet of men who do not find it easy to reach clear decisions.

And those who are in touch with Whitehall have for six months been hearing on all hands that Mr Churchill's methods of personal government have played hob with the administrative machine and made it much harder to get decisions out of this government than the last. It is strange to have to conclude that Mr Churchill, of all men, is a cause of indecisiveness. Within the range of his own attention, of course, he is not. But nowadays a Prime Minister can no more oversee the whole field of policy than a general can supervise the battle by telescope.

It is not perhaps too late for the Conservatives to make a fresh start. But nobody should underrate the difficulties of doing so. Not only would it require a change of attitude and of personalities at the top. It would also require them, amid all the pressures that office imposes on their energies, to do what most parties find difficult enough in the leisure of opposition—to think out exactly what it is they wish to do. On the whole it seems likely that the pattern of the last six months will be maintained and that Mr Churchill will continue to pursue Mr Attlee's policies with a few small changes. That will doubtless be better than Labour coming back to pursue Mr Bevan's policies. But what a pity that the country is not going to be given a chance of discovering whether there is not a practical alternative to the siege economy in which it has lived for more than a dozen years.

Western or Eastern Community?

THE latest Allied Note to Moscow about Germany is in most respects an excellent piece of work. It is true that it does not resolve the dilemma in which the Russian initiative placed western public opinion. When the Russians propose all-German elections and a unified Germany with its own national forces, some sections of western opinion—especially in Germany itself—passionately want to believe that the Russians mean it and, however sceptical they may be, do not want to miss any opportunity of bringing about a much desired alternative to the present tension and division. Other sections of western opinion, especially in France, would regard the re-creation of a unified Germany as a disaster and hope that the Russian initiative will turn out to be a bluff. The West as a whole does not, therefore, know whether to hope for an agreement with the Russians on the liberation and unification of Germany or to fear it. So long as this division of opinion exists, the draftsman of any note to be sent by the American, British and French Governments starts under a disadvantage. Indeed, the cleverness of the Russian move lay in the extent to which it brought these differences to the surface. The new Note does not essay the task of reconciling them. But there are some points on which all can agree, and it concentrates on them. Some of the most important points in the Soviet proposal are either questioned or rejected outright—for example, the suggestion that the frontiers of Germany were drawn once for all at Potsdam, and the insistence that Germany must not be a member of the Atlantic Community or of the European Defence Community. Moreover, the Note strikes at the most vulnerable points in the Russian and East German position by emphasising throughout the idea of freedom. "Unity with freedom and peace with security" is a sound slogan. It will irritate Moscow, but it will greatly strengthen the hand of Dr Adenauer, who first formulated it. The Note asks for assurances that conditions for free voting shall exist before, during and after the proposed all-German elections. It sticks to the proposal that the international commission set up by the United Nations should investigate the conditions for free elections, but the western governments are ready to consider other "practical and precise proposals for an impartial commission" that the Russians may put forward. Not only must there be free voting in the election, but the German Government formed as a result of the election must be allowed to "participate in full freedom" in the negotiation of a peace treaty.

This insistence on freedom puts the Russians in their turn in a dilemma. To grant real freedom and secrecy of voting in Eastern Germany would be to lose their present absolute control of their zone; there is every indication that the Communists would be in a tiny minority. This would be such a serious blow to their prestige that they could hardly tolerate it. It creates the strong probability that they will refuse the western condition or try to weasel out of it. But if so, western opinion will be able to close its ranks, since nobody wants unity if the elections are to be rigged in the Communists' favour. Moreover, it would then be clear to German opinion that it was the Russians, not the western allies, who are standing in the way of that unity on which every German heart is, and inevitably must be, set. For this reason, the Russians might just conceivably accept the challenge of freedom—or pretend to. If sincere, this could be on the calculation that it was worth paying even the enormous price of losing complete control of Eastern Germany, if thereby they could gain enough say in the policies of united Germany to prevent it casting in its lot with the West—a calculation which, as was pointed out here last week, might not prove to be wholly incorrect. Or the promise to restore freedom in Eastern Germany might be made as a bluff, in the knowledge that it would at least set the western countries back on the horns of their dilemma—do they want a unified Germany or not?—and could be wriggled out of before it had to be redeemed.

*

The prospect therefore is that the argument will continue for some time before anyone can see whether it is going to lead anywhere. Meanwhile the western governments are quite properly going ahead with their negotiations to substitute contractual arrangements—a virtual peace treaty—for the present occupation statute and to bring Western Germany into the European Defence community. The treaty for the EDC has been initialled and the contract should be signed, if all goes well, before the end of this month. Initialling and signature, of course, are not the same thing as ratification. It would need much boldness to prophesy that these documents will be approved by both the French and the German legislatures. The most that can be said is that the outlook in Bonn is not quite so black as it seemed to be. Dr Adenauer is said to be confident that he can get the agreements through, and he has been right before when others were despondent.

One of the arguments most frequently used against the EDC and the proposed new relationship between the

Federal Republic and the western occupying powers is that support for these instruments is obstructing the possibility of agreeing with the Russians. The substance of peace in Europe, it is being said, is being thrown away for the shadow. This is an argument that is heard in Germany and in France; and it was heard from the Labour benches in the House of Commons on Wednesday. It is true that the Russians do not like the EDC—indeed, they distrust the whole idea of Western European integration; and to those who are accustomed to western ways of bargaining, the way to get a concession from the other man is to offer one yourself. But this is not the Russian method. Certainly, on the record, to say that the negotiations for EDC have spoiled the chances of agreement with the Russians is not only untrue, but manifestly the opposite of the truth. If EDC had not been making such good progress, the Russians would never have made their latest offer, which, whether it be sincere or a bluff, is an improvement in their attitude on anything that has gone before. It is true that the actual ratification of the defence treaty might not have the same stimulating effect on Russian moderation; a man who will offer a heavy price to avoid something he does not want will withdraw his offer once it is a *fait accompli*. But even that is not certain; there will be plenty of opportunities for trouble-making within EDC, and it is conceivable that the Russians would pay the price of surrendering the Soviet zone if thereby they could make sure of an unco-operative German delegation to EDC. At every step in the building up of Western Europe's defences, warnings have been uttered that Soviet Russia "would not tolerate" what was proposed. As Mr Eden said on Wednesday, Communist threats ought not to influence the action of the western countries, except perhaps to consolidate their purpose.

★

Admittedly, the structure of the EDC is gimcrack; only the men who carried through this great piece of negotiation are enthusiastic about it. Many say it will

restore German freedom to rearm without any real guarantees against German predominance. Others say the structure is so elaborate that it will not work. But none of the critics will honestly face the alternatives. It can be taken for granted that Western Germany is about to recover its sovereignty and, for all practical purposes, its freedom of action. How is it to act, if it is not to be in the EDC? Is it to be neutral and defenceless, isolated from Western Europe, but cheek by jowl with heavily armed Communist Europe? Such a Germany would go the way of Czechoslovakia. Dertinger, the East German Foreign Minister, put it very clearly in a speech last week in Berlin:—

> It will be our duty to fight until the moment comes when an undivided democratic peace-loving Germany proclaims everlasting friendship with the USSR; is linked in friendship with our Polish and Czechoslovak neighbours, with all people's democracies and all peace-loving peoples; and becomes a full member of the world peace camp.

The other possibility is a nationalist Germany, armed but without ties to other nations—which would put the clock back to 1936. The former of these alternatives would seem to suit the Russians best—though the latter is what they seem to be arguing for. Those in the western camp who oppose German rearmament within the EDC—or who, like the Labour party, would agree to it only on conditions which, as Mr Eden demonstrated, would certainly have the effect of killing it—really ought to make clear which of these alternatives it is that they favour.

Nobody should underrate the German passion for unity. Germany has, indeed, a right to unity, and the western allies should seize every opportunity that is presented to them of making it clear that it is not they who stand in the way of "unity with freedom." But, as the allied Note says, "Germany is divided because Europe is divided." So long as Europe remains divided, Germany, whether unified or partitioned, cannot be neutral. The only choice is whether it shall belong to the western community or the eastern. It is by this test that the European Defence Community is justified.

Suez and the Sudan

THE Anglo-Egyptian talks are still eking out a death-bed existence as *The Economist* goes to press; life continues because no one wants to strike the death blow. But there comes a moment at which it is no longer possible to keep on saying that, though the other party's point of view is unacceptable, the door is still open to continue on the same basis. The Egyptian public is being led to expect some dramatic *dénouement*—to be "prepared for all eventualities." Rupture seems inevitable, and it is the more tragic because an agreement, advantageous to both parties, on most of the points at issue, was not far off.

Over the Canal Zone, agreement was actually attainable. Egypt was still unwilling to enter a general scheme of Middle Eastern defence; it cherishes the illusion that, by refusing any such link, it may be able to remain neutral in war. But it was ready, if the British army were to leave and the Egyptian army to fly its flag on the Canal, to accept the *ccdre* of British technicians and instructors without which, at present, it could not adequately defend its property. In a word, a display of mutual confidence had taken place. Where confidence was lacking was on the question of the Sudan. Both sides were agreed that the Sudanese must enjoy self-determination. The Egyptians demanded that they should enjoy it under Egyptian sovereignty, the symbol of which is King Farouk's title to kingship of the Sudan; the British would agree to this title only subject to consultation of the Sudanese. Neither side would trust the other to carry out such a consultation fairly.

The Egyptians, indeed, spend much time reasoning that consultation is unsuitable and unnecessary because, in their eyes, the Sudan is in any case already part of Egypt. Their attitude towards it is both complacent and proprietary. Last week, on the anniversary of the King's accession, the ceremonies at Al Azhar university included a speech by the mouthpiece of the Sudanese students who proclaimed the Sudan's loyalty to the King of the Nile Valley; Egyptians listen only to Sudanese who hold this view and, therefore, believe that all Sudanese do so. They prefer not to find out whether they are right or wrong. During the recent talks they

cold-shouldered two suggestions for doing so: one, that they should send a delegation to the Sudan; the other, that they should allow a dispassionate Arab statesman, such as Nuri Pasha of Iraq, to make and publish a report on the subject. At the same time, they regard every British move towards the self-government and self-determination that have been promised to the Sudan as a piece of sharp practice designed to create a state unfriendly to Egypt and run by British puppets. Only extracts from the pabulum fed to them daily by the press can convey their beliefs. In the last week alone Egyptians have read or heard that "the plan is obviously to delay the dispute with long drawn-out negotiations, whereby Britain seeks to gain time for the Governor General of the Sudan to achieve his policy—a clever encircling movement to defeat Egypt's cause in the Sudan"; that "Britain's intransigent policy in the Sudan may in some measure be due to Britain's fear that the expansion of Egypt's influence further south may result in African races now under British domination looking to Egypt as their natural champion"; and that Egypt is "the guiding star of the Middle East, the civilising and stabilising influence of the African continent." Such complacency may raise a smile among those who know the social and administrative conditions inside Egypt—the former are described in a new research report from the Rockefeller Foundation, based on the findings of a five-year study, as considerably the worst in the world: Yet the existence of such legends merits notice, for they have an important effect upon policy: they produce complete lack of confidence in British good faith and, therefore, rule out a solution in the Sudan *by Anglo-Egyptian agreement.*

★

If the talks, therefore, break down, which government—the British or the Egyptian—is the bigger loser? On balance, there can be no doubt that the greatest immediate losses will be suffered by Egypt's present rulers. They are handicapped by the fact that the Egyptian public, long accustomed to excitement, expects them to mark the breaking off of negotiations with some dramatic symbol of defiance. In internal policy, their objective is to break the power of the Wafd. The Wafd preaches violence. If, therefore, Hilaly Pasha and his cabinet fail to prove that negotiation produces better results than violence, they play into Wafd hands. They produce a situation in which violence becomes tempting and likely, and in which it will be turned—as in January—not only against the British but against their own caste and policy. Secondly, rupture with Britain defeats another of their objectives, which is to arrest the flow of foreign businesses and capital away from Cairo and towards Beirut. Only last week the Minister of the Interior, Maraghy Bey, issued a statement on amendments to the Foreigners' Residence Law designed "to give foreigners a feeling of confidence that the Government is doing its duty to preserve security with regard to them." Few foreigners will gain the desired feeling while Egypt's inclination to come to international agreements, and to keep them when made, is so slight. Lastly, not even over the Sudan does a rupture place them at an advantage. For it is not they but the British who are in Khartoum, and a break with Britain would render inevitable the pursuit of a British and not an Anglo-Egyptian policy.

The losses to Britain would also be great. The large *British and foreign community in Egypt will be in* physical danger if the policy of Cairo politicians once again tempts the public to resort to violence. Moreover, violent social upheaval in Egypt would upset security and tranquillity all over the Middle East in a way that would help no one except the Russians. Nor is it any longer possible to say of the canal, as it still is of the Sudan, that a rupture would at least leave the British in possession. It is possible to maintain a base on the canal in siege conditions, behind a desert bastion and employing imported labour, but the process is both expensive in money and distasteful politically. No one in London wants a return to the conditions that prevailed before January 26th. Indeed, some official quarters in London, having been forced to contemplate a removal of the British Middle Eastern base from the canal zone to somewhere else, have come to the conclusion that it might be better to do so than to hold the canal in the face of Egyptian hostility. If this view came to be accepted by Her Majesty's Government, a rupture might have the result that Britain would lose both the canal zone and the benefits of Egyptian co-operation.

★

In both Cairo and London the action to take in order to guard against the effects of a breakdown is being freely discussed. Some Egyptians favour a policy of non-co-operation with their British customers, regardless of the fact that to sever trade relations would hurt Egypt, in its present parlous economic state, far worse than it would hurt Britain. Others want to take the Sudan case to the International Court of Justice, though the general opinion in Egypt (as throughout the Middle East) now is that all such international bodies are tools of the Great Powers, and that no fair verdict can be expected from them. At the Egyptian end, suggestions that would enable Hilaly Pasha to hold his country steady are few or none. The British Government are, however, most unwilling to leave matters in an impasse that threatens a return to the conditions that bred the riot of January 26th. Brains are being racked, therefore, for new methods of satisfying Egypt's fear of a hostile Sudan.

One that has been suggested is the establishment of a Nile Valley Authority of the riverain states—which are not merely Egypt and the Sudan, but also Ethiopia, Uganda and the Belgian Congo, if not also Kenya and Tanganyika—to promote a sense of security about the life-line of water supply. Another is that Egypt, since it does not trust Britain to consult Khartoum about Egyptian sovereignty, should be encouraged to talk with the Sudanese directly, dealing with representative Sudanese selected by the nominees of a team such as Mr Nehru, the President of the Swiss Republic, and members of the Arab League other than Egypt. For Britain to advance suggestions of this type would be proof of disinterest, yet it would observe all obligations to the Sudanese. Egypt, by accepting them, would acknowledge that the best way to get on with an important neighbour is to keep one's mind open to his views. To refuse would be to display towards the Sudan a spirit of imperialism in the bad old sense of the word—the sense that implies a dictatorial attitude and a mind closed to all thoughts and interests but its own.

NOTES OF THE WEEK

Labour's European Policy

Mr Attlee is showing great skill in the rearguard action that he is fighting against the Bevanites' drive to change the foreign policy of the Labour party. He was unable to prevent the issue of the recent statement of the National Executive of the party, which, though it did not condemn German rearmament and the European Defence Community in so many words, proposed that they should wait until there had been consultations with the Russians and a general election in Germany—conditions which, as Mr Attlee must have known, and as Mr Eden had no difficulty on Wednesday in demonstrating, would effectively sabotage the policy. Still it was possible to argue that the actions of the Labour Government were not being formally repudiated.

The next move by the Bevanites was to try to get the party to force a division in Wednesday's foreign affairs debate and thus formally break the tacit agreement of the last two parliaments that foreign policy is a bipartisan matter. This was defeated in the party meeting—but not so much because of any attachment to bipartisanship itself as because one section of the party supports German rearmament as vigorously as the Bevanites oppose it. A vote might have repeated the scene that took place at the end of the rearmament debate, with Mr Wyatt, Mr Bellenger and their friends abstaining instead of the Bevanites.

The differences were very apparent nevertheless. There was much more contradiction between Mr Bevan's speech and Mr Attlee's than between Mr Attlee's and Mr Eden's. Mr Attlee, in fact, spoke like a responsible statesman, anxious not to obstruct the Foreign Secretary in the pursuit of a policy he believes to be right. Wisely, he refrained from any attempt to reconcile this attitude with his party's most recent declaration of policy.

This is an uneasy situation, and one that must cause Mr Attlee acute embarrassment, the more so since the tide is clearly flowing against him. The unions, as is mentioned in a later Note, are beginning to pass anti-rearmament resolutions, and though their concern is more with the domestic economic implications of rearmament, the same current is turning the party away from the foreign policies that the Labour Government pursued. Mr Attlee will before long have to choose between his own statesmanship and his loyalty to the party.

* * *

German Threatens German

An official bulletin issued in Bonn on Tuesday declared that neither threats nor terror from the East would deflect the Federal Republic from its present course. The Western Germans will certainly need steady nerves under the increasingly violent barrage now being directed against them by their Communist countrymen. The East German leaders are acting on their belief that Dr Adenauer and the Americans will retreat if they run into sufficiently obstinate resistance. As agreement between the Federal Republic and the Western allies seems to draw steadily nearer, the threats grow more strident. Dertinger, the Foreign Minister, speaks of the German people's "right and duty to reply and hit back," and Grotewohl, the Premier, writes of the imperative necessity of "joint action by the workers and mass actions by the whole West German population to overthrow the Adenauer government."

This is something more than a matter of words. Committees and councils have been set up throughout the Federal Republic, with ostensibly respectable and representative backing, to campaign against the contractual agreements. "Mass strikes" have not yet taken place, but the riots in Essen last Sunday foreshadow bigger and better demonstrations; and East German indignation against this "monstrous carnage" (one person was killed and two injured) is clearly designed to intimidate the West German authorities from taking effective police action in future. In Berlin Herr Ulbricht has stated that the day after the contractual agreements are signed the consequences for Berlin will be "clearly seen"; and already it looks as if the Russians have begun to put on the heat in and around the city by their interference with allied patrols on the Helmstedt autobahn.

Finally, East Germans are talking a great deal about their "national responsibility . . . to organise the armed defence of our homeland." They assume, for propaganda purposes, that the signature of the contractual agreements would be only a prelude to an American attack eastwards. They are therefore able to argue that the "sole purpose" of any East German army would be "to preserve peace and protect our homeland" and, at the same time, to threaten that the "German people will not stand by idly while a new imperialist army of aggression is being raised in Western Germany." In a sense, of course, the threat is not new. The East German *Bereitschaften*, now nearly 60,000 strong, are trained in the use of tanks and artillery and could be quickly expanded into a much bigger force. But the presence of this reality behind the Communist threats only adds to their effectiveness, especially as the Moscow press is already discussing the possibility of civil war in Germany.

* * *

The Unions and Rearmament

Two important unions, the Amalgamated Engineering Union and the Shop, Distributive and Allied Workers' Union, have now resolved to endorse what is usually called Bevanism—the contention that the rearmament programme is too large. Their rank and file will probably agree with them and so, undoubtedly, will many constituency Labour parties. Because it is convenient and, from a selfish point of view, advantageous to support Mr Bevan's contention, many unions have resolved to follow his lead. This does not mean that their leaders are his loyal adherents or that they believe as a matter of course in all his theories. They have merely observed the effects of the rearmament programme in action—prices are rising, shortages are prophesied and money is being spent on machine guns. They believe that hardships can best be remedied by reducing the scale of rearmament and by devoting the resources thus set free to articles the public needs.

None of this means that the unions want to install Mr Bevan as the leader of the Labour party. He just happens to be the first Labour politician to propound, in the last few years, a theory that every member of the movement must clearly find agreeable. The unions' support for his views is almost certainly coincidental—but is nevertheless genuine. Mr Bevan is not, in the strict sense of the phrase, a trade union man and does not owe his present position on the Labour party executive to trade union support. But his views on the way the nation should distribute its resources are being accepted by an increasing number of loyal and orthodox trade union members. The importance of the unions' resolutions does not lie in the effect they may have on the political future of Mr Bevan. It is in the pressure that will be exerted on the Labour party's official leaders, particularly at the Labour party conference in the autumn. Mr Bevan's personal position in the party has not been strengthened, but whatever is left of Mr Attlee's wish to impress upon his supporters the hard facts of national security is being further whittled away.

Mischief in *Le Monde*

The publication by M. Beuve-Méry, editor of *Le Monde*, of the alleged report of Admiral Fechteler, must be interpreted as a calculated blow for French detachment from the American military bloc. In his reply to the subsequent letter of resignation of M. Rémy Roure, *Le Monde's* chief commentator on home affairs, M. Beuve-Méry wrote: "Neither peace nor the solidarity of the nations will be saved by weakness, by fear or by blindness in regard to our own friends and allies." He has continuously stressed the impossibility of France's fulfilling its military engagements under the Atlantic Pact and, for the reason that the Pact contained German rearmament as an egg contains a yolk, the provocative nature of Nato from the Soviet standpoint. That a distinguished Frenchman should throughout the years have spoken honestly of his country's lassitude and weakness, in face of the various paper engagements which it has so far failed to honour, could be stimulating as well as debilitating. But to reaffirm the principle of neutrality 14 months after the establishment of Shape in Marly Forest and on the eve of the signature of the treaties of Bonn is an act of spiritual pride which has not commended itself to French opinion.

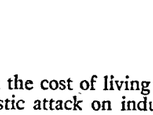
The comments of the wide range of the Parisian press, almost without exception, have been caustic and unsympathetic. Moreover, the very cautious reporting of the dispute by the Communist organs suggests that, although neutralist outbursts are normally grist to their mill, this particular exposure, three months after its original whispering in a crypto-Communist newsletter, has taken them by surprise. Even the French Communists were not immediately prepared to proclaim the "report's" authenticity. That mischief should be made with such an unconvincing report is a deplorable event in European journalism, of which *Le Monde* has been in most respects such a distinguished leader.

* * *

Request for Restraint

The chorus of impending wage demands is evidently growing louder and faster than Mr Butler had bargained for when he framed his budget. In the past week three big unions have added their voices to the clamour. The Amalgamated Engineering Union has decided to press for an increase of £2 a week for adult male workers, with increases also for women and apprentices; The National Union of Railwaymen will ask for an increase of 10 per cent, which, if granted, would add £17 million to the wage bill; and The National Union of Agricultural Workers will ask for a minimum wage of £7 a week. Against the sombre background of a still widening trade gap, lagging productivity and contracting export markets, the prospect of a large addition to labour costs is grave indeed. It is so grave that the Chancellor decided to put the matter, at a meeting on Thursday, to the National Advisory Council, a body consisting of representatives of the British Employers' Confederation, the TUC and the nationalised industries.

The results of this meeting are not known at the time of going to press. But it is certain that in asking for a policy of wage restraint, the Chancellor has not the advantages that Sir Stafford Cripps had. Having cut the food subsidies and imposed economies in the health and education services in the teeth of the TUC's protests, Mr Butler cannot easily take Sir Stafford's line that all can be arranged by agreement and co-operation. He has on his side the understanding of some of the TUC leaders, notably its president Mr Deakin, of the economic issues involved; and it may be a telling argument that, if labour costs can be kept within bounds, an era of stable prices is on the way, partly because raw material prices have already fallen, and partly because a weakening of the demand for consumer goods may bring down their prices.



The TUC leaders may perhaps persuade the unions to postpone their claims for a month or two; but they will not persuade the unions to modify their claims until they can see for themselves that the cost of living is stable—and they will expect a more drastic attack on industrial profits. Under a Tory government the unions are more than ever determined to safeguard their members' standard of living, and in the short run they are in a position to do so. The degree of disinflation brought about by the Chancellor's policy has been enough to earn him their hostility without weakening their power.

Verdict for the BBC

The Government's White Paper is a document of considerable political cleverness. Basically, the Government's decision is to accept the main recommendation of the Beveridge Committee and to leave the structure of British broadcasting mainly unchanged. They did not wish, however, bluntly to reject the pressure of their backbenchers for commercial broadcasting. So they have accepted "in principle" the view that there shall be an element of competition in television, but have hedged it with so many conditions that the would-be sponsors will find it easier to pass through a needle's eye than to get their programmes on the air. To begin with, nothing is to happen until the BBC has completed its television coverage of the country and developed its experiments with high-frequency sound broadcasting—and until the national resources (and, it might be added, the consumer's purse, which pays for all sponsored broadcasting in the end) are sufficient to justify the erection of additional stations and the manufacture of new receivers to receive on new wave-lengths. When this time comes, the advertisers are not to be permitted to buy any of the BBC's time. They are to build their own stations; there is to be a council to oversee their output; and every licence to broadcast is to be ratified by Parliament.

It is so difficult to imagine anyone risking capital on these stiff conditions, and the time is in any case so distant, that it is hardly worthwhile criticising the scheme. It is, however, a great pity that, if the Government were going to open the

ADVERTISING  WISDOM . . .

Quality sells . . . slowly

There are people who say that you don't need to advertise a really good article. They say that quality sells itself; and up to a point they're right. But quality by itself can be a slow salesman; by the time the world knows what an excellent product you are offering, you may have gone out of business.

One of the basic principles of selling is that, in the long run, if a product is going to be advertised it has to be good. But another is that even if a product is good, it still has to be advertised.

In fact, before you congratulate yourself because your product is selling very nicely on its quality, wouldn't it be as well to ask how much better it would sell if you helped it with a little of the right sort of advertising?

Why not drop in and talk about it? We can show you some actual examples that will convince you.

SAMSON CLARKS

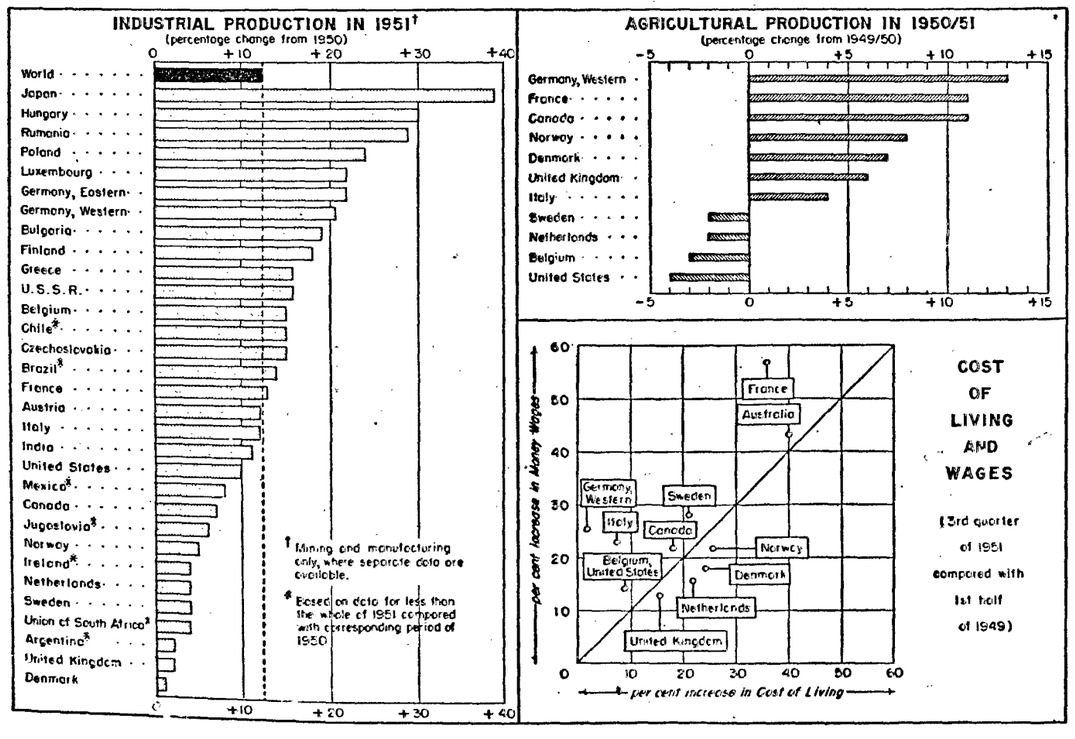
SAMSON CLARK & CO. LTD., 57-61 Mortimer Street, London, W.1. *Incorporated Practitioners in Advertising* Telephone: MUSeum 5050

door, even by a crack, to competition in broadcasting, they should have chosen to do so by way of permitting advertising on the air, instead of letting broadcasters compete in public service, and that they should have drawn this distinction between television and sound broadcasting, tending to keep them apart instead of encouraging them to grow together.

For the rest, the White Paper follows the expected lines. The Charter is renewed for ten years—which is too long, but better than the Beveridge Committee's proposed perpetuity. The Governors are to be appointed in future on the advice of an impartial panel. The Beveridge Committee's proposal for dyarchy in Scotland, Wales and Northern Ireland—with national councils responsible for some of the staff and for the content of the Home Programmes, but with the rest of the staff responsible to London—is accepted; it will be a miracle if it works without intolerable friction. In England, the regional advisory bodies are to be given greater power.

In short, the BBC is continued in its functions, subject to several more of the inhibitions and restrictions that limit its actions. The Government have not only confirmed the monopoly; they have ensured that it will be even more arthritic than it need be. Those who hoped for a more thorough reform can take comfort from the certainty that a great deal will happen in the next ten years. By 1962 it may be possible to get the public—and therefore the politicians—to take seriously the dangers and disadvantages of monopoly in this most powerful organ of public enlightenment.

Demand in the World Economy



Only two things are certain in economic affairs, first that the unexpected always happens—or nearly always—and secondly that shortages can be converted into surpluses overnight. When the rearmament programmes were launched in the second half of 1950, it seemed inevitable that the supply of civilian goods would be curtailed, for production was already at a high level and resources were more or less fully employed. Yet that did not happen. The United Nations' report on the world economic situation 1950-51* has shown that the increase in total production from 1950 to 1951 was greater than the increase in production of military goods, permitting a larger supply of civilian goods. This conclusion is, of course, a generalisation and does not necessarily apply to all countries; but it is true for many of them. Even Britain, whose increase in industrial production was smaller than that of any other country except Denmark (see accompanying chart), enjoyed a higher level of civilian consumption in 1951 than in 1950, though only at the expense of a large deficit in its overseas accounts.

It is unfortunate that the report does not present a fuller analysis of trends in consumption, and more particularly in demand. It observes that in the second half of 1951 and early 1952 "the output of consumer goods dropped, owing to a slackening of consumer demand." But that is a statement not an analysis. The almost dramatic switch from shortage to surplus that is becoming evident in many commodities—even coal and steel—is essentially a function of decline in demand rather than of increase in supply. If the trends in demand could be accurately forecast, economic prophecies might prove to be more accurate than they have been in the past.

* World Economic Situation"—World Economic Report, 1950-51, prepared by the Secretary-General, United Nations.

Changes in the World Economy, 1950-51

The following charts have been based on information contained in the World Economic Report, 1950-51, prepared by the Secretary-General of the United Nations, which was published this week. A further selection will appear in a subsequent issue of *The Economist*. The chart in the bottom right-hand corner shows the relation between the increase in money wages and the cost of living in twelve countries in the third quarter of 1951 compared with the first half of 1949. In those countries above the diagonal, money wages during this period increased more than the cost of living, implying that real wages rose. Those countries below the diagonal experienced a sharper rise in the cost of living than in money wages during the same period, implying that real wages fell.

Labour's Local Victories

The local government elections have shown a strong trend towards Labour in all types of local authority, but its success has been most marked in the large towns. Altogether Labour claims to have captured control of 11 county boroughs, 16 non-county boroughs, 29 urban districts (against one loss) and 4 rural districts. These gains must be seen against a general picture in which the great majority of local councils will remain in other hands than Labour's. In fact, Labour majorities will now exist in little more than a quarter of the boroughs in England and Wales, in less than a third of the urban districts, and in only a small proportion of rural districts.

Labour has made headway on a number of councils which previously held aloof from party politics. It has forced a considerable number of Independents to contest their seats with Conservative support. One effect of the elections has been to weaken the general position of Independent candidates, who in some areas have given ground before a militant Conservatism as well as before the Labour onslaught. The grip of party politics on local government, even in the rural districts, is everywhere tightening; but Labour is still a long way from exerting the sway in local affairs which it has attained nationally.

In the large towns the position is different. Labour may now be expected to wield control in 38 of the 83 county boroughs, and in several others it is the largest single party. The Conservatives have managed to hang on in Leeds, and Manchester also if Labour holds its hand and does not seek to displace five Liberal aldermen. But Labour gained notable victories at Bradford and Bristol and, with the aid of the aldermanic elections, it should also secure the majority at Birmingham and Leicester. Labour is not yet back to its high watermark of 1946 when it controlled every city of over a quarter of a million people except Liverpool; but it will dominate 8 of the 13 cities in this category, while at Nottingham there is the curious position of a tie.

Confessions According to Pattern

The "germ warfare" propaganda campaign, which has been carried on with concentrated intensity for many weeks by Communists throughout the world, has reached a climax with the publicity given to the alleged confessions of two American airmen, Lieut. Enoch and Lieut. Quinn. The confessions that they had taken part in germ warfare have been reproduced on the most massive scale; several complete broadcasts in Peking's home service were devoted to them and about a third of the New China News Agency's transmissions over five days were on the same theme. It is remarkable that they are not mere statements of what is alleged to have happened, but comprise expressions of complete solidarity with the Communist cause in language identical with that of Communist political propaganda. Lieut. Enoch is represented as declaring:

> I have seen the truth as printed by the democratic Chinese press. . . . I am beginning to see very clearly just who is a peace-lover and who is a warmonger responsible for this inhuman war; and I am determined to struggle for peace against Wall Street capitalism to clear my conscience of my past errors.

Lieut. Quinn likewise declared, according to the broadcasts, that "the capitalistic Wall-Street warmongers in their ruthless greed have caused this horrible crime of germ warfare to be launched in order to get more money for themselves in the hope of spreading the war"; he also talked about his conscience and his desire to "confess and repent."

If these two prisoners were simply admitting what they had done, it is remarkable that their remorse should spontaneously express itself in the special jargon of Communism. It is more likely, in the absence of any better evidence in support of the germ warfare allegations, that the two airmen were either Communists in America before mobilisation or have been converted and indoctrinated since they became prisoners. The language and tone of their "confessions" strangely recall the macabre outpourings first heard in the great Moscow trials of the Old Bolsheviks, and often repeated since in Communist courts of law. It now appears that such confessions are to become a feature of Communist propaganda in time of war, with prisoners playing the part of a Zinoviev, a Radek or a Rajk. Indeed, germ warfare seems to be a special feature of such disclosures, for in the Radek-Pyatakov trial in Moscow in 1937 the alleged Trotskyite conspirators confessed that they had planned to infect troop trains of the Red Army with disease bacteria, in order to bring about the defeat of the Soviet regime by German Fascism.

Atomic Artillery

Curious inconsistencies are to be noticed in American and British publicity about atomic weapons. British experiments off the Australian coast are to be held in conditions of the closest secrecy, although lately the Americans have allowed their journalists and soldiers to come closer and closer to the scene of experimental explosions. About British progress in atomic weapons nothing of any substance is released, but the world is told quite freely how much it depends on one British scientist—and his name and address are given. It is impossible to get out of any Whitehall depart-

Lounge Suits

ment any crumb of intelligent comment on what might be the tactical importance of atomic artillery—or for that matter guided missiles, in which British progress is said to be striking; yet the American press has printed a number of revealing comments based on official information. The discrepancy is puzzling, even allowing for British anxiety to live down the Fuchs affair.

Only last week Mr Frank Pace, Secretary of the Army, described in some detail the atomic gun now being developed in the United States and said that "atomic artillerymen" were being trained in its use. It seems obvious that tactical atomic weapons, whether used from the air or on the ground, might make much easier Nato's task of defending Western Europe against mass invasion; and that knowledge of their existence would be an added deterrent to aggression. But there is now also a danger that their importance will be exaggerated and that rearmament programmes of conventional weapons will be prematurely curtailed.

American spokesmen agree that these weapons will not, for some years, provide quick and cheap ways to military security; the need for the infantryman on the spot will remain. At the same time, the astounding skill of scientists in gradually reducing the original atomic bomb to more manageable and less appalling proportions may have the effect of reducing the general awe in which this weapon has been held. It should not be impossible for Mr Churchill to provide the British public with some material and ideas about the possibility that science is finding the military answer to Communist superiority in numbers of infantry.

Development Pains

The terse staccato phrasing of the Colonial Development Corporation's latest report hides nothing. The following quotation from the account of the abandoned Gambia poultry farm is a good illustration of its directness:—

(1) (*a*) In April, 1951, there was an epidemic of Newcastle disease which wiped out the poultry flock;

(*b*) that was the end of poultry farming.

The total loss on this scheme "will be about £800,000," which accounts for most of the total loss of £1,143,000 on abandoned undertakings. In 1951, the consolidated operating loss of the corporation and its subsidiaries was over £1,000,000, double the loss of 1950. If anyone thought that Lord Reith would achieve an immediate transformation in the corporation's prospects, he will be disappointed—and told so, bluntly, in this report.

If anything the corporation's difficulties have increased in the last twelve months. One of these is the rate of interest the corporation has to pay on its advances from the Government. If, as has happened, the rate rises after a scheme has been approved, the estimates are upset and the expected profit disappears. The corporation is enjoined by Act of Parliament, the report points out, "to do economic good; just that; but to do it without losing money." But this task may be frustrated by administrative action, which applies to the corporation the standard terms for long-term loans. If its plea for some relief gets a favourable response, "1951 should constitute the peak of Corporation loss; next year's story should be different."

Yet even this cautious note may be too optimistic. It can be assumed that there will be no more wild plunges into dubious propositions such as the Gambia poultry farm. The odds, however, are still heavily weighted against the corporation's financial success. Although it is expected to operate like a commercial concern, it has no real freedom. Even its most promising undertakings, among which the Tanganyika coalfields investigation ranks high, may be dependent for ultimate success on government action. There is certainly a good case for financial participation by colonial governments in the corporation's projects as is urged in the report. This might, however, be more easily forthcoming if there were not one corporation but several, based in the colonies and looking to a central organisation in London only for advice and technical assistance. If the need for some means of supplementing private enterprise in the colonies can be taken as proved, it is far from certain that the Colonial Development Corporation, as at present constituted, is the best means of filling the gap.

* * *

New Trials in Criminal Cases

In the House of Lords last week Lord Goddard, the Lord Chief Justice, raised again the contention that the Court of Criminal Appeal should be given the power to order a new trial in criminal cases; as he reminded the House, the question is at least forty years old, since it was raised in 1909 by the then Lord Chief Justice. The occasion for last week's debate was the recent trial for murder of two men in Liverpool, and the subsequent inquiry ordered by the Home Secretary. After the verdict at the assizes the defence raised two allegations. One was that one of the main witnesses for the Crown had committed perjury, and had confessed as much. The other was that a third man had confessed to the murder.

This country still believes very firmly in trial by jury in serious criminal cases. It is for a jury to say whom they believe among the witnesses, and whom not, and they have the advantage that they need give no reasons. An allegation that a witness is lying is common enough in court, and juries have to decide where the truth lies; but, as the law stands today, once a criminal trial is over there is no means by which any subsequent evidence may be sifted by a jury. The Court of Criminal Appeal cannot deal with it, for the three judges cannot pretend to turn themselves into a jury. The remedy is to give the appeal court the power to order a new trial, to thrash the whole thing out afresh. That is Lord Goddard's argument, and it is a strong one. The only dissenter in the House of Lords was Lord Simon; he argued that a power to order a new trial would be a power to place a man in jeopardy again for the one offence. The answer to that, made by the Lord Chancellor, was that only a convicted man has the right to appeal—the Crown cannot appeal against an acquittal—and that no convicted man would ask for a new trial unless he felt that the chances of an acquittal on the second occasion were at least fifty-fifty. (From experience in New South Wales, where new trials may be ordered, the chances are just about fifty-fifty.)

The Liverpool case does not provide the only example of a new trial being a more just solution than any other. It is not uncommon for the Court of Criminal Appeal to find that some aspect of the original hearing was unsatisfactory. As the law stands, the appeal court may either leave the conviction undisturbed, which may leave the convicted man with a lively sense of injustice, or it may quash the conviction and let the man go free—a rather chancy sort of justice. It is unfortunate that, at a time when a particular instance has revived this question, Parliament should have no chance of debating the issues involved with a specific Bill before it.

* * *

Defamation in the Doldrums

Mr N. H. Lever's Defamation (Amendment) Bill reached its report stage in the House of Commons on Friday of last week but failed to complete it. The debate stands adjourned until the end of next month. The debate itself was enlivened by a brisk interchange of repartee between Mr Lever and his political neighbour, Mr Silverman: "I don't like the Bill," said Mr Silverman; "Nor does anyone like you," retorted Mr Lever. Perhaps on this occasion it would be as well if what Lancashire said one Friday were not repeated elsewhere at all. But Mr Lever had been considerably provoked. Mr Silverman, in the view of the Attorney-General, had been acting as though he intended to "deprive the press and authors of the protection which the House has decided they should have."

Two clauses only occupied the debate—both of them reconstructions of clauses included in the original Bill. One is intended to protect writers and publishers from the worst effects of what is known as the "unintentional" libel. Without intending to do so, and without anything approaching negligence, any publication may contain a defamatory statement. Holding the balance between the rights of the person defamed and the inherent injustice of treating such a publication on all fours with the intended libel is by no means easy; but at least the revised clause met with the support of most members. The other clause is designed to improve the defence of "fair comment." At present, a single untrue fact in an article will deprive a newspaper of the legal plea that comment in the article is fair comment and therefore protected, provided there has been no wrong motive in the publication. The new clause would give the party sued the chance of proving that his actual comment was fair even though the article contained a factual mistake. Again a majority of the House was satisfied that the existing rules needed amending and that the clause proposed was a fair effort at doing so. But Mr Silverman still disliked the Bill.

The Attorney-General promised that he would do everything possible to find time to complete the Bill this session. He should certainly do so. The Bill has an entirely respectable history. It is based on the exhaustive inquiry into the law of defamation embodied in the Porter report. It is a private member's Bill, and from the Opposition side. It has been given a great deal of parliamentary time and has been discussed line by line. It now has the support of a majority of members of all parties. If all that were to be stultified it would be a poor illustration of the working of parliamentary democracy.

* * *

Dollars to Spend

Over the week-end M. Pleven, the French Minister of Defence, shocked even France's accountants by his revelation of the extent to which security in the coming year depends upon American aid, and the uncertainty that still surrounds the supply of dollars. In the first place, the budgeted expenditure on defence in 1952 of Fr. 1,400 billion assumes the receipt of Fr. 70 billion ($200 million) in respect of American offshore purchases—in this case, payment by the Americans for equipment that French manufacturers have contracted to make for the French armed forces—in addition to direct aid of some $300 million earmarked for France under the current Mutual Security programme. Secondly, the Fr. 1,400 billion programme is still well short of the amount that not only the allies but France itself agreed at Lisbon was necessary for its safety. In particular it will mean that contracts in important naval and air construction will have to be retarded if the French land forces are to be brought up to their agreed strength. According to M. Pleven, France will need a further Fr. 170 billion of American offshore procurement orders over the next three years, if it is not to be oversoldiered and undergunned.

Whether the French are justified in such precarious methods of financing is their affair. They themselves appear at last to be somewhat distressed by it, but their predicament calls attention to a fact of international importance: that the offshore procurement programme in Europe is moving at walking-pace instead of the brisk trot that is required.

European countries are relying increasingly on this form of American aid to finance their current defence contracts, and will find themselves in increasingly awkward, if not dangerous, situations if it fails to appear. In its turn the American Administration has asked Congress for greater scope than it now has in using next year's appropriations on offshore purchases, and it looks like getting it. The American service departments have appointed procurement officers working on the programme for every Nato country concerned. Yet the orders remain negligible. To some extent this is the fault of European manufacturers; but it is also due to the feeling among those who have to place the orders that American manufacturers should have first whack—a feeling that will get appreciably stronger if Congress confirms the ceiling which the House has imposed on domestic defence spending this year. Neither those who vote or spend American funds seem to realise the extent to which the efficiency of Europe's own defence production depends on their overcoming this prejudice.

* * *

An Agreement about Trieste

The agreement on Trieste signed at the end of last week by the British, Americans and Italians went as far as possible within the terms of the peace treaty in giving the Italians a share in the control of Zone A. They are in effect to take over the civil administration and this decision has been well received in Rome. The next step is to carry out the spirit as well as the letter of the new agreement, so that Italian civil government becomes a reality and not a sham; this cannot be taken for granted. The actual change-over will probably have to be delayed at least until after the municipal elections on May 25th, but then it should be completed rapidly.

With the signature of this agreement, attention now focuses on Marshal Tito. The new arrangements were bound to be opposed by the Jugoslavs but the Marshal's language last weekend was particularly unhelpful. It is hard to see what he stands to gain by his uncompromising attitude, except the rallying of his own public opinion behind the regime. Unfortunately, the more successful he is in dwelling on a Jugoslav sense of grievance, the harder it becomes to reach a settlement of the Trieste problem as a whole. The memorandum in which Jugoslavia has now formally protested against the steps being taken in Zone A is more moderate than Marshal Tito's speeches. But its firmness adds to the impression that Belgrade does not at present want a general settlement with Italy on Trieste.

The new agreement has, nevertheless, only introduced a breathing space into Zone A. The conflict of national ambitions is still there in the background and must sooner or later be resolved. To this end, two preliminaries appear necessary and they should be considered now. On the Italian side, it is essential to see that people give up expecting the three-power declaration of 1948, claiming the whole of the Free Territory for Italy, ever to be implemented in full. It was unwise of Mr Eden to refer to it again recently, as this greatly stimulates Jugoslav distrust of the western powers and gives a handle to extreme Italian nationalists. On the Jugoslav side, there is need to be reconciled to the fact that a settlement can only be reached by recognising modern realities. It is no use claiming most of zone A on the basis of the census of 1910, while at the same time giving nothing away in Zone B.

* * *

A Good Case Spoiled

The D. C. Thomson dispute is an outstanding example of two blacks failing to make a white. The firm, which has always refused to allow its employees to join a trade union, dismissed a worker because of his union membership, and the National Society of Operative Printers and Assistants and other unions are bringing pressure to bear to force the firm to withdraw the ban. Denial of the employee's right to join a union is at least as gross an infringement of liberty as the closed shop, and has an even more unsavoury

historical record; and one cannot withhold sympathy from Natsopa in its determination to liberate would-be-members from economic Bourbonism. The methods which they and their allies have adopted are, however, both dubious in themselves and dangerous in their implications. In effect, the offending firm has been subjected to a state of siege extending not merely, as in the normal trade dispute, to the supply of labour but to all the necessities of production. Its suppliers have been forced, until relieved by a temporary injunction, to break their contracts; its distributors up and down the country have been threatened; the whole force of organised labour, however remotely connected with the printing trade, has been enlisted to enforce compliance with Natsopa's demands.

The solidarity of labour, the willingness of loyal union supporters to make personal sacrifices for the sake of a principle, is in itself something to be respected and admired; the principle at issue in the D. C. Thomson dispute is an important one. But the precedent thus established—that the solidarity of the whole labour movement, not merely of those workers directly involved, may properly be called into play for the coercion of any individual who has in any way incurred the displeasure of any union whatever—could equally well be invoked in support of aims much less laudable, from the frivolous to the downright pernicious. Once fully accepted, it establishes the trade unions not merely as powerful bargaining agencies but as supra-legal arbiters of every person's economic conduct, wielding against anyone of whom they disapprove a power to inflict economic ruin limited only by their own sense of strategy and expedience. There are more disruptive possibilities in this principle than in syndicalism itself; it is, merely and simply, anarchy.

* * *

A Quiz for Economists

From time to time public interest has been caught by the predictions of American industrialists or university research workers about an oncoming slump or boom. It must be sadly admitted that not so much publicity is subsequently given to the accuracy—or inaccuracy—of these predictions. Yet the American love of forecasting is catching. The study section of the Royal Statistical Society recently invited 64 economists to predict the movement during 1952 of five selected indicators for the British economy. Some economists refused in horror to have anything to do with the idea, but 70 per cent co-operated—though many only in the spirit of not spoiling the fun. Nine of those supplying answers were from universities, the remainder in industry and commerce.

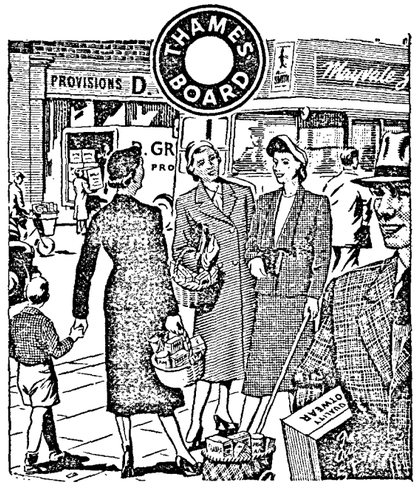
As could be expected, individual forecasts differed widely in a way that makes averages look most uneasy. But, on the whole, the professors thought much the same as the business men. The crystal gazers saw on the average for 1952 a rise in industrial production over 1951 of about 1½ per cent, a drop in the volume of exports of about 1 per cent, a fall in personal consumption of a little less than 2 per cent and a rise in retail prices of 7 per cent. The level of unemployment was put at 2 per cent. These rather harmless looking figures hide, of course, some very disputable ones. The most pessimistic put unemployment at 3½ per cent and exports at only three-quarters of last year's volume. The most hopeful expectations for British exports were that they would rise by 4 per cent.

The methods behind these forecasts are hidden, but a fair amount of guesswork is admitted. If, however, science feels slighted in this survey, it has yet to offer any conclusive proof that in forecasting it can get any nearer to the mark—or any less further from it—than the well-informed guess. This is but a game with a large gambling element, and the players get most interest out of it in deciding eventually which of them is the best guesser.

Shorter Notes

The National Coal Board has abandoned further attempts to place more Italian miners in the pits. It is now telling the 1,000 Italians who are at present in Britain learning the language or training for mining that for the time being there is little chance of finding them jobs in coal. The Ministry of Labour is attempting to find the men other work—in industries such as the brickworks foreign labour has been accepted more easily—but if the men wish to return home the Board will repatriate them. The 31 Italians suspended from underground work at Bullcroft Colliery are to be treated in the same shabby way; this does not offer rosy prospects for the future to the 1,200 Italians who still have jobs in other mines.

*



The draft treaty to establish a European Defence Community, with annexes, was initialled by officials of Belgium, France, Germany, Holland, Italy and Luxemburg on May 9th. Before the draft is complete, the six foreign ministers concerned must settle several controversial points. Before the draft becomes a treaty, it must be signed by them, but they will wait to do so until the negotiations on the contractual agreement with the Bonn government are concluded. Preliminary reports suggest that the content of the present draft differs only slightly from that analysed in an article on page 531 of *The Economist* of March 1st.

Inconsistency in Politics

For a long period we used to idolise CONSISTENCY in our public men. Adherence to party, even when the party pursued an unprincipled course—adherence to former opinions, even when those opinions had become untenable—were long regarded as constituting the first and most sacred duty of a statesman. Change of opinion, or desertion of colleagues, was the one sin for which there was no forgiveness. A politician's obligation to his country was a tradesman's debt, which he ought to pay if he could: his obligations to his party were a debt of honour, which it was unpardonable not to discharge. Reflection and circumstances have greatly modified our feelings on this matter, and the tendency now is to run into the opposite extreme . . . and, provided only the change be in the right direction, we are too ready to accept it as genuine and meritorious . . . and to pass a general act of indemnity and oblivion for the past. We must raise our voice against this tendency, as the offspring of a lax morality, and the probable parent of much future evil. Each individual change of policy or recantation of opinions on the part of leading public men must stand upon its own merits: of the simple fact of inconsistency nothing, neither good or bad, can be predicated. . . . There have been, within recent recollection, some changes so rational, so gradual, so grounded on new knowledge, wider experience, and deeper study, so justified by the purest motives, so obviously honest . . . that we class them among the most indisputable efforts of patriotic virtue. Such was that of Sir Robert Peel from 1842 to 1846. And there have been some changes, also in the right direction, so sudden, so audacious, so utterly unbased upon any additional facts, so inexcusable on the common plea of previous want of study . . . that it is impossible for the widest charity to elevate them into merits, or to give absolution to the subject of them. . . . Such, it appears to us, is Mr Disraeli's homage of adhesion to the principles and consequences of the financial policy of his antagonists. . . . It was a triumph to our cause which (as was said of the Peace of Amiens) "every one will be glad of, but no one can be proud of."

grist to the million

Any day, anywhere, you see them, their baskets filled with the necessities (and luxuries) of life, quite unaware of how much they depend on board—the "cardboard" which makes shopping easy and practicable. Board for protective cartons, board for sturdy packing cases; board everywhere, much of it produced at Thames Board Mills. From these modern mills where fifty years' experience goes into every day's work, come the "THAMES BOARD" and "FIBERITE" packing cases used for the effective distribution of hundreds of products to millions of homes.

Letters to the Editor

South Africans Entrenched

Sir,—Your otherwise excellent article in your issue of March 29th contains one error and one serious omission.

You write that General Hertzog "was forced to abandon the idea of treating the Coloured voters in the same way [as the Native voters] at that time (1936)." In fact, it was always the policy of the Nationalist Party under Hertzog to integrate the Coloureds into the European community. Hertzog's Smithfield speech of 1925 was quite explicit and Dr Malan, then a Minister, supported that policy and wished to extend the vote to Coloured women. The present opposition to the Government's attempt to re-validate the Voters Act of 1951 certainly stems from dislike of Nationalist racial ideology and fear for "the tenuous fabric of civil rights." But it has a most urgent practical aspect, which you have overlooked.

With 45 per cent of the poll the Nationalists secured a majority of seven in the Assembly at the 1948 election, which they increased to thirteen by winning all six South West Africa seats in 1950 by narrow margins. There is little doubt in Dr Malan's or anyone else's mind that his party would lose a general election today on the present electoral rolls. But if the Coloureds are put on a separate roll, the Nationalists hope to win at least six Cape seats from the United Party—a swing of twelve, less the four Coloured Representatives. They hope to gain a further four to six seats by the new delimitation of constituencies, following the 1951 census and the removal of the Coloureds. With the parties so evenly divided and the 15 per cent loading in favour of the rural constituencies where the main Nationalist strength lies, their present majority of 13 plus a further 14 probable seats as a result of these devices might very well ensure their re-election next year. If they then abolish the three Native Representatives and increase the rural loading, it may be impossible ever to vote them out again.—Yours faithfully,

C. W. M. GELL

Rustenburg, Transvaal

A Truce for the Saar

Sir,—The two main issues of the problem discussed in your article in your issue of May 3rd are political and economic. The political problem cannot be solved by internationalising the territory without considering the strong German opposition to this French proposition. The Saar is at least as much German as French, if not more so, and there is no guarantee that the Saar would wish to be independent.

What France is really interested in is shown by its integration of the Saar economy into the French system—a guarantee that Saar raw materials will be used not against France, but for it. As you pointed out, the only real solution to this problem is within the Schuman Plan, which will enable the Saar to put its economic potentialities at the service of the whole community. This consideration should be, on the one hand, a stimulus to France to hasten the day when the Schuman Plan will begin to function, and, on the other, a motive for deferring the political solution of the problem.

Deferment, however, is dangerous. The dispute is still in embryo form, and national feelings are not yet as violent on the subject as they may be a few years hence. It must be remembered, too, that the delay in holding a plebiscite in the Saar after the first world war is said by the French to have given the Germans time to instil pro-German sentiments into the Saar populace, and delay this time might provide the same opportunity for either side. As far as France is concerned, too, it can look forward only to a strengthening of Germany's diplomatic status, which will be backed more and more by Great Britain and the United States as they see what a valuable contribution Germany is able to make to the defence effort.

For these, and many more reasons, it would be unwise to allow the Saar question to drag on. An immediate plebiscite under United Nations auspices and supervision would seem to be the immediate political solution. The economic solution is in the Schuman Plan, and it is up to the Schuman Plan countries to get working together at the earliest possible moment.—Yours faithfully,

M. E. GLASSBOROW

London, E.C.4

Food Without Thought

Sir,—While being very much in agreement with your analysis of the situation in "Food Without Thought" in your issue of May 3rd, I cannot follow your conclusions about milk production.

You consider that milk producers have gained most in the recent price review while, at the same time, milk is one of the few foods that is being produced up to or, indeed, beyond the limits of effective demand. Thus, if more money is spent on milk production less is available for other more urgently wanted foods.

The fall in milk production that followed the 1951 price review showed that the producers' rewards had been relatively reduced. Although for most of the year there is still a surplus over household requirements, there is a risk of shortage in autumn. Last autumn large quantities of milk had to be imported into England and Wales from Scotland and Northern Ireland. It is forecast this year that, even allowing for greater imports, there will be a period when demand cannot be met. In a country which has to import nearly all its butter and about two-thirds of its cheese and has to prohibit the manufacture of cream (and prohibit the milk chocolate manufacturer from getting supplies for most of the year) it is difficult to see that an excess of milk is being produced.

One may ask which may be considered the most urgently wanted food after milk and cheese. If it is beef, will the housewife accept the little more that can be made available at the expense of a prolonged period of daily milk shortage and a further reduction in the cheese ration? The balance of convenience seems to favour milk. The dairy cow is the most efficient converter of food crops into nourishing human foodstuffs so that any diversion of these crops to other animals would be a net national loss.

For these reasons I think that milk is still No. 1 on the nation's shopping list, and find it hard to believe that you seriously mean it can be put last. Milk and its products undoubtedly suffer from those rigidities in supply and demand to which you refer.—Yours faithfully,

I. C. ROBERTSON

Bournville, Birmingham

Albion Toujours Perfide

Sir,—During my recent visit on your behalf to France and French North Africa, I was astonished at the number of Frenchmen that asked me whether it was true that the Anglo Iranian Oil Company had left Persia by design, having discovered oilfields that were better worth operating in Koweit and Iraq. I explained that these were no compensation for the loss of Abadan refinery, nor of Britain's dollar earning capacity, and that a company would not so lightly jettison equipment insured for £78 million, plus a valuable catalytic cracking plant that had only been in use for a few weeks. It is, of course, possible to argue that even the vast economic loss and loss of face that were suffered at Abadan are, as the months roll by, being offset by a strategic gain: we have been forced to build refineries all over the world instead of maintaining one hostage to fortune only 650 miles from the Russian border. Yet this compensating thought did not occur to many British minds at the time.

It is flattering to be thought Machiavellian on occasion, but hardly so to be thought double-faced even when drifting impotently.—Yours faithfully,

YOUR MIDDLE EAST CORRESPONDENT

Books and Publications

America—Alone or Allied?

The General and the President. By Arthur Schlesinger, Jr., and Richard Rovere. *William Heinemann.* 307 pages. 16s.

It is just a year since Washington was watching with fascination the Senate hearings on the President's dismissal of General MacArthur from his commands; this developed from an inquest on American actions in the Far East during and since the second world war into an argument over the basic concepts of the postwar foreign policy of the United States. General MacArthur epitomised the "mid-century" isolationism, the belief that, since the United States could obviously no longer cut itself off from the world entirely, it should concentrate on its traditional sphere of interest in the Pacific alone, without allies. General Marshall, then Secretary of Defence, and the others who spoke for the Administration, put the internationalist point of view; they drew American foreign policy in the round and linked the Pacific with the rest of the world.

The authors of this book, a Harvard professor of history and a Washington newspaperman, do not deal with the actual hearings in detail. It was not necessary to do so for American readers, for seldom have Congressional hearings been more fully reported in the Press, but British readers might have welcomed a summary of the evidence; other essential statements are reproduced in appendices. British readers, too, may find that they lack sufficient knowledge of the Washington scene to savour this entertaining and penetrating book to the full, just as they might not have grasped the finer points of some of the cartoons by the *Washington Post's* Herblock, an even more renowned liberal than either Mr Schlesinger or Mr Rovere; these drawings were in the original American volume but have been left out of the British edition. The authors were, however, writing not for British readers but to give Americans a quick background for a controversy that was fresh in their minds when the book appeared last autumn, and of which they may be reminded if, as is still occasionally predicted, the Republicans, falling between General Eisenhower and Mr Taft, land on General MacArthur for their presidential candidate this year.

Mr Schlesinger and Mr Rovere sketch General MacArthur's life and character, his brilliance and his egotism, with a sympathy that makes their final condemnation more telling; just as their condemnation of the confused and uncertain policy of the United States in China and Korea makes more striking their final admission that nothing else was possible. They are convinced that General MacArthur was not bellicose, but wished to carry bombing raids into China only because he honestly believed that there was no other way of stopping the bloodshed in Korea. Where he failed was in his inability to see the Korean war in a world framework, to relate it to the Administration's long-term resolve to contain Communism everywhere.

It becomes clear from this book, as the authors point out, that General MacArthur deliberately courted dismissal in order to bring into the open his fundamental disagreement with the President's international objectives, and thus the argument over his dismissal became one over the whole future of American foreign policy. It aroused "a violent and spontaneous discharge of political passion" quite incomprehensible to Europeans, who rejoiced at the departure of the General who had shown himself so unsympathetic to the ideals of the United Nations in spite of being the first United Nations commander in history. But the passion came not so much from enthusiasm for the General as from resentment against the President, and, once the American people had got rid of that passion, they seem to have been left with more willingness to face their responsibilities in the world today.

The Senate hearings did not settle the argument over the General's dismissal, for it was not possible even for a final report to be agreed. But in the year that has passed, during which Far Eastern policy almost seems to have ceased to be an issue, it has begun to look as if the argument had perhaps settled itself, as if the weight of evidence produced by the Administration's witnesses is gradually stifling the dream that it may still be possible for the United States to "go it alone."

"We've Been Using More Of A Roundish One"

Herblock in the *Washington Post*, May 7, 1951

A Soldier on Soldiers

East *versus* West. By Lieut.-General Sir Giffard Martel. *Museum Press.* 220 pages. 12s. 6d.

The core of General Martel's book is a discussion of the type of land forces needed by the western allies to defend Europe and of the type of army organisation necessary for Britain's contribution. "An army is a depressing place after a great war," he writes; and his theme is partly the struggle, decade in, decade out, between the forward-looking officers at the War Office and "the authorities," principally the CIGS, who are at best usually attached to the methods successful at the end of the latest war. General Martel tells of the efforts of the team of officers, led by General J. F. C. Fuller and including himself and Captain Liddell-Hart, to raise a mobile armoured force. In spite of the opposition of the Army Council a limited success was achieved, enough, for instance, to enable General Martel in 1940 (as it enabled his French counterpart General de Gaulle) to stand up to the German Panzer tide on a small front.

The author believes that Britain—and especially Lord Montgomery, who comes in for some very bitter criticism—has repeated the mistake of the period between the wars, the mistake of not concentrating on the production of cruiser and infantry tanks and the training of their crews. He is against conscription and in favour of a regular army of some 200,000 men enlisted for thirty years. Such a force alone could, with American help, provide the armour without which the French contribution of manpower for the infantry will remain virtually useless against Russian attack.

General Martel's military arguments (which have been partially met by the recent raising of further armoured forces and by the new form of short-service engagement) are powerful and the spirit animating them unmistakably of a high, well reasoned patriotism. He also has some striking things to say about the effect of Socialism upon leadership. The book deals also, however, with the great political forces in the world at large; with questions such as the threat arising from over-population in the East, an economic urge to expand contrasted by the author with Soviet Communist aggression which, as he says, derives solely from the Kremlin's pride and ambition.

General Martel roundly condemns the west's intervention in Korea as a

strategically ridiculous diversion of strength which has played straight into the Kremlin's hands. This argument is, however, in utter contradiction to his remarks about the easterners' obsession with prestige, which he says he observed while head of our wartime military mission to Moscow; for the Korean campaign, whatever else it is, has certainly been a smack in the eye to Communist and all other aggressors. Nor does General Martel even mention the fact that it was the Korean War that started the gigantic American rearmament without which even the best British efforts towards European defence would probably have proved unavailing. Outside the technical military sphere the author seems to have flashes of high intelligence; but more often his statements have the ring of half-truths and occasionally, for example in the section on the Mohammedan world, they descend to downright naïvety. Nevertheless, the book is clear and vigorous from the first page to the last.

Foundations of Modern Greece

The Greek War of Independence. By C. M. Woodhouse. *Hutchinson's University Library.* 167 pages. 8s. 6d.

At first sight this may seem a curiously narrow subject for a book of this series, and, treated in the conventional way, it would have been. After all, the Greek War of Independence was a small episode covering only the years 1821-29. Out of it there emerged an independent Greek nation which had not existed before, and that, it is often said, was the top and bottom of the matter.

Mr Woodhouse, however, has not handled his theme in the ordinary manner. He has improved its presentation in two important ways. First he has given depth to the story by setting it squarely against those four centuries of Turkish occupation which preceded the movement for national liberation among the Greeks. Second, in describing the Revolution itself, he has been careful to explain how it fitted into the pattern of European politics in the years after Waterloo. Not only did the movement have wide repercussions outside the Balkans, but its own course can hardly be understood unless the attitude of the great powers is taken into account.

Few readers will grudge the thirty-odd pages the author devotes to the *Tourkokratia*, for he shows, with a praiseworthy economy of detail, not only the varied character of the occupation but also what it did to the Greeks themselves. While the Phanariotes dreamed of an Ottoman Empire under permanent Greek management, many of their poorer countrymen, who had once looked to Russia, began to hope for a Greek state which should owe nothing to the Sultan or the Tsar.

With the confused story of the Revolution Mr Woodhouse has grappled valiantly, and he has also managed to convey something of the paradoxes it continually reveals. The Sultan was half-hearted against the Greeks until it was too late. The British government hastened to describe the Battle of Navarino as an untoward event. The Greeks themselves were never of one mind; their heroism was only equalled by their capacity for mismanagement; and many of them, when independence was at last attained, preferred the Turkish yoke. Altogether this is a useful book, competent and unpretentious.

Practical Farming

The Elveden Enterprise. By George Martelli. *Faber and Faber.* 172 pages. 21s.

The Elveden estate consists of 23,000 acres of land so poor and sandy and in an area so subject to drought that normal farming operations have generally been considered impossible. As recently as twenty-five years ago 3,000 acres were let at an annual rent of 2s. 3d. an acre, a sure measure of the poverty of the soil. On the other hand it is a paradise for game. As a result Elveden had usually been run not by the farm manager but by the head gamekeeper who arranged the cropping plan to encourage the game and for no other purpose.

During the last two hundred years only two owners have really tried to farm the land. The first was Lord Albemarle at the time of the Napoleonic wars and the second Lord Iveagh who took over in 1927. Mr Martelli's book deals in outline with the history of Elveden up to 1927 and in detail thereafter.

Lord Iveagh displayed considerable imagination in embarking on a programme of agricultural expansion in 1927, at the beginning of the era of bonuses for non-production when the world seemed glutted with food. Since that time he has built up Elveden into the largest arable farm in the country with yields of corn nearly up to the national average, and sugar beet actually better than average. At the same time the number of cattle was increased from 100 to 1,700—only, unfortunately, to meet with disaster in the present outbreak of foot and mouth disease.

Elveden is now run as an arable, dairy and beef farm. It is surprising, in view of Lord Iveagh's determination to build up the fertility of the land, that so many crops are sold off the farm instead of being fed to pigs. The light dry soil should be ideal for keeping pigs outdoors and they might very well be the means of reclaiming those remaining portions of the estate still considered too poor to be cultivated.

Mr Martelli is interesting, factual and objective, and the work is particularly well illustrated. It is strongly recommended to the general reader and in particular to all landowners.

The Growth of Radicalism

The Radical Tradition. Edited by S. Maccoby. *Nicholas Kaye.* 236 pages. 16s.

This, the fifth volume in a series designed to exhibit the variety of the British political tradition, is devoted to Radicalism. Its growth and the quickening influence it exerted on political life are aptly illustrated in a succession of well chosen extracts from speeches, letters, pamphlets, newspaper articles and election addresses. The editor has also given his texts a useful commentary.

Dr Maccoby holds that English Radicalism began with Wilkes and Paine, and that its distinctive influence lasted for about a hundred and fifty years, until its strength was gathered into the Labour movement in the early part of the present century. As such it was a form of political activity which flourished in that temporary and unique situation, when society here was painfully adapting itself to fit the strange new conditions created by a technological revolution of unprecedented magnitude. This is a point which seems to have escaped the notice of the editor, although his careful analysis of every phase of Radical activity makes it abundantly plain.

It is less surprising that the Radicals themselves failed to perceive it. Their concern was to agitate for fundamental changes to set right immediate grievances. They were not given to philosophising about why their problems existed at all, nor were they prone to doubt what seemed to them the self-evident virtue of the remedies they proposed. In an age when much had to be altered, their robust, if myopic, self-confidence was a source of great political strength. Yet it also had its dangers for, as the book shows, Radicalism in its heyday was always liable to topple over into revolution.

The Radicals were never a true party, and the more fervent among them, dis-

but only in the hands of experts

Linoleums have been Catesbys business for over 60 years ..... small wonder then that they know so much about it! In most fields of endeavour it is experience that counts above all. Catesbys possess the largest stocks of finest quality linoleum in the country. The great thing about linoleum is that it doesn't crack in use, is germ proof, has a long life and—last but not least—it is so easily cleaned. Fine quality linoleum deserves careful laying and fitting, especially where pattern is concerned, and the skill of Catesbys team of expert fitters is without equal.

THE CASE OF THE VANISHING VARNISH

A "liquid asset" —till it disappeared from the books!

THE BOOKS *weren't ready to be made up till* six months *after the financial year ended. By then, discrepancies had to be written off....*

THE Paint and Varnish manufacturing firm of A. Macnair and Co. Ltd., Manchester, was doing well. The volume of business had increased many times since 1939, and there were no complaints from management or factory employees.

In the office, however, staff using pen and ink methods had to put in much overtime to get statements out by the middle of the following month—there just wasn't time to check all items accurately. Sometimes, wrong figures were posted from the day book to the ledger account; sometimes, items were not posted to the ledger at all. The auditors, who were called in to make up the books at the end of the firm's financial year (usually a six-months job), found that it was continually necessary to write off discrepancies to balance the books.

Macnair's realized the danger of these mounting overheads, and they called in the Burroughs man to investigate and offer expert advice. He suggested slight adjustments to Macnair's existing system and recommended a Burroughs Bookkeeping Machine as practical for all the firm's needs.

Result? Although production has doubled and premises quadrupled, Macnair's office staff is the same size. Statements are now sent out regularly on the *second* working day of each month. The audit for the year ending March 31st 1951 was completed by April 19th!

WHAT ABOUT YOU?
If you are faced with any time-lag in obtaining full figures on the state of your business, your wisest step is to call in Burroughs now. They are experts in interpreting figuring problems in relation to the latest systems, for Burroughs make the world's broadest line of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment.

***CALL IN* Burroughs**

contented with the slow pace of peaceful change, were sorely tempted to violence in an effort to hasten the reforms they thought both necessary and inevitable. This happened on the morrow of the French Revolution of 1789, and it happened again in the Chartist movement, where extreme Radical influence was strong. There were many who agreed with William Rider that "the citadel of corruption" could only be levelled by force. Not the least surprising thing in the history of Radicalism is the way John Bright was able to swing the movement decisively from so fatal a course, and it is a point on which Dr Maccoby properly lays emphasis.

Colonial Digest

Digest of Colonial Statistics. No. 1. March-April, 1952. Colonial Office. *HMSO.* 68 pages. 3s. 6d.

There has been a long felt need for more easy access to colonial statistics and the Colonial Office is to be congratulated on a brave attempt to provide one. This publication, which is to be issued every other month, provides some of the more important figures in clearly presented tables. It is intended as a companion volume to the Digest of Statistics for the United Kingdom, but inevitably the scope of the information is more limited. Half the tables in this first number are concerned entirely with the trade of the colonies; other tables cover primary production (although in many cases exports are the only measure), price movements, area and population figures, and some rather fragmentary information on industrial production. In most series annual averages or totals are given for 1936, 1937 and 1938 and for the postwar years, with monthly figures over the last two or three years.

There are particularly interesting tables showing the direction of trade from and into the different colonial territories and the sources of supply of imported cotton piece goods where India has replaced the United Kingdom as the main supplier and Japan is becoming a serious competitor again. Yet, having been given so much, the user of these statistics will almost certainly ask for more. There are a few omissions from the list of primary products, notably coffee. If possible, it would be useful to have production figures of food crops for local consumption, particularly of rice. More is needed on industrial production, but some extension of these statistics is already promised.

There is nothing about finance in this new Digest. It is likely that such statistics as do exist are more appropriate to an annual abstract, and it is hoped that it is intended to publish one. The most welcome statistics in this would be figures for the balance of payments and estimates of the national income, so allowing comparison not only between the colonial territories but in a world setting. In the meantime, some explanatory notes on the new Digest would be helpful to answer such queries as whether the territories listed as producers of the various commodities necessarily cover the whole of colonial production.

Visionary and Adventurer

John Baird. The Romance and Tragedy of the Pioneer of Television. By Sydney Moseley. *Odhams.* 256 pages. 16s.

Baird very nearly became the Marconi of television. After his initial success (in 1926) in transmitting crude but genuine living pictures by wire, he kept himself in the public eye for more than ten years by periodic demonstrations and "stunts" while he strove to develop the system to a practical stage. For a time his name was, in England at least, synonymous with television. But as the improved system began to emerge, he was gradually overtaken, and though he struggled desperately to maintain his lead, all his ideas were abandoned, and his name lost its magic. Television as we know it owes very little, technically, to Baird, and though he has a genuine claim to be one of the pioneers, his chief contribution was in assiduously exploring all the blind alleys of television while those of clearer technical insight were biding their time. Baird may have been the prophet of the new dawn, but it is false to portray him as the neglected inventor cheated of his just reward.

In spite of his protestations, this is just what his friend and collaborator, Sydney Moseley, has tried to do, by inference, in this book, and the whole of the later part, describing the rise and decline of Baird Television Ltd., and its metamorphosis into Cinema-Television Ltd., is partisan and unreal. The early chapters, however, give an interesting picture, chiefly from Baird's own notes, of his youth and first commercial ventures; the former was sordid and discouraging, the latter not altogether respectable. The story of the romantic "garret" stage of his television experiments, in truth the zenith of his career, is very interesting, and includes impressions and reminiscences contributed by his contemporaries. Baird was part scientific visionary, part adventurer, like the alchemists of the past, and his story would have been more interesting if it had been told in its true colours.

Shorter Notices

International Economics. By Jacob Viner. *Allen and Unwin.* 381 pages. 40s.

This collection of papers, whose original publication dates range from 1924 to 1947, and which includes contributions to learned journals, to the popular press and to the proceedings of expert societies, as well as lectures delivered in a number of countries to widely different audiences, has a surprising degree of unity; the unity imposed, in the author's words, by "faithful adherence to the mode of thought and the values of nineteenth-century free-trade Liberalism." This adherence is explained, and justified in the face of the Keynesian revolution, in Professor Viner's introduction. Some of the material here re-published has been incorporated in more solid works, notably the definitive study of Customs Unions published last year. The beautiful essay on "International Relations between State-Controlled National Economies" was included in the Blakiston "Readings in International Trade." Many others, however, are made available to the general public for the first time. Throughout, Professor Viner reveals himself not merely as an acute economist but as a man of sense—using that expression in its full eighteenth-century connotation; in this quality, as in his humanism and his quiet and straight-faced humour, he recalls Edwin Cannan—particularly the Cannan of the "Economist's Protest."

Yearbook of the United Nations, 1950. *United Nations,* New York. *HMSO.* 1,068 pages. 90s.

Like its three predecessors, this official record of all the manifold activities of the United Nations suffers from the lapse of time. Whether in Korea, Libya, South West Africa or South East Asia, events have moved forward since December, 1950, the last month to which it refers. But it provides a uniquely detailed and objective account of the year which saw, for the first time in history, a multi-national force mustered to resist aggression under the flag of a world organisation. The eighty-page section on Korea is a valuable restatement of the early stages of the struggle in that country, and other sections of particular interest deal with the disposal of Italy's former colonies and the launching of the technical aid programme. The yearbook is well designed for convenient reference, each subject being treated as a whole instead of being divided between the various United Nations organs; the work of the International Bank, Unesco, and the other specialised agencies is usefully summarised; and there is a 55-page index.

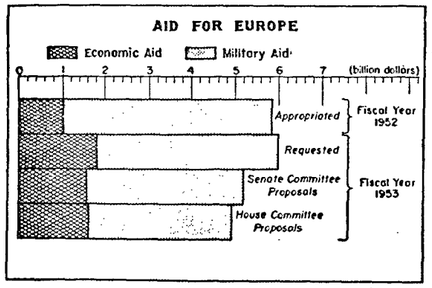
AMERICAN SURVEY

Foreign Aid Over the Sticks



Washington, D.C.

AFTER a lame start this year's foreign aid Bill, which has now covered about half the course in its annual steeplechase round Congress, is finding the going easier and is taking its fences better than the more pessimistic among its trainers and backers in the Administration had dared to hope. On April 30th the Senate Foreign Relations Committee returned the Bill to the Senate with a recommendation that the President's request for $7 billion be cut by $1 billion, by means of a uniform reduction of 12.6 per cent on each of the items in the Bill. A week later the House Foreign Affairs Committee also recommended a cut of $1 billion, to be made by taking $829 million from military aid and $182 million from economic aid to Europe. These are the Bill's two steepest fences, its Becher's Brook and its Valentine's, and although there are many obstacles yet to come, the general debates in both the House and the Senate, and the ramparts of their Appropriations Committees, it is the recommendations of these two first committees which will set subsequent standards.

At first sight the reductions made by both committees look like wild swings of the economy axe, but on closer examination of the figures it is clear that both bodies paid more serious attention than usual to the Administration's arguments. In particulars the heaviest blows have fallen not, as the legislators were predicting six weeks ago, on economic but on military aid. There were two reasons for the decision not to slash economic aid. The first was the steadiness with which the Administration stuck to its point that economic aid to Europe must be larger this year than last, not only because the rearmament burden on the European countries was increasing but also because Britain, which was not included in last year's request, was in urgent need of assistance; the Mutual Security Agency calculates this need at $590 million for the coming year. But Congress has heard many urgent pleas on this subject in the past five years from members of the Cabinet and other officials, and what really saved the day in the Senate Committee, in addition to the testimony of General Gruenther, was the strong support given to economic aid by the representatives of private organisations, the religious and philanthropic bodies, the farm and labour organisations. When the Senators began to sniff the sweet odour of votes, the attractions of economic aid became more obvious.

On the other hand, the military authorities found themselves in an awkward position for demanding an allotment of funds on anything like the scale of last year. The Secretary of Defence had somewhat ruefully to admit that, of the $9.5 billion worth of military aid authorised for Europe in the past three years, only $1.2 billion worth had actually been shipped by the end of January. The House Committee managed to elicit the fact that by March of this year only sufficient medium tanks had been sent abroad to absorb the money voted in 1949-50. The rate of delivery on most items of military equipment is beginning to rise very fast and the military witnesses asserted that, by the end of this year, it will have overtaken most of the backlog of unspent money. They argued also that the long lead time for building complicated tanks and aircraft necessitated allocating funds now for delivery several years hence. But the unspent $8 billion rankled with the legislators, most of whom had started to hear the evidence with a firm conviction that military aid should be passed in full while economic aid was pared to the bone.

There is no doubt that this year's Mutual Security Act will be a better instrument than its predecessor if it emerges finally from Congress in anything like the form which the two committees have given to it, and it is most unlikely that a Congress which is anxious to be off to the hustings will find time to amend anything other than the purely monetary provisions. The President will have power to switch 10 per cent of the funds allocated to each area to another area or between economic and military assistance. He will be able to deal with Shape and the European Defence Community, when it is set up, and to transfer military equipment to them as entities rather than being forced to deal with individual countries. Finally, at least $1 billion of the amount voted for military assistance to Europe is to be used for "offshore procurement" in Europe if the House Committee has its way.

This last provision may prove rather embarrassing to foreign aid officials, although in principle they are enthusiastic about offshore procurement, since it supplements the dollar supplies of the European countries. But in fact they have managed to allocate only $35 million of the $500 million it had been hoped to spend on European procurement this year. Plans for expansion have so far been stymied by the reluctance of European industrialists to accept the conditions attaching to American contracts and by the reluctance of American army officials to purchase anything non-American. As the Geneva correspondent of the *New York Times* expressed it:—

> An army that is still hauling canned beer 4,000 miles to be drunk by people living in Heidelberg and Munich presents a formidable psychological problem to those who want it to start buying more electronic equipment in the Netherlands and Italy.

The more reasonable atmosphere in which this year's foreign assistance Bill is being discussed is attributable to several causes. For one thing the question of how foreign aid shall be administered is no longer a major issue, and the various agencies concerned have managed to impose a pattern of modest efficiency upon their peculiar spider's web of functions. For another the steps being taken in Europe towards the ratification of the Schuman plan and the creation of the European Defence Community have provided the tokens of good faith for which Congress has been seeking so earnestly. The preoccupation with the election and the waning of the struggle between the "Europe First" and the "Asia First" schools has taken much of the heat out of the issue. Senator Connally's decision not to try again for the votes of the economy-minded Texans drew the rancour out of his attitude towards expenditure, and has enabled him at the eleventh hour to resume the role of the Administration's spokesman on the floor of the Senate.

★

There are many pitfalls ahead. So far both the House and Senate Bills have been kept free of cranky ideas, although the Administration had to bring every gun to bear early this week to kill Senator Knowland's proposed limitation on the sending abroad of jet aircraft. But if the Senate divides along party lines when the Bill comes before it, despite the belated efforts of Senator Wiley of Wisconsin to recreate a bipartisan spirit, then the Administration will have to accept further cuts and compromises, since there are several Democrats who would side with the Republicans. The temper of the House is harder to gauge. Since every member is up for re-election in November the House is more alarmed than the Senate at government spending and deficits. The House has already proposed drastic cuts in the United States' own military budget and, in the eyes of many Congressmen, foreign military and economic aid is directly competitive with, not complementary to, domestic rearmament. The fact that the Director of Mutual Security, Mr Averell Harriman, is now a declared candidate for the Democratic nomination to the Presidency tends to make foreign aid look like a policy which no Republican with a marginal seat can afford to support wholeheartedly.

For this reason, as the final stages of the foreign aid Bill and the road to the convention begin to converge towards the end of June, the relative strength of General Eisenhower and Senator Taft may well determine the shape and size of the Act that emerges. The General has twice within the past two weeks pointed out by cable the danger of further cuts and, if there is a clear upsurge of popular support for him during June, Congress will be more disposed to heed his advice. But if the Senator is clearly in the lead for the nomination, there will be very few Republican Congressmen who will care to see the Bill become law, as it stands, even with the cuts already proposed; they will try to emulate the Senators who are demanding a further reduction of $1 billion or so.

Market for Music

[FROM AN AMERICAN CORRESPONDENT]

THOSE who suffer from America's eagerness to teach the world how to run its industries can take comfort from a compensating modesty on cultural matters. In music, for example, the United States still acknowledges European supremacy. A British citizen, Mr Rudolf Bing, is putting new life into the Metropolitan Opera; an Alsatian, Mr Charles Munch, is head of the Boston Symphony Orchestra; an Italian, Mr Arturo Toscanini, now celebrating his eighty-fifth birthday, is the most famous and popular conductor in the country.

This continuance of an old homage tends to obscure the growth in musical taste, skill and enthusiasm which has taken place in the United States in the last few decades. American orchestras and ballet companies are beginning to invade Europe. American singers no longer feel that they must hide their origins under foreign names in order to attract listeners. Musical comedy is now the best native theatre playing in New York. Music printers are now reproducing certain classical scores that have long been out of print in Europe, and gramophone record dealers have invaded the bookshops to sell with equal enthusiasm the output of foreign and American musicians.

All this reflects increased public demand, and means the growth of a considerable business. In financial terms the music business would include the Metropolitan Opera's yearly budget of $3 million, the $1 million each which is needed annually for the ten top orchestras, the $180 million spent each year for recordings. In addition, there are the budgets of at least 500 smaller orchestras, of which a hundred need more than $100,000 a year apiece to support them. A recent commercial reference book also lists 80 opera companies, 540 "concert and/or marching bands," and 184 educational institutions offering major courses in music. Obviously this activity develops its own demands—the country boasts at least 255 manufacturers of band and orchestral instruments, 699 gramophone recording companies, 191 musical periodicals and 1,196 music editors and critics on 926 newspapers.

★

The oldest of the great orchestras is the New York Philharmonic which was founded in 1842. Then came the Boston Symphony in 1881 and the Chicago and Cincinnati orchestras, all founded before the turn of the century. The Philadelphia Orchestra was established in 1900, and was followed by those in Minneapolis, St Louis, San Francisco, Cleveland and Los Angeles. Ten of the big ones are more than twenty-five years old; many others have been established since the first world war.

Few orchestras manage to pay their own way. In the early days of the Boston Symphony, Mr Henry Higginson set aside $1 million which, invested at 5 per cent, was to provide the necessary income over and above the sales of tickets. The interest rate, the investment market and modern wage scales have combined to frustrate his benevolence. Nowadays big orchestras need as yearly income what he gave as capital. Two-thirds of it may come from ticket sales, the rest from radio broadcasts, the making of records, and the generosity of donors. Some city governments add a grant, but this practice is not yet common.

Smaller and less famous orchestras were brought into existence by the federal government which, during the depression, supported as many as 15,000 musicians working on some 700 different projects. A small city such as Norwalk, Connecticut, has its own orchestra, so has San Antonio, Texas. Albuquerque, New Mexico, has had the honour of giving a world première to a composition by Arnold Schoenberg. Schools all over the country teach their young to play in bands which make music at football games or for dances. The dance band can earn its way; in the hands of a famous leader, it can make as much as $500,000 on a single tour, and countless lads in lesser bands

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

follow this golden gleam as they work their way through college by playing for dances.

Economically, the opera is as lame as the orchestras. Even the Metropolitan in New York City is periodically shaken by worry about budgets; expenses in 1951 were $4,023,314, and earned income only $3,312,755. Radio has helped. Sponsored coast-to-coast broadcasts on Saturday afternoons add to the opera's regular income, and reach a wide body of listeners who contribute to opera fund drives. So far the deficit has always been met, but the sense of insecurity remains.

Smaller opera companies, like smaller orchestras, function in many cities. Some are connected with universities, some give summer opera out of doors, others depend on civic pride or the generosity of a local Maecenas. Very few of them pay their way for any length of time. Even the New York City Centre, with resident ballet and opera companies, is forgiven its taxes, and given additional help by generous donors. Its ballet company is to appear in London and Edinburgh this summer, after visits to European capitals.

★

The effect of technological changes on music and musicians is debatable. The sound track put cinema pianists out of work in the nineteen-twenties. Then the spread of national wireless networks ousted local musicians from local radio stations, and the popularity of recorded music "piped in" from a central station did away with the small dinner orchestra. The displaced musicians retorted by striking against the recording companies for royalties on every record sold, to be used for the benefit of unemployed performers. This socialistic move, by which the pay of the successful would be shared by the unsuccessful, was led by Mr James Petrillo, who heads the American Federation of Musicians. It has resulted in the creation of a Music Performance Trust Fund, which gathers about $1,500,000 a year in royalties and pays it out to musicians who give free concerts for the public benefit. As a fund in aid of wages, this would hardly provide daily coffee for the union members, but as a way of getting good music into neglected regions it works admirably.

A similar system of collecting royalties by group action was started even earlier by the American Society of Composers, Authors and Publishers. ASCAP now represents more than 2,000 composers and writers, some 350 publishers, and the rights of 50,000 foreign musicians who turn to them for royalty collection. Each year it takes in some $7 million and distributes it among its members. ASCAP's latest move is to try to extend royalty claims to the juke box —the coin record players in public places. If there are 400,000 working juke boxes in the country, and each one plays 50 records, a tax of two cents a record a week would produce $10 million a year.

The newest technological changes aim to enlarge the market by improving the reproduction of recorded music. The modern electric gramophone has had a long life, and libraries of recorded music are more often added to than replaced. If the public could be persuaded to replace both its gramophones and its record libraries the manufacturers and recorders would both profit. One attack was made by a change in the speed at which record tables revolve. In 1948 the Columbia Phonograph Company brought out a long-playing record made to turn at 33 revolutions a minute rather than the customary 78, and capable of holding an entire symphony on its two sides. This is making great progress in the field of classical music. The rival company, RCA-Victor, countered by producing a record made to turn at 45 revolutions a minute. This aims to capture the great field of popular music, which covers 90 per cent of the records sold.

The other attack takes the form of "high fidelity" installations which would replace the traditional gramophone with electronic instruments of extraordinary delicacy which can be assembled in furniture to suit the taste of the purchaser. So far these have not reached the popular market, but they appeal to music lovers who can afford them. From all this progress in the mechanics and electronics of music the performer profits, though not enough. But the old arguments that it would kill music and musicians are not often heard today.

American Notes

Strikes in Suspense

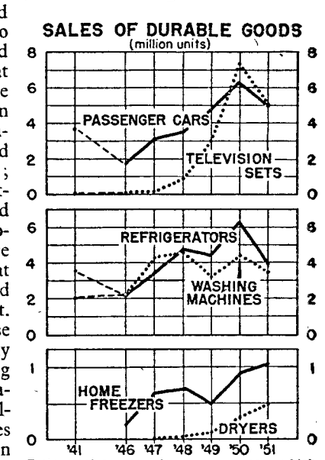
As restrictions on the use of aviation spirit became world-wide and as the shortage of petrol in parts of the United States became serious, the oil workers' leaders announced that the unions would accept, although with reluctance, the increase of 15 cents an hour, accompanied by other improvements in wages, which was the most that the Wage Stabilisation Board was able to approve for the strikers. The unions, which began by asking 25 cents an hour, had already come down to 18½ and the major companies had come up from 10 to 13 cents or more, so it seems fairly certain that most, if not all, of the various oil disputes will be settled in the next few days on the basis of the board's recommendation. The strikes have affected mainly refineries and pipelines, and it should not take long to make up the scattered scarcities of oil that have developed, except perhaps in the case of aviation spirit, of which stocks were hardly adequate even before the strikes.

The occasion of the WSB's recommendation was its disapproval of an agreement already made by one small company for an increase of 18½ cents an hour. Wages in the oil industry, averaging from $2 to $2.12 an hour, are higher than in steel, where an increase of 17½ cents an hour, and another 9 cents in additional benefits, was approved by the board. But the WSB's apparent niggardliness to the oil workers may also be explained by the unfavourable reaction in Congress and elsewhere to its generosity to the steel workers, who were given more than they expected. Ten days ago, however, the board nearly went too far in the other direction when it tried to insist that the oil stoppages should be called off before it considered the disputes. The union was so incensed that for a time there was danger that the oil strike would become as bitter as the steel strike, only in this case the bitterness would have been directed against the government rather than the industry.

The steel workers still have the government faithfully on their side. At their convention this week, the Secretary of Labour told them that the only possible settlement for their dispute was on the basis of the WSB recommendations, which the industry refuses to accept. The union representatives, asking "only that which is our due," agreed enthusiastically and unanimously that the men could not and would not continue to work indefinitely in 1952 for 1950 wages and without a contract. The meeting gave notice that there would be another steel strike if wage increases were not granted promptly. Only the obstinate steel companies can grant them, for the government has been prohibited from doing so until the Supreme Court gives its ruling on the legality of the President's seizure of the steel plants. The arguments were heard at the beginning of this week, but it will probably be some time before the Court hands down its decision.

Credit Unrestrained

The Federal Reserve Board has got in ahead of the Congressional framers of the Defence Production Act, by removing the controls on instalment credit which, when they were imposed in September, 1950, were the first official attempt, after the Korean outbreak, to control inflation. By demonstrating its readiness to relax its regulations now that they are no longer made necessary by shortages of materials and inflationary pressures, the board hopes to dissuade Congress from taking away its power to reimpose credit controls should they once more be needed. Controls on mortgage lending remain, for some restriction on building activity is still thought desirable, but it is doubtful how long they can be maintained; it may be that a politically convenient moment will be chosen for their removal. The FRB has also abandoned its voluntary restraint programme for bank loans, which had become as superfluous as the restrictions on instalment credit; there is little demand for speculative loans now that commodity prices are falling.

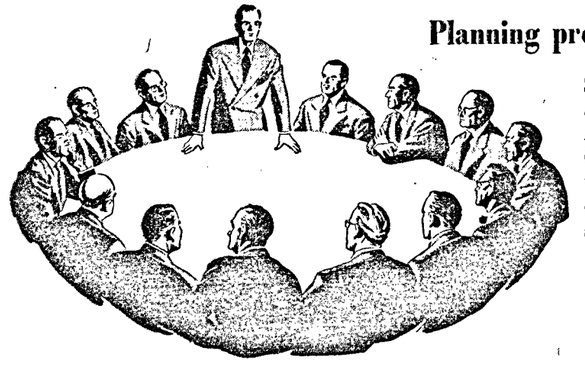


By relaxing its restraints on credit, the FRB has admitted that it does not expect any fresh inflationary pressure in the near future and that retail trade needs stimulating, especially in the durable goods market. The hoped-for spring rise in consumer buying has failed to appear and demands for the removal of credit controls have come not only from businessmen but also from the trade unions. Their pretext was that wage earners need easy hire-purchase terms if they are to buy their fair share of durable goods, but the underlying reason was labour's fear of unemployment. Three leading makers of refrigerators have been laying off workers for some weeks and output of other household equipment is also being cut back; unemployment in the motor industry is, however, falling now that more materials are available.

★

Retailers of all types of consumers' durable goods are now advertising that they can be bought for no cash payment at all, which was not permitted under the FRB regulations, and paid for over much longer periods than the FRB allowed. Whether shops will be able to obtain the financing needed to keep these promises is uncertain, and in any case there is so far little evidence that potential buyers are being attracted by these offers. What consumers want, as was confirmed by the FRB's latest survey of their plans for the coming year, is substantially lower prices. There have been a number of open, and probably even more concealed, price reductions on durable goods, but it is doubtful if it will be possible to cut many prices sufficiently to make them really tempting, especially if steel wages and costs rise. Instead most manufacturers are pinning their hopes of better business on the development of new models and new products and on aggressive salesmanship; makers of such promotional devices as advertising books of matches are doing well out of the slump in durable goods.

Durables Back to Normal



It is, however, beginning to look as if what now seems to be a slump in sales of durable goods is in fact a return to normal, as if the high levels of sales, which have come to be taken for granted during the postwar years, are gone for ever—or almost ever. A recent study by the Department of Commerce, which related such things as consumers' incomes, prices and population growth to purchases of household appliances found that in 1951 sales of these articles were lower, on the basis of this relationship, than they had been before the war; in the immediate postwar years they had been far higher. Producers are therefore beginning to fear that demand has reached saturation point. Everyone with a house wired for electricity who wants a washing machine or refrigerator may have one already and future sales may have to depend on replacements and the formation of new families. This view is reinforced by two facts: the decline in demand has taken place in spite of rising incomes, and it has not affected such new products as home freezers, dryers and air conditioners, which have only come on the market since the war.

Factory sales, except for passenger cars, which are new registrations.
Source: US Dept. of Commerce.

The Department of Commerce was more hopeful about sales of automobiles; it found that in 1951 they fell to, but not below, the level that would have been expected from their prewar relationship with consumers' incomes. This, nevertheless, means that the wartime backlog of demand for cars has apparently been satisfied at last, and at this, usually the most prosperous, season of the year, many car dealers have been worrying about where their next sale is coming from. They are more confident than are most other retailers that purchases will be stimulated by the lifting of instalment credit controls but, if sales of cars do not improve, it is doubtful if motor manufacturers will want to produce the 1,150,000 cars which will be permitted in the second quarter. Under the present limitations on output, this total permitted production is divided among the various companies on the basis of their share of the market in the years 1947 to 1949.

The Ford Company's sales lagged during these years, and

Planning produces results in the dollar market

Successful selling in the U. S. market requires a carefully planned sales approach. As one of America's oldest commercial banks, Irving Trust Company knows this great market thoroughly . . . will gladly work with you in locating competent organizations to help develop or expand your sales there.

IRVING TRUST COMPANY
ONE WALL STREET • NEW YORK 15, N. Y.
MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

as a result it has been allotted only one-fifth of total automobile output. But it is almost alone in being able to sell more cars than it can produce. This seems to be because the company, foreseeing that real competition was once more developing in the motor market, offered an entirely new model for 1952, while its rivals, expecting greater difficulties in producing than in selling cars this year, were content to make few, if any, changes in their models. The government regulations are thus preventing the Ford Company from reaping the benefits of its foresight, and the firm, over the objections of its competitors, is now trying to induce the government to give it a larger slice of the permitted passenger car output.

* * *

Policemen in the Dock

Seven months in jail have persuaded Mr Harry Gross, sentenced to twelve years imprisonment for violating New York's gambling laws, to change his mind about testifying against New York City policemen accused of accepting his bribes. On the stand, he has named men running from lowly patrolmen on the beat right up to Mayor O'Dwyer's former Commissioner of Police as willing, in return for regular "ice"—or bribes—to permit him to go on operating a bookmaking empire estimated as worth $20 million a year. In addition Mr Gross testified that he contributed $200,000 to Mr O'Dwyer's two successful campaigns for mayor.

The policemen now undergoing a departmental trial are those who had to be acquitted last year in the courts when Mr Gross—fearful of violent retribution or, as the trial judge suggested, tempted by the promise of a large sum—refused to repeat the charges which had electrified the grand jury. These men cannot be tried again on the same criminal charge, but they can, if found guilty in the departmental trial, lose their jobs and pensions. Indeed, if they are not found guilty with great dispatch, the city will not be able to refuse them the retirement with pay for which they have applied. It is not surprising that the prosecution has promised to consider some remission of Mr Gross's sentence if he will only "sing" in time.

Not all those named by Mr Gross are necessarily guilty. The grand jury refused to draw up indictments against a number. Mr O'Dwyer, who personally appointed four of the highest officials named, took refuge two years ago in the diplomatic service (he is Ambassador to Mexico) and has declined either to testify or to comment. But there is little doubt that the police department was rotten from top to bottom. This may, as the *New York Times* concludes, be inevitable as long as the state makes a crime of a highly profitable pastime in which many people see no harm.

Gambling is not a federal offence. But Congress, stirred to action by the states' failure to enforce their own laws, last year passed an Act requiring bookmakers and other gamblers to buy a $50 stamp. This may come to grief over the Constitution. A federal judge has ruled it unconstitutional on the ground that it is a police, not a revenue, measure, and thus invades the prerogatives of the states. The history of its enforcement supports the decision: the law, which also imposes a 10 per cent tax, has brought in only $3,000,000 in six months, compared with the $400 million expected in a full year, largely just because it has driven so many gamblers out of business. In the judge's view, the Act requires a man to admit he has violated state law, and therefore should be thrown out as, in 1935, the Supreme Court threw out a federal measure imposing a special tax on liquor dealers violating the law in "dry" states or cities.

* * *

Queue for the Escape Clause

Though American exports were 10 per cent higher in March than they were a year ago, and imports 10 per cent lower, and though the trade gap has widened each month this year, the demand for protection has not fallen off. Three decisions in the near future are likely to show which way the trade winds are blowing in Washington, now there is sharper competition for markets. The queue of industries applying for tariff relief under the escape clause in the Reciprocal Trade Agreements Act numbers almost twenty. It will grow longer almost overnight if the Tariff Commission finds next month that the watch industry has suffered from the concessions granted to foreign producers. Watches, and fur for hats were first in line, and the hat fur industry has already won its case. But behind them are ranked the producers of maraschino cherries, bicycles, clothes-pegs, fish, garlic—and even the twenty makers of blue cheese who are not satisfied with the amendment that was irrelevantly tacked on to the Defence Production Act last year curbing imports of fats, oils, and dairy products.

The cheese producers are seeking an import quota because of their fears that the curb may be withdrawn by Congress. The Senate Banking Committee would like, if it can outvote its Republican members, to drop a restriction which has caused indignation at home and abroad and merely empower the President to shut out agricultural imports when they threaten to saddle the price support programme with costly surpluses. The cuts in metals for civilian goods have, however, produced a proposal even more sweeping than the "cheese amendment": that foreign goods embodying scarce materials, to however small a degree, should be limited to 50 per cent of average yearly imports from 1947 to 1949. Purchasers of toys and clothes-pegs, like cheese-lovers, should buy American or go without, in the opinion of the proposal's sponsor, Senator Capehart.

A third test of how far the Administration will be allowed to practise the freer trade policy it believes in arises from the bid of Ferranti, Ltd., a British firm, to provide nine transformers for an army engineers' dam in North Dakota. Under the "Buy American" Act the government is forbidden to buy abroad goods for use inside the United States unless they are at least 25 per cent cheaper than the domestic product. The Ferranti bid is only 20 per cent lower than the lowest American bid, but it would mean a saving of nearly $200,000. Since 1950, however, the armed services have taken advantage of foreign offers in some cases when the saving was over $5,000, even though the difference was less than 20 per cent. Conceivably the Administration might find, among Congressional advocates of economy, some support for a blow in favour of freer trade.

Shorter Notes

The Treasury has announced a new programme, to begin on June 1st, which will make the purchase and retention of government bonds more attractive to small investors. New types of savings bonds bearing higher interest, as well as an increase in the interest on the old Series E bonds, are expected to give the government a larger share of the record savings now held by the public. A second important goal is to reverse the present unsatisfactory ratio between redemptions and sales; last year redemptions exceeded sales by $1.3 billion, and in the first quarter of this year by $221 million.

*

The second busiest airport in the metropolitan area of New York, that at Newark, New Jersey, has been reopened to military traffic after being closed since mid-February, and full use of the field by commercial lines may be permitted in the autumn. It was originally shut down after three aircraft accidents in two months took the lives of residents in the populous towns nearby, as well as those of passengers and crew. Careful investigations of these tragedies, and of two recent accidents in New York suburbs near other air terminals, have found no connection between the disasters, and the airport authorities have been absolved of any failures.

The world is hungry for electrical power

TWO OUT OF THREE of the world's total population of 2,400,000,000 live a life untouched by electrical power. The living standards of this great mass of mankind can only be raised quickly by electrical power — power that can be applied to the machine. Discontent with primitive conditions is spreading rapidly — a rise in prosperity through applied industrial power is the most effective answer to the political doctrines that threaten the free world.

Here is the measure of the opportunity before THE BRUSH ABOE GROUP — the greatest makers of diesel electric power plant in Great Britain and the world's largest exporters of diesel engines.

That opportunity is being grasped. By 1951, BRUSH ABOE were exporting over 70% of their total output; the greater part of it going to the backward regions of the world.

Compact, economical power units and generators, easily transported, installed and serviced, are answering the world's urgent need for industrial power.

Barren lands can be irrigated; villages can be lighted; radio sets can bring the authentic voice of information and instruction; machines, powered by electricity, can raise human productivity a hundredfold. BRUSH ABOE are helping to bring about a new industrial revolution. A revolution that will, in time, transform the lives of the two out of three who now live in poverty, deprived of the benefits that follow the introduction of electrical power to undeveloped areas.

THE WORLD OVERSEAS

Fifth Estate Under Stalin

WESTERN opinion is beginning belatedly to understand the importance, for the leadership of twentieth century revolutionary movements, of the intelligentsia, especially in countries of backward or unbalanced social structure. The first country in which the intelligentsia played this role—indeed the country which gave this ugly word to humanity—was Russia. It was there that was first formed from the ranks of an intelligentsia a caste, or priesthood, of professional revolutionaries. The Bolshevik Revolution was made in the name of the industrial working class, but Russia's subsequent history shows that power is held not by the workers but by a ruling group which has not yet been satisfactorily defined in social terms. In so far as its existence is indirectly admitted in the Soviet Union, it is referred to as the "toiling intelligentsia"; but it is so different from the pre-revolutionary group that bore this name that its use is confusing. The nature of revolutionary leadership in backward countries, and of the ruling group in the Soviet Union, presents problems of wide importance. They deserve more thought, encumbered by fewer prejudices, than they have yet received.

Among those studying them are the small number of intellectuals brought up in the Soviet Union, who, having been removed from there during the war, escaped forcible repatriation after victory. One of these, G. F. Achminow*, has published in German an interesting book on this subject. It owes much to the theories of James Burnham, and it is inevitably speculative, but it is highly stimulating, and provides a useful basis for the discussion of the problem.

Party *versus* Experts

Achminow explains the well-known paradox that Communism has obtained power not, as Marx expected, in industrially developed countries, but in backward lands with small and uninfluential proletariats, by arguing that the role of Communist revolutions is not to give power to the workers but simply to modernise backward countries. Communism is in fact an *Ersatz* capitalism. In countries where the volume of private savings and the level of skill are too small to ensure economic development by the means once used in the West, this task is performed, at the cost of greater hardship to all, by the state. To make this possible, the state must be captured by new men. These are the Communists. The new economic development, however, also calls into being a whole army of modern technicians and experts who know how to run a modern state and an advanced society but are hampered by the interference of the Communist party officials. Before the Revolution the bureaucracy of the Tsars and the miscellaneous remnants of the feudal age only just past were a "shackle on production"; likewise in the new society the party bosses are parasites who obstruct further advance. The conflict between the experts and the bosses cannot be bridged; it will become more acute. The hope of the Soviet Union lies, therefore, in the triumph of the experts, the rising social class to whom the future belongs. One might call it the Fifth Estate.

The first part of this theory is only partly true. That in countries with little private capital and skill the state must assume the tasks of economic modernisation is probably true, but it does not have to be controlled by Communists. The examples of Japan and of Kemalist Turkey are clear. Nor was modernisation of the economy the main purpose of the revolutionary intelligentsia of Russia, Jugoslavia or China. It is true that Marxists have always claimed that the introduction of socialism will make possible new and more progressive methods of production. But the motives of the Russian revolutionaries were not the desire for economic progress but a combination of personal frustration with generous indignation at the social and cultural contrasts and political tyranny of the old Russia. Emotional fanatics, not a team of clear-sighted economic planners, made the Revolution. Economic modernisation followed, but there is as good a basis for arguing that Stalin created Russia's new heavy industries in order to increase the power of his totalitarian regime and extend it throughout the world, as there is for arguing that the needs of industrialisation required power to be concentrated in the hands of the Communists.

The theory of the conflict between the party and the new experts is, however, attractive. In the first years of the Bolshevik revolution both the political and the economic administrations contained many experts from imperial times, whose skill was needed to organise the new ministries and offices. They were also useful to the government as scapegoats, used periodically to deflect the wrath of the masses when the mistakes or cruelties ordered from above produced more than the usual volume of suffering. The years of the first Five Year Plan caused a hecatomb of engineers and professors, in which the most sensational incidents were the trials of the "Industrial Party" and Mensheviks in 1930 and 1931. These were far surpassed by the great Yezhov purge in 1937-38, which massacred tens of thousands both of party officials—mostly loyal Stalinists—and of experts. Throughout these years a new generation of both bureaucrats and experts was being trained. The bureaucrats were brought up entirely within the Bolshevik system, and many were members of the party. The experts, too, knew only a Bolshevik society. Their education, both professional and general, was not always of high quality, but many had great natural ability and mastered the important and difficult tasks with which they were entrusted. To them in no small measure are due the successes of Russian industrialisation, achieved in spite of immense obstacles. The successes would certainly have been greater without the interference of the bosses of party and police, the whole army of demagogues, informers and inquisitors.

New Men and Old Ideas

Reasons for hatred between party bureaucrats and experts no doubt still exist. Achminow gives interesting quotations from recent Soviet literature, which suggest that the conflict is familiar to the Soviet public. He points out that the experts, although they enjoy a relatively good standard of living and various privileges, have no security for their possessions, their families or their lives as long as the party exercises arbitrary dictatorship. He believes that the experts as a group, amounting almost to a social class, will press for the right to own property and to bequeath it to their children until the party is forced to yield.

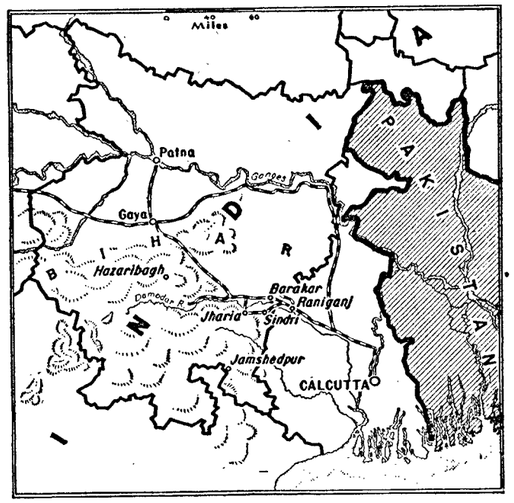
* G. F. Achminow, "Die Macht im Hintergrund," Ulm, Spaten-Verlag, 1951.

But the situation is more complicated than this. The old cadres of the party, as well as of the intelligentsia, were destroyed by the Yezhov purge. The new party officials are men of a different type. The authorities do all they can to fuse the two groups of party officials and experts. The party official is encouraged to make himself an expert in some field, or at least to equip himself with as much useful general knowledge as possible. The expert is encouraged to join the party. Already in 1936 almost all plant managers, and 40 per cent of chief engineers, were members of the party. It is probable that many experts who nominally belong to the party hate and despise it at heart ; that the waste of time in compulsory party meetings infuriate them ; that many think of the party as "them," not "us." Unfortunately no confident estimate can be made of the balance between the forces which draw experts and party officials together and those which pull them apart. Even since the end of the war this balance may have changed.

Restriction of Opportunity

It must not be forgotten that party officials and experts have common interests. Both belong to the privileged minority which, if it has no personal security, at least enjoys relative material comfort while the masses live ill-housed and ill-clad. Since 1940 there has been a marked tendency to restrict the recruitment to the privileged caste. In 1933 50 per cent of all students at higher educational institutions were children of workers, in 1938 34 per cent. In 1938, 42 per cent of such students were children of employees or specialists (bureaucrats or experts). In 1940 the number of scholarships was reduced, and fees were introduced for the higher classes of secondary schools (150-200 roubles a year) and for higher institutions (300-500 roubles). These are large sums for ordinary workers and peasants, though they are within the reach of members of the Stakhanovite labour aristocracy as well as of party officials or experts. In 1940, also, the authorities were given power to mobilise boys of 14-15 for two years' training as "skilled" workers and of 16-17 for six months' training as "semi-skilled." After completion of these courses the mobilised boys were obliged to work for four years in jobs to which they would be directed. Then would follow two years' military service. After this, at the age of 23, to pass the necessary entrance examinations and find the entrance fees for university or college while at the same time earning one's living, is an almost impossible task. On the practical working of this decree there is insufficient information, but it seems probable that not less than one-sixth of all boys of the respective age were so mobilised.

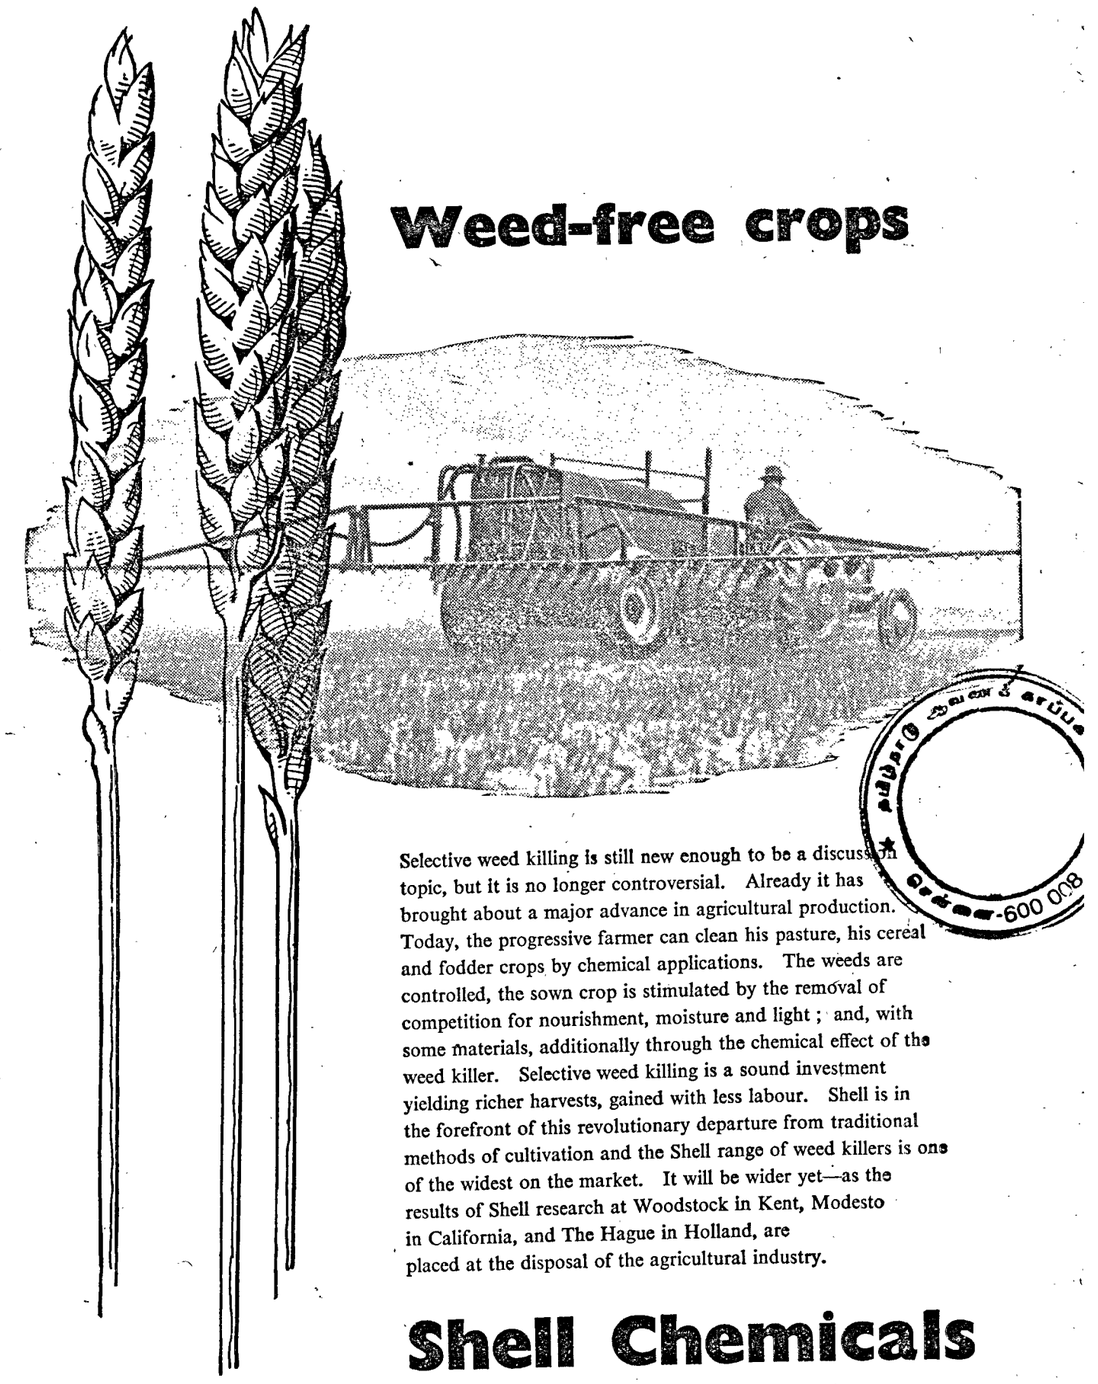
This restriction of opportunity for children of workers and peasants to climb the social ladder strengthens the position of those already privileged. It is a bond between officials and experts. The experts could be a danger to the party officials if they made themselves the mouthpiece of popular discontent: without popular support they can hardly threaten the party. But there is little sign that the experts either dare or wish to become champions of the people, or that the people regard them with confidence. One of the basic principles of Stalin's regime has been to play off sections of the people against each other. When tension becomes serious, he throws some scapegoats—party men or experts or both—to the wolves.



Whether, if the experts obtained satisfaction for their group interests, and reduced the powers of the party, the rest of the world would find it easier to live at peace with Soviet Russia, is not clear. The experts are likely to be chauvinists and imperialists ; but they would probably prefer consolidation to new adventures in spreading Stalinist revolution over the world. Any person who can throw light on this problem from concrete knowledge will render a real service to the free world.

Sindri, a Step Forward

[FROM OUR CORRESPONDENT IN INDIA]

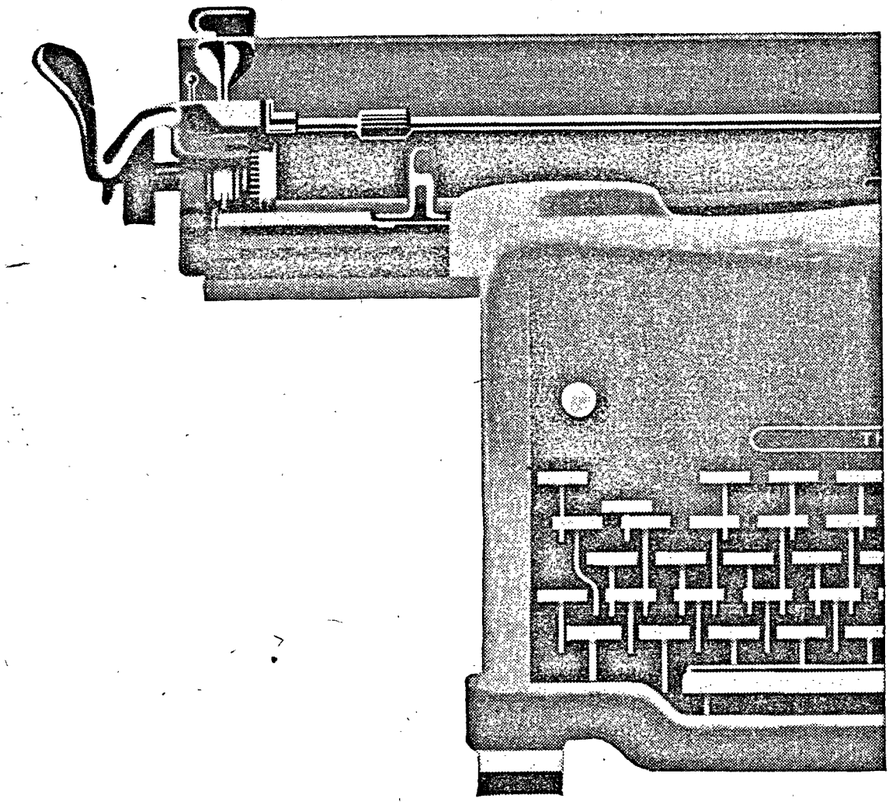


THE fertiliser plant, worth £17 million, which Mr Nehru has recently opened at Sindri in the coalfields of Bihar, represents a major step forward in India's industrial advance. Its 350,000 tons of sulphate of ammonia should produce a million tons of food a year, saving £30 million of imports ; it also generates 80,000 Kw of electricity, and will eventually be the base for the manufacture of cement, plastics and high explosives as well.

The works are the most highly mechanised of their type in the world, and they employ only about 2,000 men of whom some 1,740 are skilled. It may be asked why, in a country that has perhaps 70 million people, two-thirds of them unemployed, and whose annual savings, including depreciation funds, do not exceed £400-£500 million, so much should be spent to give so little employment. The answer goes to the heart of the whole problem of industrialisation in an underdeveloped country. The problem is, in essence, the lack of all those external things which the industrially advanced countries take for granted. There are men,

resources, and intelligence in plenty, but there is no mechanised tradition, there are no pools of fitters or mechanics, no adequate workers' housing, no foremen, no managerial classes.

It was originally planned that Sindri should use the Damodar Valley power scheme, but the dams have not been built in time, so it is now not only making its own electricity but is also electrifying the surrounding collieries and the considerable town of Hazaribagh. It had to have a special fourteen-mile railway line extended from Jharia—the chief town in the coalfields—and one of the main obstacles to further expansion is likely to be the lack of line capacity on the already overcrowded railway to Calcutta. The heaviest machinery, too bulky for the railway, had to be sent by barge to Patna and then by lorry through the hills on a specially built road which it took several weeks merely to survey. And, since there was no housing, a special township had to be built, at a cost of nearly £3 million, with markets, hospitals, schools, forty management bungalows, 800 staff quarters and a hotel. Such conditions add very greatly to the capital expenditure involved in any project, as compared with countries like England, where the roads



Weed-free crops

Selective weed killing is still new enough to be a discussion topic, but it is no longer controversial. Already it has brought about a major advance in agricultural production. Today, the progressive farmer can clean his pasture, his cereal and fodder crops by chemical applications. The weeds are controlled, the sown crop is stimulated by the removal of competition for nourishment, moisture and light ; and, with some materials, additionally through the chemical effect of the weed killer. Selective weed killing is a sound investment yielding richer harvests, gained with less labour. Shell is in the forefront of this revolutionary departure from traditional methods of cultivation and the Shell range of weed killers is one of the widest on the market. It will be wider yet—as the results of Shell research at Woodstock in Kent, Modesto in California, and The Hague in Holland, are placed at the disposal of the agricultural industry.

and the railways exist, and workers' housing is a municipal responsibility. At the Chittaranjan locomotive works, also recently built, the township represented half the total capital cost. But the difficulties of creating the necessary human material—skilled, unskilled, and managerial—are more severe still, and often even more expensive.

India is at the stage where its unskilled labour force is still deep-rooted in the countryside. Absenteeism figures of 20 per cent or more at harvest time are common. Punctuality is a virtue still unappreciated. Delicate machinery will be treated with a vigour better suited to wooden bullock cart-wheels. It is estimated that to train a skilled operator costs £3,750 in terms of the life of the machine. Though more and more firms now demand literacy, many workers still cannot read a warning notice. Conditions have improved considerably in the last twenty years, and in Bombay City or Jamshedpur a real industrial working class has at last begun to emerge; but it is still only a beginning, and meanwhile, Sindri has had to be as highly mechanised as possible in order to reduce the danger and expense of human incompetence in such a highly explosive venture as the production of ammoniated products.

The weaknesses of the labour force reflect themselves in the weaknesses of the foremen. Lack of education makes it difficult to create even good chargehands out of the rank and file; for the illiterate may have wisdom, but they rarely have intellectual initiative. Nor can the problem be solved, as it often is in the West, by taking foremen from the skilled trades, fitters, for example, for the rarity of good apprenticeship schemes combines with the lack of mechanical background to make good skilled men relatively rare. Only at the Tata Steel Works at Jamshedpur and in the railway workshops is there now growing up a second, and even a third, generation of such men. Elsewhere, the foremen have too often to be taken from special classes, Anglo-Indians (many of whom emigrated after independence), Goans, or Parsis; and, though they are often good men, they are handicapped by the difference in religion, language and customs which so often separates them from their men.

Attracting the Educated

To solve these problems, Sindri has followed a precedent set by the shell-filling factories during the war. It is employing few men and paying them enough—in India, £5 a week is enough—to attract the educated. The overwhelming majority of the skilled men are university graduates, who understand Hindi and English as well as their mother tongue. This employment of graduates provides a labour force which can be trained to understand and treat with proper care the most complicated machines. At the same time it provides a rank and file from which it will be reasonably easy to draw supervisory grades.

Most difficult, but most important of all, is the creation of a managerial class. The Indian businessman has traditionally been a Bania or a Jain and utterly separated from the craft or intellectual castes. Therefore he has no connections either with the artisan or with the professional man, the two men with whom the Western businessman is most closely related. The result is that, though there are notable exceptions such as Tatas or Bombay Dyeing, much Indian business is run by men who are capable financiers, with a keen sense of the importance of preserving their credit in the market, but who are neither technically competent nor possessed of professional standards of integrity. Such a position is both economically and socially dangerous.

Something is being done to cure this position by such government enterprises as the railways and by the better British and Indian houses. But much more is needed. One of the main values of a place like Sindri is the first-class opportunities it affords for training in industrial management. Already there are only six foreigners, and they are training the Indians who are soon to succeed them. One point, however, the authorities at Sindri have overlooked. It is not enough to produce fertiliser; fertiliser has to be sold. There is a marketing job to be done, a job of market research, of distribution, and of making the fertiliser available to the farmer where he wants it, when he wants it, in the packs and sizes he likes. There is a job, too, of education, of teaching the farmer through advertising and demonstrations, both to want fertiliser and to use it properly. If Sindri merely replaces imports, if it rests content with merely selling through state agricultural departments whose overseers have so many other duties that they are often away doing something else when the farmer comes to buy, and to whom the problems of marketing are totally unfamiliar, then the job of teaching the farmer how to use fertiliser to increase his production will not be done. The £7 million of foreign exchange which is now spent to import the 350,000 tons of sulphate of ammonia will be saved, but not the £30 million which it costs to import the food that this amount of extra sulphate of ammonia would grow. The main point, however, remains that, by the contribution it makes to the development of skill and managerial ability and urban habits, as well as to housing and power and transport, every Sindri makes the next one easier.

Soviet Dose of Disinflation

THE Soviet economy has just been given its annual dose of disinflation. A state loan for 30 billion roubles was launched at the beginning of last week, and by the end of the week it was duly oversubscribed. The savings campaign took place more quickly than usual—it normally lasts about two weeks—but both in its amount and in its terms the loan is identical with its predecessor. The bonds which do not win lottery prizes are redeemable at par over a period of twenty years. The prizes paid out every year should be equivalent to a rate of interest of 4 per cent. When the campaign was declared closed this year bonds to the total value of 35.7 billion roubles had been sold, roughly one billion roubles more than in the previous year. The Russian planner, however, must rely on further sales of bonds to banks and industrial enterprises during the course of the year, or on some subsidiary loans, if they want to reach the total prescribed in the budget. For in his budgetary speech Mr Zverev declared that revenue from state loans, which in 1951 amounted to nearly 37 billion roubles, was estimated at 42.5 billion roubles in 1952.

Judging from past performances this target will probably be fulfilled if not exceeded. If it is only fulfilled, something like 5 billion roubles more will be taken out of the consumers' pockets this year than in 1951. This should partly compensate for the recent cut in the prices of consumer goods, which,

EAST AND WEST

Two of the latest reports by The Economist Intelligence Unit review economic affairs in India and Canada, analyse these countries' plans for industrial development, and consider the prospects for trade with them.

The Unit now reports on each of nearly forty countries every three months. These reports may be obtained by annual subscription, or singly.

THE ECONOMIST INTELLIGENCE UNIT
22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1

it was claimed, increased consumer purchasing power by about 28 billion roubles compared with the previous year. The state loans will reduce effective demand and thus help to relieve the pressure on consumer goods.

In fact the primary purpose of state loans seems to be to eliminate the discrepancy between demand and the available supply of goods. The planners who determine both the supply of goods and of incomes may estimate at the beginning of the year how much excess purchasing power there is likely to be and decide on the size of the loan accordingly. The Soviet state loan, in fact, is a form of forced saving. It cannot be exactly likened to taxation since the bond-holder, even if he is not a prize-winner, should get some repayment, though hitherto this has always been in a greatly depreciated currency. On the other hand, in spite of appearances, it is not purely voluntary saving either and its semi-compulsory character is particularly marked in the towns. Thus, at the start of the recent campaign, the trade unions appealed to all workers to subscribe three to four weeks' wages to the loan (the payment is spread over 10 months) and the appeal was apparently endorsed "unanimously" in most factories. It cannot, to say the least, be easy to contract out of those "unanimous" decisions and it is not astonishing that the towns buy nearly three-quarters of the bonds.

The average Russian distrusts long term repayment, but does not consider the purchase of a state bond as a complete loss. Both these tendencies account for his preference for lottery bonds as against the interest-bearing ones. Under popular pressure the latter seem to have been abandoned; at any rate none has been issued during the last two years. Maximum lottery winnings have now been scaled down to 25,000 roubles, though there are still some 50,000 roubles awards from previous loans. The lucky winner of such an amount recently proclaimed that with the money he would buy "divans and metal beds." He thus indirectly touched the crucial point in Soviet saving. The saver or prize-winner may purchase some additional luxury. He cannot increase his power or social status nor can he assure a life of leisure for himself or his children. He cannot invest his money nor even stop working for a longer period. The Russians claim that in their economy there is no room for people "clipping coupons."

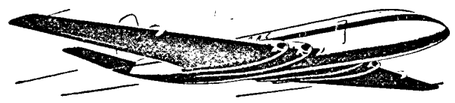
70 Million Bondholders

This lack of inducement explains the low level of Soviet saving. In 1947 total deposits amounted to only 12 billion roubles. They have been rising since then, increasing apparently by 4 billion roubles last year. This year they are expected to rise by another 4.5 billion roubles. The total amount, however, is still negligible and this forces the Soviet Government to have recourse to forced saving through state loans. The size of loans has been rising progressively. From 1928 to the outbreak of the war state loans totalled 50 billion roubles. During the war they amounted to 76 billion roubles. During the postwar 5-Year Plan 130 billion roubles were raised through state loans (though during the first two years these were still inflated roubles). For the last two years each loan brought well over 30 billion roubles. There are now apparently some 70 million bondholders in the Soviet Union.

Yet even this form of forced saving remains only a subsidiary means of Soviet fiscal policy. If everything works out according to plan this year's state loans should account for over 8 per cent of total budget revenue. This is a lot, as it is only about one per cent less than the share of direct taxation. The bulk of the government's revenue (about 60 per cent) and of the "saving" necessary for the large investment and defence expenditures, however, will be obtained through the turnover tax. Once the relative shares of production for direct consumption and investment as well as defence have been decided upon by the planners they add this tax to the price of consumer goods so as to balance supply and demand. Yet discrepancies and inflationary pressure are not altogether eliminated and so the state loan supplements the job of the turnover tax. This year it was particularly necessary after the fifth consecutive price reduction.

Nationalism in Morocco

[BY OUR SPECIAL CORRESPONDENT]

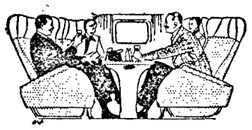


EDUCATED Moroccans are of course taking the deepest interest in the events that have been shaking Tunisia. Belonging as they do to a similar, though younger, protectorate, they are watching the shape of events that might happen to themselves. They see chiefly the superficial resemblances between their two cases—the same protector, and a similar desire for sovereignty and self-government based on a treaty with France. They ignore the fundamental differences that are going to demand different handling.

For where Tunisia is relatively adult, in that it took at once to French schooling and possesses quite a large educated bourgeoisie, Morocco is a generation behind. The Moroccans have become avid for modern education only in the last ten years. Before the war there were always empty places in the colleges with which they had been endowed; very few, therefore, have as yet had a higher education. A very much larger, a much more populous and a more spread-eagled country must therefore take two or three decades to reach the Tunisian level of development. The relatively compact nature of Tunisia produces a second contrast; there, everyone is either a Destourien or else ready to become one. In Morocco the National Front (two-thirds of it composed of the town-bred party called the Istiqlal) numbers only some 120,000 out of 8.5 million people. A third difference that may shape the pattern of events lies in the character of the respective rulers; in Tunis the Bey is an elderly and conservative lover of a quiet life. In Morocco a young, intelligent and ambitious Sultan stalks ahead, and not in the wake, of the nationalist aspiration of his people.

The Sultan in the Lead

The Sultan of Morocco is a character worth study. Originally, he owed his selection to France, and used to know it and to fear that the nationalists might prise his position from him. But since 1943, when he had an interview with President Roosevelt, he has had other ideals. Stimulated sometimes by the immature politicians of the Istiqlal, sometimes by American visitors imbued with anti-colonialism, and sometimes by cries of encouragement from the Arab-Asian group of states, he has tried his paces as a nationalist leader. He did so in his famous Tangier speech of 1947, and in the stern memorandum demanding revision of the Protectorate treaty, which was the parting shot of his visit to Paris in 1950. In extremely correct circumstances, he delivered a fresh edition of that memorandum on March 20th last. He is a man of great intelligence, with a needle-like mind that is capable of piercing to the core of a problem; what is not so clear is whether that mind has, or can develop, the knife-like cutting edge that can cleave a subject from top to bottom. He is a townsman, and moves among townsmen; it is difficult to gauge how much grasp he has of the problems of administering the rural parts of his enormous patrimony.

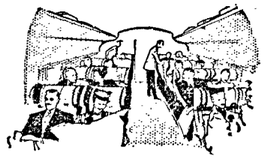


When news of the arrest of the Tunisian cabinet reached Rabat, the impact upon Moroccan minds was not uniform. Some were disturbed at what they viewed as a barren technique by Frenchmen of whom they had expected better. Others showed signs of respect for the display of force and firm handling. As the days went by, however, all were surprised and exhilarated at the vigour and unity of Tunisian resistance to French pressure. On balance, therefore, the events in Tunisia have raised rather than lowered the spirits of the Moroccan nationalists, which until this spring had been at low ebb for a year.

B.O.A.C. PRESENTS THE *Comet*

World's First Jetliner

NOW IN SERVICE BETWEEN LONDON AND JOHANNESBURG



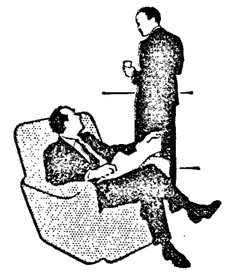
The age of jet travel is here! With this first pure jet airliner service in history, B.O.A.C. makes good an inspired bid for global leadership in air transportation.

This leadership is the result of hard work, imaginative planning, and a bold pioneering spirit which have been characteristic of B.O.A.C. from its first service thirty-three years ago.

* * *

Faster by more than 100 m.p.h. than its nearest propeller-driven competitor, the *Comet* combines speed with comfort and elegance. It takes off with a feeling of power to spare. It cruises easily, smoothly at 35-40,000 feet. It lands with perfect confidence.

The *Comet* is free from vibration. Travel fatigue is reduced to the vanishing point. There is no sensation of distance dropping behind at *eight miles a minute*!



This *Comet* service between London and Johannesburg is the forerunner of B.O.A.C. jetliner services to come.

Consult your Travel Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VICtoria 2323) or 75 Regent St., W.1 (MAYfair 6611).

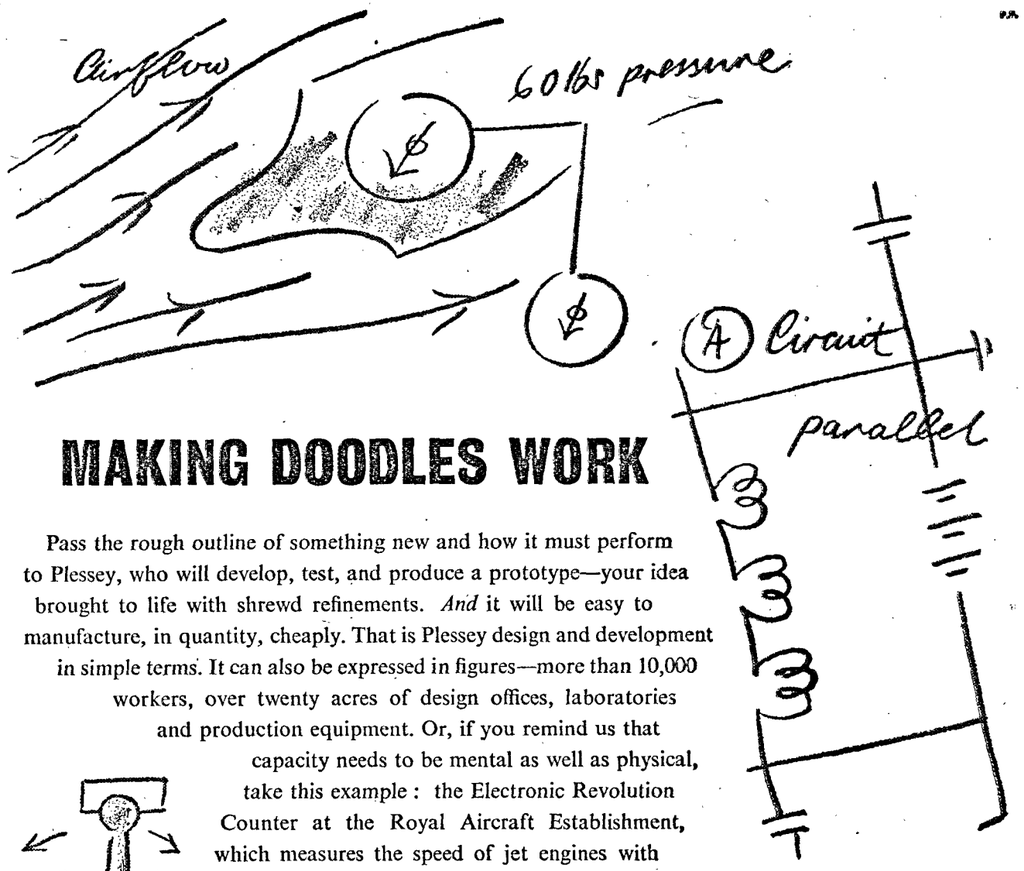
It will be remembered that, after the delivery of the Sultan's memorandum in the autumn of 1950, the Istiqlal members of the consultative body that has powers to discuss the budget complained that too much was being spent on Frenchmen and too little on Moroccans, and after an angry diatribe by the then Resident-General, General Juin, were dismissed from that body. There followed two rebuffs for the Sultan. First, the most powerful of his rural potentates, the Pasha of Marrakesh, warned him that he was making a mistake in founding his power and policy so exclusively upon townsmen ; high words were exchanged. Secondly, General Juin, in tones that were certainly brusque and which the Sultan recalls as insulting, issued two injunctions. The first was that the Sultan must sign some sixty decrees on which, at the behest of the Istiqlal, he had postponed action pending some sign that France was going to take action on his demand for revision of the protectorate treaty. The second was that he should call the Istiqlal to order and cause it to cease anti-French propaganda. When he demurred, there took place a show of the feelings that the rural and tribal leaders harbour against the Istiqlal ; they entered the towns in a way that could not have happened without French consent. During February and March of last year, the Sultan therefore signed some of the decrees, condemned "a certain party" through the mouth of his Grand Vizier, and dismissed some Istiqlal from his entourage. But he is a direct descendant of the prophet ; forty saints

bless him at the dawn of every day ; the language used by General Juin was unseemly to one so endowed, and he has not forgotten it. Among the decrees which he did not sign were those setting up elected city municipalities in which French residents are to participate ; this he and the Istiqlal regard as an infringement of sovereignty.

Relations improved when General Guillaume succeeded General Juin as Resident General last autumn. The period of the indictment of France over Morocco by the Arab and Asian delegates to the United Nations was under way in Paris. Despite the fact that France had, and has, only some 10,000 metropolitan troops stationed in Morocco, few local disturbances took place. Of those which did, one—a fight in Casablanca arising out of the Istiqlal's efforts to stop voting for the Chambers of Commerce and Agriculture which are Morocco's closest approach, so far, to popular representation—was spontaneous and indigenous in character ; but others were engineered in response to requests from outside in order to impress the United Nations. The Sultan waited until all was over before delivering, through General Guillaume, his second memorandum requesting a statement of the steps whereby France intends to fulfil its promise of self-government. In Paris, heads are at present bowed over the drafting of the reply.

The job is not easy. The rift between Frenchmen and Moroccans has grown, as General Guillaume admitted in his New Year speech to the French community. Familiar obstacles stand in France's way—notably the interests of the French settler, and the thought of repercussions in the other two North African territories. In Morocco, a third and more formidable obstacle is Istiqlalist ignorance of the problems of management in the backward areas of the country. The last of these were subdued only as lately as 1934 ; they have been run, for the sake of cheapness as well as efficiency, through chieftains who despise the Istiqlal townee. To give the government of one into the hands of the other before training rural administrators would be to court chaos—even civil war. The Istiqlal does not realise this.

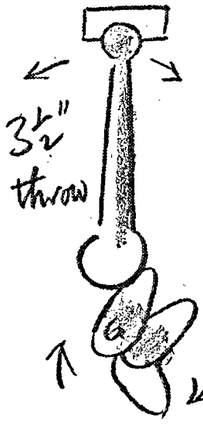
Yet the moment is in many ways propitious for a generous gesture from Paris. Initial goodwill would spring from the very fact that it would remedy the peremptory tones of a year ago. The Sultan does not want to break with France —or at least, not yet ; there are moments when he sees himself as the great and independent leader of the Moslem west, but at present he talks of "interdependence." The Moroccans do not hate the French. To anyone who knows Egypt these two assets are impressive. Can Paris, in replying to the Sultan, take advantage of them while they survive ?



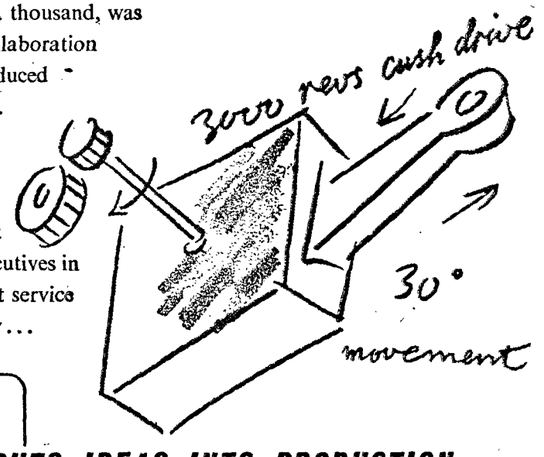
New Jugoslav Constitution

[BY A CORRESPONDENT]

THE Jugoslavs can hardly claim that their complicated new constitution represents a move towards the "withering away of the state" foretold in the Marxist theory which they profess to interpret so much more correctly than the Stalinists. Its authors claim that it is a great improvement on the old 1945 model which closely follows the Soviet design, that it is more democratic, and that it gives real meaning to the principle of decentralisation. There is no reason to suggest that the Jugoslav leaders are not genuinely anxious to move cautiously towards a more liberal regime ; but they would themselves admit that they have no intention of arranging matters so that the reins of power can be easily jerked from their hands. These—to the liberal western mind—conflicting aims help to account for the complications of the new proposals.



Three points in the new constitution are of especial interest. The first is the 40-member Presidium elected by the new bicameral parliament, which will replace the old cabinet of about 20 members. It will govern by decree when the parliament is not in session, and will work through committees appointed for specific functions. It is too early yet to say whether its size represents an attempt to move away from the domination of the executive by the Politburo of the Communist Party. The second point is the new office of President of the Republic. He will be elected by the Presidium, and, as Commander-in-Chief of the armed forces, president of the National Defence Council and chairman of the Presidium, he will possess wide powers. It is a foregone conclusion that Marshal Tito will be the president. Although his new powers will be no greater than those that he at present exercises as premier, they will now be assigned to the office rather than to the man. It is assumed that the powers of the new premier will be correspondingly less.



The third point is that only at the level of local government and only for one of the two local assemblies will the Jugoslav citizen have direct suffrage. One chamber of the central parliament, the Federal Council, will now be selected indirectly by the local councils. The second chamber, the Council of Producers (replacing the old Council of Nationalities), which will represent the industrial and economic organisations of the country, will also be elected indirectly by the local councils of producers. The effect of this will be that citizens working in economic enterprises, about two-thirds of the working population, will be represented in both houses in local as well as central government. This may be designed to give added weight to those elements of the population who are regarded as "socialised" and are therefore most likely to support present policies.

MAKING DOODLES WORK

Pass the rough outline of something new and how it must perform to Plessey, who will develop, test, and produce a prototype—your idea brought to life with shrewd refinements. *And* it will be easy to manufacture, in quantity, cheaply. That is Plessey design and development in simple terms. It can also be expressed in figures—more than 10,000 workers, over twenty acres of design offices, laboratories and production equipment. Or, if you remind us that capacity needs to be mental as well as physical, take this example : the Electronic Revolution Counter at the Royal Aircraft Establishment, which measures the speed of jet engines with an accuracy of one in a thousand, was developed in collaboration with RAE and produced throughout by Plessey. Now you have some idea of the unique combination of technical brain and mechanised brawn at your command. Executives in industry or Government service may like us to explain how...

Aspects of Enterprise No. 21

SIMON ENGINEERING GROUP

Doing it pneumatically is often the best and sometimes the only way to handle bulk materials, especially when it is important to prevent contamination, dust nuisance or the escape of noxious fumes. Simon Handling Engineers have developed the pneumatic conveying system for forty years and have applied it extensively to grain, coal and dozens of other industrial materials. Pneumatic disposal of fine flue dust is increasingly used at power stations. A special pneumatic technique is being successfully applied in flour mills. Improvements, refinements and new applications of pneumatic handling are constantly studied in the Simon research and development organisation.

Figures speak louder than words

For adequate control a typical intersection may need a minimum of two police officers if all-day point duty coverage is given. At £600 per head this would involve an annual expenditure of £1,200 *every year!* In comparison, an Electro-matic installation at an initial cost of £1,750 approx. — plus £175 p.a. for running and maintenance — can effect an economy of £300 in the *first two years* and a saving of £1,025 every year thereafter. Multiply these figures in ratio to a greater number of policemen needed, and the outstanding economies made possible by Electro-matic become even more impressive. All over the country thousands of Electro-matic installations are working full time providing an efficient, safe and reliable traffic control service on the most economical basis. May we — without obligation — call and discuss traffic control in *your* area?

THE BUSINESS WORLD

Transport Finance Off the Rails

THE past week has done little to illumine the muddle of Government transport policy. This is not surprising, for although needed reforms in transport organisation and administration are politically palatable to a Conservative government, the needed reforms in fares and financial policy most definitely are not. And it is on the problems of finance—including the proposed levy on road transport—that controversy is, or ought to be, centred in the next few weeks. For it is in a proper solution to them that the key to an efficient transport system lies.

The organisational structure of the transport system projected in the Government's proposals can be briefly described. For passenger transport few changes are envisaged. The railways, which carry rather under 1,000 million passengers a year, will continue to be under the control of the British Transport Commission, and so will 25,000 odd road transport vehicles that at present carry about 6,000 million passengers a year ; other road transport vehicles, carrying some 11,000 million passengers a year, will continue under private or local authority operation. Railway management will be decentralised, and the Transport Commission will stop its hitherto abortive attempts at devising efficient area schemes for road transport, but—in the field of passenger transport—that is all. In the field of freight transport, the railways, which have a carrying capacity of about 14½ million tons at any one moment, together with some 27,000 railway delivery vehicles and trailers with a carrying capacity of about 100,000 tons, will remain under the commission's control, while the 120,000 road vehicles with A and B licences (carrying capacity about 575,000 tons) and the 800,000 vehicles with C licences (probable carrying capacity about 1,600,000 tons) remain under private control. The main projected change in ownership is that some 44,000 long distance road transport vehicles (with a carrying capacity of rather over 300,000 tons) will be sold by the commission to private operators ; when they are sold they will, of course, be allowed to travel as far as their operators like, and the 25-mile limit at present enforced on most private road haulage vehicles already available for hire will eventually also be withdrawn.

This, then, is the projected distribution of the country's available transport resources between public and private enterprise. The great question that remains is how the pattern of changes is to be devised in order to ensure that each package and passenger is transported across the country by the medium that involves the least strain on real resources (in other words that involves the least real cost); and yet to ensure that public enterprise pays its own way while private enterprise is provided with needed incentives. When faced by this question the Government has, in effect, thrown up its hands. Its only solution is that road transport operators (including C licence holders, that is traders carrying their own goods) should pay an annual levy that will at first amount (for no satisfactorily explained reason) to the apparently arbitrary figure of £4 million a year, but that will be adjusted " at intervals, say of three years, by the Minister of Transport after consultation with the Transport Tribunal."

This levy is supposed to serve two distinct purposes. First, it is intended to amortise the capital loss that will inevitably arise when the 44,000 road haulage vehicles now owned by the Transport Commission are sold back to private operators. These vehicles were originally sold to the commission for about £80 million, including £30 million for goodwill. They were sold, however, as complete operating units, with particular stores at particular depots and other ancillary services attached to them ; unless the commission does a remarkably quick job at re-integrating the vehicles into operating units, it will now have imposed upon it a mass vehicle auction under exceedingly unfavourable conditions. The private operators who bid at this auction will have to bear all the expense and labour of building and buying up new ancillary services again—and will have to do this under the shadow of Mr Morrison's express threat to re-nationalise their businesses on disadvantageous terms if Labour returns to power. In these circumstances the price that the commission will obtain for the vehicles may fall catastrophically short of the £80 million originally paid—so short of it, indeed, that £4 million a year may go very little of the way towards amortisation of the loss.

★

Despite this prospect, the Government professes to believe that the levy will also provide some surplus funds to compensate the commission for the expected loss of traffic from rail to road transport after the projected transfer of vehicles has been carried through. In some preliminary reports this " levy-bedding " of the railways was justified by reference to the old red herring that " the railways have to pay for their own tracks, while the government pays for the roads on which the lorries run." The British Road Federation has indignantly—and rightly—responded that since motor taxation now amounts to £340 million a year and government expenditure on the roads to only £33 million a year (out of a total road expenditure of £67 million) the motor transport industry in fact pays for its " track " many times over. The Federation sees the levy as merely another attempt at feather-bedding a railway system that has been saddled with the burden of economically redundant capacity ever since the inconvenient invention of the internal combustion engine. Since the levy is plainly a political rather than an economic brainwave, and since there seems at first sight every reason why traffic that can be carried more competitively in lorries should be diverted from the railways, this view will certainly command wide support—which is not the same thing as saying that it will certainly deserve it.

The fact that the levy, as proposed, is economic nonsense should not obscure the fact that a great deal of present discussion about the competitive advantages of road over rail transport is economic nonsense too—so long as the railways are left with public obligations as common carriers. The dilemma can perhaps be seen most clearly in the field of passenger transport. In this field the railways could balance their accounts very comfortably if they were allowed to adopt the same procedure as the long distance coach companies—in other words if they were shielded from the waste of running half their trains half empty, and had to carry only those passengers who succeeded in booking the available seats in advance; a concomitant of "free competition" for transport would be that the unlucky traveller who turned up at the railway booking office at a rush period would be told that the railways would be delighted to carry him to his destination—on, say, next Thursday week. Another consequence of really "free" competition would be that the railways would be allowed to charge peak prices at peak hours, so as to minimise the need for piling up redundant capacity that cannot be used at other times of the day; at the moment a large number of season ticket holders and other concession-cushioned fare-payers travel at precisely these peak hours. And a third result of free competition in passenger transport would be that the railways should be allowed to close down a large number of uneconomic lines, with the result that many people whose whole way of life is based upon a daily journey to work from relatively remote areas would suddenly find themselves without any transport facilities at all.

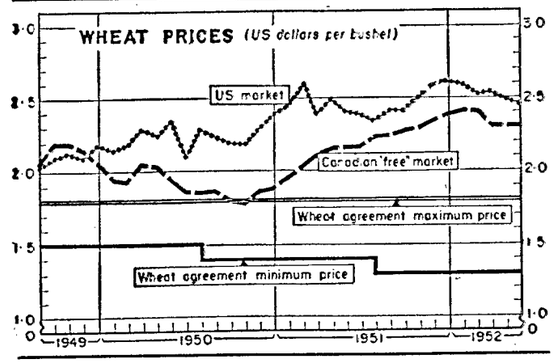
The most astonishing feature of the passenger problem is that despite the heavy burdens laid on the railways by the public obligations that preclude "reforms" of this type, trains are still a more economic form of passenger transport than coaches over certain routes—in the sense that their costs per passenger mile are less. The British Transport Commission's report for 1950 showed that the cost on the main line expresses comes out at about one-third of a penny per passenger mile, against over a half-penny per passenger mile on the long-distance coach services. On the branch line railway services, on the other hand, the cost per passenger mile was over 2s. 1d. while on the country bus services it was approximately 1d. The railways' obligation to charge uniform prices, however, means that their standard charge (before allowing for season tickets and other concessions) is 1¾d. per passenger mile on both the main line expresses and the branch line trains; in other words, long distance passengers on the main line routes pay so much more than the real cost of their journey that it is actually cheaper for them to travel by the coaches (whose real costs are greater on these routes), while passengers on the branch line trains pay so much less than the real cost of their journeys that the coaches sometimes do not find it economic to compete for their custom (although the coaches' real costs, on these routes, would be much less than the railways'). It is obvious that any sane transport policy should be devoted towards curing this absurd misdirection of resources—but it is also obvious that such a policy would meet with grave political difficulties. If pushed to its limit it would mean that some passengers on branch lines should pay fourteen or fifteen times as much for their daily train journeys as they do at the moment, even though passengers on the main line expresses should pay four-fifths less.

The problems of "competition" or "integration" in freight transport are very similar to those in the passenger traffic. Here, again, there is a wide range of cost variation per ton mile, which is not matched by an equivalent variation in the pattern of charges. The carriage of a ton of one commodity may involve the railways in a real cost twenty times as great as that of the carriage of a ton of another commodity; charges per ton mile do not vary in anything like the same proportion, and the schedules, like those for passenger fares, are riddled with concessions that have been politically rather than economically inspired. In road transport, too, the schedules of charges are affected by a host of varying influences—conditions of limited monopoly and limited competition, of past or present modes of public supervision, and of pure historical accident—much more than by real costs. Once again the result is that many goods now carried by road could more economically be carried by rail, and *vice versa*. Once again, however, any sudden revision of charges to complete conformity with the real costs of carriage would result in a quite impossible disturbance of existing trade patterns, with heavy saving to some trades offset by increases of several hundred per cent for others. Once again, therefore, any creation of really free competition would be economic nonsense unless the railways were allowed to escape from their obligations as public carriers and allowed to carry only the goods they chose to carry, and those in their own time.

★

The conclusion that emerges is obvious. It is clear that the public is not willing wholly to free the railways from their obligations as public carriers. The railways must continue to undertake to meet most fluctuations in daily and seasonal demand and continue to carry all passengers and commodities needing transport; they cannot be allowed—as the coach and air services are allowed—to carry only those whose passages are booked well in advance and timed to accord with an economic schedule of continuous on-and-off-peak operation. But it is also obvious that these obligations of a public carrier should be kept down to a minimum, and, above all, that charges should be gradually nudged some way into line with real costs. As each step is taken, the disadvantages of disturbance should be weighed against the diseconomies of the present system—but always with the overriding proviso that the schedule of charges should at least ensure that goods and passengers should not be positively attracted to travel by one medium when it is more economic for them to travel by another. If the proposed levy on road transport were designed to help this process of adjustment and to withdraw from private operators the advantages they derive from the fact that their public enterprise competitors are hamstrung by "public carrier" obligations, then there would be some case for it. But there is no sign that it is part of any such process. The Government is not deliberately stepping out in the right direction after careful analysis of the economies of transport. It is doing exactly what the Labour Government did when it murdered the case for nationalisation of transport by its mismanagement of the first attempt. It is following its political nose on the problem of ownership, but on the much more vital problem of costs and charges, it seems to be groping in the dark—and groping the wrong way.

Disagreement in Wheat



THE International Wheat Council adjourned last week without reaching a conclusion on the main issue that it had assembled to discuss. This was to advise the governments of the 46 countries participating in the present wheat agreement whether the agreement should continue for a further period after next year, when its current four-year term comes to an end. Under the terms of the agreement, any such recommendation for renewal must be made by the council before the beginning of the final crop year—that is, before next August. The council's failure to make a formal recommendation now does not mean, therefore, that the existing agreement will necessarily lapse next year. At the recent meeting, no country objected to the agreement and no country requested any major change in its form, although certain minor improvements were suggested.

The breakdown of the discussions occurred over prices—even though there were no actual negotiations about a suitable maximum and minimum price as the basis of operation of the agreement. It was clear, however, that although importing countries were quite willing to see the agreement run another term, they were not willing to commit themselves on prices at this stage. The exporters, especially the United States, wanted both the renewal of the agreement and the price range to be agreed now. As the voting power in the council is proportionate to the sizes of the several countries' obligations to buy or sell at the limiting points, and as the importers have in total the same number of votes as the exporters, a deadlock was inevitable. The decision to do nothing was in fact a compromise; the council is now expected to meet again in July to recommend that the decision on extending the agreement be postponed until the end of 1952.

The present wheat agreement is a flexible multilateral contract; it stipulates quantities that exporters guarantee to sell to the importing countries when the world price of wheat is at or above a predetermined maximum price, actually fixed at US $1.80 a bushel. It also stipulates the quantities that the importers guarantee to buy from the exporting countries when the world price of wheat is at or below a predetermined minimum price. This minimum price was set at US $1.50 a bushel for the first season and was reduced by 10 cents a bushel for each successive season. The current minimum price is $1.30 a bushel; next season it will be $1.20. The guaranteed amounts of purchases or sales by the individual countries are set out in Tables I and II.

Neither exporters nor importers have any obligation under the agreement except when the price is respectively either above its agreed maximum or below its agreed minimum. The member countries are free to buy from or sell to any other member; they can also buy freely from countries outside the agreement. The market can operate in its normal way, with either private or government trading, and theoretically the price can fluctuate freely between the agreed limits. The agreement contains no restriction on either production or consumption. But the equal voting power of importers and exporters has meant that the side that has the economic bargaining strength at the time gets its way. The wheat council was set up to supervise the operation of the agreement.

The scheme has been tested during its three years of life—but only in one direction. Throughout the period, apart from a very short time in the autumn of 1950, the world price of wheat has been above the agreement's maximum; and exporting countries have fulfilled their obligations even though buyers outside the agreement have been willing to pay (and have paid) higher prices. It is true that exporters have used various devices to increase the effective maximum price, for example, by adding carrying charges. But there is no doubt that, so far, importers have gained under the agreement. It is significant that eight importing countries (including Germany, Spain and Japan) joined the agreement after it came into force, but no additional exporting country has asked to join. Further, many of the smaller importing countries requested and were granted larger import quotas. The agreement was originally intended to cover 456 million bushels. In its first season its guaranteed sales were increased to 525 million bushels, in the second season to 563 million bushels and in the current season to 581 million bushels. On price considerations alone, therefore, exporters have lost from the agreement, though it is impossible to estimate the extent

of the loss. But this loss may be regarded as in the nature of an insurance premium. Exporters have enjoyed the security of a guaranteed minimum price that was above their costs of production; and when the agreement was signed in March, 1949, some tendencies were then being interpreted as signs that the postwar slump might be only just around the corner.

Many critics of the agreement object to it on the argument that its mechanism must inevitably tend to keep the price at the upper limit. But the experience of these past few years has not substantiated this view. In the first season (1949-50), when the price was at its maximum, importing countries bought only 85 per cent of the scheduled quantities. That restraint marked an attempt, particularly by Britain, to force prices down. In October, 1950, at the beginning of the second season, this manœuvre began to have an effect; despite the fact that the Korean war had already started, the price tended to drop below the maximum, though only slightly below it. Admittedly, this relationship did not obtain for more

than a week or two. Both importers and exporters realised that it was prudent to hold large stocks, and purchases during 1950-51 amounted to 97½ per cent of the agreed quantities. During the current season it looks as if importers will purchase all the agreed quantities at the maximum price, although they are obliged to buy their full quotas only when the world price is at or below the agreed minimum.

In present conditions there is much to be said for the agreement provided that the maximum and minimum prices are reasonable and realistic. If importing countries had the choice between the mechanism of the agreement and that of a proper free market, they would most probably choose the latter. But at present there is no question of such a choice. Since the war the United States has become the world's largest wheat exporter, and it operates a price-support system for its own farmers that virtually sets a floor to world prices. The US price is now around $2.40 a bushel compared with the maximum under the agreement of $1.80, and since the war it has tended to rise rather than fall. The only other large wheat exporter is Canada. Supplies from both Argentina and Australia have dwindled, while India, which before the war was a wheat exporter, is now a wheat importer. Wheat from the Danube basin is no longer available to the free world and only sporadic quantities (and small ones at that) come from Russia. The fact that dollar countries dominate the export trade means that countries whose currencies are not freely convertible into dollars cannot expect to return to the prewar form of trading. A further complication is that the United States is not only the largest wheat exporter, but also finances its buyers with the help of ECA (now MSA) grants and loans to buy its produce. It is, indeed, doubtful whether the agreement would have worked at all during the past three years without these dollar funds. At any rate, the price might have been forced to its minimum, and importers might have been obliged to invoke the escape clause that permits them to be freed from their obligation to purchase if they are experiencing serious difficulties on their balances of payments.

In these circumstances, the agreement is perhaps no bad thing, and if importers and exporters can agree on prices, it is certain to continue for another four or five years. Any new agreement would contain some modifications such as an arrangement to permit the International Court of Justice to arbitrate on disagreements about definitions, and a tightening up of certain definitions, particularly those referring to prices, price equivalents and carrying charges. The vital question is what should be the appropriate levels of the maximum and minimum price. The United States has had to subsidise its exports of wheat under the agreement; its minimum domestic price has been some 60 cents a bushel above the agreement's maximum. In view of the coming Presidential election, the United States wanted to see the maximum price as close as possible to its domestic

On Living Longer

IT IS ONLY WHEN WE ARE YOUNG that birthdays are absolutely indispensable. All too soon comes the time when we find it more blessed to give than to receive reminders of such anniversaries. Few of us are ambitious enough to look forward to the time when they once more become important—to the birthday which may win us overnight the distinction that only centenarians can claim. Nevertheless, the chances of this happening have been increasing with each generation; mortality statistics tell us that people today are, on the average, living appreciably longer than their grandparents.

THIS, on the face of it, is a wholly satisfactory state of affairs. For the average person, it suggests a longer period of retirement; more leisure for the garden, more time to give to friends and books and the county cricket team. This is the kind of thing that people look forward to as retirement approaches.

Charts of the proportions in each age-group of the total population of Great Britain 1851-1977★

★*The figures are taken from the Report of the Royal Commission on Population (1949); those for 1977 are projected figures on certain not unreasonable assumptions*

BUT there is another side to this picture. Leisure, if it is to be used agreeably, costs money—even a little may make all the difference between a happy retirement and an old age made careworn by dependence upon others for the little comforts of life.

MILLIONS of people would be facing the prospects of such an old age if they had not made some extra provision through voluntary saving. Only a minority of workers have jobs which carry pensions and increased longevity is in itself one of the factors which make it unlikely that National Insurance retirement pensions could go beyond subsistence level in the foreseeable future. This situation accounts, in some degree, for the steadily increasing appeal of one particular feature of the service which industrial life assurance brings to the homes of so large a section of the community. Last year the sums assured under new industrial life assurance policies amounted to £248 millions. The majority of these policies are designed to benefit their holders during lifetime—in many cases to provide, in retirement, the modest comforts that become necessities with advancing years.

THE growing popularity of home service endowment assurance is a sign of the times. A century of steadily improving social conditions has established new standards of life for the majority of folk living in these islands; and the average family expects a correspondingly wider range of benefits from industrial life assurance than was the case when such policies were taken out mainly to meet the immediate expenses at the time of death.

THIS is still one of the financial problems that confront a bereaved family. More important, however, if the breadwinner's earnings cease, is the need of ready aid to see the family through the difficult task of readjusting itself to new circumstances. Such aid can be provided by an endowment assurance, no less than by a whole-life policy. The payment every year of thousands of claims only a short time after the policies have been effected is a reminder of the two-fold purpose which this thrift movement serves in ten million households. It is a family safeguard, as well as a form of saving.

IT is difficult to see how facilities of this kind could be made available to more than a fraction of the population otherwise than through home service insurance. It requires a great effort of will to set aside savings regularly without constant prompting. This is the very difficulty that industrial life assurance is designed to overcome. It is a very practical help to have someone call to collect premiums. The insurance agent's regular visit is a reminder that does much to take the effort out of saving and to make it part of the domestic routine.

IT is this home service—perhaps the most valuable of all aids to thrift—that ensures the stability of the flow of small savings accumulated through Industrial Life Assurance. Funds administered on behalf of policyholders are increasing at the rate of nearly £50 million a year. The importance to our economic life of this net addition to the nation's savings can scarcely be over-estimated. No less important is the part played by this thrift movement in the lives of the men and women to whom it is an assurance that a longer life need not be without its comforts.

Issued by the Industrial Life Offices

CH1

floor price. Canada and Australia also wanted a higher maximum (as well as minimum) price, but they were thinking of something a little above $2 a bushel, compared with the American $2.40. The importing countries, on the other hand, felt that a general fall in commodity prices was imminent and saw no reason to accept higher prices for wheat. The postponement of this discussion was wise, for by the end of the year the general trend of prices may be more readily discernible than it is now. Moreover, the American election will be over, so that the international wheat negotiations will not have to be conducted, as the recent ones have been, with one eye on the various primary polls now taking place in the United States.

The bargaining on prices will be tough. In the absence of an agreement, importers will lose in the short run unless prices come tumbling down, for they would have to pay the American domestic price for American wheat, which would mean that they would also pay more for Canadian and Australian wheat. In the long run, however, they might gain—if the higher prices induced a larger output of wheat, particularly in countries outside the dollar area. But that would be by no means certain, for in every wheat exporting country there is a wheat board or an equivalent organisation that comes between the buyer and the farmer. For exporters, a lapsing of the agreement would mean that they would gain on price in the short run, but lose their longer-term security.

Britain's attitude, clearly, cannot be that there should be a renewed agreement at any price. Next season's minimum price is still above Canadian and Australian costs of production, and exporters should be prepared to make some sacrifice in return for this security. Importers enjoy no such advantage unless the maximum price is kept at a reasonable level, and most of them would regard the present maximum as reasonable. If this level meant a loss to the United States the agreement would, in effect, provide another method of granting dollar aid to dollar-starved importers—and it might even help to reduce American dominance of the wheat market. But, in any case, if exporting countries refuse to have the agreement except at much higher prices, it would be better to let the price mechanism operate without hindrance from any such multilateral contract or guarantees.

Problems for EPU

THE renewal of the European Payments Union after it comes to the end of its initial two-year span on June 30th next may now be taken for granted. The exact form in which it will be renewed is still under continuous and at times vehement discussion in Paris, by the managing board of EPU and the Payments Committee of the Organisation for European Economic Co-operation. These two bodies should have some specific recommendations for the Ministerial Council of OEEC when it meets in Paris towards the end of this month, but it would be stretching optimism beyond reasonable bounds to hope that the Ministerial Council will be in a position to give its approval to an agreed amended scheme. Although all concerned agree that EPU has done useful work and should on no account be scrapped, there are still some substantial differences among members about the amendments to be introduced into the scheme. The need to thrash these out is likely to delay the agreement beyond the date, July 1st next, when the new version of EPU will in fact come into force—necessitating a retroactive procedure for which there are some notable precedents in OEEC and EPU. Zero hour may in fact be around August 14th next, the value date for completing the compensation for July, the first month of the new EPU year; but agreement might even be postponed until about September 14th if it is decided to treat the first two months of the new EPU year as one accounting period, as was done in 1950. Nevertheless, agreement on broad principles will have to be indicated before the end of June if some of the countries concerned, and in particular Belgium, are to be induced to continue granting credit after the present financial period comes to an end.

The two main issues that are now being debated before the Management Board and the Payments Committee are the size of the convertible assets, i.e., gold and dollars held by the Payments Union, and the problem of the "extreme" creditors. The need to strengthen the convertible assets of EPU does not immediately emerge from a study of its balance sheet. When the Payments Union began operations on July 1, 1950, it had in hand an amount of $350 million put at its disposal by the United States Government. By the end of March last, payments of gold by the Union had exceeded its receipts of gold under the terms of the agreement by $226.7 million, absorbing all but $123 million of the original reserve. Over the same period, however, the Union has acquired $215.2 million in gold and dollars by various means not envisaged in the agreement or in the normal working of the scheme. These special receipts include dollars placed by the United States at the disposal of certain "structural" debtors of EPU, such as Greece and Turkey, in order to enable them to settle their deficits with other members. The total liquid and convertible resources of EPU at the end of March therefore amounted to $338.5 million, not much less than the initial sum. This amount, however, appears inadequate in relation to the calls that may be made on the Union in the months ahead. If Belgium remains a persistent creditor and if at the same time Britain were to reverse its recent debtor position and swing into credit, the available gold and dollar resources of the Union could be mopped up in a matter of months. They need reinforcement—a fact that was one of the main conclusions reached in the report of the Managing Board of the Union issued earlier this year (and discussed in these columns on April 5).

The hopes voiced in that report, that the reinforcement might be secured through direct assistance from the United States, must however be abandoned. The United States authorities have made it quite clear that there is no possibility of securing Congressional consent for such assistance. Some help may come from the United States indirectly, through offshore military purchases from EPU countries or through further dollar aid to the structural debtors, generally known as "the wards" of the United States. But if there is to be any substantial accretion to the convertible assets held by the Payments Union, it will have to be provided by additional subscrip-

tions from the members themselves. Some pressure has been put on these countries to make such contributions. The response so far has not been favourable, except from the countries that are likely to remain creditors and would therefore be likely to take back with one hand a great deal more than the gold and dollars they would put into EPU with the other.

An interesting proposal that may lead to a reinforcement of the gold and dollar reserve is now under consideration in Paris. It involves a steepening of the sliding scale on which debtors have to meet their deficits with EPU in gold. At present the proportions in which the cumulative deficits have to be met in gold and credit are as follows:

	Gold %	Credit %
1st fifth of debtor's EPU quota	0	100
2nd "	20	80
3rd "	40	60
4th "	60	40
5th "	80	20

If the above gold percentages were to be adjusted to 10, 30, 45, 55 and 60, the average ratio of 40:60 as between gold and credit over the whole amounts of the quotas would remain undisturbed, but more gold would have to be paid by debtors in the lower tranches of the quota and rather less by those in the upper tranches. If the adjustments were made retrospective, it would mean that a number of countries that have accumulated comparatively small deficits with EPU would have to put up additional amounts of gold. No additional payment would have to be made by the United Kingdom because it has now virtually reached the limit of its quota, at which point the ratio of gold already paid to credit already received would remain unchanged at 40:60. Britain's contribution under the new proposal would come if and when its present debtor position turned into that of a creditor. Its progress out of debt would then be made at the new scale through the various tranches of its quota. Instead of receiving gold to the extent of 80 per cent of its current surpluses when going through the fifth slice of the quota, it would receive gold at the rate of only 60 per cent, and so on as it reduced its cumulative deficit with the Union. By the adoption of some such device, the gold and dollar reserve of the Union could be reinforced and protected from the serious further encroachment to which it is open in the present circumstances. Moreover, by convincing the United States administration and Congress that the members of EPU are prepared to help themselves, action on these lines might be calculated to extract some direct assistance from the United States.

The problem of the extreme creditor, which is the second of the crucial and controversial issues now under discussion, focuses as usual on the position of Belgium. Belgium had by the end of March granted $222 million more credit to the Union than it was obliged to do under its quota. Other creditors, notably Italy and Portugal, have also exhausted their quotas, but their additional credits are still of modest proportions and do not appear to call for special remedial measures. The Belgians, however, now wish to realise part, if not the whole, of the $222 million above-quota credits that they have granted to EPU. They suggest that this sum should be funded, and that provision should be made for its repayment in gold over a term of years. If this were done, the Belgian authorities would endeavour to market the resulting obligations in the American or Swiss markets, and thus to secure their immediate conversion into the hard currencies they need. This proposal raises several points of difficulty. One of them concerns the term of years over which Belgium requires payment. If it is too short it might put undue strain on even a reinforced gold and dollar reserve of the Payments Union. Another more juridical difficulty arises in deciding whether EPU has the authority to issue bonds that could be discounted or marketed in the international markets.

This is only one of the problems arising from the position of the extreme creditors. Another relates to the treatment of any future surpluses they may accumulate with the Payments Union. If Belgium, and countries in like circumstances in relation to the Union, are to be induced to remain members of it, they must be given firmer assurances about the treatment of future surpluses than the quarterly *ad hoc* arrangements that have hitherto been made to cope with this particular problem.

The prospect of ultimate agreement on all these points is improved by the indications that the wild swings in balances of payments that have characterised the greater part of the current EPU year are gradually being corrected. The detailed figures of the April EPU compensations are chiefly remarkable for the considerable reduction in the Belgian surplus from $45 million to $16 million. In April, for the first time since Belgium's creditor position exceeded its quota, that country succeeded in keeping its current surplus within the maximum of the gold payment allocated to it for that month under the special arrangements made with EPU. This means, of course, that Belgium took 100 per cent of this surplus in gold; but there is some reassurance to be gained from the fact that the surplus itself was so sharply reduced. Another notable change revealed by the April compensation was the appearance of France as a small creditor—to the extent of $2.7 million, of which $1.6 million was recovered from EPU in gold. One feature of the returns that unfortunately shows no significant change is the United Kingdom deficit; in April it was still at the high level of $56 million, compared with $64 million in March. This involved a gold payment at the rate of 80 per cent, namely $45 million, while the balance of $11.3 million was added to the British overdraft with the Union. This overdraft has thus been increased to $633.4 million (equivalent to £226 million). By the end of April Britain was, in fact, within $13 million of having exhausted its EPU quota, and was therefore on the brink of having to pay any further deficit wholly in gold. It is high time those import cuts by the United Kingdom and the rest of the sterling area made their impact on the EPU position. But the general view held in Paris is that the swing round in the United Kingdom position with EPU will not be apparent before the autumn.

Business Notes

Spirits and a Splash

The big event in the markets this week has been the splash made by the Distillers issue, the interest in which, both by the stags and by more permanent investors, has been a major influence upon prices throughout the lists for gilt-edged and high-grade industrials. There is food for thought in the fact that this £10 million operation has caused much more disturbance than did the £150 million BEA loan; but whereas the public's response to the bigger operation was certainly not more than £50 million and the average size of application probably fairly large, the rush for this novel Distillers' stock has come from many types of investor throughout the country and reached the extraordinary total of £160 million. The lists, needless to say, were closed immediately on Tuesday morning, leaving those responsible for the issue with heavy labours to complete if dealings are to start, as hoped, on Monday next.

This sharp focusing of interest at a single point, and the tying up of some £40 million in application moneys, so distracted attention from other markets as to reverse the tendency of gilt-edged and give impetus to the sagging of blue-chip industrials, also depressed by the April trade figures, discussed in a subsequent not. Textile shares barely flickered upwards on the news of the concessions in purchase tax; and over the week the ordinary share index of the *Financial Times* dropped by fully 3½ points, to 109.7. The buoyancy in gilt-edged, deriving from small but widespread buying from private investors on a narrow market, was easily extinguished, and the recent price rises gave place to moderate declines, momentarily carrying the new BEA stock back to a fractional discount. Yet another reverberation was felt in the short loan market, where money has been very tight—to the extent, on Monday last, of forcing discount houses to seek 7-day loans at the Bank, for only the second time since the rate for such money became 3½ per cent.

The new appearance of the gilt-edged market, shortlived though it might prove to be, looks more attuned to the fundamental forces than its recent firmness did. Nothing has happened yet to justify hopes that monetary discipline need not press upon the market. Monetary policy needs to be kept firm, and it is much to be hoped that the authorities' recent request to the banks to cut down their credits for hire-purchase finance does not mean that firmness is now to be pursued rather by "directives" and exhortation than by the orthodox measures. To keep these measures fully effective, the release of stock by the "departments" will have to be continuous; and more overt moves may later be needed. Meanwhile, the needs of non-governmental borrowers are clearly sufficiently pressing to make it necessary to seize every opportunity for movement at the turnstiles.

*

Scarcely audible amid the noise of the Distillers issue, there has appeared the expected offer for Kenya—in the form of £6,115,000 of 4½ per cent stock, 1971-78, at 99½, the lists for which open next Tuesday. Of this sum, £615,000 has already been placed, and a further £1,000,000 is reserved for applicants in East Africa. The unexpected resilience of the market over the past three months is well shown by the fact that this stock is priced at ½ point above the issue price (but more than two points below the present price) of the Southern Rhodesian stock launched before the last increase in Bank rate. Yet the turn offered seems adequate to ensure a reasonable response—provided that the market, after this week's jolt, does not suddenly fasten upon the fundamentals of Britain's problems, from which it seems lately to have kept its eyes carefully averted.

The Decline in Exports

British exports in April amounted to only £217.5 million, or £23 million less than in March and £12.8 million less than in April, 1951. Simultaneously re-exports fell to less than half the March rate, presumably owing to smaller shipments of rubber and tin to the United States. Fortunately, however, these figures convey a too gloomy impression. The daily rate of exports at £9.1 million was only a little below the corresponding rate of £9.2 million in April, 1951, and compares with £9.3 million in March this year. The Easter holidays came in April this year so that the month had only 24 working days; if it had contained the normal number of working days exports would have been only £3 million less than in April, 1951, and not much more than £5 million below the March total. It seems probable that when the detailed figures are published later this month they will show that the Australian and other Commonwealth import restrictions have begun to take their toll. On the other hand, exports to North America during April showed a heartening rise and were above the monthly rate for the first quarter of the year. Exports to the United States fell slightly but the fall was more than offset by the rise in exports to Canada.

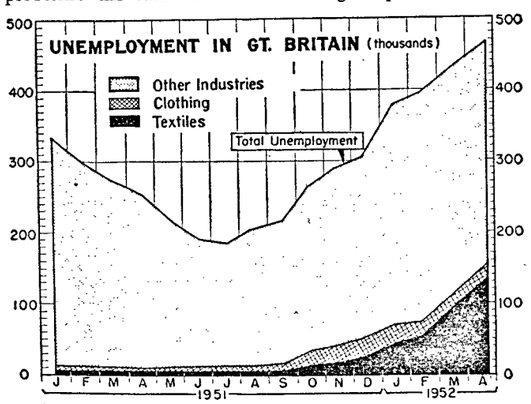
Imports last month amounted to £325.1 million and were thus 4 per cent higher than a year ago, though they were slightly less than in March and also less than the average for the first quarter of 1952. But in this casee, too, allowance must be made for the smaller number of working days in April. When this allowance is made, it becomes apparent that the daily rate of imports is still obstinately rising; in March it was £12.8 million, in April, £13.6 million. The excess of imports (valued c.i.f.) over exports (valued f.o.b.) thus increased to £96 million in the month, compared with £70 million in April, 1951.

* * *

Concessions in Purchase Tax

The concessions in purchase tax announced this week erode another £10 million this year and £17 million in a full year from the foundations of a budgetary policy that was never very surely based. Yet, as a matter of political tactics, the Chancellor of the Exchequer may feel that he has paid only a moderate price for getting the "D" scheme more or less intact through the committee stage of the Finance Bill. From the narrower standpoint of the industries affected by the change—those making textiles, clothes and shoes—a reduction in tax rates was preferable to the increase in individual "D" limits of tax exemption for which the Opposition was asking. Apart from a few minor exceptions, Mr Butler refused to raise the "D" levels, but he has brought down the rate of purchase tax for clothing, including gloves and shoes, from 33⅓ to 25 per cent and that for piece goods and household textiles from 66⅔ to 50 per cent. All other rates, including those on furs and furniture, remain unchanged. The tax exemption limits are to be changed only for a few goods such as fur coats, men's slippers and bootees (the trade term for women's wool-lined boots).

The immediate effect of these changes is to give small but much-needed relief to quality goods. These form the spearhead of British exports of consumer goods, particularly to the dollar markets; it looked as if the "D" scheme in its original form might so drastically narrow down the home market for such goods as to force some of them out of production altogether. Their prices, including purchase tax, were too high to be susceptible of any noticeable reduction through the introduction of a tax-free element into them;



they could be helped only by a reduction in the rate of purchase tax itself. At the other end of the price scale, however, goods just above the tax-free limits were already attracting so little tax that the reduction in the rate will make only a few pence or a few shillings difference to their selling prices. In making these changes, Mr Butler was probably swayed much more by arguments for relieving quality goods than by any consideration of stimulating the average level of domestic sales of textiles or footwear; the stimulus here will be hard to detect.

* * *

Unemployment Still Rising

Up to about three weeks ago unemployment in Britain was continuing to rise steadily, and though it had not quite reached half a million it was higher than at any time since 1947. The total registered on April 21st was 467,000 persons, compared with 433,000 on March 17th and with 252,000 in April, 1951. Since July last year, when postwar unemployment reached its lowest ebb, the number of people unemployed has risen by about 150 per cent—though it should be noted that it is still only 2.2 per cent of the employed population. The slackening of activity in many industries is reflected in the total of persons temporarily stopped, which has now risen to 142,800, and also in the records of those working short time—276,000 in the last week of March compared with 216,000 in January. But nearly 1,200,000 people are still working overtime—roughly the same number as were doing so at the beginning of the year.

Textiles remain the core of the 1951-52 unemployment problem: the chart indicates how large a part of the rise

in total unemployment is accounted for by the textile and clothing industries. Up to the end of the year the dismissals seem mainly to have taken place in the wool and the clothing industries; since then, though in clothing at any rate the number of people out of work has somewhat declined, dismissals of workers in the cotton industry have greatly swelled the total of workless in these industries. It is not clear whether this flow of workers out of soft goods is still benefiting the production of metal goods for export or of defence equipment to any considerable extent. In March, as in February, there was no significant increase in the numbers of people employed in the engineering industries, and the vehicles group continued to lose labour. The aircraft industry is still continuing to recruit labour fairly steadily at present, though for a number of factories the point has been reached at which more skilled men are essential before more unskilled workers can be used. Recruiting into the ordnance factories has slackened; but this has happened partly because certain of the factories using mainly unskilled labour are no longer needing workers in large numbers. It would seem that there is a slight movement of labour within the engineering industries towards defence and the factories most busy on exports—and a trickle, still inadequate, of skilled labour in the same direction.

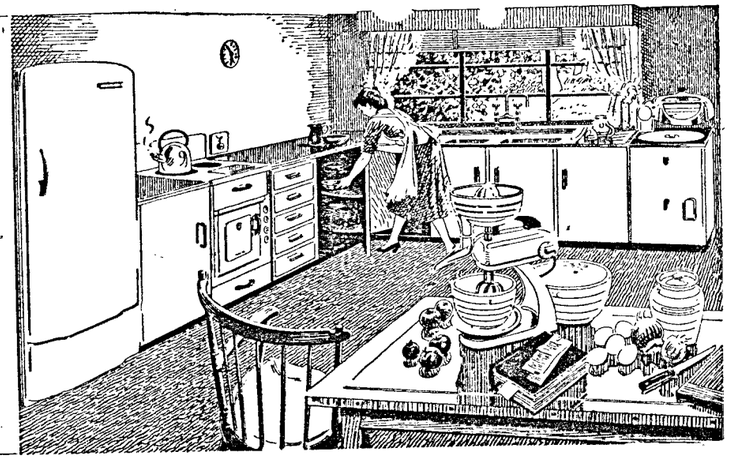
* * *

Sterling Rate Contrasts

Some interesting contrasts have characterised the movements in various sterling rates since the beginning of the month. In the spot market sterling has been inclined to give way against the dollar. At the end of April the spot rate was very close to $2.81. It has since fallen away to $2.80⅛, though it has in the last few days hardened to $2.80⅜. The experience of the market suggests that sterling is still receiving the support of bear covering operations and in particular of the repayment of foreign acceptance and other credit facilities that London banks, under instructions from the Bank of England, are not renewing. The decline of the spot rate in spite of this continuance of covering operations suggests that the commercial demand for dollars remains persistent.

The rate for transferable sterling in New York has, on the other hand, remained very firm. It was quoted at $2.53½ at the beginning of this month and has since risen to $2.55. Reports from New York suggest that the market remains fairly active and this, in its turn, indicates that a certain amount of commodity shunting continues despite the narrowing of the margin between the official and transferable sterling rates. For some time past the Dutch monetary authorities have given considerable support to the British in endeavouring to stop such switches through their country. The technique of commodity shunting has, however, kept pace in its elaboration with the restrictions decreed by the Netherlands Bank. Although it is no longer possible to obtain permission from the Dutch authorities to export sterling commodities to a dollar market, it is possible to secure authorisation to ship commodities from London to a continental port and to obtain authority for similar shipment from a continental port to New York. The fact that identical goods may be involved does not emerge from the double switch procedure and thus the shunting can and does proceed unbeknown to the Dutch authorities. Nevertheless, given the present margin between official and transferable sterling rates, the profitability of such deals must be very exiguous.

* * *

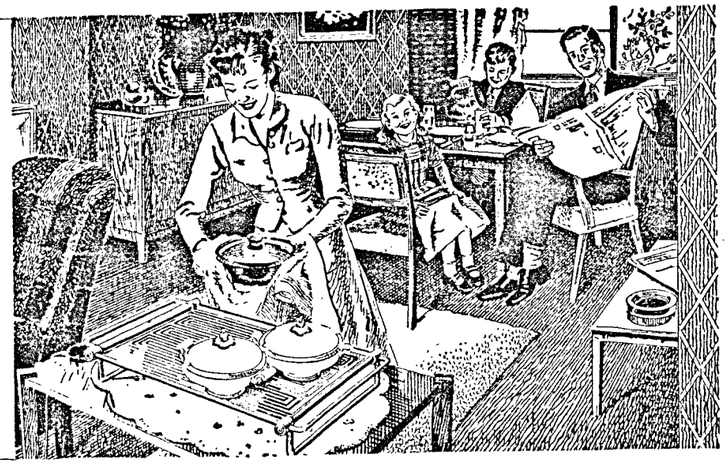


Retail Trade in March

Retail sales in March were on average 8 per cent higher than in February, which means little more than that sales are returning to their normal seasonal pattern. The sales index (1947=100) rose from 143 in February to 154. It was one point higher than in March last year, but this comparison is slightly misleading. In the intervening twelve months there has been a big increase in food prices, and a sharp fall both in the prices and in the sales of clothing and textiles. The index of food sales has risen from 146 in March of last year (and only 144 this January), to 162, largely because of the rise in prices. Meanwhile, the clothing index has fallen from 183 in March, 1951, at the height of the sales boom, to 152. Over the month, these sales showed an improvement of 25 points, a largely seasonal movement, but one that also owed something to the early budget and the removal of doubts about the future of the utility schemes. Although, by value, sales of men's clothing have been larger than those of women's the index suggests that men stocked up much more heavily than women during last year's panic sales, and are consequently buying more slowly this year.

This has had its effect on the movement of stocks. Clothing stocks as a whole stood at 222, not an unsatisfactory figure as compared with the level of 192 reached in March last year, when heavy sales were running stocks down below

'ENGLISH ELECTRIC'

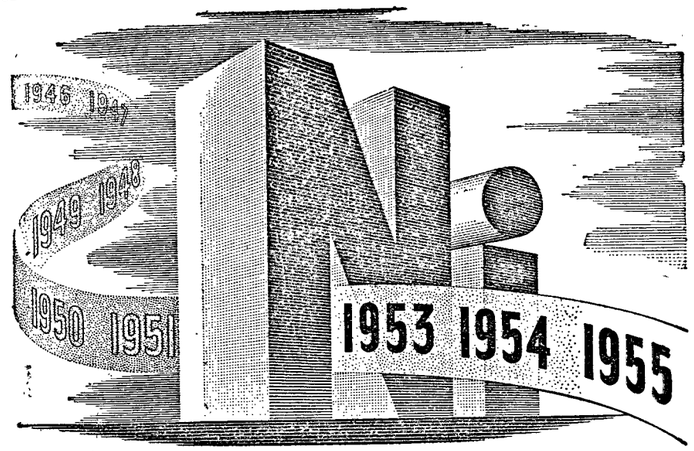


How many housewives know the joy of working in a really modern kitchen? How many know the advantages of a refrigerator, a food mixer, a washing machine, or a really up-to-date cooker? The simple answer is: 'not nearly enough!' To help meet this demand 'ENGLISH ELECTRIC', as one of the world's largest electrical organizations, is using its unique resources to equip more housewives with more modern domestic appliances.

bringing you

By continuous research on new labour-saving ideas, by the conversion of these ideas into practical household appliances of the highest quality, and by the production of those appliances on a large scale, 'ENGLISH ELECTRIC' is contributing to the better living of families all over the world.

In this and countless other ways 'ENGLISH ELECTRIC' puts the power of electricity at the service of millions.



better

living

WHEN IT'S A QUESTION OF TIME...

It is only natural that, if there are fast and slow clocks about the premises, workers will tend to arrive by the slowest and leave by the fastest. Industry loses many millions of productive minutes every year through this time leakage alone. There is a simple answer. Accurate time must be clearly shown and sounded throughout the premises. T.R. Time Control does this, and much more, to eliminate time waste in industry and implant a wholesome sense of time value in the minds of everyone concerned. Spend a profitable moment now to write for full particulars.

the safety level. Stocks of women's clothes, at an index level of 143, are actually 11 points lower than they were a year ago. Stocks of men's clothes, at 187, are 16 points higher and shoe stocks, at 333, are 76 points higher. For nearly eighteen months the shoe trade has been suffering from over-production, and in spite of these high stocks, shoe sales, at 128, were only ten points below the level of the previous March. These figures confirm the impression of recent weeks that retail sales have returned to equilibrium, though at a level considerably below that reached last year. The level of retailers' stocks suggests that the shops are now in a position to start ordering again; that they have not yet done so on any scale seems to have been chiefly due to uncertainty about the levels of purchase tax.

Control Scheme for Rubber?

The prospective surplus of rubber is at last attracting attention and the International Rubber Study Group, which ended its ninth session in Ottawa last weekend, has proposed to set up a special committee to study the problem. The committee will comprise representatives of the main producing and consuming countries and will meet in London in July. Its terms of reference are to consider whether it is possible to work out a plan to prevent "burdensome surpluses and serious shortages" of natural rubber and whether such measures are necessary or practicable. The committee is also required to submit drafts of any agreements that might be required to implement such proposals. As the study group is not expected to meet again until next year, there is no likelihood of any early action, even if a scheme is recommended by the committee.

The Study Group has estimated world production of natural rubber in 1952 at 1,690,000 tons compared with 1,880,000 tons last year. Indonesian output is put at 675,000 tons (804,000 tons in 1951) and Malayan output at 550,000 tons (605,000 tons in 1951). World consumption is forecast at 1,450,000 tons, or 80,000 tons less than last year; the United States is expected to use 465,000 tons (454,000 tons in 1951) and Britain 210,000 tons (234,000 tons in 1951). The apparent surplus of 240,000 tons may be partially absorbed by American stockpiling. But on this topic the group had nothing to say. These figures do not portend any rosy future for natural rubber, and that impression is confirmed by the group's estimate for synthetic rubber. Synthetic production is expected to be virtually the same as last year—910,000 tons, compared with 908,000 tons. American output is forecast at a slightly lower level—825,000 tons, compared with 845,000 tons in 1951—but Canadian and German production is expected to increase quite sharply (Canadian from 62,000 tons in 1951 to 79,000 tons and German from 850 tons to 6,000 tons). The total output is expected to be either consumed or absorbed into stockpiles. The group apparently does not think that natural rubber, when it competes freely with synthetic rubber in the United States in the second half of the year, will make much headway there; but much depends on the price at which the American government sells its synthetic output.

This high rate of synthetic production, selling at some 20d. a lb compared with the present price of natural rubber of 25d., could quite easily create a burdensome surplus of natural rubber within the next year or so. But past experience has shown that rubber consumption increases with the general expansion in world industrial activity and if it is so that this prospect of surplus does not imply that there cannot be a shortage at some later date, say, in 1960. No new synthetic plants are being built to meet this contingency—not even under the American defence programme. On the other hand, the lower price of rubber will reduce natural rubber output. Even United Sua Betong Rubber Estates Limited, recognised as one of the efficient producers, is finding the present low price an embarrassment. Its chairman, Sir John Hay, told shareholders that "costs at the end of March just about matched the present price of rubber"; he added, that, as nearly 70 per cent of estate expenditure consisted of wages, the only scope for major economies is by reducing the labour cost per unit of output. Most of the Malayan trees, particularly in the smallholdings, are now 20-30 years old, and conditions of surplus offer no incentive to replanting. In any case the holdings, other than the estates, are not sufficiently large to permit replanting without depriving the smallholder of his main source of income. A solution would be to replant in new areas, but that is not feasible so long as the present bandit operations continue. These are problems that the special committee should consider within their broad terms of reference, for they affect the long-term interests of the rubber industry. A scheme that supports prices artificially has only a limited value, as the prewar restriction schemes have now proved.

France's Gold Loan

Full details should be announced next week of the French Government loan by which it is hoped to mobilise resources to finance capital projects of the government for the coming year. Enough has been divulged about the character of this operation to allow its general outlines to be discernible. Its most interesting feature will be the conditional gold guarantee that will attach to its capital value. The loan is to be issued for an unlimited amount. It will bear interest at 3½ per cent tax free. The capital of the loan will be accepted by the Treasury in payment of certain direct taxes. When so accepted the bonds will be valued at least at par, and will receive a premium proportionate to any increase in the price of the 20-franc gold coin above its present level on the Paris free market. The louis or napoleon is now quoted at about Frs. 4,000. If its rises to, say, Frs. 6,000 the Treasury will have to redeem the bonds for taxpaying purposes with a 50 per cent premium. The intention of the authorities is to give the French investor the gold guarantee that he evidently desires. It should be added that in the choice of the gold coin as measuring rod for this guarantee, the French Government is taking a standard that, from its own point of view, is decidedly favourable. The present value of the gold louis in the Paris free market stands at a premium of nearly 40 per cent over the free market price of gold bars, which itself is at more than 6 per cent premium over the official price for gold. The French authorities are, therefore, giving themselves a fairly generous margin. Even assuming a further depreciation of the franc, it should be possible by minting new coins to keep down the price of the louis and thus prevent the depreciation of the currency from translating itself into a corresponding increase in the price at which the French authorities would have to accept the bonds for tax purposes.

It is hoped by the French Government to secure the dishoarding of a considerable amount of gold to provide the francs to subscribe to the new loan. Gold coins will be accepted for subscriptions at the current free market price. The reasoning that has been advanced to encourage such sales of gold coins is that the new loan will provide all the security that gold coins now offer and that in addition it will offer the holder a tax-free 3½ per cent income. The fact that a loan of this character should have to be offered is not calculated to inspire confidence in the franc, but it reflects the touch of realism that is the hall-mark of the Pinay Government's financial policy. Whether in fact the loan will dislodge any appreciable avalanche of gold subscriptions, is a question to which no very hopeful answer can at present be given. The gold guarantee is not immediately attractive, since it is based on a somewhat artificial current price for gold coins. Furthermore, it lacks the all-important virtue of a two-way exchange. There is no provision by which the

capital of the loan can at the will of the holder be reconverted back into gold, even though the original subscription was made in that form. The would-be subscriber with one louis in the hand will not even be attracted by a promise of two in the bush.

ICFC's Steady Expansion

In the first six years of its life the Industrial and Commercial Finance Corporation has called up £23 million of its authorised capital of £45 million from shareholding banks. By March 31st last its invested funds, including some funds from ploughed back profits and from an unsecured bank overdraft of £52,723, totalled £23.7 million; they had risen by another £3,437,000 in the year, as a result of the granting of £5,336,000 of new advances and the receipt of £1,900,000 from repayments realisations. With the audited accounts of most of its 383 customers showing new increases in profits, the corporation increased its total income from £852,811 to £1,000,153 and its net profit from £361,197 to £388,032; the directors found it necessary to set aside only £100,000 (against £150,000) for doubtful advances and investments. Indeed, apart from a few accounts opened in 1946, the corporation has proved remarkably efficient in steering away from sour loans, despite the fact that it operates in the risky field of small business, with a normal ceiling of £200,000 on any one loan.

In the current year the tighter rein on commercial bank advances might at first sight seem likely to increase the number of applicants for loans from the corporation. Lord Piercy expects, however, that the corporation's business may decline slightly. One reason for this is the directors' strict conformity to the Treasury's directives on lending policy and priorities. Another and more potent reason is that the corporation has recently increased its new lending rates, though it still aims at keeping "on the low rather than the high, side" of the trend of the normal capital market. So far, customers seem to have taken in their stride these higher rates, but Lord Piercy believes that "they have been floated, so to speak, on a distinct buoyancy of profits which has lasted now for two or three years. As this buoyancy disappears, high priced capital will become onerous." The general air of caution that overlays Lord Piercy's review is reinforced by the fact that EPL will fall harshly on many of the most promising developing industries under the corporation's wing and by the high proportion of its customers in the consumer goods trades, including some in the development areas; for example, £1 million of last year's increase of £3,437,000 in invested funds was due to increased lending to the textile industry, which now accounts for 12.1 per cent of the corporation's outstanding loans (while the clothing and footwear industries account for another 4.4 per cent). The corporation's own profitability may be safeguarded, however, by the emphasis on prior claims in its portfolio; 38 per cent of that portfolio is in secured loans, 22 per cent in unsecured loans, 31 per cent in preference shares, and less than 8 per cent in ordinary shares.

* * *

Cheaper Newsprint

Although the cut in the price of newsprint announced this week by the Ministry of Materials amounts to only 5 per cent—from £66 to just over £63 a ton—it is of real significance, for it marks the end of the high price regime for the commodity, and is likely to be the first of a series. With effect from May 19th the controlled price of newsprint is to be lowered by £2 17s. 6d. a ton, while the reductions in mechanical printing papers will range from £7 to £23 a ton acording to the mechanical pulp content of the paper. Newspaper publishers had seen the price of newsprint increase twofold to £66 a ton over the past two years; in Britain newsprint is sold at a figure that averages out the prices of home produced and imported newsprint.

So far only British newsprint has fallen in price, following the fall in the cost of wood pulp imported into this country. Scandinavian newsprint is still imported at £70 a ton; and the Scandinavian countries account for about 120,000 tons, or more than one-sixth, of the 700,000 tons at present available for consumption in Britain. However, the Newsprint Supply Company is now negotiating with Scandinavian producers about prices and supplies for Britain in the second half of 1952, and is expected to secure a reduction to £50 a ton, although even at this price Scandinavian newsprint would be slightly dearer than Canadian. Moreover, supplies of newsprint in Britain are improving. Scandinavian exporters appear willing to ship more newsprint despite the lower price; imports from Canada are likely to be maintained at their present level of 90,000 tons a year; and the British newsprint industry is enlarging its capacity beyond the present level of 600,000 tons a year by setting up new plant and raising the operating speeds of existing machines. So there are good prospects that, before long, the press will be able to get more and cheaper newsprint, quite possibly at less than £60 a ton.

This weakening in newsprint prices has not followed upon any sharp change in the world supply-and-demand position. World production of newsprint this year is expected to increase by only 350,000 tons to 9,500,000 tons, and the increase is almost certain to be absorbed by a newsprint-hungry world. Indeed there remains a potential demand that cannot be satisfied because of import restrictions imposed by countries short of foreign exchange. But the demand for marginal supplies has lost its intensity, and it was due to this small volume of demand at the margin that prices soared to astronomic heights last year and were maintained for so long against the general trend of commodity prices. Only a few months ago some South American newspaper proprietors were readily paying more than £100 a ton in the spot market to cover their essential requirements; but not today. The growth of North American newsprint production has been reducing United States demand for high-priced European newsprint, and a small tonnage of Scandinavian and Canadian newsprint has been diverted to other markets, mainly European. In any event, the recent decline in wood pulp prices was bound to be reflected in lower newsprint costs. Last February the British Government imposed ceiling prices some 20 per cent below the prevailing quotations on pulp imported from Scandinavia, and its move was the signal for a widespread easing of pulp prices in pulp producing and importing countries.

* * *

"D" Scheme and Furniture

Provision has been made in the Finance Bill for the eventual extension of the "D" scheme to cover the furniture industry, and the Opposition failed last week to get this clause removed. Nevertheless, an early ending of the utility scheme for furniture seems unlikely. At least 90 per cent of furniture bought today is utility; if a "D" scheme is introduced on the same basis as in textiles it will presumably mean that nearly half these purchases will in future attract tax. This in itself would not prevent the change being made; whatever is being said to the contrary, the fact that tax would be paid only on the amount by which prices exceed the "D" limit means that the tax liability of all but the highest-priced goods would be extremely small. The government's real difficulty is to devise a reliable method of maintaining a minimum standard of quality in the industry when the utility controls are removed, and its task has not been made any easier by the views just expressed by the Furniture Development Council in its latest annual report.

The utility scheme gave an effective guarantee of quality only by laying down in considerable detail the method of construction to be used for each utility article. This rigid

"As important as my telephone – and as easy to use!"

The Dictaphone Time-Master is the simplest dictating machine

Here is a dictating machine that is really simple to operate —just as simple as using your telephone! The Time-Master requires the minimum of controls. There are no intricate, time-wasting adjustments to be made.

THE MARVEL OF THE DICTABELT

The great advances in both design and performance shown in the Time-Master were made possible by the use of the Dictabelts. These little plastic belts carry on the well-proved principles of cylindrical recording, which ensures uniform quality recording, uniform speed *and* uniform back-spacing.

Slip in a Dictabelt and you are all ready for 15 minutes perfect crystal-clear dictation. Flick a lever, the completed Dictabelt pops out, ready for your secretary to transcribe.

ONLY THE TIMEMASTER OFFERS ALL THIS

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Dictabelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O. 107, *Kingsway, London, W.C.2.*

ARGYLE STREET WORKS · BIRMINGHAM

control over manufacturing methods has had a serious effect on the industry's development and the Douglas Committee suggested that it should be ended, even though it was beyond the committee's considerable ingenuity to suggest an alternative scheme. The Furniture Development Council has been working out a series of performance tests for individual items of furniture, and it had been hoped that these would provide a basis for evolving minimum standards. But the Council has now published its evidence to the committee, which says that it does not regard such performance tests as any alternative to the Utility specifications. The Council believes these specifications will have to be retained and with them the system of licensing production. There is surely some more satisfactory alternative than this, but it looks as if the Government must discover it for itself.

Wool Consumption Rising

The London market confirmed this week the upward trend in wool prices noticeable in the recent Australian and New Zealand sales. On Tuesday merino 64's were sold at 130d. a lb (clean) and crossbreds at 59d. a lb, compared with 110d. a lb and 44d. a lb respectively at the close of the last London sales in April. The 1951-52 selling season is now drawing to a close; the New Zealand sales ended a fortnight ago. The firmer tone in the world's wool market is undoubtedly due to a last-minute spurt in demand by manufacturers who fear that their stocks may not be big enough to last until the new season begins in September. In most consuming countries stocks that had been allowed to fall to a very low level last season have risen moderately during the past six months. This intake, combined with a purchase of 50 million lb of wool for Britain's emergency reserve, was sufficient to absorb most of the threatened surplus and to prevent wool prices from dropping as sharply as they would otherwise have done during the main selling season. Some manufacturers, hoping for such a fall in prices, may perhaps have delayed part of their purchases. In the event, considerable competition has developed for the comparatively small supply of wool that remains to be sold. Crossbred wools may be less affected than merino by the present slight squeeze in supplies.

Source: "Wool Intelligence" (Commonwealth Economic Committee).

Argentina and Uruguay have been unwilling to sell their wool at the market prices and are holding large stocks, mostly of crossbred wool. Uruguay at least is now apparently prepared to sell at current prices and quite sizeable shipments are expected during the next four months.

The worldwide fall in wool consumption that began early in 1950 seems at last to have been arrested. According to the current issue of "Wool Intelligence," prepared by the Commonwealth Economic Committee, consumption of virgin wool in the eight major consuming countries has risen for the second successive quarter. It is provisionally estimated at 323 million lb (clean), in the March quarter, about 3 per cent above the previous quarter, but 21 per cent below the corresponding figure for the first quarter of 1951. Italy was the only major country where consumption fell; in the United States it increased by 4 per cent, in the United Kingdom by 6 per cent and in France by 11 per cent. The wool textile industry is using a larger proportion of virgin wool compared with other materials, such as noils, waste and artificial fibres. The increased consumption of raw wool has not so far been reflected in any general revival in the wool textile industry, but top-making showed an encouraging rise in most of the principal producing countries last quarter.

* * *

Australia's Import Policy

Shortly after the Australian Government swung its vicious axe at imports from non-dollar countries in March, it froze all outstanding licences for imports from the dollar area, which were, of course, already severely restricted. These dollar licences have now been unfrozen again, but they have been cut by 20 per cent. The cut does not apply evenly to all goods; some licences will be cancelled, others merely reduced. The goods principally affected are tobacco, fats, oils, textiles and timber from the United States and timber, pulp and newsprint from Canada; most of them, however, are of a type that cannot be supplied from this country so that no relief will be accorded to British exporters by the new measure, which aims at cutting some $20 million from Australia's dollar expenditure this year. Certain materials obtained under allocation by the International Materials Conference, petroleum products and goods covered by irrevocable letters of credit will be exempt.

Meanwhile the earlier restrictions on consumer goods imports from non-dollar countries have led to an unexpectedly large trade in quotas between Australian merchants. It will be remembered that under the restrictions announced in March category A imports (essential goods) are being cut by 20 per cent, and category B imports (consumer goods) by 80 per cent below the 1950-51 level. As in the past, the source of these category B imports is not specified; for example, an Australian importer who imported £100 worth of pottery from this country in 1950-51 will be entitled to import only £20 worth this year, but he can if he wishes buy the pottery from any non-dollar country. Moreover, it now appears that if he does not wish to import pottery at all his £20 quota can be used to buy other category B goods, such as toys from the Continent. This flexibility does not apply to category A imports, but within the category B group holders of quotas for textiles (with which Australia is overstocked) are selling them to merchants wishing to import other consumer goods. According to reports, importers of non-dollar tobacco are active purchasers of these unwanted quotas.

* * *

Marks and Spencer Dividend

Investors have been set some unusual problems by the preliminary statement of Marks and Spencer for the year to March 31st last. Despite a fall in gross profits, from £7,335,900 to £6,513,877, the directors have decided to raise the ordinary dividend from 75 per cent to 80 per cent; at the same time, however, they make no mention of any small capital bonus of the sort that has been a customary feature of the company's accounts for some years past. The directors explain that the decline in profits was due to a progressive writing down of stocks in the wake of the general fall in textile prices. The volume of the company's business actually increased by 15 per cent last year. In view of the slump in retail trade since last summer this was an exceptionally good achievement; it pays tribute to the widely based nature of the business, to its strict and centrally controlled system of buying, and to the company's evident willingness to cut profit margins on its cheaply priced textile goods in order to maintain sales. Stock losses were clearly unavoidable and the decision to write these losses directly off profits was a deliberate one. The directors specifically state that the stock contingency reserve was not drawn upon; in fact they propose to increase this reserve to £1,000,000 by an appropriation from profits. The company's total reserves

have been increased by £1,722,196 to £11,054,413; the year's transfers include £883,198 (against £505,321) from profits to a general reserve and £520,733 from a net surplus that arose on the sale of properties and investments.

In view of these satisfactory results the market's reception of the preliminary statement may seem to have been excessively churlish—especially as the absence of any mention of the usual small annual capital bonus may be explained by the decision taken last March to capitalise £2,261,746 from reserves in order to make a 100 per cent scrip bonus. But some shareholders are clearly afraid that the latest increase in cash distributions may mean the end of the practice of issuing small annual scrip bonuses. This uncertainty led to wide fluctuations in the market price of the 5s. "A" ordinary shares after the announcement; the price ranged from 78s. 6d. to 76s. 3d., at which price the yield is 5¼ per cent. Investors are aware that dividend rates tend to move by fits and starts and may prefer the practice of annual scrip bonuses, which in the past few years has resulted in a regular, though slight, increase in equity payments year by year.

* * *

Tax Relief for the "House"

After the apparently endless succession of increases in taxation reported by British companies, it must be a pleasant change for the members of the Stock Exchange to read one report that not only includes a smaller provision for taxation but also holds out the promise of a permanent relief from part of the burden of taxes. This oddity is to be found in the report of the Council of the Stock Exchange itself. About a year ago the Council made a submission to the Inland Revenue authorities that, as the members and proprietors of the Stock Exchange had become identical following the amendments in 1948 to the Deed of Settlement, any surplus arising from an excess of income derived from members over the expense of providing any facilities given to them should not be liable for taxation. The Special Commissioners upheld this plea and, as the Inland Revenue has not appealed against it, this ruling has become final.

The advantages stemming from this decision are plainly revealed in the Council's accounts for the year to March 24th last. Not only has the Council been able to transfer to a special reserve £268,811 from sums previously set aside for taxation, but the total charge for taxation has been reduced from £82,500 (including £46,100 for income tax) to £15,000; this charge represents £10,000 set aside for profits tax and £5,000 provisionally provided for EPL. Despite a modest decline in net revenue, the available surplus has therefore increased from a mere £5,085 to £71,317, which, together with £7,923 withdrawn from the carry forward, has been transferred to the annuities' redemption account. A further growth in expenditure, from £480,110 to £512,376, has offset the improvement in gross income from £567,695 to £598,693; this latter increase reflects, in the main, a rise in entrance fees from £39,842 to £69,662 and in quotation fees from £90,787 to £103,537. Another aspect of the Stock Exchange's work has been illumined this week by the publication by the Share and Loan Department, together with other interested institutions, of suggested standardised forms for letters of rights and allotment. If these pro forma documents are accepted by company secretaries, they should bring some relief to investors who are all too frequently harassed and perplexed by the vagaries and complexities of the documents now in use.

* * *

Cuts in Aviation Spirit

The American oil strike will probably be settled before shortage of aviation spirit has led to any serious curtailment in air services, but it may be some time before the British corporations return to normal schedules. No immediate provision has been made in the British refinery programme for the production of aviation spirit, which requires special chemical additives, and since the loss of Abadan the bulk of British requirements have come from the United States. Aviation spirit represents about 3 per cent of the world trade in oil products, and although no separate import figures are published, it is reasonable to assume that high octane fuel accounted for 9 million out of the total of 2,700 million gallons of oil products imported into this country last year. The great proportion of this was used by the British airlines; Air Ministry consumption of high octane fuel has been declining steadily as more squadrons are re-equipped with kerosene-burning jet aircraft.

The brunt of the cuts has so far been borne by British European Airways, which has had to cut its services by 13 per cent for the best part of a fortnight and faces the prospect of more severe restrictions if the strike does not in fact end as expected. British Overseas Airways Corporation managed to maintain scheduled services until yesterday, partly by drawing on fuel stocks, but principally because much of the Corporation's refuelling is done outside this country. But Stratocruiser services to New York are now being cut from 14 to 8 a week. The new tourist flights are not yet affected but other services on the eastern and African routes are being reduced by roughly one-third.

American operators, who are also trying to adapt schedules to a 35 per cent cut in fuel supplies, are in general maintaining their North Atlantic services, which are booked to capacity, and are cutting down on their flights to the Continent and to Latin America. A 35 per cent cut in aviation spirit supplies is now beginning to be enforced in most European countries, which also rely heavily on the American refineries. Provided the strike is not prolonged, the financial loss to the airlines may not be serious. By doubling up services, it is probably possible to carry most of the passengers who have booked, with the added advantage of operating the aircraft at 100 per cent capacity. But if fuel is still rationed over Whitsun, so that BEA, for example, has to cut some of the holiday services, the results may be serious. One result of this strike may be to lead to a change in British refinery programmes, and it is probable that at least one company may be asked to produce aviation spirit. The obvious choice at this stage appears to be Esso.

Shorter Notes

Steel output last month was at the annual rate of 15,866,000 tons, compared with 16,648,000 tons in March. This was about 17,500 tons a week less than was produced in April last year; but Easter came in March last year and in April this year. Pig iron output was less affected; it remained almost as high as in March, the annual rate for April being 10,472,000 tons.

*

The Ministry of Materials has this week reduced its selling price for lead by £16 from £147 to £131 a ton. This follows a similar reduction in the American price and is the third time in as many weeks that American and British official prices for lead have been cut. As recently as the end of January the Ministry's price was £175 a ton; it is now at its lowest level since late autumn, 1950.

*

The Board of Trade is examining the problem of trade marks that were on the register in the name of German persons or concerns at the outbreak of war, but that have been used in connection with goods manufactured in this country. All organisations with a continuing interest in such trade marks should get in touch with the Patent Office.

Company Notes

Monsanto Chemicals.—The recent history of Monsanto Chemicals is aptly described by its chairman, Mr E. A. O'Neal, as an "evolution from a small business with growing pains into a medium-size business with ambitions." The company's early ambitions have certainly borne a healthy crop of fruit in 1951. Turnover exceeded £10 million for the first time in the company's history, and was 47 per cent higher than that achieved in 1950. These increased sales reflect greater production and the development of broader and more varied markets—and they were achieved despite the fact that capacity production was prevented in some cases by a shortage of basic chemical raw materials. The increase in sales was accompanied by the now familiar industrial pattern of rising costs, due to higher raw material prices and increases in wages and salaries; but, despite this, the group's trading profits rose from £1,685,897 to £2,889,330, and its net profits from £1,104,942 to £1,947,011. This increase enabled the company to pass on some of the benefits arising from expansion to ordinary shareholders. A dividend of 22½ per cent has been declared on the equity capital of £2,700,000, as increased by last year's 200 per cent scrip bonus; this compares with the dividend of 55 per cent declared on the original capital of £900,000 in 1950.

Monsanto Chemicals is still a growing concern, but its growth—though it cannot be completely stifled—may be hampered by the heavy weight of taxation that is now to be made more burdensome by the imposition of EPL. The chairman expects another increase in production this year; some part of this increase will reflect the completion of the new plants under construction at the end of last year. On December 31st last the book value of capital works in progress was £861,505 (against £841,044) and outstanding capital commitments were estimated at £1,157,000. Raw material shortages may hold up production but there is some hope of an improvement in supplies of naphthalene and refined benzol, and the company has arranged to import chlorine from Norway and Italy if supplies in Britain prove to be inadequate. Increased production must, however, be matched by increased sales and, these depend in turn on the company's ability to increase exports. The restrictions placed on imports from Britain by European and Commonwealth countries may therefore have an adverse effect on the company's sales, and the danger of competition from Europe, America and Japan is growing. The yield on the 5s. ordinary shares of 4.7 per cent at the current price of 29s. 3d. must be assessed in terms of these dangers as well as in terms of the expansionist record and character of the company.

*

P. and O.—Full provision now appears to have been made by P. and O. for the reconditioning of its fleet. The operating surplus of £18,850,336 in the year to September 30th last, unlike the previous year's profit of £13,336,633, was no longer shown as "after making provision for reconditioning of fleets and appropriations to reserves for contingencies." One burden has therefore been removed, but the even more onerous burden of replacement has grown heavier. The group's fleet now comprises 2,203,525 gross tons of shipping, of a type that can normally be expected to have an economic life of about twenty years. About 110,000 gross tons have therefore to be replaced each year, and at the prices ruling in 1951 replacement on such a scale would cost about £12,500,000 annually; once allowance is made for depreciation of the group's other fixed assets the total yearly provision required amounts to about £13,125,000. Yet last year all that the group could set aside for depreciation and in reserves of all kinds was £12,561,432—and this sum was after bringing into account tax relief on initial allowances, which will eventually have to be repaid. Every rise in shipbuilding costs widens the gap; in addition, as part of the group's reserve funds are held in investments (of a book value of £32,714,962), the recent changes in monetary policy have reduced the real value of these reserves. An expansion in operating earnings will not ensure in itself that sufficient sums are set aside to meet the full cost of renewal, for each increase in earnings is accompanied by an increase in taxation—and this year there will be EPL as well.

£1 deferred stock at 47s. 6d. yields £0 45s. per cent.

Replacement finance has recently figured very prominently in the accounts of the shipping companies, but as yet there has been no hint that the problem will force the companies to raise new money from the public. Thus far, for example, P. and O. has been able to renew and add to its fleet from its own internal resources, and appears ready to continue to do so. At the end of the financial year the net book value of ships and small craft in service or under construction was £91,337,554, an increase of over £11 million on the previous year's figure of £80,102,919, while shipbuilding bills payable were entered at £4,672,750 (against £3,892,000). In the parent company's balance sheet the estimated cost of tonnage under construction, less amounts written off, was entered at £6,558,788 (against £1,037,964), while commitments for new tonnage ordered but not laid down at the end of the financial year were estimated at £9,610,000. When set against these figures the strength of the group's liquid resources is more apparent than real. Shareholders would be unwise to expect anything more than the maintenance of the deferred dividend at 16 per cent.

*

Union-Castle.—Outwardly, at least, the directors of Union-Castle seem to be less concerned with the problem of replacement financing than are the directors of P. and O. In the Union-Castle report the directors are content to say that depreciation provisions as allowed by the taxation authorities are not sufficient to meet the full cost of replacement, and that therefore it is necessary "to retain in the business large liquid resources." The nature of the problem is the same for both companies; it merely differs in size. At the end of last year Union-Castle had only three vessels under construction or on order, while outstanding commitments for capital expenditure were estimated at £5,234,093. In the consolidated balance sheet the net book value of the fleet, including expenditure on vessels under construction, was entered at £11,869,129, compared with £10,510,552 at the end of 1950.

On the question of replacement, the accounts of Union-Castle have very much the same appearance of those issued by other liner companies recently, but in another respect—that of earnings—there is a disappointing contrast. Although the parent company, like other shipping lines, enjoyed a substantially higher revenue from passenger and cargo traffic in 1951, its profits were less, owing to the serious increase in costs. The increase in profits of the group as a whole, from £4,164,808 to £4,723,125, appears to have been due almost entirely to an increase in earnings by a freight-carrying subsidiary the King Line. In these circumstances, it is not surprising that the increase in Union-Castle's ordinary dividend payment, from 10 to 12½ per cent, fell short of the best expectations in the market. When these results were first announced the £1 ordinary stock units fell from 45s. to 41s. and then—somewhat illogically—were marked up to 43s. 7½d. on the news of the 100 per cent scrip bonus. At the current price of 42s. 6d. xd the £1 stock units yield nearly 5.9 per cent—a yield that may indicate an over-optimistic view of future earnings and dividends.

£1 ordinary stock at 42s. 6d.xd yields £5 18s. per cent.

Brush Aboe.—For some months now a new issue of either loan or share capital by the Brush Aboe group has seemed to be just around the corner, and this has helped to depress the price of the 5s. ordinary shares to the current level of 5s. 3d.; at this price the shares offer the high yield of 9½ per cent. The 1951 accounts strengthen the impression that this yield is not too high, for the need for more permanent capital seems pressing. The accounts also suggest reasons why an issue has been delayed and why some difficulties may still stand in the way of its eventual success. The group's trading results in 1951 were somewhat disappointing when measured against the standard of prosperity of the electrical industry as a whole. Earnings from the group's sales rose from £19,995,431 to £24,148,594, but about one half of this increase of £4 million was due to sales by subsidiaries in Australia and Vancouver whose results had not previously been consolidated. Moreover any genuine increase in sales revenue was offset by higher costs, which rose from £17,528,306, to £21,475,215, so that trading profits advanced only slightly, from £2,467,125 to £2,673,379. As earnings did not respond to the increase in sales the directors have been unable to prepare the way for a rights issue of ordinary shares by raising the payment on the equity; the dividend has merely been maintained at 10 per cent. In view of the small current premium on the ordinary shares the directors may not be able to float a rights issue, and may fall back on a redeemable loan or debenture stock which could be secured on the company's freehold or leasehold properties.

Sir Ronald Matthews, the chairman, suggests one reason for the lag in profits by explaining that a large number of the orders executed in 1951 had been taken on the group's books in the preceding eighteen months at fixed prices; the company had to adhere to these prices in spite of the increases in manufacturing costs. This difficulty has now been largely overcome, for most of the new orders accepted last year, worth about £40 million, were "subject to a rise and fall clause or similar arrangement." The group therefore entered 1952 with an order book of record strength, of which less than 6 per cent by value represented the outstanding balance of fixed price orders. Usually such a "cost plus" system of pricing only remains effective in a seller's market; shareholders must ask themselves how long such a market can persist both at home and overseas. Meanwhile, the greater the expansion in the group's business, the more pressing becomes the problem of finance. Last year's increase in sales, for example, was accompanied by a rise in the book value of stocks and work in progress, from £5,576,603 to £9,229,045, and in debtors, from £4,154,391 to £5,885,496, so that—despite the receipt of some payments on account of work in progress—bank loans were increased from £2,103,584 to £4,578,901 and cash balances were reduced from £640,694 to £172,812.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 10, 1952, total ordinary revenue was £73,030,000, against ordinary expenditure of £75,567,000 and issues to sinking funds £1,230,000. Thus, including sinking fund allocations of £3,291,000 the deficit accrued since April 1, 1952, was £50,883,000 compared with a surplus of £44,286,000 for the corresponding period of the previous year.

COMPANY MEETINGS

ANGLO-PORTUGUESE TELEPHONE COMPANY

EXCELLENT RECORD OF PROGRESS

FURTHER OPPORTUNITIES FOR ADVANTAGEOUS INVESTMENT

SIR ALEXANDER ROGER ON PROVISION OF FURTHER PERMANENT FINANCE

The sixty-fifth annual general meeting of the Anglo-Portuguese Telephone Company, Limited, will be held on June 5th at Strowger House, 8 Arundel Street, London, W.C.2.

The following is the statement by the chairman and managing director, Sir Alexander Roger, KCIE, which has been circulated with the report and accounts for the year ended December 31, 1951:—

The accounts for 1951 show that during the past year the progress of your company has continued satisfactorily. Total revenue amounted to £1,504,396, the increase of £200,663 over the 1950 figure being due partly to the operation of the new tariffs, which came into effect on May 1, 1950, for a full year, and partly to the expansion of the business. The rate of exchange has steadily remained at Escs. 80.50 to the £ since September, 1949. All currency figures have been converted at that rate as they were in 1950.

Total expenses have increased from £1,213,590 in 1950 to £1,386,754 in 1951, after providing for renewals, taxation, debenture and loan interest, and debenture sinking fund instalments.

Net profit at £117,642, compares with £90,143. The usual interim dividend of 3 per cent on the ordinary stock was paid in November, 1951, and it is proposed to pay a final dividend of 5 per cent, making 8 per cent in all, together with a dividend of 8 per cent on the "A" ordinary stock. This rate of dividend on both ordinary and "A" ordinary stocks has now been maintained for 25 years in good times and in bad, in peace and in war, a record we may well be proud of.

After providing £71,400 for dividends and transferring £38,866 to the contingency reserve, to bring it up to the round figure of £100,000, the amount of the carry forward is £74,812, an increase of £7,376.

Following upon their annual investigation of the telephone plant and equipment the consulting engineers have again recommended that an additional allocation be made over the normal allocation from revenue for renewals and depreciation. The provision for renewals now stands at £1,560,216, representing approximately 30 per cent of the cost price of installed plant, and in the opinion of the consulting engineers is adequate. In point of fact the present-day value of telephone plant and of buildings is unquestionably substantially in excess of the balance-sheet figure. All plant is maintained at a high standard and new equipment is of the latest design.

The company's reserves continue to be wholly invested in the business.

The expansion and development programme and normal maintenance requirements resulted in the shipment of £343,000 of telephone plant from Great Britain during 1951, bringing the total for the past five years to well over £1,500,000. Purchases in Portugal of various classes of material during the year totalled 15,680 contos (£196,000). The quantities and values of materials purchased in Portugal represent a substantial contribution to the economy of the country.

GENERAL PROGRESS OF THE COMPANY

The expansion of the company's systems in Lisbon and Oporto continued without interruption during 1951 and a further 8,296 stations were added, bringing the total to 109,193.

The internal exchange plant of your company's telephone systems in Lisbon and Oporto consists at present of five main exchanges housed in company-owned buildings, and ten subsidiary exchanges, in rented premises in some cases, and company-owned in others, their combined capacity providing for approximately 74,000 exchange lines in the city areas. In addition, in the outer city areas there are 129 smaller exchanges providing for approximately 14,500 exchange lines. All these exchanges are interconnected in the respective areas of Lisbon and Oporto.

The main exchanges and some of the subsidiary exchanges in Lisbon are equipped with automatic plant, but until a short time ago, for various reasons, not the least being the economics of the service, the dial or automatic system had not been introduced into Oporto.

Picaria is the name of the main exchange in Oporto and last year you will remember it was hoped that the conversion of this exchange from manual to automatic would be completed early in 1952. This hope was fully realised and on January 19th last the new automatic equipment of up-to-date design and pattern, increased to provide capacity for 10,000 exchange lines, was put into service.

The inauguration of the new service was an important occasion. The company was honoured by the attendance of the Minister of Communications, Colonel Manuel Gomes de Araujo, representing the Government of Portugal.

The Minister presided at the ceremony and was supported by the Civil Governor, the Commandant General of the Military Forces, the President of the Municipal Chamber of Oporto and a representative of the British Embassy.

Your company was represented by directors from London, Lisbon and Oporto, the general manager and senior officers. Telephone specialists of our organisations in London and Portugal were also in attendance in addition to those of the Portuguese Telephone Administration headed by the Postmaster General, Senhor Enginheiro Luiz Couto dos Santos.

Nearly 200 guests were present at the inaugural ceremony and inspected the automatic equipment, included in the number being representatives of the Municipal Departments, the Military Forces, Police and most branches of commerce and industry. The various speeches were broadcast over the national radio system of Portugal.

It is gratifying to report that the arrangements were entirely successful, deservedly so as their success resulted from care, thought and planning which commenced six months in advance of the new service.

EDUCATION OF USERS OF NEW SYSTEM

The community of Oporto had not been accustomed to dial working and, in order to attain the highest level of co-operation, it was essential to educate telephone users in advance of the date.

Selected employees were trained and schooled for this purpose and every telephone subscriber was visited individually and given first-hand instruction. Demonstration units and instruments were fitted at thickly populated parts of the city. Radio broadcasts of the sound effects and various tones of the automatic service when dialling were constantly put over the air in special programmes. Newspaper publicity and pamphlet distribution, complete with diagrams and drawings, were a feature of the campaign, in fact, every visible and invisible method was adopted day after day to familiarise the public with the new service. The company received splendid support and collaboration from the Portuguese Telephone Administration, the press, the broadcasting services and the public, and I take this opportunity of expressing your appreciation.

I would also like to thank on your behalf the Minister of Communications, who sacrificed many hours of his valuable time in leaving his Ministry in Lisbon in order to officiate at Oporto and address the gathering, and all those many public and influential personages, some in their official capacity and some in their private capacity, who attended. The presence of all these important people signified their goodwill and interest in our company's endeavours to broaden and facilitate the telephone service of Oporto and neighbouring areas to the advantage of the community.

The conversion of other exchanges in Oporto from manual to automatic working will follow in rotation from time to time.

It was with great regret that I was unable to be present in person. I was at the time on my way through South Africa to visit Lourenço Marques and inspect a large automatic telephone exchange which has been manufactured and installed by our associated company, the Automatic Telephone and Electric Company, Limited, for the Administration of posts, telegraphs and telephones of the Portuguese Colony of Mozambique.

OTHER ACTIVITIES

Another undertaking which required much careful planning and attention to detail was the laying of an additional submarine cable across the River Tagus, extending telecommunication facilities between the north and south sides of our system in Lisbon.

Because of the tides and currents there are very few occasions of the year when this work can be carried out, and at the best of times it is a hazardous task.

Some idea of the handling difficulties and the apparatus required, including a barge especially fitted out, will be realised as the cable measured 2,400 yards in one single length, drum and cable weighing 36 tons, the drum in diameter measuring 12½ feet and in width 6¼ feet.

On the morning of June 6, 1951, after many days of preparation, the job was successfully accomplished and the various activities of the work filmed for the company's records and future reference.

Work was well advanced during the year on Graça Exchange, a new main exchange in the Eastern area of Lisbon. The cost of

the land, buildings and equipment will amount to approximately 30,400 contos (£380,000) and will provide initial capacity for some 10,000 subscribers. The building is almost ready and the greater part of the equipment shipped, and it is hoped that the exchange will be opened at the end of 1952 or shortly after. It will materially help to extend the telecommunications service of the Lisbon community, and be an important addition to your company's plant and property.

Of the larger jobs, extension, relief, and interworking equipment was installed in several of the exchanges in Lisbon and Oporto, and the usual multitude of smaller jobs undertaken and completed.

CONSTANT DEMAND FOR TELEPHONES

The demand for service by new applicants never ceases. As fast as the longer term waiting subscribers are connected new applications are added to the list. For example, the waiting list at December 31, 1950, was 23,182 and although, by stretching our resources and our organisation to the limit, 8,296 stations were added, the list stood at 22,527 on December 31st last.

We are doing everything possible under efficient organisation and management to meet the demands and we keep the Portuguese Authorities and the public constantly informed of the company's plans and activities.

We in London assist substantially by calling on the experience and knowledge of the group of which your company is a member, a group which in its combined forces is one of the largest in the world, and embraces every branch of telecommunications business—financial, manufacturing, engineering, installation, research and overall technical consultative advice.

PROVISION OF FINANCE

Of this group Telephone and General Trust, Limited, provide the initial finance for your company and under this arrangement your company borrows from the Trust on a day-to-day basis by means of unsecured loans This is well suited to the interests of your company and the telephone public of Portugal, as we find it the most economic form of temporary financing.

The loan from the Trust at December 31st last was £208,829. At this date it is £250,000, and further sums are required to pay for new plant and equipment already shipped and on order.

The time is shortly arriving, therefore, when it will be desirable to fund the loans from the Trust and provide additional capital, a situation typical of all well-managed telephone companies.

As all the authorised capital of your company has been issued it is proposed at the forthcoming general meeting to create an additional 1 million ordinary shares which will be available for issue when required.

So far as we can see ahead, opportunities for further advantageous investment in the telephone business in Portugal appear to be bright, as we have been entrusted with a vital communications service governed by a franchise which is mutually satisfactory to the Portuguese Government and to your company.

We do not forget, however, that every expanding telephone company must provide for a margin of spare plant and equipment and there is always a period, short or long as the case may be, when a portion of the capital is not fully remunerative.

Furthermore, if the cost of living increases and wages follow suit there is generally a time lag before suitable increases in tariffs are arranged.

These and similar problems are not new to us, but as I have already said, we have been enabled over the past 25 years to pay 8 per cent per annum, provide adequate depreciation amounting to £1,560,000, and at the same time set up a modest £100,000 contingency reserve which is available for unforeseeable ups and downs in revenue.

PORTUGAL

Portugal owes its material recovery and political stability fundamentally to the healthy financial conditions she has enjoyed consequent upon the financial measures introduced in 1928 and subsequently by the Prime Minister, H. E. Doctor Antonio Oliveira Salazar, when Minister of Finance, and which have been maintained despite many obstacles.

The year under review was marked by the completion of a number of large-scale construction schemes throughout the country and by the continuation of the expansion of foreign trade.

The government's plans to provide an abundant supply of cheap power from natural sources were advanced by the inauguration of the Castelo do Bode (Zezere), and the Cavado-Rabagao dams and generating stations, which serve Lisbon and Oporto respectively. Further power schemes are being engineered and will be brought into operation during the next few years, thus adding to Portugal's productive capacity. Towards the end of the year the opening of the Marshal Carmona Bridge over the River Tagus at Vila Franca de Xira represented a triumph for British engineering in collaboration with Portuguese and Danish firms, and provided another instance of the benefits arising out of co-operative national and international enterprise.

Throughout the country there was heavy expenditure on roads, housing, water and electricity plants, irrigation, and on many new mills and factories for the production of fertilisers, textiles, flour, paper, woodpulp and iron and steel tubing. A number of new ships were added to the merchant fleet and improvements were made in the railway system.

Abroad Portugal's trade flourished. The value of exports of cork, canned fish, resin, timber and minerals increased substantially as did the value of colonial products, and gold and foreign currency reserves of the Bank of Portugal increased by over 20 per cent. The convenient geographical position of the country has caused Lisbon to achieve prominence as a centre for international conferences, and the important North Atlantic Treaty Organisation meetings were held there in February last.

At short notice the company undertook, at the request of the Portuguese Government, to provide telephone facilities at the Instituto Superior Técnico where the conference took place, and it is pleasing to report that the elaborate service provided received many congratulations.

SUCCESSFUL STRIVING FOR PROGRESS

The North Atlantic Treaty Organisation Conference brought Portugal, and Lisbon in particular, very much into world news. It is not for me in a company address to assess the results and, in any case, the conclusions have been fully reported. I think it is apposite for me to say, however, as I did in a recent speech, that the meetings served to reveal to many for the first time the general signs of order prevailing in Portugal and the successful striving for progress which is so evident there, conditions which are not always to be found in many other countries of the world at the present time.

It likewise gave the Portuguese Press and delegates an opportunity to recall that the concept of an Atlantic Pact uniting and utilising political aims and co-operation for the peace of Western Europe and America, was forecast with remarkable prevision by the Portuguese Premier, H. E. Doctor Antonio Oliveira Salazar, as far back as May, 1945, and stressed by him in subsequent speeches.

I am sure that many of the delegates and many of their staffs would have been impressed with an international commercial concern happily and efficiently at work—the Anglo-Portuguese Telephone Company, Limited. The capital has been found in Britain and the highly technical and specialised plant is exported from an associated company.

Our systems in Portugal are serviced by 3,250 trained employees, of which only a small handful is British. Substantial royalties are earned and paid to the Portuguese Government. It is indeed pleasant to reflect that our company is a good example of private international enterprise, contributing materially to the economies of both Britain and Portugal.

We should never cease to be grateful for the fact that it is because Portugal cordially welcomes foreign enterprise such as ours that the combination of effort is made possible and successful.

INTERCHANGE OF VISITS AND PERSONNEL

In my statement last year I referred to the loss sustained by the Portuguese nation through the death on April 18, 1951, of the President, H.E. Marshal Carmona, who had been head of the State since 1926. On July 22, 1951, his successor, General Francisco Higino Craveiro Lopes was elected.

I made two visits to Portugal in 1951 where, like all my colleagues, I have many friends, in order to renew my associations there and to inspect the new development of your company's systems, both in Oporto and Lisbon.

I had the privilege of meeting the new President for the first time and again was most cordially received by H.E. Doctor Antonio Oliveira Salazar, and practically all the Ministers of the Portuguese Government at separate times. I also had the pleasure of exchanging views with the President of the Lisbon Municipality, Colonel Salvacao Barreto.

I received much spontaneous commendation of your company's activities reminding me that every addition to our plant and installations strengthens the Portuguese economy through the greater commercial, industrial and social use of the telephone.

The cordial ties between London and Portugal were further maintained by the exchange of visits of other members of your London board and London office, and colleagues and personnel in Portugal.

The support we continue to receive from Senhor Enginheiro Antonio Branco Cabral, our admirable chairman of the board in Portugal, and from Doctor Antonio Bustorff Silva, our legal adviser, becomes increasingly valuable as the years go on, and working, as they do so closely in co-operation with Mr Thorp, in whom we have a most able and energetic general manager, we have the utmost confidence in the running of our business in Portugal. The other members of the board in Portugal, Senhor Eduardo Luiz Pinto Basto, Senhor Antonio Calem, CBE, Mr Francis Frick and Doctor Augusto de Castro are always available to bring their long experience to bear and to assist the interests of the company in their respective spheres.

We are extremely fortunate in having Senhor Antonio Calem, CBE, as our representative director in Oporto. Senhor Calem is a highly important and respected leading member of the Oporto commercial community, and among his many public appointments is the chairman of the Oporto Commercial Association.

He was a leading figure at the Picaria cut-over to automatic service, and is splendidly supported by our Oporto manager, Mr J. C. G. Mitchell, and officers of the company in Oporto.

On your behalf I would like to thank all these gentlemen and the Lisbon and Oporto staff and workpeople throughout for their loyalty and conduct of the company's affairs and the excellent standard of work achieved.

CEREBOS LIMITED

HOME AND EXPORT SALES RECORDS

PROPOSED INCREASE OF CAPITAL

MR W. ARNOLD INNES' REVIEW

The forty-eighth annual general meeting of Cerebos Limited was held on May 15th at Cerebos House, London, NW10, Mr W. Arnold Innes (the chairman) presiding.

The following is the chairman's review which was circulated with the report and accounts for the year ended December 31, 1951.

This being the first time I have had the privilege of addressing stockholders as chairman of the company, I propose to refer briefly to the changes which have taken place in the constitution of the board during the past year. Last July, after a period of over fifty years' service with the company, Mr J. Weedy resigned from the offices of chairman and managing director, and my colleagues did me the honour of electing me to be their chairman, whilst Mr L. H. McRobert was appointed deputy chairman. Previously Mr William Tricker, who had been our secretary since 1941, had been elected a director and his appointment will be submitted for your confirmation. Along with other duties which result from my office, it is my intention to maintain the very active interest I have always taken in the selling, marketing and advertising side of the business, whilst Mr McRobert will continue to be responsible for production throughout the Group.

PRODUCTION

Although the reconstruction and re-equipment programmes are as yet by no means complete, the past year was the first financial period to derive any material benefit from the modern packing machinery which has been installed and the new and improved methods and processes adopted, and I am glad to say that the resulting economies have, to a noticeable extent, offset severe increased costs in other directions.

The prices of all packing materials, of which we are considerable users, rose steeply throughout the year and reached peaks which at one time would have been thought impossible. Whilst some proportion of these increases was no doubt attributable to the inflationary conditions resulting from the Korean war and also to the restrictions imposed by the previous Government on the import of Canadian board, one is justified in questioning whether the extremely high levels eventually reached were not due to a certain exploitation of the situation created by the shortage of pulp and board. In a continuing business it is necessary to protect our supplies; consequently, we had to accept the position as we found it, and by the month of July the effects of rising costs were such as to cause serious concern. We were obliged, reluctantly, to advance the prices of certain of our products by a moderate amount to offset partially the effect of these increased charges. Present quotations for packing materials and for certain raw materials still remain exceptionally high, but, with the exception of tinplate, offers of supplies seem more plentiful and the outlook for the immediate future better than at one time seemed likely.

We continue to devote much attention to improving the organisation of our various factories, and steady progress has been made in fusing the various units of the Group into one efficient and economical organisation.

DIVERSITY OF PRODUCTS

Although the Group is probably best known for its proprietary brands of table salt—Cerebos, Saxa and Stag—it may interest stockholders to know that it is one of the leading suppliers of bulk salt for the agricultural, water-softening, chemical, bakery, fishery, glass, soap-making and tanning industries. In addition, Bisto Gravy Powder and Paxo Stuffing are esteemed by millions of housewives at home and overseas, whilst there is an extensive trade in pepper, spices and seasonings. One subsidiary is a large supplier of rusk for sausage-making, and we have recently acquired a substantial interest in the breakfast cereal trade. It will therefore be seen that our business is very broadly based.

HOME SALES, MARKETING AND ADVERTISING

Both in tonnage and in value our sales for the past year again exceeded all previous records, and it is indeed gratifying to have this evidence of the universal popularity of our products. The food trade is, and always has been, highly competitive, consumer choice being the determining factor and the success achieved clearly shows the housewife's appreciation of our efforts to maintain unimpaired the high standard of quality and excellence for which our products have always been famous. The margin of profit on our lines remains very modest and we can legitimately claim to be playing our part in endeavouring to restrain the upward trend in the cost of living.

I would like here to acknowledge the friendly co-operation and support we continue to receive from the distributing trades, to whom we are indeed grateful.

The publicity campaigns carried out during the year were very favourably received and were an important factor in stimulating the demand for our products and enabling us to maintain our factories in full production. Careful organisation and strict supervision are necessary to keep expenditure to an economic level, and here we derive considerable benefit from scientifically planned market research.

Efficient investigation into current trends and into the movements and distribution of our own and competitive products in the retail and wholesale grocery trade, enables us to direct our advertising and sales promotion campaigns more skilfully, thereby securing substantially better results for less expenditure.

EXPORT SALES

Our export trade continues to expand, sales for the past year being by far the best in our history. The demand from overseas for our principal brands of salt and for Bisto continues to be most encouraging and our turnover would have been considerably higher but for the shortage of shipping space and the serious delays caused by congestion at overseas ports. Unfortunately, there are still far too many restrictions upon international trade and several very good prewar markets remain closed to us. In some instances countries refuse to admit British food products whilst at the same time sending us quite a wide range of their own, and I suggest that this is a matter to which official attention should have been given long before now.

DISTRIBUTION

Present day carriage charges inevitably make the reconciliation of two matters of policy, viz., service to customers and economy in distribution, a matter of some difficulty. There is no doubt that the goodwill of the business has been augmented by the service we have given in this direction in the past. Our object, largely achieved, has been to effect the quickest possible delivery to every part of the British Isles at national prices. Thus a customer in John o'Groats or Lands End receives his goods in the minimum of time and at the same price as a customer whose premises are next door to one of our factories.

Such a service cannot be run cheaply and both costs and practical difficulties have increased since the nationalisation of rail and road transport, unquestionably due to the fact that, in the absence of healthy competition, these services are in no way as efficiently or economically run as they were before they became state organisations. The possibility of substantial increases in our fleet of motor vehicles, designed with the dual purpose of increasing service and reducing costs, is under serious consideration.

SCOTT (MIDLOTHIAN) LIMITED

In August last we acquired a 50 per cent interest in Scott (Midlothian) Limited, a holding company controlling A. & R. Scott Limited & John Inglis and Son Limited, both old-established businesses manufacturing, amongst other products, the well-known Scott's Porage Oats, Scott's "Piper" Oatmeal and Scott's Baby Foods. Apart from increasing the stake which your company has in the food trade, these products are sold to the public through the same trade outlets as our own and consequently this community of interest should eventually lead to substantial expansion and greater economy of operation. Mr McRobert and myself have been appointed to the board of Scott (Midlothian) Limited and, together with Mr Patterson, to the boards of A. and R. Scott Limited and John Inglis & Son Limited.

SUBSIDIARY AND ASSOCIATED COMPANIES

It is gratifying to be able to report that all our subsidiary and associated companies

have experienced a successful year's trading and have made their due contribution to the results of the group.

DIVIDEND POLICY

That our share capital is widely held is evidenced by the fact that we have today 6,650 stockholders, of whom 5,925 own £250 worth of stock or less, and, as from time to time, I receive inquiries in regard to the rate of dividend, which has remained unchanged for many years, perhaps I should say a few words upon this subject.

The fall in the value of money, which has accelerated sharply in recent years, has moved your directors to regard with sympathetic feelings the very legitimate claim for an increase in our dividend; we must, however, consider not only the Government's plea for restraint in this respect and the difficulties and uncertainties which beset industry today, but also the effect of the present penal rates of taxation upon our liquid resources, to which I shall refer more fully in a later paragraph.

Due consideration of all these factors must lead us to the inevitable conclusion that the time has not yet arrived when it would be in the best interests of the stockholders to increase the dividend, but your directors have decided that it is desirable to take the necessary steps to bring the issued capital of the company more in line with the value of the assets. Accordingly, an application has been made to the Capital Issues Committee for permission to increase the capital of the company to £2 million by the issue to stockholders on the register of members at a date to be fixed of one new £1 share free for every four 5s. units held on that date.

STAFF AND EMPLOYEES

The results it is my pleasure to put before you could not have been achieved without the loyal and devoted efforts and splendid teamwork of all who serve the company, and on behalf of the board I wish to place on record our sincere appreciation of their excellent services.

TAXATION

It will be noted that the group provision for taxation on the profits of the year under review amounts to £555,866 and you will be interested to know that during the past five years no less a sum than £2,544,000 has been provided by the group in respect of taxation. As the official allowances for depreciation of fixed assets are based upon original cost and not on replacement values the "profits" brought into charge for taxation purposes are considerably in excess of the real profits earned. The effective rate of tax is therefore much higher than is generally realised and unless additional relief is granted in this respect industrial undertakings will find it increasingly difficult to provide out of taxed reserves the resources necessary to finance re-equipment programmes which are essential to maintain productivity at the highest and most economic levels.

BALANCE SHEET AND ACCOUNTS

These are presented so clearly that I do not think much comment is necessary. The total fixed assets of the group, after providing £85,707 for depreciation and including trade investments, amount to £2,291,388, compared with £1,822,660 for the previous year. This increase in capital outlay is naturally reflected in the net current assets, which at £1,077,192 show a reduction of £362,114. Reserves and surplus stand at £2,326,480 against £2,179,866 for the previous year.

The net profit of the group for the year, after providing £555,866 for taxation and including £100,000 provisions no longer required, is £456,611 and to this has to be added £233,996 brought in, making a total to be dealt with of £690,607.

Although our holding of British and Commonwealth Government securities is in fairly short-dated stocks, your directors consider it prudent to appropriate the sum of £49,190 for the purpose of writing it down to the market value. In addition, they recommend a transfer of £200,000 to general reserve, leaving an amount available of £441,417. Your directors now recommend a final dividend of 30 per cent (less tax) which, with the interim dividend of 10 per cent (less tax) paid in November last, makes 40 per cent (less tax) for the year. The dividend payment absorbs £210,000, leaving £231,417 to be carried forward.

FUTURE PROSPECTS

I am sure I shall not be expected to make any prophecies, as the field of industry in which we are engaged is highly competitive, but the popularity of our products, our sound financial position, our experienced and enterprising management, and the skill and industry of our employees, encourage me to view the future with confidence.

In conclusion, I wish to express my appreciation and thanks to my colleagues on the boards of Cerebos Limited and our subsidiary companies for the support they have given me during the year.

The report and accounts were adopted.

Mr W. Arnold Innes, the director retiring by rotation, was re-elected. Mr William Tricker, who was appointed a director during the year, also retired and was re-elected. The proceedings terminated with a vote of thanks to the chairman.

VINE PRODUCTS LIMITED

PROGRESS DESPITE DIFFICULTIES

The twenty-sixth ordinary general meeting of Vine Products Limited was held on May 14th at Surbiton.

The Viscount Marchwood, KCVO, the chairman, in the course of his speech said: The year 1951 was difficult. Your directors were faced with a continuous rise in costs and with the undesirability of increasing our prices in the face of curtailment in the spending power of the public. In addition we had to cope with the burden of increased taxation.

These difficulties have been successfully overcome by the expansion of the business. In other words, it is entirely due to the excellence of our products and to their increasing popularity with the general public that we have been able to achieve results which, under the circumstances, I hope you will consider to be very satisfactory. For over half a century the company has played an ever-increasing role in the wine trade of the country.

The higher profits have been more than offset by increased taxation. Nevertheless, the net profit is about the same as last year. The financial position of your company is now stronger than it has ever been. A dividend of 17½ per cent is proposed on the ordinary capital, which is an increase over that of the previous year. On the other hand, the distribution out of capital profits has been reduced to the same extent as the ordinary dividend has been increased.

As to the effect of the excess profits levy on your company, we are of the opinion that this will be largely, if not wholly, covered by the estimated reduction in the aggregate profits tax payable.

The report was adopted.

THE LONDON ASSURANCE

PREVIOUS RECORDS SURPASSED

The annual general court of The London Assurance will be held on June 4th, in London.

The following is an extract from the statement circulated by the governor, Mr R. Olaf Hambro:

Once again we have to report fresh records in the volume of our premium income in every department of our business, fire, marine, accident, and life. While the figures undoubtedly were affected by the inflationary trend, I am satisfied that the "London" has more than held its own, and obtained a good share of the new business that has been available.

Of the individual accounts, fire remains the largest, with a net premium income for the year of £7,298,000 as compared with £6,366,000 in 1950. As regards losses, the overall result is satisfactory, notwithstanding a disastrous cotton fire in the Sudan, in which the corporation was heavily interested. After setting aside as reserve for unexpired risks £3,649,000, which represents 50 per cent of the premium income for the year, we have been able to transfer to the consolidated profit and loss account the sum of £541,000 which represents about 7½ per cent on the premium income for the year.

In the marine department, net premiums written during the year amounted to £3,523,000, as compared with £2,927,000 for 1950, an increase of approximately 20 per cent. This year, the amount transferred to the consolidated profit and loss account is £500,000, as compared with £300,000 in the previous year, but I wish to make it clear that the size of this transfer is a reflection of the exceptionally fortunate experience of the account written in 1949 which is now being closed.

In the accident department, 1951 has proved to be a very difficult year. The premium income at £3,718,000 as compared with £3,234,000 in the previous year, shows the satisfactory increase of 15 per cent, but claims paid and outstanding went up during the same period from £1,756,000 to £2,215,000, an increase of 26 per cent, and the profit for the year has fallen to just under £100,000.

Life account: I am happy to say there has again been a large increase in the volume of business written, the total sums assured for 1951 being over £6 million, as compared with £5,289,000 for 1950. There has also been a welcome increase in the premium income from £1,504,000 to £1,708,000.

Our pension scheme business continues to increase, and has become an important section of our life business.

The investment income of the life department amounted after deduction of tax to £541,000, and gives a yield of £3 7s. per cent. This shows a satisfactory increase from £3 6s. per cent in 1950, and £3 3s. 8d. per cent in 1949.

Profit and loss account: We are left with a net profit for the group for the year of £560,000, as compared with £609,000 for 1950.

The cost of the dividends to the preferred and ordinary shareholders is approximately unchanged.

Accompanying this report is a notice convening an extraordinary general court for the purpose of submitting a special resolution to capitalise part of the general reserve and pay up the uncalled liability on the ordinary shares. Your directors believe that this proposal is in the best interests of shareholders, but the proposal should not be regarded as affecting the amount to be recommended in future for distribution by way of dividend.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

RECORD NEW LIFE BUSINESS

CONTINUED SUCCESS IN HIGHLY COMPETITIVE FIELD

MR HUGH WATSON ON THE SATISFACTORY RESULTS

The 127th annual general meeting of the company was held in Edinburgh on May 14, 1952.

The following is an extract from the statement by the chairman, Mr Hugh Watson, WS, circulated with the report and accounts:—

Since the last annual general meeting our colleague, the Earl of Home, has been appointed the first Minister of State, Scottish Office, and in consequence of this, he found it necessary to resign from the Board. We regret losing his experience and counsel and wide knowledge of affairs, but we congratulate him upon the appointment and wish him every possible success in his new responsibilities.

The chairman referred to the appointment of Sir John Edward Gilmour, Bt., DSO, of Montrave, to the Head Office Board, to the honour of Privy Councillor bestowed upon Sir Ulick Alexander of the London Board in the New Year's Honours List, and to the election of Mr Denis H. Scott to the London Board.

Regret was expressed at the deaths of Mr Harry George Younger, who retired from the board in 1948 after having been a director of the company for forty-six years, of Dr Edwin Bramwell, who was the company's chief medical adviser from 1926 to 1946, and thereafter served as honorary medical consultant, of Mr E. H. Montfort of the Melbourne board, who was formerly our manager for Australia and had given over fifty years' service to the company, and of Mr George H. Clark, a former secretary of the company.

LIFE DEPARTMENT

During 1951 new life assurances to a total of £4,973,577 were written and the new annual renewal premiums in respect of that business amounted to £182,201. In addition, immediate and deferred annuities totalling over £540,000 per annum were underwritten in return for single premiums exceeding £300,000 and new annual premiums of £185,399.

These are all record figures for the company and the effect has been that the annual renewable income of the combined life and annuity business increased by £309,579, compared with the previous year, and now amounts to £1,666,951.

The increase in our life account is due in no small measure to the expansion of our group life and pension business, and it is encouraging to note our continued success in this highly competitive field which is, we feel, a reflection of the first-class technical advice and service which we are able to offer to our agents and to the public.

The increase in the rate of interest obtainable on new investments has resulted in an increase in the interest yield on the life and annuity fund to £4 11s. per cent before deduction of income tax. On the other hand, we have been faced with a fall in the market values of investments already in our portfolio. It will be remembered that after the quinquennial valuation of our life and annuity business at the end of 1950 the sum of £300,000 was applied out of the surplus to strengthen the actuarial reserves as a safeguard against future contingencies. This sum has now been transferred to investment reserve and after allowing for this transfer the life and annuity fund showed an increase for the year of over £800,000, the total being now £15,495,362.

FIRE DEPARTMENT

In the fire account the premium income has now exceeded the sum of £5 million for the year, and this in spite of the fact that certain automobile business in Canada which was previously included in the fire account has been transferred to the accident and general account. The provision for unexpired risks, which we make on the conservative basis of 50 per cent of the premiums for the year, has been increased by almost £433,000, and although this adds to the strength of an already strong fire fund it restricts our transfer to profit and loss account to the sum of £100,827.

While no major disasters were sustained in North America, such as those experienced in 1950, the latter part of the past year could not be regarded with complacency, as the claims experience in that part of the world was distinctly higher than normal. At home and in other parts of the world the underwriting experience was satisfactory.

ACCIDENT DEPARTMENT

The premiums in the accident and general account have increased substantially from £1,049,291 to £1,376,739. Part of this is due to the increase in Canadian automobile business, which was formerly carried in the fire account. In connection with our policy of providing a wider service to our friends in Canada we have begun to underwrite additional forms of casualty business in that dominion. It seemed appropriate that as these risks had to be carried by the accident department the automobile figures should also be included in the accident and general account.

Despite the most careful selection, the motor claims experience has again been most unfavourable. Premium rates are still too low and so long as repair costs and awards for damages continue to mount, it is difficult to see how insurance companies can show favourable results in their motor accounts. We feel that we must continue to give service to our customers by transacting motor insurance, but it is not unreasonable to expect a higher degree of care on the part of the motoring public, both for the security of human life and in the interests of economy.

The other sections of the accident and general account—viz., personal accident, burglary, fidelity guarantees, public liability, etc.—have produced satisfactory results, but unfortunately these results have been overshadowed by the loss in the motor section.

The surplus in the whole account for the year was £56,010, but the substantial increase in the premiums requires a sum of £163,838 to be added to the provision for unexpired risks in order to maintain our accident and general fund at 50 per cent of the premiums for the year. Consequently, it is necessary to transfer the sum of £107,828 from the profit and loss account to maintain the reserve position on the same footing as hitherto.

MARINE DEPARTMENT

Our marine business is mainly handled by the "Maritime" of Liverpool. In spite of the continuing keen rates in the marine market and the very careful selection of business which is exercised, the premiums have shown a further increase from £1,388,725 in 1950 to £1,578,367 in 1951. Costs of repairs and replacements continue to rise and the shortage of shipping and the high freight earnings result in many repairs being long delayed. All these factors necessitate a constant watch being kept on the adequacy of the estimates of claims for damage and make it essential to maintain a strong marine fund. The sum of £135,000 has been transferred to the profit and loss account and the fund has been increased from £1,791,063 to £1,967,906.

CAPITAL REDEMPTION ACCOUNT

Our capital redemption fund has increased from £679,445 at the beginning of 1951 to £776,876 at the end of the year. You will remember that a quinquennial valuation of the fund took place in 1950 and resulted in a transfer of £20,000 to the profit and loss account.

INVESTMENTS

The fall in the stock exchange quotations of fixed interest stocks (particularly gilt-edged) naturally affected the values of our investments, but you will be pleased to know that in both our life and annuity fund and our general fund the market values were in excess of book values when our books were closed at December 31, 1951.

DIVIDEND

The board have once again given careful consideration to the rate of dividend and, in spite of the unfortunate experience in the accident and general account, have felt justified in making a small increase in the dividend to 30 per cent.

OVERSEAS VISITS

In continuance of our policy of developing our business overseas and maintaining close contact with our organisation abroad, several visits have been made by directors and officials of the company to places abroad. In particular, Mr Hugh Cowan-Douglas, accompanied by the general manager, made an extensive tour of Australia and, *en route*, visited our important connections in Ceylon. The investment secretary, Mr Martin, visited the USA and Canada, and Mr Geddes, during visits to the USA on other business, was also able to render valuable service to the company in that country.

Mr Watson concluded by saying: "I wish to make special reference to the services which have been rendered to the company by our loyal and hard-working officials and staff both at home and overseas. I can say a personal word on this subject because I had occasion recently to meet representatives of the home staff association and was much impressed by the enthusiasm and loyalty displayed. We are fortunate in the harmonious relationship which exists between staff, management and board. We are also grateful to the staffs of our associated companies and we appreciate highly the services and valuable support which we receive from local directors and agents throughout the world."

The report and accounts were adopted.

NORTH BRITISH & MERCANTILE INSURANCE COMPANY

EFFECT OF PRESENT ECONOMIC CRISIS

PROBLEM OF FINANCING BRITISH INDUSTRY

TAXATION SYSTEM HIGHLY INIMICAL TO SAVING

LORD BRAND ON THE CURRENT POSITION

The one hundred and forty-second annual general meeting of the North British & Mercantile Insurance Company, Limited, was held on May 8th, at the North British Station Hotel, Edinburgh.

The Rt Hon Lord Brand, CMG, DCL (Chairman of the General Court of Directors), who presided, said:—

In my statement to shareholders I have informed them of the results of the past year and of the present position of their company, and I have nothing to add to what is contained in it. For the last few years, however, I have generally taken the opportunity of this meeting to make a few brief remarks on the country's economic and financial outlook, since this is a subject which is, in fact, of the greatest importance to our shareholders. Shareholders in insurance companies are as vitally interested in it as any other citizens, and the problems which it raises ought to be discussed as widely as possible. We can only expect to escape disaster if our vast electorate has some knowledge of them.

EXTREMITY OF PRESENT CRISIS

The country is for the present in a period of suspense, waiting to see whether the measures taken by the Government will enable us to meet the extreme crisis which we are facing, and to secure a breathing space during which to consider our plans for avoiding such misfortunes in the future. The extremity of our present balance of payments and reserves crisis is obvious from the Economic Survey just published. It made itself clearly apparent suddenly in the last half of 1951. The Economic Survey states that while in 1950 the United Kingdom had a surplus on its balance of payments of £244 million (which was, in fact, more apparent than real), in 1951 it had a deficit of £521 million, a difference of £765 million between the two years. But that was not the only drain on our gold and dollar reserves. Other sterling area countries, particularly Australia, developed very large deficits on their balance of payments with countries outside the sterling area, the burden of which also ultimately falls on our own dollar reserves. If we take the sterling area as a whole, including the United Kingdom, its dollar deficit in the last six months of 1951 was $1,578 million, or at an annual rate of over $3,000 million a year, a staggering sum at a time when our reserves were less than $3,000 million in total.

These figures indicate the problem which has to be met immediately. The situation is, as the Chancellor of the Exchequer has stated, now improving and indeed we must hope it will shortly improve very rapidly. The immediate crisis arose largely out of the consequences of the Korean war. The great rise in the price of raw materials was both a heavy blow to us and at the same time encouraged the raw material countries themselves to enter on an import buying spree, which, when prices fell back, caused a huge deficit in the balance of payments of some countries.

The effect on the worsening of our own terms of trade was very marked. The Economic Survey shows that our "total import bill for 1951 was over £1,100 million higher than in the previous year." There was an actual increase of about 16 per cent in the *volume* of our imports, but two-thirds of this total rise was due to higher prices of our imports. It is fair to say, I think, that unless we all admit that "planning" is meaningless much of what has happened could have been foreseen a good deal earlier.

It may be asked why a change in world condition adverse to us theatens us so immediately with disaster. The answer is that since 1945 our country has devoted itself not to the vital task of building up the strength of its external position, its reserves and its currency, but to creating an internal social and financial structure, which, without the preliminary strengthening of our external position, has no solid base. As soon as we recover our breath, it should be the first duty of the Government to see how this can be rectified.

VALUE OF RISK CAPITAL

There is one aspect in particular of our economic position that I think should be of special concern to insurance companies, and their shareholders, and that is the question how British industry in the widest sense is to be financed in future. From what sources is British industry going to obtain the capital it requires? It will require a great deal in order to keep abreast of its competitors. Most of its financing, in excess of what it secures from its own undistributed profits, ought to be obtained through the issue of ordinary shares. For this a sufficient supply of "risk capital" is required, that is, of personal savings, of savings directly or indirectly by individual savers, who can afford to take the risks involved. Institutions, e.g. insurance companies themselves, provide, of course, a certain amount of "risk capital" for the purchase of ordinary shares. But all this comes in one way or another from personal savings invested, for instance, in life or industrial insurance. Moreover, at the present moment it is probable that a part at least of the money received by institutions from savers is passed out again to other persons who are not only not saving, but living on capital. To live on capital they must constantly be selling securities, and no doubt some of these are bought by institutions.

PERSONAL SAVINGS

On this question of personal savings the evidence provided by the recent White Paper on the National Income is significant. The Government statisticians have greatly reduced their estimate of the total savings made directly or indirectly by persons. They have in previous years put this figure—which, as the White Paper says, is subject to a wide margin of error—at some £300 million to £400 million a year. They now think that these figures are much too high, and have reduced them broadly speaking to under £100 million a year. I always thought they were too high, since I could never see what class in the community was saving on this scale. And the above figure is, as I understand, a gross figure, and includes personal savings, however made, whether through institutions or otherwise. And to get a *net* figure death duties should be deducted.

Every year, to provide payment in cash to the Government of death duties, executors of deceased estates must sell to the public, assets of a corresponding value, amounting last year, for instance, to £190 million. The great proportion of these assets is presumably bought out of personal savings, and goes to reduce the amount available for other investment. Thus personal savings available for industry show now in reality not a plus, but a very large minus figure.

This picture is all the more serious since the only other resource of industry for risk capital, namely company profits, is taxed more and more stiffly every year, and this again is the more serious because these profits are to a considerable extent not real but inflationary profits, needing further resources in the future to make them good.

As we all know, the Conservative Government now proposes to deplete the sums still available for industry by another £100 million.

QUESTION OF SAVINGS

Where then are the resources for industry to come from? This, I suggest, is a problem Government and Members of Parliament should seriously study. After all, it is on our productive industry, and on that alone, that our whole material welfare, whether in the true or the technical sense of "welfare" depends. It is the only cow that gives the milk. If she is not nourished sufficiently, she will fail to give it. Everything, whether our currency, our social services, our exports, our actual means of keeping ourselves alive, depends on this not happening.

I will put the matter, as I see it, in a simple way. In a community like Russia, where everything is owned by the Government, industry gets the resources it needs either from its own profits or from taxes imposed on the public by the Government. In other words the standard of life is what is left after the Government has seen to it that industry is fully equipped for its task.

But a community which depends on private industry must have private savings and most of our industry is still private. There must be a sufficient number of persons, capable of saving and investing the necessary amount of savings. This is by no means the case now. If private savings are not there, in the end our Government must follow the Russian system directly or indirectly and take by taxation or otherwise such sum as it decides is necessary to keep British industry going. But, of course, in so far as private industry is financed by the Government, it ceases to be private industry. We become a Collectivist state.

The Economic Survey does not as far as I can see devote a word to this question of savings. It is an important matter, and if I am wrong in my figures or the conclusions I draw from them I should be only too glad to be corrected.

TAXATION

I have often in the last few years ventured to say in the House of Lords that the central problem of the kind of economic system we have now constructed is the taxation it involves. I do not believe any free economy which takes so great a proportion of the National Income in taxation will be lasting, or will be able to create a stable currency framework, since the foundation it rests on is too insecure. My own view is that altogether apart from balance of payments difficulties, such an economy itself leads to inflation and to a condition when from time to time things have to be made bearable by a depreciation of the value of money. This I regard as a system under which a community such as ours cannot thrive—still less such an institution as the sterling area.

Politicians will say that no substantial diminution of taxation is possible; certainly no such diminution as would lead to a large increase in personal savings. It is indeed true that the present system is highly inimical to saving. The Welfare State "soaks the rich" and all those who possess what may be called "risk savings" and will presumably continue to do so, while at the same time the fact that it purports to provide security throughout life for the rest of the population discourages other savings and increases consumption. If things were to improve and if production were to increase presumably the benefits would in the main be limited to the lower income groups, which would be likely, as things are, again to increase consumption but not savings. If all this be true and if under our present system savings are to continue to be inadequate for the purposes of our industries, we are, in fact, saying that we intend to continue as a nation to consume more than we can afford. History shows that if no remedy for such a situation is applied by a government or a people, the economic consequences in the end produce the remedy themselves, probably in a very painful and disastrous way.

The report was adopted.

EAGLE STAR INSURANCE

RECORD NEW LIFE BUSINESS

The annual general meeting of Eagle Star Insurance Company, Ltd. will be held on June 6th.

The following is a summary of statement by chairman and managing director, Sir Brian Mountain, Bt.:

For sixth year in succession Life Department transacted record total of new business with net new sums assured of over £50 million exceeding 1950 figures by more than £7 million. Expense ratio was less than 7¼ per cent and mortality continued favourable.

Once again a record addition was made in Fire Department premium income both home and overseas. Profit was £323,000, or 11.29 per cent of premium income.

The Accident Account (including Motor, Personal Accident and General business) showed a loss of £109,000. Further additions to motor rates are already overdue both at home and overseas.

The Marine Fund at £1,917,082 represents 124.5 per cent of premium income and a transfer of £150,000 has been made to profit and loss.

Net income from investments was £419,155, and shareholders' profits from current life and annuity fund were £41,308. Dividends require £296,417. Net transfers from trading departments were £364,000. Profit for 1951 is £350,191. Profit and Loss appropriation receives £250,000 from Investment Reserves and transfers £750,000 to General Reserve, which, after transferring £1,250,000 to Life Department Investment Reserve, stands at £3 million.

Total assets exceed £65 million and reserves and undistributed profits £4 million.

ATLAS ASSURANCE COMPANY LIMITED

FURTHER EXPANSION

MR RUDOLPH E. F. DE TRAFFORD'S SURVEY

The annual general meeting of proprietors of the Atlas Assurance Company Limited will be held on May 30th at the company's head office in London.

The following is an extract from the statement by the chairman, Mr Rudolph E. F. de Trafford, OBE, which has been circulated with the report, accounts and balance sheets for the year ended December 31, 1951:—

Before reviewing our accounts for 1951 I would draw attention to a departure from previous practice in the form of the presentation to you of our fire, accident and marine revenue accounts. Hitherto overseas taxes on profits have been included amongst the charges in these accounts, but, this year, we have carried these taxes direct to the profit and loss account. In order to provide a true comparison, the same procedure has been followed in respect of the comparative figures relating to the revenue accounts for 1950 shown, in brackets, in this statement, and in the accounts themselves. It will nevertheless be seen that an item for overseas taxes still appears in the revenue accounts. The charges now included under this heading, however, are confined to various taxes which we have to pay in carrying on our business abroad and are not, in any sense, taxes on profits.

FIRE ACCOUNT

Our fire premium income, at £5,624,740, has again moved upwards by £523,668. On the debit side of the account, in addition to the normal run of losses, we, with our widespread business, naturally did not escape the consequences of the Jamaica hurricane, of windstorms which occurred in the United States of America and of the severe bush fires in Australia. It is, however, to relieve distresses such as these that your company exists. In that purpose it has not failed.

The sum transferred to the credit of profit and loss account amounts to £707,212 (£747,207), and it is a satisfactory feature that our home, United States and general overseas business have, between them, contributed to this total in reasonable proportions. All concerned are to be congratulated.

ACCIDENT ACCOUNT

Our accident department operations have continued to expand and we have now passed the two million mark with a premium income of £2,064,459, an increase of £288,585 over the 1950 figure. Naturally, however, our results reflect the heavy toll of road accidents, which continue to increase in number and in cost both in this country and abroad. Indeed, our home motor business was particularly punishing, and our experience overseas was not much better. Shareholders will perhaps not be surprised at being told that we have been able to transfer the sum of £53,098 only (£178,014) to the credit of profit and loss account.

MARINE, AVIATION AND TRANSIT ACCOUNT

Our marine premium income, amounting to £891,591, represents an increase of £211,396 over the 1950 figure.

As to claims, it will be seen that payments totalled £521,475, as against £392,105 in the previous year—an increase of £129,370. In my statement last year I sounded a note of warning in regard to the trend of both hull and cargo business. I wish I could feel happier today. In making a transfer to the credit of profit and loss account we have, therefore, limited ourselves to a figure which does no more than cover taxation on profits.

LIFE DEPARTMENT

The new business completed during 1951 constituted a record in the history of the company. The sums assured under new life assurances amounted to £5,641,967 after deduction of reassurances. Deferred annuities amounted to £482,546 per annum.

The premium income, £2,239,259, was £377,896 more than the 1950 figure. The average gross rate of interest earned on the fund increased by 7s. 3d. to £4 8s. per cent and the corresponding net rate by 7s. 1d. to £3 12s. 6d. per cent. The expense ratio increased by only 1s. 3d. per cent from £12 8s. 9d. per cent to £12 10s. per cent.

The actuarial valuation as at December 31st last revealed a surplus of £673,288. Included in this figure is the sum of £218,776 brought forward from 1950 and £153,649 released as the result of certain minor modifications in the bases on which the estimates of liabilities were made.

In view of the marked rise in the level of interest rates the directors considered it desirable to set up a reserve to cover possible depreciation in the market value of investments other than Stock Exchange investments. They have, therefore, set up an investment reserve of £200,000.

Interim bonuses and bonuses on reassurances received from other companies absorbed £13,615 and the sum of £19,403 was written off securities. The balance of the surplus, amounting to £440,270, has been carried forward.

PROFIT AND LOSS ACCOUNT

Your directors have decided to pursue, in the case of overseas taxation, the same policy as that which they have followed for some years now in connection with United Kingdom taxation, that is to debit the account not only with taxes paid during the year, but, in addition, with taxes which our operations during the year will attract. Thus for 1951—and for 1951 only—we provide for a double dose of overseas taxation.

APPROPRIATION ACCOUNT

The balance brought down from the profit and loss account amounts to £558,823. Out of this sum your directors have decided to transfer £300,000 to the fire fund, thus bringing the "Additional Provision" up to £1 million. Having done this and having provided £147,262 for the dividend at the rate of 12s. 9d. per share, 6s. per share of which was paid in November last, the total carry forward amounts to £871,939.

GENERAL

It is always with a sense of great pleasure that I am able to use this annual statement as a medium for conveying to our many friends—be they members of our local boards, directors of our subsidiary companies, or our other business connections throughout the world—a word of appreciation of their loyalty and unswerving support.

All of us, together, are associated in a world-wide business and, in the building of that business, a cottage has become a great international city in which a mass of different people, speaking many different tongues, have come to understand a common language. It is the language of security.

PHŒNIX ASSURANCE COMPANY

STEADY PROGRESS IN ALL SECTIONS

NEW RECORDS ESTABLISHED

The one hundred and seventieth annual meeting of the Phœnix Assurance Company Limited, will be held on June 4th at Phœnix House, King William Street, London, EC.

The following is an extract from the statement by Mr William Shearer, the chairman, which has been circulated with the report and accounts for the year 1951:

It has been usual to commence my review of the past year's operations with a reference to changes in the directorate and on this occasion I have to record the resignations of the Rt. Hon. Anthony Eden and the Rt. Hon. Lord De L'Isle and Dudley, who left us in November last to take up the Ministerial appointments of Foreign Secretary and Secretary of State for Air respectively. In accepting these resignations and extending best wishes for success in their important new duties, the board also placed on record warm appreciation of the splendid service these directors rendered to your company.

Before reviewing the accounts there is one further development of importance that I bring to your notice. In July of last year, our general manager, Mr E. B. Ferguson, was elected by his colleagues of the British Insurance Association as its chairman, the highest honour in this business which can be given to any insurance manager. This association consists of over 200 member offices, comprising the whole of the insurance company market, including tariff, non-tariff and mutual offices. In these days when so many problems confront our great industry we know, from the leadership and guidance which he has always given to the "Phœnix," that he is well qualified to tackle them. We wish him every success during the remainder of his period of office.

The year 1951, the 170th of the company's existence, has seen no lessening of the difficulties under which our world-wide activities are conducted, and it is, therefore, the more gratifying to be able to report steady progress in all sections of our business. The premiums in the fire, accident and marine departments established new records for the company, and now amount to almost £27 million. The aggregate net underwriting profit of £1,295,000, whilst less than the previous year's record figure, is nevertheless a most satisfactory outcome of our international operations.

FIRE DEPARTMENT

Premiums of £10,039,000 show an increase of £789,000 on those for 1950. Our income in this department has, in fact, almost doubled since the last war ended. Admittedly some of the growth has arisen from the devaluation of the pound, but in looking at our 1951 premiums as compared with those of the preceding year, this factor had no influence and the increase was wholly derived from a general expansion of our operations.

There is a welcome improvement in the claims ratio which at 42.6 per cent is one of the lowest we have had in the last fifty years. This favourable figure was achieved notwithstanding a fairly general increase in fire wastage occurring throughout the world, with the exception of Canada where the heavy experience of 1950 was reversed. The hurricane which struck Jamaica in August caused serious damage to all kinds of property, but our policy of granting hurricane cover in these vulnerable areas, only as accommodation to our important insured, saved us from too severe loss. In the United States the total fire losses for 1951, as estimated by the National Board of Fire Underwriters, were $731,400,000, an increase of 6 per cent over the previous year, and in the United Kingdom the estimate was £23,148,000, an increase of 18 per cent. This latter amount is unfortunately an all time record and represents a waste of materials which the country can ill afford at present. I cannot emphasise too strongly that this drain on our national wealth could be greatly reduced by the exercise of reasonable care.

We report a slight increase in the expense ratio from 43.7 per cent to 44.7 per cent in 1951. There was scarcely a country in which we operate where costs have not moved against us.

The profit of £882,000 is, in ratio, almost the same as that produced in 1950, but in amount is again a record, and I would remind you that it has been secured after setting aside a provision for unexpired risks at a rate of 50 per cent of premiums, which we established for the first time at the end of 1950. This means that of the premium increase of £789,000, no less than £394,500 has been retained in reserve—£78,900 more than would have been required on the former 40 per cent basis.

ACCIDENT DEPARTMENT

Premiums amounted to £14,186,000—£1,528,000 more than the 1950 figure. Again, this substantial increase reflects in a measure the continuance of inflationary conditions in many parts of the world, together with some increases in premium rates, but there has also been real expansion of our business in most countries in which we operate.

We write a substantial proportion of our business in the United States of America, where the whole postwar period has been a most trying one for casualty insurers. Automobile insurance there has again been unprofitable.

A development of considerable interest there is the recent introduction of a rate-making formula which brings the level of rates up to that indicated by the very latest available claims experience. This is a much-needed recognition of one of our serious problems.

It may perhaps be asked why we should continue to transact motor insurance whilst it remains so unprofitable. The position is, however, that this class of business forms an integral part of the service we give to the general body of our policyholders and we could not withdraw our protection in this one class of risk without injury to our connections and avoidance of our public responsibilities.

The numerous other types of risk handled in the accident department have, generally, produced good results. Workmen's compensation insurance in the United States, of which we have a substantial volume, did not run well in 1951, but there are good prospects that this business will be restored to a more satisfactory basis. In the United Kingdom, insurance of the common law liability which remained on employers following upon the repeal of the Workmen's Compensation Acts, has proved more onerous than was originally thought. It will be remembered that last year I said there were indications that the scale of rates for this class of business might require revision. In a number of trades, these higher rates are now coming into force.

The loss ratio in the accident department at 54.3 per cent was almost identical with that of the previous year. There was a slight decline to 39.6 per cent in the ratio of commission expenses and taxes overseas. Because of the substantial advance in premium income an additional amount of £611,000 was required to provide for unexpired risks and there is a balance to be transferred to profit and loss account of £252,000.

LIFE DEPARTMENT

I should like to refer to the rise in interest rates consequent upon the Government's anti-inflationary policy under which the Bank Rate has once again become a forceful weapon in support of the purchasing power of the pound. Whilst this return to a more realistic state of affairs, as opposed to the cheap money era, was essential in order that sterling should retain its leading place as an international currency, it resulted in a considerable depreciation in the value of Stock Exchange securities as at the close of 1951. Your directors have accordingly deemed it prudent to transfer £500,000 from life fund reserves to the investment inner reserve in this account.

The gross rate of interest earned on the funds before making this transfer has risen from £4 2s. 4d. per cent to £4 7s. 8d. per cent, and the net rate from £2 18s. per cent to £3 2s. 9d. per cent.

Our net new sums assured during 1951 amounted to £6,517,000, which again constituted a record for the company. The funds increased during the year by over £1 million to £28,321,000 after allowing for the transfer to investment inner reserve which I have just mentioned. For the first time our net life premium income passed the £2 million mark, having increased during the year by £185,000 to £2,054,000. A feature of our trading is the continued development of our pension business, both under group schemes and under individual pension arrangements.

The mortality experience continues to be favourable and the expense ratio follows much the same course as in previous years.

MARINE DEPARTMENT

We record a further advance in premium income which now amounts to £2,720,000, being £393,000 more than for 1950. This increase is mainly due to a continued rise in world prices. After transferring £160,000 from the profits of previous years to profit and loss account, our marine fund of £3,815,000 is larger by £225,000 and represents 140 per cent of the higher premium income for 1951. This fund is regarded as amply sufficient to meet all outstanding losses and liabilities.

PROFIT AND LOSS ACCOUNT

The first item shown here is that of interest, dividends and rents. Once again we have achieved a substantial increase in gross interest at £1,338,000, but, as you know, income tax was deducted at 9s. 6d. in the £ as compared with 9s. in the previous year, and thus the net figure of £710,000 is only £42,000 in excess of 1950. The total transfers from the revenue accounts amount to £1,295,000 and out of these receipts we must set aside a provision for United Kingdom taxation which, at £925,000, is perhaps higher than might have been expected in view of the reduction in the profit. The heavy charge is due to the increase for 1951 in the rate of Profits Tax on distributed profit as well as to the higher rate of income tax.

It is appropriate at this stage to refer to the excess profits levy. Doubts have been expressed on all sides as to the wisdom of imposing such a tax at the present time, as it is considered that its long-term effects must be harmful to industry. Much criticism has been directed at the rigidity of the method to be used in arriving at the standard profits and at the choice of the years 1947, 1948 and 1949 for this purpose. We in the insurance industry feel that it penalises us unduly.

It will be recalled that in the years since the war, strenuous efforts have been made to increase insurance earnings from abroad, and particularly from the USA and Canada. Considerable success has attended these efforts, thereby adding appreciably to the country's invisible exports at a vital time. It therefore appears to us inequitable that the fruits of our enterprise, now included in our accounts at inflated sterling values, are to be compared, for excess profits levy purposes, with the results of the years prior to the devaluation of the £ sterling. The inclusion of the year 1950 as one of the standard years would go some way towards mitigating this obvious hardship and providing some incentive to the further increase of dollar earnings which we have always recognised the Chancellor so much desires. We anticipate having to set aside in 1952 an even higher proportion of our profits for taxation, and to that extent we shall be denied the opportunity of further strengthening our free reserves.

To return to the profit and loss account items, there is the usual transfer for pensions. As to the dividend, we have maintained the rate at 15s. per share, to which it was increased last year. After making provision for this, we are able to carry forward a balance of £1,563,000, which is an increase of £321,000 on last year.

Finally, I must once more pay tribute to all those associated with me who have given their best in another difficult year. To all my fellow directors of the parent company, to the boards of our associated companies and to the members of our local boards in all parts of the world, to our executive officials, branch managers, staff and agents, I tender my warmest appreciation of their work and congratulate them on their success. We have every reason to feel proud of the virility, strength and world-prestige of the "Phœnix."

ROYAL INSURANCE COMPANY, LIMITED

106th ANNUAL REPORT

RECORD PREMIUMS £42,650,000

COL. A. C. TOD'S WORLD SURVEY

The annual general meeting of the Royal Insurance Company, Limited, will be held on June 4th in Liverpool.

The following statement by the chairman (Colonel A. C. Tod, CBE, TD, DL) has been sent to stockholders with the 106th annual report and accounts.

I am glad to say that, in 1951, our business throughout the world developed and progressed with every sign of undiminished vigour. Fire, accident and marine premiums, at the record total of £42,650,000, were almost 20 per cent higher than in the preceding year, and new sums assured in the life department exceeded the £10 million mark for the first time in our history.

It is significant—and immensely gratifying—that our overseas business has shared fully in this marked expansion. Nearly three-quarters of our entire business came from abroad: a fact I record with some pride at a time when the contribution of invisible exports to the balance of payments is still so vitally important.

Underwriting results receded from the favourable levels of recent years. Even so, the fire and marine business showed satisfactory profits, but the accident account did little more than break even.

The total profit was £2,024,000 or 4.75 per cent of the premium income.

CONFIDENCE IN STERLING

Our task, as exporters of insurance, is by no means easy. We have to face—naturally enough—the competition of indigenous insurers; we have to cope with a maze of exchange regulations with all their restrictive drag on currency remittances; and we have to submit to legislative measures which, in many countries, impose considerable restraint on us to the advantage of the local market.

But there is one vital problem which has its roots here at home: the problem of confidence. It is so important to remember that we are trading, not in material things, but in an intangible—a "Promise to pay." That being so, our success in the markets of the world rests entirely on confidence. The reputation of British insurers was never higher. But, in many territories where we operate, we have been disturbed by the evident lack of confidence in the financial state of the United Kingdom: a lack of confidence which becomes more pronounced with each succeeding financial crisis at home.

This mistrust arises essentially from the unconvertibility of sterling. I know that there is no easy way by which this can be set right, but failure to do so is bound to have a cumulative effect upon the invisible exports on which our trade balance so vitally depends. I believe that this is one of the most important problems to be tackled in the long term interests of this country, and I earnestly trust that our leaders will not flinch from the hard course. I believe that our people are willing to accept drastic remedies if these are properly presented and explained, and there can be no doubt as to the revival of confidence overseas which would result.

OVERSEAS OPERATIONS

In the United States of America—with which great country our own company has been closely linked for one hundred years—the story of 1951 is not dissimilar to that which I reported last year.

We recorded again a considerable rise in premium income, with an overall result that has been satisfactory, though less favourable than in 1950. The reduction in the profit was due chiefly to heavier losses on the casualty side, of which automobile claims were again the major problem. Automobile premiums were increased substantially in 1951 in most States, but the effect will not be fully reflected in the results until this year. Experience is continually under review and further increases will almost certainly be required in 1952.

Our Canadian operations, too, show substantially increased volume; fire results were particularly favourable, but here also casualty business did not on this occasion produce a profit, mainly due to unfavourable automobile claims experience.

Our results in Australia—although satisfactory—were affected by the devastating bush fires which caused such tragic loss to the agricultural communities of the Eastern and Southern States.

In New Zealand, our most distant sphere of operations, we can report substantial progress. Our accident account in particular has benefited from the return of Workmen's Compensation business to private enterprise after a short period of nationalisation.

In the other overseas' territories in which we operate we can broadly survey a year of progress and development, though naturally the picture is not entirely uniform.

Our affairs in India, South Africa, South America and the Continent of Europe continue to progress. Development was maintained in each area and, despite exchange and other difficulties, all our branches were able to make a satisfactory contribution to our global results.

LIFE DEPARTMENT

Year	New Sums Assured	New Annuities (Per Annum)	Claims by Death	Maturing Endowment Assurances
	£	£	£	£
1951	10,663,180	414,705	880,157	1,352,568
1950	9,240,613	308,178	1,009,743	1,278,721

In the life department the considerable increase of nearly £1½ million in new sums assured was well spread over the territories in which we do life business both at home and abroad whilst the increase of nearly 35 per cent shown in new annuities was almost entirely due to a further expansion of home business under staff pension schemes.

In 1951, the mortality experience was exceptionally favourable, so that, despite the increase in the business in force, the claims by death were about 13 per cent below those for the previous year.

FIRE DEPARTMENT

Year	Net Premiums	Profit	Percentage of Premiums
	£	£	
1951	20,023,505	1,673,904	8·36
1950	16,916,294	1,856,308	10·97

Our fire premium income has, for the first time, passed the £20 million mark.

Home fire premiums, reflect the higher prices and costs which occurred during the year. The increase is most noticeable in the industrial section of our portfolio; but there is still considerable under-insurance in the case of dwelling houses, shops and similar properties.

ACCIDENT DEPARTMENT

Year	Net Premiums	Profit	Percentage of Premiums
	£	£	
1951	18,545,687	25,709	0·14
1950	15,453,602	351,159	2·27

Although our accident premiums have expanded, the trend towards higher claims costs has continued, and, in some sections, has been considerably accelerated, so that the business of this department shows only a very small margin of profit on the year's working. Rate increases have been applied in the motor and employers' liability sections, but it seems unlikely that they will prove sufficient.

MARINE DEPARTMENT

Year	Net Premiums	Fund as at Dec. 31st	Percentage of Net Premiums
	£	£	
1951	4,080,410	7,227,956	177·14
1950	3,327,386	6,743,203	202·66

Our 1950 marine underwriting account has been closed with a profit of £324,210, or 9.74 per cent of the premiums.

The past year's premiums—for the first time, exceeding £4 million—reflect the rise in values of tonnage and commodities. As cargo rates are now even lower than they were in 1950, a note of warning should, perhaps, be given that the 1951 account carries a heavier burden of liability.

FOREIGN EXCHANGE

Apart from the United States and Canada, currency figures have been converted at approximately current rates of exchange. In dealing with our business in the United States and Canada, we have continued to convert the dollars at approximately $4.86 = £1. Actual remittances, however, from all countries have been taken at the sterling values realised.

DIVIDEND

The directors were able to recommend a final dividend of 4s. 9d. per £1 stock, making, with the interim dividend distributed in November last, 9s. 6d. for the year, as compared with 8s. 6d. for 1950 and 7s. 6d. for 1949.

FRIENDS' PROVIDENT AND CENTURY INSURANCE

The annual general meeting of the Friends' Provident and Century Life Office was held on May 14th in London. Mr Herbert G. Tanner, JP, the chairman, said:

I announce with much regret the retirement of that stalwart friend of the office, Bernard H. Brigham. To succeed him as secretary your directors have appointed Samuel Arthur Mills.

Each year since I have been in the chair it has been my pleasant duty to report continued progress in all departments of our business and this year is no exception.

New life sums assured increased by over £4½ million to the record total of £15,672,551. Increasing advantage is being taken of our expert knowledge and special experience of group life and pension business. The strong position of the life fund enabled your directors on the recommendation of the actuary to increase the rate of bonus from 30s. per cent compound to 32s. 6d. per cent compound. Your directors have also approved a revision in the rates for immediate annuities and special guaranteed annuities which will make these contracts even more attractive.

Fire trading throughout the world has again been good and it is gratifying to record a substantial profit. The net premium income continues to expand at a satisfactory rate and the results prove that quality is not being sacrificed to quantity. In the accident department our personal accident and miscellaneous accounts have produced good results; but employers' liability and motor business continue to cause anxiety. It is not yet possible to judge the effect of recent rating revisions upon employers' liability insurance, but it is clear that last year's very modest increases in motor rates are inadequate to keep pace with the ever-mounting costs of repairs and of court awards. The position remains under constant review. Overseas we are pursuing our planned development of accident business and our income from this section of our operations has increased substantially. It will be observed that for the first time the accident net premium income exceeds £1 million. From these and the other departments we have earned a profit of £313,469.

In all departments there is a gratifying reduction in the expense ratios. The total premium income of the group is now in excess of £10 million; the total funds exceed £40 million.

New money becoming available has been invested to better advantage than in recent years as a result of the higher level of interest rates; the satisfactory increase from £5 7s. 9d. per cent to £5 10s. 0d. per cent in the gross rate of interest earned is partly due to this cause. Although there was a fall in the prices of stock exchange securities during the past year, our reserve fund for depreciation of investments enabled us to meet this liability with a substantial margin in hand.

At no time in the world's history has there been such a realisation that if living standards are to be maintained in the West and raised to a reasonable level in Asia and Africa resources everywhere must be developed. Your organisation with its large funds cannot stand aside and I believe we shall be following your wishes, as well as serving your interests, by taking our share in this task. You will not need me to tell you that we shall act with that caution and prudence which have always been characteristic of the Friends' Provident and Century.

The report was adopted.

PARKINSON & COWAN, LIMITED

RECORD TRADING RESULTS

SIR GEORGE JESSEL'S ADDRESS

The fifty-second annual general meeting of Parkinson & Cowan, Limited, was held, on May 9th, in London.

Sir George Jessel, Bt., MC (the chairman), in the course of his address, said:

Our accounts for the year ended December 31, 1951, show a consolidated trading profit of £524,054 (£379,748 in 1950). After deduction of depreciation, debenture interest and redemption, income tax and profits tax, we are left with £147,014 (£122,741 in 1950). The substantial increase in trading profit marks a successful year, though we must not forget that in times of rising prices a healthy company's profits expand naturally. We produced more goods per unit of labour employed, we continued at an accelerated pace the re-equipment and improvement of our factories, and we devoted an even larger proportion of our revenue to the research and development of new products which are the lifeblood of our business.

Your directors recommend that we repeat our distribution of last year by the payment of a 7 per cent ordinary dividend and a 2 per cent. bonus. Of the balance of £93,312, we have applied the sum of £50,746 to reduce the goodwill in our consolidated accounts to the round figure of £1,000, which leaves the sum of £42,566 to increase the carry forward to £193,919.

ELIMINATION OF GOODWILL

I have referred to our reduction of the consolidated goodwill item to a nominal £1,000. I hope that the stockholders will derive satisfaction from the fact that in 1945 this item stood at £164,000, whereas today our consolidated balance sheet is clear of all intangible encumbrances and shows the finances of our company in a simple, solid, and in our view, satisfactory condition.

DEPRECIATION

I draw your attention to the heavy depreciation of £114,000 (£93,000 last year) which we have applied to our fixed assets. There is in these days an element of unreality in the application of the word "depreciation." The fact is that many of the assets which your company owns, far from depreciating, have considerably appreciated in recent years and the true value of our fixed assets greatly exceeds the figure shown in our accounts. Against this, in the engineering industry obsolescence is often a more costly factor than depreciation, as the latter term is normally used. We prefer to deal with the whole conundrum of replacement values by the omnibus process of using exceptionally high "depreciation" rates.

THE STATE OF THE COMPANY TODAY

I think that stockholders would be encouraged if they could see all our activities and study our plans for new and improved products. We believe that size for size the versatility of our group is exceptional. In changing times this adaptability is a source of strength to us but, as I have told you in past years, it does create very heavy burdens for our higher management. We are now carrying a large load of production work for the armed forces which combined with our basic business is keeping our factories fully occupied.

The provisions of the Excess Profits Levy will fall with especial severity upon your company, as our profits since 1945 have climbed more steeply than the average, but whatever may be the immediate hardships of taxation and market uncertainties your board feels that our long-term prospects are excellent. We are solidly entrenched in many lines of business in which the longer future appears to us to range upwards. Our managerial and technical staffs, which constitute the foundation of our business, are skilful and determined, our mechanical equipment is modern, and we can look at the future with bright expectations.

The report and accounts were adopted.

The retiring directors, Sir George Jessel and Mr R. J. Rogers, were re-elected and the chairman concluded with a tribute to the managing director, Mr H. P. Barker, and to the staff and workpeople.

THE BRITISH OXYGEN COMPANY, LIMITED

RECORD RESULTS

The sixty-sixth annual general meeting of this company was held on May 15th, in London.

Mr J. S. Hutchison, the chairman, in the course of his speech, said: The year 1951 brought new sales and production records in almost all sections but was affected by continuous and heavy advances in operating costs. The consolidated trading profits at £4,595,000 include the profits of all our home and overseas companies, and show an increase of £369,000 which arises from sources of general expansion. The increase in trading profit is almost entirely absorbed by an additional £140,000 for depreciation and an additional £215,000 for taxation, leaving net profit up by only £13,000 after these charges.

At this early stage it is impossible to forecast with any pretence to accuracy the effect excess profits levy may have on us but our impression is that on earnings at the level we are reporting to you today any payment of excess profits levy will not be very important. It must be clear to you, from the way in which our additional £369,000 of trading profit for last year dwindled to £13,000 after depreciation and taxation just how little chance industry has today, quite apart from any new difficulty of excess profits levy, of setting apart profits to create capital for its necessary expansion or even the replacement at greatly enhanced cost of those assets which have become worn out in the twelve years or more we have had of very high taxation. Taxation affects the methods by which industry must obtain the capital it requires for expansion and for the launching of new enterprise.

TAXATION AND NEW CAPITAL

It is harmful that industry should suffer serious penalties on the raising of capital. I am quite aware that the taxation features causing them fit conveniently into the pattern of existing taxation law and practice but surely when the basis of taxation is being reconsidered some ready method can be devised of removing those disabilities which bear so heavily on capital issues and which appear not to have been designed to act as they do but to have arisen unintentionally as a part of the general taxation system. These are taxes on enterprise which add appreciably to the already great discouragements to progressive industry in its endeavours to bring to practical application the oft repeated injunction to do everything to help the National objective of increased production and increased efficiency.

I appeal for a new and realistic outlook which will give encouragement to industry to forge ahead and I am convinced unless there is to be some encouragement that a time is fast approaching when the will to advance will become so blunted that we shall be in danger of losing that ability to pioneer which is so characteristic of our race.

It is gratifying to be able to record today excellent progress by our overseas associated companies in the past year.

The expansion in sales continues and our totals to date in the current year at home and overseas are fully satisfactory, but we must bear in mind that there have been far reaching changes during the last six months in the conditions regulating the National economy, and I do not think some of these changes have yet made their full impact on business.

I trust I shall not be proved to be lacking in caution if I express the hope that next year we can put before you accounts which you will find satisfactory.

The report was adopted.

SUN INSURANCE OFFICE

EXCELLENT FIRE RESULTS

DIFFICULT YEAR FOR ACCIDENT BUSINESS

The annual meeting will be held on June 10th. In the statement issued by the chairman with the accounts Mr Pryor first mentioned the two new directors. He said that, having regard to the many years during which his father and he had been on the board, it gave him the greater pleasure to refer to the appointment in June last of his son, Mr R. M. M. Pryor, MBE.

Mr C. H. Villiers, MC, was appointed at the same time and, as chairman, he was sure that the office was to be congratulated upon the addition of one who could and would be of real value by reason of his practical financial experience.

The retirement had been announced of Mr H. W. Stokes, the deputy general manager, on the grounds of ill-health. It was with sincere regret that the directors agreed to this course as from March 25th last. Mr S. V. Bangert had been appointed assistant general manager, Mr W. R. Stevenson joint secretary, and Mr R. Macdonald Smith an assistant secretary. Good wishes were extended to Mr C. Axten, manager, city branch, Mr J. H. F. M'Guire, manager, Fenchurch Street branch, and Mr W. H. Hudson, joint branch manager at Manchester, in their retirement.

Increasing values, he stated, had not by any means always been followed by the maintaining of full cover which alone could give policyholders complete indemnity when loss was suffered. On the question of premium income he gave a comparison with the year 1950:—

	1951	1950
	£	£
Fire ...	6,445,516	5,840,970
Accident...	6,465,686	5,775,124
Marine ...	1,345,600	949,648
	£14,256,802	£12,565,742

FIRE INSURANCE

The advance in fire premium income was £604,546. Although substantial fires had occurred from time to time throughout the year at home and overseas, they had again secured a useful margin of profit. In Canada they achieved improved results and the USA also made its contribution upon a somewhat higher level. The profit, amounting to £815,390, to be transferred to the profit and loss account was 12.65 per cent of the premiums.

ACCIDENT BUSINESS

A premium increase of £690,562 was recorded. The transaction of motor insurance had continued to be difficult all over the world. They had found that in Australia, Canada, New Zealand and the United States of America it had been particularly costly. The adjustment of rates in these and other areas was receiving constant attention, but in present conditions further advances in the cost of repairs and third party claims might well tend to offset any benefit almost before it accrued.

There had been a marked deterioration in the results of Employers' Liability business in this country. The rise in the level of damages had been reinforced by the ever more onerous liabilities falling on employers. The total accident profit was £95,146.

MARINE BUSINESS

The marine income increased by £395,952. Since January 1, 1951, they had been operating with the North British and Mercantile Insurance Company, Limited, and the Royal Exchange Assurance under the experienced underwriting control of Mr A. W. Theobald. 1951 was unlikely to prove so attractive to underwriters as previous years, particularly as in the closing months there was an unusual number of serious marine casualties.

A transfer of £100,000 to profit and loss account had been regarded as appropriate, leaving in the fund a sum of £1,871,999, representing 139.12 per cent of the premiums.

PROFIT AND LOSS ACCOUNT

The transfers from the three revenue accounts totalled £1,010,536. Interest, dividend and rents, less tax, increased to £379,219. £545,000 had been provided for United Kingdom taxation. The amount transferred to the pension fund was £210,000 and £10,049 to the staff widows and orphans fund.

An interim dividend was paid on January 1st at the rate of 2s. 2d. per share, less tax, and it was proposed that a final dividend be paid of 2s. 6d. per share, less tax, making the total dividend payment for the year £294,000.

The book value of the investments stood at £15,813,764, which compared with £14,901,282 last year. The market value of the investments left, in the aggregate, a substantial margin over the book value, thus representing an important additional security to policyholders and shareholders.

The chairman, after paying tribute to the loyalty and efficiency of the management and staff at home and abroad, under the leadership of the general manager, offered his warmest thanks to them, the advisory committees, local directors and other representatives throughout the world.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

RECORD LOANS

The annual general meeting of this company was held on May 14th in London.

Mr E. J. Bunbury, MC, the chairman, in the course of his speech, said:

We have experienced during the year a steady increase in the demand for our long-term mortgage loans. This is doubtless partly due to the special advantages of our loans, which cannot, like bank loans, be called in during the period of the loan, except for failure to carry out the covenants and maintain the instalments. The total of new loans completed during the year, amounting to just under £5 million, has broken all previous records in the twenty-three years of the corporation's existence and represents an increase of 19 per cent over the previous year's figure.

Furthermore, the total of loans sanctioned by the directors and in course of completion at March 31, 1952, was just under £2 million and over half a million more than the corresponding figure a year ago. This indicates that the increased demand for our credit continued right up to the end of our year, in spite of the fact that on a rising money market our lending rate had been raised during the year progressively from 4 per cent to 4½ per cent, 4¾ per cent, and finally to 5½ per cent in February, 1952.

Our lending rate is entirely dependent on the rate at which we can issue our public debentures in the money market, plus the cost of running our rapidly increasing business. Our objective remains so to arrange our long-term credit business that it can diminish and finally dispense with the annual loan or grant made by the Ministry for a limited period ending in 1959, when our 5 per cent debentures can first be redeemed.

SERVICE TO COMMUNITY

I feel that this unique experiment in long-term finance for agriculture is now well on its way to carrying out our important service to the industry without special subsidy. No concern such as ours can expect to settle down on a proper basis until the volume of its business has reached a certain size and until the refunding of its series of debentures enables it to have some degree of flexibility in its own finance, which in turn will be to the benefit of borrowers. If we achieve that self-sufficiency by 1959, after a comparatively short existence of only 30 years, the corporation will have established a valuable new channel for providing agriculture with a type of finance suited to its special long-term needs.

In days of stress and troubles the security of good farm land remains perhaps the most enduring security available in a country with such rich farming capacity and dependent for its economic well-being on the necessity of living as far as possible off its home-produced food. Our loans are well spread over England and Wales and the underlying security is valued for loan purposes on its strictly farming value.

The amount available on profit and loss appropriation account is £22,583. Of this, £2,688 has been transferred to special reserve, £8,083 has been written off the discount at which the four and a half per cent, three per cent and three and a half per cent debenture stocks were made and £10,274 has been written off the items for expenses of issuing our debenture stocks, leaving a balance of £537, which the directors propose to carry forward.

The report was unanimously adopted.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY, LIMITED

The forty-second annual general meeting of The Rhodesia Broken Hill Development Company, Limited, will be held at Kitwe, Northern Rhodesia, on June 4th.

The following is an extract from a statement, dated May, 1952, by the chairman, Sir Ernest Oppenheimer, circulated with the annual report and accounts for the year ended December 31, 1951:—

The past year's operations resulted in establishing new records for this company. Sales, which amounted to almost £8 million, were nearly double those of the previous year, while the resulting profit, before taxation, of approximately £5,750,000, is almost precisely £3 million greater. These figures are a reflection of the high prices of zinc and lead which obtained throughout the greater part of 1951.

METAL PRICES

The figures now published must, however, be regarded as abnormal. Since the beginning of 1952, world prices of both zinc and lead have fallen and, on present indications, it is likely that the current year's operations will show a smaller profit, although there is every reason to think that it will still be most satisfactory. At the present time, however, the indications are that a buyer's market has developed.

Many members will have seen reference in the Press to the serious flooding which took place at the mine during March of this year. This was caused by completely abnormal and protracted rains, resulting in underground waters in the vicinity rising in many places almost to ground surface level. The volume of water was in excess of pumping capacity, and it was necessary to remove equipment and temporarily to discontinue working on the 550 foot level. Emergency steps were taken to provide increased pumping capacity, and these fortunately coincided with the complete cessation of the rains. While it may well transpire that similarly heavy rains will not occur in the future, the provision of additional pumping capacity, capable of dealing with any recurrence of the abnormal situation, is under consideration.

DIVIDEND DECISION

In deciding to recommend to members a final dividend of three shillings and threepence, making four shillings and sixpence per stock unit for the year, your Board were actuated primarily by the view that members were entitled to receive by way of dividend the fruits of the past year's favourable results, but they nevertheless considered that it would be wise to set aside some part of the profits and therefore decided to place £500,000 to general reserve.

In conclusion, I reiterate what I have said earlier in this statement—that I do not expect the record results of 1951 to be repeated this year. Your company's affairs are, however, in excellent order, plant extensions have necessarily been delayed, but their completion in the near future is now certain and will ensure that the treatment of your company's ores is on a properly balanced basis. This fact, combined with the present very satisfactory financial position, enables me to regard this company's future prospects with every confidence.

Copies of the annual report and accounts may be obtained from the Head Office, Kitwe, Northern Rhodesia, or from the Transfer offices at 44, Main Street, Johannesburg, and 11, Old Jewry, London, E.C.2.

THE HIGHLANDS & LOWLANDS PARA RUBBER COMPANY LIMITED

RECORD PROFIT EARNED

MR T. B. BARLOW'S STATEMENT

The forty-sixth annual general meeting of The Highlands and Lowlands Para Rubber Company, Limited, will be held on May 20th, at Plantation House, Mincing Lane, London.

The following is the statement by the chairman, Mr T. B. Barlow, which was circulated with the report and accounts.

Once again the report and accounts carry good news of the largest profit ever earned. But this entails the liability estimated at £245,000 for taxation after the payment of £87,000 in Malayan Export Duty and Quit Rent. Having allowed for taxation and adding the net amount brought forward, there remains in round figures £245,800. Fixed assets exceed capital and capital reserves by over £188,000 so that it is expedient to transfer £50,000 to general reserve bringing it up to £200,000 and thereby balancing our capital position. Immature areas of rubber and oil palms may well cost £150,000 to bring to maturity, hence the large appropriation of £75,000 to replanting reserve. Buildings and machinery have increased by nearly £47,000 in the year and note (3) on the balance sheet draws attention to the fact that contracts for over £88,000 have been placed (these are chiefly in respect of oil palm machinery) hence the appropriation of £22,000 to reserve for depreciation of buildings and machinery. This explains why the dividend for the year is only 25 per cent.

The chief event of the year was the appointment of General Sir Gerald Templar as High Commissioner. He deserves the wholehearted support of all responsible people, and if he deported a few journalists whose news is tinged with left wing propaganda his task might be easier. Sir Gerald has made a singular improvement in morale and organisation, and with unfailing support from all sections of the community he should clear up the folly of dual administration and restore the country to peaceful conditions. Carping criticism in parliamentary debate and elsewhere cannot be too strongly deprecated.

TAXATION BURDENS

Excess Profits Levy may well be the last straw in a series of burdens that have befallen the plantation industry. The Japanese occupation entailed four years' neglect of estates and the loss of a large proportion of young rubber. Then in 1945, rubber was sold to America at 10d. a lb. This was a sacrifice to national expediency and good relations with America, which it has been calculated cost the plantation industry as much as the whole Marshall Aid which England received from America.

After that there was the delay in settling war risk and war damage claims. In 1951 at the instigation of Whitehall a special export tax was imposed in Malaya for precisely the same purpose and there can be no justification for being twice mulcted for the same reason. The Rubber Growers' Association and some of our friends have made representations to the Chancellor pointing out that already we are paying about 75 per cent of our profits in taxes and it is equitable and expedient that rubber plantations should be exempted from E.P.L.

The importance of the main industries of Malaya cannot be too forcibly stressed when we realise that in 1951 the country's trading produced no less than US $320,000,000 net for the Empire Dollar Pool or slightly more than in 1950. It is important, therefore, to

maintain the price of our commodities as a depression in the produce markets would have most unfortunate consequences, both economic and political.

BRITISH-AMERICAN TOBACCO COMPANY, LIMITED

SATISFACTORY INCREASE IN SALES

MR T. F. WINMILL'S SPEECH

The forty-ninth annual general meeting of British-American Tobacco Company, Limited, was held on May 9th in London.

Mr T. F. Winmill (the chairman), in the course of his speech, said:—

Prudent financial policies which have been followed consistently have had the satisfactory result that we and our associates have not been unduly embarrassed in meeting the strain of long continued inflation, but have even been able to continue to expand business wherever a suitable opportunity offered.

This meeting is taking place during an acute crisis in the nation's affairs and at a time when it is difficult to judge of the effects of the various measures proposed by the government. There can, however, be no possible doubt about measures which tend to hinder the re-building of capital in industry here and abroad.

Your company contributes not inconsiderably to the balance of payments by earnings from direct exports from this country and by earnings from invisible exports in the form of dividends, interest, and royalties remitted to this country from its associated companies. Taxation as it affects these earnings is of first importance to us, and to the country generally.

TAXATION BURDEN

In 1950 I referred to the unsatisfactory rate of progress being made in the negotiation of bilateral treaties for double taxation relief. In that year, some, most welcome but partial, unilateral relief for overseas taxation was granted and, subsequently, further bilateral treaties have been concluded, but the overall situation continues to remain somewhat unsatisfactory. The system of double taxation relief now available in the form of treaty credits or unilateral credits is very complicated and still incomplete. I believe that so far as profits from overseas branches or dividends from overseas companies are not remitted to this country, there is a very strong case for removing them from the charge to United Kingdom taxation altogether.

Last year, in my absence, the vice-chairman referred in quite strong terms to Section 36 of the Finance Act, 1951, which gives the Treasury a power of veto over the removal of control of a business from the United Kingdom, the transfer of its business or part of its business to an overseas subsidiary company, and also the creation or transfer of shares in overseas subsidiaries.

Despite the co-operative attitude of the officials charged with the administration of this Section, the experience we have had of its operation during the past year in no way allays our fears about it. No amount of broadminded administration within the framework of the Section can remove the damage which it is doing to the country's long term interests. In particular, we fear the possible consequences which may arise from this country exercising control over matters which come within the jurisdiction of overseas governments.

The repeal of the Section, has been made much more difficult by the introduction of excess profits levy, which brings into computation all direct and investment income from overseas. In view of the necessity for

improving the balance of payments, and as part of that operation to increase income from invisible exports, and bearing in mind the fundamental reason for the introduction of excess profits levy, there seems hardly any justification for charging overseas income to this tax, thereby penalising those who have been enterprising enough to risk their money abroad and develop their overseas interests since the years which it is proposed be adopted as standard for the purpose of this tax.

COMPANIES IN CHINA

You may have seen reports in the Press that our associated companies in China are handing over their assets to a Chinese Government sponsored company. When this is completed, we understand that the 16 British and 4 American employees still in China will be applying for exit permits, which we hope will be promptly granted. I would remind you that last year it was mentioned in the speech from the chair that our investment in China had been appropriately dealt with in view of its unprofitability, and I would now confirm that it was written off some time ago.

As to the future, continued increase in the volume of our business depends largely on economic factors prevailing in different parts of the world. In some areas there are signs of recession and in other areas the demand for tobacco and cigarettes remains strong, but it would not be prudent to ignore the possibility of some contraction in the demand for consumer goods such as cigarettes and other tobacco products in view of the more general adoption of disinflationary policies. Nevertheless, from the fact that for the first six months of the current financial year the sales of your company and its subsidiary companies continued to show an overall satisfactory increase, we have every hope of being able to present to you next year results at least as satisfactory as those now before you.

The report was adopted.

MONSANTO CHEMICALS LIMITED

NEW HIGH LEVEL OF TURNOVER

MR EDW. A. O'NEAL ON THE GRATIFYING RESULTS

The eighteenth annual general meeting of Monsanto Chemicals Limited, was held on May 14th in London, Mr Edw. A. O'Neal, Jr., chairman and managing director, presiding.

The following are extracts from his circulated statement:—

The results of the company's activities for the year have been very gratifying.

Turnover for the year again reached a new high level, exceeded our budget by 11.6 per cent and was 47 per cent above 1950.

The 1951 results of our company, in a way, constitute a milestone in our progress, marking our evolution from a small business with growing pains into a medium-sized business with ambitions. This is reflected in many ways—employment reached 3,700; stockholders numbered 5,700; assets rose to £11,792,099, and turnover exceeded £10 million for the first time in our history.

That our company should have reached such a stage in its growth in 1951, the year which marked the fiftieth anniversary of the founding of our parent company, Monsanto Chemical Company, is especially pleasing to the directors and to all members of our organisation.

PRODUCTION, SALES, AND EXPORTS

The higher turnover in 1951 is chiefly attributable to increased production and the development of broader and more varied markets, though in some cases full capacity output was not attainable owing to shortage of basic chemical raw materials.

The value of our direct exports was 56 per cent higher than in the preceding year and represented 33 per cent of our total turnover. In addition, we made a further substantial contribution to the Government's drive for increased exports. So far we have successfully met newly developing competition in our foreign markets.

Monsanto Chemicals (Australia), Limited, has continued to expand its manufacture and sales and reports a record turnover again in 1951; its rate of growth continues to our best expectations.

The year's trading of Monsanto Chemicals of India, Limited, showed an appreciable increase over 1950.

Construction of the styrene monomer plant at Grangemouth for Forth Chemicals, Limited, in which we have a one-third interest, has proceeded satisfactorily.

The transfer of the manufacturing facilities of Silicon (Organic) Developments, Limited, to our Newport factory and the absorption of its selling activities by our company was accomplished at the end of 1951.

It is too early to determine the full effect of the proposed changes in company taxation. Nevertheless, there is no doubt that overall a much heavier burden will fall on industry. The reduction in profits tax is welcome, but is much more than offset by the imposition of an EPL; this tax can only be discriminatory and can only hamper the ability and incentive of those concerns upon which the country is largely depending to provide increased exports.

THE PROSPECT FOR 1952

In budgeting the company's production and sales for the year 1952, we have again felt justified in anticipating a further increase in turnover. Shortage of raw materials may continue to restrict volume of production.

The increase in budgeted sales depends upon our ability to increase our exports. Restrictions being placed upon imports of British goods by Commonwealth and European countries, normally our traditional export markets, may have an adverse effect on our total turnover if extended over a long period of time. We expect the pressure of competition to increase during 1952. Accordingly, every effort is being made to increase efficiency and quality of production, sales service, and advertising in overseas markets.

The income of the group for the year was £2,892,987, compared with £1,686,478 in 1950. The group profit carried forward to the appropriation account was £911,929. After providing for parent company's dividends, there remains to be carried forward to 1952 £1,272,371 for the group as compared with £740,099 at the end of 1950.

The report was adopted.

MONSANTO CHEMICALS LIMITED AND SUBSIDIARY COMPANIES

CONSOLIDATED PROFIT AND LOSS ACCOUNT FOR THE YEAR ENDED DECEMBER 31, 1951

	1951	1950
	£	£
Balance from Trading Account	2,889,330	1,685,897

GEDULD PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting on May 6, 1952, said that the ore milled in 1951 amounted to 1,259,000 tons or 20,000 tons less than in 1950, and the average yield at 2.93 dwt was lower by 0.12 dwt. Consequently the working revenue at £2,412,283 was lower by £54,307, or 3d. per ton milled, than in the previous year, despite an increase of £77,819 in the premium obtained from the sale of gold at enhanced prices for artistic and industrial purposes. Working costs increased by 10d. per ton milled, due to further rises in the prices of commodities and to certain increases in wages and other benefits granted to employees during the year under review, leaving a working profit of £658,396, which is £83,790 less than in 1950.

He stated that the dividend income from the company's holdings in East Geduld Mines, Limited, and The Grootvlei Proprietary Mines, Limited, which remained unchanged, amounted to £770,585.

After providing £277,070 for taxation and taking into account the other items specified in the profit and loss account, there remained a net profit of £1,154,476, which was £97,013 less than in 1950. Two dividends totalling £1,077,382, or 14s. 9d. per share, being a decrease of 1s. 9d. per share, were declared, and after making provision for the other items detailed in the appropriation account, the carry forward was increased by £20,870 to £387,440.

DEVELOPMENT WORK

Development work on Black Reef totalled 17,485 feet, and of the 12,955 feet on reef and sampled, 1,775 feet, or 14 per cent, was payable, averaging 4.1 dwt over 53 inches.

The ore reserve recalculated as at December 31, 1951, showed a decrease of 500,000 tons to 3,500,000 tons. The value at 3.40 dwt and the estimated stoping width at 51 inches remained unchanged.

During the first quarter of 1952 the ore milled amounted to 314,000 tons and the working profit was £115,248. In addition £20,928 accrued to the company from premium gold sales. Development work totalled 4,377 feet and 1,860 feet were on reef and sampled, of which 720 feet, or 39 per cent, was payable, averaging 4.3 dwt over a width of 62 inches.

For some time past, owing to the general increase in electric power demands in the Transvaal and Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission had found it increasingly difficult to supply the gold mining industry with its full power requirements, and had intimated that this inability would continue for several years. In order to meet this position, it had been necessary, *inter alia*, to curtail milling during periods of peak loads. Some mines had been granted a certain measure of relief by a relaxation of the regulation prohibiting Sunday milling, but no such relief was possible in the case of the company as milling was normally on a seven-day week basis. So far reorganisation of mill maintenance work had ensured no loss of production, but any further power cuts would result in loss of output.

The motion for the adoption of the reports and accounts was carried unanimously, and the retiring directors, Mr Clement Davies and Sir Robert N. Kotze, were re-elected.

ST HELENA GOLD MINES, LIMITED

DEVELOPMENT PROGRESS

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting held at Johannesburg on May 6, 1952, said that in March, 1952, the issued capital of the company was increased from £3,750,000 to £4,812,500 by the issue of 2,125,000 new shares at a price of 16s. per share, leaving 375,000 shares in reserve. Out of the proceeds of this issue, amounting to £1,700,000, the temporary loan from Union Corporation had been repaid with accrued interest and the balance of the funds available were being used to finance capital expenditure at the mine which was largely in connection with necessary excess development. Apart from loans on the security of the company's houses, which were repayable in moderate annual instalments, the company was now free of debt.

It was essential at present to carry out the maximum amount of development work in order to build up ore reserves, which at the year-end amounted to 625,000 tons having an average value of 5.9 dwt over an estimated stoping width of 48 inches, and also to provide as rapidly as possible sufficient stope faces to feed reduction plant with stope ore on a scale commensurate with the plant's full capacity of 80,000 tons per month. So far the rate of development work during the current year had exceeded that of last year by nearly 60 per cent and the amount of payable footage developed had shown a welcome increase, though it would take some time materially to improve the stope face position.

The value of ore being sent to the reduction plant was below the average grade of the mine as only about half of the tonnage milled was coming from stopes. The yield had, however, improved with the gradual increase in the proportion of ore from stopes since milling commenced, so that during the current year the mine had been earning modest working profits on an increasing scale in contrast to a working loss of £43,995 for the two months of milling in 1951.

THE CURRENT YEAR

During the first quarter of the current year, the tonnage milled was 130,000 tons and the working profit therefrom £5,542, to which must be added £11,772 from premium gold sales. The total footage driven amounted to 15,840 feet of which 8,485 feet were on basal reef and sampled, disclosing 3,085 feet or 36 per cent payable, averaging 13.9 dwt over 25 inches.

For some time past, owing to the general increase in electric power demands in the Transvaal and the Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission had found it increasingly difficult to supply the Gold Mining Industry with its full power requirements and had intimated that this inability would continue for several years. In the case of St. Helena it had been necessary to curtail milling during certain periods of the day but as the milling capacity was at present greatly in excess of the tonnage being produced, it had been possible fully to make up for time lost.

In concluding, Mr Anderson said that steady progress had been made since production started and provided there were no unforeseen set-backs shareholders could look forward to continued and in due course more rapid improvement in the mine's position.

The motion for the adoption of the reports and accounts was carried unanimously and

the retiring directors, Messrs C. B. Anderson, H. F. Oppenheimer and M. W. Richards, were re-elected.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

RECORD TONNAGE MILLED

Mr P. M. Anderson, the chairman of the company, in addressing stockholders at the annual general meeting held at Johannesburg on May 6, 1952, said that the tonnage milled in 1951 increased by 71,500 tons to the new record figure of 2,338,500 tons, which however was still below the capacity of the mill owing to shortage of labour. Although the yield was 0.12 dwt per ton lower than in 1950 the working revenue rose by £254,043 or 5d. per ton milled to £6,793,020. The higher working revenue was due in part to the increased output but was mainly accounted for by the increased premium from sales of gold at enhanced prices for industrial and artistic purposes which in 1951 brought in £317,698 as compared with only £98,043 the previous year.

He stated that the increase in working revenue was, however, largely absorbed by higher working costs, which rose by £182,258, or 10d. per ton milled, so that the working profit at £3,871,900 was only £71,785 more than in 1950. The increase in working costs was due to increased costs of stores and materials and to certain increases in wages and other benefits granted to employees.

Provision for taxation amounted to £2,055,744, an increase of £138,716 compared with 1950 and the net profit was £1,818,798, or £64,575 less than in 1950. Two dividends totalling 3s. per unit of stock were declared and absorbed £1,715,822. The amount carried forward was £661,121.

Development footage at 58,027 feet had decreased slightly compared with the previous year. 42,810 feet were sampled and 21,710 feet or 51 per cent was payable, averaging 12.3 dwt over 18 inches.

ORE RESERVES

The recalculated ore reserves increased by 500,000 tons to 15,500,000 tons, averaging 4.7 dwt over an estimated stoping width of 48 inches. The value was 0.1 dwt higher and the width 2 inches greater than in 1950.

The ore milled during the first quarter of 1952 was 573,000 tons and the working profit £791,357. In addition, £51,918 had accrued to the company from premium gold sales. Development work totalled 11,987 feet and 8,585 feet were sampled, of which 4,710 feet, or 55 per cent, was payable, averaging 13.1 dwt over 16 inches.

For some time past, owing to the general increase in electric power demands in the Transvaal and the Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission had found it increasingly difficult to supply the gold mining industry with its full power requirements and had intimated that this inability would continue for several years. In order to meet this position, it had been necessary, *inter alia*, to curtail milling during periods of peak loads on weekdays and to make good the tube mill hours so lost by operating the reduction plant on Sundays. So far these arrangements had ensured that there had been no loss of production but if further power cuts had to be imposed, some loss of output might result.

The motion for the adoption of the reports and accounts was carried unanimously, and the retiring directors, Messrs I. W. Gwynne-Evans and T. P. Stratten, were re-elected.

EAST GEDULD MINES, LIMITED

RECORD WORKING REVENUE

Mr P. M. Anderson, the chairman of the company, in addressing stockholders at the annual general meeting held at Johannesburg on May 6, 1952, said that the tonnage milled in 1951 at 1,738,000 tons was the same as in the previous year, and the output at 521,469 ounces fine showed a slight increase. The premium from sales of gold at enhanced prices for industrial and artistic purposes was considerably higher than in 1950 and brought in £322,669. The working revenue rose by £209,147 or 2s. 5d. per ton, to the record figure of £6,811,129. Owing to further rises in the prices of stores and commodities and to certain increases in wages and other benefits granted to employees during the year under review, working costs rose by 1s. 3d. per ton milled and the working profit at £4,604,113 was only £99,098 more than for the previous year.

He stated that largely owing to the increase in the Formula Tax which became effective from January 1, 1951, provision for taxation increased by £191,925 to £2,522,275. After taking into account income from investments amounting to £82,557, being mainly dividend income from the company's holding of 537,600 stock units in The Grootvlei Proprietary Mines Limited, and the other items detailed in the profit and loss account, the net profit was £2,158,393, or £96,065 less than the 1950 figure. Dividends totalling 4s. 4d. per unit of stock, being 3½d. per unit less than in 1950, were declared and absorbed £1,950,000. After providing £144,125 for capital expenditure and setting aside the other amounts detailed in the appropriation account, the carry forward was increased by £64,417 to £557,797.

DEVELOPMENT

A total of 11,132 feet of development was accomplished on Main Reef, of which 7,195 feet were on reef and sampled, disclosing 3,470 feet, or 48 per cent, payable with an average value of 7.8 dwt over 24 inches. In addition, 2,190 feet of development was accomplished on the Kimberley Reef Horizon in the region of No. 1A Sub-Vertical Shaft. Most of this development consisted of cross-cutting and only 335 feet were on reef and sampled, disclosing no payable values.

The recalculated ore reserve decreased by 100,000 tons to 12,400,000 tons. The value and estimated stoping width remained unchanged at 5.7 dwt and 51 inches respectively.

The ore milled during the first quarter of 1952 was 432,000 tons and the working profit was £1,024,855. In addition £49,725 accrued to the company from premium gold sales. Development work on main reef totalled 2,604 feet and of this 1,495 feet were sampled disclosing 675 feet, or 45 per cent, payable averaging 8.4 dwt over 22 inches. 594 feet of development was accomplished on Kimberley Reef, and 475 feet were sampled disclosing a negligible payable footage.

For some time past, owing to the general increase in electric power demands in the Transvaal and Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission had found it increasingly difficult to supply the gold mining industry with its full power requirements and had intimated that this inability would continue for several years. In order to meet this position, it had been necessary, *inter alia*, to curtail milling during periods of peak loads on weekdays and to make good the tube mill hours so lost by operating the reduction plant on Sundays. So far these arrangements had ensured that there was no loss of production but if further power cuts had to be imposed, some loss of output might result.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, Messrs C. B. Anderson and M. W. Richards, were re-elected.

VAN DYK CONSOLIDATED MINES, LIMITED

EFFECT OF INCREASED WORKING COSTS

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting at Johannesburg on May 7, 1952, said that the tonnage milled in 1951 showed a small increase at 1,204,000 tons and the yield improved slightly to 3.02 dwt per ton milled. In addition, sales of gold at enhanced prices for industrial and artistic purposes brought in a premium of £113,687 as compared with only £32,591 in the previous year. Accordingly, the working revenue rose by 1s. 7d. per ton milled, but this was more than offset by an increase in working costs of 2s. 11d. per ton milled, so that the working profit at £262,686 was £77,578 lower than in 1950.

He said that more than half the rise in working costs was due to increased development work and the balance to rises in prices of commodities and to wage increases and other benefits granted to employees.

The net profit was £249,703. Capital expenditure, mostly on work in the No. 5 shaft area, absorbed £176,645 and the carry forward was increased by £68,845 to £71,460.

The total development footage was 51,487 feet, or 8,596 feet more than in 1950, and of the 27,700 feet on reef and sampled, 28 per cent was payable averaging 11.4 dwt over 19 inches.

The ore reserve, recalculated as at December 31, 1951, was 100,000 tons less at 1,700,000 tons, the grade and estimated stoping width being unchanged at 3.6 dwt and 40 inches respectively.

DEVELOPMENT

In the No. 5 shaft area, development was continued on the 48 Level and 21,549 feet were driven during the year. For ventilation reasons, 48 Level Drive was being advanced as twin headings, one on reef and the other in footwall. Development work had disclosed folding and faulting of the formation. The reef heading of 48 Level West passed into footwall 850 feet west of the shaft and had advanced 4,425 feet in footwall by the year-end. Consequently, of the total development footage in the No. 5 Shaft area during the year only 4,480 feet were on reef and sampled disclosing 960 feet, or 21 per cent payable averaging 12.9 dwt over 14 inches. At the end of February of the current year, 48 Level West picked up the Reef Horizon again and development was at present taking place about 1,000 feet from Borehole No. V.S.6. Of the 6,482 feet driven in the area during the first quarter of 1952, 2,125 feet were on reef and sampled, disclosing 26 per cent payable averaging 9.0 dwt over 18 inches. The rate of development in this area was expected to increase as additional levels became available.

The ore milled during the same quarter was 317,000 tons and the working profit £37,086. In addition, £21,337 was received from premium gold sales. Development footage, including that in the No. 5 shaft area, was 12,252 feet and of the 6,960 feet on reef and sampled, 29 per cent was payable averaging 9.5 dwts over 22 inches.

For some time past, owing to the general increase in electric power demands in the Transvaal and the Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission had found it increasingly difficult to supply the gold mining industry with its full power requirements and had intimated that this inability would continue for several years. In order to meet this position, it had been necessary, *inter alia*, to curtail milling during periods of peak loads on weekdays and to make good the tube mill hours so lost by operating the reduction plant on Sundays. So far these arrangements had ensured that there had been no loss of production but if further power cuts had to be imposed, some loss of output might result.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, Messrs C. B. Anderson and T. P. Stratten, were re-elected.

MARIEVALE CONSOLIDATED MINES, LIMITED

IMPROVED RESULTS

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting held at Johannesburg on May 7, 1952, said that the tonnage milled in 1951 increased slightly to the record figure of 729,000 tons but as the yield was lower by 0.06 dwt per ton, there was a small reduction of output. The consequent loss of revenue was, however, more than offset by the increased premium received from sales of gold at enhanced prices for industrial and artistic purposes which in 1951 brought in £109,773 as compared with £34,069 the previous year. Accordingly, the working revenue rose by £57,837, or 1s. 3d. per ton milled to £2,364,979. Rather more than half this increase in working revenue was absorbed by higher working costs which rose by £33,397 or 9d. per ton milled, so that the working profit at £1,009,055 was only £24,440 higher than in 1950. The increase in working costs, which has taken place in spite of most rigid economies, was due to further rises in the prices of stores and materials and to increases in wages and other benefits granted to employees during the year under review.

He stated that due to the increased profit and the 5 per cent increase in the formula tax, provision for taxation increased by £53,647 to £485,748, so that the net profit at £512,140 was £32,660 less than for 1950. Two dividends totalling £450,000 or 2s. per share, an increase of 2d. per share, were declared and after making provision for the other items detailed in the appropriation account, including £67,066 for capital expenditure, £467,751 was carried forward.

DEVELOPMENT

The total development footage driven during the year was 32,175 feet, of which 22,598 feet were on the Main Reef Horizon and 9,577 feet on the Kimberley Reef Horizon; 13,365 feet were on Main Reef and sampled, of which 49 per cent was payable, averaging 13.6 dwt over 19 inches; 6,320 feet were on Kimberley Reef and sampled, of which 39 per cent was payable, averaging 13.8 dwt over 20 inches. By the year-end 6 Level East Drive had been advanced 3,117 feet into the farm Bloemendal No. 19. Encouraging values had been found near the eastern boundary of the company's property but the remainder of the drive had disclosed consistently disappointing values.

The ore reserve, recalculated as at December 31, 1951, increased by 200,000 tons to 3,200,000 tons, averaging 5.5 dwt over an estimated stoping width of 46 inches. The

value was 0.1 dwt. lower and the estimated stoping width was one inch more than the previous year. Included in the ore reserve tonnage was 290,000 tons from the Kimberley Reef Horizon, averaging 5.7 dwt. over an estimated stoping width of 46 inches.

THE CURRENT YEAR

The ore milled during the first quarter of 1952 amounted to 180,000 tons and the working profit was £210,858. In addition £20,167 accrued to the company from premium gold sales. 5,041 feet were driven on Main Reef, of which 3,430 feet were sampled, disclosing 48 per cent payable, averaging 15.4 dwt. over 18 inches. 2,116 feet were driven on Kimberley Reef, of which 1,280 feet were sampled, disclosing 17 per cent payable, averaging 20.2 dwt. over 15 inches.

For some time past, owing to the general increase in electric power demands in the Transvaal and Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission had found it increasingly difficult to supply the gold mining industry with its full power requirements and had intimated that this inability would continue for several years. In order to meet this position it had recently become necessary, *inter alia*, to curtail milling during periods of peak loads on weekdays and to make good the tube mill hours so lost by operating the reduction plant on Sundays. So far these arrangements had ensured that there had been no loss of production but if further power cuts had to be imposed, some loss of output might result.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, Sir Robert N. Kotze and Messrs R. Bowman and S.R. Fleischer, were re-elected.

ARMY AND NAVY STORES

INCREASED SALES

The eightieth annual general meeting of this company was held on May 9th at Westminster.

Commander S. C. Lyttelton, OBE, DSC, chairman, in the course of his speech, said: Last year the late chairman mentioned that the current year's figures were good. This was certainly the case for the first half of the year, and while there was a falling off later it is satisfactory to record that the total sales and gross profits were up. This increase in profit was, however, overtaken and absorbed by the rise in expenses, which, together with an increase in the amount of tax payable, produced a lower figure of net profit after taxation.

We have recently taken the best professional advice as to the value of our properties. The result is very satisfactory in that it shows that our fixed assets are worth very considerably more than the figure at which they stand in the balance-sheet. During the year there have been from time to time considerable fluctuations in the Stock Exchange price of our shares. These fluctuations have almost always been accompanied by rumours of a possible "take-over."

There can be no doubt that at the present time, with retail distribution passing through a difficult period and with properties standing at very high values, the idea of acquiring control of a company such as this, with its valuable properties, must be very attractive to property dealers, and I wish to make it quite clear that the board has not entered into any such negotiations, neither have we any intention of endeavouring to do so.

The report was adopted

THE EVER READY COMPANY (GREAT BRITAIN), LIMITED

MANUFACTURERS OF DRY BATTERIES

MR E. N. ROWBOTHAM'S COMMENTS

The annual general meeting of The Ever Ready Company (Great Britain), Limited, will be held on Thursday, June 5th, at the head office, Hercules Place, Holloway, London, N.7.

The following are extracts from the statement of the chairman, Mr E N. Rowbotham, which has been circulated with the report and accounts for the year to February 29, 1952.

RECORD EXPORT SALES AND PROFIT

Stockholders are aware that since the end of the war the directors have consistently endeavoured to expand your company's share of the world trade in our products which are marketed overseas under our trade name "Berec." Export sales have expanded year by year and I am glad to be able to inform you that this year's sales show an increase of approximately 90 per cent over last year and, in fact, it is to this very substantial increase in export turnover that the improvement in our trading profits is almost entirely due. Great credit is due to the staff and workpeople in the export division and factories who have coped with this greatly increased volume of trade—not without difficulties—but as we hope and believe in a manner which will enhance the prestige of your company throughout a large part of the world.

HOME SALES INCREASED

Home sales have also increased as compared with last year, but in spite of certain higher selling prices which your directors were reluctantly compelled to introduce early in the year the increased costs of raw materials, wages and other production costs have prevented this increase in home sales from producing a proportionate increase in net profit.

In spite of the change in the rate of purchase tax from 33⅓ per cent to 66⅔ per cent, the company's "Alldry" battery operated radio receivers continue to sell well and plans are in hand for increasing the production of these receivers both for the home market and export. The sales of battery-operated toys have also improved.

The extension to our chemical plant is nearing completion, and I am optimistic with regard to this section of our business.

EXPANSION OF PRODUCTIVE CAPACITY

The consolidated balance sheet shows that slightly over £200,000 has been expended on fixed assets—chiefly plant. A considerable part of this expenditure relates to the enlargement of facilities for the production of chemicals and to increasing the company's power of production of radio and hearing aid dry batteries of the latest types. This expenditure should result in increased sales of these products in the future and the additional efficiency which will be attained should ensure a reasonable return.

In January last we made a further investment in an engineering company which has for many years past made a large proportion of our specialised plant. The closer association now achieved should show considerable advantages in the development and production of our plant requirements. This company now becomes a subsidiary and as a result there is an increase of £30,153 in the investment in subsidiary companies and a fall of £5,374 in trade investments representing the book value of the previous investment now transferred. Since this company was acquired so late in the year the accounts are not consolidated.

ROLLS RAZOR LIMITED

INCREASED DEMAND

MR A. COLIN KINGHAM ON THE CONTINUED PROGRESS

The twenty-fourth annual general meeting of Rolls Razor Limited was held on May 9th in London, Mr A. Colin Kingham, MC (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:—

The net trading profit is up by £25,745 to £168,889, another record in our history. Taxation takes £99,270 and the net profit is 20 per cent greater at £69,619.

In recommending a dividend of 33⅓ per cent the directors again decided to take a prudent course and make the same distribution for the sixth successive year.

Our two principal products, Rolls Razors and Viceroy Dry Shavers, have again met with a great success during the year and are continuing to do so at the present time. During 1951 large increases in production costs, mainly due to wage increases, had to be absorbed, and it may well be asked where is the finishing post in the race in which increased wage demands chase inevitably increasing prices of goods. There may be a point where the price becomes too high for the public to buy in quantities necessary for economical production. The full impact of recent wage increases and longer holidays accrues in 1952 and we have been reluctantly compelled to raise our prices to meet it. The same will apply if further demands for wage increases are met. How far in fact can a snake swallow its own tail before it dies?

For the second year in succession our exports again increased by 50 per cent, and this increase could have been greater at the expense of the home trade had it not been for the lamentable delays which take place after goods are packed and ready for shipping. If this situation could be rectified the export market for many English manufacturers might improve considerably and today this is more essential than ever in view of the import cuts which have been announced recently by some of our best markets in the sterling area and by a recession of trade in dollar markets.

NEW PRODUCTION FACILITIES

Within the next few months we expect to be in production in our new factory at Hemel Hempstead New Town. In this we shall concentrate on the manufacture of Viceroy Electric and Non-Electric Dry Shavers, the sales of which are increasing satisfactorily. This will give us more space in our Cricklewood Factory to increase the production of the Rolls Razor. Throughout a large part of the world the trade outlook is not as bright as in 1951 and it is too early in the year to make a forecast of our trading for the year 1952. Providing we are allowed the necessary materials, and production can be increased without costs rising, we believe the excellent products we make and the goodwill we possess will carry the company forward as they have for the past quarter century.

Thanks are due to our staff and employees who have worked efficiently and well.

The report was adopted.

54, 55 & 56, THREADNEEDLE STREET, LONDON, E.C.2

AVELING BARFORD LIMITED

Notice is hereby given that the following Resolutions were passed at a meeting of the Board of Directors of the above Company, held on May 13, 1952:—

"That dividends be paid on July 1, 1952, on the £250,000 5½ per cent Cumulative Preference Stock at the rate of 5½ per cent per annum for the six months from January 1, 1952, to June 30, 1952, and that the 5½ per cent Cumulative Preference Transfer Books of the Company be closed from June 10 to June 24, 1952, both days inclusive.

"That dividends be paid on July 1, 1952, on the £500,000 5 per cent Second Cumulative Preference Stock at the rate of 5 per cent per annum for the period from January 1, 1952, to June 30, 1952, and that the 5 per cent Second Cumulative Preference Stock Transfer Books of the Company be closed from June 10 to June 24, 1952, both days inclusive."

By Order of the Board,
Invicta Works, Grantham. H. C. RYAN, Secretary.

AN EASTERN BANK seeks a Resident Principal (male) for its Training College for Asian executive officers which will shortly be opened in Surrey.

Candidates must be British subjects by birth, not older than 55, and they should have held teaching or administrative posts at universities or colleges in Southern Asia, South-Eastern Asia or the Far East. A degree in Economics or Commerce would be an advantage.

The appointment will be made for an initial term of five years.—Applications, accompanied by testimonials, should be addressed to Box 5835, c/o Charles Barker & Sons, Ltd., 31, Budge Row, Cannon Street, London, E.C.4.

THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London.—Write, Major B. Carnegie, "Stronvar," Balquhidder, Perthshire.

12.48 PER CENT simple interest p.a. offered for trade bill discounting facilities. Large and small bills available with a supporting guarantee. Particulars from the company's accountants.—Box 908.

SENIOR BUSINESS EXECUTIVE with world-wide experience, fluent French, German, Spanish, available for executive position entailing business journeys abroad.—Box 914.

GOOD FOOD

We specialise in catering for industrial canteens, offices, and luncheon clubs. Our organisation is not too large or unwieldy and we can give personal supervision to all our contracts. Write for testimonials from our clients; addresses given on application to:-

WE HAVE BEEN FRIENDS TOGETHER, by Maritain (15s.), 3s. 6d. plus 9d. postage. ADVENTURES IN GRACE, by Maritain (15s.), 3s. 6d. plus 8d. postage. All copies as new. Send remittance with order (refunded if out of stock) to Compass Book Company, King's Buildings, Smith Square, London, S.W.1.

WHY do so many businessmen, economists, accountants, subscribe to the INCOME TAX DIGEST AND ACCOUNTANTS' REVIEW? It is because this monthly journal is practical, authoritative, and a real help to those who have to deal with Income Tax, and Trustee or Funds administration, etc. Annual Subscription 21s. post free; overseas 23s. Specimen current copy 2s. on application to The Secretary, The Fiscal Press Limited, P.O. Box 45, St. Albans, Herts.

A YOUNG man under 30, with suitable academic qualifications (degree or Higher Certificate) and some industrial experience, is required to undertake in a works department special assignments which entail some statistical background. The minimum commencing salary will be £450, and the selected applicant will be expected to undertake the training necessary to fit him ultimately for higher management. North London area. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.—Apply Box 947.

LADY GRADUATE (aged 21-30) required by market research organisation for position of Research Assistant in statistical department. Statistical knowledge desirable (preferably with economics degree though mathematics considered). No previous experience necessary. Applications, in writing, to Personnel Manager, A. C. Nielsen Co., Ltd., Oxford.

DANISH CIVIL SERVANT (27), single, first-class Hons. cand. oecon. (M.A. Econ.), seeks post, preferably research. Economics, Public Finance, Statistics, Sociology, Social Security. Excellent English. German-Scandinavian languages. Good references. In Britain June.—Box 956.

EFFICIENCY IN BUSINESS.—An Exhibition of the latest books on all aspects of business administration and management is open until June 6th, from 9.30 a.m. to 6 p.m. daily, at C.P.C. LONDON BOOKSHOP 6, VICTORIA STREET, S.W.1. Tel.: WHI 4011.

CANADA.—Top executive (40) seeks responsible post in Canada. Exceptional experience in engineering industry including finance, administration, factory organisation, sales and service. Adaptable to any type of business.—Write Box 931.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations: B.Sc. Econ., LL.B.; and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal tuition for Prelim. Exams. and for the professional exams. in Accountancy, Secretaryship, Law, Sales Management, &c., and many intensely practical (non-exam.) courses in commercial subjects.

More than 50,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request mentioning exam. or subjects in which interested to the Secretary

In Defence of the Realm

NUMBER 6 IN A SERIES

Drawing reproduced by courtesy of "Flight".

Have you ever designed an aircraft?

(Above) left to right, S. D. Darles, Chief Designer, A. V. Roe; W. S. Farren, Technical Director, A. V. Roe; S. Camm, Chief Designer, Hawker Aircraft; T. O. M. Sopwith, Chairman, Hawker Siddeley Group; Sir Frank Spriggs, Managing Director, Hawker Siddeley Group.

Ask Sydney Camm, Hawker Chief Designer, that question and he'll tell you no one man *designs* the aircraft of to-day. The modern jet fighter springs from one man's conception carried through by a complex team of airframe designers, aerodynamicists, process executives, stress analysists, wind tunnel men, weight control technicians, hydraulic experts . . . many, many men guided by many, many years of experience. As one man welds these individual experts into a team which thereby designs brilliant aircraft, so the Hawker Siddeley Group organises its member companies as a team, by whose association even better and greater aircraft are produced. Largest of its kind, this great industrial commonwealth now employs all its mighty resources in building the defensive strength of the Free World.

Which Law for

BEFORE the House of Commons and public o[pinion] there has come lately from the battlefield of Korea a question which should have received an instantaneous answer from people of principle and conscience. Instead there have been trimming and shilly-shallying among some politicians and uneasy silence from those who normally leap into the battle of controversy. Once again the suspicion has been created that there is one law for the Left and another for the Right: what Dr Malan is doing is wrong—and it is, indeed, very wrong—but what Mao Tse-tung is doing may be right; the Russians are within their rights in organising Eastern Europe after their own design, but it is wrong for the Americans to seek any influence in Western Europe. The suspicion may fairly be tested in the matter of the Korean prisoners. Some say that to refuse to repatriate North Koreans and Chinese who do not want to return home is to put mercy above good sense, because peace could be had in Korea by giving way. Others say that international law in this case is unclear, and that the rude and stubborn men who face the United Nations negotiators at Panmunjom should have the benefit of any doubt there may be. The argument goes on and those who know few of the facts and nothing of the law waver in confusion, feeling that to return the prisoners would be wrong but thinking that to retain them might be dangerous.

The United Nations has been standing on a matter of principle, in the conviction that to retreat would be as morally disastrous as loss of the last line covering Pusan would have been militarily disastrous in the late summer of 1950. At first it seemed that the British Government could rely on steady support from public opinion, and Mr Attlee in the House of Commons fully endorsed Mr Eden's arguments against forcible repatriation. Later, however, questions from the Opposition benches showed that the Labour Party was by no means united on the subject. The persistent contention of the Communists that the United Nations Command is bound by the Geneva Convention of 1949 to repatriate all prisoners, even against their will, has had its effect in the absence of a clearly stated case to the contrary. Even more disconcerting has been the sequence of events at the Koje Island prison camp, giving rise to the suspicion that prisoners may have been under pressure from American and Chinese Nationalists to refuse repatriation.

There are, therefore, two quite distinct issues and they must not be confused. Whether some prisoners have been improperly induced to refuse repatriation is one question; whether the principle of forcible repatriation is to be accepted is quite another. Even if there were only a few prisoners who refused to go back, the conflict of principle would still be unresolved. As it is, it is surprising that nearly a quarter of the North Korean and over half the Chinese prisoners should have refused to return, and it may be that screening officers and propagandists have been too zealous. There is a strong case for review by some neutral body, so that authentic choice may be determined.

164799

...as in fact already offered conclusion of an armistice. ...ist on forcible repatriation of all ...ception.

In ...osition under the Geneva Convention of ...cussed by a correspondent on page 523. The ...ig of the Convention is ambiguous; indeed, it ...ems likely that the delegates of the Soviet Union and those of Britain and the United States had quite different conceptions of what it implied when they signed it. It is impossible to believe that the British and Americans intended to repudiate for prisoners of war the right of political asylum, which they maintain in peacetime even for military deserters. Nor can it be believed that they regarded the forcible return of a prisoner, for punishment by death or concentration camp at the hands of his own government, as one of the "rights" secured to him by the Convention. Their aim was to make sure that the detaining power would have no ground for refusing to repatriate a prisoner who wished to return home, and it was assumed that virtually all British or American prisoners would so wish.

The Russians, however, approached the question as delegates of a totalitarian state. They were not only indifferent to the rights of individuals as such, but anxious to establish a right to recover and punish all their citizens who might show disaffection in time of war. Totalitarian rulers are haunted by a dreadful fear of treason and desertion. They can maintain control internally by means of police terror, but their power is not absolute as long as escape abroad is possible. It is war that offers the great opportunity of such escape. It must, therefore, be demonstrated to the citizen of a Communist state that even if he goes over to the enemy in time of war, the long arm of the party will get him back. There can be no doubt that the Communist rulers of China and North Korea share this view of the importance of recapturing *émigrés*, particularly those from the armed forces.

If the United Nations Command, in order to obtain an armistice in Korea, were forcibly to repatriate some thousands of men who had declared for the anti-Communist cause, trusting in Allied protection, no soldier of any Communist army in any future fighting would dare to act politically against his own government. Forcible repatriation would be not only an act of shameful and cruel inhumanity, but also gravely imprudent. The free world cannot afford to preclude itself from making use of disaffection in the enemy ranks in any future struggle which Communist aggression may force upon it. For Communist states fifth columns, with incitement to mutiny and desertion, are an important part of their war potential; but they are themselves highly vulnerable to counter-attack in kind.

The problem is one which did not arise in 1945 because Germany surrendered unconditionally. But if the last war had ended in a negotiated peace and if the principle of forcible repatriation of all prisoners had then been accepted, this country would have had to send back to Germany prisoners who had assisted the Allies against Hitler. Those who have suggested that the United Nations should give way over the prisoners in Korea should say whether they would have approved of sending back anti-Nazis to a Nazi Germany. It is time that they said frankly whether, in their view, there is one law for defence against Fascist tyranny and another for defence against Communist tyranny. If that is their view they will not be happy until the second cold war, too, has produced its Munich.

Full Stop for Fabianism

FEW ideas in human history have had as direct a bearing on events as the Fabianism of which Sidney Webb was the chief architect. It has been the main intellectual driving force of political and economic change in Britain in the twentieth century. It was not replaced by Keynesian ideas but rather became entwined with them. The two together bred, in the stimulating temperature of war following the great slump, the British revolution of the nineteen-forties. "Fabian Essays" were published in 1889. What was still clearly applicable in them—and some that was not so applicable—had by 1948 been done. The first section of the new Fabian tracts for the times, published this week, could hardly have been called anything but "the loss of momentum."

Fabianism in the early years of the century provided the developing Labour movement with a philosophy and, later, a policy—largely, the policy that was put into effect in 1945. The movement's need for a new philosophy and new policy is no less acute now, and if the Fabians had anything to offer it would be of first importance; there is nowhere else—unless it be from Mr Bevan—that a modern doctrine of the Left is likely to be found. The Fabians certainly have not found it yet. The practical test of the new essays is less ambitious: is there anything constructive towards which Fabianism shows signs of feeling its way?

The first step is to make clear what it is that has lost its momentum. The point is not that the ideas of Fabianism have withered away; it is that they have been turned upside down by the Socialists themselves. The doctrine of sixty years ago had two main elements. First, there was the conviction that modern industrial society was becoming, and was bound to become, collectivist. The original Fabians hardly discussed at all whether collectivism was desirable. The essay on the moral basis of socialism was mainly concerned not to expound a non-Victorian ethic but to claim that "Socialism is merely Individualism rationalised, organised, clothed, and in its right mind." The basic argument was that on the Victorian presuppositions about progress, what was happening was good. The proud message of the Fabian Essays was that "some very large and definite extension of collective authority" was enforced by "the irresistible sweep of social tendencies." From this the Fabians' belief that the transition to socialism must be gradual followed with inevitable logic.

This was the determinist side of Fabian philosophy. Its second element, the element of choice and, therefore, of moral advocacy, was the social reformer's standard protest against poverty. The capitalist and the landowner were becoming useless, and therefore advantage should be taken of the collectivist evolution to make the

distribution of wealth and income more just. There was enough to redistribute for poverty to be largely cured. "Productive power is increasing," Bernard Shaw wrote, "and nothing but the perversion of this power to the production of socially useless commodities prevents the apparent wealth from becoming real."

Few resources are thus perverted to the luxuries of the idle rich in 1952. Of the two bases of Fabianism, it is the reduction of inequality that is now accepted as an "irresistible" tendency—not by Socialists alone, but by most men of all parties. The structure of society is taking, it is true, a little time to reflect the economic changes wrought by high death duties and the massive redistribution of incomes by taxation. Some sections of the rich are delaying the full impact by consuming capital. But a continuing tendency towards a more equal society is implicit in the legislation that no one proposes to undo. On the other hand, there is little enthusiasm for accelerating the tendency. In "New Fabian Essays"* Mr Roy Jenkins suggests that socialists should "press as hard as they can for an ever greater degree of equality"—but he suggests also that the Left-wing conscience need not be very sensitive; delays to the progress of equality "should not . . . be treated with too much intolerance." The Left as well as the Right is uncomfortably aware that a more equal society may be a poorer society—because the incentives to creating wealth are weakened—and a less liberal society.

The equality that the Fabians urged as a moral choice in 1889 has become the tendency that everyone accepts but watches cautiously in 1952. On the other hand, the collectivism that the Fabians in 1889 joyfully heralded as an inevitable tendency has become the moral choice that in 1952 the leaders of Socialist thought decisively reject. The modern Fabian writes in the shadow of the Stalinist state in Russia—and knowing the impersonal rigidity of the large nationalised industry in Britain. In the new essays, Mr Crossman says:

> Instead of regarding social change as tending towards the enlargement of freedom, we must assume that increased concentration of power, whether in the form of technological development or social organisation, will always produce exploitation, injustice and inequality in a society, unless the community possesses a social conscience strong enough to civilise them.

The modern Fabians do not quite bring themselves to reject nationalisation; they want to extend public ownership and control—provided that its extension takes new, more decentralis... undefined) forms. Remarkab... socialism today is to prevent the ... in the hands of either industrial state bureaucracy." With that, Sta... indeed.

...ed that France ...ssays of ...ntrast lies ...d to stamp ... happened ... of the ... simple view ... of em

The old Fabians wanted more equa... thought collectivism gradual... inevitable. For the new Fabians, it is rather equality that is gradually inevitable while collectivism they distrust... They thus dismiss the two basic conceptions of the original essayists. That is important and valuable. But it also destroys the basis on which the new essays themselves are written. For if the earlier doctrine is so butchered, the task of the modern Fabian is not to restore a lost momentum; it is to create something new to move. The task is not, as Mr Strachey confidently claims, "to preserve, to perfect, to extend our newly developing social and economic system"; it is to refashion the foundations of that system. And here the new essayists have very little indeed to offer. Mr Crosland presents a skilful analysis of the mixed economy, neither capitalism nor socialism, that war and six years of Labour rule have created. Mr Strachey thinks rather well of the result and Mr Crossman, naturally, dismisses it contemptuously as "welfare capitalism." Neither manages to define the socialism which he wants to evolve from it. Mr Crosland himself effectively challenges the stock Left-wing assumption that the mixed economy is naturally transitory and must pass quickly into some sort of socialism; and he dismisses several of the orthodox lines of advance—more social services, more nationalisation, more controls, more direct taxation—without making the alternatives at all clear. Mr Jenkins is tentative in his proposals for more taxation of capital. Mr Albu offers thoughts on the reform of joint-stock companies that may eventually prove to have some virtue in them but are no more than quarter baked as yet. Mr Mikardo writes on the need for structural changes in the trade union movement without tackling the central problem of wage policy in a fully employed economy. Mrs Cole is vague about education. The gross result is certainly not even the beginnings of a new philosophy either of socialist change or of consolidation in the welfare state.

The main reason why the Fabians fail in this is their surprising complacency about the stability of what was done in the nineteen-forties. It is true that, as between

* New Fabian Essays." By R. H. S. Crossman, C. A. R. Crosland, R. Jenkins, Margaret Cole, A. Albu, I. Mikardo, D. Healey and J. Strachey. *Turnstile Press*. 215 pages. 15s.

...1889 and the essays of 1952, the obvious ... in the optimism of the old and the pessimism ...ew. That is partly because the original Fabians ...y ignored the world outside the favoured Britain ... Victoria. Their successors have to look at it boldly —particularly in Mr Healey's realistic essay on British foreign policy. The deeper reason lies in the general experience and philosophy of our times. "So far . . . from viewing history as a steady advance towards freedom, we should regard exploitation and slavery as the normal state of man and view the brief epochs of liberty as tremendous achievements." In this Mr Crossman is stating the basic proposition of conservative political philosophies: the belief that because liberal civilisation is a fragile growth, a thin crust over social forces that are always liable to engulf freedom in totalitarianism, it is often wise to be patient, to tolerate a measure of injustice and inefficiency rather than to risk breaking up an established mode of society by trying to improve it quickly.

The dilemma of the Fabians is that, while the monsters of twentieth-century totalitarianism have brought them to an intellectual recognition of this principle, they are emotionally bound still to champion—and to want to press farther—all the rapid changes of the past ten years. And they therefore make light of the dangers to which the welfare state is exposed. Can it avoid continual inflation—the surest corrosive of liberal society? Can it be reconciled with the economic flexibility on which Britain as a trading nation depends? Can it provide incentives for the increasing production of wealth on which, when the poor have no more to gain from redistribution, the resolution of its social tensions depends? Until these questions can be confidently answered, the first need of the new British society is consolidation. And the meaning of consolidation is not grimly to preserve what is; it is to strengthen the foundations to which, in the years of erecting the welfare state, little attention was given. The Fabian essayists certainly have no answers to these questions. They barely ask them. The omission is too glaring for the essayists themselves to be unconscious of it. No doubt they hope to remedy it in the second volume which is promised. But the failure to put the first thing first cannot inspire much hope about the eventual answer. It indicates a confusion and lack of assurance hardly worthy of the ancient Fabians.

For the present, the new Fabianism has no momentum because it has neither an engine nor a steering wheel. Every democrat must hope that they will be found. If the Labour movement does not get a new philosophy, it will still have to find a policy—which will then be based on the stale emotions of the class war. Any sober socialist must be tempted, after reading these essays, to hope that somehow the Conservatives can make a job of governing Britain for four years, if not for eight, before the Labour movement again has to bear the responsibilities of office. For if it does not recover a philosophy in time, something more than Fabianism will have died. With it will have gone the chance, perhaps for many decades, that the party of the Left in British politics can remain true to the values of the free society.

France and North Africa

FOR some weeks items of news from French North Africa have been appearing daily in British and American newspapers. They come principally from Tunisia, where the French are beset from several sides with arguments for and against quickening the pace at which they organise self government. But some of the news comes also from Algeria and Morocco: Algerian nationalists have been demonstrating in the streets of France; a leading Algerian nationalist has been deported; the Sultan of Morocco is pressing claims for emancipation from some of the shackles of the protectorate. These symptoms of disquiet are no longer of concern only to France. They affect France's allies. Twice since December an appeal against the French handling of affairs in North Africa has been lodged with the United Nations: once on the subject of Morocco, once on that of Tunisia. Each time France was able to secure a majority for its contention that these protectorates fall within its domestic jurisdiction. Each time it did so largely thanks to support or abstention by its friends in Britain and the United States. The unrest continues; the same problem is likely to arise again for France's allies. They have, therefore, to make up their minds how far they approve and sympathise with French policy and whether there are limits beyond which they could not support it unconditionally.

French North Africa, taken as a whole, is unique among dependent territories. It is one of the parts of the world that has been peopled with Europeans who have struck roots. Approximately one and a half million Europeans have settled in the three territories. Its nearness to Europe and the mother country has kept these North African Frenchmen extremely close to France, economically and politically; if thoughts of secession have crossed their minds, these have been only momentary. They belong to families that have built the successful fabric of modern North Africa not only with French money but French blood; a generation ago, they still bore the marks of the struggle. Today their sons take their position and patrimony for granted. Like other white settlers in Africa, they tend to be diehard and to think first in terms of their immediate interests and with reluctance, if at all, of long-term considerations. The difference between the older generations and the young settler of today is well marked by the fact that, nowadays, most educated Moslems draw a distinction in conversation between the local Frenchmen—*les colons*—and *les Français de France*.

Proximity to France and Europe has also bred some unusual traits in the indigenous peoples, both Arab and Berber. It has caused large numbers of them to know Metropolitan France and to acquire many ambitions that are furthered by their connection with it. The pull of this attraction is strongest in Algeria, where France has practised its traditional policy of assimilation for over a century, and where it encountered no rival culture. It is weaker in Tunisia, where the period of time has been shorter—only seventy years—and where an Arab élite had preserved an Islamic heritage; it is still weaker in Morocco because the period of contact is forty years only, and because the Moroccans are more isolationist and less adaptable than either of their neighbours.

Nevertheless, all three peoples feel, each in their own degree, an affection for France and an appreciation of the part it could play in their future.

Simultaneously, however, they feel the pull of other loyalties. A very natural longing for a patrimony of their own, and for the dignity which inheritance imparts, causes them to look also towards Islam and to the independent states of the Middle East for inspiration. Now that the Sudanese are on the eve of self-government, they are the only important group of Moslems that remains under direct Western administration and they imagine a country like Egypt to be a social and technical paradise, much better off than they are. This counterpull of an influence which works against France is enhanced by other factors. One is to be found in the educated Moslem bourgeoisie, and springs from their growing feeling that Frenchmen who have reared them on a diet of liberalism and equity are, in the protectorates, not practising in politics what they preached in school. Another flourishes in the nascent African proletariat that is springing up round French industries, and lies in its capacity for voicing the Moslems' sense of social and economic inequality. A third lies in the mounting African birth rate, one of the highest in the world; this, as it increases the pressure upon jobs and land, inevitably increases resentment against the European employee and settler.

★

France, therefore, faces in North Africa the problem of meeting obligations to two communities inhabiting the same soil but seeking different objectives: to Europeans whose future security depends on their retaining their link with Paris, and to Africans most of whom want to assert their individuality by cutting some, if not all, of the strands. The latest news, particularly from Tunisia, shows that the problem is beginning to press, but it is still some way from a climax. It has not yet reached that stage because the North Africans are themselves divided as to how many strands to cut. Their affection for France survives and could be nurtured afresh by Frenchmen possessed of the vision and courage to grasp the nettle. But these qualities are seldom present in shaky coalition cabinets.

In order to devise the necessary policy, however, Frenchmen need to drop their maddening habit of attributing all their North African difficulties to outside factors: to Britain with its greater tendency to hand constitutions and independence to Moslems, or to American GIs who preached anti-colonial doctrines in 1942; to the United Nations which founded Libya; to the Arab-Asian *bloc* which provides professional agitators with valid passports. Of course, all these factors exacerbate a problem that is already difficult; but it is useless to behave as if they alone created the difficulties and as if, could France but be insulated against them, no problem would arise. The chief cause of the present dilemma is that Frenchmen have, over the years, laudably created a modern North African citizen in the image of 1789 and after; but they are now unable to meet his demands for the fruits of liberty, equality and Marxism owing to the pressure exercised by the French settlers.

Different Frenchmen see different ways out of their dilemma as between *colon* and Moslem. Some think that all can jog along as before, provided a handful of nationalist leaders is exiled, and provided that France maintains sufficient forces to show might, and to stamp out terrorism by means of ruthless reprisal, as happened in Algeria in 1945 and in Tunisia this year. This view is held by a majority of the *colons*. Too many of them are blind to the fact that this policy no longer quells Arab nationalism, and that it repels some of France's most important allies. A few Frenchmen—some soldiers as well as some *colons*—are, by contrast, a prey to despair; they see no future for a European minority in the protectorates and talk of packing their traps for a move to France or French Canada. Happily there are half-way houses between these two extremes. Many Frenchmen in France, and a small minority of far-sighted *colons*, recognise that Paris has categorically promised self-government to both the protectorates, and that this fact must in the long run affect Algeria's inclination to become more autonomous. They see that the *colon* must now cross the Rubicon at which he has been jibbing for two years, and must define the timetable whereby changes are to take place. He is suffering the rude shock of discovery that, if the promise of autonomy is kept, he will in due course have to become either a member of a foreign minority or else take some form of local nationality. There is talk of meeting his needs by devising a form of double citizenship that would enable him to participate in a local autonomous government without losing his French nationality. The Algerian Moslem already enjoys a species of double citizenship, only the other way about, since he is a full French citizen yet preserves his right of recourse to Moslem law.

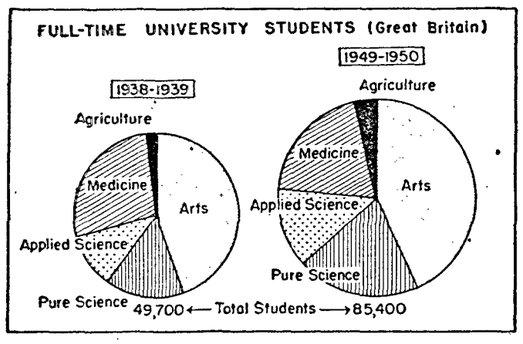
French North Africa presents a problem of obligations to two communities that is every bit as complex as that which once confronted Great Britain in Palestine. The Palestine analogy, though not accurate in every respect, also holds with regard to intrusions into local policy by semi-informed members of the United Nations. Yet this reflection should not be taken as a hint that France can rely on British and American backing for a policy whatever its form. There are not many people, even among the old colonial powers, who now share the smug belief of the *colon* and his supporters in Paris that they can hold their grip provided that no one interferes with them. Frenchmen must accept the fact that other powers now have some concern in the matter. North Africa is full of Nato bases, and the relations between two different communities on this single stretch of territory could vitally affect the future of Europeans at other points in Africa and the Middle East.

No one who is informed of France's difficulties wants to throw stones at the French. No one envies the French government its position, pommelled alike by Moslem and settler. But if it is to succeed it must abandon its old policy of keeping both at bay by giving in, with the regular swing of a pendulum, first to one and then to the other. A new policy of defining its long-term aims will call for a change of heart, for boldness and for imagination. This may never win Morocco for the French Union, for the Moroccans are not an adaptable people, but it would have a chance of winning Tunisia and a very good chance of retaining the feelings cherished for France by the Moslems of Algeria. France's success depends on ability to bring out qualities of generosity in its own folk. Unless it does this, how can it expect a display of such qualities on the part of the African peoples whom it has educated?

Arts to Excess?

ONE effect of rearmament may be to save the arts graduate from unemployment. Fears that the output of arts graduates at its present rate may be too great have been expressed from time to time, among others by the University Grants Committee in its report in 1948. So far, however, these fears have not been realised.

They have not been realised because industry has greatly increased its demand for arts graduates. Oxford University's appointments committee, for example, reports that the number of such vacancies on its books in 1951 was 48 per cent higher than in the previous year. This greater demand is no doubt partly due to defence work; as firms extend their activities they need more administrative staff. But industry's demand for graduates would have increased in any case, even without rearmament, because more and more firms are being converted to the idea of employing them. They realise that, unless they are prepared to do so, they will be recruiting at a lower level of ability than they did before the war. The bright boys whom they then snapped up when they left school go on almost as a matter of course to a university, now that financial barriers have been removed. Thus if industry is to have its fair share of ability it must take people at around twenty-three years old, after they have done their national service and taken their degrees.



Those firms which want to employ arts graduates do so in the belief that they are particularly good raw material for management. Humanist studies are thought to give the breadth of outlook that is necessary for policy making, and university life, particularly if it is residential, is believed to develop personality, which is, above all, the quality that industry is seeking in its managers. The appointments boards of the older universities have had little difficulty recently in placing their arts graduates. But quite apart from the fact that the demand for them may fall when it is no longer stimulated by rearmament, full employment for arts graduates does not mean that arts men, scientists and technologists are at present being turned out in the right proportions—or at least in proportion to the demand for them.

*

For scientists and technologists the demand is far more voracious. Industry's chief need is for chemists and chemical engineers, physicists, mechanical and electrical engineers, especially for radar and electronics. The shortage was made much more acute by the defence programme, to which it is a serious threat. It has reached these proportions in spite of the fact that, following the recommendation of the Barlow Committee in 1946, the output of graduates in science and technology was doubled.

Being so sought after, graduates in science and engineering are offered substantial salaries even in their first jobs. This has helped to overcome the snobbery about industry to which university men used to be prone; so, too, did the arrival of a generation of mature war veterans. It is no longer true, as it seemed to be before the war, that graduates go into industry for want of anything better. It is still true, however, that a very high, although somewhat diminishing, proportion of science men take up postgraduate research and university teaching, and that these tend to be the best minds. According to figures compiled by the University Grants Committee, of 760 students who are known to have graduated in chemistry in 1951, 334 went into postgraduate research and 242 into industry. If the best students stick to pure science, it is enough to account for the fact that in this field the products of British universities are second to none, but that in the field of applied science the deficiency, in quality and quantity, is glaring.

Academic life, of course, has attractions of its own that have nothing to do with money, and no doubt it will hold its own against the blandishments of industry. But not so the schools. The relatively high salaries offered to young science graduates in industry have led them to look with great disdain on the Burnham scale. The lack of teachers is serious because it will dry up the supply of scientists at the source; but it is an insoluble problem while the general shortage of scientists is so great, for obviously the science master cannot be paid more highly than the man who teaches history or English. The end of the period of rearmament may mitigate it, but against

that, industry's demand for technical graduates is likely to increase steadily as competition becomes keener and as the conviction of their value takes root.

The fact that he gets a high salary on starting in industry does not mean that the technical graduate is handsomely rewarded throughout his career. He is apt to find himself in a back room with a specific piece of research to do, and little prospect of achieving a position of any responsibility. A few firms are very ready to promote technical men into high administrative positions, but more often the attitude is that their background is too narrow and too specialised to fit them for management. To this criticism the universities reply that as the frontier of knowledge advances there is more and more to cover in a limited time, and that they can give the science man a broader training only if they are allowed to keep him for an extra year. This attitude is not shared by universities on the Continent or in the United States. At the famous Technische Hochschule at Zürich, for example, a technical student gets a much more liberal education than he does in Britain. In the United States, too, the science and engineering courses at universities are

increasingly being given a humanistic element. The purist may object that this can only be a smattering, and that the average first degree in science or engineering at an American university is of no higher standard than the Higher National Certificate taken in British technical colleges. But the fact remains that a degree in engineering is the most usual background for management in the United States; and it seems to produce rapid technological progress. No one would wish to lower the exceptionally high standards of pure science in this country; but industry's technical efficiency depends as much on the run-of-the-mill technical men as on the rare and brilliant specialist, and some universities might well give more attention to producing the general competence and wider vision necessary to make distrust of the technician in positions of management disappear.

Meanwhile, is it essential that arts graduates be produced at their present rate to fill the positions of management for which scientists are considered unfitted? On the whole, industry wants only good arts graduates—people selected for exceptional potentialities. It has little use for the third or fourth class arts graduate from a not very distinguished university. These are the people who may in the future be difficult to place. Many of them must go into industry if they are to be employed at all. Now that they are so large, the arts faculties can no longer regard themselves simply as a source of recruitment for the professions and the civil service. Their graduates must find new outlets. But at lower levels of ability they have little to offer the business world that is not offered, at less expense and at a more teachable age, by boys just leaving school. If these graduates were scientists and technologists, on the other hand, their value would be in no doubt.

When it was decided to double the output of graduates in science and technology it was decided that the output of arts graduates should be doubled also. This desire to preserve liberal education deserves every sympathy, but it cannot seriously be maintained that its influence is threatened when, even now, about 43 per cent of the total number of university students are reading arts subjects while only about 33 per cent are studying pure and applied science. Very few people would wish to see the universities regarded as vocational education. But the needs of the economy, as well as the employment prospects of graduates, also need consideration. There does seem to be a case for some shift in the university population to a greater emphasis on science and technology at the expense of the arts.

To say that a retreat from the arts appears to be desirable is not to say that it is at present practicable. The universities cannot produce any more technical graduates than they are doing at present. Scientists are born, not in the universities, but in the schools, where the shortage of teachers keeps their birth-rate low. The faculties concerned, moreover, require special buildings and equipment, and are far less easy to expand than arts faculties. But the question whether such an expansion should be aimed at in the long run requires careful reconsideration. Meanwhile, the contact between the universities and industry which is to take so many of their products needs to be greatly strengthened. It has become much stronger in recent years, thanks partly to the lead given by the Federation of British Industries. But there is still scope for improvement if industry is to make the universities aware of its needs, and students aware of its possibilities. There are still complaints on both sides: the appointments boards think that industry could do more, by means of brochures, for example, or perhaps short vacation courses, to show the prospects they offer. Some firms, on the other hand, say that representatives of the appointments boards do not seem to have the time to get to know industry at first hand. Compared with the cold shouldering of prewar days the relations between the universities and industry are effusively cordial; but compared with the relations that exist in some other countries they still amount to mere acquaintance. There should be the closest co-operation.

NOTES OF THE WEEK

Transport in Confusion

The House of Commons showed much passion in Wednesday's debate on the Transport White Paper, but most of it seemed highly synthetic. It may be good party tactics for the Opposition to rake up Mr Lennox-Boyd's pro-Franco past or for Mr Churchill to taunt Mr Morrison with having been a conscientious objector thirty-five years ago. But it is hardly relevant to the merits or demerits of selling lorries back to private owners and imposing a levy on road haulage.

The vehemence with which each front bench put its case was no doubt intended to hide a certain vagueness in its attitude. Mr Churchill promised to be "affected" by informed public criticism of the White Paper's proposals while the Bill is being drafted—which is to be done by July. This was his recognition of the strong criticisms of the Government's proposals within the Conservative party, criticism which is not confined to the back bench enthusiasts. On the other side, Mr Morrison, though categoric in his threat that Labour would re-nationalise road haulage, was deliberately vague about the amount of compensation which would be paid. Neither the Government nor the Opposition went into much detail on the real points—the performance of road transport under nationalisation and the nature of the changes which private ownership would bring. It was left to a Tory back bencher, Sir Ralph Glyn, to make the best speech of the debate; and the burden of it, based on long experience in transport, was that the White Paper policy would not work.

But the rights and wrongs of the Government's method of denationalisation were not the central issue of the debate. It became at least as much a debate about how the Labour party would re-nationalise once it got power again. This exemplifies the sense of instability which haunts the Conservative party at Westminster. It has allowed Labour to regain a sense of initiative. Underlying the Tories' concern about transport is a fear not merely that they may not last their full term, but that they have already lost the next election. It may be difficult to avoid thinking that a Labour victory is likely, but if the Tories allow themselves to live in fear of it, or even to give the impression of fear, they will corrupt their own efforts now and they will also make their defeat in truth quite certain. On transport, as on other issues, they have no choice but to be bold and clear-headed. And in the drafting of the Transport Bill, there is need—and, fortunately, there is still time—for much more clear-headedness than has yet been shown.

Wages and the Moon

Mr Butler's appeal last week to the trade union leaders to restrain their members from demanding more money has every merit except that they cannot respond to it. Most unions were committed, long before Mr Butler spoke, to what has now become a general campaign for higher wages. Their leaders can scarcely be expected to reverse this process, for if they do they are likely to be replaced by people who care a good deal less for the nation's interests. Mr Butler waited until the unions' vernal wage claims were well and truly launched before explaining, with any memorable emphasis, that they were likely to cause a national disaster. When the late Sir Stafford Cripps uttered similar warnings and made a similar appeal in February, 1948, he did so before the representatives of six million workers were pledged to secure wage increases. He did not ask them to reverse a process just when it had gathered momentum.

Mr Butler's appeal was, unfortunately, lame as well as late. All that he had to say about the cost of living was that there was "a real chance of stabilising prices" and that the Government was anxious "to do whatever is in its power to keep prices down." So vague a statement cannot help a trade union leader to persuade his members that if only they will postpone their wage demands they will be at least as well off. And it was unfortunate that Mr Butler timed his appeal almost to coincide with what the Communists can easily represent as a lightening of the Excess Profits Levy to the employers' advantage.

It would, admittedly, have been difficult for Mr Butler to get any better result. But there was no point in crying for the moon. A more limited and definite appeal would surely have been better. If Mr Butler had held out a firm hope that, with wage stability, the cost of living might be stabilised by a specific date in the foreseeable future, some union leaders might have been able to do what he asked of them. As it is, lacking anything but patriotic exhortations, they will have to continue to press their members' claims—while employers, citing the same exhortations, will oppose them more stubbornly, Mr Butler's warnings were fully justified; but he (and the country) will be very lucky if they have any effect.

Fine Words

Last weekend the White Rock pavilion at Hastings echoed with courage, determination and lofty sentiments. The Liberal party was holding its annual conference. It shows no inclination whatever to give up its heartbreaking electoral battle. Indeed, Mr Frank Byers said that the mistake they made at the last election was to fight on too narrow a front. Faith in the unique contribution of the Liberal party remains. Mrs Gorsky, in her presidential address to the Women's Liberal Federation, said:

> There is only one path to security and prosperity. The path of courage to meet all comers freely without fear, proud in the knowledge that British goods and British workers, not afraid of hard work, can face the world and prosper. Only the Liberal party is ready with distinctive policies to meet this challenge.

The "distinctive policies" were outlined in a resolution called "A Radical Programme" which was put to the conference. This showed no more realism than is evident in the Liberals' electoral strategy. They have no qualms about including in a political programme such items as the establishment of a "world authority for peace"; and the contradictions in policy that result from the party's fission into left and right wings are veiled by the vague terms in which the policy is described. The Liberals would like to sweep away the food subsidies, for example, but the Women's Liberal Federation is concerned with the "drastic reduction" of the standard of living. The conference will leave the public no wiser about what the Liberals really are driving at.

The nearest thing to realism was the speech in which Mr Frank Byers told the conference of the efforts that are being made to improve the party organisation. He also suggested one way in which some more Liberals might find their way to Parliament. He warned the Conservatives that unless they introduced electoral reform they would find themselves voted out at the next election, for those who were tired of them would have to vote Labour. To pin hopes to Conservative fears in this way is certainly a slight basis for the Liberal party's future, but it is regrettably difficult to see what more promising ground there is for its faith.

* * *

Atlantic Weekend

There lies ahead a week of much coming and going of Atlantic personalities. General Ridgway takes over Supreme Command in Europe from General Eisenhower in three or four days' time, and engagements in Washington have deprived him of the experience—planned by some incautious person—of arriving in Paris on a Sunday, the day when the city's Communists put on their biggest and best demonstrations. The Foreign Ministers of the Big Three should be signing early next week with Western Germany the general convention that gives it something very little short of sovereignty; they should then sign, if they have not done so already, the much battered and disputed treaty for a European Defence Community. Then the summer campaign of the cold war will open.

It is a dangerous moment for prophecy, but one thing is certain. Whatever the Russian reaction to these challenging acts of policy, there will be plenty said about them by their critics in Germany, in Western Europe, and in this country. The British taxpayer will want to know how much the agreed German defence contribution leaves him to pay after 1953 for the British forces in Germany. Frenchmen will waver between saying that the EDC has too much authority over the French Army and too little over the German. Germans will be trying to find out what kind of bargain Dr Adenauer has struck. It is likely to be an excellent one by any normal peacemaking standards, but the Social Democrats will want to keep their leadership of what they believe to be national feeling. They will ask how an all-German government, if such a thing came to pass, would be bound by the engagements of the general convention with the Allies and by the pledges of the EDC. They will do their best to shake the confidence of Germans in the packaged settlement of external problems that the Chancellor has won for them.

General Ridgway takes over at a real turning point in Nato's affairs and will find that his main difficulties are political. He would be well advised to look around carefully, test the ground and work out a policy of his own. Europe takes leave of General Eisenhower with admiration and deep regret, but also with a feeling that the role of Supreme Commander now needs playing in a fresh style.

* * *

Soviet Tactics in the Eastern Zone

Russian intentions towards Berlin when the agreements between the Federal Republic and the western powers have been signed are still obscure. The Soviet military authorities appear to have grown tired of their cat-and-mouse games with the allied military patrols on the Helmstedt autobahn; and neither the Russians nor the East Germans have said anything to elucidate the dark threats uttered by Herr Ulbricht nearly a fortnight ago. Presumably this atmosphere of doubt and uncertainty is just what the Russians want to create.

In the Soviet zone proper, however, the aims of present Russian tactics seem fairly plain. In the first place, they are trying to convince the East Germans of the necessity of a national army to protect them from the "aggressive designs" of Dr Adenauer and his American and British masters. With this object in view, the East German authorities are every day unearthing fresh examples of the alleged activities of western-paid spies, saboteurs and terrorists. In their trials, which are given the widest publicity, these agents are accused of a wide variety of crimes ranging from attempts to blow up the shipyard at Warnemuende to attacks on newsvendor stands in east Berlin. These trials are bringing their expected sequel in a series of resolutions by factory workers demanding "increased protection" from the authorities. The pattern is only too familiar.

In the second place, measures are being taken which can have no other consequence than to isolate the Soviet zone more effectively from the rest of Germany. The armed "people's police" have been given the sole authority to issue inter-zonal passes and the residential permits which visitors from Western Germany must have. Minor railway crossings between the western and Soviet zones have been closed without warning. Frontier villages have been incited to complain of "provocations" by American and West German police. East Germans working in the western zones have had their inter-zonal passes confiscated and have been forced to accept employment in the Soviet zone. Such tactics may only be part of the Russian campaign to secure their ends by fear and uncertainty, but they hardly square with the professed Soviet aim of free elections throughout Germany. The iron curtain is getting tighter not looser.

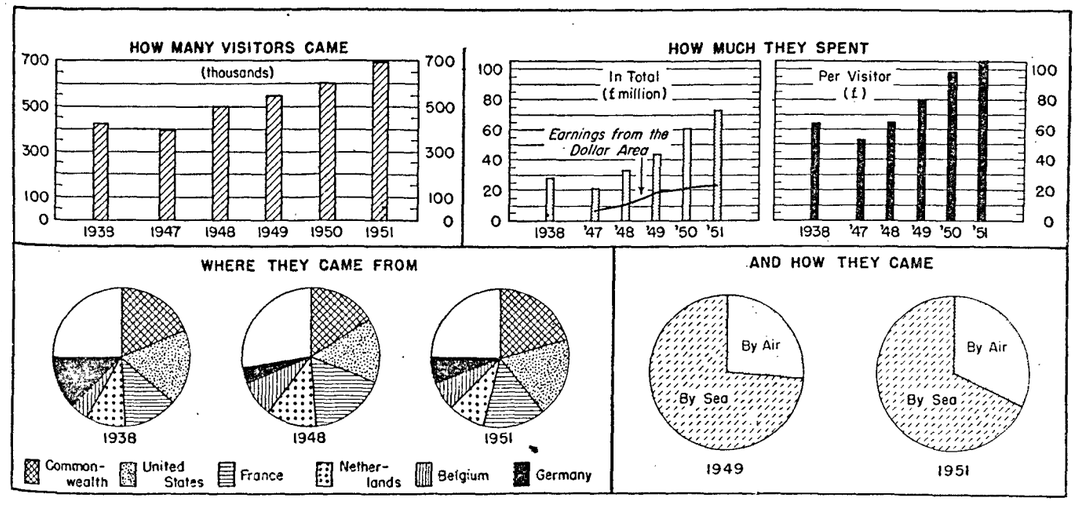
* * *

Cairo and the Sudan

A verbal reply from Egypt to the British Government's latest proposals has reached London. It was delivered on the eve of Mr Eden's departure for Germany; British foreign policy, in contrast to that of Egypt, has on its hands a number of problems just as important as the Anglo-Egyptian dispute. The reply has therefore not been published; but it is known that, while not slamming the door to further talks, it rejects British insistence that the Sudanese be consulted before the King of Egypt is recognised as King of the Sudan.

Meantime, a statesmanlike attempt to break this deadlock has been made by the Egyptian premier, Hilaly Pasha. Departing from the usual Cairo attitude of listening only to the Sudanese who favour union with Egypt, he has invited the leader of the principal Sudanese independence party, Sayed Sir Abdel Rahman el Mahdi Pasha, to send a delegation to Cairo. Sir Abdel Rahman is said to think that a delegation of a wider nature might serve the purpose better; but he, too, is in favour of the talks.

Anybody who wants to see settlement of the dispute must warmly welcome this new departure, and must hope that neither side will set conditions of acceptance with which the other cannot fall in. The Egyptian public, misled for so long by news that it likes to hear, is being told that immediately brother meets brother all problems will melt away. The prospect is unfortunately not so bright, for Sudanese opinion is divided and the whole of it does not concur in Egypt's views. If the talks are to come to fruition, therefore, the Egyptians taking part will have to listen to some ideas that are not entirely to their taste.



* * *

Old Mother Hubbard

Britain is in for a lean time; its larder is becoming empty, and rations will fall. Instead of the normal spring increase in the meat ration, the British consumer must wait until June 15th when the price of meat and the ration will

Britain's Tourist Trade

In Festival year, 87,000 more visitors than in 1950 came to Britain—an increase of 14 per cent. Although a large rise, this did not do much more than continue the upward trend of recent years. The increase was mainly in visitors from Europe and the Commonwealth; the numbers from the United States rose by only 2 per cent. Nevertheless, the proportion of visitors coming from the United States was a little higher than in 1938 and appreciably higher than in the immediate postwar years, when European visitors, particularly French and Dutch, were proportionately more numerous. Tourist earnings (the amount spent in this country by overseas visitors) have risen from £28 million in 1938 to £73 million last year; about one-third of this 1951 expenditure was made by visitors from the dollar area. But average expenditure per visitor has only increased by about two-thirds between 1938 and 1951, so that, after allowing for higher prices, the average visitor spent in real terms only about four-fifths of the 1938 amount.

be increased together. The so-called "spring flush" of eggs has again failed to make an appearance, although the Minister of Food assured the House in last week's debate on food supplies that the total allocation for the year will be larger than in 1951. Butter is rapidly becoming "something like a luxury food," and a reduction below the present ration of 3 ounces a week appeared, to the Minister, unavoidable. The gloom continued: "we shall be hard put to it to maintain the present ration of one ounce a week [of cheese] towards the end of the year." The margarine and sugar rations are to be maintained. The only bright spot is the increase in the tea ration from 2 ounces to 2½ ounces a month earlier than had previously been announced.

To some extent, this gloomy prospect reflects the balance of payments. If Britain had the dollars, sweets and sugar rationing could be abolished. The United States and Canada both have ample supplies of cheese; enough could certainly be imported from them to offset the decline in shipments from New Zealand and Australia. There are also ample supplies of vegetable oils in the world, but again Britain cannot buy them.

The balance of payments is not, however, the only reason for continued and smaller rations. Australia, Britain's second largest source of supply, has exported no butter since February 9th; from the beginning of last July until April 19th its total exports were 92 tons, compared with 995 tons in the same period of 1950-51 and 1,841 tons in the corresponding period of 1938-39. This is but one example, and it is a good illustration of what is happening in countries that are Britain's main food suppliers. Production is declining and home consumption is increasing. Admittedly, there has been a drought this season in Australia, but output began to decline before it. The larger shipments of meat from New Zealand this year are not, unfortunately, a reversal of a declining trend. The lambs were not slaughtered last autumn in order to get the spring clip of wool, so that this year's increase is only offsetting the reduced supplies last year. If agricultural production is to be expanded prices must be paid that will induce such an expansion, and farmers must receive those prices in the form of net income. This, of course, will mean higher prices for the consumer, but the Ministry of Food cannot much longer go on refusing to pay them on his behalf. Or does the present Government, like its predecessor, prefer that people should live in butterless equality?

* * *

Foot-and-Mouth

New outbreaks of foot-and-mouth disease are still being reported from widely spread parts of the country, and the veterinary facts remain obscure to the experts as well as the layman. The Ministry of Agriculture has decided only this week that calves can carry the disease to healthy stock without themselves showing its symptoms. This makes the policy of slaughtering animals that have been in contact with a known case an even more hit-and-miss method of restricting the disease than had been supposed. On the other hand, it strengthens the case for controlling the movement of stock—about which official policy is less strict than about slaughtering. It is difficult to resist the impression that the Ministry of Agriculture, not being sure what is best, tends to shun measures that cause inconvenience to all farmers and the public; but slaughter, with compensation, hurts severely only a few farmers whose years of work in careful breeding is undone because one animal contracts foot and mouth.

Both sides to the controversy over the slaughter policy accuse the other of panic—and both have some justification. The defenders of slaughter say that it should not be judged by the losses it imposes at the height of a widespread outbreak. Over a period of years, they contend, it keeps this country relatively free of a disease that is endemic on the Continent, and does so at a cost which, averaged over the years, is very reasonable. The opponents of slaughter reply by asking if the avoidance of the disease is the one object, to be secured above all others. If so, then obviously slaughter is right, since foot-and-mouth could be avoided completely by having no cloven-hoofed animals at all in the country. But plainly the object of agricultural policy is to have an adequate number of highly productive animals. The slaughter of healthy stock—some 40,000 animals have been killed since November—is tragically wasteful when so much needs to be done to raise the quality of British livestock, and particularly to get rid of tuberculous animals. This must inevitably be delayed if the animal population is seriously reduced by slaughter for foot-and-mouth—which since human beings do not catch it, would have to be widespread indeed to equal the damage to the country's health done by tuberculosis.

Slaughter cannot, in any event, be altogether ruthless. In practice, it is generally limited to one farm, although animals in neighbouring fields—and, since the disease is carried so easily, much farther away—have also been exposed to infection. In a real epidemic such as the present, this limited slaughter policy is plainly inadequate to prevent a considerable spread of the disease. There would therefore seem to be a case for at least experimenting with other methods in limited areas: for example, farmers might be allowed to choose between slaughter and an attempt at isolation and treatment under very stringent conditions—stringent enough to make the risks of infection little, if any, greater than they are at present. Slaughter is so extreme and painful a policy—and, at least at first sight, so unscientifically heavy-handed—that the Minister cannot afford to make it a dogma. He should be ready to re-examine it frequently and thoroughly.

Commonsense in Chicago

Mr Gaitskell's recent speech in Chicago, addressed to an influential businessmen's club, was aimed at a more appropriate target than any of the official protests against threatened increases in American tariffs. If no more irrationally protectionist sentiments than those of the United States Administration had to be taken into account, the world economic outlook would be much brighter. This does not mean that American business opinion is universally protectionist; but business leaders who champion liberal policies are apt to encounter the unanswerable argument that no trade organisation failing to press for maximum protection for its members' products can survive the resulting loss of subscriptions. Thus, trade by trade, the high protectionists call the tune. Mr Gaitskell rightly asked American business opinion to "stand back and look at the tariff situation as a whole," to contemplate "some decision as momentous as Britain's free trade policies of the nineteenth century." Only in such a context do the claims of sectional groups fall into a proper perspective and their common interest in freer trade emerge.

The general gains of free trade are less obvious and less capable of arousing a politically effective emotion, in a country like the United States, whose imports are comparatively dispensable, than in a nineteenth-century Britain hungry for cheap imported food. Where the particular losses of free trade are concerned, however, nineteenth-century Britain affords a much closer parallel. America holds today, but in far fuller measure, what Britain held a hundred years ago—an economic initiative, derived from a long lead in productivity, which gives power to shape the international division of labour. Business men, workers and governments of other countries have to adapt themselves as best they can to this initiative; it is on them, rather than on their American counterparts, that there falls the incidental cost and loss inseparable even from economic changes that are in the long run most beneficial.

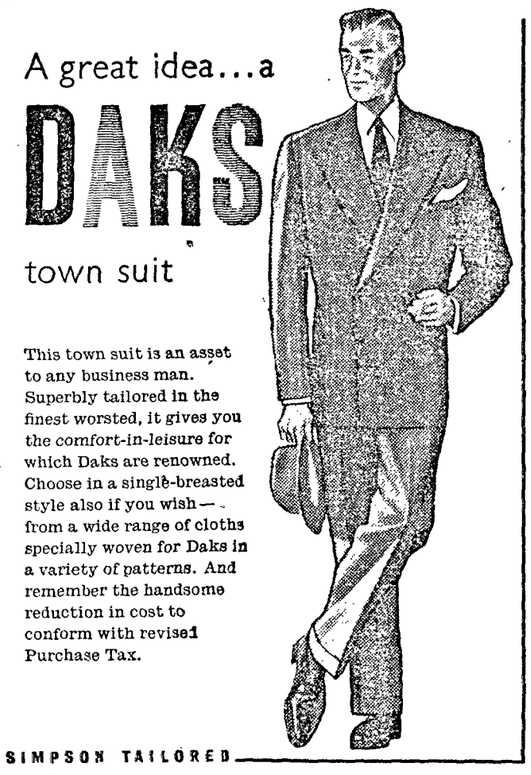
This consideration is already paramount with a certain school of left-wing opinion; it could end by making present barriers and discriminations against American imports a permanent and deliberate feature of European policy—which is the last thing American business wants. It is overwhelmingly reinforced by American actions suggesting that no adaptation, however courageously and effectively carried out, will be allowed to reap its reward; that when it is the turn of American business to adapt, however slightly, to the consequences of its own initiatives, it will always boggle at the necessity. Mr Gaitskell may be wise or unwise in pressing for an international conference to consider the dollar problem, the maintenance of full employment and the development of backward areas; the Bretton Woods analogy is not over-encouraging. But for his direct appeal to American business opinion there can be nothing but congratulation.

* * *

Secession from South Africa?

A new twist has been taken this week in the battle for South Africa. Senator Heaton Nicholls, speaking for the Opposition, has given public expression to the threat, already discussed in private for several weeks, that Natal might secede from the Union if the government presses on with its policy of overriding the constitution on the issue of coloured representation. This has followed Dr Malan's announcement last week that the British failure to transfer to South Africa responsibility for the protectorates of Bechuanaland, Basutoland, and Swaziland could not be tolerated indefinitely. The position of the Nationalists in parliament is by no means strong enough for them to face the possibility of losing votes if next year's election is fought on the constitutional issue, and their dictatorial attitude is causing a good deal of uneasiness among their marginal followers. There was always, therefore, the probability that Dr Malan would strike at his opponents by launching an issue on which opinion could be expected to rally behind the government. The question of the protectorates certainly has this effect. However sincerely the United Kingdom may believe that it cannot ever transfer the trust to which it is pledged in the interests of the African inhabitants of the protectorates, this is not a point of view likely to appeal to South Africans, of any political colour, now that they are in every respect equal partners in the Commonwealth.

The attitude of Natal, however, puts a new complexion on Dr Malan's chances of carrying South Africa along with the extreme Nationalist segregation policy of *apartheid*. Natal is, as it always has been, predominantly British. It was an independent colony for many years before the Act of Union. Whether constitutionally or not, it could well become so again—or a self-governing dominion. Its secession would be a grave loss to the Union and would certainly mean that the Nationalists had cut off their nose to spite their face. For Natal would be in a strong position to drive a hard bargain with the rump of the three other provinces. Not only is it fully capable of supporting itself but secession would bring overnight a flood of foreign capital for development. Moreover, the port of Durban handles more cargo than all the other ports of the Union put together, and the Union could ill afford to lose this outlet. Equally, in the military sphere, Natal would be able to meet all the essential requirements of Commonwealth defence and this would deprive the Union of much of its importance in the strategy of Africa.



The United Party is not enthusiastic about secession, since it would wipe out the party as an effective political force in the rest of the country. But more and more voices speak in favour of salvaging something from the wreck to which Nationalist policies appear to be leading South Africa, and Dr Malan must be aware that the threat offered by Senator Nicholls is a real one.

From Expansion to Stagnation

A few years ago Western Europe suffered from a shortage of statistics. Data had to be estimated or more often guessed. Now there is almost a surfeit of statistics and the Organisation for European Economic Co-operation is at least to be congratulated on this achievement. But what is lacking is a clear analysis of Europe's difficulties. The OEEC's new report,* on economic trends in Western Europe in 1951, does not pretend to be an analysis; it merely draws attention to certain salient features. The first is that the rate of increase in industrial production in Western Europe is slowing down. That is perhaps inevitable after the period of postwar rehabilitation and recovery. The increase between 1948 and 1949 was 12½ per cent, between 1949 and 1950, 11 per per cent and between 1950 and 1951, 9½ per cent. These figures are in no way alarming. But the quarterly figures for last year show a much more disconcerting trend; the table on page 508 shows quite unmistakably that in almost each successive quarter the percentage increase over the corresponding quarter of 1950 declined and in the last quarter it was no more than 3.6 per cent. The rise in agricultural production shows a similar trend—rising, but at a declining rate—and the increase in 1951-52 over 1950-51 is expected to be only a few points.

On the industrial side, the shortage of key materials limited expansion; another cause was the measures taken by certain countries to control inflation, and yet a third the fact that hitherto unemployed resources were being fully utilised. But more recently a more important cause has been the falling off in demand. This was particularly noticeable for textiles and clothing and also for other consumer goods. The production of capital equipment is apparently still expanding and unemployment generally is still only a small proportion of civilian working population.

* Third Survey, prepared by OEEC for the Council of Europe.

be incr in consumer demand may be only the normal eggs on to the abnormal buying spree of the Korean boom—M pause before the further rise. It may, however, have deeper roots. Full employment can be bolstered up for a time by inflationary conditions. But sooner or later the inflation must be checked or the gold reserves allowed to

Italian Election Prospects

Election prospects for the association of the four constitutional parties which have at various times been in the De Gasperi government have continued to improve as polling day on Sunday has drawn nearer. The Christian Democrats and the Republicans still form the coalition, while the right wing Socialists (PSDI) and the Liberals have been out of it for over a year. While this improvement has not been enough to make the group's chances very good, two factors have moved in the Christian Democrats' favour. The first is the change in the tactics of the Church. At the opening of the campaign the Vatican wanted to bring the Christian Democrats into an electoral alliance with the extreme Right. But it has lately realised that, having failed to secure adequate backing for this policy throughout the party, it was in danger of seriously splitting the anti-Communist vote, particularly in Rome itself, in Naples and in Bari.

Secondly, if one of the more explicit of ex-King Umberto's many interviews with the Italian press, he has said plainly that he looks back to the last months of Mussolini's regime—the "Social Republic"—as a deplorable parenthesis in the otherwise civilised traditions of Italy. This is a most unpleasant knock for the main Monarchist party which has allied itself with the neo-Fascist MSI, the heir to the traditions of the period in question, and it may incline many who had thought of deflecting their votes to the extreme Right to vote again for the Christian Democrats. The Christian Democrat group is now expected to win in the capital. It may fail to hold Naples, but there seems little chance of the camouflaged Communist lists capturing this important southern city.

In the rest of the south the great swing to the Right, long expected and referred to lately by Signor Nenni as a virtual certainty, may prove to be only moderate. The extreme Left shows no sign of a victorious mood; one of its main victories may be in Ferrara, one of the few northern municipalities voting on this occasion. Meanwhile events in Sicily, even in the main centres of Palermo and Catania, are deprived of drama by the obstinate and prudent refusal of the Sicilians to give up their traditional and simple proportional representation in favour of the complex and risky system adopted on the mainland.

* * *

The Scholarship Stakes

The winning of an open scholarship at Oxford or Cambridge is still the crown of a schoolboy's career. There are other universities; and there are, nowadays, many other forms of award from the state and from local education authorities. The vast majority of university students in this country hold awards of one kind or another, most of them given on some kind of test of academic attainment. But the scholarship and exhibitions awarded by the Oxford and Cambridge colleges after competitive examination still stand in a class entirely by themselves as a test of the merits of the schools and their scholars.

Mr. N. Whatley has now contributed his annual analysis of these awards to the *Oxford Magazine* and *The Times Educational Supplement*, and as has been our practice for several years past, a summary table is printed below:—

SCHOOLS WHICH WON EIGHT OR MORE SCHOLARSHIPS OR EXHIBITIONS AT OXFORD AND CAMBRIDGE IN 1951-52

	No. of Boys	Oxford	Cambridge	Total
1. Manchester G.S. (1)	1,365	7	18	25
2. Winchester (2)	500	18	7	25
3. Eton (8)	1,160	11	11	22
4. St. Paul's (5)	690	9	9	18
5. Marlborough (4)	760	4	12	16
6. Rugby (3)	675	7	8	15
7. Bradford G.S. (7)	988	8	6	14
7. Clifton (6)	574	2	12	14
9. King Edward's, B'ham (10)	680	3	10	13
10. Christ's Hospital	834	8	4	12
11. Dulwich	1,200	3	8	11
12. Bristol G.S. (9)	1,013	7	4	11
13. Harrow (14)	550	7	3	10
14. King's, Canterbury	600	5	5	10
15. Ampleforth (7)	422	4	6	10
16. Sherborne	541	3	6	9
16. Westminster	371	7	2	9
18. Charterhouse (11)	622	2	6	8
19. Wellington	620	4	4	8
20. Liverpool Collegiate	657	3	5	8

The figures in brackets show last year's order. Where there is an equality between two schools in total awards, but one has gained more scholarships than the other, it is given the priority.

To summarise in this way does some schools more, and others less, than justice. For one thing, it is not practicable to exclude the "closed" awards (i.e. those where the competition is limited to certain classes of candidates, sometimes to those from one school only); there are not many of these, but they may inflate the figures of certain of the older founda-

INDEX

The Index to *The Economist* is now published quarterly. Subscription rates are **5/-** a year; single copies are priced at **2/-** each. The Index to Volume CLXII (January to March, 1952) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

tions. On the other hand, schools are of different sizes. A column has been added showing the number of boys at each school; but this does not tell the whole story, as some recruit at a lower age than others, and some lose more of their boys before the sixth-form stage. For a school of less than 500 to get into the list is an achievement, and there are some small schools which did very well without getting into the list at all. Leighton Park, for example, with only 220 boys, secured six awards, five of them scholarships. Bradfield and Bryanston, with less than 400 boys, each gained six awards.

The total of awards in the two universities was 854; of these, 841 were won from schools which fall into one of the recognised categories, as follows:—

	Oxford		Cambridge	
	No. of Awards	Per cent	No. of Awards	Per cent
Independent	212	56·25	227	48·9
Direct grant	51	13·5	75	16·2
Maintained	114	30·25	162	34·9

"Independent" schools are those which are entirely self-supporting; "maintained" schools belong to the state system; "direct grant" schools are an intermediate category.

The differences between Oxford and Cam
explained by any difference in social or
but simply to the fact that Cambridge gives
awards in those subjects (science, mathematics,
guages and—particularly and surprisingly—Engl
which the maintained schools do relatively well, and few
classics and history, which are still largely the preserve
the independent Public Schools.

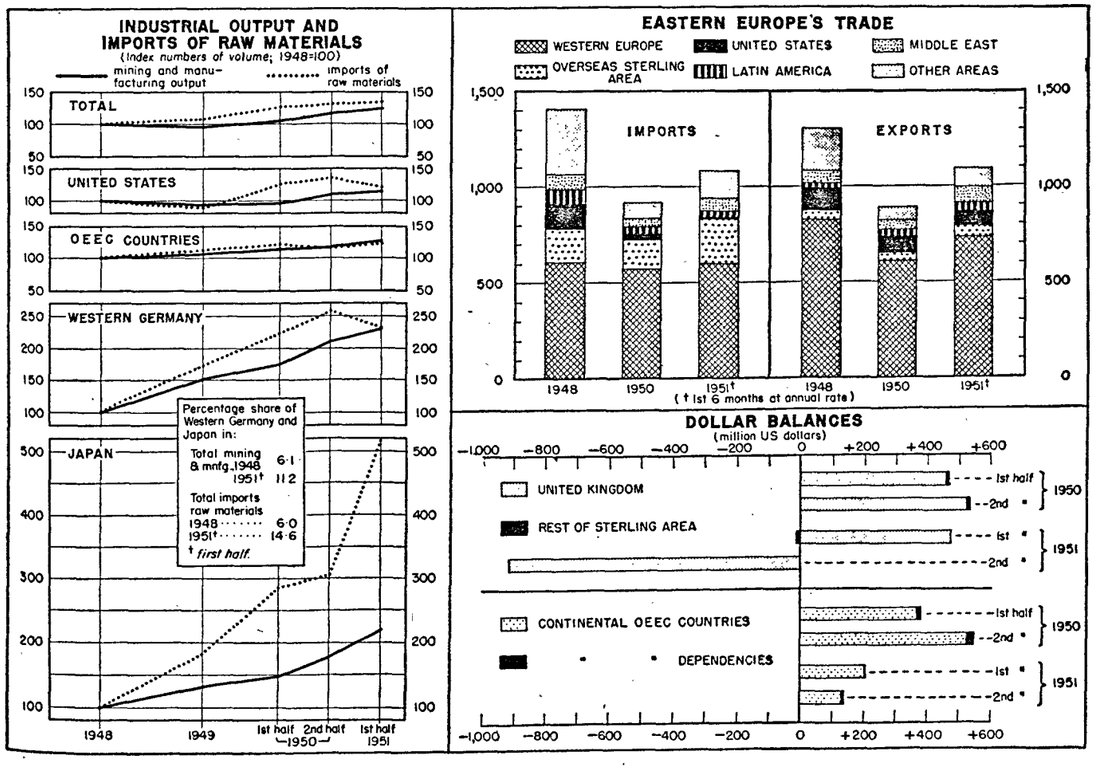
Housing Extravagance



Some light on the dark corners of public housing finance is shed by the second issue of an annual survey of housing statistics compiled by the Institute of Municipal Treasurers and Accountants.* This survey is for the financial year 1950-51, and it covers the accounts of the London County Council, all county boroughs, and a fair proportion of other local authorities in England and Wales.

It reveals some disquieting facts. The capital cost of a 3-bedroom house and ancillary services completed during the year varied among local authorities from £1,113 to

* Available from the secretary, 1, Buckingham Place, S.W.1. Price 7s. 6d.

Changes in World Economy 1950-51

The following charts are a further selection based on information contained in the World Economic Report, 1950-51, prepared by the Secretary-General of the United Nations. The chart on the left hand side shows the increase in imports of raw materials compared with the rise in mining and manufacturing output based on 1948. In Western Europe it was equal to the rise in industrial production during the same period. In the three other countries imports of raw materials up to the end of 1950 showed a much sharper proportionate rise compared with 1948 than the increase in their industrial production, indicating that stocks of raw materials were accumulated. The top chart on the right-hand side shows the pattern of trade for Eastern Europe in the three years 1948, 1950 and 1951. The bottom chart shows increases and decreases in dollar balances held by the sterling area and continental OEEC countries in the first and second halves of 1950 and 1951.

be incr. This range is wide enough to warrant the most eggs.ful scrutiny of their costs by authorities in the upper Minges. The average net rents charged by local authorities for postwar 3-bedroom houses varied even more widely—from 9s. 3d. to 29s. 3d. a week. In order to keep rents down, many local authorities paid extra subsidies out of their general rate fund in addition to the statutory rate subsidy. Another favourite device was to raid balances in the repairs fund held over from wartime, a practice which the present Housing Bill attempts to stop by raising the minimum annual contribution for repairs from £4 to £8 per house. The LCC was notably extravagant under both these heads. Its repairs account was run down by over £600,000, while it supplemented its statutory payments of £775,000 for housing with an additional £665,000 from the rates.

These unsound methods of finance, to which the desire to keep rents low leads many local authorities, build up a heavy burden for future ratepayers. Public housing is already sufficiently subsidised without the additional subventions and subterfuges which this survey shows to exist—and whose cost, moreover, will progressively increase. Unfortunately, the Government's increase of the Exchequer subsidy cannot fail to encourage councils to continue their own shortsighted varieties of extravagance.

* * *

No Change on Equal Pay

Once again the champions of equal pay for equal work by men and women have received a stonewalling reply from the Treasury. At the end of last week a private member's motion called upon the Government to announce "an early and definite date" for beginning the application of equal pay in the public services. Mr Boyd-Carpenter's reply, like that of Labour ministers before him, was to the effect that the present Government agreed with the principle but, because of the financial state of the country, could not possibly agree to increasing the cost of the public services by £28 million, with a considerably bigger increase elsewhere.

A Labour member pointed out that in February, 1948, the staff side of the civil service Whitley Council saw Sir Stafford Cripps about a scheme for the gradual application of equal pay on the morrow of the beginning of the wage freeze, and that last week's debate was taking place on the morrow of Mr Butler's appeal for wage restraint. Mr Boyd-Carpenter did, in fact, use this argument. None of the supporters of equal pay will, however, be satisfied with it, and the Civil Service Clerical Association has passed a resolution at its annual conference calling for vigorous action to press the Government "to carry out the will of Parliament."

But with the best will in the world the Government cannot name a date for introducing equal pay. Equal pay will surely come, probably by stages on the lines of the scheme put forward by the civil service. Mr Boyd-Carpenter did indeed go one step further than previous ministers by announcing that the Government intends to examine all the devices that have been suggested for minimising the inflationary effects of equal pay. He hinted that discussions with the staff side of the civil service would follow. That is probably as much as any government could say at present. On the other hand, any government is always likely to find the time unripe for introducing equal pay—unless a general election is approaching. It is right, therefore, that the pressure should be kept up; but it is to be hoped that the advocates of equal pay realise the corollary of introducing it—that in a time of anything less than full employment more women than otherwise would lose their jobs.

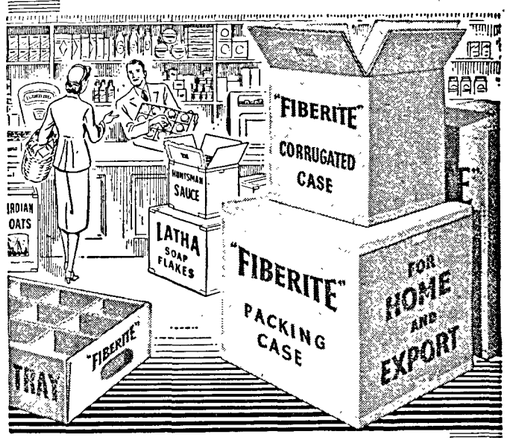
French and English

An interesting proposal is to be debated by the Strasbourg Assembly at the end of this month. It is that French should be taught to all English-speaking, English to all French-speaking children, and one or other of these lauguages to children of other nationalities. The plan is a French one emanating from *L'Association "Le Monde Bilingue"* under the stimulus of M. Alfred Coste-Floret. The Association rightly holds that some linguistic measures must be taken to strengthen the unity of the free world and counteract Soviet policy which, from Berlin to Vladivostok, is establishing Russian as the second language of the East.

> Europe will never be united if [its peoples] remain aliens to one another. The European Army will remain a pipe-dream if all the troops it must bring together . . . call to mind the Tower of Babel.

The sponsors of a bi-lingual world regard English as the already established utility language and French as most representative of European culture.

The hub of the question is clearly: which language is to be taught to the unfortunate non-English and non-French? M. Coste-Floret remarks that "the others" should preferably all choose *one* of these languages but does not commit himself to the obvious necessity of their choosing English. French has certainly a central position in European letters and might usefully supplant Latin as a basis of higher universal education; but for communication between Danish and German platoon-commanders it is next to useless. The trouble is that the elegant abdominal vowels of the French language, so well suited to indoors diplomacy, do not carry in the open. It is also doubtful whether the forceful French of the Foreign Legion, in which the subjunctive is scarcely ever used, could be formulated for general consumption. The truth is that French without frills is not French at all whereas English can still be conveniently murdered, as it has been the world over for the last two centuries. *Le Monde Bilingue* will speak as its foreign tongue either Queen's French or pidgin English.



The Press of England

Happily, for the press of England, it has been left free, and it is at once more useful and more honest than the press on the Continent. The several members of it watching over one another make deceit ruinous; and wilful deception . . . never is attempted. If it have no subventions and no patronage, it has no censorship. It is heavily taxed, like several other industries, and has no peculiar awards. Its members do not claim, as a matter of right, professorships, councillors' places, or seats in the cabinet. Like other professions, it is a path by which clever men attain distinction, but it confers no honours. It is wholly independent of Government, and exclusively dependent on its readers. All the evils they feel, it expresses; it continually exposes abuses and helps to redress grievances. It does not stir up enthusiasm by indulging in glowing visions of an impossible nationality, nor by always dwelling on a departed glory which no skill can revive. It deals much less with abstractions than with material interests. It chronicles the every-day business of the whole people; and the sufferings of the lowest classes, the active pursuits of trade, and the brilliant trifling of the classes who are opulent enough to pass their time in amusement, equally receive notice in its columns. Our press is the natural growth of the national progress: it belongs to all the people, is a part of their daily lives, and is indispensable to civilisation. How long our press will retain its high, honourable, and useful position, is not to be foreseen. Our hope is, that it and the nation will increase in power and glory from age to age.

Facts on Films

The British Film Industry. A Report by Political and Economic Planning. 305 pages. 18s.

In all film producing countries outside the Iron Curtain but one, film making seems inherently unprofitable and exists only by virtue of Government subsidy—in spite of the fact that a proportion of screen time at all cinemas is reserved by law for the native product. Films made in the one exception take up from 35 to 80 per cent of screen time in the cinemas of all the others. Perhaps the main virtue of PEP's new study, which was suggested and paid for in part by the British Film Institute, is that it shows how common to all these countries—apart from that triumphant exception, the United States—are the problems that beset the British film industry.

Because the cost of an extra film print is so small in comparison with those incurred in getting a feature film on to the master negative, the film is, in theory at least, "infinitely exportable." Any producer has the strongest incentive to expand distribution of his product to the utmost, to seek and almost to saturate the world market. Given the cessation of film production in Europe in the first world war, and the size of the United States home market, it seems in retrospect almost inevitable that the American producers should have been able to establish their products throughout the world to such an extent that no other commercial film industry has ever regained the chance to compete on an equal footing without protection. But was it inevitable that no protected industry should graduate to profitability? So far, so it seems.

This study follows the reports of at least five official committees on British films, apart from much discussion and legislation, and PEP could not hope to turn up much that was new. What it has done is to set down well and concisely, and annotate, an account of the present situation of the industry and how it arose. Its conclusions, again, cannot be new; and its suggestions, in the main, are left to be inferred. This does no harm.

The report reproduces, and brings up to date in some cases, the statistics that are the ammunition common to all sides in the controversy over film economics, and it will no doubt be quoted variously, selectively, and tendentiously. But it wisely does not join the popular game of "Hunt the exhibitor." The cinema owner in Britain is mainly a retailer of American entertainment to a public brought up to prefer that entertainment. There would seem no obligation upon him to foster a competitive native producer who may offer slightly worse trading terms, to pay in addition special rake-offs to keep this competitor in business, or to try unduly to influence the taste of his patrons towards this alternative brand. The cinema business in Britain is making a living and perhaps a more comfortable living than its representatives are always prepared to admit; but that does not mean that it owes a comfortable living to British films.

Whether British films are to be made, the report concludes, therefore remains a question of national policy. British films may be earning overseas almost as much as from the home market, and this offers some hope for the commercial future; but, in general, as the report says,

> If the public considers it desirable for political, cultural or economic reasons that British films should be produced, then it must be prepared for the Government not only to protect the industry indefinitely, but also to aid it financially for as far ahead as can be seen.

Whether the public, given the facts, really would consider it desirable has never been made clear; but both the main political parties seem to.

Lost Illusions

Victorian Olympus. By William Gaunt. *Jonathan Cape.* 199 pages. 15s.

This is a book of unusual quality. Mr Gaunt deals with a subject far removed from the modern sensibility—the so-called classic painters of the Victorian age. Yet his style is so engaging and his critical apparatus so sensitive that any reader who comes to this book disposed to scoff at its theme will lay it down with a feeling of a tragic twist in the loom of time.

The Elgin marbles brought to England a revelation of the glory of Greece whose influence endured through the nineteenth century. In Mr Gaunt's phrase "the classical world made a new appearance in the land of the factory and the steam engine." The Greek revival was the inspiration of a school of painting that Mr Gaunt describes as the Victorian Olympus. Its members were dedicated souls. They found a moral purpose as well as an aesthetic thrill in the classic renaissance. The brushes of these artists, who had been sanctified by the vision of Greece, would wipe away some part of the hideous ugliness of Victorianism, or at least redeem its materialism. G. F. Watts, Alma Tadema, Albert Moore and E. J. Poynter are among the painters Mr Gaunt deals with; but his hero, the Zeus of the Victorian Olympus, is Frederic, Lord Leighton. It is extraordinary that Leighton, whose personality fascinated his age, is now so utterly forgotten. In his prime he was regarded as the match in painting of Tennyson in poetry; and, like Tennyson, he was rewarded by a peerage. But Tennyson is saluted today as still a fine poet, while poor Leighton's pictures are derided as dead academy exercises. One doubts if even Sir Alfred Munnings would forecast his artistic resurrection.

Twenty years ago, in the debunking era, this situation would have been treated with pert facetiousness. Today we are discovering a sympathy with the lost illusions of the Victorians. It is in tune with the modern temper that Mr Gaunt, with delicate skill and understanding, unfolds his Olympian tragedy. Frederic Leighton was a man of great general intelligence and many attributes. He looked like a marble Olympian; he had magnetic social charm; he would probably have made a successful politician or an ambassador of the Lord Dufferin type. Why did Leighton fail? asks Mr Gaunt. His book makes us appreciate that it was at least in a noble enterprise that Leighton failed.

Philosophy and Personality

The Logic of Personality. By Bernard Mayo. *Jonathan Cape.* 188 pages. 10s. 6d.

Philosophy to the amateur still tends to mean the purveying of comprehensive answers to omnibus questions about the nature of man and his place in the scheme of things. But during this century philosophy has come to mean something quite different to professional philosophers. Their main preoccupation has been with techniques of logical analysis, which help to show what kinds of question are being asked rather than to formulate comprehensive answers. Often, in this process of polishing tools, philosophers have become indifferent to many of the questions which lead people to an interest in philosophy. Scholasticism takes the place of metaphysics and the ordinary man is either bored or bewildered.

This book is, therefore, particularly welcome. For, though bearing the unmistakable stamp of modern philosophy, it deals with problems which are both intellectually exciting and practically important. "What is personality?" persistently puzzles the reflective person. The author points out that there is no straightforward answer to this question, but that, once certain important distinctions have been grasped, much can be said that is both stimulating and suggestive. In the first place we must understand the difference between knowing the properties of a thing or person which he has in common with others and being aware of the uniqueness of a person. Many of the deficiencies in the psychologist's account of personality occur, partly, because he deals only with properties. In the second place we must distinguish between knowing about things or persons by description and being acquainted with them by becoming familiar with them. The author illuminates this distinction by brief excursions into the theory of knowledge, biology, and primitive language; and shows the importance of both distinctions in the fields of art and morality.

Many would call into question the basic distinctions made by the author and would cavil at particular points of

detail. Nevertheless the excursions illuminated by the distinctions are eminently worthwhile; for new ways of looking at old problems are always stimulating. And if the reader is left without any comprehensive view of personality but with his head slightly clearer about what the problems of defining it are, the author will have achieved his main purpose.

A Victorian Statesman

The Public Career of Sir James Graham.
By Arvel B. Erickson. *Blackwell.* 433 pages. 32s.

Sir James Graham had everything that was needed for success in politics early in the last century: birth, money, energy, distinguished appearance, and power of connected thought. On leaving Oxford he rose at once, with effortless grace, to high position in the state; and though he never became First Minister, he admirably filled the post of second-in-command to the even more oustanding personality of Sir Robert Peel. Like Peel, he was too good an administrator to be a good party man; and at various times in his career he was, or at any rate was called by his enemies, a radical, a whig, a plain tory, and a conservative supporter of free trade. He sat on the Cabinet committee that drafted the great Reform Bill; changing sides, he joined the great conservative reforming government of 1841-46; in Aberdeen's unhappy coalition he bore some responsibility for the outbreak of the Crimean war; and he died, an elder statesman, in the same year as the Prince Consort.

This interesting, if personally sometimes repellent, figure has fascinated Professor Erickson, who has written a long, an expensive, often a most informative, and often, it must be confessed, a dull study of his public career. Graham's speeches are among the rare oases in the deserts of Hansard's early series, and the author has garnered many interesting passages from them; moreover, he has used the Graham family papers and the archives of the two great departments, the Admiralty and the Home Office, where Graham did his best work. Some of the points he has discovered in these original sources are of genuine interest to those concerned with the details of the period, and being a diligent researcher who does not ignore what is already in print Professor Erickson has many more small points which his fellow specialists may have overlooked. However, the "general reader" may be dismayed at the abrupt, unheralded changes of subject in this narrative, which is written in weak English, tiresomely pitted with small errors of fact and obscurities of style.

Professor Erickson says in conclusion that "Sir James Graham, next to Peel, deserves to be ranked as the ablest man in English public life in the years from Waterloo until his death in 1861." On the evidence he has adduced, this is more than can be claimed for the contemporary of Canning and Palmerston, of Chadwick, Cobbett, and Wilberforce, of Wellington and Derby, and of the young Gladstone and the young Disraeli.

Letters to the Editor

Profits Too Low

Sir,—In an article in your issue of May 3rd you rightly draw attention to the official estimate of £1,200 million for stock appreciation in 1951. May I be allowed to comment on some of the implications of this enormous figure?

The estimate must be subject to a fairly wide margin of error in either direction; but if it is accepted as being the best official guess, it follows that business will pay over £600 million in taxation on last year's profits which it would not have to pay if profits were assessed according to the principles officially adopted in estimating the national income. This somewhat startling inference may have begun to cause embarrassment in Whitehall. At all events, the £1,200 million does not appear separately in the table headed "national output and expenditure" in the Economic Survey.

While we may sympathise with the authors of the Survey, who are no doubt uncertain about the accuracy of the £1,200 million, it is more difficult to excuse their neglect of the effect of stock appreciation in their references to profits. Thus we are told that: "The income of companies and public corporations increased by one-fifth, or just over £500 million, between 1950 and 1951." This is untrue. Stock appreciation cannot have been zero. The bulk of the £1,200 million, if this figure be accepted, must be deducted from these profits. (Last year's Economic Survey implied that the fraction would be seven-eighths, the remainder being attributable, presumably, to small firms.) It follows that corporate profits fell by £500 million or more last year. Unless Whitehall is prepared to deny the logic it has accepted elsewhere, it cannot dispute this conclusion. Nor can it be denied that, for the same reason, undistributed profits were substantially negative last year—not, as the Survey indicates, a positive figure of £774 million.

"Some politicians," you observe, "choose to ignore these statistics, but most, of course, have simply not heard of them." Mr Gaitskell clearly belongs to the first category, but it is more difficult to place Mr Butler. Any adjustment in the current assessments must be out of the question, but that is no reason why the artificiality of the figures for nominal profits should have been ignored by the Chancellor. "I am not prepared," said the Chancellor, when he was announcing the Excess Profits Levy, "to bring into the average the profits of 1950, and still less those of 1951. The profits of both these years were inflated by the events following the outbreak of the Korean War." He ought surely to have added that this apparent inflation of profits was largely caused by stock appreciation; indeed, last year's profits would probably be no higher than those of 1948 or 1949 if the effect of this item were eliminated. At a time when restraint in the pressing of demands for higher wages is so much in the national interest, it seems absurd to publicise figures which give a grossly misleading impression of rapidly increasing profits.

In conclusion, I should like to draw attention to some figures, derived from the White Paper on National Income, which indicate the ominous weakness of the British economy last year.

	£ million
Personal savings	95
Corporate savings	774
less	
Capital taxes	−191
Stock appreciation	−1,200
Corrected net private savings	−522

Defamation in the Doldrums

Sir,—In your note on the Defamation Bill you report that Mr Silverman said he did not like the Bill and that I retorted "Nor does anyone like you." Hansard correctly attributes the retort to another member, so perhaps you will kindly allow me to disclaim responsibility for it.—Yours faithfully,
HAROLD LEVER
House of Commons

Plain Word?

Sir,—I believe the letter referring to the word "diseconomies," which appeared in your issue of May 17th, reflects the attitude of many people towards economic phraseology. Economics is a subject which, having new ideas unrepresented by existing words, must construct new ones if the ideas are to be expressed clearly. Little good has come, in the past, of employing common expressions like "price," "cost," "saving," "capital" or "investment" to mean something different from their everyday meanings.

To suggest that a new idea should be expressed in existing terms is to clothe the babe in his grandfather's apparel; it is quite unfitting and must smother the body of the idea. Doubtless there are ugly words in the vocabulary of economists, but it is difficult to avoid them in striving after clarity together with conciseness.

Perhaps a safer ground for dispute over the language of economists is that each uses the same word with a slightly—and at times markedly—different portent. It may be possible to standardise the meanings applied to some terms which are particularly open to abuse in this way. Until this is done, I think that these different interpretations of a similar notion expressed by the same words in the minds and writings of different economists should at least be indicated to students. Otherwise, both students and ideas may become confused.

(I wonder what Mr Goodchild thinks about "equilibratory" and the family of "poly's," including "polypoly" and "oligopoly"?)—Yours faithfully,
R. FORMAN

Each different sales situation,
its own advertising conception

now *for you, a mattress of pre-war quality and post-war design*

the NEW Slumberland Red Seal —in your shop!

Read about the new 'ORTHO-FLEX' springing, exclusive to Slumberland. The other exclusive features: the deeper richer comfort: the unprecedented value!

People who bought Slumberland that year until tell you ..there's a lifetime of better sleep in a Slumberland

THE Red Seal is a mattress made with one idea in mind — to give you a lifetime of better sleep: a mattress of pre-war quality but post war design. Inside the Red Seal is the latest and greatest advance in bedtime comfort — the new Ortho-flex springing

Exclusive Slumberland feature No. 1: 'Ortho-flex'
With these entirely new and different springs, resilience goes deeper because every coil in every spring works. And, because all the coils take their fair share of weight, the support is gentle and blissfully deep from head to toe — and no spring ever gets overworked or overtired. Ortho-flex springs don't wear out.

Exclusive feature No. 2: 'Slumbertown'
Over the springs, in a Red Seal, a sumptuous cushioning. Layer upon layer of bellowy 'Slumbertown' and fibre. What a wealth of comfort—typically Slumberland!

Exclusive features Nos. 3, 4, and 5
Ticking, rich and attractive, specially woven for Slumberland to give a lifetime of friction resistance. Eight air vents in the border: they keep the mattress fresh and sweet — aired automatically. And Slumberland's patent piped roll-border. Details seemingly, but vital details in designing for ultimate perfection and service.

See the Red Seal this week in the shops
October 2nd — October 14th is Slumberland National Quality fortnight. 1,500 shops throughout the country are displaying Slumberlands — and featuring the Red Seal.

Go and see it, feel it, try it. See, too, all the other Slumberland mattresses, the attractive Divans and the famous Slumberland Pillows. Ask your dealer for the new catalogue, with full details and prices. Ask, too, for a demonstration of Ortho-flex springs; how they work and how they are cushioned. Then think, all that rich, deep resilience, that sleepful comfort can be yours — every night of your life.

Set Red Seal prices against what they buy: the utmost comfort you desire: a lifetime of better sleep — and better value, too.

Indian Colossus

What do you know of the Bhakra-Nangal project, the vast Indian scheme to irrigate and develop the Punjab, the main dam of which, at 680 feet, will be the highest in the world after the Boulder Dam.

This project, described in *New Commonwealth* of February 18, is only one of the many great public works and industrial developments taking place in the British Commonwealth. In Alberta there are new oilfields to be equipped and exploited; on the Gold Coast ambitious plans for land settlement, etc.; new ports in E. Africa, etc.

These schemes represent an expenditure of hundreds of £ millions. You can learn about them first and most easily in the *New Commonwealth*—the fortnightly magazine devoted exclusively to Commonwealth trade and affairs. Through the advertisement columns of *New Commonwealth* you can introduce yourself and your products to those responsible for these projects of the sterling area.

ALL-WEATHER TYRE BY GOODYEAR

6 POINTS OF SUPREMACY

- **LONGER LIFE.** Tread is tougher, wider, flatter—gives lasting wear.
- **EXTRA STAMINA.** Stronger cord fabric resists cruellest road shocks.
- **STRONGER GRIP.** More grip, safer cornering from Diamond Tread — with Stop Notches.
- **MORE STABILITY.** High tensile steel beads for firm anchorage on rim.
- **STRONGER SIDEWALLS.** Thicker, tougher shoulder buttresses protect sidewalls from strain, kerb-scuffing.
- **INCREASED COMFORT.** Strength and resilience correctly balanced for maximum comfort.

AMERICAN SURVEY

Eisenhower's Homecoming

Washington, D.C.

THE significant primary elections are now over. Although Californian Republicans have still to give the Governor, Mr Warren, official title to the state's delegates, and a number of state conventions at which the Taft forces will be unembarrassed by expressions of public opinion have to pick their delegations, the season of counting and trading has begun. Neither of the two main Republican candidates has as yet accumulated enough support to guarantee nomination and neither seems likely to be able to influence enough of the waverers between now and the convention on July 7th to do so. It is never easy to estimate with any accuracy how many delegates the various candidates have in their pockets. At present the Taft headquarters are claiming 474 to the General's 310—604 votes are needed to win—while the Eisenhower camp maintains that the General will get 524 on the first ballot. But the best independent guess, after Oregon, is that the Senator will go to Chicago with a firm lead of about 50 votes.

A lead of this size is always useful and to such an experienced politician as Mr Taft it might be conclusive, if the Eisenhower forces included only the chicken-hearted Senator Lodge and the band of enthusiastic political amateurs who make up the General's official organisation. But, fortunately for those who do not want to see the Republican party commit suicide, Mr Herbert Brownell, who ran Mr Dewey's two campaigns for nomination, is at work behind the scenes. And whatever his shortcomings may have been in actual election campaigns, he has more than once shown his skill at persuading delegates to commit themselves and at announcing accretions of strength, however small, at the moment when they will have the most psychological effect.

It can be assumed that Mr Warren's 76 delegates will be available to the General as soon as the Governor of California is satisfied that there will be no deadlock of which he can take advantage and so, presumably, will Mr Stassen's—at a price. What the price will be and whether anyone will want to pay it is another matter. Nobody knows yet which way the Michigan and Pennsylvania delegations will vote. Indeed, the disposition of the Pennsylvania delegation is one of the crucial questions which may remain unanswered until the convention is under way. The only effect of the rivalry of the Taft and Eisenhower forces for the favour of Governor Fine, who controls Pennsylvania's votes, is to make him more demanding. The Eisenhower headquarters would, no doubt, dearly love to be able to ensure victory without making any concessions to Mr Fine, or to Mr Stassen either.

Whether they will be able to do so may depend on a little group of southern states, the most important of which is Texas, from which two sets of feuding delegates, each demanding to be recognised, are likely to arrive in Chicago. The southern states, none of which votes Republican except on rare occasions, have a surprising amount of influence in the party's convention. Southern Republican machines are small, intimate, family groups and the meetings at which their self-appointed officials decide, with the help of adequate supplies of whisky, to nominate themselves to go to the convention are exclusive affairs. But this year the organisation in a number of states is being challenged by outsiders who believe, not without reason, that General Eisenhower could win quite a number of southern states and certainly would do so if the Democratic platform is as outspoken on the question of negro rights as it was in 1948. The result has been violent quarrels and the spectacle of rival meetings electing hostile delegations, to decide between whose conflicting claims will be one of the first and most urgent problems facing the Republican convention. Mr James Reston estimated recently in the *New York Times* that 113 votes may depend on the decision.

There is a complicated procedure—nothing is ever uncomplicated in American politics—for deciding who is to be recognised in a dispute of this kind. The National Committee is the first body to give a ruling. The losing side then appeals to the Credentials Committee, set up especially to decide these knotty problems, and its decision, in its turn, can be and is appealed to the full convention. None of these bodies makes any pretence to judicial objectivity ; all decide on partisan grounds. And there is every reason to believe that, in the first two, supporters of Senator Taft will predominate. The Eisenhower ship might, therefore, founder before balloting for the candidate ever started. But the full convention will contain anti-Taft elements—the Warren and Stassen supporters—which will not be present in strength in the two committees.

*

General Eisenhower's letter saying that he believed that control over tidelands oil should be returned to the states was a desperate, if rather transparent, device for helping his campaign managers to round up votes in Texas and Louisiana, states resisting the federal government's claim to oil under the sea. Coming, as it did, shortly after another letter in which he maintained that his military duties had not allowed him time to reach a conclusion on the difficult issue of Negro rights, it showed a rather alarming amateurishness in his camp. The American voter has to put up with a lot of artfulness from the candidates he is offered, but he may well compare these two letters with some surprise. The civil rights issue is one on which every inhabitant of the country has usually made up his mind early in life—certainly before the age at which General Eisenhower's military duties began to press on him—while tidelands oil is a subject which has come into the limelight, for those who live in coastal states, only since the General had more immediate preoccupations. Yet he has found the time to reach the conclusion that the Supreme Court was wrong to decide that the oil under the sea had always belonged to the federal government.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

This kind of dilemma is facing General Eisenhower even before he has come home and taken off his uniform. When he holds his press conference on June 5th at Abilene, Kansas, he will be asked more difficult questions than have ever been asked of an individual before. Suggested lists of them are published frequently. If he can survive that ordeal it will be almost impossible to stop his nomination. But those who for months have been urging him most fervently to get into the battle are now terrified at what could happen on the fatal Thursday.

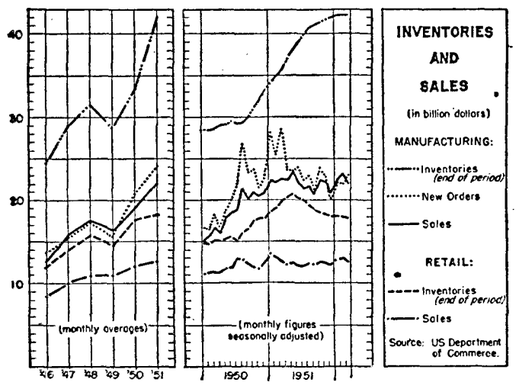
General Eisenhower must be far enough to the right to win the fight within his own party, but not so far that he risks losing the subsequent election. He must woo the trade unions, but the method used by General MacArthur last week, when he warned the automobile workers in Detroit that they would lose the gains of the last century if they tried to exploit industry, is not recommended. At the same time he must give Mr Paul Hoffman, who said the other day that under an Eisenhower Administration business would have a bigger hand in government than at any time in the past twenty years, some ammunition for use in converting Taftian industrialists. He must attack Mr Truman's foreign policy, of which he has been the enthusiastic agent in Europe, while taking credit for its success in avoiding a third world war, and the method Senator Lodge has been using on his behalf could be improved upon. Finally, he will have to say firmly what he would have done about General MacArthur without offending any one. If General Eisenhower can do all these things then he will certainly deserve to be the candidate of national unity.

American Notes

The President Starts Campaigning

When President Truman announced that he would not run again, many Democrats jumped to the conclusion that they would be able to remodel the party in time for this year's election. But Mr Truman seems determined to see that the new tenant makes no changes, even though the cracks need papering over and the foundations may be shaky. If he goes to the convention as a delegate and makes a speech, in itself an unheard-of performance for a retiring President, Mr Truman says it will not be until the candidate is chosen. But he is already hammering planks into the platform on which the candidate will have to stand, and has promised to campaign for him as vigorously at all the "whistle stops" as he did on his own behalf in 1948.

This would be almost unprecedented, and the single precedent in the twentieth century is not reassuring. Theodore Roosevelt picked William Howard Taft as his successor in 1908 and campaigned for him, but the two soon fell out and in 1912, when Taft secured his own renomination from the Republicans, Roosevelt split the party and opened the way for Woodrow Wilson's victory.



Mr Truman is deeply convinced, and history supports him, that the Democrats will be lost if they throw their liberal principles overboard and allow the Republicans to put them on the defensive. The Republicans may have General Eisenhower—if they will take him—but the Democrats, the President considers, have the winning issues, which have never failed them in the past twenty years. So he has been recalling vividly the depression horrors from which the Democrats rescued the farmers, a group whose votes are an essential ingredient in either party's success. At a meeting of the Americans for Democratic Action, a northern progressive group, he nailed the Fair Deal flag to the Democratic masthead, and vigorously denounced the "dinosaur wing" of the Republican party, which, he said, would always frustrate the best of Republican candidates.
