The outcome of the review of Entertainments Duty bequeathed to Mr Butler by his predecessor is the introduction of an entirely new scale of duty for admission to sporting events, pitched rather lower than halfway between the present reduced rate that applies to the theatre, music-hall and other "live" entertainment and the full rate that will now apply to the cinema almost alone. This innovation is a duty of 1½d. on the first 1s. 1½d. charged for admission to sporting events of all kinds, with ½d. duty on every penny or part of a penny above 1s. 1½d. Its effect may be judged by an example: a 2s. seat in the theatre will bear 2d. in duty, at a sporting event 4½d. in duty, and in the cinema, still, 10½d. in duty. Duty on racing will come down to this new level on March 30th; and that on football, cricket and other sports will be raised to it on August 31st. The change will cost about £500,000 in 1952-53 against £250,000 in a full year, because the reductions thus precede the increases. It can be inferred that racing of all kinds, which paid duty amounting to nearly £3,500,000 in 1950-51, and probably more in 1951-52, will receive a concession worth £850,000 in a full year; while football and cricket, and all other sports bearing the higher rate—which paid about £900,000 in duty in 1950-51—may have to contribute nearly £600,000 a year more. Football can presumably pass on this increase in costs per admission without much apprehension, though some other sports may do so with less confidence that attendance will remain unaffected; certain of the more fortunate racing promoters have undertaken to pass on to their customers also at least some part of the amount they save in duty.

The review has thus regularised one of the illogicalities of this duty. Equal treatment for all sports, instead of lumping some with the cinema and some with the stage, probably justifies introducing yet a fourth class into the official evaluation of entertainment. The favourite class of duty-free "cultural activities," however, is to lose one interloper; the Treasury has taken the opportunity to screw up a loose definition by reason of which music-hall and variety entertainment on occasion slipped into the "educational" reserved compartment.

It is surprising that no action has been taken about the particular part of the Entertainments Duty over which the whole argument for a review was put forward. The awkward scale of cinema duty, which makes it impracticable to charge some of the prices for seats that are preferred by both exhibitors and their patrons, remains unaltered. It is true that the cinema trade presented Mr Butler with a readymade excuse for turning down the proposals for a better-designed scale of duty that it had put before him. The more evenly graduated scale of duty that it proposed would have cost the Exchequer some £5,500,000 a year; it is not easy to accept at face value the trade's convenient assumption that no improved scale could be devised without a cut in the duty. Some part of this saving in duty by exhibitors might have been paid out in the hire of American films, though not necessarily remitted in dollars. No doubt, however, it was easier for the Treasury to reject these proposals as impracticably expensive than to devise a better scale that might hardly alter the yield of duty. But the anomalies remain: and not even the clumsy advocacy of the cinema trade will forever serve to obscure the fact that it has a fairly good case for wanting them removed.

* * *

Betting

The amount that will be saved by the slight alteration Mr Butler has made in betting tax is negligible; but it will stop a loophole in the existing law governing gambling on football. Certain bookmakers had been trying out a system known as "variable fixed odds," by which they quoted fixed odds but retained the right to reduce those odds if more than a given proportion of gamblers won. This quite legally combined the freedom from tax of ordinary betting at fixed odds on football (which is to remain tax-free) with the protection from risk enjoyed by promoters of pools, who are taxed at the rate of 30 per cent. In future, such hybrid betting transactions will rank for duty.

Commercial History and Review of 1951

This week's issue of the *Records and Statistics* Supplement to *The Economist* includes the second part of the Commercial History and Review of 1951—the 89th of the series which began in 1863.

Part I provided a general review of British economic developments last year, and special articles on finance, investment, overseas trade and agriculture. Part II contains articles on all important British industries, and Part III, consisting of overseas economic reports, will appear in April.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

Business Notes

Break in Markets

Beyond doubt, the big impact upon the stock markets this week has come, not from the budget, but from the increase in Bank rate. Even among the banks and the discount market, few people had been looking for a further immediate turn of the money screw, and no one was prepared for so sharp a tightening as the increase in Bank rate from 2½ per cent to 4 per cent. In the early reactions in the markets, the violence of this movement overshadowed all other considerations, not excluding the new Excess Profits Levy—except that flags were hoisted in the brewery share market at the absence of change in the beer duty. But when the City's view of the budget did become separately discernible, it was very evident that the judgment of many people was still clouded by relief at the Chancellor's leniency instead of the severity that had been feared. Only the minority were yet taking any clear view of the dangers of the raids on capital and of the troubles piled up for 1953; but the few whose eyes were opened to these aspects of the budget were strong in their condemnation, despite their welcome to the realism and courage of the cuts in subsidies and the swing to monetary policy.

Inevitably, the shock from dearer money was felt in the gilt-edged market most violently among the short bonds, although at the outset on Wednesday the whole list was marked down almost indiscriminately. As the selling developed, the price movements became more selective, and at the close the biggest net falls were shown by 2¼ per cent Exchequer Stock 1955 (down 2$\frac{27}{32}$ at 96½), the 1953 and 1954 Serial Funding stocks (down 2$\frac{1}{16}$ at 97 and 96 respectively) and 2½ per cent Funding 1956-61 (down 2$\frac{5}{8}$ at 89½). The yield adjustments in the shorts were generally of the order of 1 per cent, and in some instances more than that. At the other extreme of the market, the net fall in Consols by 2½ points (to 58) raised the flat yield by 3s. per cent, to £4 5s. 5d. per cent. By Thursday morning the market was recovering its breath; and the feeling was spreading that, in the long-term market, the falls might have been overdone. Many people are already jumping to conclusion that the next move in Bank rate—long though it may be delayed—will be downwards rather than upwards. Though this argument takes a great deal for granted, it sufficed to bring in some buyers, and Thursday's closing prices for the longer stocks showed perceptible gains. The shorts, too, recovered sharply, but the movement here was entirely due to the decision of the banks to reduce by ¼ per cent the new rates fixed on Wednesday for call loans to discount houses against bond collateral.

The markets for high-grade equities of course took their tone from the gilt-edged market, though the sharpness of the first day's fall certainly owed something to the preliminary, and very hazy, impression of the new system of profits taxation. On Wednesday, the ordinary share index of *The Financial Times* dropped by 3.4 points—easily the biggest fall on single day since the violent 4.6 drop that greeted Mr Gaitskell's announcement last July of impending legal control of dividends. At 109.3, the index was carried down to its lowest level since May, 1950, and to over 30 points below the peak reached last June; on Thursday, despite a short-lived rally, it receded further, to 108.9.

* * *

Effects of Four per Cent.

The steep increase in Bank rate, which has been followed by roughly corresponding adjustments in money and bill rates, has of course had violent effects in Lombard Street, since the discount houses have had to face severe losses on their portfolios of both short bonds and bills. The big banks, too, are ruefully computing the effects on their profit and loss accounts; as Mr Ralph Assheton, a director of the National Provincial Bank, said in Wednesday's debate, "if the bankers succeed in breaking even as a result of the Bank rate going up, they will be very pleased indeed"—and this, evidently, before taking account of the impact on their investment valuations.

The key adjustment in the rate structure in response to the Bank rate change was an increase in the allowance on deposit accounts (the notice period of which is now lengthened from 14 to 21 days) from ¾ per cent to 2 per cent, a movement accompanied by a precisely similar change in the minimum rate charged by the clearing banks for call loans to the discount market against Treasury bills. The clearing banks' charge for loans against the security of short bonds and bank bills was at first raised to 2¾ per cent (against 1⅛ and 1¼ per cent respectively), but this steep increase was later abated to 2½ per cent—partly, it seems, after consideration of the particularly heavy burden thrust upon the discount market by the break in short bond values. The rate charged by the banks and the market to borrowers by the discount of three months bank bills was raised by the full 1½ per cent, to 3 per cent, but the cost to the Treasury of borrowing on Treasury bills will be rather less than this. In the weeks ahead, the actual rate will be governed partly by the cost of financing the bills on money borrowed from the clearing banks (2 per cent) and partly by the extent to which the authorities compel the market to secure a marginal money supply by formal borrowings at the Bank of England (where loans against such bills, for the minimum period of seven days, now cost 3½ per cent, compared with 2 per cent previously).

The effect on the cost of loans and overdrafts from the banks is less easy to assess. It will not be governed, as most of the recent increases mainly were, by specific official pressure on the banks to raise their charges. This initiative was taken then because bank lending rates for most customers were out of touch with the low Bank rate, even after its increase to 2½ per cent. Now the majority of the initial adjustments will be determined automatically by the arrangements already subsisting between the banks and their customers. A high proportion of personal and business advances (as distinct from those to public and semi-public bodies) were already made, in terms, at ½ per cent or 1 per cent above Bank rate, subject to a minimum rate varying according to the class of borrower from 3½ per cent to 5 per cent. Since an advance running at the highest of these minimum rates is already 1 per cent above the new Bank rate, it will not be automatically affected at all. On the other hand, the majority of the more credit-worthy borrowers, except the strongest of those already paying 4½ per cent (subject to a ½ per cent excess over Bank rate), will pay more, most of the increases being ½ per cent or 1 per cent and a few, perhaps, of 1½ per cent. The first result, therefore, will be to narrow the spread between high and low grade borrowers, and to put many concerns that have previously been quite strong bargainers on the same 5 per cent footing as the small personal borrower. It seems improbable that this anomaly will endure for long, though it was widespread in earlier phases of tight money; some banks, at least, are likely in due course to edge up beyond 5 per cent the rates charged to the least credit-worthy of their customers.

The Sterling Area's Gold

The latest figure for the gold reserve, which the Chancellor announced in the Budget speech, sets the key in which the whole tenor of his proposals must be read. That reserve stood at $1,770 million at the end of February, having fallen by nearly $2,000 million since June, and by $299 million and $266 million in January and February respectively. This means that in the first two months of this year the run on the reserves reached a fever pitch of $63 million a week. In the third quarter of 1951, which looked bad enough in all conscience, the loss of reserve amounted to $598 million or $46 million a week. In the fourth quarter of 1951 the fall swelled to $934 million, which—when payments on the United States and Canadian lines of credit are omitted—shows an average loss on commercial transactions

THE CONSOLIDATED MINES SELECTION COMPANY, LIMITED

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR ENDED 31st DECEMBER, 1951.

CAPITAL.

The authorised capital was increased during the year from £900,000 to £1,200,000. The issued capital remains unchanged at £900,000.

ACCOUNTS.

	1951 £	1950 £
PROFIT—		
Profit after charging all expenses but before providing for taxation was	281,920	305,795
Deduct: Taxation—United Kingdom (and South African)	131,083	122,996
	150,837	182,799
Add: Unappropriated Profits brought forward	36,581	41,032
Making a total available for appropriation of	187,418	223,831
APPROPRIATIONS—		
Deduct: Amount transferred to General Reserve	25,000	50,000
	162,418	173,831
Deduct: (Proposed) Dividend of 1s. 6d. per stock unit and Bonus of 1s. 0d. per stock unit (less Income Tax) and Directors' Additional Remuneration	128,125	137,250
Leaving Unappropriated Profits to be carried forward	£34,293	£36,581

The profit for the year of £281,920 is some £24,000 lower than the previous year's figure but is arrived at after writing-off from the book values of certain investments a net sum of £32,612. In accordance with past practice, quoted investments are shown in the Balance Sheet at cost or market value whichever was the lower. Due to the general recession in share values which took place in the latter part of 1951, a total amount of £51,614 had to be provided to adjust book values to this basis. The book value of one investment had on the other hand to be written-up by £2,750 which was credited to Investments Reserve. The net allocation required of £48,864 was met by utilising the resultant balance on that reserve of £19,002 and charging against profits the £32,612 referred to above. Stockholders will, however, appreciate that whilst the method of valuing investments makes this charge necessary, it has little bearing on the overall strength of the Company's investment position for at the date of the Balance Sheet quoted securities had a market value of £3,288,525 which was more than double their book value of £1,534,750.

The distribution recommended is the same as for last year, viz.: a dividend of 1s. 6d. per stock unit plus a bonus of 1s. 0d. per stock unit. It is not proposed to maintain a balance on Investments Reserve Account but £25,000 has been allocated to General Reserve, thus slightly reducing the balance of unappropriated profits compared with the figure shown in the Accounts for last year.

The Profit and Loss Account shows income from dividends and interest of £249,024. This represents a substantial increase over the £180,000 your Directors foreshadowed on the basis of normal dividends from investments held at the end of 1950 and provided no new revenue producing shares were acquired meantime. The comparative figure for 1950 was £284,855 but, as mentioned in the Report for that year, this included certain revenue of a non-recurring nature. The present amount contains no special items. It includes income from newly acquired investments and also reflects increased dividends from certain companies, in particular from Rhodesian Anglo American, Limited. Whilst the dividend income for 1951 can be considered satisfactory, your Board wishes to stress that the Company's revenues from all sources must inevitably fluctuate year by year.

Although the year under review was again unfavourable for share dealing, net profits from share realisations, underwriting commissions, etc., showed an improvement of some £47,000. Income from underwriting continued to be a fruitful source of revenue, and given normal trading conditions the Directors feel that this branch of the Company's activities can be further and profitably developed.

After allowing for the dividend and bonus recommended by the Directors, the Balance Sheet shows a surplus of current assets over current liabilities and provisions of approximately £127,000. Against this there were contingent liabilities in respect of underwriting and other commitments of £297,000. Since the close of the financial year, some £68,000 of this amount representing underwriting contracts has been discharged with a small profit. Of the remainder, £200,000 is the underwriting commitment outstanding at the date of the previous Balance Sheet in respect of 5 per cent. registered unsecured convertible notes of President Steyn Gold Mining Company, Limited, which are under option until the 30th April next.

INVESTMENTS.

Generally speaking, the pattern of your Company's investments has undergone no radical change, though there are some differences. For instance, the Company has acquired a substantial interest in Rand Selection Corporation, Limited, an active mining finance company with a consistent record of satisfactory dividends, which appears to possess attractive prospects. Investment has also been made in 4½ per cent. registered unsecured notes of African and European Investment Company, Limited. The notes while bearing a useful rate of interest are convertible between April, 1953, and March, 1955, into ordinary shares of African and European at 66s. 8d. per share. This latter holding accounts in the main for the increase over last year in the total of the unquoted investments.

In the course of the year considerable progress has been made in the development of the Orange Free State goldfield, in which your Company has important direct and indirect interests. Two of the mines there have now reached production stage, others should shortly follow suit, though it will naturally be some while yet before these mines work up to full scale and profitable production. Thus, though there is further time to wait before your Company can expect to reap the full benefit from investment in this field, the Company can look forward to receiving income from this source on an increasing scale over the next few years.

The Fifty-sixth Annual General Meeting of members will be held at The Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2, on the 31st March, 1952, at 12.30 p.m. Copies of the full Report and Accounts may be obtained on application to the Company's office, 11, Old Jewry, London, E.C.2.

of $58 million a week. If this trend continued the gold reserve would be exhausted by September.

Fortunately, Mr Butler declared in his speech that the country could "confidently rely upon a considerable reduction in the rate of loss in the course of the next few weeks." Two factors are needed to make this prophecy come true. First, foreign confidence in sterling has got to be revived, and bears of the pound sent scuttling for cover. Judging by the impact that the details of the Budget have had on the various rates for sterling some small improvement in this regard is already afoot. By Wednesday evening the premium on dollar securities in London had fallen from 14 per cent to 13 per cent, and the three months premium on forward dollars had moved from 2⅜ cents to 2½ cents.

Secondly, the brave resolutions set out after the Commonwealth Finance Ministers' conference last January must be translated into very speedy action. Here the picture is still an uncertain one. The Chancellor announced in his speech that new arrangements with South Africa (which is itself cutting imports) should allow the United Kingdom to earn at least £50 million of South African gold "and perhaps substantially more" during 1952. Australia's response has also been heard this week in terms as unmistakable as they will be painful to particular interests. New Zealand is cutting down imports from the non-sterling area (and imports of motor vehicles from all areas) and is to aim at a £25 million surplus on non-sterling account. But of the response from other parts of the Commonwealth, all the Chancellor could say was that he had received certain assurances from New Zealand, India, Pakistan, Ceylon and Southern Rhodesia. These countries, he added, have also "told me of their special difficulties." It remains to be seen whether this form of words indicates a resolution that is adequate to meet the needs of the hour.

* * *

Further Cuts in Imports

The third, and what is hoped the last, dose of import cuts outlined in Mr Butler's budget amounts to £100 million. Some £80 million covers goods, the nature of which, according to the Chancellor, cannot be disclosed "for commercial reasons." The remainder is met by substituting specific for open licences for a host of miscellaneous items ranging alphabetically from "armbands, spring" to "wreath and floral frames of metal." The collection is so heterogeneous that it is possible to make only a very rough guess of what the total quantity of these imports amounted to in 1951. It was somewhere around £150 million and the Chancellor hopes to lop off £20 million. A complete embargo has been placed on the import of all these goods until the end of April—by which time a new licensing scheme will be worked out—unless an importer can prove the existence of a firm contract. This new attack on open general licences means that only 46 per cent of Britain's private imports from Western Europe will be free from quota restrictions compared with 90 per cent last October.

The cut that the British public will feel most is that on imported cheese—the non-rationed varieties. Last year these supplies accounted for about a third of Britain's total imports of cheese, and they were a very useful supplement to the meagre ration of "non-frivolous" cheese. Other articles that will disappear from the British table are gherkins in syrup, tinned herring roes and sauerkraut. The list of prohibited textiles is formidable, covering shopping bags, canvas, coir manufactures, cotton yarn and thread, fabrics, handkerchiefs, piece-goods, woollen and worsted yarns. A number of electrical appliances including irons, kettles and toasters are to be cut; metal goods from balances to collapsible tubes; egg-timers; books and periodicals, including comics; toilet requisites; smokers' requisites and even ice-cream spoons, shoe horns and trouser pressers.

It is impossible to assess the effects of these cuts until it is known just how strict the licensing authorities intend to be. A reduction of £100 million of imports—and most of them presumably consumer goods—implies a reduction in supplies to the home market of something like 5 per cent. The dangers of these cuts to the prospects of British exports to Europe are obvious. Mr Butler, indeed, recognised them, though in a somewhat curious phase: "It is essential in our economic and commercial interest to maintain trade at the highest level we can afford."

* * *

Australia's Import Cuts

Last Friday Mr Menzies swung his long-expected axe at Australian imports—some weeks late but with devastating effect. Overall, Australian imports are to be cut by 50 per cent below their 1950-51 level; this implies a much bigger percentage reduction below the levels recently in operation. The biggest cut is, inevitably, being made in consumer goods, including cars, textiles and footwear; the reduction here will be 80 per cent of the 1950-51 level. Last year British exports of cars to Australia were valued at £23 million (21 per cent of total car exports), British exports of cotton yarns and manufactures to Australia at £39½ million, and of woollen and worsted goods £15½ million. If these exports are now to be cut by between 80 and 90 per cent—as seems probable—it is clear that a hard task in finding alternative markets lies ahead.

These savage cuts are being matched by consequential brutality in Australian exchange control procedure. It was announced this week that no foreign exchange, including sterling, is to be sold or letters of credit established for any Australian imports except those for which a valid import licence is already in force. In the case of goods from the sterling area, for which import licences were not previously necessary, exchange will be sold if the goods have already been landed or are to be landed by March 22nd, or if payment is being effected under documentary credits established on or before March 7th.

A substantial volume of exports ordered by Australia and now in transit may be axed by these orders, and a number of them may now have to be returned to the seller. The Australian authorities have also announced that any increases in the amounts or extension of the expiry dates of letters of credit are to be treated as applications for new letters of credit. In order to soften the impact of the new regulations the London offices of the Australian banks have been advised that they may negotiate documentary drafts not under credits where they are satisfied that the goods in question were shipped on or before March 7th, but in all other cases the negotiation of drafts will only be effected if evidence can be provided of the existence of a valid import licence. Parallel restrictions on payments to non-residents of the sterling area have had to be placed by intermediaries in the United Kingdom on behalf of Australian importers. Such payments can be authorised by an Australian bank only when the transaction is covered by an import licence. Only two exceptions are provided—the first where the goods were shipped to Australia by March 7th, and the second where the payment is being effected under a documentary letter of credit.

* * *

Spending Too High

The main conclusion to be drawn from the Central Statistical Office's preliminary estimates of national income in 1951 is that last year's slide towards insolvency was domestically inspired; it was due to the familiar faults of allowing costs to rise faster than productivity and of trying to eat more cake than was there. According to the estimates,

the money value of gross national product in 1951 was £12,414 million. This represented an increase in money terms of £507 million (or about 4¼ per cent) in the year, compared with an increase of £600 million (or about 5¼ per cent) in 1950. Since industrial production, in real terms, is estimated to have risen by under 3 per cent in 1951, compared with 8½ per cent in 1950, it is clear that wages and other domestic costs rose by more than productivity last year, whereas in 1950 they apparently rose by less than it.

With only an additional £507 million, in money terms, available from home production, personal consumption soared by £710 million, public authorities' expenditure by £387 million, fixed capital formation by £188 million, and stocks and work in progress by £166 million. Most of these increases—both in supply and in demand—were due to higher prices. But the fact remains that the British people were taking far more out of the pot than they were putting into it. The immediate consequence was the alarming plunge from a balance of payments surplus of £238 million in 1950 to a deficit of £516 million in 1951.

National Income and Expenditure in 1951

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hong Kong)

(The liability of members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1929 of the Colony)

REPORT OF THE DIRECTORS.

SUBMITTED to the Ordinary Yearly General MEETING of Shareholders held at the Head Office, Hong Kong, on Friday, 7th March, 1952

The Directors have pleasure in submitting the Balance Sheet at 31st December, 1951, together with the Profit and Loss Account for the year ended at that date.

The Profit for the year, after providing for taxation on profits earned to date and after making transfers to the credit of Reserves for Contingencies, out of which Reserves provision has been made for any diminution in value of current assets, amounts to		HK$17,283,671
		6,699,224
To this must be added the undistributed profit brought forward from the previous year		23,982,895
		5,163,025
An Interim Dividend of £2 per share, free of Hong Kong Corporation Profits Tax, was paid on the 13th August, 1951, amounting to £320,000 at 1/2 7/8		18,819,870
leaving a balance available for distribution of	HK$3,000,000	
This balance the Directors recommend be appropriated as follows:— Amount to be written off Bank Premises	7,744,538	10,744,538
A Final Dividend of £3 per share, free of Hong Kong Corporation Profits Tax, £480,000 at 1/2 7/8		
leaving a balance to be carried forward to next year of		HK$8,075,332

The above appropriations have been incorporated in the Accounts.

DIRECTORS.—The Hon. Sir Arthur Morse, C.B.E., continues in office as Chairman and Mr. C. Blaker has been elected Deputy Chairman.

Mr. C. Blaker, Mr. H. D. Bentham and Mr. E. R. Hill retire by rotation, but, being eligible, offer themselves for re-election.

AUDITORS.—The Accounts have been audited by Messrs. Lowe, Bingham & Matthews, and Messrs. Peat, Marwick, Mitchell & Co., who are eligible for re-appointment.

By Order of the Board,

A. MORSE, *Chairman.*

HONG KONG, 26th February, 1952.

BALANCE SHEET at 31st December, 1951

		Sterling Equivalent			Sterling Equivalent
Share Capital— Authorised and Issued 160,000 Shares of HK$125 each, fully paid	HK$20,000,000	£1,250,000	**Cash in Hand, in Transit and at Bankers**		HK$374,211,486 / £23,388,218

C. BLAKER, J. H. KESWICK, H. J. COLLAR, } Directors.

REPORT OF THE AUDITORS TO THE MEMBERS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION

We have examined the above Balance Sheet with the Books of the Corporation kept in Hong Kong, with the audited accounts of the London Office, and with the returns received from the other Offices which have been signed by the Branch Managers. We have obtained all the information and explanations we have required, and in our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Corporation's affairs at 31st December, 1951, according to the best of our information and the explanations given to us and as shown by the books kept in Hong Kong and by the returns received from the other Offices.

LOWE, BINGHAM & MATTHEWS, PEAT, MARWICK, MITCHELL & CO. } *Chartered Accountants, Auditors.*

HONG KONG, 26th February, 1952.

PROFIT AND LOSS ACCOUNT for the Year ended 31st December, 1951

Interim Dividend of £2 per Share, free of Hong Kong Corporation Profits Tax, paid 13th August, 1951, £320,000 @ 1/2 7/8		HK$5,163,025	
Appropriations recommended by the Directors:— Amount to be written off Bank Premises	HK$3,000,000		
Final Dividend of £3 per Share, free of Hong Kong Corporation Profits Tax, £480,000 @ 1/2 7/8	7,744,538	10,744,538	
Balance carried forward to next year		8,075,332	
		HK$23,982,895	
Special Administrative Expenses, including Chairman's emoluments as Chief Manager, Directors' Fees and London Committee Fees amounted to HK$770,505.			
Balance brought forward from 31st December, 1950			HK$6,699,224
Profit for the year, after providing for taxation on profits earned to date and after making transfers to the credit of Reserves for Contingencies, out of which reserves provision has been made for any diminution in value of current assets			17,283,671
			HK$23,982,895

STATEMENT IN CONNECTION WITH SUBSIDIARY COMPANIES

(1) The Investments in Subsidiary Companies appearing in the annexed Balance Sheet represent the Issued Share Capital of three Trustee Companies and three Nominee Companies wholly owned by the Bank. No Group Accounts have been submitted as the Directors are of the opinion that such Accounts would be of no real value to the members of the Bank.

(2) No part of the Profits earned by the Subsidiary Companies has been dealt with in the Accounts of the Bank. The net aggregate amounts of the Subsidiaries' profits after deducting the Subsidiaries' losses are as follows:—

(i) For the year ended 31st December, 1951	HK$67,804
(ii) For previous financial years	112,715
	HK$180,519

Profits Too Low

The principal reason for this disastrous excess of demand over domestic supply was, quite simply, that wage and salary earners (who spend) got too much of the year's increase in incomes and company and corporation profits (which are the principal private source of saving) got too little of it. While total incomes rose by £507 million, wages and salaries (including armed forces' pay and employers' national insurance contributions) rose by £844 million. Other incomes, when struck net of stock appreciation, therefore fell by £337 million. Since stock appreciation, which the national income statisticians estimate at the very high figure of £1,200 million, cannot yet be divided between partnerships, public corporations and companies, it is impossible to examine this fall in detail. If the national income statisticians' figures are right, however, small traders and partnerships seem likely to have been hit even more harshly than companies. Rentiers remained among the depressed classes. Dividend and interest payments by companies increased by £78 million, but total rent, dividends and interest received by persons are estimated to have been virtually unchanged. All these figures, of course, are before tax.

SAVINGS AND INVESTMENT IN 1951
(£ Million)

* Balance of payments deficit plus certain small war disposals, settlements, etc.

The details of the deterioration in the balance of payments are set down in the accompanying table. It will be seen that the main feature in the year as a whole was the widening of the visible deficit by £638 million to £786 million, thanks to the swamping of a £485 million increase in exports by a £1,123 million increase in imports; the invisible surplus, at £270 million, was only £116 million less than 1950's record figure. But in the second half of the year it was the invisibles that showed the most strain; largely no doubt because of the Abadan crisis, the invisible surplus declined from £216 million in the first six months to £54 million in the second, while the visible deficit (under the strain of a £209 million increase in imports) widened by £110 million to £448 million. Throughout this period exports went on increasing, by £99 million in the half year, but this movement must have masked a drop in exports to non-sterling countries. Mr Butler revealed in his budget speech that Britain's deficit with the non-sterling area rose from an annual rate of about £325 million in the first half of the year to nearly £1,200 million in the second half. It follows that the surplus with the sterling area must have widened concurrently from an annual rate of under £100 million to one of very nearly £400 million. It is against this truly frightening background that Mr Butler's blueprint for the balance of payments in 1952, discussed on page 656 of this issue, must be judged.

Deficit through the Ceiling

Some unofficial, but possibly better-informed, estimates about steel supply and demand this year have been made this week by Mr Robert Shone, Director of the British Iron

* * *

Beyond the Steel Shortage

Steel output in February was at the annual rate of 16,281,000 tons, compared with a rate of 15,234,000 tons in January and of 16,952,000 tons a year in February, 1951. Production was thus 13,000 tons a week lower than a year before, much the same as it had been in January. The increase in pig iron output that has been continuous since last August was checked in February: the annual rate was 10,263,000 tons, comparing well with 9,687,000 tons in February, 1951; but output in January had reached a rate of 10,319,000 tons. The main reason for this drop in iron output was the inadequacy of supplies of coke. The steelworks produce most of their own coke, and a steady increase in the capacity of their ovens is keeping in step with the demands of the blast furnaces. But the proportion of metallurgical coke that is bought from the National Coal Board and other coke-oven operators has not increased to the same degree; the blast furnaces require about 76,000 tons a week from these sources but are obtaining only about 70,000 tons. The Coal Board was supplying coke at this rate in 1948, and the oven capacity that it owns is now somewhat larger. But over these marginal supplies there is always some reluctance to jettison alternative customers; the Coal Board is probably not confident that the steel industry will always need to buy as much as it needs today, and in recent years has been seeking to diversify its markets for hard coke. The issue is one that may not be settled without a decision from the Government; if steel is scarce to the extent that official estimates suggest, the coke must be made available.

For the long term, the most serious consequence of last year's squeeze on profits may be its effect on the liquidity of companies; this strain, of course, is heightened by the fact that companies and corporations had to pay or put aside £1,320 million for taxes last year, compared with £928 million the year before—principally because the Government's tax collectors (unlike their objective national income statisticians) treat stock appreciation as income. But the most immediate effect of the squeeze was to cause a drastic deterioration of saving. The accompanying table shows that, if additions to tax reserves are excluded, new domestic savings fell by £870 million last year; if tax reserves are included, they fell by £430 million. Against this, however, total capital formation rose by £354 million—with increases in stocks and work in progress taking £166 million more, fixed capital formation in manufacturing industry £93 million more and in utilities £37 million more. Here again—since all roads lead to Rome—the immediate consequence was a £743 million deterioration on external borrowing account.

REPORT BY THE COURT OF DIRECTORS OF

The ROYAL BANK of SCOTLAND

TO THE ANNUAL GENERAL COURT OF PROPRIETORS, ON WEDNESDAY, 12th MARCH, 1952

The Court of Directors now submit to the Proprietors Group Accounts comprising the Balance Sheet and Profit and Loss Account of The Royal Bank of Scotland as at 13th October, 1951, and the Balance Sheets and Profit and Loss Accounts of its Subsidiary Companies, Glyn, Mills & Co. and Williams Deacon's Bank Limited as at 31st December, 1951.

The Net Profit of THE ROYAL BANK OF SCOTLAND for the year to 13th October, 1951, after providing for Taxation and making transfers to Reserves for Contingencies, out of which Accounts provisions have been made for all bad and doubtful debts and fluctuations in the value of Investments, amounted to		£602,728 17 10
Interim dividend at rate of 8½ per cent. actual paid at Midsummer, 1951, required	£361,250 0 0	
Less Income Tax	171,593 15 0	
	£189,656 5 0	
Interim dividend at rate of 8½ per cent. actual paid at Christmas, 1951, required	£361,250 0 0	
Less Income Tax	171,593 15 0	
	189,656 5 0	
There have been:		
Transferred to Property Maintenance Reserve Account	30,000 0 0	
Contributed to Staff Pension Fund	75,000 0 0	
Contributed to Staff Widows' Fund	15,000 0 0	
Carried to Reserve Fund	103,416 7 10	
		£602,728 17 10

The Reserve Fund now amounts to £4,877,216.

A dividend of 17 per cent. per annum having already been paid, the Court of Directors do not recommend any further dividend for the year.

A valuation of the Bank's quoted investments at 13th October, 1951, is in excess of the sums at which they appear in the annexed Balance Sheet.

The Directors, in virtue of the powers conferred upon them by the Royal Bank of Scotland Act, 1873, have elected Thomas Gordon Waterlow, C.B.E., and David Fortune Landale, Ordinary Directors of the Bank; they hold office until this Annual General Court only, but are eligible for re-election.

The Governor, the Deputy-Governor, the Extraordinary Directors and the Senior Ordinary Director (Mr. Charles Augustus Carlow), retire at this time and are eligible for re-election.

Mr. S. W. Murphy, C.A., Joint Auditor for the past year, is willing to continue in office and will be re-appointed pursuant to Section 159 of the Companies Act, 1948.

Mr. George James Gregor, C.A., Joint Auditor for the past year, has intimated his desire not to seek re-appointment. A Resolution will be moved that Mr. James Haldane, C.A., Edinburgh, be appointed a Joint Auditor to act along with Mr. S. W. Murphy.

By Order of the Court of Directors,
J. M. THOMSON, *Cashier and General Manager.*

Edinburgh, 18*th February*, 1952.

LIABILITIES for Acceptances, Confirmed Credits and other Obligations		

Notes:—

The profits of Williams Deacon's Bank Ltd. and Glyn, Mills & Co. have been taken into the Royal Bank of Scotland profit only to the extent of the Dividends declared.

The Nominee Companies are non-trading and have made neither a profit nor a loss for the year ended 13th October, 1951.

Foreign Currency Balances have been converted into Sterling at the rates current on 13th October, 1951.

United Kingdom Income Tax has been provided on the profits to date.

Statement required by the Eighth Schedule of the Companies Act, 1948

The Directors of the Bank have, in terms of Section 153(1) of the Companies Act, 1948, investigated the possibility of making the financial year of each of the Subsidiaries coincide with its own. The practice of the Subsidiaries has been to make up their Accounts as at 31st December in each year, and it is considered impracticable to alter this arrangement. The Royal Bank of Scotland has, since 1879, made up its Accounts annually on the second Saturday of October, and any alteration in this long-established and convenient procedure would involve administrative difficulties in the conduct of the Bank's affairs. The Directors are satisfied that the foregoing considerations constitute good reasons for not making any alteration in the financial years of the Bank or of the Subsidiaries.

AUDITORS' REPORT

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our Audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of those books, and proper returns adequate for the purposes of our audit have been received from Branches not visited by us.

We have examined the above Balance Sheet and Profit and Loss Account which are in agreement with the books of account and returns of the Bank. In our opinion, and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1948, in the manner so required, and on the basis authorised by the Act for a banking company give a true and fair view in the case of the Balance Sheet of the state of the Bank's affairs at 13th October, 1951, and in the case of the Profit and Loss Account of the profit for the year ended on that date.

We have examined the Group Accounts (comprising the above Balance Sheet of the Royal Bank of Scotland as at 13th October, 1951, and the annexed Balance Sheets of its Subsidiaries, Glyn, Mills & Co. and Williams Deacon's Bank Ltd., both as at 31st December, 1951) with the audited accounts of the Banks dealt with thereby, which accounts, with the exception of the Royal Bank of Scotland, have not been audited by us. Subject to the foregoing, in our opinion, the said Group Accounts have been properly prepared in accordance with the provisions of the Companies Act, 1948, and, on the basis authorised therein, give a true and fair view of the state of affairs and of the profit of the Royal Bank of Scotland and its Subsidiaries.

REPORT OF THE AUDITORS TO THE MEMBERS.

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of those books and proper Returns adequate for the purposes of our audit have been received from Branches not visited by us. We have examined the above Balance Sheet which is in agreement with the books of account and Returns. In our opinion and to the best of our information and according to the explanations given to us the said Balance Sheet gives the information required by the Companies Act, 1948, in the manner thereby authorised for Banking Companies and on such basis the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 31st December, 1951.

We have also examined the annexed Consolidated Balance Sheet and Consolidated Profit and Loss Account of the Bank and its Subsidiaries dealt with thereby with the audited accounts of those Companies. In our opinion such Consolidated Balance Sheet and Consolidated Profit and Loss Account have been properly prepared from such accounts in accordance with the provisions of the Companies Act, 1948, in the manner thereby authorised for Banking Companies and, on this basis, give a true and fair view of the state of affairs of the Bank and its Subsidiaries dealt with thereby so far as concerns members of The National Bank of India, Limited.

and Steel Federation. He estimated that home production might well be about 250,000 ingot tons more than in 1951, exports about the same as last year, and imports at least a million ingot tons more. Making generous allowances for rebuilding of stocks and for the amount of imported steel that may still be in the pipeline at the end of the year, he felt that at least 500,000 ingot tons more steel should be available for home industry this year. Mr Shone calculates the extra steel content for rearmament in 1952, as against 1951, as 300,000 ingot tons (making no reference of any nature to the statement in the recent white paper on defence that in all a million tons of finished steel, or about 1,400,000 ingot tons of crude steel, would be required for defence production this year). From the Chancellor's varying estimate about increases in engineering exports, Mr Shone deduced that such exports might need an additional 350,000 ingot tons; cuts in durable consumer goods, plant and machinery would provide enough "to ensure that at least there is the steel content available for the increased exports at which the Chancellor is aiming." It is not surprising, therefore, that Mr Shone should now be looking forward beyond the immediate shortage of steel to the period in which "the broad emphasis of policy will change from steel shortage to a question of holding and trying to expand our markets for engineering exports."

Changing Vista for Eastern Banks

There is a grim sound of the unwinding of great ventures in some of the recent reports of British banks doing business with the Far East—but there is also compensating evidence of adaptation and new development. The chairman of the Hongkong and Shanghai Banking Corporation can scarcely have avoided a note of nostalgia when he announced that there were now only four members of the foreign staff in the Bank's imposing and magnificent Shanghai office. Sir Arthur Morse said that trading arrangements with China were now very largely in the hands of Chinese government departments and their agents, and estimated that between 70 and 75 per cent of China's foreign trade was now with the Soviet Union and its satellites. With banking in China following the Russian pattern, the bank has had to take steps to withdraw its offices from Tsingtao, Swatow, Tientsin and Peking. Fortunately for the bank, activity in other sectors of its vast field of enterprise has offset the loss of business in China. Those other fields—Malaya, India, Ceylon, Thailand, Burma, Indo-China and Indonesia—have not been without their problems; but the manner in which the bank has adjusted itself to prevailing difficulties can be gauged from the further increase of £38½ million, to a record £254 million, in its balance-sheet total.

The Chartered Bank of India, Australia and China has also been called upon to adapt itself to a gigantic revolution in the social and political systems of its own particular sphere of interests. The chairman of the bank, Mr V. A. Grantham, claimed that the success with which this adaptation was being achieved owes much to the readiness with which branch managers have adjusted their way of life to unfamiliar social conventions and new forms of government and jurisdiction. Never have Britain's overseas ventures been called upon to adapt themselves to deeper changes than those that have occurred in Asia over the past six years. This theme was also stressed by Sir Charles Innes in his recent review of the affairs of the Mercantile Bank of India. This bank shares with its competitors some of the benefits of the transition from state bulk buying to private trading in commodity markets. Shipments of tea from India to the United Kingdom are now financed almost entirely by usance bills that are negotiated by the banks; when the Ministry of Food was the sole importer, the tea was paid for by telegraphic transfer. The National Bank of India, whose report and accounts were also recently published, has responded to growing difficulties in Asia by developing its interests in Africa. This is a development of fairly long standing, but has been pressed with increasing vigour and the result has been satisfactory to all concerned. Industrially and commercially the High Commission territories of East Africa—Kenya, Uganda, Tanganyika and Zanzibar—continue to expand, and the bank has played its full part in their development.

* * *

The ICI Issue and After

The £23 million rights issue by Imperial Chemical Industries went through before the Budget—and may have profited greatly thereby. About three quarters of the 10,093,023 new £1 ordinary shares, offered at 40s. 6d. each, were taken up by equity shareholders exercising their right to subscribe, and shareholders applied for about one and a half million more "excess" shares than were required to ensure a full subscription list. Stockholders who applied for more than 110 "excess" shares will receive one half of their requirements or 110 shares, whichever is the least, while smaller applications will be satisfied in full.

On the heels of this successful flotation—but also on the heels of the Budget and the Bank Rate change—British Insulated Callender's Cables are coming to the market for the much smaller sum of £3.4 million. This also will be a rights issue to equity shareholders, who are being offered 3,109,614 new £1 ordinary shares at 22s. each in the proportion of one new share for every three held. As £9,240,386 of £1 ordinary stock units are already in issue, the new offer will leave a small balance of shares, to which equity shareholders can also subscribe by right. The new shares do not rank for any ordinary dividend paid for the financial year ended December 31st last, but assuming that the dividend of 7½ per cent paid in 1950 will be repeated on the new ordinary capital of £12,350,000 the new shares at 22s. offer a yield of 6.8 per cent. Full details of the offer will not be posted to shareholders until March 28th, so that shareholders—and the directors—have a full fortnight to watch which way Mr Butler's measures will buffet equity prices and the confidence factor on which so much now depends.

Company Notes

Cable and Wireless (Holdings).—In two successive years the directors of Cable and Wireless (Holdings) have taken the market by surprise in announcing an ordinary dividend that went beyond even the most optimistic of forecasts. From the full accounts, now published, it is clear that the latest ordinary dividend of 8 per cent (against 6 per cent) was well secured by earnings. The dividend takes £210,000 net; with the help of £9,295 received as income relating to earlier years, this leaves £163,175 to be retained within the group—£115,950 by the holding company and £47,225 by Electra House. As last year witnessed modest increases in distribution on the equity capital of many British companies, it might at first have been expected that the gross investment income of the group would have risen. In fact, although 84.2 per cent of the group's investments is held in equity shares (compared with 75.7 per cent in 1950), gross investment income has fallen from £1,048,227 to £900,873. The main explanation of this drop is the reduction in the group's holding of quoted investments from £12,840,118 to £11,202,668, as a reflection of the redemption of another £2,291,632 tranche of the 3 per cent unsecured loan stock.

On December 31st last, the market value of the group's portfolio of quoted investments was £973,150 above its book value of £11,202,668; the directors add, somewhat cautiously, that unquoted investments were worth in aggregate "at least" their book value of £3,187,974. During the year the group hedged against inflation by adding to its holdings in equity shares at the expense of fixed interest stocks. At the end of 1951 only 7.2 per cent (against 15.8 per cent) of the company's holdings was in gilt-edged securities, while debenture and loan stocks of all kinds represented only 10.7 per cent (against 19.0 per cent) of the portfolio. The value of equity shares rose in the year

from £12,364,141 to £12,933,163. Moreover, last December the group held £2,041,166 in United States securities, representing 13.3 per cent of its total holdings; in 1950 it held £975,496, or 6 per cent of its portfolio, in this form. Meanwhile its holdings of British stocks were reduced sharply from £9,415,621 (or 57.6 per cent) to £7,240,255 (or 47.2 per cent). As yet it is too early to judge whether these changes indicate the future pattern of investment by Cable and Wireless. But clearly much of the group's income comes from equity shares, and as the excess profits tax on industrial profits may keep equity dividends at their present levels, shareholders in Cable and Wireless—and probably in other investment trusts as well—should not bank on a higher distribution this year.

Consolidated earnings :—	Years to December 31, 1950 £	1951 £
Investment income	1,048,227	900,873

£100 ordinary stock at 114½ xd yields £6 19s. per cent.

★

Associated Electrical.—The full accounts of AEI help to fill in the details of the picture presented when its preliminary results were commented on in *The Economist* last week. Behind the recent rights issue of ordinary shares lay the solid achievement of a further increase in the value and volume of production last year, despite labour difficulties experienced in one of the most important of the group's factories. This increase was not confined to the home market, as export sales, particularly to hard currency areas, were also increased. A steady increase in production, reflected in the rise in trading profits from £8,439,937 to £10,321,225, cannot be secured in a period of rising prices without leading to some difficulty in financing additions both to fixed and working capital. The strain that this imposed is shown most clearly in the increase in the book value of stocks held by the group (from £23,464,714 to £30,497,630), in the fall in cash balances (from £2,104,806 to £1,116,144), and in the borrowing of £2,062,533 from the banks. The new money is needed to pay off this bank loan and to help to finance stocks, which will probably increase still further both in volume and value this year. Moreover, the group intends to spend about £5.5 million on capital extensions in the next three years; even by the end of the financial year outstanding capital commitments were estimated at £3,677,000.

Consolidated earnings :—	Years to December 31, 1950 £	1951 £

£1 ordinary stock at 68s. 9d. xd yields £6 16s. per cent.

stantial retentions from profits in addition to the £6.6 million raised by the new issue. Last year about £1,750,000, excluding the sum earmarked for the replacement of fixed assets, was retained by the group. Since the directors are making prudent provisions to bridge the shortfall between actual depreciation provisions and current replacement costs, replacement has also made—and will make—a considerable call upon profits. Nor will an excess profits tax, added to the already burdensome load of taxation, make any easier the company's task of preserving its capital intact, let alone adding to it. Equity shareholders cannot therefore reasonably look beyond the promise already made that a dividend of 20 per cent should be paid on the revised capital.

★

British Industrial Plastics.—An expansionist policy of capital development, a larger and more even flow of raw materials, and the adoption of four-shift working have all contributed to the increase in output achieved by British Industrial Plastics in recent years. In the year to September 30th this continued expansion of output, together with increases in selling prices, caused a jump in group trading profits from £443,237 to £626,439. Within the year the group earned nearly £4 million from sales, including nearly £1.2 million from direct exports. Equity shareholders have not been forgotten in this year of records. In 1950, a dividend of 20 per cent was paid on the ordinary capital of £580,892 and an interim dividend of 10 per cent was paid on the same capital in 1951; a final dividend of 10 per cent has since been declared on the revised capital of £830,892 as increased by a rights issue of 2,500,000 2s. ordinary shares last June. In addition, equity shareholders are to receive a tax-free bonus of a halfpenny a share from the capital profit of £40,560 that arose when BIP sold its holdings in the Australian company, Beetle-Elliott Ltd.; £20,069 of this profit has been transferred to capital reserve. The company's issued capital is now completely out of line with its real capital, and the chairman, Mr K. M. Chance, believes that this disparity can only be corrected by a bonus issue. But before such an issue can be made, Mr Chance appeals to preference shareholders to form a committee that can decide with the directors on an equitable scheme to convert the preference share capital of £14,820 into ordinary shares.

The new money raised by last year's rights issue has enabled the company to weather an increase in stocks from £467,077 to £720,498 without imposing any strain upon liquid resources. But the rise in the cost of raw materials, especially woodpulp, has forced the directors to create a contingency reserve to which £75,000 has been appropriated from profits and £15,600 has been transferred from a plant replacement reserve. Further extensions to the group's fixed capital should begin to make their contribution to earnings this year, and there should be no difficulty in paying a dividend of 20 per cent on the increased ordinary capital.

REPORT OF THE AUDITORS TO THE STOCKHOLDERS

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the bank so far as appears from our examination of those books, and proper returns adequate for the purposes of our audit have been received from the branches, which have not been visited by us. We have examined the annexed balance sheet and profit and loss account of The Chartered Bank of India, Australia and China, which are in agreement with the books of account and returns as aforesaid. In our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by the Companies Act, 1948, in the manner so required for banking companies, and, on the basis indicated in Note (4) on the balance sheet, such balance sheet gives a true and fair view of the state of the bank's affairs as at 31st December, 1951, and the profit and loss account gives a true and fair view of the profit for the year ended on that date.

We have also examined the annexed accounts of the subsidiaries, Allahabad Bank Limited and The Chartered Bank (Malaya) Trustee Limited, which have not been audited by us. Subject thereto in our opinion such accounts have been properly prepared in accordance with the provisions of the Companies Act, 1948, so as, in conjunction with the accounts of the bank as audited by us (which include particulars regarding Nominee Companies), to give on the basis mentioned above a true and fair view of the state of affairs as at 31st December, 1951, and of the profit for the year ended on that date of the bank and its subsidiaries so far as concerns stockholders of The Chartered Bank of India, Australia and China.

NOTICES

COMMITTEE OF LONDON CLEARING BANKERS

NOTICE IS HEREBY GIVEN that the maximum rate of interest allowed by the undermentioned London clearing banks on deposits, which must be lodged for a minimum period of 21 days and be subject to a minimum notice of withdrawal of 21 days, will be 2 per cent per annum until further notice:—

Barclays Bank Limited
Coutts and Co.
District Bank Limited
Glyn Mills and Co.
Lloyds Bank Limited
Martins Bank Limited
Midland Bank Limited
The National Bank Limited
National Provincial Bank Limited
Westminster Bank Limited
Williams Deacon's Bank Limited

For the Committee of London Clearing Bankers,
A. I. HANCOCK, Secretary.

London, March 11, 1952.

FERRANTI LTD. have an important vacancy for a man of suitable qualifications and experience to study the uses of the Ferranti Electronic Computer in large-scale accounting and statistical calculations. He will be required to prepare detailed reports on systems now in operation and to work with mathematicians on the problems which arise in the application of new techniques.

Permanent staff appointment with superannuation benefits and generous salary according to qualifications.

Forms of application from Mr. R. J. Herbert, Staff Manager, Ferranti Ltd., Hollinwood, Lancs. Please quote reference DC Comm.

KUMASI COLLEGE OF TECHNOLOGY, GOLD COAST

(PRINCIPAL: J. P. ANDREWS, D.Sc., F.Inst.P.)

Applications are invited for the undermentioned posts in the DEPARTMENT of COMMERCE:

(a) 4 Lectures (Grade I), in (1) English, (2) Mathematics, (3) Economic History and Geography, (4) Economics.

(b) 2 Lecturers (Grade II), in (1) Accountancy, (2) Law.

(c) 1 Lecturer or Senior Lecturer in Local Government Subjects.

Candidates should have appropriate teaching experience and must possess at least Graduate or equivalent Professional qualifications.

Posts are pensionable (in exceptional cases appointment by contract might be arranged). Salary scales:

Lecturers (Grade I): £798-£1,147 per annum.
Lecturers (Grade II): £798-£1,450 per annum.
Senior Lecturers: £1,266-£1,780 per annum.

Above scales include overseas pay and temporary cost-of-living allowance of approximately 15 per cent of basic salaries (£510-£798, £540-£1,000 and £840-£1,200 respectively). Point of entry according to qualifications and experience. Income tax at local rates much lower than U.K. rates. Leave on full salary at rate of 7 days for each completed month of resident service, normally but not necessarily taken annually. Free first-class passages once each way for each tour of service for successful candidate, wife, and children under 9 up to three in number conditional upon their residing in the Gold Coast for a minimum of 6 months during the tour. Partly furnished quarters provided at rental not exceeding 10 per cent of basic salary.

Further information concerning the College and method of application is obtainable from the Secretary, Advisory Committee on Colonial Colleges, 15, Victoria Street, London, S.W.1, to whom enquiries should be addressed in time for applications to be submitted before March 29, 1952.

COMPANY MEETINGS

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

ACCOUNTS REVEAL FURTHER EXPANSION

GREAT BRITAIN'S BALANCE OF PAYMENTS PROBLEM

FINANCIAL AND TRADING CONDITIONS IN FAR EAST

GIGANTIC REVOLUTION IN A DECADE

MR V. A. GRANTHAM ON THE POSITION AND OUTLOOK

The ninety-eighth ordinary general meeting of The Chartered Bank of India, Australia and China will be held on the Bank's premises at 38, Bishopsgate, London, E.C., on April 2nd.

The following is the statement of the chairman, Mr V. A. Grantham, which has been circulated with the report and accounts for the year ended December 31, 1951:—

Before presenting my statement reviewing the affairs of the bank, I would refer to the sorrow which has come upon the Mother Country, the British realm overseas, and the Commonwealth of Nations through the death of His late Majesty, King George. Throughout the eastern lands, among people of diverse races and allegiances, there have been in recent weeks many touching evidences of the universal respect and admiration in which the King was held.

With devotion and loyalty we pay homage to Her gracious Majesty the Queen, confiding that her reign may be long and indeed happy and glorious.

A CENTURY IN RETROSPECT

Almost a hundred years have passed since Her Majesty's ancestor, Queen Victoria, granted to this bank a Royal Charter, and I hope that, in 1953, it will be possible to mark in some way the attainment by the bank of its first centenary.

In the course of this survey I shall refer to some of the political and economic factors which, to a greater extent than formerly, influence the administration of the far-flung branch organisation and world-wide business interests of the bank. When making my last report I paid tribute to the devotion to duty, loyalty and skill with which our overseas branch managers and their British and Asian colleagues continued to serve the bank under conditions of difficulty, discomfort and often danger. Few people who are not concerned from day to day with British commercial and financial operations in Asia are able to comprehend the significance of the political and social changes which have taken place during a decade which may well prove to be one of the great watersheds of world history. Never have there been in so short a time such extensive transfers of sovereignty.

A revolution on so gigantic a scale might have been expected to extinguish institutions more firmly established than the branch organisation of a commercial bank controlled and directed from Western Europe, but it is remarkable that, notwithstanding the almost cataclysmic changes which have occurred in the social, political and economic structures of nearly all the Asian lands engaged in international commerce, The Chartered Bank has preserved its system of branches almost intact.

TRIBUTE TO BRANCH MANAGERS

An important factor in this signal achievement has been the readiness with which our branch managers have adapted their way of life to unfamiliar social conventions and new forms of government and jurisdiction, and adjusted their professional technique to changed commercial customs. In countries proud of their newly acquired standing as sovereign nations and highly sensitive to criticism, the bank's officers have shown patience and comprehension, and manifested an unfailing helpfulness which has won the confidence of the new generation of administrators and made possible an extensive enlargement of the bank's clientele. It is a privilege to be able to acknowledge that the bank is extremely well served by its British and Asian staffs at home and abroad, and that they have never been led so successfully as they are to-day by the general managers under the guidance of Mr Cockburn and Mr Morford.

Throughout the period of the war, revolution and political change in the East, the bank has survived with added prestige and a considerable accession of strength, and I venture to hope that it will go on from strength to strength through the storms and stresses which must be expected to accompany the inauguration of what can best be called the New Order in Asia.

IMPARTIAL SERVICE

On previous occasions I have often said that throughout its existence the bank has sought impartially to serve the needs of the commercial communities, irrespective of nationality, in the countries to which its representation extends. Fifteen years ago the numerous Asian territories served by the bank had many economic interests in common. Their fiscal policies were on the whole liberal. Exchange control and autarchical conceptions of government were almost unknown. Throughout the area there was freedom for British citizens to reside and to trade, and between the governments of Southern and South-Eastern Asia, and to some extent those of the Far East also, there was a large measure of political accord and economic co-operation. In time the administrations of the newly emancipated national states will no doubt restore some measure of economic collaboration and resume multilateral trading, but, in the meantime, the political fragmentation of that great trading area, which extends from the Arabian Sea to the Pacific Ocean, must continue to confront the bank with many new and recurring problems of management and administration.

It is no longer possible to take comprehensive views of the area served by the bank and to formulate policies, however limited in their scope, applicable to the establishment as a whole. Each territory in which the bank conducts business must be viewed, and to a large extent managed, in isolation from the rest. Some economic phenomena are common to several of the Asian countries, but so widely do political systems diverge, that it would be dangerous to apply the experience gained in one to the solution of parallel problems in another. Perhaps some slight comfort may be discerned in the present situation from the reflection that crises of confidence, if not political crises, are less contagious than they were.

Management.—At the beginning of this year the board appointed Mr W. G. Pullen to be a general manager of the bank.

THE BANK'S BALANCE SHEET

Again this year the accounts indicate a further expansion of the bank's business, and the total of the balance sheet at £213,632,879 is the largest we have ever shown, as it exceeds the figure for last year by £20,030,239. It is only fair to say, however, that the very great expansion which was evident during the first six months of the year under review, has been partly offset by a moderate recession in the latter half of the year, and that this recession has continued into the present year, so that we may look for lower figures in future.

On the left-hand or liabilities side of the balance sheet, current and other accounts, fixed deposits, bills payable and loans payable are up by £18,940,198, £2,567,460, £666,688 and £165,931 respectively, all these items being sound indicators of increased business. On the other hand, notes in circulation and acceptances are down by £450,898 and £1,873,436 respectively. The reduction in notes in circulation reflects a slight recession in our business in Hongkong, where alone among all our branches the bank still issues notes. The reduction in the figure for acceptances reflects in the main increased competition from other banks in Japan for this class of business.

SUBSTANTIAL INCREASES

On the right-hand or assets side, cash in hand, at call and at bankers, Government and other securities, and advances to customers and other accounts, all show substantial increases, the figures being up by £2,373,210, £6,235,254 and £19,621,661 respectively, while decreases of £17,500, £1,357,326 and £1,873,436, are shown in the figures for securities held against the note issue, bills of exchange and liability of customers for acceptances respectively. The increases in cash in hand, at call and at bankers, and in the amount of government and other securities, represent the result of our efforts to maintain a strong degree of liquidity in the face of the increased demand for accommodation in the shape of advances

to customers and other accounts which has persisted throughout the year.

The diminution in the amount of securities held against the note issue represents depreciation only, and it will be clear that there is a surplus in this account which could be withdrawn and added to cash in hand or government and other securities, but which is being retained in case there should again be an expansion in notes in circulation. The decrease in bills of exchange reflects the moderate recession in business which took place in the second half of the year and to which I have already drawn your attention, while the fall in liability of customers for acceptances, balances the reduction in acceptances on the liabilities side and is, of course, due to the same cause.

PROFIT AND LOSS ACCOUNT

The net profits for the year are £697,097, an increase of £64,290 over those of last year, which themselves reflected an even greater increase over those for 1949. Throughout the last three years there has been a general deterioration in working conditions in almost every country in which the bank operates, accompanied by higher and ever higher working costs, and only the fact that the bank has handled a progressively increasing volume of business in each of these three years has enabled us to show an increased net profit return on each occasion. Last year I said that we should be prepared from then onwards for diminishing net returns and, although we are, this year, fortunately able to report not diminished, but greater, net returns, it would be foolhardy, in the face of the recession we are now experiencing, although so far this has been of moderate dimensions, not to be prepared for some reduction in future net profits. While we may still hope to increase our share of such business as is available, our turnover must in the end, be related to the volume of trade in the countries which the banks serve.

The stockholders will be only too well aware that there has been a considerable fall during the year in the market value of our investments in government securities. Our holdings are all dated, and predominantly short-dated, so that the losses that have been provided for should be largely recovered in due course. Suffice it to say that all losses have been fully provided for out of our internal reserves, and that in the meanwhile the prices at which these securities now stand in our books bear a more realistic relationship to current rates of interest.

DIVIDEND AGAIN 14 PER CENT

We paid an interim dividend in September last of 7 per cent, less income tax, absorbing £110,250, and it is proposed that, out of the balance now available, a final dividend of 7 per cent, less income tax, should be paid, costing £110,250, making the total distribution for 1951, 14 per cent, as was also the case for 1950.

We propose to repeat the allocations made last year to the pension fund and the widows' and orphans' fund of £125,000 and £20,000 respectively. The calls on these funds continue to be heavy and it is necessary to build them up against the future. Even so, the pension fund only provides for more or less uniform payments to all senior officers and does not permit of senior officials, and in particular officers serving abroad all their lives, receiving on their retirement pensions bearing some relationship to their active service emoluments. It is clearly of importance that the remuneration of all members of our staff should be adequate. Apart from the simple question of justice, it is obviously to our interests to provide emoluments that attract the best men to our service.

During the year, therefore, your directors decided to inaugurate a supplementary pension scheme which, in the case of senior officials and officers serving abroad, would not only increase the ultimate pension, but would, during the service of such members, give substantial benefits to dependents in the event of the untimely death of the member. This scheme is fully covered by insurance and will involve the bank in annual payments which will vary in amount according to the numbers of staff embraced by the scheme. Our opening contribution was made to the debit of profit and loss account prior to striking our profit figure for the year, and we propose to follow this procedure in future years. I feel sure that the stockholders will approve of what has been done.

PREMISES ACCOUNT

Considerable expenditure continues to be incurred in meeting the cost of extensions and renovations of bank premises and in the provision of houses for our officers in the eastern branches, and the board therefore propose that again £200,000 should be applied toward writing down bank premises and furniture account. Our Singapore office extension was recently completed, and we are informed that this large and profitable branch is now a most imposing edifice, providing every possible facility for a full banking service, including an up-to-date safe deposit for our customers and the public.

Finally, it is proposed once again to transfer £100,000 from profit and loss to contingencies, leaving £397,433 to be carried forward to next year, an increase of £31,597. I trust the stockholders will approve of our proposals.

STRUGGLE FOR STABLE GOVERNMENT

I propose to continue my practice of reviewing conditions in the areas in which the bank operates; but I would ask you to bear in mind that there are now so many imponderables on the far eastern horizon, particularly with the Korean trouble still unsettled, that it is unwise, if not impossible, to express views with complete frankness or any assumption of authority. Everywhere we see the struggle for stable government against Communism. In every country in which we operate the impact of Communism is felt in a greater or lesser degree. Everywhere the paramount need is for peace and confidence in place of war and suspicion, but unfortunately the solution of the world's troubles which can in the main be traced to one source, is not yet in sight.

In the meanwhile, the attraction of such lands as the three Delta countries of Indo-China, Thailand and Burma, the granaries of South and South-East Asia, to a country so immense and thickly populated as China, is, unfortunately, obvious. China has been in the past, and is reputed to be again, self-supporting in food grains, while, for some years past, India and many other lands in South and South-East Asia and the Far East, have depended upon rice from the three Delta countries for some portion of their annual requirements, so that the mere possibility that the produce of these three countries might be lost to South and South-East Asia is an arresting thought, which must leave no doubt in the minds of the United Nations Organisation that they must be protected from violation, the more so as their loss would leave Malaya exposed and Indonesia in danger.

We recognise, and are alive to, the threat inherent in the present political situation in the Far East; but, as our interests are purely economic, we can only hope that the counsels of peace will prevail and that we shall be permitted to carry on our normal function of assisting trade and commerce in the Far East without interruption or molestation.

I shall now proceed as usual to devote several paragraphs to each of the countries in which the bank maintains branches; but I feel that I must, without further delay, refer to the position of our offices in China instead of relegating my remarks on that area to their normal place in my review.

CHINA

The bank first opened its Shanghai branch in 1858, and, in spite of many vicissitudes, it operated with success and was effective in aiding the trade and commerce of the country until the outbreak of war with Japan in December, 1941. Stockholders will not need to be reminded that our officers were then interned and suffered considerable hardships until the Japanese were defeated, or that they were among the first to return to China to assist in the rehabilitation, not only of our own business, but of the trade and commerce of China. Exchange control and depreciation of the currency under the Kuomintang Government nullified all efforts to rehabilitate China as one of the great trading nations of the world, and, although since the advent of the People's Government, the internal value of the currency has been stabilised, commerce with the outside world has declined, or is handled on a governmentally-controlled basis, and our usefulness in China as an exchange bank appears to be at an end. As a first step, therefore, we have sought permission of the financial authorities of the People's Government to close our Tientsin office, and, although our Shanghai office remains open for the time being, a great exodus of foreigners has taken place from Shanghai and China generally, and we are handling very little business now, even in Shanghai.

John Hay, who was Secretary of State in the United States Government at the turn of the century, is credited with the assertion that he who understands China holds the key to the world's politics for the next five hundred years. This bank has a longer experience of Chinese affairs than has been given to any other foreign financial institution, and, although many of its officials, both past and present, have striven diligently to find the key, none has been successful. The record of the bank in China over a period of nearly a hundred years is one which we are reluctant to bring to a close, but there would appear to be no alternative.

INDIA

While external developments inevitably left their impress upon the Indian economy during the year, there has been within the country an all-round increase in industrial production, due to an improvement in labour conditions, better transport facilities and a greater availability of raw materials, especially cotton and jute. On the other hand, production of food has not come up to expectations or requirements and, in spite of all that is being done to enlarge the country's capacity for growing food, the task of making India self-supporting in this direction, already almost insuperable, is one of ever-increasing magnitude due to the perpetually rising tide of population.

The deficit in food supplies during the year widened to some three million tons and, but for timely assistance from a number of countries in the shape of food grains and shipping space, famine worse than any known in recent years would have been inevitable. Much of the aid which saved the country from disaster came from the United States, by means of a loan of two million tons of wheat, the rupee proceeds of which India has now been permitted to utilise in financing development projects.

RAW MATERIALS

Notwithstanding the greater availability of raw materials, including jute and cotton,

these two commodities remained in sufficiently short supply to prevent the achievement of full-scale production programmes, while the steady rise in the prices of both jute and cotton exerted considerable inflationary pressure throughout the year. An agreement covering the exchange of a number of commodities was negotiated by India and Pakistan on February 25, 1951, under which India was to obtain from Pakistan *inter alia* 35 lakhs of bales of raw jute between the date of the agreement and June 30, 1952.

Early arrivals of jute were below expectations, however, and although the agreement had the immediate effect of easing pressure on demand and prices, it soon became evident that the growers were in a much stronger position to hold the commodity until the price suited them, and no doubt this has been the main factor, together with demand from other manufacturing centres, in keeping deliveries to India well below the optimum figure. In concluding the agreement in February, 1951, India accepted the official par value of the Pakistan rupee, thus removing one bone of contention between the two countries, although of necessity exchange control has had to be instituted.

STERLING BALANCES

In October, 1951, it was announced that the British Government had agreed to permit the transfer of £310 million of India's sterling balances from the blocked account to the current account, to be held as a currency reserve and drawn upon only in an emergency. The country's sterling balances, which stood at about £643 million on June 30, 1951, had been reduced to some £570 million by February 8, 1952, about which time Sir Chintaman Deshmukh, the Indian Finance Minister, reported that, by an exchange of letters with the British Chancellor of the Exchequer in London, the sterling balances agreement of June 30, 1951, had been extended for six years until June 30, 1957. Under this agreement £35 million is to be transferred each year into current account, and it will therefore be apparent that, at the end of the period, the amount remaining blocked should be inconsiderable, and consequently will also be freed, which means that India's sterling balances problem should by then be completely solved.

The Reserve Bank of India rate was increased from 3 per cent to 3½ per cent with effect from November 15, 1951. This was the first movement since November 28, 1935, and, with a view to making it an effective curb upon inflationary tendencies, the reserve bank simultaneously withdrew its support from government securities, which immediately curtailed the ability of the commercial banks to accommodate the demand for loans and advances. The tempo of inflation had been quickening, and the measures taken by the reserve bank were therefore appropriate to the situation, as also was their expressed determination to keep inflation in check. Following the lead of the Reserve Bank, the commercial banks throughout India also raised their interest rates; but so great is the pressure for accommodation and so tight the condition of the money market, that it is more than likely that the process will have to be continued further before the Indian economy can be brought into balance.

A SIGNIFICANT DEVELOPMENT

The Government of India has recently concluded agreements with the Standard Oil Company of New York, the Burma Shell and Caltex Oil Companies, for the establishment of modern oil refineries in areas near Bombay and Madras. This significant development reveals the Indian Government in a realistic approach to economic and industrial difficulties, entrusting the creation of an important heavy industry to specialised foreign enterprise and capital, while, on the part of the great oil companies, it is an indication of their confidence in the present administration of India. It has been estimated that, in full production, the three refineries will meet nearly 90 per cent of India's present needs of petroleum products.

Toward the implementation of the Five-Year Plan, the Indian Government have already received assistance amounting to some Rs. 75 Crores from the proceeds of the United States wheat deal, and expect to receive a further Rs. 15 Crores from Canada and Australia under the Colombo Plan. There is, therefore, every indication that the first year's programme under the plan will be fully implemented. The budgetary position, too, would appear to be satisfactory in that, according to statements by the Minister of Finance, a surplus of Rs. 25/26 Crores was expected in the revenue of the country during the current year.

INTERNATIONAL BANK'S MISSION

A mission from the International Bank for Reconstruction and Development completed its investigations in India recently, but so far its findings have not been disclosed. The main objects of the mission were to:—

(a) Investigate and report upon the planning, financing and execution of the development programme;

(b) Consider and report upon the factors which bear on the ability of India to assume further external indebtedness in the near future.

India's ability to realise favourable trade balances has been demonstrated over the last two years, but inability to grow sufficient food has rendered the country dependent upon external aid if famine conditions are to be avoided. The Government therefore seeks, through the Five-Year Plan, to strengthen the agricultural side of the national economy, while leaving private enterprise free to increase industrial development. These are worthy and clear-cut objectives, and now that the Congress Party is assured of a working majority in the House of Representatives, it is to be hoped that nothing will be allowed to stand in the way of their accomplishment.

PAKISTAN

It is with deep regret that I record the tragic death, on October 16, 1951, of Mr Liaquat Ali Khan, a great statesman and the first Prime Minister of Pakistan. The late Mr Liaquat Ali Khan became Prime Minister on the birth of Pakistan in August, 1947, and following upon the death of Mr Mohamed Ali Jinnah, the first Governor-General, on September 11, 1948, the whole burden of building a modern state devolved upon Mr Liaquat Ali Khan, and, in spite of many difficulties, he succeeded in guiding the people in the way of progress and peace. The loss of a leader with such outstanding qualities of wisdom and statesmanship at that crucial time was widely deplored, and was a cruel blow to Pakistan, to whose service and welfare he was so wholeheartedly devoted.

During 1951, Pakistan enjoyed a reasonable prosperity, in spite of some final reduction in the prices of the country's main products, cotton and jute, on which it depends for economic stability. Pakistan is one of the many countries throughout the world having a vulnerable economy due to over-dependence upon a few exportable commodities; but, last year, as a result of favourable prices for both cotton and jute, which together represented about 85 per cent in value of total exports in the year ended June 30, 1951, a substantial favourable balance of trade was achieved, which left ample margin for the import of the first instalments of machinery and plant for the new industries which it is planned to set up, with a view to diversifying the economy and rendering the country less dependent upon imported manufactured goods. As the year wore on, and specifically in the period July to September, Pakistan's balance of payments deteriorated to the extent that a substantial deficit was incurred which, however, will probably turn out to be no more than a temporary phenomenon.

IMPORTANCE OF CO-OPERATION

For some years past I have recorded my opinion that the economies of Pakistan and India were complementary, and that the prosperity of both countries depended in some considerable degree upon the two countries working together, India supplying, *inter alia*, manufactured goods, while utilising Pakistan's cotton and jute to produce them. This remains the ideal arrangement, of course, but it is becoming clearly apparent that, in spite of India's agreement to accept the present parity of the Pakistan Rupee, the exchange of commodities and goods between the two countries is still far below the levels which might reasonably have been hoped for, and that Pakistan is determinedly building up industries which are intended to have the effect of rendering the country free from the necessity of importing extensively from her great neighbour. At first glance this procedure would appear to augur well for the future of Pakistan, but independence of the nature envisaged must always be purchased at some cost to the country, for no matter how efficiently the new manufacturing industries are planned and worked, they will find it difficult, if not impossible, to compete on level terms with the industries of other nations, including India, which have the advantage of catering for world markets from the privileged position conferred by the existence of an extensive home market.

The development of Chittagong as a port of importance proceeds apace, and it is satisfactory to record a considerable improvement in the loading of tea and jute for export and in the handling of shipping entering the port. The opening up of subsidiary ports in East Bengal is also making progress, and the Government can be congratulated upon their enterprise in these directions.

STATUS OF CURRENCY

As I have already stated, the Indian Government accepted the official parity of the Pakistan Rupee, after concluding a trade agreement in February, 1951. The International Monetary Fund announced its acceptance of the Pakistan Rupee on the same terms on March 19, 1951, and the currency has therefore attained an international standing which, to date, the prosperity of the country's trade has done much to enhance. The basis of prosperity—as pointed out above—is somewhat limited, and the possible effects of changing conditions of trade will always have to be kept under consideration and guarded against.

Inflation in Pakistan has resulted from and been accentuated by the increased money incomes which have accrued to the agricultural workers and the higher profits earned by the business classes, as a result of the higher prices obtained for exported raw commodities. All things considered, however, Pakistan has come through the last year in a very creditable manner, due in no small measure to the wise and able guidance of her Ministers of State and the State Bank, and to the manner in which the whole community have applied themselves to the task in hand.

BURMA

Until security in the districts can be improved, little further progress in stepping-up production of paddy (rice) to prewar levels is possible. On the other hand the import market, which was flooded toward

the close of the year 1950 with textile goods imported under open general licence conditions, has remained somewhat stagnant until recently when, with the advent of the harvest, the offtake has improved. Economically, however, Burma has not suffered greatly from the effects of this over-importing, and the overall position remains much as it was when I last addressed you.

Before the war, rice exports ran as high as 3,000,000 tons per annum and constituted about 68 per cent of the total exports. In 1949-50, with the insurrection at its height, the export of rice at about 1,200,000 tons, represented about 88 per cent of the whole. No official estimate of Burma's exportable surplus for 1951/52 has yet been issued, but in unofficial circles it is placed at from 1,250,000 to 1,500,000 tons.

Dependent almost entirely upon exports of one commodity for the viability of her economy, Burma is at least fortunate that the commodity in question is rice, for which ample markets exist at prices which hitherto have offset the lack of other exports. Nevertheless no country can afford to be permanently dependent upon only one product, however important and the Burmese Government are now showing concern, and some eagerness to re-start oil production within the country.

BRITISH GOVERNMENT LOAN

In furtherance of this objective the British Government has promised a loan of £2,500,000 towards financing the Burmese Government's share in a proposed joint venture with the Burma Oil Company to produce and refine the country's oil. The amount of the loan is payable as soon as the Burmese Government and the Burma Oil Company reach a mutually satisfactory agreement, but while agreement has been reached in principle, some difficulties, not considered insurmountable, still stand in the way. The joint venture envisages the formation of a new local company in Burma with a capital of £15 million, the shares to be held jointly by the Government and the Oil Company. The Burma Government had asked Britain for a loan of £5 million with which to purchase one-third of the share capital of the new Company.

It was recently announced by Premier Thakin Nu that the Burmese Government had accepted Britain's invitation to join the Colombo Plan. The decision followed a recommendation by a sub-committee of the Cabinet on the grounds that it would be advantageous for Burma to do so. Burma has also joined the International Monetary Fund and the World Bank for Reconstruction and Development.

A trade agreement has been concluded with Japan on a barter basis for the supply by Burma of 200,000 tons of rice at £44 per ton against the import from Japan of miscellaneous goods. The Burma Government is apparently now endeavouring to induce Japan to pay in sterling or United States dollars, but it is understood that Japan, while she might agree to such terms, would like to receive an additional 100,000 tons of rice on a barter basis, and this is holding up agreement as Burma would prefer to be paid in sterling or US dollars.

CEYLON

Again, as in the two previous years, a fair measure of prosperity has been enjoyed by Ceylon, and for this blessing the island is indebted to the continued flow at reasonable prices of the staple exportable products of the country: tea, rubber, coconuts, copra and spices. The prices of these commodities have fallen between 15-40 per cent from the closing prices of last year, but they were all remunerative at the average prices obtained during the year. The position at the end of the year, however, was not so favourable, for any further continued fall in the prices of tea, rubber and coconut products would soon expose the weakness of the country's economy, which depends to an overwhelming extent upon the prosperity of these few agricultural industries.

The government, fully aware of this over-dependence upon tea, rubber and coconuts, etc., especially in face of the need to import a large proportion of the food required by the increasing population, has already devoted considerable thought and planning toward devising means to increase the production of food within the country by extending irrigation and conservancy works. It also recently invited a mission from the International Monetary Fund to visit the island and advise upon means whereby the country's economy could be diversified, e.g., by setting up secondary industries, which would render the country less dependent upon imports of foreign manufactured goods and establish a sounder and more broadly-based economy. The mission's report, which has not yet been published, is eagerly awaited. Further evidence of the efforts being made to diversify the island's economy is found in the appearance of 1,500,000 lb. of tobacco (unmanufactured) among the products to be supplied to India, with 50,000 tons of copra and coconut oil and 400 tons of graphite, in exchange for coal and manufactured textiles, in an agreement just signed covering trade between the two countries for the year 1952.

DROP IN DOLLAR EARNINGS

For a number of years past the demand for rubber and tea from the United States of America has enabled Ceylon to realise a dollar surplus. Last year there was a sharp decline in dollar earnings due to falling commodity prices and a considerable reduction in purchases of Ceylon rubber by the United States. In the face of reports that the stockpiling of natural rubber is nearing completion in the United States, it may be that Ceylon will experience some of the graver disadvantages of the inflationary position, on which I have commented for some years past, and which the country has hitherto escaped due to the continued high prices of its exportable commodities.

No doubt the experience would be uncomfortable; but the country possesses adequate international reserves and, provided the government is prepared to adopt sufficiently severe remedies, there is no reason why the economy should not be streamlined to the more spartan conditions which appear to lie ahead. The measure of the increase in inflation which has taken place over the last year is in the rise in the note circulation and bank deposits, amounting together to about 4-5 per cent; not much in itself, but sufficient, perhaps, in conjunction with the fall in the prices of the main exportable commodities, to render production uneconomic and readjustment a necessity.

CENTRAL BANK'S BALANCE SHEET

The second balance sheet of the Central Bank of Ceylon, for the year ended December 31, 1951, reveals considerable changes since the initial balance sheet of December 31, 1950, appeared. Notes in circulation increased by Rs. 44.5 million and now stand at Rs. 397.75 million. Commercial banks' balances at Rs. 193.43 million are some Rs. 28 million higher than last year's figure. On the assets side, the international reserve had increased by Rs. 103.36 million to Rs. 668.41 million, cash and balances abroad showing an increase of Rs. 43.68 million and foreign government securities an increase of Rs. 46.37 million, the balance being represented by increases in foreign bills discounted, and holdings of Ceylon Government War Loan (payment guaranteed by the United Kingdom Government).

The position of the Central Bank of Ceylon, and therefore of the currency, is thus very strong; but as the balance sheet now gives no indication of the currencies in which the reserves are held except as regards the holding of Ceylon Government War Loan, it is impossible to say what proportion of the international reserve is held in sterling, but it is presumed that it must remain large.

MALAYA

The policy of Her Majesty's Government in respect of Malaya continues to be "that the peoples of the country shall become a united, self-governing nation within the British Commonwealth of Nations." Towards this end, legislation is being enacted under which full Malayan citzenship will be available to all who look upon Malaya as their permanent home; unofficial majorities in the legislatures in Kuala Lumpur and Singapore have been established, and popular elections are being increasingly instituted. While steady progress towards self-government is thus being made, all energies are being directed toward the eradication of the terrorist activities which continue to disrupt the life of the community, so that the full benefit from the country's natural resources, for which there is normally a world-wide demand, cannot be reaped, while the peoples continue to live under conditions of strain and hazard.

As a result of the recent visit to Malaya of Mr Oliver Lyttelton, the new Secretary of State for the Colonies, General Templer was appointed High Commissioner of the Malayan Federation. It is confidently expected that new and effective means will now be adopted to meet the terrorist menace, and devoutly to be hoped that they will bring relief in the near future to this sorely-tried country. It is fitting that I should refer here to the untimely death at the hands of bandits, and in the course of duty, of His Excellency Sir Henry Gurney. His wise counsels and unflinching determination were a strong influence in the fight against terrorism, while he also gave his full support to the policy of political evolution. Nor would it be just were I to omit to record our admiration of the miners and planters who, in a situation of great danger and personal discomfort, continue to carry the burden of the day's work with fortitude and maintain production of the commodities on which the life and well-being of the whole country depend.

RECORD TRADE FIGURES

The trade of Malaya during 1951 again reached record figures, and realised for the second year in succession a heavy export surplus. This must be reckoned a heartening and eminently satisfactory result, more particularly when account is taken of the inability of tin miners to prospect for new fields of operation, the comparatively small amount of replanting which has been possible in recent years on the rubber estates, the illicit tapping which is a feature of the unsettled conditions, the restlessness of labour under present pressures and the constantly rising production costs.

The overall surplus in visible trade is set at Straits $1,268 million (£148 million), compared with Straits $1,066 million (£124,370,000) for 1950. The actual figures for 1950 and 1951 were:—

	1950	1950
Exports	$3,957,000,000	(£461,650,000)
Imports	$2,891,000,000	(£337,280,000)
Total Trade...	$6,848,000,000	(£798,930,000)
Surplus	$1,066,000,000	(£124,370,000)
	1951	1951
Exports	$5,991,000,000	(£699,000,000)
Imports	$4,723,000,000	(£551,000,000)
Total Trade...	$10,714,000,000	(£1,250,000,000)
Surplus	$1,268,000,000	(£148,000,000)

Exports in 1951 to the United States of America aggregated about Straits $1,193,500,000 (Straits $1,048 million in 1950) which produced about US$390 million (US $345 million in 1950) for the Empire Dollar Pool, while imports from the United States, including United States dollar goods imported through Hongkong, reached only Straits $218 million (Straits $89 million in 1950) or, say, about US $70 million. Nett US dollar earnings for 1951 were thus in the neighbourhood of US $320 million, or slightly more than in 1950 and were well maintained when it is remembered that the United States consistently refrained from purchasing tin from Malaya from March right through to December, 1951. As will be recorded later, shipments of tin to the USA during 1951 amounted to only 2,532 tons, against 44,590 tons in 1950.

FALL IN COMMODITY PRICES

It should be noted that no less than 70 per cent of the visible surplus of trade in 1951 had already been reached in the first five months of the year, and that the maintenance of that high level was not possible, chiefly because of the material fall in the prices of the principal commodities during the latter half of the year, which is reflected in the following table of price changes in rubber and tin during 1951:—

	Spot Rubber	Cash Tin
Lowest	40½d. (28.11.51)	£805/807 (7.8.51)
Highest	73d. (2.3.51)	£1,610/1,620 (14.2.51)
Closing	41½d.	£905/907½

While in no sense did slump conditions develop during the latter part of the year, a significant element in the Colony's internal economy was the considerable degree of inflation which followed the high prices, resulting in an almost insatiable demand for consumer goods, and later, when the prices of the exportable products began to fall, the inevitable saturation of import markets. Overstocking of markets became general as cargoes continued to arrive, and with similar conditions obtaining in neighbouring territories, particularly Indonesia, there was a marked tendency for prices of imported goods to fall, and importers generally found difficulty in carrying their excessive stocks.

RUBBER, NATURAL AND SYNTHETIC

Rubber production in Malaya during 1951 at 603,880 tons fell short of the 1950 figure by some 100,000 tons, chiefly due to the effects of bandit activity, and again, as in the previous year, about one-half of the production came from small holdings. Inclusive of imports amounting to 547,105 tons, chiefly from Indonesia, total exports were 1,155,264 tons, against 1,106,483 tons during the previous year. The United States of America took 360,000 tons of the export figure, and it may be of interest here to note that the estimate of the annual world consumption of rubber (natural and synthetic) is now put at some 2,340,000 tons, against total production of some 2,760,000 tons, a large part of the surplus last year having gone into stockpiles.

The costs of production of the natural commodity have risen in Malaya, and probably also elsewhere, to approximately double the 1950 figure. Various proposals were made by the Malayan Government in an endeavour to obtain further contributions from the industry to provide for replanting, and to assist in combating inflationary tendencies. The industry again felt, however, that it was being singled out for additional taxation, as had been the case when the increased rate of export duty to which I referred last year, was applied, but, nevertheless, a further cess, this time of 4½ cts. per lb., while the price remains in excess of 75 cents per lb. is to be applied as from March 1, 1952, to rubber produced on small holdings, the amounts collected to be returned eventually against proof of replanting.

In regard to the synthetic product it would seem now to be accepted that, while the limit of the uses to which it can be put have not yet been reached, there must always remain a reasonable demand for the natural product for purposes for which synthetic rubber is not suitable. However, stockpiling last year accounted for a considerable portion of the off-take of natural rubber, and it must be assumed that, if purchases for the stockpiles of the World cease, and particularly if the United States reduces purchases of natural rubber, the price must be expected to fall, with repercussions upon Malaya which may militate against the successful eradication of the bandit menace. It is to be hoped, therefore, that both the United Kingdom and the United States may find it possible to support the market at a figure which will at least maintain employment in Malaya.

TIN PRODUCTION

The production of tin in 1951 at 57,000 tons differ little from the previous year, which was a postwar record, and exports, including re-exports, amounted to some 64,650 tons, against some 81,000 tons in 1950, when it may be assumed that considerable shipments from Ministry of Supply stocks in Malaya took place.

Due to the discrimination shown by the United States of America purchasing authority against Straits tin, exports of tin to the USA at 2,532 tons showed a diminution against the previous year's figure of no less than 42,058 tons. It was generally regretted that the American purchasing authority should have thought fit to accuse the tin producers in Malaya of "gouging," and though a team of experts which visited Singapore and the Federation appeared to have been satisfied that the charge was unfounded, as indeed it was, no official withdrawal was ever made. Being unable to fix contracts with Bolivia and Indonesia and possibly, too, in the realisation of the importance of tin's dollar earning capacity for the sterling area, the United States of America have recently indicated a change of policy, and one result of Mr Churchill's meeting with Mr Truman, was that 20,000 tons of Straits tin are to be released this year to the United States against payment in dollars.

Recognising that the industry suffers from a lack of publicity, tin producers during the year voluntarily agreed to a cess of 50 cents per picul on tin as from March 1, 1952, which is to be used for propaganda purposes.

IMPROVED BUDGETARY POSITION

The budgetary position of the Federation of Malaya shows further marked improvement, due in great part to the increased export duty on rubber effective from January 1, 1951, which alone is estimated to have brought in to the Treasury $140,960,000, or about 20 per cent of the total estimated revenue of some $689 million. The revised estimate of expenditure is now put at about $563 million, leaving an anticipated surplus of $126 million. In order to present a truer budgetary position revotes are to be made from a reserve created out of the surplus; for 1951 the amount required is $80 million, thus leaving a final estimated surplus for the year of $46 million. Revenue for 1952 is estimated at $641 million and expenditure at $596 million, giving an anticipated surplus of $45 million. Accumulated surplus funds amounted at December 31, 1951, to about $321 million. But the recent fall in the price of rubber has revealed the vulnerability of the revenue position, which the steep grading of the export tax greatly accentuates, and again for the good of the country, we must hope that the fall in the price of rubber will be arrested before irreparable damage results.

The inflationary spiral in Malaya continued as a consequence of the high average prices obtained during the year for the main export commodities, and in step with this situation the note issue expanded considerably. Last year I referred to the danger that a marked fall in the price of rubber and tin would bring heavy losses to importers, and I now have to record that, following the recent fall in the price of rubber, import markets in Singapore have been gravely affected and several failures have already been reported. There still remains a great deal of money in circulation, however, and it would appear desirable that the Governments, both of the Federation and of Singapore, should continue to encourage the people to save, while themselves curtailing expenditure, except to the extent that it assists to provide employment and is economically advantageous for the future.

PREMIUM BOND ISSUE

During 1951 the Government of the Federation of Malaya, in an effort to encourage the public to take an interest in government loans, issued a loan of $10 million in the form of ten-year premium bonds redeemable (unless previously redeemed by half-yearly drawings) in 1961 at $11 for each $10 bond. The response was negative, however, only $877,510 being subscribed up to January 9, 1952, this being rather in line with experience gained in respect of similar issues after the 1914-18 war. On the other hand the Government of the Federation issued a tap loan of $32 million at 3¼ per cent per annum, at $98 per cent, repayable 1961-71 to which subscriptions by the end of the year amounted to about $16.5 million, or slightly over half the amount sought. In view of the marked fall in government securities in the United Kingdom and the consequent enhancement of the rate of interest at market rates now ruling, it seems unlikely that further subscriptions to the tap loan in the Malayan Federation can be expected, although at the date of writing the loan is still open.

Notes in circulation on January 1, 1952, amounted to $764,109,209, against $633,487,211 at the beginning of 1951, a truly staggering increase over the figure of $400 million at December 1, 1948, and a clear index of the advance of inflation in all the territories affected.

NEW CURRENCY LAW

In the latter part of the year the new Currency Ordinance of 1951 became law and implemented an agreement between the Governments of the Federation of Malaya, Singapore, Sarawak, North Borneo and the State of Brunei for the establishment of a Currency Commission to control a single currency which would circulate in all these territories. Provision is made for a board of Commissioners of Currency having the sole right of issuing currency notes and coin which are legal tender in the agreeing territories. Bornean notes and coin, however, continue to be legal tender in Borneo until called in and demonetized.

I can, perhaps, best sum up the position in Singapore and the Federation of Malaya by saying that, after a year of almost unprecedented prosperity, the future is most uncertain, and dependent as ever upon the price of rubber and to a less extent upon the price of tin. In view of the present political conditions in the Far East, and of the struggle in Malaya, it would appear to be vital to the interests of the United Nations that support should be extended to Malaya at least, to the extent that full employment on the rubber estates can be maintained.

NORTH BORNEO

While some progress has been made in the colony during the year, the rate of progress has been hindered by the inadequacy of the labour force available, and in some degree by the budgetary position. The Government has continued its endeavours to find suitable additions to the present labour force and, though the demand arising from their various building projects may cause withdrawals from agricultural areas, to the detriment of the colony's earning power and ability to become self-sufficient in the production of rice, the Government is wisely endeavouring to avoid recruitment of persons who might prove undesirable from the political angle. Some Cocos Islanders, despite casualties due to the change of climate, have arrived, and negotiations are being conducted with the Indian Government for the settlement of Indian labourers, which, if successful, might well prove, here as elsewhere, to be a very satisfactory solution of the problem.

Town plans for Jesselton, Labuan, Kudat, Sandakan and Tawau have been adopted and permanent building in the former two towns has commenced. Government has placed contracts for premises for its own use and plans for some commercial building are well advanced.

High prices for rubber, especially during the early part of the year, brought a good return to producers, but inevitably, and unfortunately, the concomitant of increasing inflation. A restriction of imports as primary commodity prices fell did not wholly prevent markets from becoming overstocked, though it appears to have been sufficient to prevent prices of imported goods from falling to disastrous levels. In consequence of these conditions the cost of living continued to rise. Exports of cutch, copra and timber have been well maintained.

IMPORTS AND EXPORTS

The total of imports and exports for 1951 at $184 million (£21 million) compares with $138 million (£16 million) for 1950, and a favourable trade balance of $43 million (£5 million) shows an increase of $2 million (£300,000) over the previous year's figure, a position which must give all-round satisfaction.

Budget figures for 1951, as now revised, show an estimated surplus of approximately $8 million, against an estimate a year ago of only $1.6 million which, together with the balance brought forward at the beginning of the year of $4 million, give a final surplus of $12 million. While the estimated revenue for 1952 of about $25 million falls short of anticipated expenditure of about $28 million, there is estimated to be a final surplus, after taking account of the amount carried forward from 1951, of some $9 million. In an endeavour to place itself in a position to carry out reconstruction and development plans without calling upon Her Majesty's Government for grants-in-aid, the Government propose to take advantage of the very much improved budgetary position to create a reserve against future commitments.

The exclusive rights of the British Borneo Timber Company will expire on June 30, 1952, by mutual agreements and substantial timber areas will become available to approved applicants. The policy of Government is to plan on a long-term basis, so that the vast resources of timber may be developed in a way which will ensure that valuable forests are not destroyed while substantially increasing commercial production, and a scheme by which concessionnaires will work systematically through forest areas, is being introduced.

On December 14th the King in Council passed the necessary legislation to establish the new Supreme Court of Sarawak, North Borneo and Brunei, and a Chief Justice has since been appointed. The colony has been well served by shipping lines and air services have been increased by the addition of a further weekly flight by Malayan Airways. During the year ex-Japanese rubber estates were sold by the Custodian of Enemy Property and henceforward should represent a useful addition to the colony's export potential.

SARAWAK

Sarawak has enjoyed a full year of commercial prosperity. Estimated trade figures for 1951 give exports at Straits $494 million (£57,633,000), including oil valued at Straits $292 million (£34,067,000) and imports at Straits $330 million (£38,500,000), including oil of a value of Straits $260 million (£30,333,000) and disclosed a visible surplus of Straits $164 million (£19,133,000) or double that for 1950.

Production of crude oil has continued to increase and new borings are being made. Though refining facilities are as yet inadequate, this source of both the crude and refined product must constitute a valuable contribution to the pool of "Sterling" oil now that Abadan has ceased to function. The timber industry is making good headway, chiefly due to the adoption of modern methods and, as a result of the expansion which is taking place, a good export trade is developing. On the other hand, sago production may be expected to fall somewhat for a few years owing to delay in replanting areas which were cut out and the produce exported after the war.

The Colony still has to import about one-third of its rice requirements, but Government projects in this field, limited to some extent by shortage of staff, are progressing satisfactorily. The budgetary position is better than at any time in the Colony's history. For 1951 an excess of revenue over expenditure of some Straits $32,500,000 is expected when the accounts have been finalised, bringing the surplus balance up to some $54,500,000. The estimated surplus for 1952 is put at $8,600,000, but the Government realise that its recent income has to some extent been fortuitous and so intend to act with caution in utilising these accrued funds, partly, and one would say very wisely, to meet an expected deficit under the development plan.

THAILAND

The political peace which has reigned in recent years in Thailand was shattered in July by a coup d'état which broke the power of the navy, and this was followed by the dissolution of Parliament in late November, the result of which has probably placed the Government on a stronger, albeit pro-military, basis.

These events caused no more than a momentary hesitation in the steady economic advancement of the country during the year. Exports of rice of over 1½ million tons aided by remunerative prices for tin and rubber ensured a further strengthening of the country's already favourable external balances, and the result was a steady appreciation in the value of the tical against both sterling and the United States dollar. Typical was the official sterling import cover rate which, from ticals 57 per £1 on January 1, 1951, had been reduced to ticals 52 by the end of the year. It is the avowed intention of the Government to increase the value of its currency and there appears no reason why the above trend should not continue in 1952 as, notwithstanding the new buffer pool of three hundred thousand tons of rice to be created to hold internal prices at the present level, it seems likely that, with the newly increased external selling prices, the final earnings in sterling and United States dollars will not be less than the record figures for 1951. Thailand has also a favourable agreement running through most of 1952 for the sale of its rubber to the United States of America.

A DANGER

A danger to this encouraging trend would be a repetition of the situation that arose in last June and July, when excessive imports in respect of orders placed earlier in the year made inroads into reserves and caused a slump, particularly in textiles, in the Bangkok market. There are indications that the authorities are well aware of this danger and in consequence may restrict the import of luxury goods.

Three loans were obtained from the International Bank for Reconstruction and Development at the end of 1950, covering railway rehabilitation, irrigation, and port development, and the first benefits from the schemes financed should soon be felt. No review of Thailand would be complete without my making favourable reference to the full settlement of war debts during the year.

Perhaps the one jarring note from the point of view of ourselves and all other authorised banks in Bangkok is the reluctance of the authorities to take action against unofficial dealers in exchange who openly compete for business without being made to pay the heavy 2 per mille exchange tax on both purchases and sales, and can thus underquote the banks which must pay the tax. The only way to stop this unfair competition and serious loss of legitimate business would seem to be to abolish the tax.

REPUBLIC OF INDONESIA

President Sukarno, in his message to the peoples of Indonesia in August last, on the anniversary of the Republic's independence, regretted that the ultimate aim of a just and prosperous society had not been achieved. Was this statement, I wonder, tinged with the disappointment that the President, in common with his senior officials, must feel, that lack of internal order and security had prevented full advantage being taken of trade conditions in 1951, propitious enough to have consolidated the Republic's economy?

Not that no progress was made during the year. On the contrary, the continued satisfactory world prices obtainable for the many primary products, resulted in Indonesia's holding of foreign exchange and gold in December, 1951, showing a considerable increase over the figures a year earlier. Export figures in tonnage, as well as in value, were maintained to a remarkable degree, but a continuance of this satisfactory position is doubtful, for more and more estates are closing down as their tea, tobacco or rubber can no longer be produced at market rates owing to wage demands from labour often bordering on the ridiculous, coupled with strikes, ill discipline, squatting and theft of produce. This makes Indonesia's economy more than ordinarily vulnerable to the effects of a fall in world prices of its main exports—rubber in particular.

DR SCHACHT'S REPORT

It is this situation which doubtless led Dr Hjalmar Schacht, the former German finance minister, to stress in his report on general economic conditions in Indonesia which he made at the invitation of the Indonesian Government, that there is not the least chance of the forward development of the country if complete safety of persons and property is not restored. This report of Dr Schacht's appears to a close observer of the Indonesian scene to be a constructive, well-balanced document, and his suggestion for the abolition of the complicated certificate system for exports and imports in favour of outright devaluation, which appealed to all

bankers operating in the area, has now been adopted. The new value of the rupiah is based on the middle rate of 31.72 to £1 sterling and, although this new financial measure is accompanied by a set of export duties, graduated according to the assessed ability of each commodity to bear such duty, the immediate effect should be to alleviate the hardship caused to producers by the inequities of the exchange certificate system.

The finance department officials, who at one time appeared to dislike foregoing the easy source of revenue provided by the certificates, are to be congratulated on the realistic manner in which, in the greater interest of the Indonesian economy as a whole, they have accepted instead the uncertain yield of the export taxes. Perhaps the thought that a re-valuation of the gold stocks and foreign exchange holdings resulting from outright devaluation would more than wipe out the present budgetary deficiency, was a deciding factor in the choice between assured revenue and the placing of trade on the simplest and soundest basis.

The dollar export certificate, a new feature in Indonesia's trade, was introduced simultaneously with devaluation. Its object is to induce producers to export to the dollar area, and banks are authorised to issue certificates to seventy per cent of the value of export bills presented to them. These certificates can then be sold at a price determined by the market and, as merchants cannot import from the dollar area without possession of such certificates, imports through private channels are automatically restricted to seventy per cent of the value of exports.

FOREIGN TRADE

An interesting feature in 1951 was the participation by Indonesian nationals for the first time on a large scale in foreign trade, particularly as importers. Unfortunately many newcomers, whose business experience was probably limited to recent inflationary conditions, seem to regard import licences as synonymous with profit and indiscriminate buying and general over-import, coupled with poor internal communications and disappointing up-country offtake, have produced a saturated and stagnant market which may take a considerable time to revive. In the meantime sharp losses have been made by many dealers and credit is strained.

The Chartered Bank has continued to back to the full extent of its resources the trade of the young republic and it was galling to find that, at the end of a year in which our increased participation earned the thanks of officials and business men alike, the Government should suddenly impose a retrospective company tax graduated up to the crushing impost of 52½ per cent. This measure is another blow to Indonesia's chance of attracting the foreign capital and skill it so badly needs. Indonesia's insistence on reparations, which in any case will only take the form of services, is difficult to understand as the long-term benefit may accrue to Japan rather than to Indonesia.

VIETNAM

This country has been much in the news during 1951. Its defence against the Vietminh forces represents a constant drain upon the French economy, and the French Government has on more than one occasion during the past year, been subjected to pressure from the political left to pull out and leave the country to be defended by indigenous troops. The much-to-be-deplored death of Marshal de Lattre de Tassigny added a note of grave uncertainty to the future of military operations within the country; but recent successes have raised the morale of the fighting services, both French and Vietnamese, the latter every day becoming more numerous and stronger, and some slight improvement in the outlook is apparent, although, overshadowed at present by the possibility of intervention by Chinese volunteers, if by no more regular forces from the north, the position must remain somewhat uncertain.

The economic background, although the country is still far from self-supporting, has improved to the extent that exports of rice during the first nine months of the year increased almost threefold from about 122,000 tons in 1950 to 300,000 tons in 1951. It is estimated that the total shipments during 1951 reached at least 350,000 tons and that, unless conditions deteriorate again, exports of rice should certainly rise to 400,000 tons in 1952, with a possibility that even 500,000 tons may be reached.

The note circulation, which at December 31, 1950, was $4,755,618,583, had increased by December 15, 1951, to no less than $6,121,318,093, a sufficient indication of the inflation within the country which renders the cost of living unduly high. Imports and exchange are closely controlled and restricted; but such imports as are permitted and arrive in the country are sold at high profits, despite which they find a ready market. This is tantamount to saying that the currency is so inflated as to create a lack of confidence in its sustained purchasing power, a condition which must continue so long as the country is unable to stand on its own feet in respect of its foreign trade position or meet its full expenditure for defence and administration from internal revenues, a position which, while nearer than it was, is unfortunately not yet in sight.

REPUBLIC OF THE PHILIPPINES

At one time it appeared that, in 1951, the Philippine Republic would, for the first time since the war, succeed in balancing its external trade, but two unfortunate setbacks prevented this goal being attained. A lapse on the part of the licensing authorities resulting in over-import of non-essentials, and the havoc to export crops by the typhoons which swept over the Visayas during the early part of December, threatened serious damage to the economy and, notwithstanding record exports, the final figures showed a trade deficit of some pesos 120 million.

In spite of this there were many encouraging features noticeable during the year, the most important, perhaps, being the halting of the inflationary tendency which at one time threatened to undermine the national economy. Contributing to this was a rising output in the main export crops which was particularly fortunate as world prices of copra, sugar and hemp, the main dollar earners, tended to ease in varying degree.

There is no doubt that a determined effort is being made to reverse the downward trend revealed by the Bell Report, and revived United States confidence in the economic future of the islands probably accounts for the increased ECA assistance that has been given and promised, although very few signs of the practical results of this ECA expenditure are yet to be seen.

SOUND MONETARY POLICY

A sound monetary policy by the Central Bank prevented any substantial losses of international reserves during the year and consequently the necessity for the Monetary Board's directive that commercial banks must maintain, in certain specified assets, a ratio of 70 per cent to their total letters of credit outstanding is not obvious. The restriction that it places on the volume of import and export trade which this bank is permitted to handle represents a further reduction in an earning potential which has already suffered by the 17½ per cent tax on remittances which, incidentally, has now become the highest revenue-earning tax in the Republic and is, therefore, not likely to be rescinded two years after its inception as originally promised.

Over the past eighty years this bank has given its fullest assistance to the furtherance of the progress and development of the Islands, and in the process has experienced lean years as well as the more profitable periods, and our capital losses in the Philippines in the war years were of a very substantial nature. It would be a poor reward for the whole-hearted efforts made by our branches in the Philippines, and those of other Exchange Banks in the past, if we were not to be allowed to continue to operate with normal commercial freedom of action and potential return of profits, and it is to be hoped that the authorities, who seem essentially practical, will realise that, if we are left to handle the business in which we are so well versed, and the newly formed Philippine banks concentrate on the finance required for internal development, the best results for the economy as a whole will be obtained.

A noticeable trend, and one worthy of comment, is the large part which Japan is again playing in the external trade of the Republic.

HONGKONG

The total overseas trade of Hongkong in 1951, as in 1950, reached record figures. They are quoted here for purposes of comparison:—

	1950	1950
Imports	$3,802,976,054	(£237,686,003)
Exports	$3,756,828,200	(£234,801,762)
Total Trade...	$7,559,804,254	(£472,487,765)
	1951	**1951**
Imports	$4,892,046,009	(£305,752,875)
Exports	$4,460,563,941	(£278,785,246)
Total Trade...	$9,352,609,950	(£584,538,121)

At first glance it might be deduced from these figures that the boom conditions experienced in Hongkong in 1950 had continued right through 1951. Nothing could be further from the reality. The increased figures for 1951 represent the phenomenal extent of trade in the first few months of the year, since when, as a result of the United States embargo upon the shipment to Hongkong of all goods from which strategic exports could be produced, depressed conditions have ensued and trade figures have declined month by month. The position is aggravated by the fact that exports have declined more than imports, which continue to arrive to the embarrassment of many, and especially of the smaller import firms, some of whom may eventually be forced out of business.

EFFECT OF AMERICAN EMBARGO

The industries mainly affected by the American embargo, are those using imported cotton, tinplate and rubber. The cotton mills, dependent as they now are upon imports of Pakistan cotton, which is considerably dearer than American cotton, find themselves unable to compete with Japanese produced yarn made from the cheaper American cotton with which Japan is liberally supplied, so much so that Japan has largely supplanted Hongkong as an exporter of cotton yarn and piece goods to China. Recently it was reported that as many as 15,000 cotton mill workers were unemployed, and Hongkong's difficulties in this respect were accentuated by similar conditions in the other trades chiefly affected by the American embargo.

One major development, unforeseen at first, has been the extent to which China has been turning to Russia for more and more of her requirements, and although the trade between Hongkong and the China mainland remains considerable, it is no longer so confidently

accepted that China could not do without Hongkong's assistance in trading with the outside world. This is a development of some importance which only adds to the uncertainty surrounding Hongkong's continued existence as a world port and manufacturing centre.

JAPAN

Last year I mentioned to you the enormous task ahead of Japan in respect of its overseas payments position, in view of the discontinuance of American aid. I feel that the seriousness of this problem, concealed as it is at the moment by the increase in Japan's foreign exchange holdings, has not been fully realised.

In the first place, the financial position of the banks in Japan is steadily becoming more and more strained. In September last, the advances of the eleven leading banks exceeded their deposits and even the provincial banks had outstanding advances equal to 95 per cent of their deposits. This situation was largely caused by the urgency of the Government's policy of immediate and full-scale rehabilitation. No savings were available to be invested and the only recourse was to the banks.

In 1951 it was deemed necessary to increase industrial production to meet American procurement for the Korean war; but the overlending of the banks caused thereby is obviously a serious development. Remedies which have been proposed in some quarters include deficit budget financing, and a further extension of credit by the Central Institution, the Bank of Japan. The effect could only be to increase the already high degree of inflation and, as the prices of some of Japan's important export commodities have already risen above world market prices, increased inflation would merely create further difficulties in the maintenance of Japan's overseas payment position on a sound basis. No doubt all this is well understood by those officers of the government responsible for the country's financial policy, and based on past experience, I feel confident that the position is receiving their full care and attention.

FUTURE DIFFICULTIES

As I see the position, however, Japan must continue to face considerable difficulties in the future. Japan's purchases since the war, with dollar aid, have been largely from the dollar area, and a large proportion of the country's sales have been made to willing buyers in the sterling area. Any corrective policy involving the curtailment of imports of coal, scrap iron, and cotton from the USA and a similar curtailment in sales of textiles, machinery, etc., to the sterling area, would result in industrial difficulties, a state of affairs to be avoided in Japan at present, especially as the financial structure is in no position to withstand capital losses in any of the industries concerned. The fact that Japan is at present in possession of, and appears to be accumulating, foreign balances by restricting the importation of consumer goods, is an indication of vitality, but it also masks future difficulties and the resultant inflationary pressure is doubtless being reflected in higher and higher internal prices, which must eventually limit Japan's competitive power in world markets.

Something might be done by a monetary policy aiming at a cheapening of the cost of internal financing while still maintaining strict control over the amounts advanced. Overnight loans between banks in Japan carry interest at no less than 8.28 per cent per annum. Advances for commercial purposes are not obtainable at less than 8 per cent per annum, and even the rediscount rate of the Bank of Japan is 5.84 per cent per annum. Japanese banks pay 6 per cent per annum for 12 months' deposits and this rate makes it essential that all commercial borrowing rates shall be considerably higher. The high rates of interest are no longer a deterrent to business. Money must be procured whatever the cost, as the low wage levels in Japan, as compared with those ruling in countries in competition with Japan, still permits of profits in most lines of business. Until the banking system is placed on a sounder basis, however, and the price of money returns to a more normal level, Japan will continue to operate under a severe handicap which must militate against the attainment of a permanent viable position in respect of her balance of payments.

BALANCE OF PAYMENTS POSITION

In considering the position of Japan, I have concentrated upon the difficulties inherent in her internal position and the effect which it might be expected to have upon her external balance of payments. Actually Japan's present position in respect of her balance of payments is extremely favourable in that it is estimated that, at the end of the current fiscal year, Japan will have a favourable foreign trade balance equivalent to US $585 million, which will bring her holdings of foreign currencies to an estimated value of US $1,080 million, comprising:—

US $594 million in US currency.
US $299 million in sterling.
US $187 million in open account currencies.

US $1,080 million.

With this balance of US $594 million in hand, and an estimated surplus of US $46 million in her current year's trade with the dollar area, Japan is apparently considering the possibility of increasing imports from the dollar area, "provided such imports consist of materials and equipment which in turn can be used for increasing exports to the dollar area."

Before the war, and before the operation of exchange controls, Japan's foreign trade was largely with countries (if we exclude China) which are now within the sterling area, and Japan's problem is how to fit in its new pattern of trade with the actual currency conditions as they exist today. In prewar times America was an avid buyer of Japan's raw silk, and this commodity represented Japan's main export to the United States. Now that the demand for raw silk by the United States is strictly limited, it seems that Japan—as soon as the abnormal demands created by the Korean war cease to operate—will be driven again to trade principally with sterling area countries, and that, as the markets turn more and more from sellers' to buyers' markets, as would appear to be happening now, Japan will yet find her surplus holdings of sterling a very useful standby.

OFFICES AND AGENCIES

New York.—Our New York office provides a most valuable link between our many offices in the Orient and the United States, and enables us to maintain close relations not only with our many banking friends throughout the length and breadth of the country and in Canada, but with clients with world-wide business connections, who may find our specialised knowledge useful at times. Moreover, as American economic policy in relation to more than one of the world's raw materials emanating from our fields of operation is the dominating factor, it is essential that we should be represented in the United States, from which also flow loans from the International Bank for Reconstruction and Development and from the Government under the Point IV programme, both of which set up a wide interchange of trade with countries in the Orient, which it must always be our endeavour to assist and handle.

Hamburg.—With a continued expansion of the trade between Germany and the Far East, greater use of our agency has been made and figures show that we can be well satisfied that we have adequate representation in a country which is emerging more fully into the economic life of the world.

Manchester and Liverpool have continued to provide an important link in our participation in the finance of eastern trade, and at the same time to be a source of valuable market information for Head Office and the branches.

West End, London, adequately fulfils its function of providing a full service for many clients of the Bank's eastern branches with with whom it is increasingly popular.

GREAT BRITAIN'S DIFFICULTIES

In closing, I propose as usual to devote my last few paragraphs to conditions in Great Britain, and, because of our special interest in the subject, to the difficulty which Great Britain is experiencing in achieving an external balance of payments.

Much has been written recently on the subject of the United Kingdom's inability to pay for imports with the proceeds of exports, and because of the special difficulty experienced in meeting the cost of imports from the dollar countries, there are many who advocate avoidance of dollar imports and concentration upon imports from Commonwealth and other sterling area countries and from such European countries as will take adequate supplies of goods from the United Kingdom in return. While this might be a practical solution of Great Britain's payment difficulties, were all the sterling area countries able and willing to disregard the effect which such a policy might have upon their sterling balance positions, and allow their sterling balances to rise without limit whenever the United Kingdom's imports exceeded exports, it must be evident that any assumption to this effect would be no more tenable than one which assumed that the United Kingdom might continue to import from the dollar countries, trusting to the United States, Canada and other dollar-based countries, to allow the sterling area, as personified by Great Britain, unlimited credit.

AFTERMATH OF WAR

No doubt there is much to be said in favour of Great Britain, for, when this country was predominant in world trade, it exported capital and capital goods abroad in large measure, building up, *inter alia,* railways in the United States, Canada and the Argentine, to mention no other countries, and was content to wait for repayment until those countries prospered. Moreover, Great Britain's present plight can, to some extent, be attributed to the results of war and the liquidation of the country's foreign holdings of securities in the common cause of the Allies. Having thus received at the hands of Great Britain the seeds of prosperity, these same lands, partly due to the possession of greater natural resources than Great Britain, have proceeded to eliminate Great Britain as a competitor in their home markets, if not by ability to produce cheaper and better goods, then by hedging themselves around with protective duties and regulations.

None of these countries, however, all being sovereign states, can be expected or induced to adopt policies similar to those which enabled Great Britain to remain for an era the great creditor nation of the world, while at the same time encouraging and helping other countries with unfavourable trade balances to prosper through the continued extension of loans and other assistance by way of capital goods. In fact, the world of today is in a different stage of development and, apart from some assistance by way of establishing oil refineries in sterling area countries, there do not appear to be many long-term fields wherein the dollar countries could come to the rescue of the sterling area countries by investing capital in quickly productive enterprises in the way Great Britain did a century ago. If this be so in relation to assistance from the dollar to the sterling area countries, and the United States has been more than generous in extending dollar aid to relieve distress, it is equally so in relation to assistance from Great Britain to the less developed countries of the sterling area, although Great Britain is still sending capital goods in addition to manufactured goods to many of these countries, in payment, or part payment, for imports of vital raw materials, etc.

MUST STAND ON OWN FEET

Therefore, it seems essential that the United Kingdom should become able to stand upon its own feet in relation to both dollar-based countries and sterling-based countries, whether of the British Commonwealth of Nations or otherwise, and as practical bankers, much engaged in the exchange markets of the world, it seems to us that the problem which faces the United Kingdom is essentially a practical one, which can be illustrated in some degree from our own experience.

The Chartered Bank if not the greatest single financial institution based on London dealing with the United Kingdom's foreign trade, is certainly one of the first half-dozen so engaged, and every year the bank makes a very substantial contribution to the United Kingdom's balance of payments and prosperity, without using up any labour or imported raw materials, and with only the minimum consumption of resources within the country. We may therefore claim, without fear or favour, that the bank is a valuable asset of this country, and is justified in giving expression to its views upon this all-important subject of balancing the country's trade.

PROFITS, TAXATION AND INFLATION

The Bank also pays a heavy contribution in tax on all its profits, both abroad and in this country, and the final amount taken by this country, after providing for all foreign payments, is far from inconsiderable. The proportion of profits paid to the stockholders, who take all the risks, and provide all the reserves necessary to the business, represents a very small share indeed as compared with the taxation the Bank pays. So that inflation caused by the payment of dividends by this bank scarcely exists. And if taxation were less, the bulk of the saving to the bank would not be paid out in increased dividends, but would be used in the furtherance of our business abroad, which would not only eliminate any possibility of its creating inflationary pressure here, but would contribute to the greater benefit of this country's balance of payments. As the position stands to-day, what the bank pays in taxation here on profits earned overseas, is spent in this country, and to this extent we are debarred from helping to increase the foreign income which this country so urgently needs.

That all heavy taxation is inflationary is axiomatic, but here we have a concrete instance of taxation which is both damaging to the country's foreign payments position and, at the same time, contributes to inflation within the country. If all the expenditure in this country were necessary we should be the last to complain, but to the average man unnecessary expenditure appears to be incurred and, even if this were not so, there could be no justification for expenditure in this country, whatever it might be for, if it led to the ruination of other nations in the sterling area, through the collapse of sterling as a world currency.

OUTLOOK BLEAK

The plain fact of the matter is that Great Britain must live within its income. That Great Britain is not doing so at present is patent in its inability to balance the foreign payments position. In other words Great Britain is taking more out of the common pool than it is putting into it. This position can only be rectified by putting more into the pool and/or by taking less out of it, which means working harder and/or lowering the standard of living. If this implies, in justice to our friends throughout the world, that the more affluent of the people of the United Kingdom, whether workers or others, must eschew television sets, electrical appliances, films, tobacco, and even some proportion of the food subsidies and benefits of the welfare state, then the people concerned must face up to the position or emigrate, for it is quite certain that sooner or later our friends abroad will refuse to foot the bill. As was appropriately quoted the other day in a special article in *The Times* on "The Beveridge Principles," "To each according to his needs, at the best standard the community can afford."

The outlook is therefore sufficiently bleak; but the unequivocal declarations of the present Chancellor of the Exchequer have given hope that the Government will leave no stone unturned to correct the disequilibrium of Great Britain's foreign payments position, and I have therefore felt justified in putting my views on this painful subject before our stockholders, which hitherto I have refrained from doing. Given the ability to greatly increase production of coal and steel, and accelerate the building of ships, and the production of all kinds of motor vehicles and machinery, etc., the welfare state without modification would be well within the grasp of the people, and the balance of payments position would take care of itself. No doubt all this is very clearly in the mind of the Chancellor of the Exchequer, but until the people of the country can be inspired to greater efforts (which to be effective must not carry with them equivalent monetary gains) the measures open to the Government to balance our foreign payments position are in the main of a restrictive nature. The balance of payments once achieved, however, must be regarded as the initial step to greater effort and greater freedom. Only so will the country regain its stature and justify the use of sterling as the world's most used and most useful currency.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit

22 Ryder Street, St. James's, London, S.W.1

THE STERLING TRUST

HIGHER GROSS INCOME

The thirty-fifth annual general meeting of The Sterling Trust, Limited, was held on March 11th in London, Mr A. H. Wynn presiding in the absence of the chairman, Mr M. F. Berry.

The following are extracts from the chairman's circulated statement:—

Gross income, excluding arrears, for the past year amounted to £278,645, as compared with £248,709 for 1950, thus showing a satisfactory increase of £29,936. Nett income was £99,560 against £85,314. For 1950 the dividend on the ordinary stock was 7½ per cent. For 1951 your board recommend a total dividend for the year of 10 per cent. This will absorb £45,937 and it is proposed to deal with the balance by adding £30,000 to the revenue reserve account, raising that account to £430,000 and by adding £654 to the carry forward which will then amount to £71,307.

In recommending this larger dividend, your board have been influenced, of course, by the estimate of revenue for 1952 which indicates that it should be possible to maintain this dividend for the current year. In view, however, of the prospect of even higher taxation, shortages of raw materials and the impact of a rearmament programme on our industrial output, it is impossible to put forward estimates of a longer term.

The capital position shows a further small improvement during the year, the valuation at December 31, 1951, at £5,384,815, showing an appreciation of £979,655 or 22.24 per cent over the book cost of £4,405,160. A year earlier the appreciation was 19.2 per cent.

The report was adopted.

THE OMNIUM INVESTMENT COMPANY

DIVIDEND INCREASED TO 9 PER CENT

The 65th annual general meeting of the Omnium Investment Company, Limited, was held on March 6th, in London.

Mr H. C. Drayton (the chairman), who presided, in the course of his speech, said: The gross revenue for the year amounted to £213,800 against £184,600 last year, which is an increase of £29,200. It is satisfactory to note that our income from dividends and interest rose by £31,200 from £177,500 to £208,700. Our expenses of £141,600, which include income tax and debenture interest, show an increase of £22,200, which is practically wholly due to a rise in income tax from £53,600 to £74,600.

We have, therefore, a net figure available for distribution of £72,200, against £65,200 last year, an increase of £7,000. If shareholders endorse our recommendations to pay a final dividend of 5½ per cent, making 9 per cent, and to transfer £5,000 to a superannuation fund, we shall carry forward £87,500, an increase of £16,400 on the year.

I do not think you can expect me to attempt to tell you how the Budget may or may not affect the revenue of this company for the year. I would, however, point out to you that, taking into account the £6,800 additional tax reserves we have made, we earned 16 per cent on the ordinary stock, against the 9 per cent we are paying; so that, taking it by and large, while I cannot forecast what our revenue is likely to be, I think you can take it that your 9 per cent dividend is safe.

The report and accounts were unanimously adopted.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

STEADY BUSINESS EXPANSION REFLECTED IN RECORD FIGURES

FAR-REACHING MEASURES TO STOP DRAIN ON GOLD RESERVES

COMMONWEALTH'S AIM TO MAKE STERLING FREELY CONVERTIBLE

STABILITY HAMPERED BY INFLATION AND LAWLESSNESS IN FAR EAST

EFFORTS TO OBTAIN RELAXATION OF AMERICAN RESTRICTIONS

THE HON SIR ARTHUR MORSE ON THE COLOMBO PLAN PROGRESS

The ordinary yearly general meeting of The Hongkong and Shanghai Banking Corporation was held on March 7th at the head office, 1 Queen's Road, Central, Hongkong.

The Hon Sir Arthur Morse, CBE, who presided, said:—

Ladies and Gentlemen,—We meet here today, still under the shadow of the loss suffered by the Commonwealth and Empire just four weeks yesterday, when the death occurred of our beloved King George VI. In his life His Majesty symbolised some of those characteristics which as a nation we have long considered important—a sense of duty, service for others, and the family life. Our sympathy goes out to the members of the Royal Family and especially to the three generations of Queens who hold a very special place in our hearts. We greet the accession of Queen Elizabeth II with pride, hope, and trust. No successor to the throne could be so welcome. She is the ideal Queen. Long may she reign over us.

NET PROFIT AND APPROPRIATIONS

Turning to the accounts before you, the net profit for the year, after making transfers to reserves for contingencies, amounts to HK$17,283,671, which slightly exceeds the corresponding figure for the previous year. Including the balance of profit brought forward from last year, the total available for distribution amounts to HK$23,982,895. Out of this total it is recommended that, as in previous years, a sum of HK$3 million be written off bank premises, and, after allowing for this amount, the interim dividend of £2 per share, and the final dividend of £3 per share which is now proposed, there remains a balance of HK$8,075,332 to be carried forward to next year.

You will see from the balance sheet that there has again been a substantial increase in the figures and that the total now exceeds £254 million, an increase of £38½ million over last year's total and an all-time record in the history of the bank.

The increase of £38½ million is made up of a rise of £36 million in current and other accounts and £2½ million in acceptances on behalf of customers. Current and other accounts, which now amount to almost £196 million, continue to reflect the steady expansion in our business which has been in evidence during the past years.

ASSETS AND INVESTMENTS

With regard to our assets, cash has decreased by some £4½ million, but you will notice there has been a substantial increase of over £32 million in money at call resulting in a net increase in our liquid assets of approximately £28 million. Bills receivable now amount to nearly £51½ million, the increase of £12½ million being due partly to a rise in our holding of United States Government Treasury bills in New York and partly to the greater extent to which the facilities of the bank have been utilised in financing trade during the year under review. In this connection it is interesting to note that over 64 per cent of our liabilities to our customers is represented by cash, money at call, and bills receivable.

Investments at £26 million show a decrease of just over £6½ million. This decrease arises mainly as a result of the redemption of certain of our short-dated securities, but is also due to some extent to the fall in the market prices of our investments. In common with other financial institutions, our holding of British Government securities suffered a severe decline in value during the closing months of the year. In order to provide for this depreciation a sum has been allocated from our reserves for contingencies, which is an illustration of the necessity to which I referred in my remarks last year of continuing to build up our internal reserves. The only other material alterations in the totals of the assets are increases of £2 million in advances and £2½ million in acceptances which do not appear to call for special comment.

"PEACE BECOMES EXPENSIVE"

"Peace becomes Expensive" was the apt title used by *The Times* for the main editorial in its review of the year 1951. I think that these three words sum up very adequately one of the main economic features of the past year. Rearmament turned out to be a bigger burden than had been expected. The dollar gap yawned wider and deeper than anyone had foreseen and the crisis was clearly revealed in all its seriousness when Mr Churchill's new government took office in November. Now Great Britain is preparing to face the grim task of closing the gap.

The Commonwealth and Colonial Empire must, of course, bear their share of the burden and help to pay the high price of peace. The Commonwealth Finance Ministers agreed in London last January to stand solidly by the sterling area, starting with drastic, realistic, and far-reaching measures to stop the drain upon gold reserves, but ending with expansion and development of the great resources of that widespread area. The Chancellor of the Exchequer said that there was no sign of any of the countries of the Commonwealth wishing to leave the sterling area. The final aim and the lasting solution of the problem is one which will make sterling freely convertible into all the main currencies of the world and will drive on to the position, for which we all so greatly hope, when restrictions and controls can be cast to the winds. I myself am convinced that the more we get rid of the barriers the more rapidly will trade get moving to meet the shortages of raw materials and consumer goods which still exist in so many parts of the world.

INFLATIONARY SPENDING IN THE FAR EAST

But so far as the Far East is concerned and while the war continues in Korea, and even after peace comes (for I fear that in the foreseeable future the tension is unlikely to ease much in the East any more than in the West), currency difficulties will remain and we are unlikely to get back to those happy days of almost unrestricted freedom of trade. Even if political developments in the East get no worse, it is difficult to see how stability can be expected while there is inflationary spending and incompetence on the part of governments and a sad lack of law and order in many areas. Yet so long as there is a demand for the products of these areas, and while they continue to fetch good prices, a fair volume of trade should continue and an improvement should come as and when political conditions take a turn for the better.

One of the most striking features of the postwar years has been the way in which through international agencies or otherwise the countries blessed with a relatively high standard of living have made efforts to bring aid to the less developed territories throughout the world. The United Nations, the United States, and the British Commonwealth have been prominent in such activities.

THE COLOMBO PLAN

I made a reference in my last statement to the Colombo Plan, which was initiated at the meeting in Colombo of the Foreign Ministers of the Commonwealth countries over two years ago. In July last the main plan of development was launched, but in January, 1951, a Council of Technical Co-operation had already been set up in Colombo as an integral part of the whole idea. Real progress has been made with this particular scheme, which provides technical experts and technical training for Asian personnel needed to carry through the projects adopted by the several countries whose development plans have been set forth in the Colombo Plan report. The original report, which was published in November, 1950, no longer accurately describes the scheme of things as now existent. The Commonwealth Consultative Committee has become an International Committee, in which the United States are taking part, and included in the general scope of the "Plan" are the extensive measures undertaken by the United States Government in the same area, such as some of the "Point Four" projects, certain parts of ECA aid (now Mutual Security Administration), and various International Bank and Export-Import Bank loans wherever any of these touch the planned programmes of the participating countries.

It is significant and important that the present emphasis in the whole area should be on agricultural development or plans which will in the main benefit the rural economy of these areas. I heartily welcome this trend of events. I am convinced that it is a mistake to hasten industrialisation, and after all it is hardly surprising that the dominant aspect of planning policy should have turned towards agriculture and food, seeing that more than half of the population of the world get barely half of the calories they need. Thus the Colombo Plan has become an aggregation of various aid projects for the whole of South and South-East Asia. The launching of the original scheme served a valuable purpose in calling attention to the urgent needs of the underdeveloped countries in the area, which, if neglected, would inevitably result in political and revolutionary discontent or revolts against the established authorities.

I have referred in some detail to this matter because the plans and projects now being pressed forward are especially important both economically and politically to the areas where our bank operates. Moreover, in England last year at the first meeting held to welcome the representatives of British Overseas Legislatures I noticed that much stress was laid on the Colombo Plan by the Secretary of State for the Colonies in his opening speech on that occasion.

HONGKONG

I feel sure that I speak for all who have at heart the welfare of Hongkong when I say that it was with great pleasure that we heard that the term of office of His Excellency the Governor, Sir Alexander Grantham, had been extended until July, 1954. Sir Alexander is not only popular in all circles, but he is also honoured and respected for the wise and understanding way in which he administers the affairs of this Colony. We are indeed fortunate that he is to stay with us. But we suffered a blow last December when we heard that our extremely able Colonial Secretary, Mr J. F. Nicoll, was to leave Hongkong on his promotion to the important post of Governor of Singapore. Hongkong's loss is Singapore's gain. I have no doubt at all that Mr Nicoll will very quickly gain the confidence of all sections of the community in his new and onerous appointment as he did so quickly here in Hongkong.

Mr Oliver Lyttelton's visit last December was very welcome to all of us and to the whole Colony, especially as I believe it was the first visit paid to Hongkong by a Secretary of State for the Colonies. It is good to know that the Colonial Office is now in charge of an official with recent personal knowledge of conditions in Hongkong. We can feel that our problems are in safe hands. I would like, however, to add that on recent occasions in London when I had conversations with Mr Griffiths, the former Colonial Secretary, I was much impressed with his keen grasp and wide knowledge of the problems of the Colony. Mr Lyttelton took the opportunity of his visit to make a particularly welcome declaration which I will again place on record. He said:

"His Majesty's Government are resolved to maintain their position in Hongkong, and will discharge to the utmost of their ability their responsibilities towards the Colony as regards both defence and the welfare of its population."

Every year at this time prior to the introduction of the Appropriations Bill, the Governor makes a speech outlining some of the major developments in the Colony. Invariably a great deal of interesting and important information is provided to the public. Again this year, on March 5th, His Excellency's speech was packed with information about Hongkong which should obtain the widest possible circulation. The Governor has always urged that we should press on as much as circumstances permit with those things which we know Hongkong needs; hospitals, schools, reservoirs, roads, the city hall, and, perhaps most important of all, housing for the less privileged members of the community. I fully endorse this policy of advancement. The budget of the Colony was presented to the legislative council on the same day in a very lucid way by our new financial secretary, Mr A. G. Clarke. Naturally there has not yet been time to make a careful study of his figures and I will merely say that it is satisfactory that revenue has remained buoyant throughout the past year and that we have an increased revenue balance against future contingencies.

THE COLONY'S FINANCES AND TRADE FIGURES

However, the long list of important public works which are on the financial programme makes us realise that we cannot be complacent about the financial position of the Colony. Many of these works are urgent: all of them necessary if we want to see Hongkong develop on the right lines. It is quite obvious that it would be out of the question to attempt to float a loan at the present time so we must face the fact that payment for these works must come out of revenue. But as these works get under way their annual cost will grow. I am not in favour of drawing on our general revenue balance as it may well be needed in the future. The implication is that if revenue falls off we may have to face additional taxation to meet these important charges on revenue.

This time last year we hardly expected that the immense trade figures for 1950 could be excelled by those for 1951. You will remember that the 1950 figures for exports were no less than 60 per cent higher than those for 1949 while imports were 38 per cent higher. Yet in fact the 1951 figures show exports up a further 19 per cent and imports nearly 29 per cent. The peak was reached, however, by the end of March, the record month, when imports and exports together totalled HK$1,091 million for the one month, or about the same as for the whole of a normal prewar year such as 1938. By December, 1951, the month's figures were down to HK$737 million, though here we saw some reaction from the low spot of the year which was HK$591 million in September, but even this was well above the monthly averages in 1947, 1948 and 1949, and not far short of the monthly average in 1950.

EXPORTS TO CHINA

The effect of the embargo on exports to China imposed at the instance of the United Nations which comprehensively covered "items useful in the production of arms, ammunition, and implements of war" and which came into force in June, can be seen in the fact that Hongkong's exports to China (excluding Formosa) were valued about HK$1,151 million from January to the end of June, but from July to the end of the year they amounted to only HK$452 million. Imports from China in the two half years showed little change, being HK$455 million in the first half and H.K.$408 million in the second half of the year. Towards the end of the year the balance of trade with China turned in favour of imports: thus exports to China were down to HK$107 million in the last two months of the year, as against HK$173 million of imports from China. It is possible that China will before long start buying non-embargoed goods again in the Hongkong market on a more extensive scale than recently, but there is no doubt that she is concentrating a lot of attention on trade with Russia and East European countries. Meantime there is a large accumulation of goods in Hongkong warehouses, but nothing like the amount we experienced two years ago, which very suddenly dissipated.

The commercial cargo tonnage discharged and loaded has naturally fallen off when compared with 1950, but the figures are still only slightly below those for 1949. It is clear that a moderate recession got under way in the later part of the year. However, in our experience of trade in the Far East the word "normal" has rarely found a place and we can only meet the future as it arrives. Banking operations have continued at a high level. The Clearing House figures fell off a little at the end of the year, but they were still well above the average monthly figures for 1950, and the total for the year 1951 was equivalent to more than £1,100 million, which compared with £900 million in 1950.

AMERICAN RESTRICTIONS

The United Nations embargo, coupled with the restrictions imposed by the United States on shipments to Hongkong in December, 1950, which are still in force, have naturally had an unfortunate effect on some of Hongkong's industries. Efforts are constantly being made, without much success, to obtain relaxation of the more onerous of the American restrictions, which do not do any harm to China and in some cases have caused unemployment in Hongkong through the closure of factories. In others they have put up the costs of local industries, which have had to buy their raw materials, especially cotton, in a more expensive market. As a result Hongkong goods find it difficult to compete with Japanese goods made from American materials. These difficulties will, we hope, be solved if a settlement is reached in Korea: they are just another instance of the pernicious injustices brought about by controls, restrictions, and embargoes, however justifiable they may seem to be.

Further significance is added to what I have just said if you will note that Hongkong's imports from Japan have increased rapidly from HK$229 million in 1950 to HK$392 million in 1951. Exports to Japan only increased from HK$120 million to HK$192 million. Japan has expanded her trade in the past year with all the countries in the East, as is well known, a matter to which I shall refer again later on: Imports from and exports to the United States fell off considerably last year, as was to be expected, but imports from Germany increased from HK$37 million to HK$214 million in the year, and the latter has in fact expanded her trade throughout the East in a way only second to Japan.

I cannot conclude this section of my speech relating to Hongkong without saying how much we appreciate having the British armed forces stationed in the colony. Not only are we glad to have them here for defensive purposes, but also we welcome them because of the part they take in the life of the colony. We must continue to assist in providing amenities wherever they are needed.

CHINA

Trading arrangements with China, both imports and exports, are now very largely in the hands of Chinese Government Departments or their agents, and it has been estimated that 70 to 75 per cent of China's foreign trade is with the Soviet Union and East European countries. Banking is also becoming more and more under Government control, not so much in the western sense, but rather following the Russian pattern.

Two years ago I said that we did not propose to withdraw our offices from China so long as there was some likelihood of their being able to do business. Now it seems that there is little room for foreign banks to operate in China. In fact, we took steps to withdraw our offices from Tsingtao and Swatow in January, 1951. In September Tsingtao was effectively closed, but although we have now liquidated our office in Swatow,

our agent has been unable to get a formal clearance from the local authorities, and he is still there. In September we took steps to close our Tientsin and Peking offices, and we are doing no business at these places while liquidation is proceeding. In Shanghai we now only have four members of the foreign staff, and business as far as we are concerned is at a standstill.

Apart from saying this I do not propose to attempt to penetrate the curtain which hangs over China—whether it is a bamboo or an iron one. We, like others, have a number of problems awaiting solution with the Chinese authorities, and it would not help matters to refer to them. I will however say this. What is at stake in all this turmoil and confusion is something that goes far deeper than party dogma or political theories; it depends upon the honour, good faith, and fundamental character of the Chinese people.

MALAYA

I will now turn to Malaya, a very important territory for the bank. Early in 1951 the Communist rebellion—the so-called "Emergency"—was satisfactorily held in check and indeed for some months considerable success was obtained as a result of the vigorous operations undertaken by the police and military combined. The resettlement of squatters also proceeded smoothly. These intensified efforts appear to have driven the enemy into a desperate recrudescence of bandit activities which, in spite of many losses, brought them not a few successes. The police, military, and civilians as a consequence had serious casualties. The culminating point was the disaster suffered in the murder of the High Commissioner, Sir Henry Gurney, on October 6th. Sir Henry's untimely death was a serious blow to all communities in Malaya as the many remarkable tributes to his great qualities have shown. We wish General Sir Gerald Templer every success in the important tasks ahead of him. Mr Oliver Lyttelton's visit helped to clear the way, but the support of all communities will be needed to obtain a speedy solution of the troublesome problems of Malaya.

It has been said before, but I *do not* apologize for saying again, that the confidence of the Malay, Chinese, and Indian communities needs to be gained and maintained. It is especially important that the Chinese should be enlisted actively on the side of the Government. Phrases like these come easily off the tongue, but to put such words into practice takes time and patience. The Commissioner-General, Mr Malcolm MacDonald, has done a great work in this direction. Definite progress has been made in the past six years while he has held his office and the Malay and Chinese communities are more and more showing a willingness to compromise their differences and to combine for the good of Malaya. It is good news that Mr MacDonald's term of office has been extended. Much still remains to be done and the European, Indian, and Eurasian communities also have their part to play in order to ensure that the peninsula is swept clear of militant communism and united in loyalty to a country which will, we hope, take its place in due course as a sturdy self-governing unit of the British Commonwealth of Nations.

COMMERCIAL AND ECONOMIC DEVELOPMENTS

There is a great deal that could be said about Malayan commercial and economic developments in the past year but it would lengthen this survey too much to do more than refer rapidly to some of the outstanding affairs. The 1951 trade figures were once more a record, being no less than 56 per cent higher in value than those for 1950. Exports exceeded imports by about Malayan $1,270 million. It has been estimated that Malaya's United States dollar net earnings for the year were about 410 million in spite of the fact that the United States Government dropped out of the Singapore tin market in March, 1951. The trade figures were enhanced by the exceptionally high prices of rubber and tin in the early part of the year, but later the fall in prices brought the monthly figures down well below the comparative months in 1950.

Imports, however, were maintained. It is noteworthy that shipments from Japan rose from M$93 million in 1950 to M$243 million in 1951 and from Germany rose from about M$22 million to M$76 million. The fact that imports from the United States dollar area increased considerably to M$270 million must be recorded with some surprise. Tin exports were slightly under 65,000 tons, as compared with nearly 82,000 tons in 1950, but production of tin has been maintained at roughly the same level as the previous year, in spite of the great difficulties facing tin miners under the hazardous conditions in Malaya.

There is reason to hope that the arrangement made by Mr Winston Churchill with the United States Government in January providing the latter with 20,000 tons of tin by the end of 1952 will at any rate bring to an end the boycott of Malayan tin. Those concerned with the tin industry are seriously worried at the almost insuperable difficulty of prospecting for new tin-bearing areas under present conditions in the interior.

Exports of rubber from Malaya, including re-exports, were maintained at the high level of about 1,150,000 tons, of which exports to the United States of America were a little over 360,000 tons. Incidentally, the value of rubber exports came to roughly 70 per cent of Malaya's total exports. Over 40 per cent of the national income of the federation is believed to be derived from the rubber industry and around 30 per cent of the labour population is engaged in this activity. The importance of rubber is therefore obvious and no stone should be left unturned in order to ensure that the industry is maintained in a healthy and prosperous condition. The fall in Malayan rubber production in 1951 by about 90,000 tons was due to a number of causes, such as labour shortages, the disturbed conditions around and on the estates, and so on. Meantime Indonesian production increased by roughly the same amount. It remains to be seen what effect the new exchange regulations issued in Djakarta last month will have on Singapore's entrepôt trade and United States dollar earnings.

RUBBER REPLANTING

One of the most serious problems now facing the Federation Government is that of taking steps to ensure that replanting is started on the 1 million acres of small holdings which contain trees over 30 years old. It is also very important for the future that some agreement with the United States Government should be reached to bring about the relaxation of their policy of enforcing artificial controls and limitations on the use of natural rubber and of subsidising synthetic rubber. Sudden falls in prices such as have occurred recently are not only harmful to the industry, but are an additional cause of anxiety to the local authorities.

Malaya's prosperity depends on rubber and tin; the Communists are doing everything they can to interfere with plantations and mines. If these industries are depressed by policies adopted by the largest consuming country it will in effect be playing into the hands of the Communists and seriously endanger the political and social stability of this peninsula, which is undoubtedly the most vital spot in South East Asia.

It is satisfactory that rice production is steadily increasing year by year. The 1950-51 season gave a record crop of over 442,000 tons, but a similar quantity is still being imported, and Malaya will remain in an unhappy situation at the mercy of the big producers until she becomes self-supporting, as no doubt she will before very long.

INFLATION DANGERS

The danger of inflation in Malaya seemed particularly serious early in the year 1951 when rubber and tin prices were at their peak, but by the end of the year the situation was less menacing. In 1950 the bank note circulation increased over 50 per cent, but last year it rose from M$633 million to M$764 million, some 20 per cent. At the same time total bank deposits were up 21 per cent to M$1,263 million, while the monthly clearings dropped slightly in the latter part of the year. The cost-of-living indices for 1950 rose 10 per cent to 20 per cent according to the grades concerned, and in 1951 there were further rises up to 11 per cent. It is clear that inflationary possibilities need watching.

The financial statement for 1951 of both the Federation and the Singapore Governments show satisfactory revenue surpluses for the year of about M$110 million and M$41 million, respectively, thanks to the swollen receipts from rubber and tin duties and in spite of record expenditures. When it is remembered that these two administrations depend so much, directly or indirectly, on the continued prosperity of the rubber and tin industries, which are subject to many unpredictable tendencies, there is every reason to support the present policy of building up financial reserves against the rainy day. The difficulty of raising capital by means of public loans was illustrated by the lack of public support for both the Federation Government Loan and the Singapore Municipal Loan floated last autumn at the price of 98 with 3½ per cent interest, repayable 1961-71. But considering that as good or better returns were available from prior Singapore and FMS loans and from government stock issued in London and tax free to residents in Malaya, the failure of these issues was not surprising.

Before I pass on to other topics, I must record a note of congratulation to Singapore on its receiving a Royal Charter conferring on it the dignity of a city on September 22 last. Singapore's history dates from January 28, 1819, when a few huts on the edge of the jungle were all there was to indicate to Sir Stamford Raffles a site for this great and prosperous city which he then started to build. The loyal population of Singapore, predominantly Chinese, celebrated the occasion with enthusiastic civic pride. We British, whose forebears initiated the building of so many famous towns and cities in the East, proudly associate ourselves with the honour done to Singapore—"Majulah Singapura"—"Let Singapore flourish."

Finally, a word about the retirement of our Singapore manager, Mr Charles Edwards, who has just left the bank after nearly 40 years' service. As manager for Malaya in the postwar years he has done us very good service and he will be missed by a wide circle of friends. It was fitting that only last June he had conferred upon him the honour of Commander of the Most Excellent Order of the British Empire.

NORTH BORNEO AND BRUNEI

You are probably aware that for administrative reasons our office at Jesselton is entrusted with general control over our other offices in the Colony of North Borneo and the State of Brunei. These agency offices are at Sandakan and Tawau in Borneo, and Brunei Town and Kuala Belait in Brunei. In the latter territory the oil field at Seria dominates the scene. It is operated by the British Malayan Petroleum Company in a progressive way. The production of oil is increasing rapidly and a self-contained town is being built for its general needs. The administration of Brunei naturally profits from this situation and revenue is now, I believe, higher than that collected in the Colony of North Borneo. Perhaps inevitably developments in the towns where our offices are established in Borneo seem to compare unfavourably. Nearly seven years after the reoccupation of the territory the public utility services in these towns are still either non-existent or ineffective and inefficient. Much planning has been done and the groundwork has been laid for progress which will no doubt get under way when steps are taken to import the necessary labour. Nevertheless the natural wealth of the country has come to its rescue. For the second year in succession exports exceeded imports by the equivalent of about £5 million. Rubber accounted for 76 per cent of the value of exports and copra for another 14 per cent, while timber accounted for a considerable part of the balance. Other agricultural products are being encouraged as is indeed very necessary. The Governor has indicated his keen desire for more rapid progress in the development of the country and this augurs well for the coming years. After much delay we have recently obtained a suitable site for a proper bank building in Jesselton. The plans have been prepared and work will start shortly. Although the returns are not spectacular I am satisfied with the steady progress our offices are making in Borneo.

INDIA

The year 1951 provided India with a number of difficult problems, but in spite of periods of despondency she surmounted them surprisingly well, partly as a result of fortuitous circumstances and partly through her own foresight. The tragic death of Mr Liaquat Ali Khan resulted in a lessening of political tension between India and Pakistan and caused at any rate a temporary improvement in the Kashmiri political situation. Furthermore, the fixing of the rupee rate and the trade agreement between the two countries eased up trade difficulties, and in particular helped the movement of raw jute and coal. Prices rose rapidly in the early part of the year, but serious inflationary possibilities were forestalled by Government action coupled with a reaction in prices. The food situation was at one time alarming owing to floods here, droughts there, and the Assam earthquake, but somehow the patient and long-suffering population escaped a major calamity. Yet five million tons of wheat had to be imported and the outlook for 1952 is not much improved.

Much has been written about the ambitious five-year plan, the draft of which was published during the year. Its importance is clearly evident, and it is justly claimed to be an advance on the six-year plan prepared in connection with the Colombo programme, but the prior emphasis is still on schemes which will help to produce large quantities of food. Meantime, as part of their contribution to the Colombo Plan programme Australia, Canada, and the United States of America have contributed supplies of food grains and the rupee counterpart fund has been used to provide loans to help local projects which also benefit food production. Early in January an agreement was signed with the United States by which the latter agreed to provide US$54 million as a technical co-operation fund for rural development schemes. This project, taken with the technical programme which is already progressing rapidly under the Colombo Plan, will undoubtedly prove of great benefit to India's production in the course of time.

The recent agreements relating to the establishment of three oil refineries in India is also of great interest and importance in view of the special terms obtained by the oil companies.

My comments today on developments in a large country like India must necessarily be inadequate and sketchy. I have looked on the rosy side of things: there is unfortunately another side, but the balance shows that there has been progress, although much remains to be done.

CEYLON

The foreign trade of Ceylon continued in a satisfactory state last year and exports exceeded imports by Rs.345 million. Great interest was taken in the visit of a strong mission from the International Bank under the leadership of Sir Sydney Caine, who is so well known to many of us in this Colony. The mission will shortly be reporting on the financing of further agricultural and industrial development which is much needed in order to diversify the economy of the country. The Government Party lost a few adherents during the budget debate last year, but the Prime Minister still has a working majority and his views and outlook were happily expressed in the course of the same debate when he said: "We want friends and we feel that the best friends we could have are the British and other members of the Commonwealth."

THAILAND

The International Bank authorities have also been active in Thailand in connection with their loans made at the end of 1950. A railway authority and a port authority have been set up each governed by an autonomous board as stipulated by the bank. The year saw some surprising political occurrences, but after the dust had settled down outward appearances showed no change. The financial situation gives no cause for immediate anxiety, but there are inflationary tendencies as in so many other countries in the world. Mr W. A. M. Doll, the financial adviser to the Government, who has for 15 years identified himself faithfully with the interests of Thailand, resigned last March. His final report received considerable publicity and contained a number of important recommendations which will no doubt receive the careful consideration of the Government. Mr Doll asserted that "Siam is riding on the crest of a wave of unparalleled prosperity," but he also uttered some words of warning about the excessive number of small banks, the need to strengthen the central bank and the evil effects of the exchange turnover tax. There was again a bumper rice crop last season, and exports in the year probably exceeded 1,600,000 tons, a record figure. Unfortunately the surplus for export in 1952 is put at only 1,100,000 tons, which is, I hope, an under-estimate.

BURMA

It is disappointing that internal political conditions in Burma should have failed to improve in the past year, and recently the situation on the Burma-China-Siam frontier has given rise to much uneasiness. The decision of the Burmese Parliament last October agreeing to the establishment of a Karen State within the Union of Burma was welcome, but more genuine co-operation on the part of the Karens as a whole has not yet become apparent. The rice trade is, of course, the backbone of Burma's economy, but rice exports are still a long way below the prewar figure of 3½ million tons, although there was a slight improvement in 1951 when exports reached slightly over 1¼ million tons. Other important export products such as timber, minerals, and oil remain far behind prewar levels. Nevertheless, the balance of trade for the year showed a favourable balance of Rs.63 million. The agreement made on December 1st with the Burma Oil Company leads to the hope that in due course the oil industry will once again recover its former capacity, even though progress in this direction is certain to be slow. Another good sign was the agreement reached in October with the Burma Corporation on the working of the Bawdin Mines which in the past have produced large quantities of silver, lead and zinc. American aid has continued, and arrangements have been made to rehabilitate the port of Rangoon and five other ports which between them handle most of the foreign trade of the country. Recently Burma has decided to participate in the Colombo Plan. The Government fully realise the need for attracting foreign capital to rehabilitate and develop the country, and in this connection they hold strongly that Japan should provide reparations to restore the damage caused in the war.

INDO-CHINA

The untimely death of General de Lattre de Tassigny cast a gloom over all who are interested in the future welfare of Indo-China but the General's policy of building up the political and military strength of Vietnam has been endorsed and is being continued by the French Government. Meantime the American military aid programme has been getting into its stride. Business conditions are naturally unstable but exports of the country's main commodities, rice, rubber, and coal, increased in 1951 over the previous year. Rice exports totalled over 360,000 tons, as compared with 140,000 tons in 1950, and there is an optimistic outlook regarding rice prospects for 1952, based on the expectation of increased production of Cambodian rice. Our offices at Saigon and Haiphong fully utilised all the resources at their disposal and had a successful year, but when a comparison is made with prewar economic conditions it is tragic to realise how much leeway there is to make up and how much better trading conditions would be if only political troubles did not dominate the scene.

INDONESIA

In Indonesia our branches at Djakarta and Surabaja have continued to improve their business in spite of the confused and disturbing state of affairs in that country. Banditry and gang terrorists not infrequently sweep across parts of the country like tidal waves, clearing out crops and produce from plantations and estates. Other parts after a period of quiet and prosperity may in their turn suffer in the same way. Nevertheless, taking the picture as a whole, progress has undoubtedly been made. Security at the ports has greatly increased and the large quantities of rubber exported at high prices (estimated at nearly 800,000 tons in 1951) have provided a valuable source of foreign exchange for the country. The tonnage of copra exports was also higher than in any other postwar year, but sugar, which previously was such an important export commodity, remained depressingly in the doldrums, while tea and tobacco plantations have suffered severely from troubles of all kinds. The new exchange rate and the associated regulations which were enforced last month came to the rescue of the more depressed commodities and are more realistic than the former Certificate system. The leading authorities at Djakarta are, of course, well aware of the need to deal with the problems of law and order, security, the encouragement of foreign capital, the increase of the productivity of labour and, generally speaking, to ensure that ordinary fundamental economic principles are put into practice. Indeed, we are aware that such problems are being tackled in spite of the many handicaps which are at present obstructing rapid progress. It is highly satisfactory that the authorities are seeking foreign technical assistance and advice in regard to many matters and that financial aid from the Mutual Security Administration and the Export-Import Bank is continuously being

received. But what the country needs most of all is a period of real law and order.

PHILIPPINE ISLANDS

The internal political situation in the Philippine Islands improved in the past year largely through the effective efforts of the energetic Defence Secretary, whose intensive campaign against the Hukbalahaps has brought about a definite change for the better. Unfortunately the land reform measures are lagging and agrarian unrest seems likely to continue until more active steps are taken to deal with this problem. Externally the outstanding event of the year was the signature of the Mutual Defence Pact between the United States and the Philippine Islands, which was followed by the signature of the Japanese Peace Treaty at San Francisco on September 8th. Now the negotiations with the Japanese regarding war reparations have started and there will no doubt be long and hard bargaining before any agreement is reached. Various important recommendations of the Bell Economic Mission have been implemented in the course of the year, such as the Minimum Wage Law and the Exchange Tax Law. The latter and other increased taxes were of considerable benefit to the coffers of the government. However, the international reserve of the Central Bank fell during the year from US$290 million to US$246 million, owing largely to increased issues of import licences, which were aimed at counteracting inflationary pressures. Whereas there was an export surplus in the first half of the year, the second half produced a considerable increase in imports, so that the final trade figures were imports Ps.959 million, exports Ps.831 million, showing an adverse balance of Ps.128 million. The decline in prices of important export commodities, such as copra, coconut oil, and hemp, in the second half of the year also affected the export figures. In view of the world demand for many of the products of the Philippines, more rapid progress with the agricultural programme already laid down would greatly benefit the economy of the country.

JAPAN

The Treaty of Peace which was signed by forty-nine nations at San Francisco on September 8, 1951, was of course the most notable political event of the year for Japan. But the opposition of Russia and the Chinese People's Government leaves serious problems for the future. In the business field one of the main events was the transfer by SCAP of control over foreign currency funds to the Japanese Government Foreign Exchange Control Board as a consequence of which Japan obtained complete control of her foreign trade. Another important event was the signature of the new Sterling Area Payments Agreement on August 31st last. In this agreement the dollar convertibility clause of the earlier agreement was omitted thus leaving all payments between Japan and the sterling area to be settled in sterling. It was hoped that this would result in an expansion of trade both ways but unfortunately Japanese exports to the sterling area have increased while imports have not kept pace, leaving an accumulation of sterling amounting possibly to as much as £100 million. Meanwhile exports to the dollar area have fallen off but imports from that source have increased. It is obvious that adjustments are necessary whereby Japanese purchases can be switched in the future to the sterling area so far as it is possible. This complicated matter is now being studied in Tokyo by representatives of the two Governments.

The dangers of inflation in Japan have become very real in the course of the past year as has been pointed out by the American banker, Mr Joseph Dodge. Currency in circulation has increased from 422 billion to 506 billion yen, and prices have been rising steadily. At the same time an unhealthy situation has been developing as a result of the excessive credits granted by the Bank of Japan to some of the leading Tokyo banks. On the other hand industrial activity and production still continue to expand and agricultural production is now claimed to provide over 80 per cent of Japan's food needs. There will be many difficult problems facing Japan in the coming year. Reparations will be the subject of negotiation with several countries. The future of Korea will affect Japan closely. Trade with China bristles with political complications as does also the matter of her relations with Formosa: a satisfactory settlement can hardly be expected until the Korean conflict comes to an end. Towards the end of 1950 and early in 1951 a fairly active trade was developing between Japan and North China and some steel was shipped amongst other less important commodities. The United States then stepped in and at the present time it is believed that only a small business is proceeding. A further problem is that of Japan's textile trade: the effect on Lancashire is hotly debated in Great Britain without, so far as I am aware, any decision being reached as to how to get a sensible settlement. Further expansion has taken place in our offices in Japan. We opened a new office at Osaka during the year and have recently obtained a site on which we propose to erect a bank building for our branch there.

You will have noticed references in the various sections of my speech to the grave problem prevailing throughout the whole of South and South East Asia of the insufficiency of food—particularly rice—and the crying need for greater agricultural production. Exports of rice are still less than half of the average prewar level, but the population has increased 10 per cent. The shortage is mainly due to the poor production in Burma, Indo-China, and South Korea, where large-scale increases are only prevented by political disturbances. It is right that much attention should be given to this problem in the Colombo Plan and the United States Aid Programmes, but top priority is necessary, and I feel strongly, as I have already said, that further industrialisation should in the meantime be given only secondary consideration throughout the greater part of this area.

ANGLO-AMERICAN RELATIONS

Before I conclude there is one word I want to say about Anglo-American relations. In regard to the economic needs of the East there is no difference of opinion. In political matters there are divergencies, as was honestly recognised by President Truman and Mr Churchill in their joint statement issued at Washington last January, and as we in Hongkong know so well. But divergencies can be straightened out if realistic attempts to do so are made by both parties on all levels. I sincerely hope that this will be done in the near future.

Finally, I feel sure that shareholders will wish me to thank the staff of the bank for the very satisfactory result of the past year's operations. If you look through the list of the branches of the bank the varying conditions at each place will at once come to mind. In some places the strains and difficulties have been much worse than others, but I am well satisfied with the competent way in which each office has faced its particular problems.

I now beg to propose the adoption of the report and accounts as presented.

After the proposal has been seconded I shall be pleased to answer to the best of my ability any questions which shareholders may wish to ask.

The motion was duly seconded and carried.

NATIONAL BANK OF INDIA, LIMITED

FAR EASTERN CONDITIONS

MR J. K. MICHIE'S REVIEW

The annual general meeting of the National Bank of India, Limited, will be held on April 1st in London.

The following are extracts from the statement by the chairman, Mr J. K. Michie, circulated with the accounts:—

The accounts for the year 1951 again show increased figures, the total of the consolidated balance sheet having risen to £147,283,674 from £133,404,121 at December 31, 1950. The figures pertaining to the National Bank of India, Limited, alone show a rise of £15,326,882 over the year, but, contrary to our experience in 1950, and for reasons indicated in my last statement, there was a relatively small increase in deposits and a considerable increase in advances.

LARGER NET PROFITS

After the necessary transfer to the staff pension fund and after making full provisions for taxation, bad and doubtful debts, and other necessary reservations, our net profits are £410,673, an increase of £48,716 over the previous year. In the special circumstances obtaining over the latter part of the year I regard these as satisfactory results.

Although in common with other financial institutions our holdings of gilt-edged securities suffered a considerable depreciation, that has been fully taken care of out of inner reserves and current profits. Our portfolio is very largely in dated stocks on which the depreciation should eventually come back to us. We propose to allocate £75,000 to the general reserve fund, bringing our published reserves up to £3,675,000. The amount remaining to be carried forward shows a small decrease of £5,952. Grindlays Bank, Limited, had a satisfactory year and we are well pleased with their progress. Our Finance and Development Corporation continues to meet the functions for which it was created.

BALANCE OF PAYMENTS PROBLEM

Last year I wrote at a time when the spurious prosperity induced by the 1949 devaluation of most of the currencies of the sterling area had been exhausted and when the balance of payments gap, now so starkly outlined, was plainly foreseen by bankers if not by governments. It is an unfortunate fact that in these days of governmental control or direction of commerce and industry, whether through state trading, import and export licensing systems, export duties, credit policies and or taxation, responsibilities and burdens are thrown on banking systems which in times of greater economic freedom they would take steps to avoid or to neutralise.

I commented on this tendency a year ago and we are now surrounded by its financial results. It is true many commodity prices have fallen, cotton, wool, jute, rubber and copra are cases in point, but stocks have risen, many markets are stagnant, and in these changed conditions capital accretions have not met the needs of industry and trade. In this country a very necessary credit restriction—even if a double-edged measure so far as banks are concerned—has been put into operation. In other countries, commercial banking has taken such steps as are within its power to curb credit but it is not yet a general policy in the sterling area and so is only partly effective.

In India, 1951 was another year of difficulty, crops and foodgrains in particular being adversely affected by a poor monsoon. The food position has been considerably relieved by shipments of wheat from the United States of America largely financed by loans. Economically, Pakistan has enjoyed a very successful year. The trade and revenue of Ceylon continues to be buoyant. In Burma the economic position tends to improve.

I write in the interval between the recent London Conference of the Sterling area countries called to consider the critical position of the balance of payments for the whole area, and the issue of certain national budgets in which presumably the general policy agreed upon will be reflected.

As a bank operating in many of the countries concerned, we hope sincerely a concerted policy will be followed and that, in so far as this requires credit restriction, we shall have the full support of the central banks concerned.

OUTLOOK FOR 1952

Now that it has been agreed inflation must be fought, it is surely an anomaly that money which is a scarce commodity should be "cheap" while everything else is dear. It is this unbalance that has been the cause of some of our postwar economic ills and which must be rectified on world-wide lines. Banks do not want dearer money for its own sake or for their profit, but because money rates must be allowed to reflect market conditions and so play their part in the fight against inflationary tendencies.

1952 is bound to be a year of adjustment and difficulty, but we have no reason to expect that it will not be reasonably successful. In their quality and in the enthusiasm of our staff in the bank's interests we have the assurance that everything possible will be done to make it so.

ROYAL BANK OF SCOTLAND

RECORD DEPOSITS

COUNTRY'S ECONOMIC PROBLEMS

STRAIN OF REARMAMENT PROGRAMME

THE DUKE OF BUCCLEUCH'S SPEECH

The annual general Court of Proprietors of the Royal Bank of Scotland was held in Edinburgh on March 12th.

In the unavoidable absence of His Grace the Duke of Buccleuch and Queensberry, KT, PC, GCVO, governor of the Bank, his speech was read by Mr Kenneth Murray, chairman of the Court of Directors. It was as follows:

Before dealing with the ordinary business of the meeting, I have to refer with deep regret to the loss which we have sustained through the death of Sir James Lithgow, Baronet, GBE, who had been an extraordinary director of the bank since 1939, and one of the leading personalities in the industrial life of the West of Scotland. On the other hand, I have pleasure in referring to the appointment of two additional ordinary directors, Mr Thomas Gordon Waterlow, CBE, and Mr David Fortune Landale. We welcome them as colleagues, and we feel sure that their qualifications and experience will prove of much value in the deliberations of the board; they hold office till this court but are eligible for re-election.

I assume it will be your pleasure that the annual report of the bank, and our balance-sheet and profit and loss account and those of Glyn, Mills and Company and Williams Deacon's Bank, Limited, which have been circulated, shall be taken as read, but in compliance with statutory requirements the auditors' report falls to be read at this meeting, and I now call upon the secretary to do so, after which it is open to inspection by any proprietor.

The secretary (Mr Alexander Anderson) then read the auditors' report.

DEPOSITS AND OTHER LIABILITIES

The governor's speech continued:—Referring first to the balance sheet, it will be observed that the tendency of our figures has again been upwards. Deposits and other accounts at £135 million—a fresh record—show an increase of £4 million as compared with last year, and notes in circulation at £9,160,000 are slightly higher. The total of acceptances and other obligations shows an increase of nearly £3 million, and, as this item mainly arises out of the assistance we give to the country's foreign trade, the increase is one which gives us special pleasure.

Our capital remains unchanged at £4,250,000, but the reserve fund, by the addition of £103,416 from profits, as I shall refer to later, is £4,877,216.

LIQUID ASSETS AND INVESTMENTS

On the assets side of our balance sheet, it will be seen that our total assets now amount to £166 million. The figures under the various headings provide ample evidence that the highly liquid position of the bank is being fully maintained. Cash in hand and balances with the Bank of England and other London bankers, along with money at call and short notice, amount to over £34 million.

The high figure of our bill portfolio last year has on this occasion been exceeded, and the proportion of commercial bills is still further increased. The £1 million of Treasury Deposit Receipts outstanding at October has since been repaid to us.

The total of our quoted investments shows a slight reduction on the year and, as always, they are valued in the balance-sheet at or under market prices ruling on the date of our balance. In the conditions then and still prevailing, it is no secret that banks have had to make adjustments in values by drawing on inner reserves created to meet such conditions, and we have not escaped from this need, but the funds in question are much more than adequate to meet the call thus made upon them. We are fortunate in that a large proportion of our British Government securities consists of short and medium dated stocks.

Advances to customers show a larger movement than usual, having increased by over £6 million. The increase is well spread over agriculture, trade and commerce, and is mainly due to the larger amount of working capital made necessary by the higher level of prices. The other items on the assets side do not appear to call for comment.

PROFIT AND APPROPRIATIONS

Turning now to the profit and loss account, our year's profit at £602,728 shows a decrease of some £16,000 but, considering the higher level of charges and the increased burden of taxation, the directors consider this a satisfactory result. Following our usual practice, full provision has been made for contingencies and all bad and doubtful debts.

Two interim dividends having been paid at midsummer and Christmas respectively, amounting together to 17 per cent per annum, the directors do not recommend any further dividend for the year. The allocations proposed for property maintenance reserve and the staff pension and widows' funds are similar to those of last year. A balance of £103,416 has been added to our reserve fund, raising it, as I have already mentioned, to £4,877,216.

The Three Banks Group.—The accounts of the other two members of the Three Banks Group, namely, our associated banks, Glyn, Mills and Company and Williams Deacon's Bank, Limited, have already been submitted to their general meetings and duly approved. I am pleased to report that the businesses of these two institutions also continue to develop along sound and satisfactory lines.

ECONOMIC SITUATION

The particulars which I have given concerning ourselves are of importance to our customers, our stockholders, our staff and to the community at large, but, satisfactory as we may regard them, their real and ultimate value rests on the general economic structure of which we form a part. Our future, and, indeed, the future of all, rests on the strength and security of the nation as a whole. We must all be conscious of the fact that only yesterday the Chancellor of the Exchequer introduced his Budget and, as my remarks have necessarily had to be circulated in advance, I am, to my regret, denied the opportunity of referring to the measures which the Government have felt themselves forced to regard as essential to our economic wellbeing. There will be varying views on the adequacy and, it may be, fairness of the steps which are to be taken to combat and overcome the difficulties which beset us, but, whatever the differences of opinion which may emerge, all must agree that the dangers inherent in the present economic situation of the country call for definite and drastic action.

It is, I know, customary to acclaim increased productivity as a major contribution towards solving the problems which confront us, but one is at times forced to ponder the extent to which this simple truth has impressed itself on the minds of the people. On the surface of things, many aspects of our everyday life still do not reveal the underlying strain, but in the end a nation, no different from the individual in a matter of this kind, will assuredly go down if it fails to pay its way.

TAXATION: THE HUMAN ELEMENT

It is more than unfortunate that in our present struggle to maintain an adequate export trade we should have to bear the extent to which this simple truth has defence is one which cannot be denied. The strain which our rearmament programme imposes on the standard of living is obvious. Capital and labour, which otherwise would be utilised in adding to the real wealth of the nation, are diverted into channels which, in a material sense, are unproductive; but social security in these days without the means and ability to defend the system which supports it would be nothing other than a delusion.

This strain on the balance of payments position must be faced, and it is only by our own efforts that the disequilibrium which it aggravates can be adjusted. There is no other way. It is the case that our problems of today are largely of an economic nature, and yet one is at times forced to consider whether or not sufficient heed has been given to the important part which the human element must necessarily play in their solution. High taxation in these days is regarded as inevitable but, when administered to an extent which causes it to be regarded as penal, it is bound to have a depressing effect on output.

The call for increased productivity will sound a more popular and alluring note if the need for some forms of incentives is not forgotten. To combat the growing evil of inflation, the disciplinary effect of a restriction of credit and purchasing power is readily appreciated, but more important than all else is the urgency to ensure that nothing is done to impede the production of essential commodities to the fullest possible extent and at all levels.

VIRTUES OF SAVING

At a time when our export trade is all-important, and the amount of goods for home consumption is being reduced, the virtues of saving become more than ever apparent. Saving in itself has a beneficial effect on the currency in these days, and, in return, nothing will encourage saving more than the maintenance and improvement of the external and internal value of the pound sterling. Simply stated, it can be said that, in our modern system, our material welfare largely rests on the value of the unit against which our prices are measured. Schemes of rationing and restraint do restrict the free use of money; but, nevertheless, to industry and to the individual alike, the burden of rising prices is one of our most serious problems.

The current high level of prices is, of course, due to many different causes—some of them quite beyond our control—and there is no simple remedy. But the situation is one which calls for the most serious thought and attention on the part of those in authority and the support of all our people. The pound sterling can look back on a glorious history. Today, if not so strong as it used to be, it has, when compared with many other currencies, stood up well to the strains and stresses of two world wars, and, if those now in authority can by their actions maintain and improve its value, they will indeed have made a solid contribution towards our economic recovery.

SCOTTISH AFFAIRS

Under conditions which, in their impact, are of world-wide significance, the industrial and commercial activities of any one country are largely subject to influences which affect the whole and while one would not wish to view Scottish affairs in any spirit of isolation, there are certain features of the trade and industry of Scotland which are deserving of comment. The shipbuilding and steel industries have on hand work which will keep them busy for a long time, but output has, unfortunately, been restricted by the scarcity of raw materials. The production of coal in 1951 was only slightly in excess of that for the preceding twelve months, and all will hope that the output for the current year will show further improvement. The coal industry has for long had its own particular problems, but it is more vital than ever to our existence as a nation, and everything possible must be done to establish those conditions which will make for increased production.

The year has been difficult for the textile industries and, in particular, the wide fluctuations in the price of wool have been the cause of much concern to those dealing with this commodity. The Scotch whisky industry, it is pleasing to record, continues to play its important part in the export trade, and has still further enhanced the enviable record which it holds as the industry which contributes more than any other to the dollar earnings of the nation. Agriculture, on the whole, has had a difficult year, and the needs of this industry—as vital as any in our programme of defence—merit the fullest consideration and support.

The industries I have so far referred to are among those which have been long established within our borders, but there exists in Scotland today a strong desire to widen the scope of her industrial development and much has already been achieved in this direction. The petroleum chemical industry is showing signs of rapid growth. Production has now commenced at Grangemouth, and it is likely that, as a result of these activities, other new industries will in time be established.

STAFF

It is once more my pleasure to pay tribute to the loyal and efficient manner in which the business of the bank has been conducted during the past year, and to express on behalf of the directors their sincere appreciation of the valued services rendered by Mr Thomson the general manager, the assistant general manager, and the officials and staff at head office, London City and West End Offices, Glasgow, Dundee, Aberdeen, and all the other branches.

APPROVAL OF ACCOUNTS

I now beg to propose that the report, containing a statement of the accounts and balance-sheets, be approved.

The report was approved, and the governor, deputy-governor, extraordinary directors and the retiring ordinary directors were re-elected.

THE MERCANTILE BANK OF INDIA

YEAR OF CONTINUED PROGRESS

SIR CHARLES A. INNES ON GRAVE ECONOMIC PROBLEMS

The fifty-ninth annual general meeting of The Mercantile Bank of India, Limited, will be held on April 1st in London.

The following are extracts from the statement of the chairman (Sir Charles A. Innes, KCSI, CIE):

The record of the bank in 1951 was one of continued progress though the rate of expansion slowed down compared with the previous year. Deposits increased by some £5 million, and the balance sheet total is £74 million against £67 million a year ago. Our profit is better than last year, and we are maintaining our dividend at 12 per cent. We have made the usual allocations and have increased the carry forward. I hope you will agree that the results of the year's working are satisfactory.

DETERIORATION IN INTERNATIONAL SITUATION

Last year I referred to the worsening international situation and in 1951 there was a further deterioration especially in the Eastern half of the world. You are aware of recent events in the Middle East, in Malaya and in Korea, and there is little I need add. The plain fact is that a formidable military machine is being built up in China, and it still remains to be seen whether it is intended merely for the defence of China or whether the People's Republic of China has aggressive designs in South East Asia. I am more concerned in this speech with economic conditions. I have no doubt that in the long view the gravest economic problem in the East is that of food. It is the same story in India, Japan, Malaya and Ceylon. All are deficit countries in the matter of food and in all of them population is increasing at an alarming rate.

A more immediate problem is that of inflation. It is still rife everywhere. Another thing that impresses one in one's study of economic conditions is the way in which international trade is complicated, hampered and distorted by regulations and controls

In spite of all things, however, many of the countries in which we operate enjoyed a year of great if possibly somewhat hectic prosperity and the business of the bank expanded. The general pattern of the year's trade is clear enough. The spectacular rise of prices which followed the outbreak of the Korean war in July, 1950, and which resulted from the general scramble for scarce commodities continued into 1951 and reached its peak in February. At the end of that month rubber was selling at 6s. a pound and tin at £1,422 a ton. It is not surprising that boom conditions supervened in places like Malaya and Hongkong and also for different reasons in Japan, and a good deal of overindenting took place with untoward results later in the year. Prices broke soon afterwards and for the rest of the year the trend of commodity prices was downwards. This fall of prices is a healthy sign as long as it is not pushed too far and too fast. In this matter, of course, much depends on American policy. One of the outstanding features of the modern world is the way in which American demand conditions most of the world's commodity markets. Moreover the end of the year was marked by the balance of payments crisis which blew up so suddenly in this country. It is a crisis which affects the whole of the sterling area, and all member countries have agreed that it must be surmounted and that as a first step they must combat inflation and live within their means. This country has led the way by raising the bank rate, by imposing import cuts and by funding operations which have had the effect of reducing the liquidity ratio of the banks and so restricting credit. Further measures are promised in the Budget. It is obvious that the era of cheap money has passed and that we are in for a period of higher money rates and credit restrictions which may slow down trade.

INDIA.—In the last two or three years there has been an increasing tendency for foreign firms of world-wide repute to establish new industries in India. Usually half the capital employed is Indian. These joint enterprises already cover a wide range of manufactures, and the development constitutes a useful addition to India's capital resources and industrial capacity.

PAKISTAN.—Progress is being made in the programme for the industrial development of the country.

MALAYA.—Immediate prospects for tin seem reasonably good. There is anxiety in Malaya as to the future trend of rubber prices. It would be disastrous if rubber prices were allowed to fall to an uneconomic level and it is to be hoped that measures will be concerted in good time by the American and British Governments to prevent this happening.

JAPAN.—The expansion of her industries in the last two years has been spectacular, and we must expect her to take an increasing share of world trade in the near future. The bank, too, must expect increasing competition from Japanese banks. Our policy must be to establish a reputation for service so that when Japan again becomes a free and independent country the bank may be recognised as a valuable asset in the economy of that country.

JUTE INDUSTRIES, LIMITED

FACTORS CONTRIBUTING TO SATISFACTORY RESULTS

DEMAND FOR PRODUCTS FULLY MAINTAINED

NEED FOR CONTINUITY OF SUPPLIES

MR W. G. N. WALKER ON HIGH INDIAN EXPORT DUTY

The thirty-first annual general meeting of Jute Industries, Limited, was held on March 10th, in the Board Room of the Association of Jute Spinners and Manufacturers, 5, Cowgate, Dundee, Mr W. G. N. Walker (chairman and joint managing director) presiding.

The secretary (Mr W. A. Jeffray, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended September 30, 1951:—

The group trading profit of £1,381,057 exceeds last year's figure by £352,371. This satisfactory result can be attributed to two main reasons; firstly, trading conditions were good and our turnover increased substantially both in value and volume despite the shortage of certain of our raw materials, and, secondly, the large economies effected in manufacturing costs by the progressive installation of modern plant and machinery.

The consolidated and parent company's balance sheets have been prepared on similar lines to last year. The provisions made for depreciation of buildings, plant and machinery are again £140,000. The tax equalisation reserve, which was created two years ago, so as to spread the tax relief on initial allowances over future years and thus more nearly relate the charge for taxation to the profits of each year, has been increased from £90,500 to £123,200. In arriving at this figure, £9,300. a proportion of the reserve created during the past two years has been written back into the accounts under review.

The parent company's stock valuation as at September 30, 1951, is £626,620 up on last year, due to higher prices of raw materials and increased activity. Your directors have considered it prudent to transfer from the profit and loss account a further £150,000, making the total of the stock reserve in the balance sheet £400,000.

To help resist the continuing pressure of inflation on the capital resources of the company, your directors have decided to transfer from the profit and loss account to general reserve a sum of £220,000 which, with a transfer of £10,500 in the accounts of a subsidiary company, brings the total under this head in the consolidated balance sheet up to £918,060.

BURDEN OF TAXATION

The oppressive effect of taxation at its present level may be measured by the fact that the total provisions for taxation in the consolidated profit and loss account for the year under review amounts to £708,417 or 51 per cent of the group trading profit. It is significant that the charge for taxation is equivalent to about one-half of the annual salaries and wages paid to our employees, who number over 5,000.

Your directors recommend the payment of a dividend of 10 per cent on the Ordinary stock, carrying with it a final dividend of 8 per cent (making 12 per cent for the year) on the Eight Per Cent Non-Cumulative Participating Preference stock; in addition, in view of the improved trading results during the year under review, a bonus of 5 per cent on the Ordinary stock and 2 per cent on the Eight Per Cent Non-Cumulative Participating Preference stock is also recommended.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said: With your permission I will take the accounts, and the statement which was circulated with them, as read. (Agreed.)

RAW MATERIAL SUPPLIES

The past year has seen great changes in the availability of our main raw material. Raw jute imports from Pakistan have been of sufficient quantity to allow the spinning side of the industry to operate to the best advantage within the limits imposed by labour availability, but stocks in this country are still too low to allow of proper selection and assortment.

In contrast to the extreme shortage of supplies which prevailed at this time last year, imported cloth from India is now plentiful. The stocks of these goods held in this country by the Jute Control have borne the very high Indian export duty of £112 per ton imposed in November, 1950, and so are very dear in relation to today's replacement cost. (This duty was only £6 per ton in 1949.) Many responsible bodies made strong representations to the Indian Government to remove, or at least reduce the duty substantially, and so assist in stimulating the demand for a product whose main attribute is its cheapness. Irreparable damage, particularly in the North American market, has already been done; the continued obstinacy of the Indian Government in acting against the advice of Indian industry and of all those who deal in Indian hessian cloth throughout the world was incomprehensible and may well have serious repercussions on Indian economy in the future.

I am glad to say that the Indian Government announced on February 18th that as from that day the hessian duty would be halved, making it 750 Rupees, or £56 per ton. As the Jute Control's issue prices of imported goods and raw jute are now both well above the prices at which they can be imported, it is of vital importance to our industry and our consumers alike that major price reductions should be announced at the earliest possible moment.

PRODUCTION AND DEMAND

The demand for our manufactured products was fully maintained during the year under review, and the production of our main manufacturing sections increased by approximately 20 per cent. Your directors have made it their constant endeavour to retain flexibility of manufacture and so far, despite reduced demand in recent months, have been able, apart from a few isolated instances, to retain our full labour force without resort to short time working. Certain sections of our manufacturing activities are bound to feel the effects of the trade recession throughout the country to a greater or lesser degree and it would be imprudent to attempt to forecast precisely what may happen during the remaining seven months of the current financial year. I feel reasonably confident, however, that next year we shall again be able to put before you results which, under the circumstances, will be considered satisfactory.

PRODUCTIVITY

During the past five years the number of our employees has increased by approximately 1,000 and our labour force has been used to greater advantage as the result of the widespread introduction of modern labour saving machinery and re-deployment. The productivity per worker per hour during these five years has increased overhead by no less than 33 per cent, and amply justifies the large expenditure of capital on the modernisation of plant and machinery in recent years. Without this expenditure our output could not possibly have reached its present level and our profits would have been of a very different order.

CONTINUITY OF SUPPLIES TO CONSUMERS

When I addressed you last year, I gave an outline of the causes of the cloth shortage which was then causing considerable embarrassment to our customers. I do not wish to go over the ground again, but feel that it is my duty to emphasise once more the all important question of "Stability"; upon the outcome of this problem depends the future of the jute industry in the United Kingdom, and therefore of your company. If the industry is to serve its customers, it must be in a position to provide supplies from home or imported sources when they are required and at reasonable prices. We must not have recurring shortages and crises of the type experienced during the past few years. Only half of the cloth requirements of this country was until recently satisfied by Dundee manufactured goods—the remaining half being met by imported goods. The home manufacturing industry cannot possibly meet all consumer demands, and therefore imported goods are necessary. All we ask is that cloth will only be imported to the extent required to cover the demand which cannot be met by the home producing industry instead of as happened before the last war, home produced cloth being limited to the amount required to cover the demands not met by imported goods.

Lack of stability in the home producing industry in the inter-war years did not worry our consumers because in the event of a shortage of imported goods the home industry with mass unemployment at its doors was always able to step into the breach and meet the demand. The position today is quite different. The home industry is now operating at about two-thirds of its prewar level of activity and there is virtually no unemployment at the present time. If the importation and issue of these goods is not regulated in some way, the consumer will be deprived of continuity of supply at times of temporary shortage.

CONTROL

The Jute Control has been operated since its inception by members drawn from the industry. It has had two main functions (1) the purchase of raw jute and imported

goods, and (2) the control and distribution both of Dundee produced goods and imported goods to consumers. The first main function of the Control has given stability to the trade; its removal at the present time would have a damaging effect on not only the industry itself, but ultimately also on its consumers. The second main function—that of licensing—has been carried out in a fair and just manner. It is debatable, however, whether it is necessary today to continue this system. We in the industry are most anxious that our consumers should not be burdened with filling in forms and applications for permission to purchase, and we would co-operate with the Government to the best of our ability should it be decided to dispense with this function of the control.

FINANCE

There is one aspect of finance which should be mentioned and that relates to our raw material stocks. Although stocks appear in the parent company's balance sheet at £1,942,159, only approximately one quarter of this figure relates to raw materials, and the balance comprises work in process and finished stocks, etc. Raw material stocks are low because we are only carrying the amount required for normal day to day working, the balance being held by the Jute Control. Removal of control on the raw material end would, therefore, throw a serious additional burden on our finances. The magnitude of this burden would depend, of course, on price levels.

AUSTRALIA

Your directors have been considering for some time how to improve the company's sales organisation in the Australian market. One of your directors visited Australia to gain first hand knowledge of the position, and after consideration of the whole problem it was decided to wind up your Australian subsidiary company. This company—Jute Industries (Proprietary) Limited—accordingly went into voluntary liquidation on October 1, 1951. This action is in the best interests of the business as a whole, and does not in any way imply a diminution of our interest in the Australian market.

TRADE ASSOCIATIONS

There are two trade organisations of comparatively recent origin which deserve special mention—The British Jute Trade Research Association and The British Jute Trade Federal Council. Your company has had a research department for over thirty years, but the advent of the trade body has widened the scope of research and has been of great service to the industry.

The British Jute Trade Federal Council is a body to which all associations in the trade, with one small exception, are affiliated. Your company is a member of all the constituent associations and we have been much impressed by the spirit of co-operation and confidence within the industry which this council has built up. The industry has suffered for some time from lack of publicity, with the result that the people of this country have not realised the basic importance of jute to the national economy. The Federal Council's recent action in appointing a public relations officer is therefore very much in our interest.

In conclusion, I am sure you would wish me to convey to all executives, management, staff and employees at home and overseas your most sincere thanks for their work during the past year. All concerned have worked together with enthusiasm and common purpose. As I said last year, this team spirit, a characteristic of your company, is also one of its greatest assets.

The report and accounts were adopted and the dividend as recommended was approved.

The retiring directors, Mr B. C. Walker and Mr G. H. Pilcher, were re-elected and the remuneration of the auditors, Messrs Dewar and Robertson, CA, having been fixed, the proceedings terminated.

THE MONOTYPE CORPORATION LIMITED

SATISFACTORY YEAR'S TRADING

THE LORD RAMSDEN'S STATEMENT

The forty-fourth annual general meeting of The Monotype Corporation Limited was held on March 11th, in London.

The Lord Ramsden (chairman) presided.

The following is an extract from the chairman's statement circulated with the report and accounts.

Although this does not fall in the year under review, a most important event has been the increase in the capital structure of the Corporation.

At the extraordinary general meeting held on Tuesday, December 11, 1951, unanimous agreement was expressed by shareholders with our proposals and the operation has now been completed.

It is believed that this increase, which more accurately represents the true capital of the Corporation, will eventually prove to be in the best interests, not only of shareholders, but also of those in the employment of the Corporation.

SATISFACTORY PROFIT

The profit earned this year has maintained the high level reached in the postwar years. Under existing conditions, this can be considered satisfactory. A slight increase in turnover contributed to the result. However, the already high level of taxation, still further increased during the year, has reduced our disposable balance, and prevents us making the provision for reserves which we should like.

This increased production, mainly due to the new and well-equipped engineering shop, has made it possible to deal more rapidly with orders for Commonwealth and foreign countries. The order book is still big although we are catching up with the backlog, particularly in overseas markets. Every attempt is being made to obtain orders, but it is unlikely that there still exists the same spectacular demand we have had since the end of the war.

NEW PRODUCTS

We are also making every endeavour to find new products suitable both to the works and the trade in which we are interested.

In this connection, one of our newest products, the 'Monotype' Boston Stitcher, has met with a good reception, and the 'Monotype' Thompson Casting Machine will be available for sale in the near future.

On previous occasions my predecessor made reference to the development of a photo-composing machine. Here again, what is now known as 'Monophoto' has been favourably received and pilot machines are in the course of production. In this matter, the interest and help given by some of our customers is much appreciated.

With regard to the question of matrices, towards the end of last year permission was given us to proceed with a new building. It is required to deal with ever-increasing demands for the production of matrices of all types.

Our objective is to offer from stock, or be able to deliver quickly, standard matrices. We are also developing as quickly as possible those special types which are required for use abroad. These range from Greek to Urdu. Special attention has been and will be given to the needs of Eastern and Far Eastern countries.

As in the case with other new buildings and equipment, referred to in previous reports, the funds for the new matrix building are being provided out of existing capital.

A conservative policy, followed for a number of years, has more than justified itself. In present circumstances it would have been difficult, if not impossible, to borrow money for such capital expenditure.

Every endeavour is made to maintain the closest possible contact with existing or potential users of 'Monotype' equipment, both at home and abroad. In this country, our representatives and inspectors call regularly on those engaged in the printing trade. In the overseas field, in addition to our representatives on the spot, members of the board and senior officers of the Corporation have paid visits to many countries.

The Corporation can once again be said to have contributed materially to the national export drive, upon which so much depends today.

If this country is to redress its adverse balance of trade, it is not merely a question of sales to what were generally referred to as hard currency countries, but sales everywhere. We have buyers throughout the world.

CONDITIONS DURING THE YEAR

During the year conditions have not been easy. Shipping space has not always been available when it was needed and on more than one occasion consignments were held up for long periods. It was fortunate that towards the end of 1951 we were able to ship a substantial number of machines.

Supplies have also been difficult to obtain—more particularly steel—and strenuous efforts were necessary in order to obtain the materials essential to keep the works going. Unfortunately, the coming year does not appear likely to bring any ease. On the contrary, there is every expectation that conditions will be more difficult. However, wherever possible, stocks are being built up and everything has been done and will continue to be done to obtain all that is required.

An advance in wages was granted recently and this became effective in November, 1951. The full effect is expected to cost something round about £60,000 per annum. This, added to the very largely increased cost of

practically everything that we use has compelled us, although reluctantly, to follow with an increase in our prices. From the beginning of this year, machines, etc., have had a general increase of 12½ per cent and matrices of 25 per cent.

EXCESS PROFITS TAX

The Chancellor of the Exchequer has announced that from the first of this year an Excess Profits Tax is to be levied on business gains. When these notes were prepared no knowledge existed, however, of the system which would be applied. This lack of knowledge in itself causes a certain amount of difficulty.

It is to be hoped that any scheme will leave sufficient funds in the coffers of this corporation in particular, and of industry in general, that it will be possible to provide for the repair of old buildings and the erection of such new buildings and equipment as will make for still further efficient and economic production.

Any system of taxation which does not allow for these factors is bound, in the long run, to have an adverse effect upon the future of British industry.

CHANGES ON THE BOARD

I now refer to changes that have taken place on the board in 1951.

First, Mr Silcock, the general manager, who has rendered most valuable service in that capacity, was made a director.

In November, 1951, Mr Harold Macmillan was appointed a member of his late Majesty's Government and in consequence was compelled to resign his seat on the board. From the point of view of the corporation this was regretted. His sound knowledge and experience had been most useful during the many years he served as a director.

I am glad to say, however, that his son, Mr Maurice Macmillan, having been invited to become a director, accepted the invitation. His knowledge of the publishing and printing of books will be of value to the corporation.

THE DIVIDEND

It was made clear in the circular to shareholders dated November 16th, that the amount paid in dividend would not be increased for the present year. In consequence, it is proposed that the final dividend shall be at the rate of 6½ per cent on the new capital of £1 million. This, together with the interim dividend of 5 per cent already paid on the old capital, leaves the distribution at the same rate as last year.

THE FUTURE

It has always been my custom when dealing with the future to use great caution. This is particularly desirable today when everything is so uncertain, and when I address shareholders of The Monotype Corporation Limited for the first time. The order book still remains good, but how long this will last one cannot say. Furthermore, what increases there will be in the costs of materials and services we use cannot be foreseen. For this reason it is better not to be prophetic. All one can say is that everything possible will be done to serve the interests of stockholders. Much of our future, however, is in the hands of others.

The report and accounts were adopted.

INDIAN JUTE MILLS ASSOCIATION

IMPROVED RAW MATERIALS POSITION

LOST MARKETS IN NORTH AMERICA

The annual general meeting of this company was held at the Bengal Chamber of Commerce, Calcutta, on Wednesday, February 27th.

Mr K. D. Jalan presided, and the following are extracts from his speech:—

There is available this year from India and Pakistan a raw jute crop which is the second highest ever to be produced. Prices were obtained for raw jute as also jute manufactures which were the highest ever witnessed in the history of the trade; their continuance would certainly have meant our extinction and we welcome a return to lower realistic levels. The fall in prices of raw jute has not been in proportion to that of gunny prices. It cannot be too strongly emphasised that jute goods attained their premier position in the packaging world by reason of cheapness; that factor is increasingly important with competition from substitutes daily gaining in strength.

THE PRICE FACTOR

The Government's efforts to increase jute cultivation will be subject to their most critical test once the heady stimulant of high prices disappears, as it must. Far greater attention must be paid to increasing the yield per acre as also to all other factors which can reduce the production costs of raw jute. According to official estimates the yield per acre today is less than it was in 1948-49. It is under 2.4 bales per acre, a deplorably low figure. Equally as important as the quantity of raw jute production is the question of quality. I am confident that should no catastrophe happen our crop in India will be in the neighbourhood of 50 *lakh* bales for the next jute year, inclusive of "bimli" and "mesta." It is not possible now to judge the position in Pakistan for the season 1952-53; but I should imagine that the crop will not be any less than this year, say about 70 *lakh* bales.

HESSIAN TRADE LOSES GROUND

With the exception of an insignificant amount, all of our hessian production goes overseas. The jute mill industry has always been India's greatest dollar earner; and two years ago we maintained that position, contributing to India 54 per cent of her total dollar earnings in trade with America and Canada alone. Last year our contribution to India's dollar earnings fell to 29 per cent of the total from these two countries, an event of significance to us in particular and to this country in general.

By far our biggest hessian consumer is America. That country normally takes over half of our production, and on average we exported to America 19,000 tons per month. That figure dropped to under 10,000 tons per month in 1951. Our next biggest customer is the Argentine, to which normally we exported over 5,000 tons a month. Even with the aid of the much advertised barter deal in foodgrains for jute goods, our exports were in 1951 only 4,800 tons monthly. That barter deal is finished; there is now no market for that production.

We have lost no opportunity of bringing these extremely pertinent facts most prominently to the Government's attention.

THE EXPORT DUTIES

What now stares us in the face is that the demand for our goods, by two countries previously taking over 65 per cent of our hessian production, is now halved in relation to an output which in itself is down by a quarter of its previous level. Raw jute costs are beyond our control, and they constitute by far the major factor in the cost of the finished article. Labour charges—our next largest single factor in costs—are dictated by Government awards. Finally, there is added to the price a duty which prior to its reduction constituted an addition of approximately 73 per cent to the cost of an article which we must sell to consumers abroad.

We are not unmindful of the courageous step taken by the Government in slashing by half a penal duty which has been a millstone round our necks for too long. We are unable, however, to share with the Government a belief that our products are so valuable in the eyes of our consumers that they can still afford to pay the present duty of Rs. 21s. per 100 yards to the Government before they are allowed to purchase from us. On today's prices of jute and at the present level of costs we are making no profit but rather a heavy loss in selling hessian. The high rate of duty is therefore not being borne by overseas consumers in its entirety; it is now an additional direct tax on the Indian industry from which producers in Europe and elsewhere are deriving every benefit.

THE SACKING POSITION

To think that the present duty on sacking is not unduly high and could be justified would also be to neglect facts. We here in India, because of the techniques we ourselves developed, could utilise our great sacking production to support and maintain our competitive position in hessian. In 1950 the duty levied by our government in India was Rs. 50s. per ton of sacking goods. Today, the duty is seven times higher at Rs. 350. The effect of this has also been to provide encouragement to our foreign counterparts. I would, therefore, urge upon the Government of India now to give their serious consideration to the question of reducing this duty to the original level.

THE FUTURE

It must be accepted that the prewar capacity of the jute industry outside India is now fully restored if not more. Their level of efficiency is much higher than in this country today. New jute manufacturing industries are springing up not only in countries cultivating a fibre akin to jute, but in Pakistan where there is first-class jute in abundance at a cost cheaper to them than to us. I submit that we cannot hope to face such intensified competition, in addition to paper and cotton substitutes, if our goods are subject to what we still regard as heavy and crippling rates of duty. Despite its being reduced by half, the hessian duty amounts to over a third of the price at which we can sell our goods today. But the history of our industry shows that, since its inception, we have been subjected to an almost constant series of ups and downs. This applies equally to the volume of our business as to our profits or losses. I am not therefore unduly dismayed by the prospect before us; we have a wealth of skill and experience both technical and scientific; we have a great resilience and an extraordinary measure of resourcefulness and adaptability. Our record is a proud and good one and I am sure that we can face and overcome whatever difficulties lie ahead. To that end the Association will continue to work in the closest collaboration with our government and will continue to receive, I feel sure, every consideration, sympathy and co-operation.

BRITISH INDUSTRIAL PLASTICS

EXPANSION OF THE CHEMICAL INDUSTRY

ADVANTAGES OF FREE ENTERPRISE

MR KENNETH CHANCE'S ANSWER TO MONOPOLY CRITICISM

The annual ordinary general meeting of British Industrial Plastics, Limited, will be held on April 3rd in London.

The following is an extract from the circulated statement by the chairman, Mr Kenneth M. Chance:—

The consolidated profit and loss account shows an increase in trading profit at £626,439 of £183,200. Taxation amounts for the year to the huge sum of £257,113, and there is a sum of £159,957 available for reserves and dividend. £75,000 has been transferred to a contingency reserve, and after providing for proposed dividends the Group carry forward has increased from £123,702 to £133,058.

MONOPOLY PROMOTES ECONOMY

During the year under review substantial gross profits have been made, and your managing director and his staff and workpeople at Oldbury have done wonders in increasing the output of moulding powders, adhesives and resins for various purposes from your Oldbury factories. But during the period your directors have had to increase the price of first grade Beetle powder twice, and the fact that even now its price exceeds the basic prewar price by less than 40 per cent does not make such increases any the less distasteful.

The following figures speak for themselves:—

Cost September, 1939		Cost September, 1951
100	Urea	112
100	Formaldehyde	128
100	Hired transport	233
100	Packages	237
100	Boiler slack	300
100	Woodpulp	595
100	Zinc oxide	913
	Basic selling price of first grade Beetle powder, which contains about 30 per cent of	
100	woodpulp	139.4 (August, 1951)

Both urea and methanol, the raw material for formaldehyde, are made by only one manufacturer in this country and may therefore be termed monopolies. So much was said during the recent General Election about the evil of monopolies that I most devoutly trust, in the interest of your company, that before monopolies of this kind in the chemical industry are condemned that they shall receive close study for, to quote from the Report on The Chemical Industry, 1949, published by the Association of British Chemical Manufacturers: "Monopoly as we have described it does not necessarily raise prices; it may be a potent means, and is sometimes the only possible means, of reducing them."

THE BENEFITS OF FREE ENTERPRISE

I receive the admirable publications of the Institute of Public Affairs of the State of Victoria, and the following quotation is taken from the recent address by its chairman: "Open hostility to free enterprise may, it is true, be confined to a minority. But the real trouble is that there is so little real enthusiasm for it . . . this lack of enthusiasm has developed because great numbers of people do not understand the simple truths about business and the means by which private business operates to improve the living standards of the people. In turn, this absence of understanding is partly attributable to the failure of business men to play an adequate part in educating the public about the system in which they believe."

I will take up that challenge. The condition of the chemical industry 60 years ago was chaotic. With a few exceptions, it consisted of a number of family concerns, once prosperous but having failed to maintain sufficient reserves, competing with one another in the manufacture of alkali and acids and now finding competition from the more economic process of making alkali installed by Brunner Mond. In self-protection the United Alkali Company, Limited, was formed, but in those days British capital was more often invested abroad to open up new markets for the products of worn-out plant than in creating new industries at home. So the outbreak of war in 1914 found this country dependent for its nitrogen upon shipments of nitrate of soda from Chile to supplement ammonia from gasworks and for its dyestuffs mainly upon one small factory. This was converted into British Dyestuffs, Limited, which fell on evil days after the war through lack of ability to compete with products from abroad. Meanwhile, Germany had developed a great industry from the invention of the Englishman, Perkin, for making aniline dyes, and had invented processes and installed plant for the extraction from the atmosphere of the nitrogen essential for explosives.

FORMATION OF THE BRITISH CYANIDES COMPANY, LIMITED

Another British invention, the MacArthur-Forrest process, for extracting gold from the tailings of the ore from the mines by means of cyanide led to the formation of companies to manufacture sodium cyanide for this purpose, of which two survived the South African war when the mines were closed down. One of these was The British Cyanides Company, Limited, from whose reconstruction your company has developed.

After the war came the slump of 1920-21 and the General Strike and prolonged coal stoppage of 1926, followed by the combination, of Brunner Mond, Nobel Industries, the United Alkali Company and British Dyestuffs into Imperial Chemical Industries Limited. Now the chemical industry is progressive, creative, based on solid foundations, well managed and with endless scope for further development. Other great concerns have arisen and there is a host of lesser companies, among them yours, which prosper and depend for their success upon raw materials supplied by these great concerns. I have been brought into contact with several of their directors and have learnt something of their methods. They are among the hardest-worked men in this country and it is only because of their excellent methods of management that these concerns have so greatly expanded.

The greatest restriction to industry today is the burden of taxation which deprives industry of the surplus which should be put aside for renewals and the development of new processes and deprives the individual of the ability to save and lessens his incentive to work. Restrictions on commerce, the handmaid of industry, are too numerous to mention, often ludicrous, always troublesome. I was personally responsible for the negotiations which resulted in the rise of your company from the burnt out ashes of The British Cyanides Company, Limited, and I know that they could not have succeeded in present conditions.

CONCLUSION

I am proud that it has been my lot to spend my life in industry during a period when it has conferred benefits so great upon the whole community and I hope that before it is too late unwarranted criticisms against monopoly, profits, "big business" and those who control industrial concerns, above all against the British workman, the backbone of industry, may cease, to give industry a chance, under wise and sympathetic Government, to play its part in saving this country from the perils by which it is menaced. The future prospects of your company are governed by the conditions I have referred to. I have only to add that at present they are satisfactory.

THE EASTERN BANK LIMITED

The Transfer Books and Register of Members will be CLOSED from April 1 to April 15, 1952, both days inclusive.

By Order of the Board,
C. L. MANNING, Secretary.

2 and 3, Crosby Square, London, E.C.3. March 12, 1952.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of LECTURER or ASSISTANT LECTURER in Economic Theory in the Department of Economic Science, at an initial salary within the range £450 to £600 per annum, according to qualifications and experience.

Applications stating age, academic qualifications and experience, together with the names of three referees, should be received not later than March 24, 1952, by the undersigned, from whom further particulars of the conditions of appointment may be obtained.

STANLEY DUMBELL, Registrar.

February, 1952.

HOLIDAYS abroad—not "organised" or mass produced but arranged as you or your friends may want. Cyprus—15 days (by air) from £131 9s.; also Malta and Gib. No currency restrictions. Europe—any country available on £25 limit with adequate spending money.—Write for brochure or phone Business and Holiday Travel Ltd., Grand Buildings, Trafalgar Square, London, W.C.2. WHItehall 4114/5.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (*periodicals excluded*).

EDITOR required by senior London publishers for the development of a monthly industrial publication. Sound technical editorial record with background of university degree or equivalent plus practical experience in industry and knowledge of management techniques are desired qualifications.—Write, stating salary, to Box 880.

BUSINESS EXECUTIVE (Company Director), aged 45, wide administrative experience agricultural marketing, wartime Ministry, film exhibition and distribution, retaining present interests, seeks additional occupation offering financial prospects. Responsible position or high level representation. Would consider full time. Negotiations strictest confidence, highest references. Birmingham area.—Box 886.

DOLLAR EXPORTS COUNCIL requires services of a full-time Senior Executive Officer, age 32 upwards. Good business experience and personal acquaintance with North America essential. Experience in marketing, public relations and public speaking also desirable. Salary £2,000 to £3,000, according to experience.—Applications, in writing, to the Secretary, 41, Buckingham Palace Road, London, S.W.1, marking envelope Senior Executive Officer.

THE KNOWS HAVE IT. Discriminating drinkers know the brandy that's best for their purses—J.V.R. at 37s. 6d. a bottle is a fine South African brandy you can rely on. In half-bottles at only 19s. 3d.

TRADING OR ESTABLISHING in CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 345 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA

108, Old Broad Street, London, E.C.2

Established in Canada in 1832 with limited liability.

NATIONAL BANK OF EGYPT

Incorporated in Egypt. Liability of Members is Limited.

Head Office - - - CAIRO

Commercial Register No. 1 Cairo.

FULLY PAID CAPITAL - - £E.3,000,000
RESERVE FUND - - - - £E.3,000,000

London Office:

6 & 7 KING WILLIAM STREET, E.C.4

Branches in all the Principal Towns in EGYPT and the SUDAN

THE UNIVERSITY OF MANCHESTER

Applications are invited for research posts in ECONOMICS, and in ECONOMIC STATISTICS. There are three grades: Grade I, £500-£1,100 per annum; Grade II, £450-£500 per annum; Grade III, £350-£400 per annum. Applications should be sent, not later than April 15, 1952, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN ECONOMIC STATISTICS in the Faculty of Economic and Social Studies. Salary scale £450 to £500 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than March 31, 1952, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

SECRETARY FOR A COMPANY NORTH OF MANCHESTER

A vacancy occurs, due to retirement, in a firm established over fifty years. The Secretary will be required to advise Technical Directors on financial matters, company taxation and economic trends, and to take complete control of the offices. Applicants should be worth not less than £1,500 per year. The successful candidate will be required to collaborate with consultants now developing budgetary control routines. Acquaintance with price fixing and sales forecasting methods an advantage. Age limit 45 years. Closing date for applications March 28th.—Box No. 905.

MANAGER REQUIRED for its Export Branch, by firm with established trade abroad. Applicant should be between 30 and 45; will control from London Office with periodic overseas visits.—Apply, giving particulars, to Box 889.

MONEY isn't everything, even in advertising. Ideas, drive and organisation are the first essentials. For sound guidance through every stage of an advertising campaign, consult SAMSON CLARK & CO. LTD., 57/61, Mortimer Street, London, W.1. MUSeum 5050.

STAFF PROBLEMS SOLVED!

Let us shoulder *your* staff difficulties as we have already done for ¼ million other employers!

EFFICIENT OFFICE STAFF
Permanent and temporary—always available.

HIGHER APPOINTMENTS SECTION
Supplies all executive (non-technical) personnel—male and female.

GROUP STAFFING—in and out of town! From time to time we handle the complete staffing of new organisations.

In every case pre-selection by FINE'S saves time. Please write for a copy of our 4-page brochure which gives full details of our unique service.

In Defence of the Realm

NUMBER 3 IN A SERIES

Europe's Night Watchman

ARMSTRONG WHITWORTH N.F.11

As befitting a good night watchman, the Armstrong Whitworth N.F.11 spots danger quickly and clearly in the dark, thanks to the keenest, most extensive radar equipment carried by any night fighter. Moreover, it is fast, has a superb rate of climb and is easy to maintain and service. Deliveries of this deadly night fighter for Western European defence are being made against production orders placed with Armstrong Whitworth Aircraft.

The N.F.11 is still another product of the Hawker Siddeley Group. Largest of its kind, this great industrial commonwealth of companies now employs all its mighty resources in building the defensive strength of the Free World.

Bargaining for Germany

THERE should be no illusions anywhere in the western countries about the meaning of the new Soviet proposals for Germany. Without much regard for consistency with their previous attitudes, the Russians now propose that the present occupying powers should sign a peace treaty with an independent German government, representing a unified country, and withdraw their armies of occupation, leaving the new Germany completely sovereign and free—among other things, free to have its own national army, provided only that it was pledged not to enter into any alliances or coalitions. The magnitude of the somersault involved in these proposals in itself reveals their purpose. They are plainly designed as a dramatic move to stop Western Germany from becoming a permanent partner and military ally of the Atlantic Powers and to work for the withdrawal of American forces from central Europe. The move is neither surprising nor novel; for eighteen months the Soviet bid for German favours has been steadily rising towards this point. Soviet policy has naturally tried, ever since the early days of the revolution, to break up by diplomatic means any coalition of capitalist countries hostile to it; and the group that is now gathering strength in the West has in Soviet eyes two specially alarming features. One is the presence of rapidly increasing American power at the heart of Europe; the other is the plan to rearm Western Germany as part of a European Defence Community comprised within Nato. To remove these simultaneously is a diplomatic objective so vital to Moscow that it might pay a high price to achieve it. There are, therefore, two questions to be examined. First: what price are the Russians offering? Second, is it a fair exchange for American and British abandonment of the policy built up in the last three years?

No one should underrate the appeal of these proposals to the German public. To a defeated, occupied and partitioned people, unity, national freedom and equality have an emotional appeal which, for all but the most wary, may well overwhelm all sober, logical calculations of advantage and all fears of possible consequences. No German government could turn down these proposals out of hand, and Dr Adenauer has not attempted to do so. The three western occupying powers are not so affected by emotion—or at least not by the same emotions as the Germans—and they can therefore give the Trojan horse from Moscow a cooler scrutiny. But to them also it has a number of apparent advantages. There are many people in the West who have shown a liking for the notion of a free and united Germany pledged to neutrality. Western Germany is larger than Eastern Germany, and it is tempting to take it for granted that a reunited Germany, whatever else it might be, would not be Communist.

This is, indeed, an appealing picture. If it were attainable and if, once attained, it could be guaranteed to stay that way, it would solve many problems. Indeed, the Russians bait their offer with the assurance that "a peace treaty with Germany would make it possible

once and for all to solve problems which have arisen as a result of the Second World War." If this is read to mean that the most crucial issue in east-west relations is the future of Germany, it is true. If it means that the west should make a bad bargain over Germany in the hope of getting better, but unspecified, bargains elsewhere, it is both untrue and dangerous.

Unfortunately, it is almost certain that acceptance of the Russian proposals would not lead to the idyllic state of benevolent neutrality for which the wishful thinkers in the West yearn. The catches are all too obvious. In the first place, the general evacuation of Germany means that the Red Army would retreat fifty miles eastwards over the Polish frontier, while on the other side it is doubtful whether American or British troops would remain anywhere on the Continent ; even if the French invited the Americans to remain in France, Congress could probably not be persuaded to agree. Secondly, it cannot be taken for granted that the merger of the two Germanies would mean one less Communist state in Europe. Eastern Germany may be much smaller than Western Germany, but it would be a tough morsel for the westerners to swallow. It has been made as indigestible as six years of Communist treatment can make it. Again, it might seem an advantage that the new German government would pledge itself to enter into no coalitions or military alliances against any of the victors of 1945. That seems to promise a harmless armed neutrality, a vast Switzerland between Poland and France. It might just as well mean that a Germany forbidden to join the Atlantic pact could conclude with the Soviet Union an arrangement like the Stresemann treaty of 1926. This enabled the Germans to draw loans from the United States with one hand while receiving secret military assistance from the Soviet Union with the other. Only the German nationalists and their Communist allies could benefit from such an outcome.

*

There are other questions that must be asked about these proposals. The West has friends in Western Germany. They are still, it is true, a minority ; but they have worked loyally for the European policy of Dr Adenauer and run risks for it. How would they fare in the new Germany? All its subjects would enjoy " the rights of man and the fundamental freedoms "; the " free functioning of democratic parties and organisations " would be secured. That is, in principle, excellent. But it must be understood that in Communist parlance the whole organisation of Eastern Germany is democratic: Herr Grotewohl and his monolithic Socialist Unity Party are democratic, whereas Dr Adenauer and his friends are enemies of peace and democracy. According to the Soviet proposals, the peace treaty would forbid " the existence of organisations hostile to democracy and the cause of maintaining peace "; whereas full civil and political rights would be given to all former members of the German Army and to all former Nazis save those serving sentences for political crimes. Equally, there is a catch in the proposal to permit a new national *Wehrmacht*: the East Germans would confront the frontier police and ex-servicemen of the west with a large body of trained and indoctrinated young soldiers from the *Bereitschaften*. It is by no means impossible that a Germany reunited on the Soviet terms would be a Soviet satellite, or at the least a Russian ally, within a matter of months.

For these reasons the western allies are approaching the Soviet proposals with the greatest caution. They will not, it appears, turn them down from the start ; they may accept, at least in principle, the proposal of another four-power conference. But they will subject the whole new Soviet initiative to the most rigorous tests to determine its sincerity. The first test they are likely to apply is whether the Russians will agree to wholly free elections, in the east as well as the west, properly supervised. It should not be taken for granted that the Russians will reject this. To accept it would, of course, involve them in losing the Communist majority they enjoy in their zone. But in Germany as a whole, owing to the blind rancour of the Social Democrats, there might well not be a majority for Dr Adenauer's policy of integration with Western Europe. Its halting compromises would hardly compete in popular appeal with " unity and peace." After the election, the disciplined Communist minority would be instructed to co-operate with the Social Democrats and even with the Nationalists—anything to keep out the westerners. Dr Schumacher, the leader of the Social Democrats, seems to be preparing himself for the role of von Papen. At the best, all-German free elections at the moment would give a parliament as divided as the French Assembly. At the worst, they would start a slide into " popular democracy " and alliance, overt or covert, with the Soviet. This is not to say that the western powers should now abandon the demand for free elections that they have so often made ; indeed, they are about to reiterate it. But they should make it quite clear that they will not agree to withdraw their forces of occupation until they see what sort of new Germany emerges from the reunion.

*

When examined, therefore, the prospect held out by the Russian offer is not nearly so attractive as at first sight. There is certainly nothing in it to make the western allies turn aside from their present plans for a European Defence Community and for the gradual integration of Western Germany into Western Europe. But the Russian offer does underline one fact of great significance and danger. The present western policy does not make nearly enough allowance for the natural emotions of patriotism in the German public. It may be right that western integration should precede any revival of German nationalism ; from the American and British, and most particularly from the French, point of view it is essential that it should. But to say this, and this only, is for the West to appear before the Germans in the very dangerous pose of opponents of their unity and freedom. To the German nationalists, the western policy seems to offer almost nothing ; the Soviets now seem to offer them almost everything.

Not quite everything ; for in addition to unity, freedom and equality, there is one other German aspiration on which the Russians offer no concession. No German (save a Communist mercenary, and he not in his heart) can ever accept the line of the Oder and Neisse rivers as the eastern boundary of Germany. On this subject, the Russian Note simply says that the frontiers of Germany have already been laid down by the Potsdam decisions. This is untrue ; it was agreed at Potsdam that " the final delimitation of the western frontier of Poland should await the peace settlement " and the Oder-Neisse line has never been formally accepted by the western powers.

This is, for the West, an extremely delicate question, the difficulty of which they have hitherto recognised by their complete silence on it. To admit that the Oder-Neisse line is a perversion of justice—as it unquestionably is—aggravated by the policy of expulsion enforced by the Poles to the east of it, would be to encourage in the Germans the hope of western support in a war of revenge and to tie the Poles the more firmly to Moscow. But silence also has its dangers. For the Oder-Neisse line is not a weakness in the Russian case, but potentially, and even actually, the greatest strength of all. It is the Poles, not the Russians themselves, who occupy the lost German lands. Not even the dispossessed Germans can positively relish the idea of another war to get them back. But the only alternative method is an agreement with the Russians, and with every demonstration of the desperate desire of the Russians to win the whole of Germany to their side, it becomes more likely that the Kremlin will, some day, offer the supreme bait of another partition of Poland. They would certainly not be held back from any such proposal by considerations of honour or decency, any more than Catherine the Great was. There is nothing the western allies can do to deprive the Russians of this trump card. But it might at least be forced into the open. If there are to be four-power discussions on a peace treaty with Germany, the western powers should insist that they should cover the whole question of Germany's eastern frontiers.

This is only one example of the sort of hard thinking that the western powers, if they reject the Russian initiative, will have to impose upon themselves. The auction for Germany is on, and the bids are rising. The western powers are right to insist that integration must come first. But they will show themselves foolish and short-sighted if they do not see in the Soviet Note a strategy for the capture of Germany to which a counter-strategy must be devised. They have been slow in the past to grasp what is needed to win a divided Germany for the western camp ; and even now the policy of integration and limited rearmament hangs in the balance because most Germans believe—rightly or wrongly—that partnership in Western Europe does not offer them the real substance of sovereignty. Perhaps the French will now see in the Soviet proposals what is the real alternative to a generous policy towards Dr Adenauer : an independent, rearmed, united Germany, owing to the Kremlin both its unity and its hope of regaining the eastern territories—and the Saar.

Where is the Left ?

AFTER the Labour party's internal struggles about rearmament everyone agrees that it is moving to " the Left " ; but no one knows where that is. The past fortnight has been given over to the appeasers within the Labour party. They have gained their immediate reward. Mr Bevan has been spared a public whipping for his revolt in the rearmament debate. He has not been squashed, but he has been pushed back quietly into a pose more befitting the dignity of the outraged Labour front bench. The party's standing orders will provide some guarantee against another damaging public demonstration of its private differences. It is even possible that the left-wing journals will now fly some decent shreds of pink and white bunting over the Jolly Roger, and peaceful citizens like Mr Attlee and Mr Deakin will be able to face their Fridays with more composure.

The Labour party has dramatised and advertised its personal rivalries with so effective a simplicity that their fascination is irresistible. But the important thing to assess is not who has won the recent struggle but how its results may be shown in the policy of the next Labour Government. The struggle has confirmed more than it has brought to light. There was never any doubt that the Labour party would move to the Left while it was in opposition, and hardly more doubt that it would contrive to stick together during the move. A few personalities on the extreme Right of the party may be jettisoned, or at least left in the backwaters. It is quite possible that in the process some of the more strident extremists on the Left may also be thrown out, as a sop to the reformist conscience ; but the victims would probably be men of the stature of Mr Bevan's lieutenants rather than of Mr Bevan himself. For all practical purposes, the Labour party is likely to stick together even if no one knows where it is going.

The real problems are two. First, where nowadays is the Left ? To what new doctrines is the Labour party's inevitable movement, as it revives after its exhaustion in office, likely to lead it ? And, secondly, as the Labour party gropes for the new Left, will it also be able to play the role of a constructive and responsible Opposition ? Or will the country have to put up with an indefinite continuance of the spectacle of the last five months, when Labour has been so blinded by its internal and external rancours that it has succeeded only in making itself look foolish ? This is the first test of the party's qualities out of office since 1940—when it had had no real experience of power. They are muddy waters that have been stirred. The first test brought out the worst in the Labour party. It has shown before that when it is in a jam, even when it is merely in an unfamiliar position, it turns nasty. Rather than state any coherent alternative to the policies of the Conservatives, it has simply impugned their honesty and competence. As soon as Labour's leaders can close their minds to the discipline of facts that power imposes, as soon as they are free from the restraining influence of the civil servants, they tend to see red and run wild—or, what is perhaps worse, they run wild because they think their followers are seeing red.

Perhaps it would be wrong to draw any firm conclusions from the record of these first few months. The Labour party could not be expected to adjust itself to opposition quickly. And it is still suffering acutely from the splits and divisions that disturbed its last year of office. The occasion of those divisions was in defence policy—and, therefore, by easy extension, in foreign policy. But it would be a mistake to suppose that these are the real bones of contention between the Right and the Left, or that, in the process of " going to the Left," the party as a whole will greatly change its policy in these largely external matters. The leaders of the party are too far committed both by their past policies and by their personal convictions to turn their coats on these issues. If the party were going to become pacifist and

neutralist it would have to depose and expel its own majority, including Mr Attlee himself, and there is no prospect whatever of that. Moreover, there is no such thing as a Bevan policy on defence and foreign policy; there is merely dissent from the official policy. And as circumstances change, that will become increasingly unreal as a dividing line of policy.

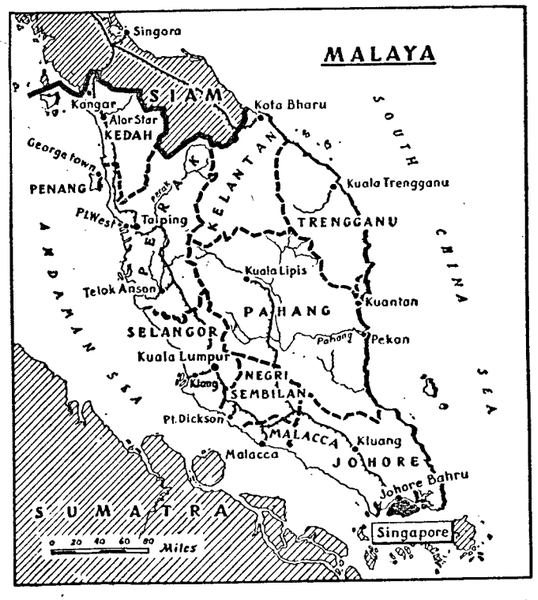
It is on domestic policy that the war between Right and Left in the Labour party will be fought out. It is economic and social policy at home that interests the party as a whole, which is still far too irregular in outlook to bother unduly about external affairs unless they threaten the standard of living of the trade unionist. So much is reasonably certain; but it is not by any means clear what the dividing line will be. Indeed, on the surface, there is much agreement. The exhaustion of the capital of ideas Labour had in 1945 is universally recognised. There is a widespread feeling that, since Labour executed in four years the ideas that had taken it twenty years to establish, the new period of gestation will also properly be prolonged. There is no present sense of what a coherent Left-wing policy for Britain in the nineteen-fifties implies. Men of the Left as well as of the Right are prepared to say that the distribution of incomes is (or was before the Budget) equal enough, that Labour cannot give the workers more benefits at the expense of the middle-classes or the rich. Nowhere in the party are there large ideas for further social reforms or grandiose nationalisations. The vacuum is complete; such groping for new ideas as there has been so far has come, oddly and significantly enough, as much from the normally passive co-operative movement as from the Fabians or other intellectuals.

★

But a common emptiness of ideas is not unity. No one who knows the Labour party can fail to be conscious of a keen sense of mental divorce between Right and Left; it would not be going too far to speak of a lack of intellectual and emotional contact between them. The differences are real enough, but they have not yet crystallised into specific disagreements on policy. Nobody can yet say how, in a future Labour government, the Left would differ from the Right in the things it wanted to do, because neither side has yet cleared its mind. It is only possible to speak of differing approaches and attitudes. But the differences are large.

The Right thinks that Socialism on the British pattern was established in 1945-51. Power to control the economy was successfully transferred to the state. It turned out to be a control different from expectations, owing more to the ideas of Keynes and the experience of wartime planning than to the collectivism of the early Fabians. But the Right thinks it to be little the worse for that. The Labour party has still to discover how to use this socialisation of economic power to free Britain from difficulties with its balance of payments and to maintain full employment without inflation. The Right would also say that the part-socialised economy should be turned to new social purposes—perhaps to reducing inequalities in the ownership of capital. It has still to find adequate ways of improving productivity. There may be scope for further experiments in different forms of public ownership. But essentially men like Mr Morrison and Mr Gaitskell are well content with the machinery that six years of Labour Government have established. The new policy for Labour is to be found in widening its purposes and improving its methods.

The Left, on the other hand, sees that the nationalisation and planning of the past six years have not produced the utopia that was expected of them and concludes that there must be something wrong with the machinery. The mixed economy is an unsatisfactory compromise that should at least wither away pretty quickly. If the workers are not yet well enough off, the levers of economic control must still in some mysterious way lie in private hands. The Labour party did not achieve its main aims in 1945-50. Socialism is still far off, and Labour must not sink into being a reformist party. The Left that agrees with Mr Bevan on this extends far beyond his 56 supporters on rearmament. The "revolutionary purpose and idealism" that it wishes the Labour party to serve is not aimed at any large schemes for social benefit; those have not been thought of. It is aimed at undefined changes in the mechanism of the modern state—changes that the Right does not want.



★

Even if on many particular issues the two wings of the party come closer together, this fundamental division is likely to remain. At the best, it will take a long time to hammer out a new policy and it will be difficult to put much realism into it. In the meantime, while the vacuum continues, there are real dangers for Labour's effectiveness as an opposition, and therefore for the service that it can render to the nation. The Labour party will remain tempted to try to hide the vacuum by simply abusing everything the Government does, good, bad or indifferent. The party's official leaders tried to resist this tendency in the defence debate; but after getting for their pains nothing better than an open clash and a temporary stalemate with Mr Bevan, they will be under increasing pressure to try to swim with the tide even if it means rejecting their own recent policies. The pressure is unlikely to diminish even when a new policy crystallises, since there is little doubt that, within the ranks of active party members, the Left is emotionally far more attractive than the Right. The party leaders will obviously be tempted to try to keep their control by rivalling the Left in the violence of their generalised words. And though that may gain them votes within the bosom of the party, it is more likely to lose them in the country.

In all these battles within the party, the elector is the forgotten man. That is true to some extent in any party—the practising politician spends his life among the converts and zealots—but it is true in a quite peculiar degree in the Labour party. Its leaders should remember that they have never yet been placed in office by a positive preference of the voters, as distinct from dissatisfaction with the Tories. Certainly its only chance of moving to the Left and taking the country with it is by showing responsibility, reason and charity. In that lies also the only chance of having a coherent policy if office is regained. The leaders must know this. If Labour's move to the Left is made in an atmosphere of irresponsibility, then the Left will indeed turn out to be nowhere. The inevitability of the move is not in dispute. But the quality and realism of the policy that it eventually produces depend on the fight that the official leaders put up in the next few months—a fight not against new ideas and new policies but against moving blindly at the bidding of the demagogues and the doctrinaires.

The Dilemma in Malaya

THE realistic programme outlined by General Sir Gerald Templer in the Malayan Legislative Council on Wednesday marks the opening of a new phase in the conduct of the emergency. Although there was little new in his proposals, this was the first time that they had been put together in a detailed and co-ordinated form. They spring from the British Government's original directive to the new High Commissioner, which was an excellent analysis of Britain's proper aims in Malaya. It showed that Mr Oliver Lyttelton, the new Colonial Secretary, had gone to the roots of the immediate problem during his South East Asian tour. There were, however, limits beyond which the directive clearly did not profess to go. It said nothing, for instance, about tackling the obstacles to good administration presented by the present constitution of the Federation of Malaya. And it did not embark on the very delicate issue of putting Singapore and the Federation under a single administrative authority, a course which has been strongly urged in some quarters since General Templer assumed his appointment as High Commissioner. While the Government is likely to be forced sooner or later to take fundamental decisions on both these questions, the first is so urgent that it ought to be dealt with at once.

During the past few months there has been a complete change of almost everyone responsible for the conduct of affairs in Malaya. This is partly chance; the last High Commissioner was assassinated within a few days of the British general election, and Sir Harold Briggs, the Director of Operations against the guerillas, handed over to Sir Rob Lockhart on a schedule agreed upon several months before. But Mr Lyttelton's arrival at the Colonial Office has started a chain of events which also led to the resignations in Malaya of the Chief of Police, the head of the police intelligence and the Chief Secretary. The result of this clean sweep has been to create what many observers believe to be at once a unique and final opportunity of recapturing the initiative in Malaya.

During the past few weeks the casualties inflicted on the guerrillas have risen, largely because more information about their movements has been given to the police. The amount of such intelligence is always a barometer of the government's prestige, and there can be little doubt that the guerillas have not lately made any new headway. On the other hand, the crucial fact in Malaya is that if the government does no more than maintain its position it is in reality losing ground. One of the most distressing features of the campaign is that the Communists, however many guerillas are killed or captured, appear to retain a constant operational strength of about three thousand. This implies that they are continually able to recruit new men, and to maintain their forces at a predetermined level—not too many for subsisting in the jungle but enough to cause the maximum harm to Malaya.

Recently the Communists have adopted the tactic of terrorising estate workers. They have succeeded in slowing down the tempo of Malayan economic life both by these direct methods and indirectly through the general demoralisation that the long emergency has gradually induced. This is a new and serious development, particularly at a moment when the price of rubber has fallen to a point at which some of the high-cost producers now have very little in hand before running at a loss. Seventy per cent of estate costs are for labour, whose real wages have risen considerably during the past two years. At the same time, as Sir John Hay recently stressed in a report to shareholders, productivity has been going down. He spoke of an average monthly output in the present year 21 per cent below that of the corresponding period before the emergency began, while on an estate in the most dangerous area the fall had been 38 per cent, although the rubber trees of this estate are of particularly high-yielding stock. Part of the Communist tactic is now to attack the economy of the country and there can be no doubt that this is beginning to succeed. If he continues, then the already declining boom in rubber and tin, which has hitherto done much to smother the effects of the emergency, will collapse altogether and economic stagnation will make the government's task even harder than it is to-day.

This, then, as Mr. Lyttelton has recognised, is a moment which may not come again. New men and new methods could still do much to change the trend of events. Before he left Singapore, the Colonial Secretary emphasised six headings under which he proposed to attack the immediate problem, and these now form the basis of General Templer's programme. He would streamline civil and military control; the new regime under General Templer is the outcome and by all accounts it has started well. He would reorganise and retrain the police; in a sorry state as a result of being expanded so far so quickly, the force is already beginning a drastic overhaul at the hands of the new Chief of Police, Colonel Young. Then there must be "a much higher measure of protection of the resettlement areas" and the "organisation of a Home

Guard"; both steps are already in hand—although the arming of Chinese recruited for Home Guard duties is a leap in the dark. Lastly, the civil service must be put on a sounder basis and—a point to which Mr Lyttelton attaches the greatest importance—the Federation must accelerate its schemes for compulsory primary education. In addition, General Templer now includes among his proposals a Federal military force recruited from all communities, and security of land tenure for resettled Chinese squatters.

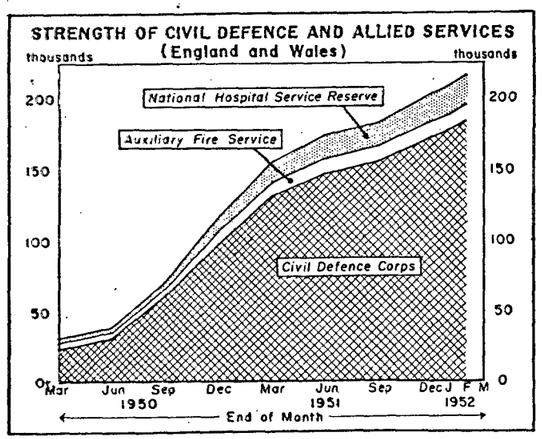
The resolution and boldness of these proposals present an encouraging picture of understanding in the Government. Satisfactory also is the importance attached, in the directive to General Templer, to such fundamental political necessities as the establishment of a "common form of citizenship for all who regard the Federation or any part of it as their real home and the object of their loyalty." Yet it is for just such problems as Chinese citizenship and tenure or police reform that the present means of carrying out the new policies appear inadequate. General Templer has been sent out to Malaya with supreme political powers only within the sphere of federal action. Malaya, it is often forgotten, really is a Federation. The constitutional powers of the central government are limited and there are no less than eleven constituent elements with a wide range of local autonomy. Moreover, nine of these eleven are Malay sultans who, as the natural repositories of Malay conservatism, are in large degree inherently opposed to the kind of measures now necessary to beat the Communist guerrillas; they are also very slow—sometimes, it would seem, deliberately. They understandably consider it to be in their interest to prevent the Straits born Chinese obtaining a greater foothold in the country. Yet if these native Malayan Chinese are not given a bigger stake in the future of Malaya, there can be little chance of their coming off the fence.

*

This is characteristic of the way in which the whole Malayan problem now goes round in circles. The British cannot win unless they woo the Malayan Chinese; yet to do so is to risk alienating the one section of the population on which they depend, the Malays. Again, if the British are to make any progress they must try to work with the local leaders of all the communities; yet there are no real leaders possessing the confidence of their peoples with whom to work. And even if the Chinese, like the other races in Malaya, are to be encouraged—as they must be—by grants of land, new forms of citizenship, steps towards representative government, and the promise of eventual independence, none of this is really of any use on its own. However important these steps may be in themselves, the supreme requirements above every other are that public security should be restored and that the British should neither intend nor look like scuttling out of Malaya. As Lord Milverton said last month in the House of Lords:

> Not one Communist rebel would desert if every Chinese in Malaya were given a vote tomorrow. Not one would desert if Malaya were independent under a Chinese President tomorrow. . . . The crying need of Malaya is not self-government tomorrow, but government now.

In these circumstances there is a strong case for carrying the policy of firmness combined with political development to its logical conclusion. This would mean suspending the present Federal constitution of Malaya until the emergency is over. It may be recalled that the constitution was introduced only after the war, when the idea of a Malayan union fell through. If the union had been better prepared and better handled, the Malay rulers might have accepted the idea even then, and it is certainly arguable that sooner or later the federal arrangement will have to go if Malaya is to make progress on the road to self-government. But this is not the moment, at the height of the emergency, to hammer out a new constitution.



To suspend the federal constitution, on the other hand, is another matter. It would be a temporary measure and it could and should be taken without prejudice to any eventual constitutional development. There would have to be promises that, while the Government's policy of giving the Chinese a stake in the country makes a number of immediate administrative measures inevitable, the constitutional rights of the Malay rulers would be safeguarded at the end of the emergency. Naturally, these are political matters of great delicacy. Their successful handling, with or without suspension of the constitution, depends on the right leadership from Kuala Lumpur. But unless the government now goes the whole way in assuming powers to carry out its policies swiftly and effectively, the alternative may well be to drift into a growing state of frustration and eventually chaos. As things are, a good start has been made in drawing up a clear list of priorities and in trying to inject a new sense of determination and efficiency into government policies. It would be logical now to remove the one major obstacle to their execution.

Gap in Defence

CIVIL defence is badly out of phase with the rest of the defence programme. By 1954, it is hoped, rearmament will have gone far enough to deter aggression. But civil defence in Britain, at its present rate of progress, will be invitingly weak for several years after that. Only in part does this reflect public indifference. The Labour Government acted on the assumption that it was impossible to do much while maintaining a politically acceptable standard of consumption. Expenditure on civil defence is to rise sharply this year—to £45 million—but that reflects the implementation of plans and orders already decided on. It does not mean that the new Government is making any change from the policy of giving civil defence a low priority.

There is no shortage of plans for civil defence. They originate in the Home Office, and are based on scientists' forecasts of what could be expected in another war. They are then referred to the civil defence Joint Planning Staff, on which all the departments are represented; and when a joint decision has been reached, the plan is handed over to the appropriate department for further elaboration, or—on rare occasions—for action. This cumbrous machinery is hardly suited to produce quick decisions, and it is confusing for local authorities to receive circulars from so many departments. It is probably true that at present, while civil defence administration is on a small scale, it would be wasteful to centralise it under a single roof at the Ministry of Defence or the Home Office. But the test of the organisation should be what would work in an emergency. Civil defence is comparable to a military operation and ought to have a clear chain of command. At the top there is divided authority. In the regions, none of the commissioners who are to control the civil defence forces in their regions has yet been appointed, and a start is only just being made in providing control rooms. On local councils civil defence must go through the slow mill of democratic discussion, and probably takes a lowly place compared with matters of immediate practical importance like drains or the appointment of a new headmaster. The fundamental problem is that, since there is little money for it, the officials responsible for civil defence within the local authorities are few and have little authority.

Only in the matter of training leaders has there been a suitably military approach. The Civil Defence Staff College at Sunningdale gives advanced courses in civil defence leadership, originally intended for those sent by local authorities or large firms, but also attended by visitors from all over the free world. There are, in addition, three technical schools, where practical courses are given. But when those who have taken these courses return to instruct others, they find very few people willing to be instructed. The ambulance section has done best with 63 per cent of the required peacetime strength; it would do still better if it offered to teach people to drive and to service cars, because this would be a useful qualification in peacetime. The rescue section, vital in a war where great numbers of people would be trapped by debris, has only 20 per cent of its establishment. The welfare section, which would be concerned with receiving refugees, has reached only 31 per cent; it would be quite unfitted to deal with hordes of homeless people, possibly panic stricken, and with vast problems of transportation, sanitation and mass emergency feeding.

The plans for evacuation, indeed, are among the vaguest and least realistic. To cope with the mass exodus that would occur after the first heavy bombing, it would be necessary to set up transit camps on the outskirts of the main target areas—but this is a subject which so far is merely being "studied" by the Ministry of Housing, the department responsible. The reception areas have very little idea of what they might have to expect. It is admittedly difficult to tell them with any accuracy. For the planned evacuation of mothers and children, specified parts of the target areas are to be linked with specified reception areas; but if war broke out, people would scatter in all directions—to wherever they had a relative or even to wherever they could get a train. At least, however, the evacuating authorities and those that will receive their refugees ought to be working in close consultation and be fully informed of each other's plans. This is not happening at present. The London County Council, for example, has had no general conference with the authorities in its reception areas.

*

For those who had to stay behind in the target areas there would be very little protection. There are shelters for only 3 or 4 per cent of the population, and those are not necessarily where they would be wanted. Local authority areas are classified according to the risk of their being attacked, in order to determine the type of shelters that might eventually be allocated to them. Anderson shelters can give fair protection against an atom explosion as little as 130 yards away, provided that they are covered with 3 feet of earth. The jigs for producing them have been ordered, but the start of production must wait upon steel supplies. As for concrete shelters, their construction is not in sight, for they compete directly with building resources which the Government has earmarked to implement its unfortunate promises about housing. Housing is a good political bet, shelters a bad one; but that would not be so if the threat of war became imminent. Meanwhile the failure to provide them prevents people from taking civil defence

seriously. They know that it took two years to put up the shelters last time, and this convinces the optimists that there is no urgency to join civil defence and the pessimists that there is no point, as everyone will be dead anyway.

The provision of respirators is much nearer than the provision of shelters. There are probably enough left over from the last war, and held in Government stores, to equip people in the most likely target areas. Production of a new respirator, which fits more closely than the old, is in the pilot stage.

There are ambitious plans for the hospital service, intended to provide some half a million beds for air-raid casualties. Of these, over 5,000 would be in 186 emergency wards. But these plans are on paper only; the present state of their execution is that 60 of the emergency wards are being built, providing only 2,000 extra beds, and the National Hospital Service Reserve is below 25 per cent of the required peacetime establishment. Equally poor is recruitment to the Auxiliary Fire Service, which stands at a mere 15 per cent of the first stage of its planned expansion. Here, for once, the supply of equipment outruns the supply of men. But the service is still pitifully small in relation to the fire danger that could be expected in a future war; for not only can the flash of the atom bomb ignite inflammable material two miles away, but there is the possibility of "saturation" bombing with incendiaries, leading perhaps to a fire-storm like the one which devastated Hamburg.

A case for giving civil defence little priority can be made out. Wars are not won, nor aggression deterred, by encasing the civilian population in concrete. The essence of defence policy is to achieve a marginal superiority over the whole field of potential warfare—and there is no reason to think that civil defence is less advanced here than behind the iron curtain. But even from a strictly military standpoint, civil defence is a vital part of defence strategy. Not only does the protection of industry depend on it (here it is slightly encouraging to note that civil defence in industry is rather farther advanced than elsewhere), but also it is vital to morale. It is no use taking the attitude that "it will be all right on the day." A heavy onslaught on a people utterly unprepared could break morale in no time, and once the destruction had begun it might be impossible to organise anything. It would be foolish, too, to count on several months or even weeks in which it would become clear that war was on the way, and still more so to rely on having a few weeks' breathing space while the enemy attacked Europe.

If people are to see the urgency of joining civil defence they must be given a clearer idea of what they could expect if war broke out, and what would be expected of them. The official guardians of morale are afraid to tell them too much at this stage. But if people are able to take measure of the danger and of the possibility of defence, they will be less inclined to dismiss the whole subject of air attack with a shrug of vague defeatism. The vagueness and the defeatism must be dispelled. They can be dispelled only if people see more visible signs of civil defence preparation. That ought to have more priority even though it makes heavy demands on materials and labour. A moderate increase would make a lot of difference if it was combined with franker discussion. And who could dispel vagueness and defeatism better than the Prime Minister?

NOTES OF THE WEEK

Mr Eden Encourages Europe

It looks as if Mr Eden's advisers are now trying hard to think constructively about the part that this country can play in the process of European integration without weakening its position in the Commonwealth and the Atlantic community. During the meeting in Paris this week of the Committee of Ministers of the Council of Europe, the Foreign Secretary struck a blow at the Foreign Office's reputation for obstruction by putting forward a useful proposal. It is that the Council's consultative assembly and committee of ministers should, by remodelling themselves, provide the assembly and committee of ministers needed for the European coal-steel pool and defence community.

Here at last, his listeners must have felt, was a positive idea for strengthening the organs of unity in Europe coming from across the Channel, even if the British are proposing to *sauter pour mieux reculer*. It would mean that the countries which take integration seriously—even to the point of ultimate federation—could make a reality of the Strasbourg spirit; while those which favour European consultation, and nothing more, would cease to hamper the Council's development by their limited view of what it should do.

Mr Eden went to the roots of the basic problem of West European politics. There are urgent reasons why Western Europe should unite, but the French and others are reluctant to unite without Britain being there to hold the balance between France and Germany. Britain has decided—and both parties in the House of Commons agree on this—that it cannot enter institutions which involve a growing surrender of sovereignty. It promises association, but that is a concept too vague to satisfy Continental ways of thinking. In the present situation the proposed institutions may miscarry.

Mr Eden sees that Britain has a clear duty and interest to bring them to birth. He has hinted at a future, not so distant, when his government would sit in the counsels of a confederate Europe, participating but not voting. France and Germany could then feel that Britain was at least sitting at their elbow, not merely listening, like the Irish and Swedes, in the public gallery. This is a promising and important move which will be welcomed in the United States.

Atomic Allies

The visit to London of Dr Conant, President of Harvard University, to give the Stevenson Memorial Lecture at the London School of Economics, has produced a useful stir of ideas on Anglo-American co-operation. As a scientist who is now head of a great home of the humanities, he called attention to the complexity of the problems raised both for science and for politics by the current situation with regard to nuclear physics. He made the point that, although in the past scientific knowledge has frequently been applied to the invention or improvement of weapons of war, this has always involved hitherto only a special application of principles already discovered through free scientific inquiry. The development of atomic weapons has for the first time subjected a large field of science to conditions of secrecy under the control of national governments. Dr Conant did not question the need for such secrecy in a world of dangerous international tensions, but urged that the implications of such a state of affairs should be frankly recognised.

Dr Conant claimed that the economic uses of atomic energy could not be separated from the military. Quite apart from the hazard and uncertainty introduced into all public consideration of international affairs by ignorance of the real power possessed by each nation, it had become impossible to check claims of what could be done industrially with atomic energy. This situation gave enormous scope for speculative rumours, demagogy among politicians and "court intrigues" in administrative circles. As between the three countries which had jointly promoted the production of the atomic bomb during the last war, there was now an unfortunate lack of close co-operation, for the question of security had become a matter of mutual recrimination on both sides of the Atlantic; Americans accused Britain of being negligent in precautions against espionage, while voices in Britain talked of American "hysteria" and "witch-hunting." With so much misunderstanding and distrust it was impossible to obtain the benefits of joint endeavour in the field of atomic research. He suggested that the present emergency required the creation of a joint Anglo-American commission for co-ordination of atomic energy policies.

Dr Conant's views are worthy of serious consideration, but the difficulties should not be under-estimated. In any case action in the direction he advocates can hardly be expected in the American election year. The trouble about international co-operation in these matters is that no nation is willing to enlarge the security risk by divulging secrets of such transcendent importance even to its allies, especially when so many scientists everywhere are genuinely opposed to any restriction of the traditional freedom of publicity in science—or have Communist sympathies.

* * *

Whose Fleas?

The charges of American bacteriological atrocities which are now the main theme of the Chinese Communist propaganda machine become more and more fantastic. According to Peking, flies, fleas and mosquitoes carrying cholera and plague germs have been fired into the North Korean lines in shells, and dropped in bombs some of which explode at 6,000 feet, from which height the insects make a free drop. The North Korean Minister of Health has admitted that these airborne insects, despite their apparent ability to survive these ordeals, die quickly of cold once on the ground; but he assures his people that the germs are quite capable of "living on in the snow" for weeks on end. These are tall tales; but for sheer improbability they do not compare with the many Communist claims that the Americans have spread germs in the foremost Chinese positions, sometimes sending infantry patrols across to do this nefarious work. To spread cholera, a water-borne disease, by means of flies, which can only transmit it for a few hours after infection, would be a remarkable feat; to spread it a mile or so from one's own front line would be suicidal.

All atrocity stories have a recognised propaganda value, but these particular charges have other uses. They will help to keep Koreans and Chinese away from points where UN aircraft have dropped leaflets until Communist "sanitary squads" have cleared the area. They are also the basis for an intensive anti-epidemic drive in North Korea, where plague often appears when flea-bearing animals come out of hibernation, while cholera has probably been introduced by soldiers from south China. There is little evidence that either has taken much toll as yet; indeed, according to the North Koreans, only three fatal cases have occurred.

The only reason the Communists have given for refusing to let the International Red Cross investigate their charges is that no epidemic has yet begun. The logic of this argument is not apparent even to Marxist minds, for demands for a Red Cross Inquiry have come not only from Washington but also from European Communists.

The Budget Debate

The general debate on the Budget ended on Monday with the House of Commons concentrating on two main themes. First, is the Budget fair in its balancing of bigger social service benefits and income tax reliefs against higher food prices? Secondly, is Mr Butler's surplus about right or will it provoke either inflation or deflation?

The first issue was debated with a wealth of arithmetic which, if sometimes confused, never left the main point in doubt. The lower-paid worker with a small family or none will be a little worse off. The Labour party naturally condemned this as unfair and reactionary—by its own standards of what equality should mean. What was patently wrong was the attempt of some speakers to suggest that these workers were being penalised in order to relieve the surtax payer. Mr Butler had no difficulty in showing that the principal benefits of his Budget will in fact go to the very needy—to large families and to people dependent on social security payments—and to the higher-paid wage and salary earners. Since the tax reliefs give an incentive to higher production, that is entirely in accord with Tory social philosophy and Mr Butler could quote the evidence of the Gallup Poll that the majority of voters thought it fair.

On the second issue, the debate was more confused. Some Opposition speakers seemed to accuse Mr Butler of providing a licence for inflation, and others thought that he was provoking a slump; a few appeared to make both charges. On the Government side, it was agreed that some of the assumptions on which the Budget was based were optimistic; but Mr Butler thought that if things turned out to be worse the penalty would be "disinflation"—"and consequent unemployment greater than any of us would wish to see." It would be unfair to read too much meaning into a necessarily discursive speech answering the main points raised in a long debate. It is none the less plain that, though his choice of phrase is less sure, the underlying ideas of Mr Butler's economics are remarkably close to Mr Gaitskell's. But the Government view was certainly far more coherent than that of the Labour party, which in the divisions on Thursday fell into the usual irresponsibility of a baffled Opposition by voting against the tax increases and not against the tax reliefs.

* * *

Mr Butler the Bear

The most important feature of Mr Butler's speech on Monday was the bearish economic forecast that it implied. The Chancellor has been greatly impressed by the evidence that inflation has been arrested and the financial climate of the whole world economy is changing. The signs have hardly gone as unobserved as he seemed to think. But past experience should have taught some caution in interpreting them. There is a tendency, both in the United States and in this country, towards a seasonal recession; the early months of the year have several times given a misleading impression of what was to follow.

This year, it is true, is different. Whatever the general level of employment and incomes turns out to be, a serious contraction of world trade seems to be more than a possibility: Britain's import cuts are the biggest single contribution to it. And for this country such a contraction would undoubtedly produce unemployment in many industries even if there was no stay to activity in most of the world. For a country with a healthy balance of payments the remedy would be to keep up demand at home; for a country struggling to close a desperately large external gap at the last moment, a weaken-

lng of overseas demand makes it more necessary than ever to put financial pressure on manufacturers in order that they will find every possible market abroad. The threat of a slump in exports does not do the work of disinflation for the Government: on the contrary, it increases the amount of disinflation that an adequate Budget should secure. The transitional unemployment involved becomes the direct and obvious instead of merely the contingent price of solvency—and, therefore, the price of preventing still more unemployment.

Precisely because they are so far from wanting to use deflation as a deliberate weapon of economic policy, it is most important that the Conservatives should be clear-headed about this from the start. If the contraction of demand that Mr Butler fears is one that comes from outside this country, there is nothing that can be done to prevent it happening. But the best way of preventing it from opening up a new gap in the balance of payments—and, incidentally, the best way of minimising any unemployment it may cause—is surely to try to extend British sales in markets that are not contracting. And for that, on Mr Butler's own showing, the best method is continuing disinflation. At this stage, the argument about whether the Budget is disinflationary enough depends primarily on estimates of the future strength of home demand, not of export demand; and about this Mr Butler had little to say. It would have been difficult for him to offer evidence of anything but the beginnings of a mild and indispensable shake-out in an overloaded economy.

* * *

Drilling Orders for Labour

For the first time since the controversy with Mr Bevan became acute two months ago, the stocks of Mr Attlee and the more orthodox Labour leaders rallied last week. In the Budget debate Mr Bevan's supporters were overshadowed by the Opposition front bench, and Mr Gaitskell's broadcast on the Budget was as skilled a piece of party pleading as could be wished by the most ardent opponent of the Tories. This greatly strengthens him in the rivalry between the front bench and Mr Bevan who, though an orator, is no broadcaster.

These gains in public were followed this week by a tactical success for the front bench in the semi-privacy of the Parliamentary party. At the meeting on Wednesday the official leaders showed unexpected resource and skill. They easily secured a vote that the party's former standing orders, which had been in suspense, should be put into force as an interim measure until new orders are framed. This not only brings Mr Bevan's followers under immediate discipline, but makes it idle for them to attempt to delay, by lengthy debate, the new orders. Indeed, they now have an interest in seeing that the new orders replace, as soon as possible, the old ones under which "persistent refusal" to toe the party line is punishable. This shrewd manœuvre bears all the signs of Mr Morrison's planning. It is said to have been accompanied by the first outspoken speech Mr Morrison has made for months, in which he tackled Mr Bevan with much of his old vigour. If Mr Morrison is getting back to form—and getting back into his familiar field of domestic politics—the rebels will find the future a good deal tougher than the recent past.

The debate on the new orders brought forth many objections from the Bevanites, but the main lines of the official draft, which requires Labour members to abide by majority decisions in their speeches as well as in their actions, will probably be adopted. The Bevanites are anxious to widen the clause permitting abstention on grounds of conscience. They might by that means greatly modify the meaning of the orders. But success or failure in this would not be decisive. What matters is not so much the precision with which Labour members' obligations are defined as the degree to which the existence of some rules reflects a determination in the party to blend discipline with unity. Any sanctions under the new orders, however drafted, can be imposed only with the consent of the majority of the party. Their effectiveness will depend, therefore, on the spirit in which they are applied; and that will not be decided solely in the present discussions.

* * *

No Business in Moscow

Preparation of the economic conference which opens in Moscow on April 3rd has been notably thorough. If the visitors from all over the world do not agree that American foreign policy is the chief barrier to increased trade and co-operation between countries, it will not be the fault of the organisers. The propaganda that is being made shows that a notable success for the peace campaign is expected—if sufficient numbers of the right people turn up. Moscow Radio has given the impression that this is to be an informal get together of business men and economists organised by an "international initiative committee." In fact the arrangements have been under Moscow direction for some time.

The Soviet Preparatory Committee has received copies of all correspondence arising from invitations, and it has insisted that lists of proposed visitors should be restricted to what it considers a proper representation from each country. The Committee is directing all propaganda for the occasion not only in the Soviet Union but outside as well. National committees under its instructions arrange interviews and press articles, and select public personalities as mouthpieces. So official is the Soviet Committee for this unofficial meeting that it includes the deputy minister of light industry, the deputy minister of internal trade and the deputy chairman of the State Bank. The hospitality offered is generous; a sojourn of ten days in Moscow and opportunities for travel in the Soviet Union afterwards. Air passages are paid from points as far apart as Warsaw and Karachi. One-third of the cost is being borne by the Communist governments of Eastern Europe, the Chinese Government, and the Soviet Government.

From REYKJAVIK to RANGOON

History TODAY

has enthusiastic readers

Read in every continent, and in cities as far apart as Reykjavik, Teheran, Hongkong and Rangoon, HISTORY TODAY is a magazine designed for the intelligent man or woman, planned upon entirely new lines. The basic idea is very simple—that to understand *today* and forecast *tomorrow*, one must have studied *yesterday*, and that the key to present problems often lies in the remote past.

Among articles published in the March issue, now on sale, are: *The Pictorial Records of the Medicis*—a richly illustrated article on the great Renaissance family of patrons, bankers and politicians, by F. M. Godfrey; *Thomas Paine*, a study of the famous Radical, with special reference to the part he played in shaping the constitution of the United States; an illustrated account of *The Vanished Churches of the City of London* by Gerald Cobb; and *The Tinkers and their Language*, a description of a mysterious and rapidly vanishing Scottish tribe of Gipsies by Naomi Mitchison.

History TODAY

ON SALE NOW—2/6

From booksellers and newsagents everywhere, or direct from the publishers price 2/9 (post free). An annual subscription costs 30/-.

HISTORY TODAY, 72 COLEMAN STREET, LONDON, E.C.2.

The event will show how free discussion will be and whether the recommendations reflect minority—that is to say, non-Communist—views. If there is fair play for all, then the instructions of the World Peace Congress in Berlin which proposed this conference will have been disregarded. This would be surprising and significant; but it is unlikely. Mr Acheson hit the nail on the head last week when he spoke of this "stratagem to lure unsuspecting men of good reputation to participate in order to misuse their names and their public standing." They have been warned. They would do better to watch the conference on east-west trade that is being summoned by the Economic Committee for Europe in Geneva.

* * *

Taming Communism

In his recent pronouncements on foreign affairs Mr Aneurin Bevan has constantly resorted to a line of argument which is as seductive to uncritical minds as it is dangerous to the safety of the free world. It is the thesis that rearmament is not really necessary for resistance to Communism, because Communism is simply a product of poverty; therefore the only way to resist it is by promoting higher standards of living everywhere. In the foreign affairs debate in the House of Commons on February 26th Mr Bevan, after referring to the Korean war and the Middle East, declared:

> we think that a very great deal of energy, of material wealth, is being thrown away on fighting the wrong sort of war. The war that we want fought is a war against those despairing social conditions that give rise to war. As a result of pouring out our treasure on a myth, on an assumption that all this is Russian military aggrandisement, Europe has been ruined.

Recent history does not bear out the idea that mass poverty is the most significant factor in the spread of Communism. If the Russians had won in the blockade of Berlin, Germany would now have been under Communist control, but the outcome of that crucial conflict did not at all depend on the degree of poverty then existing in Germany. The nearly achieved conquest of South Korea was not due to any rising of desperate, poverty-stricken South Koreans, but to a straight military invasion with tanks (which Russia had supplied to North Korea, but America had not supplied to South Korea). It is plausible enough to attribute Communist movements in Asia to "despairing social conditions," but how can this explain the remarkable strength of Communism in Australia, which enjoys one of the highest standards of living in the world?

The fact is that Communism as a totalitarian political system uses force whenever it appears expedient, propagates and exploits the idea of Soviet military invincibility, and appeals to every sort of discontent, grievance or ambition, whether economic in origin or not. The attraction which Communism has for sections of the middle-class intelligentsia, both in western and eastern countries, is not due to hunger in these circles, but mainly to factors of another kind: the craving for the certainty and safety of a system of intellectual authority which is "scientific" and yet admits of no doubt or questioning; the desire to belong to a dominant *élite* and at the same time to sink one's individuality in a collective will; the romantic appeal of the fairyland of marvels which Soviet propaganda projects. Nationalist resentments and hatreds, which are much more than mere manifestations of poverty, are likewise exploited by Communism, as they were recently by Fascist movements. To promote higher standards of living throughout the world is in itself a desirable object of policy, but it is no substitute for defence.

Back to the Donkey

The Persian New Year, which is celebrated with all the zest that the Anglo-Saxons devote to Christmas, not only falls this weekend but immediately succeeds "Nationalisation Day." Dr Mossadegh is therefore able to profit by the holiday he has announced for the one occasion and by the thirteen days of festivity accorded by custom to the other. That is to say, for a fortnight, he will be immune from attack on the score of his failure to come to terms with the International Bank. The Bank mission has returned to the United States, and American and British views on the impossibility of dealing rationally with the Mossadegh government are probably closer than they have ever been before.

The talks broke down upon three points, of which one was so fundamental to the other two that the latter were not worth discussing until it was settled. The key point was whether the Bank or the Persian government should be master of policy; the Persians maintained that, under the nationalisation law, the Bank could be no more than their agent. The Bank replied that, given its status as an international body representing fifty countries, it could not serve any one of them in such a capacity. So long as this issue remained unresolved, questions of price, and of whether or no to discriminate against British technicians (whom the Persians say they cannot re-admit), were immaterial.

Persia's New Year prospects are not bright. A member of the Mixed Oil Commission has announced by broadcast that "it is the duty of the Iranian government to ignore the loss of oil income." He did not add the corollary, which is that Dr Mossadegh has nothing to show for his year of nationalisation save dwindling finances, curtailment of development and welfare, and a retrogression—both economic and spiritual—towards mediævalism. The number of elderly reactionaries who are being elected to Parliament on the wings of oil nationalisation is alarming all Persians who are anxious to see their country play an important part in Asia. If the year now starting goes on as Dr Mossadegh has begun it, its trend will be away from the Packard and towards the donkey, away from the new look and back to the veil.

* * *

The Pace of Pay Increases

The Chancellor can never have supposed that the rise in the cost of living would not provoke successful claims for higher wages this year. His reason for ignoring them in his Budget speech was, presumably, a belief that the unions would formulate claims at their annual conferences in the spring and early summer and the normal leisurely negotiations would follow; people would not actually get more money until the autumn, when many things may have changed. Wages might on balance lag behind prices and exert no net inflationary influence.

It is by no means certain, however, that this year the pace will be so slow. There was a quick reaction even before Mr Butler predicted this Tuesday that the cut in food subsidies would raise the cost of living index by 4½ points. The unions argue that higher insurance contributions, increased bus fares and even higher mortgage charges by the building societies must all be added to the higher cost of food in estimating the budget's total effect on their members. A delegate conference of the National Union of Mineworkers has already called for a new wage demand "to offset the effects of this budget upon our members' living standards." The president of the Union of Shop, Distributive and Allied Workers, who is a Labour MP, has predicted a similar claim by workers in the distributive trades. Leaders of the foundry workers' and electrical trades' unions have also announced that they intend to ask for more money soon. The electricians pronounce that "the bogy of inflation will not deter us from leading the fight for increased wages."

Some of these demands, notably that of the mineworkers, may have been advanced in an attempt to forestall the inevitable complaints of the Communists. But the complaints

have been made and will certainly be pressed as soon as the unions can collect the evidence on which to base them. The first will probably be advanced when the distributive workers meet in conference at Margate on April 13th. The next important claims will probably come from the miners, the railwaymen and the engineering workers. They may easily precede the annual conferences of these unions, which do not take place until July and August. Union leaders, who have experienced the delays of arbitration, now tend to anticipate rises in the cost of living instead of reacting to them after they have happened. It is likely, therefore, that many wage claims will be lodged by midsummer, several months earlier than usual. By then, too, workers whose wages are linked to the cost of living index (notably the steel workers) and others whose claims were pending before the budget will no doubt be getting more money than they have now. It would be wrong to assume that there will be no restraint at all by the unions, or no resistance from employers. But the increase this summer in the cost of labour is certainly likely to exceed the corresponding increase in 1951.

* * *

Cuts within the Commonwealth

The President of the Board of Trade was recognisably and understandably unhappy in his attempt last week to explain Australia's cuts in imports, which many British industries seem to find nastier the longer they are studied. He and his colleagues find themselves, indeed, in an unpleasant dilemma. Either the cuts were discussed and agreed to at the Conference of Finance Ministers, or they were not. If they were, then the Government must bear the odium of having condoned the infliction of a heavy blow on the already hard-pressed textile industry and must, moreover, be convicted of moral cowardice for having failed to give any indication of what was in store. If they were not, then Commonwealth economic co-operation must regretfully be dismissed as a form of words. It is true that there is not much political capital to be made out of events which no United Kingdom Government, of whatever party complexion, had power to prevent; but that hardly consoles Mr Thorneycroft, or anyone else, for so apparently devastating a demonstration of imperfect solidarity.

What is really being demonstrated, however, is less a lack of reasonable solidarity than a hard fact which no professions of solidarity can conceal: the fact that not even the best-intentioned and most co-operative member of the Commonwealth can be expected to go bankrupt in the interests of either the profits or the employment levels of particular British industries. It is for industry and the pattern of employment to adapt itself to the needs of external markets, and not vice-versa. That the adaptation called for in this instance should be sudden and violent, making hardship inevitable, is the kind of misfortune that is the penalty for delaying adjustments as long as they have been delayed both by Australia and by the United Kingdom itself. If blame is to be laid on the Australian Government it is not for deciding that Australia is no more able to afford a flood of new cars than is Great Britain; it is for failing to realise that fact earlier and to shape its economic policy accordingly.

There remains, however, a hard core of unanswerable reason in the Opposition's protests. The manner of the cuts, leaving goods earmarked for Australia on the exporters' hands, is impossible to reconcile with the notion of an agreed approach to a common goal of solvency, however loosely the idea of agreement is construed. Somewhere between Canberra and London the machinery of co-operation seems to have broken down in a manner unworthy of what Mr Thorneycroft rightly called a "great, useful and powerful organisation." One must hope that a repair squad is now at work.

* * *

Budget Obscurity

For all the lucidity that marked most of his Budget speech last week, Mr Butler managed to leave one important matter completely obscure. Did the Government intend to raise all national insurance benefits or only retirement pensions? He spoke of "uniform benefits" of 32s. 6d. a week, which would appear to mean that sickness and unemployment benefit would be put on the same level as pensions. But he was speaking in the context of old age pensions; he did not mention the other benefits by name; and he certainly left most of his audience with the impression that by uniform benefits he meant merely that he would abolish the distinction introduced last year between pensions for the old and pensions for the elderly.

The odd thing was that this mistaken impression was not corrected immediately. It would surely have helped the Government's case to let people know that their other insurance benefits—particularly unemployment benefit—would also be increased. But nothing was said until Monday's debate. Mr Butler then announced that the higher family allowances and insurance benefits would come into force by the end of September but that possibly the higher sickness and unemployment benefits might be introduced earlier.

All these changes will need legislation, and the Minister of National Insurance will introduce a Bill as soon as he has consulted both sides of industry. In the meantime the lack of further progress on the National Health Service Bill strengthens impressions that it is being substantially modified before it gets its second reading. There seems, in fact, to be every likelihood that the age limit for exemption from the charge for dental treatment will be raised to 21. This has much to commend it—on one condition: that equivalent economies will be made elsewhere.

Americans and Greeks

An incident in Athens last week shows how difficult it is for a great power to be at the same time generous, firm, and tactful. General Plastiras, the Prime Minister and leader of the EPEK, announced from his sick-bed that he personally disapproved of his Liberal colleagues' plan to reintroduce simple proportional representation. He said he would prefer to see the majority system of voting used in the next elections. The American Ambassador, Mr Peurifoy, then sent a message to General Plastiras, intended for publication, in which he strongly approved of the Premier's stand against a return to methods which, in the Ambassador's view, could only perpetuate the chronic instability of Greek governments and would seriously threaten the efficient use of American aid. Mr Peurifoy's action, which has been deeply resented by the Greek Government, has received the backing of the State Department, which went so far as to imply that future American aid depended on a sensible solution of this electoral problem.

Few would deny that Greece's economic reconstruction has suffered from the instability of its governments. And it is natural for the Americans to do what they can to create the political stability which is essential if the Greek economy is really to be put on its feet and if the American taxpayers' money is not to be wasted. Indeed, the United States' present generosity to the other countries of the free world could be a golden opportunity for some of them to put their houses in order. That they do not is a proof of the restraint with which American officials normally behave. Whether their advice is taken depends to a large extent on the manner in which American influence is exercised. There is all the difference between friendly private persuasion and a statement by the US Ambassador, which publicly takes sides in a dispute within the Greek Cabinet over a domestic matter.

It is hard to see how Mr Peurifoy could have failed to foresee the results of his intervention. No doubt he intended to strengthen General Plastiras's position; instead he appears to have done the exact opposite. The new electoral law has, it is true, been pigeon-holed for the time being; but Mr Peurifoy's action destroyed any chance there might have been of drawing a veil over the differences within the coalition over it. And General Papagos (who also favours a majority system of voting) has seized on this as a good moment to launch an all-out attack on the Government in Parliament. Moreover the Greeks' open repudiation of American advice can hardly have improved their standing in the Congressional committees which are now considering next year's Mutual Aid funds.

Israel's Preoccupations

The visit to London of Mr Sharett, the Foreign Minister of Israel, has two main purposes. The first is to talk with Mr Eden about Anglo-Israel relations in general and Israel's attitude to Middle East defence in particular. The second, no less important, is to stimulate the raising in Britain of the £2 million at which this year's Jewish Palestine Appeal is aiming.

The defence prospect is still so full of unknown factors that no conclusions have been reached. The Israel government is not anxious to take part in any scheme that might jeopardise the position of the two million Jews in the Soviet Union, of whom one man only, Mr Kaganovitch, still holds an important post. It has an open mind about changes in the existing defence structure, provided that these do not end simply in a strengthening of the Arab League Security Pact, a document conceived as a weapon against the Jews. Israel has yet to be convinced that the integration of Arab armies into some wider defence framework would ensure that they would not be used for local quarrels.

The fund-raising problem is serious. Israel's sterling balances are exhausted and its need of sterling is great. Few people realise that the gifts received from British Jewry are almost as generous, if computed pocket for pocket, as those from American Jewry. In the four years 1948-1951, contributions to the Jewish Palestine Appeal in Great Britain totalled nearly £6 million; in the same period, the United Jewish Appeal in the United States contributed just over $325 million. Whereas the British figure has risen in the last two years and still seems to be rising, that in the United States has fallen. The slump last year to $85 million is causing anxiety and a minimum of $151 million has been set for 1952. Collection has not been made easier by Mr Ben Gurion's speech to the Knesset last December, in which he upbraided communities that were "able but unwilling" to furnish Israel with educated immigrants, thereby frightening the many "America first" Jews in the United States. The gathering of money is not an entirely straightforward task; Mr Sharett has done well, therefore, while he is in England, to stimulate the collection of over one quarter of the sum hoped for this year.

* * *

The Exchequer and the Schools

The Ministry of Education estimates make Miss Horsbrugh's bark look worse than her bite. They provide for total expenditure of £206 million, or nearly £6 million more than in the year now ending; but grants to local authorities, at £184 million, are more than £10 million greater than in 1951-52. The cut of 5 per cent ordered by the Minister was, of course, to be made in local authorities' original forecasts of their expenditure in the coming year, and not in their actual expenditure in 1951-52. A higher total is inevitable in view of the larger number of schoolchildren; the increase in teachers' salaries that was granted in April, 1951, will not be fully charged to the Ministry's grant until the coming year; and costs generally are higher—that of school meals, borne entirely by the Exchequer, will be even higher than these estimates allowed for, now that subsidies are to be cut.

There have been some reductions in the Ministry's estimates for its expenditure other than grants to local authorities. The amount for scholarships and maintenance grants is reduced by nearly £2 million to £5½ million. The Ministry explains that this reduction is due to the running down of the Further Education and Training Scheme and to the ending of the Emergency Training Scheme for Teachers. It does not mean that there is any reduction in the number of state scholarships, which is to remain at 1,850. But the maintenance grants to be given with state scholarships are still under discussion. They will almost certainly be increased—sufficiently, it is to be hoped, to cover the higher cost of living; for it would have been better to reduce the number of scholarships than to keep the scholars in perpetual financial anxiety.

An interesting point in the estimates is that in the calculation of the grants to local authorities there appears the item "Additional 15 per cent Grant for Advanced Technology Courses, £50,000." During the lifetime of the last government a White Paper argued against the establishment of a university of technology, but recommended that grants should be made to existing technical colleges to enable them to establish advanced courses in technology. But the present government has made no pronouncement on this subject, and the Ministry's estimates appear to be a jump ahead.

After Groundnuts, Sorghum

Little attention was paid to the Queensland-British Food Corporation in its early years because its activities were so completely overshadowed by the East African groundnut scheme. What little was heard about the Queensland scheme seemed to be fairly encouraging. Defending the policy of the Overseas Food Corporation, which was

originally responsible for both schemes, Mr Strachey, then Minister of Food, once said that in Queensland things were going "extremely well." The scheme was "well ahead of programme" and so far had been "remarkably successful." That was at the end of 1949. A year ago, direct responsibility for the Queensland scheme was transferred from the Overseas Food Corporation, which with its groundnuts was placed under the overlordship of the Colonial Office, to the Minister of Food. The report on the Queensland scheme which has just been published is therefore the first to stand alone, no longer hidden by the longer and sorrier tale told by the report on groundnuts.

It is now clear that earlier hopes that the Queensland scheme would redeem the public corporation as a means of carrying out big agricultural projects on undeveloped territory were unjustified. The original intention was that it should produce large numbers of pigs for the United Kingdom, increasing the bacon ration just as Kongwa's groundnuts were to increase the ration of margarine. Fortunately, those responsible were far more cautious in their approach to pigs than the Overseas Food Corporation to groundnuts. They began by concentrating on the production of sorghum for export; then a start was made on fattening cattle to use the sorghum residues, but pig production was, and still is, largely experimental. Moreover, the financial results of the year ended September, 1951, have been disappointing. Because of drought, only a little more than half of the acreage planted to sorghum was harvested, with a financial loss on the year of £184,000. There was a loss of £16,000 on pigs, and a profit of £9,000 on cattle.

The corporation has consequently decided that a review of the whole scheme, which had to be undertaken within the next three years in any case, should be started immediately, and in the meantime no further expansion will take place. The report comments that production on the present scale "cannot make any significant contribution to the food requirements of the United Kingdom." The only consolation is that the Ministry of Food has so far invested only the comparatively small sum of £1,406,000 in the scheme and the Queensland government £469,000.

No Quarter for Tourists

Britain gets more visitors than it deserves. The British Travel and Holidays Association, whose forecast of about 700,000 overseas visitors was near the mark in 1951, estimates that there will be some 750,000 this year, of whom 200,000 will come from North America. The tourist (second class) air fares which come into operation on May 1st have stimulated heavy advance bookings. But British hospitality does not become any less austere. The Government says it has no time to deal with the Travel Association's proposals for changes in the licensing laws. It is still impossible for a traveller, except in "permitted hours," to buy a drink on arrival or departure from an airport, or to stand one to a friend at his hotel. And there are, if anything, rather fewer suitable hotels for him to stay in.

At the peak season, the hotels may be fuller than ever this year, in spite of higher living costs. Not only will there be more overseas visitors, but some people who otherwise would have spent all their holiday abroad will be forced by the £25 tourist allowance to spend at least part of it at home. It is true that the overseas visitor is not as a rule interested in the coastal resorts so dear to the British, but there are a few places—London, the Lake District, Edinburgh and other places in Scotland—where home and overseas tourists clash.

The proposals of the British Travel and Holidays Association for drawing some of the July and August traffic into June and September have received an even more dusty answer than its proposals for changing the licensing laws. The Transport Commission, in understandable fear for its finances, refuses to reduce its fares outside the peak season; and the Government has now announced that it will make no change in the dates of the Whitsun and August bank holidays, on the ground that there is no public support for the proposal. Enthusiasm was not to be expected, but there is sense in the idea that if the August bank holiday, at least, were shifted to the last Monday in the month, many people would time their holidays with it in order to get the extra day; and the weekend traffic would not be added to the peak of holiday traffic, as it is now. Britain is too slow to adapt itself to the tourist trade; its welcome still has an undercurrent of "take it or leave it."

Shorter Note

The table in a Note entitled "Trade with the Communists" on page 515 of *The Economist* dated March 1st, showed that the United States was still exporting in 1951 a fairly large quantity of goods to China. It is learnt that no American exports went to the Chinese mainland last year and the figures refer to shipments of American goods to Formosa. The Office of the International Monetary Fund, whose figures were used to compile that table, points out that they include Manchuria and Formosa under "China" although no such indication is given in their *Direction of International Trade*. The point of the Note, however, is not materially altered, for an American import surplus with China implies that the United States is providing China with dollars—the one universally accepted currency—which could be used to foster illicit trade.

Tory Reform

In plain language Lord Derby proclaims that his is not a Protectionist, but a *Conservative* and reactionary Ministry. Protection to corn and sugar, important as he deems it, is only one phase of his policy. . . . A duty on foreign corn, both for the sake of revenue and protection, he thinks desirable and just; but . . . he is not prepared as Prime Minister to force it on the country. But apart from this—and apparently a matter of greater magnitude in his estimation—he conceives that the general tendency of things in England has for some time past been in a dangerous direction; our national as well as our commercial policy has been based upon erroneous principles; the democratic element has become too strong—it is undermining the pillars of the Constitution . . . it is augmenting the difficulties of administration to an insurmountable height. This general tendency he proposes to stem: the question of Protection to our home industry may be decided against him: he has still a higher duty to perform to his country, and an object of deeper and more universal interest to strive for. . . . Supposing the question of the Corn Laws decided and laid to rest for ever—as it will be three months hence—what will remain as the avowed object of Lord Derby's Ministry? . . . The readjustment of our system of taxation, with a view of relieving property, and especially landed property, and raising a greater proportion of the revenue than at present by import duties on foreign produce. . . . Lord Derby imagines that the existing surplus in the revenue would already enable us to dispense with half the income tax. . . . Now, we are by no means prepared to defend all points of our actual fiscal system. . . . But in the meantime we must remind Lord Derby . . . that it is *not by augmenting but by reducing* the Excise Customs duties that the revenue is increased. . . . One thing is perfectly certain:—that the country will not endure to have its consumption either of home food or foreign imports curtailed.

Decisive stroke solves knotty problem

In Gordian Knots or Heavy Duty Cooking

ZEUS had spoken. The oracle was quite definite. Whoever could undo the knot that bound King Gordius's chariot-pole on to its yoke, would be the master of all Asia.

Alexander (whom some talk of) had ambitions that way — but the knot was a really knotty problem. So he smartly drew his sword and slashed the Gordian knot through. In the ancient world, this was good evidence that Alexander must be irresistible.

Time and again, he who hesitates is lost. For instance, if you order Falkirk Cooking Equipment *now*, then you will get it now — and at the very reasonable *current price*. Just think what a decisive stroke that would be for your budget!

Decisive Facts about Falkirk

- Equipment for Gas, Electricity, Oil, Steam and Solid Fuel
- Really tough cast-iron construction—will last for years
- Efficient modern equipment means less work for small staffs
- No weak links, a complete and balanced range of equipment
- Specially designed installation and plans for each customer
- Price most competitive
- If you need new kitchen equipment, *now* is the time to buy

Find out NOW *about*

WHAT DISAPPOINTMENTS dogged the early aviators in their first experiments in flying. Many worked in secret; few were so ambitious as Sir Hiram Maxim who in 1894, testing his machine at Baldwyns Park in Kent, coaxed sufficient power from a light marine steam engine to lift the whole contraption off the rails. There his endeavours ceased and who would have thought that in less than 60 years men would be flying at speeds faster than sound? Who, indeed, could have foreseen the great industries which would arise from the inventive genius of the 1890's? In that same year, 1894, Albert Edwin Reed acquired his first paper-mill at Tovil near Maidstone, to lay the foundation of what is today one of the largest organisations of its kind in the world. He was outstanding among the pioneers of modern paper-making methods and from his vision and enterprise have grown the great Aylesford mills of the Reed Paper Group, where giant high-speed machines turn out mile after mile of newsprint and the tough Kraft paper which has entirely revolutionised this country's packaging methods.

PIONEERS IN MODERN PAPER TECHNOLOGY

The Hawker Touch

Shortly going into service with the Royal Navy, the new Sea Hawk definitely has the Hawker touch. It's clean, it's fast, it's manœuvrable, it's easy to handle, easy to fly—and easy to land on a carrier deck. It has exceptional endurance, and finally its firepower has a real bite. Here's the naval strike fighter at its very best.

Guardians of Expenditure

The Control of Public Expenditure. By Basil Chubb. *Oxford University Press.* 291 pages. 25s.

It may be claimed that the two factors that have enabled the British economy to achieve an enormous volume of public expenditure without seriously reducing the productivity of industry are on the one side the efficiency of tax administration and on the other the system of control of expenditure which has been built up since the time of Mr Gladstone. Dr Chubb now tells us for the first time the history of the development of that system through the financial committees of the House of Commons. It is, however, something more than a parliamentary account, since the secret of the system's success has been the close co-operation with the executive—the Treasury on one side and the Department of Exchequer and Audit on the other—from the very beginning.

The greater part of Dr Chubb's book is concerned with the Committee of Public Accounts. This is natural because of its long and distinguished career. Its power and prestige are shown to have been partly due to the happy associations of its birth—established five years in advance of the Department of Exchequer and Audit, it helped to determine the form of that department and was also instrumental in the emergence of the Comptroller and Auditor-General as a great parliamentary officer; on the other hand, it was enabled to do these things because the Treasury had wisely seen that the best men for the job were appointed to the committee.

Dr Chubb traces carefully the successive solution of the technical problems of orderly accounting—the achievement of a complete set of accounts (1868), the rules for virement and a code for contracts (the Public Accounts Committee condemned the use of "cost plus" as early as 1903). It was of incalculable advantage to the country that orderly accounting and close estimating had already been achieved on the eve of the great expansion of public expenditure in the eighteen-nineties. As time went on much of the purely administrative control was—appropriately—transferred to the Treasury, and by this means, from the early interwar years, the Public Accounts Committee was released from detailed control for the consideration of matters of principle and efficiency. Not all its efforts have been successful; and it seems to emerge from Dr Chubb's researches that where the committee has failed it has usually been because—exceptionally—it has had something less than the full support of the Treasury.

Although the Public Accounts Committee is as fully respected as it ever was, it seems clear that its constructive period is long over. Even if it were to be established that the committee was the best answer to the as yet unsolved problem of parliamentary examination of the reports of the nationalised industries, the committee would be able to do little without drastic changes. It has no power to call for papers, and it could have no assistance from the Comptroller and Auditor-General, who has himself no jurisdiction in the matter.

Interest, in fact, has now shifted from the Public Accounts Committee's job of securing correct expenditure to the more difficult job of securing wise expenditure—to the work of an expenditure or estimates committee. A no less interesting part of Dr Chubb's work tells the story of the slow and painful steps by which a committee that started off as badly on the wrong foot as could be has made itself into probably the most powerful check of efficiency in spending that any country has devised at the parliamentary level.

The story of how obstacles were overcome is fascinating. First came the problem of when to examine. The Select Committee on Estimates has solved this by abandoning the attempt to vet the estimates between the Treasury and the Committee of Supply, investigating them instead only as they go into operation. Secondly, there was the difficulty of what to examine (in the absence of an agenda parallel to that prepared by the Department of Exchequer and Audit for the Public Accounts Committee). This was solved, in so far as it has been solved, by the use of the subcommittee system (which we owe essentially to Lord Samuel), and in particular to the work of the co-ordinating or steering subcommittee whose job it is to find the right subjects. Other important obstacles have been overcome, though there are also urgent problems still awaiting solution; in particular, the question of the form of the public accounts must not be allowed to rest.

Dr Chubb has written a scholarly and readable book; but there is one aspect of the subject on which one might reasonably ask for more. We are always told how the committees functioned, often what they investigated, but virtually never what they said. This omission is especially regrettable in respect of the work of the estimates committee, for an investigation of a series of reports shows clearly that the same sources of waste occur again and again. One may instance the premature engagement of staff and purchase of materials, faulty planning often due to the employment of an insufficiently experienced officer at the initial stage, change of plan after substantial investment has been incurred. These errors are no doubt pointed out to the departments concerned as they occur; but Dr Chubb might have contributed importantly to keeping them before the eyes of ministers and of officers responsible had he included a thorough investigation of this aspect of his subject.

Personality and Period

Montrose. By C. V. Wedgwood. **Queen Elizabeth.** By Milton Waldman. Brief Lives. *Collins.* 158 pages; 159 pages. 7s. 6d. each.

This series, good though it is, seems to be heading for the usual difficulties of the short biography. Is it to deal with a personality with the minimum of period background and political analysis? Or is to deal with a period in the course of studying a great man—or woman? Miss Wedgwood does the former, quite deliberately and successfully. Mr Waldman does the latter, apparently with reluctance. The publisher would have done better to let him concentrate on Elizabeth the woman ruler, leaving a fuller picture of the manifold achievements of the reign to further lives—say of Cecil and Walsingham.

Nevertheless, two classes of reader will be well satisfied with both volumes: young people—and their teachers—who want to escape from the kind of textbook which treats politics and personalities as far less important than the invention of windows and the expansion of the wool trade; and older people who want to refresh and correct their memories with two hours' reading under a good guide. In this role Miss Wedgwood writes excitingly about Highlanders in action and movingly about Montrose himself, while Mr Waldman condenses admirably. His is certainly the more difficult job: to bring out in 159 pages the story of a Queen in times more perilous than our own, when the French were on the Scottish border and England lay, in the continental struggle, like a bone between two dogs.

There is much to be said for reading the two books together. Montrose is a figure of romance, "kin to Hector, Roland and Lancelot." A brilliant and humane general, he lacked the sheer cunning and ruthlessness of the Queen, whom events made into a pretty tough character before she was even adult. He is all the better for this worldly weakness, and we are all the better for being reminded of the way he died and of the legend he created. Elizabeth Tudor is all "patience, compromise and thrift," guarding an England of 3½ million souls, conducting the cold war of the sixteenth century with high skill, and holding her own in will and intellect with the brains trust of Cambridge intellectuals who composed her council. Those who hope and plan for a new Elizabethan age under the House of Windsor should notice what the principles of government in the Tudor reign were: the security of the realm, ceaseless and determined diplomacy, as little ideology as possible in foreign policy, the development of wealth and the release of energy. But they should also note the nobility of character and the deep religious convictions of that Elizabethan character, Montrose, without whose qualities politics is a pretty sordid affair.

Medical Economics

The Cost of Health. By Ffrangcon Roberts. *Turnstile Press.* 200 pages. 16s.

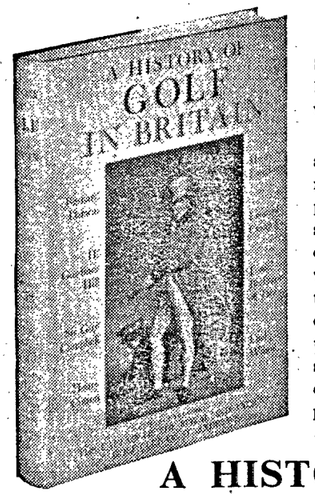
A few years ago, Dr Roberts began to wonder why, with the big advances made in medical treatment in the last twenty years, we should be wanting more and more hospital beds. Looking for an answer he studied a few hospital statistics: first, in his own speciality, radiology, the number of X-rays taken; then, in pathology, the number of blood counts done; and so on. Seeing the great increase in the number of tests carried out, not only on a greater number of patients, but on each individual patient, he built up a theory about the cost of health which he describes in this book.

Briefly, his theme is that the application of science to medicine in this century has enabled it to expand indefinitely. But in its successful advance medicine has been selective. Its victory over acute diseases is virtually complete. In other cases, it cannot cure, it merely prolongs life; and the future progress of medicine is bound to be along the lines of further prolonging life. Hence the ageing of the population; hence the cost of the health service; hence the compatibility of an increase in ill-health with an advance in medical knowledge. In diagnosis, too, science has made investigations infinitely more elaborate, infinitely more refined, infinitely more costly.

Dr Roberts has a number of minor themes which he argues as persuasively and as lucidly as his main one. His section on medical auxiliaries, for instance, in which he describes how new occupations, each eager to emphasise its professional status, can grow up, is particularly revealing.

But what is of immediate importance is the relation of his main theme to the national health service in this country. Dr Roberts ridicules the proposition expressed in the Beveridge report, and widely held among politicians and people of all parties, that by diminishing ill-health a national health service increases productivity—in other words, that we cannot afford not to have a health service. He shows that a vast amount of sickness is treated under the service without productivity being affected one jot.

The treatment that he prescribes for the ills of the health service is twofold. First, doctors must rationalise medicine. They must ask themselves to what extent, measured by results, modern methods of investigation and treatment are necessary. Secondly, since it has now been made clear that the state, like the private citizen before 1948, has to limit expenditure on its health, there must be priorities. The first claim on the health service's resources should be given to those whose ill-health prevents them from working and the second to those for whom treatment is purely or mainly humanitarian. The rest, those whose ill-health is not disabling, however distressing—acne in a young woman for instance—ought, in the present economic state of the nation, to pay for their treatment.



Dr Roberts' book is not so cold-blooded as this summary makes it sound. But he makes a justifiable plea for emotional attitudes to be shed when the health service is discussed. What a pity that this book was not written six years earlier—although if it had been, few people would have believed it.

Ricardo in Parliament

The Works and Correspondence of David Ricardo: Vol. V. Speeches and Evidence. Edited by Piero Sraffa. *Cambridge University Press.* 534 pages. 24s.

In this, the fifth volume of his great edition of the Works and Correspondence of David Ricardo, Mr Sraffa has carefully gathered the entire documentation of Ricardo's parliamentary career; speeches, evidence before committees, papers on parliamentary reform, and for good measure several contemporary appreciations of his work. This is the first time that these have been collected and reprinted; and the difficulty of the editor's task has lain not only in the tracking down of the matter and its proper setting against its historical background, but in assessing the accuracy of reports made from semi-surreptitious longhand notes by parliamentary press correspondents existing on sufferance in the back rows of the Strangers' Gallery.

Ricardo in his parliamentary role appears as a respected and valued independent member—his seat was a most disreputable pocket borough, obtained, in consideration of a large loan, on terms which gave him politically a free hand—with a striking gift for getting to the heart of the matter under discussion, a corresponding unconcern with the compromises of practical politics, and on occasions a surprisingly forceful turn of speech. While the greater part of his contributions to debate concerned the questions of currency on which he was, owing to his part in the Bullion Controversy, a recognised authority, he also took a vigorous concern in general economic questions, and on occasion (notably in the debate on the Six Acts) spoke up as a good liberal on matters of free opinion and free assembly. He also appears, not only in the House but out of it, as a champion of parliamentary reform. Had his premature death in 1823 not cut short his parliamentary career after less than five years, it is hardly too much to say on the evidence of this volume that he might well have been remembered today no less as a statesman than as an armchair economist.

SIR GEORGE CUNNINGHAM
1950-1 Captain of the Royal & Ancient writes in his Foreword:

"This book will, if I am any judge, be a classic in the literature of golf. The names of the contributors, famous for playing the game and for writing on it, are sufficient earnest of that. There is a wealth of fascinating reading here for everyone, whatever his taste. Whether his fancy turns to the early history and implements of the game, to heroes and heroines of today and yesterday, to incidents and stories of famous matches, or to the ways of hitting a golf ball, he will find in these pages what he seeks."

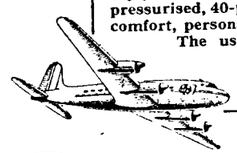
Cheaper Dollars!

FROM MAY 1st



Only £94.13.0 to reach the Canadian dollar market by *TCA*

DOLLAR EARNERS should take advantage of new, reduced fares to Canada. Beginning May 1st, these tourist fares will be the lowest ever! On a single ticket to Montreal you will save £41.9.0 and on return ticket £74.12.0.

TCA 'North Star' Skyliners will leave daily, providing most frequent service to Montreal, all of Canada and the U.S.A. Make your reservations now. Contact your Travel Agent or TCA, 27, Pall Mall, S.W.1. Telephone: WHItehall 0851. Scotland—Prestwick Airport, Ayrshire. Telephone: Glasgow Central 3428 or Prestwick 7272, Extension 268.

REDUCED FARES—REGULAR FLIGHTS
—SAME TCA COMFORT

Although making big savings in fare, you will enjoy the same TCA 'North Star' service in roomy, pressurised, 40-passenger Skyliners with armchair comfort, personal attention and 'on-time' arrival. The usual delicious hot meals will be available at a moderate charge. Ground transportation at nominal cost.

Observation of Masses

On the Objective Study of Crowd Behaviour. By L. S. Penrose. *H. K. Lewis.* 73 pages. 10s.

It has long been plain that the behaviour of men as individuals is quite different from that of the same men as members of a team, a nation, or a mob. Some thirty years ago, both McDougall and Trotter published classical studies of group behaviour, and more recently "the group" as a therapeutic medium and as a stimulus for leadership has aroused great interest.

In this short book Professor Penrose suggests that the behaviour of crowds should be studied quantitatively. He uses the analogy of epidemics and points to the great advances in the control of bacterial infection made possible by a careful study of the infective agent, the means of transmission, and the phenomena of immunity. From detached witnesses of the behaviour of crowds he would like to have detailed accounts of how fast an infectious idea travels, of the numbers of people infected at various times, and of the cooling-off phase. His analogy is briefly illustrated by descriptions of some crazes, an outbreak of religious fervour, a run on a bank, and the "invasion from Mars" scare in the United States in 1938; in later chapters he discusses politics and war from the viewpoint of epidemiology.

The author's second theme is mathematical, and though he feels at home many readers may be loth to follow him far in it. He is at pains to show by mathematical means how powerful, in deciding the result of a vote, a small and resolute block can be, under the simple majority system, if the mass of voters is indifferent.

It is a pity that this essay is so short. A fuller exposition of his fertile analogy would have been rewarding, and the author could thereby have avoided one or two dogmatic statements which slightly mar his objectivity.

Letters to the Editor

Mixed Verdict

Sir,—The leading article on the Budget in your issue of March 15th contains the following statement:

> The reason why Mr Butler excited such jubilation on the benches behind him was that they thought the Budget would win them votes in by-elections which they had fully expected to lose.

This conclusion is not one of your best. In the first place, there are no by-elections impending, and we are all in good health in the Conservative party. Secondly, it occurred to those of us behind Mr Butler, just as it did to you, that this was "politically the most courageous" of the postwar Budgets. We felt that the salvation of our country had at last been made possible. Was there not cause for honourable jubilation?—Yours faithfully,

JOHN HOPE

House of Commons

Will France Face the Facts?

Sir,—The picture of French internal politics given in your issue of March 8th is, on the whole, true, but I am afraid you are fundamentally wrong on the taxation problem.

According to eminent financial experts, France is taxed on up to 31 per cent of the national income, against 24 per cent in the United States and 33 per cent in Great Britain. This represents a heavier burden for France than for the other two countries, as the portion of national income remaining after deduction of the "vital minimum" is much smaller than in either Great Britain or the United States.

As regards the proportion between direct and indirect taxation, I quote below an excerpt from the report of the French Budget Minister, M. Edgar Faure, to the Government in April, 1951:

> Although direct taxes represent only 30 per cent of the overall fiscal revenue, compared with 70 per cent in the US and 60 per cent in Great Britain, our rates are higher than in those two countries. If the yield is relatively smaller, this is due to well-known causes, the more important of which are: average French income per head of population is two-thirds of the British and only one-quarter of the American; one-third of the French population lives by agriculture, which pays its contribution, not by direct taxes, but by selling its products at prices which leave but a small income to the average farmer and producer; the socialised portion of personal income (family allowance, sickness and death insurance) is not subject to tax, and the ever-growing extension of social security constantly reduces the base of assessment of direct taxation; nationalised industries, which represent 20 per cent of French industrial capacity, make no profits, which fact further reduces the base of assessment.

On the basis of 1949=100, the wholesale price index of French agricultural products was 133.8 in February, 1952, as against 170.2 for industrial products. I shall be glad to know how to make large taxable profits when buying on the basis of 170.2 and selling on that of 133.8.

I do not know much about the American taxation system on farmers' profits, but has the United States Government not spent billions of dollars to support agricultural prices? What about the subsidies for not sowing potatoes? We in France have not gone to quite such lengths yet.

These are uncontroversial facts, which seem to have escaped your correspondent's notice. Will they lead you to revise your views on the desirability of the drastic remedy you so complacently suggest?—Yours faithfully,

GÉRARD F. SILHOL

Paris

Partnership or White Supremacy?

Sir,—The recent article in *The Economist* has been unjustly criticised by Mr Roy Welensky, leader of the European unofficials in the Northern Rhodesia Legislative Council.

He condemned the statement that on the copperbelt "a black miner's cash wage may not exceed 2s. a day" as "a deliberate attempt to distort the truth," and quoted the "overall average cash payment to African miners underground" to have been 91s. 3d. during November.

His use of the qualification "underground" is significant and in no way invalidates the statement in the article. One need comment no more on this point; but Mr Welensky went on to suggest that the statement was doubly misleading because "in Northern Rhodesia no African, irrespective of income, pays any income tax." This is a half truth which may give the British public the impression that the African pays no direct taxation. The truth is that, while not paying income tax, every adult African male, irrespective of income, pays direct taxation in the form of poll tax, which is now 17s. 6d. per annum on the copperbelt and 12s. 6d. in the rest of the country. Europeans pay income tax only if their income is above £300 per annum. Since the average black miner's earnings are under £60 per annum the non payment of income tax is hardly relevant.—Yours faithfully,

Ndola SIMON B. ZUKAS

Planning in Practice

Sir,—It seems to me that, as a connoisseur of the vagaries of planning in practice, you will be glad to hear of another interesting example.

During the war, a large military hospital was built in the grounds of a women's college at Oxford. The buildings consist of five large wards and two smaller ones, all very soundly built of brick and concrete. The university, which has leased the buildings since the war, has no further use for them, and no one can blame the college for wishing to restore its flowerbeds without delay. Accordingly, the buildings are being demolished.

One might have thought that some use could have been found for them. (The civil defence authorities in Oxford have spoken of the urgency and the difficulty of finding a reserve of hospital accommodation for use in the event of war.) One might also have thought that landscape gardening was the sort of project which had to be postponed, along with other kinds of investment, in order to support the process of disinflation. In any case, the destruction, by the use of powerful machinery, of physical assets makes a curious sight in March, 1952. The whole thing is made more extraordinary by the knowledge that the necessary licence for the work, having been withdrawn by the Labour government early in October, was re-issued by the present government within a few weeks of taking office, and within a few weeks of the Chancellor's first "austerity" speech.—Your faithfully,

Oxford E. P. M. BUCKATZSCH

AMERICAN SURVEY

After New Hampshire

Washington, D.C.

SENATOR KEFAUVER called his success in the Democratic primary election in New Hampshire a "victory for amateur politicians," and said that it indicated that there is "a wide and growing popular demand for new blood and new ideas in both parties." He could have used General Eisenhower's defeat of Senator Taft as further evidence of the truth of his contention because, although most of the Republican leaders in this particular state supported the General, the Eisenhower-for-President movement has been conspicuously amateurish in its operations, and its very existence is a symptom of the popular suspicion of those professional politicians who have grown old in pursuit of office. It is often remarked that there is a whole generation of American voters who cannot remember when there was a Republican President in the White House, but it is sometimes forgotten that at least half of that generation cannot remember a time when Senator Taft was not frantically trying to get there.

On the day on which the result of the New Hampshire primary was published, Mr Newbold Morris, the New York Republican who had the courage to accept the thankless task of investigating corruption in the Federal government, was being bullied by a Senate committee. Unlike most people who appear before committees, Mr Morris turned and attacked his inquisitors. He spoke of the "diseased minds in this chamber," told the Senators that they had "created an atmosphere so vile that the people have lost confidence in their government" and, when reprimanded for being "pretty critical of Congress," retorted that he was "not as critical as 150 million people—you ought to hear them in the corner store." The vote in New Hampshire suggests that Mr Morris may be reporting accurately and that the people there are "tired of both ends of Pennsylvania Avenue"—the White House and the Capitol.

The vote in the Minnesota primary was even more surprising. It is made very easy to vote for candidates whose names are printed on the ballot paper and very difficult to write in the names of others. The Eisenhower enthusiasts had only four days in which to organise a write-in campaign and there is no previous instance of a candidate getting, as the General did, 40 per cent of the vote under such circumstances. That is not to say that, despite what has just happened, the electorate may not find itself, when November comes, with only a choice between Mr Taft or Mr Truman for President. There are few states with any kind of primary—an election in which members of the two parties indicate their preferences amongst their party's candidates—and even fewer that have one which provides, as New Hampshire does, a genuine opportunity for the people to give firm instructions to the delegates to their party's national convention. General Eisenhower and Senator Kefauver could win every primary in which their names are entered, and repeat their Minnesota performances in states where they are not entered, and still lose the nominations in the conventions in July; the Senator, at least, probably will. But their victories in New Hampshire will continue to have a profound effect on the rest of the campaign for the presidential nominations.

Mr Kefauver's was as amateur as any campaign could be. His delegates were unknown and without funds. Yet he beat the state Democratic organisation, which had the support of the trade unions, without difficulty. Nobody knows how this result will affect Mr Truman's decision on whether or not to run again for the presidency, and there are some who think that his irritation with Senator Kefauver may make him stubbornly determined to put the Senator in his place. But it should certainly convince Mr Truman that there is no urgent need for him to sacrifice himself and run again for the good of the Democratic party. The good of the party, it is now clear, would be served best by choosing a candidate who could be nominated on the first ballot at the Convention with the unanimous—or nearly unanimous—support of all the various Democratic factions.

★

There only appears to be one possible candidate on whom the two main wings of the Democratic party could agree—Governor Stevenson of Illinois. Mr Stevenson is not yet a recognisable public figure but Senator Kefauver has already proved what television can do in a few weeks for a man whose name and face were relatively unknown until last year. Today he is recognised on every street corner. The Democratic National Committee would have no difficulty in doing the same for Mr Stevenson, who already has a reputation for having cleaned up a state which every other state is happy to acknowledge as the most corrupt in the Union.

But, at the moment, Mr Stevenson's position is a difficult one. He cannot, of course, give any indication of his availability until Mr Truman has announced his intentions and Mr Stevenson is, as he says, at the moment only a candidate for a second term as Governor of Illinois. He would probably like nothing better than to continue in that role, but he will have no choice in the matter if the President decides, as most people now think he will decide, to retire, for there is little doubt that Mr Stevenson has been chosen as heir apparent. Because he would have the support of the party organisation—and, it is believed, that of Governor Byrnes of South Carolina and most of the rest of the South—he could probably be nominated without doing anything between now and July 21st. But he would be under pressure to use the three precious months before the convention to make his name a household word and his face as familiar as General Eisenhower's. And that would mean withdrawing from the contest in Illinois, where he is unopposed in the gubernatorial primary on April 8th, and losing his present job, before knowing whether he is certain to be nominated for the presidency or who his eventual opponent might be.

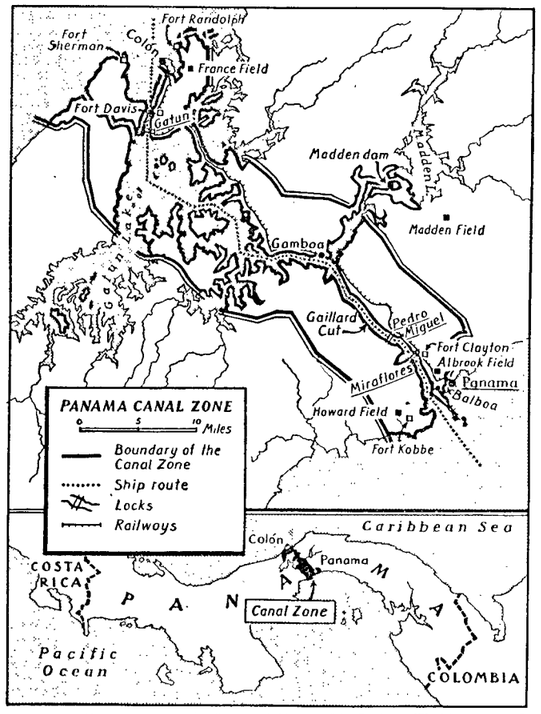
General Eisenhower's easy victory over Senator Taft in the Republican primary in New Hampshire was not as sur-

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

prising as that of Senator Kefauver over Mr Truman. It would not have been a surprise at all if, as the campaign progressed, the Eisenhower supporters had not become more and more gloomy and those of the Senator increasingly confident. Had the General been beaten or won with not much to spare, it is probable that little more would have been heard of him as a candidate, for most of his organisation would have folded their tents and stowed them on the Taft bandwagon. As it was, General Eisenhower proved that he is as formidable a popular figure as his supporters had believed —until they began to get cold feet in the New Hampshire snow—and as the public opinion polls had suggested.

But the Eisenhower-for-President movement has a long way to go yet. Senator Taft is continuing his strenuous campaign all over the country, making four or five speeches a day, and, before he meets the General again in the New Jersey primary on April 15th, he will have collected, in primaries where he has weaker opposition, many more delegates than he lost in New Hampshire. Nevertheless many people will begin to question the myth of the Senator's invincibility and to recall that, before his defeat of the ridiculous Democratic candidate in the Ohio election of 1950, he had always been conspicuously inept at persuading the electorate to vote for him. Mr Taft, indeed, needed an almost uninterrupted string of successes to keep the myth going, just as General Eisenhower's forces needed a resounding victory at their first attempt to get the movement started.

★



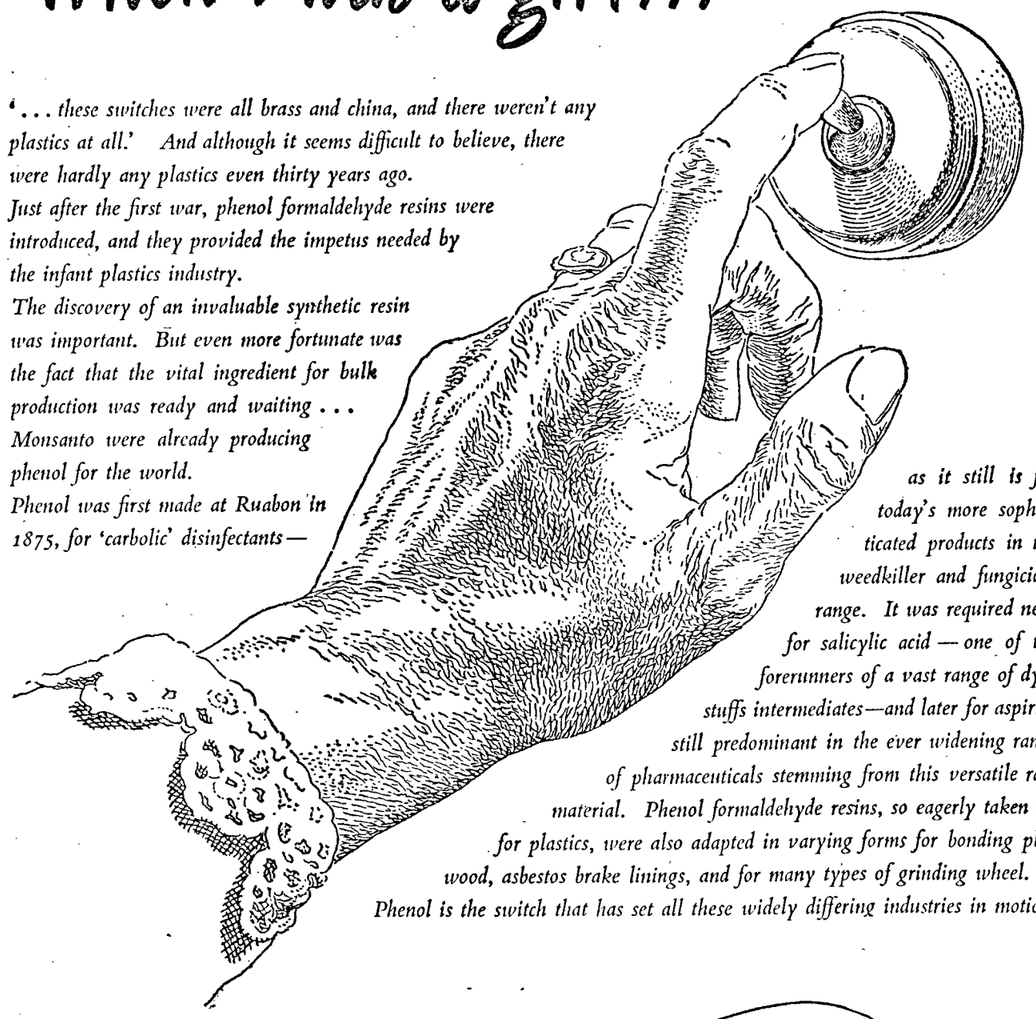
The movement has started now and Minnesota showed how infectious success can be; but it only started just in time. A number of waverers—among them the Governors of two states—have already begun to talk as if they had always been for the General; over the next week or two some of the delegations to the nominating convention, which the Senator thought he had sewn up, will probably begin to come apart at the seams. But the group that is running the Taft campaign consists of hard-bitten professionals, and it would be fatal for the Eisenhower forces to repeat the mistakes they made in New Hampshire and hope that the Senator would again save the day with an answering blunder. However, the professional element, which has been so badly lacking in the Eisenhower campaign, is now being brought in and the effects of its competence will no doubt soon be apparent. And Mr Paul Hoffman, who is now taking a leading part in the movement, has been in Paris this week trying to find out whether the General can be induced to return to the United States as a candidate before the Republican convention invites him to do so.

But even if the General does consent to campaign on his own behalf, he cannot count on the nomination. For what New Hampshire meant was that there would be a hard fight at the Republican convention—not that General Eisenhower would necessarily win it. Minnesota suggests that the General is capable of a runaway victory; Mr Stassen may have been his chief victim on Tuesday, but the small number of write-in votes for Mr Taft is a further indication that his attraction is for other politicians, not for the public. Before the New Hampshire result was known, there was a growing belief that Mr Taft would be able to do what he claimed he could do and arrive in Chicago with enough delegates committed to him to make his nomination a certainty. That now seems impossible and it is the task of the General's new and newly inspired team to turn the Senator's discomfiture into a rout.

Transcontinental Canal

FROM AN AMERICAN CORRESPONDENT

THE Panama Canal, that useful cut in the thread of land connecting North and South America, has never been the scene of bloodshed such as that over the Suez Canal which has embittered Britain's relations with Egypt. There is, however, always an undercurrent of anti-American feeling, particularly when the slackening of the never-ending work on the Canal causes unemployment. Communists are thought to have been particularly active in fomenting the student strikes and anti-United States disorders which are accompanying this year's Presidential campaigns in the Republic of Panama. The likelihood is, however, that on May 11th the victor will be Colonel Remón, the chief of the National Police, who has made and unmade several Presidents, and



By courtesy of the National Geographic Society, Washington, D.C.

who is regarded as pro-American. Colonel Remón is expected to profit from the release from jail of ex-President Arias, still a very popular figure, though last year he was removed from office for seeking dictatorial powers.

Except at election times, Panama has never seemed to resent the Canal, or the fact that the United States built it thirty-eight years ago. The Panamanians, in fact, have been so busy supplying goods and services to the Canal and its clients that they have neglected their own mineral resources and their own agriculture; Panama imports 60 per cent of its food. Panama, indeed, owes its existence to the Canal in another sense. When, in 1903, Colombia refused to ratify the treaty granting the United States the site for the canal, the separatist movement which had been brewing on the Isthmus of Panama boiled up into revolt. Theodore Roosevelt, who had not been without foreknowledge of what was happening, recognised the new republic in three days.

'When I was a girl'...

'... these switches were all brass and china, and there weren't any plastics at all.' And although it seems difficult to believe, there were hardly any plastics even thirty years ago.
Just after the first war, phenol formaldehyde resins were introduced, and they provided the impetus needed by the infant plastics industry.
The discovery of an invaluable synthetic resin was important. But even more fortunate was the fact that the vital ingredient for bulk production was ready and waiting ... Monsanto were already producing phenol for the world.
Phenol was first made at Ruabon in 1875, for 'carbolic' disinfectants— as it still is for today's more sophisticated products in the weedkiller and fungicida range. It was required next for salicylic acid — one of the forerunners of a vast range of dyestuffs intermediates—and later for aspirin, still predominant in the ever widening range of pharmaceuticals stemming from this versatile raw material. Phenol formaldehyde resins, so eagerly taken up for plastics, were also adapted in varying forms for bonding plywood, asbestos brake linings, and for many types of grinding wheel.
Phenol is the switch that has set all these widely differing industries in motion.

"There's a whole morning's mail answered!"

Perfectly recorded by the Dictaphone Time-Master on a single Dictabelt

On to one little Dictabelt, you can often dictate the replies to a whole morning's mail! There they are, perfectly, clearly recorded and ready for your secretary to transcribe at the most convenient moment.

For the amazing little Dictabelts—small pliable plastic belts—give *more* recording as well as *better* recording. In fact it was the invention of the Dictabelt that led to the development of the Time-Master—a smaller, simpler, more efficient dictating machine than was ever thought possible!

SIMPLER, CLEARER DICTATION

Dictation with a Time-Master is remarkably simple. Controls are reduced to a minimum and are wherever possible, fully automatic. The tap of a finger is all you need to put a new Dictabelt in or get a completed Dictabelt out; flick a switch and you're all set for 15 minutes of crystal-clear recording.

And Time-Master recording is *clear*—the sensitive microphone picks up every word, even a whisper—making transcription easier for your secretary.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Dictabelts, low-cost plastic medium. 6. Service facilities in principal cities, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co., Ltd., Dept. O, 107 Kingsway, London, W.C.2.

For an original payment of $10 million and a yearly one of $250,000 (raised in 1936 to $430,000) Panama granted the United States the use, in perpetuity, of a strip of land ten miles wide, over which the United States was to possess and exercise all sovereign powers. The Canal, which was opened to sea-borne traffic in 1914, was a tremendous engineering feat.

Construction followed the earlier plan of the Frenchman, De Lepinay, whose countrymen, unfortunately for themselves, turned it down in favour of a disastrous effort to build a sea-level canal. That effort defeated De Lesseps, who had succeeded at Suez. Ships passing from the Atlantic to the Pacific—an eight-hour journey—ascend the Valley of the Chagre River, and then are raised, in three stages, to Gatun Lake, eighty-five feet above sea-level. This is the height of most of the Canal's fifty-one mile length. After passing through a cut in the Continental Divide, the descent is made through the Pedro Miguel locks to Miraflores Lake and through the Miraflores locks to sea level. The only major improvement to the canal since 1914 has been the construction of Madden Dam, which conserves the vast quantities of water needed to operate the locks. It takes 50 million gallons of water to pass a ship through, and in 1950 nearly 5,400 commercial ships were shifted from one ocean to another. This was not as many as in the peak year 1929, but the net tonnage was greater.

Iron ore and nitrates from Chile, wheat and timber flowed from the Pacific to the Atlantic; mineral oils, iron and steel manufactures and phosphates moved the other way. In 1950 American intercoastal traffic accounted for nearly a quarter of the total tonnage, but this was due to abnormally heavy fuel oil shipments from California. Usually, the busiest trade lies between the west coast of South America and the east coast of the United States.

★

The Canal is operated by the Panama Canal Company, whose one share is held by the Secretary of the Army; and the President of the Company is also Governor of the Canal Zone, with its population of some 50,000 American and Panamanian workers and their families. The present arrangement is the result of a reorganisation carried out by President Truman in 1950, a progressive step which for the first time permitted the Canal company to retain its toll revenues, instead of making them over to the US Treasury and having to secure Congressional approval of its operations every year. The Canal company is also authorised to set its own toll rates, subject to Presidential approval, but so far nothing has been done, despite Congressional prodding, to raise the rate of 80 cents a net ton, in effect since 1937.

Nothing has been done, either, and nothing is likely to be done in election year, to satisfy those who feel that the vulnerability of the locks and dams to air attack demands the conversion of the vital artery into a sea-level canal. The defences of the Canal have fallen away since the war, when the Zone bristled with troops and aircraft. In 1947 Panama, in an outburst of nationalism based on economic misery, refused to allow the United States to retain the air bases on Panamanian territory that had been granted during the war. Since then, the sharpening of world tensions has meant the transferring of men and equipment to more vulnerable spots. A number of airfields in the Zone have been closed down completely. Defence of the Canal today depends on strict regulation of all commercial aircraft (which are not allowed to fly over or near the Canal), scrutiny of all ships before they reach either end of it, and a careful watch on all strangers in the Zone. Last year the Governor's security powers were increased by the President.

Congress had shown some interest in the arguments for a sea-level canal as early as 1939, when it approved a plan to add a third set of locks. (There are now two, allowing traffic to move in both directions at once.) The plan accepted contained features which would have made it possible to convert the Canal to a sea-level route. But work on the new locks had to be abandoned in 1942, when labour and materials were required for more urgent purposes. Again in 1945, after Hiroshima, Congress called for a new report on the best way of defending the Canal and expanding its capacity. The Mehaffey Report submitted to the President two years later recommended an entirely new sea level canal, estimated then to cost $2.5 billion. But neither the President nor Congress, absorbed as they were in domestic matters and an approaching election, received it with enthusiasm. Those on the spot in the Canal Zone seem to think that the danger from the air is over-estimated; today there is no unfriendly nation near enough to deliver a large full-scale attack on Panama. They are more alarmed by signs of internal unrest, which has brought the Communists political power in Guatemala, and feel money would be better invested—as it is being, to the tune of nearly $1 million a year in Panama under Point Four—in alleviating the miseries which open the door to Communist propaganda.

American Notes

Economy Begins Abroad

The President's annual request for funds for foreign aid, for the 1953 fiscal year beginning next July, is once more being put through the Congressional hoops by the Administration's most experienced ring-masters: one round through committees and floor debates in each House for authorisation, and then another for appropriations. This year the request is again appearing under the ingratiating name of mutual security, but even so its chances of getting through the programme unscathed are worse than usual. For even the official sponsors of the request in Congress, Senator Connally of the Foreign Relations Committee and Mr Richards of the House Foreign Affairs Committee, both take it for granted that the amount ought to be cut by $1 billion or more.

MUTUAL SECURITY FUNDS REQUESTED FOR FISCAL YEAR 1953

Columns do not add to totals because the figures are rounded.

It will do little good for Mr Acheson to argue that this year's request—for $7.9 billion compared with $8.5 billion asked and $7.3 billion received last year—is "the lowest limit of safety" for both the United States and its allies. What Senator Connally and Mr Richards, and many other members of Congress, are thinking of is the safety of their seats in next November's elections. They are convinced that this can only be secured by economy that begins not at home, where American voters would feel it, but abroad, where only America's allies would suffer. It will take more to shake this conviction than last week's primary elections, even though the voters there showed that they can see beyond the budget deficit.

Congress is not likely to be very careful about where its pounds of flesh for the voters comes from, although it will ask a great many questions before actually cutting it. At the moment the knives are being sharpened for economic aid for Europe; its new name of "defence support" will not persuade Congress that this is anything other than the remains of the Marshall Plan that was supposed to end this year and, at $1.8 billion, it is just about the amount of flesh that is wanted. Of this sum, $400 million is intended for Greece, Turkey, Jugoslavia and Austria, and the rest for the original Atlantic Pact countries. Britain's share, put at $600 million,

"Nothing Personal, Pal. I Just Want To Impress A Girl"

Herblock in the *Washington Post*

may have been saved by the good impression made by Mr Butler's Budget, but France's new government will have to balance its accounts quickly if that country is to get its $400 million.

Last year General Eisenhower came to the rescue of economic aid for Europe and the Administration will be very tempted to appeal to him again. He had not intended to give evidence to Congress this year, but already Democrats are suggesting that he should be summoned. They, however, are thinking as much of the presidential election as of their allies. It would be most embarrassing for the Republicans if their potential candidate came back to the United States, not as a politician to fight for the nomination, but as a non-political figure to fight for the Mutual Security Programme which is one of the Democrats' chief assets.

Steel Deadline

Last week's short stoppage on the New York Central Railroad was an attempt, which has had some success, to focus attention on the three-year-old dispute between the railway unions and the companies. It is nearly two years since the railways were taken over by the government, in order to prevent strikes, and the members of the union are justified in feeling rebellious at the long delay in reaching a settlement. So far the steel workers have only had to postpone their strike for less than three months, since January 1st, but their leaders have no intention of giving the false impression that they are likely to be as patient as the railwaymen's leaders have been. Midnight on Sunday is the deadline when the 650,000 members of the steel union are supposed to stop work and Mr Murray, president of the union, has refused to promise that they will change their minds, even though this means that a certain amount of steel output will be lost this week as furnaces are damped down.

The union committee is, however, meeting in Washington to decide its final action while *The Economist* is in the press. The decision will turn on the recommendations for the settlement of the dispute made by the Wage Stabilisation Board, which has been considering them since January, and on the reactions of the steel industry to these recommendations. The board is expected to propose a wage increase of from 15 to 18 cents an hour, consisting partly of holiday and other "fringe" benefits. This should be acceptable to the union, even though it is not all it has asked for, but the industry has already stated that it cannot agree to such an increase unless it is allowed to raise steel prices by $6 a ton; it calculates that every extra cent an hour in wages adds 44 cents to the cost of a ton of steel.

The stabilisation authorities refuse to accept this argument, although they are about to give permission for a smaller increase in steel prices, probably an average of from $2 to $3 a ton, under the Capehart formula, which lifts price ceilings by an amount equal to increases in costs during the first seven months of last year. But this will not satisfy the steel companies, and they are now less afraid of a work stoppage than they were in January, since steel is in better supply; a few furnaces are already being shut down for that reason. There will almost certainly be some attempt at collective bargaining on the basis of the board's recommendations but after that, as far as can be judged at the moment, a steel strike is very possible. It could, of course, be prevented if the mobilisation authorities overrode the stabilisation officials and gave the companies the price increases they want in order to pay the higher wages, or if President Truman obtained a court injunction against the strike. But the one, with its inflationary consequences, would be unpopular with consumers and the other with trade unionists. The Administration will hesitate to offend either of these large groups of voters in an election year.

Bargains in Spain

As soon as he reaches Madrid next week Mr McVeagh, the new American Ambassador, is to begin negotiations for a bilateral agreement which will permit the United States to use Spanish air and naval bases. The ground was explored by two American missions last year, a military one under Major-General Spry, and an economic one under Professor Sufrin; in his pocket Mr McVeagh will have the $100 million for Spain pressed on the Administration last October by Congress. Mr McVeagh's job is to work out the conditions of the bargain with a government which has stood outside the international give-and-take of the last four years.

Spain's need for help has already prompted the offer of certain concessions: American troops would be allowed to be stationed in Spain to defend the bases, and General Franco might be willing to allow the Spanish army to take part in the defence of Europe. Mr McVeagh's hand is also strengthened by the evident waning of the enthusiasm of the Air Force, at least, for Spanish bases. It was the services which forced the President to swallow his publicly expressed distaste for the Spanish regime. But the Air Force, with its vast construction programme in French North Africa, is now interested in Spanish bases only as a last resource, to be used if and when necessary.

General Franco has already been given notice that as far as military aid is concerned—and the Spanish army needs help of every kind: food, transport, weapons and armour—Spain will have to take its place at the end of the queue, behind Korea, Indo-China and the North Atlantic Treaty countries. In the American view, the rehabilitation of the railway system, the building of roads and the dredging of harbours should come first. Mr Sufrin reported in December that Spain could absorb up to $450 million in the next three years if its military importance justified such an expenditure. Encouragement would also be given to the production of wolfram, pyrites, lead and mercury, all strategic materials.

The spending of economic aid would be strictly controlled—something which it may be hard for Spanish pride to stomach. But apparently no more pressure is to be put on General Franco to liberalise his regime than has been put on Marshal Tito. There is, however, the matter of the Benton amendment to the Mutual Security Act, which requires countries receiving aid to take a stand against cartels and in favour of free enterprise and free trade unionism. This presents no problem to General Franco. But the American negotiators may find it harder to accept the view that the Spanish management-labour syndicates, and the ban on strikes, constitute free trade unionism in Senator Benton's meaning of the phrase.

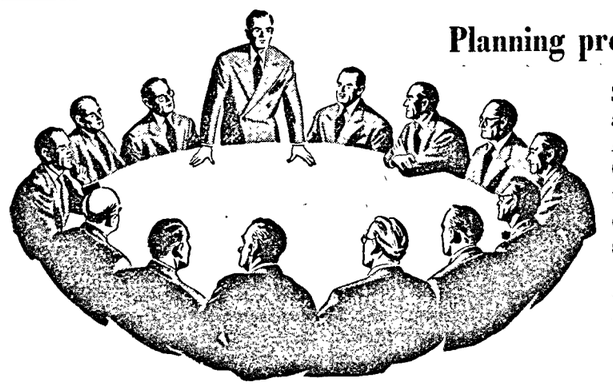
Communists and Constitutional Liberties

The proceedings against groups of local Communist party leaders which are now going on in Los Angeles and Baltimore appear to be more orderly and dispassionate than was the original trial in New York of the party's national leaders. They were found guilty of conspiring to overthrow the government of the United States by force, under the Smith Act of 1940, the legislation which the Administration considers adequate to keep the party under control. The Supreme Court confirmed that conviction last year and it has now also given its approval, although not very enthusiastically, to part of the McCarran Act of 1950, Congress's complicated and controversial answer to the Communist problem.

The Court has ruled that there is no constitutional barrier to the deportation of aliens who have been members of the party, even though they may have come to the United States as children thirty or more years ago, and may no longer be Communists. The majority of the Court admitted that Congress was justified in deporting anyone who had not taken out citizenship papers, but Mr Justice Jackson added that "judicially we must tolerate what personally we may regard as a legislative mistake."

The Court further decided that the Attorney-General could constitutionally refuse bail to alien Communists awaiting deportation, although Mr Justice Frankfurter opposed this decision on the grounds that the government should not make a habit of denying bail automatically to active Communists as it seems to have been doing lately.

It was on similar, practical, grounds that Mr Frankfurter also last week dissented from the majority of six Justices who upheld the constitutionality of New York State's Feinberg Law, passed in 1949. It requires the state educational authority, the Board of Regents, to bar from employment in the public schools anyone who belongs to a subversive organisation. The Court held that it was the duty of the state to protect its children and to preserve the integrity of its schools, and that there was nothing improper in judging a teacher's fitness for employment from the company he kept. However, the two most liberal Justices, Mr Douglas and Mr Black, who frequently dissent from anti-Communist decisions on the grounds that they infringe the constitutional liberties of the individual, objected that this ruling established the doctrine of guilt by association.



Mr Frankfurter, on the other hand, dissented because the decision was made on a test case, brought to prevent the Board of Regents from implementing the Feinberg Law. He felt that the extent to which the law limited academic liberty and the right of free association could not be judged until it was put into operation. The critics of the law believe that, once this happens, the judgment will inevitably be adverse. They object, as a rule, not to the principle of the law but to its methods, thinking that it can hardly fail to work unfairly and to weaken the independence and originality of the teaching in New York's schools. Nearly all anti-Communist laws can reasonably be criticised on these lines for, even when they do not violate the letter of the Constitution, there is usually a danger that they will be applied in a way that violates its spirit.

Shorter Notes

In spite of determined efforts by Senators of both parties interested in retaining political patronage and keeping the corruption issue burning during an election year, the President's reorganisation of the Internal Revenue Bureau was approved by a vote of 53-37. The new system, which went into effect on March 15th, happily coinciding with the deadline for filing tax returns, eliminates from the government "the last big island of political influence."

CHATHAM HOUSE

THE ROYAL INSTITUTE OF INTERNATIONAL AFFAIRS, with its Headquarters at Chatham House, St. James's Square, came into existence immediately after the First World War. Its object was to stimulate, through discussion, publications, and general research, the study of International Affairs, without fear or favour, propaganda or government 'inspiration.' So well has it pursued its declared intention, that its name upon a title-page is a guarantee of the highest motives and the most efficient scholarship. Since 1920 the OXFORD UNIVERSITY PRESS has been privileged to publish on its behalf a number of books which have not only recorded, but made, history.

Among these may be numbered the remarkable series of **SURVEYS OF INTERNATIONAL AFFAIRS,** to which Arnold Toynbee devotes much of his time, and the companion volumes of **DOCUMENTS;** to these may be added the six volumes of Arnold Toynbee's **STUDY OF HISTORY** (and their one volume abbreviation by D. C. Somervell). Dr. Toynbee has now completed the remainder of his great 'Study' and it is hoped that we may have the last three volumes ready for publication in 1954.

These are a few landmarks of the past. But the work goes on. The present and the future show promise of being no less productive.

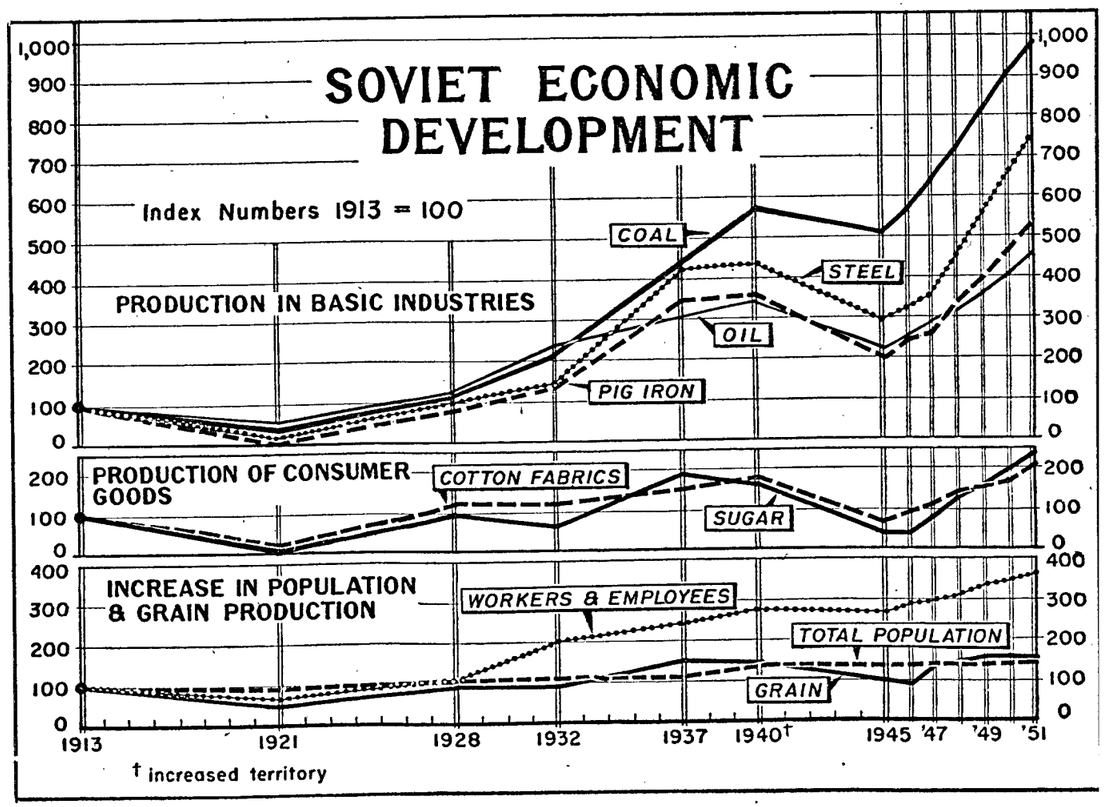
THE WORLD OVERSEAS

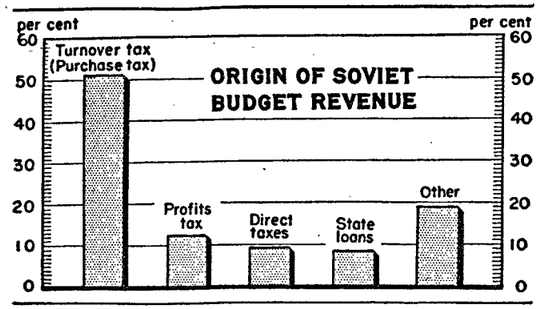


Burdens of the Soviet Budget

THE budget plays such an important part in the Soviet economy that if the Russians were to reveal their detailed accounts they could certainly produce an illuminating *tableau économique* of the Soviet Union. This is probably the chief reason why the veil of secrecy surrounding the budget figures is raised so reluctantly. The recent budgetary session of the Supreme Council was no exception in this respect and the Minister of Finance, Mr Zverev, was rather more reticent than usual. He reviewed briefly the accounts for 1950 and, somewhat incompletely, for 1951 (he omitted, among other things, the actual expenditure on defence) before announcing the estimates for 1952. The debate over the new budget provided few additional clues; the Supreme Council limited its task almost entirely to raising the estimated revenue and surplus by another 1,100 million roubles.

Yet even the limited information given to the Supreme Council throws some light on the trends of the Soviet economy. In *The Economist* last week, the rise in Soviet defence spending was analysed. It was shown that direct defence expenditure rose by over 16 per cent in 1951 and is scheduled to increase by nearly 19 per cent in the current year. What is the impact of this growing cold war burden on the economy as a whole, and how is this burden apportioned between the various sectors?

To a certain extent the task of the Russian planners is made easier by the wide scope there still seems to be for rapid expansion. It is claimed that in 1951 national income rose by 12 per cent and the Russians probably expect to maintain this rhythm of growth. Though defence expenditure is now rising at a much quicker pace than the national income, it would appear from Soviet statistics that the other branches of the economy have not, as yet, begun to decline in absolute terms; but they have increased at a declining rate, getting a relatively smaller slice of the bigger national cake.



In 1951 the social and cultural services seem to have been the chief "relative victims" of the defence effort, the main sufferers in terms of alternatives forgone. The amount spent on this item rose by less than 2 per cent over the year, scarcely more than the usual growth of population. Consumption, on the other hand, is not expected to be seriously affected by the arms drive until the current year. The price reductions announced in March, 1951, were to result during that year in a "saving" by consumers of 27,000 million roubles in their purchases in state retail shops. Yet the yield of the turnover tax, which falls almost exclusively on consumer goods, rose by some 11,000 million roubles. This year the estimated increase in the yield of the turnover tax is slightly greater, but for the first time since 1949 no lowering of

prices of consumer goods has been announced. Taking the Soviet figures at their face value it would appear that in 1951 consumption roughly kept pace with the growth of the national income, but this year it is expected to increase by less than 5 per cent.

On the face of it, investment too has suffered a similar relative decline, for wholesale prices of products of heavy industries and engineering have fallen. Such reductions were announced successively in 1950 and January, 1951 and 1952. These are probably not mere propagandist claims, but may well be the belated effects of more efficient production, due to the continued mechanisation and schooling of technicians. The effect of these reductions is that prices of heavy industrial goods have fallen more than prices of consumer goods and this manœuvre may well hide part of the actual increase both in investment and rearmament.

Referring to the revenue side of their budget, Soviet propagandists made much of the fact that the Russians' taxes account for less than ten per cent of total revenue. This is rather a naïve boast. They simply forgot to add the word "direct," since it is well known that direct taxation plays an unimportant role in the Soviet fiscal system. Since wage differentiation forms part of a definite policy for creating incentives there is no intention of jeopardising it by a progressive income tax.

For the average Russian the main tax has been, and still is, the indirect turnover tax, the sales or purchase tax mentioned above. According to most modest estimates this tax adds at least one-third to the total nominal value of consumption. It also accounts regularly for over half of the total budget revenue. It enables the Soviet planners to balance the supply of goods with the demand for them and to impose the "saving" necessary to finance the high level of investment and defence expenditures. In this year's accounts the share of the turnover tax is slightly less than usual, probably because of the relative drop in consumption.

Voluntary saving cannot flourish in the Soviet Union if only for the reason that none of the advantages of the *rentier* class can be enjoyed there. A semi-compulsory form of saving, the purchase of State bonds, is expected to bring in over 8 per cent of the revenue, a somewhat larger share than in the previous years. The yield from taxes on profits is also expected to provide a larger share of the total. The growing volume of production and cost cutting have probably enabled industrial enterprises to make larger profits. The state will take a part of it, but it has apparently been decided to leave a substantial part for the enterprises to plough back into investment, since direct investment by industrial undertakings is to account for a larger proportion of total investment than in the previous years.

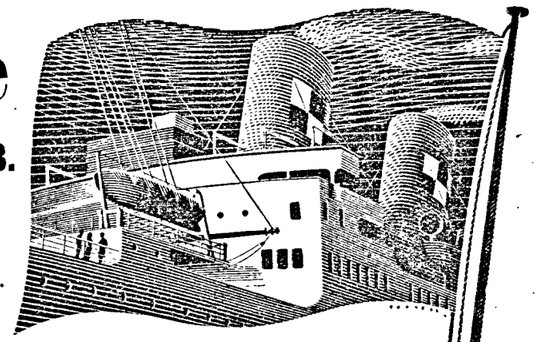
Generally, however, there are no important structural changes on the revenue side of the budget. Here growing rearmament required only a greater volume of revenue to finance it. On the other hand, the planners had to decide what items of expenditure to eliminate to make room for the arms drive. The cold war has imposed a similar problem both for the West and for the East.

The Russians may find it more difficult to curtail consumption not only because their level of consumption is lower, but also because the ratio of consumption to total output is lower in the Soviet Union than in the West. Many reliable estimates have put Soviet investment, including investment in defence industries, at over 20 per cent of total output. If one adds about 15 per cent for direct defence expenditures and 6 per cent—the usual figure—for stockpiling there remains less than 60 per cent for consumption. On the other hand, out of their expanding production the Russians have apparently managed hitherto to pass on, at least a part, to the consumers and these increases, even at a declining rate, must have been more than welcome after the appallingly low wartime level of consumption. Furthermore the ploughing back each year of a large slice of the national income is not a new thing for the Russians. A glance at the accompanying chart of Soviet industrial development will show that the emphasis had always been put on heavy industry, investment taking precedence over consumption. In the long run the Soviet planners cannot tolerate any encroachment on investment's share of productive resources. Thus if defence expenditure goes on expanding more than proportionately the point will soon be reached when consumption will have to drop not only relatively but even in absolute terms. The average Russian has only just recently regained his prewar standard of life. Will he find out that some curse prevents him from ever substantially exceeding it? Will he soon look back with regret at the modest prosperity of 1951?

European Socialists and Rearmament

[BY A CORRESPONDENT]

EXPERTS from the Socialist parties of Europe—and Japan—met near London last week to discuss the economic and social effects of rearmament. The noises-off from Westminster which accompanied their discussions need not have embarrassed the British representatives unduly. During the last twelve months, many of the European Socialist parties have found their loyalty strained by rearmament—while the Japanese Party split into two over this issue.



Thus in Norway, Mr Bevan's resignation was preceded by a crisis which threatened to develop along very similar lines. In January, 1951, the Finance Minister, Hr. Meisdalshagen, was actually delivering his Budget speech when Hr. Hauge, the Minister of Defence, told a press conference that defence expenditure was to be greatly increased above the budget estimate. Pressure from the Prime Minister and Foreign Minister compelled Hr. Meisdalshagen to accept the addition, but several months later he indicated his desire to resign. Hr. Meisdalshagen was an old Socialist of some standing in the party, while Hr. Hauge was young and politically inexperienced. At a private meeting of the Labour MPs, Hr. Meisdalshagen had actually won a majority for his case when the Prime Minister threw his immense prestige into the balance. The party accepted the new arms programme and Hr. Meisdalshagen withdrew his resignation. Most of the dispute was concealed at the time, and all the protagonists, except Hr. Hauge have since left the Government. Since the middle of 1951 there has been no organised opposition to rearmament in Norway.

Uneasiness about Nato policy is, however, reflected in the proposal to set up a Scandinavian Parliamentary Assembly, which might revive the spectre of a Scandinavian Defence Act, unsuccessfully conjured up a few months ago by Hr. Kekkonen, the Finnish Prime Minister. And the Norwegian Socialists, always the most idealistic in Europe, are looking for some positive policy to offset the negative policy of rearmament. It is likely they will shortly launch

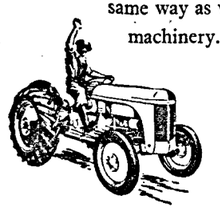
A Symbol of Progress

Development work by Mond Nickel looks years ahead — to the time when new engineering projects, at present only in vague outline, will need improved materials to carry them out. The metallurgist aims always to anticipate these needs so that the designer, making his first drawings, may have confidence that the better properties he seeks will be available when design gives place to construction.

MOND NICKEL



THE MOND NICKEL COMPANY LIMITED, Sunderland House, Curzon Street, London, W.1.

At a time when every nerve is being strained to increase the export drive, we are neglecting our richest source of production — the land. There are 17 million acres of rough grazing in Britain whose fertility can be vastly increased — for the first time — by modern mechanical methods. Every million acres of land thus reclaimed is capable of fattening 250,000 store cattle. Yet only £5 million in 3 years has been allotted for the reclamation of marginal land.

At a time when our strategic and economic security depends on self sufficiency, this situation makes neither strategic nor economic sense. We are spending more than half the proceeds of our export drive on buying expensive foreign food. We are trying to keep food prices down by subsidies instead of by growing more and cheaper food.

One way out of this highly uneconomical situation is to equip farmers in the same way as we have equipped industry — with efficient, labour saving machinery. *Harry Ferguson Ltd., Coventry.*

Grow more food in Britain

Ferguson tractors are manufactured for Harry Ferguson Ltd., Coventry, by The Standard Motor Company Ltd.

an international campaign to support the UN technical assistance programme. Neutral Sweden, ironically enough, has also had its crisis over rearmament. Hr. Gustav Møller, for thirty years among the most prominent architects of the Swedish welfare state, threatened last spring to resign as Minister of Social Affairs if rearmament interfered with his plans for the social services. He carried out his threat a few months ago, but failed to win any support for his position. In Denmark the Social Democrats had an easier passage since they left office before Nato decreed the great increase in arms. Indeed the Social Democrats' unwillingness to accept direct responsibility for the consequences of rearmament may give the present Danish Government a longer life than it could otherwise expect. Nevertheless they have given the Government public and unequivocal support in both foreign policy and defence.

In Holland, too, rearmament has caused no breach inside the Labour Party—perhaps because it has no left wing. When the Labour Party was formed in 1946 on the model of the British, the left wing of the prewar doctrinaire Social Democratic Party in the main refused to join it, voting Communist in the first postwar elections and abstaining later. So far these dissidents have failed to form their own organisation, though some of them recently set up a "third way committee" whose programme is nearer that of Mr Zilliacus than that of Mr Bevan.

Bevanism in Germany

It might be expected that Bevanism would rouse the loudest echoes in the German Social Democrat Party, which opposes the Adenauer Government not only on the military but also on the financial contributions to defence. But for the most part the Social Democrat Party's position is based far more on national interests than on Bevanism. The only common ground between them is the plea that a defence contribution may wreck the social and economic stability which is needed to prevent Communist penetration. In recent weeks, however, Bevanite arguments have helped to mobilise trade union, as distinct from Socialist, opposition against the rearmament policy of the Adenauer Government. A German translation of "One Way Only" has been widely distributed in the German Trade Union Federation (DGB). When the Bavarian trade unions on February 10th led the way to the DGB's recent withdrawal of support for a German contribution, they were fortified by a well-argued pamphlet which denied that Germany or Western Europe stood in danger of attack, and presented Communist penetration as a greater danger than Soviet aggression.

Bevanism has, of course, considerable appeal in the French Socialist Party—indeed the British resignations received more acclaim in France than anywhere else in Europe. A vociferous left wing group led by the ex-Trotskyist, M. Marceau Pivert, maintains some contact with British Bevanites, particularly those of ILP origin. But the French Socialist Party as a whole has not needed to adopt Bevanism, since, like most French parties, it finds no difficulty in voting for increased armaments while refusing to vote the funds necessary to provide them. Many observers last year saw M. Jules Moch's defeat in the elections to the party executive, like Mr Shinwell's in Britain, as the penalty of serving as Defence Minister; but this was only a contributory factor.

Only one Socialist Party has wholeheartedly accepted the Bevanite position—that of Belgium, which draws heavily on "One Way Only" for arguments to justify its opposition to the Government's defence programme. No doubt its hatred of the Christian Socialist Party now in office helps to explain its position. Moreover most Belgians are fatalistic about a Russian occupation, which they imagine as no more unpleasant than the German occupation they survived so well. But much in Mr Bevan's mode of argument corresponds to the ideological traditions of Belgian socialdemocracy. In Italy, too, the left-wing Socialist splinter groups drew new confidence from "One Way Only."

The fact is that, though the rearmament programmes have had their opponents in most European Socialist Parties, only those of Latin extraction use the same sort of arguments as Mr Bevan. For the speed and level of rearmament raise no question of Socialist principle. Mr Bevan has tried to make his opposition to the arms programme a matter of principle by exploiting prejudices about Russia, America, and the causes of war which are stronger in Socialist parties than in others. But the rhetoric in which he clothes his prejudices has little appeal in Northern Europe.

French Taxes and Benefits

THE frequency of French budget crises and the general atmosphere of fiscal irresponsibility which has surrounded the Fourth Republic have tended to distort two basic facts of French social life. The first is that one way or another —and admittedly the ways are sometimes strange—the French nation as a whole surrenders almost as much of its income through taxation as the British. According to French official claims the figures are 38 per cent of the national income in the French case and 40 per cent in the British. The second fact is that since 1946 France has been building up a system of social security and free health services which is at least as comprehensive as any in Western Europe. The delusion that the French state handles an insignificant portion of the country's resources has led to this second delusion that in France there are virtually no welfare services as they are understood in Britain. It is impossible to make a fair comparison between the social benefits in two different countries. But, for illustration only, there are given overleaf the tax obligations and security benefits of three different types of employees in Britain and France, earning what are roughly comparable salaries for each type of work in each country.

The table does not show that either nationality is better off than the other, for the background conditions are unequal. In France, food costs more, rents less, clothes are not so essential and fuel consumption is lower than in Britain; the average income per head, and hence the general standard of living is lower; and so, in every case, is the basic wage. All that is proved is that both British and French families tend to receive the same sort of benefits in the same sort of quantities from their respective states; that on the whole the French employee earns less from his employer and receives more from the state; and on the whole the English employee pays a higher income tax, and a slightly lower

AUSTRALIA'S DILEMMA

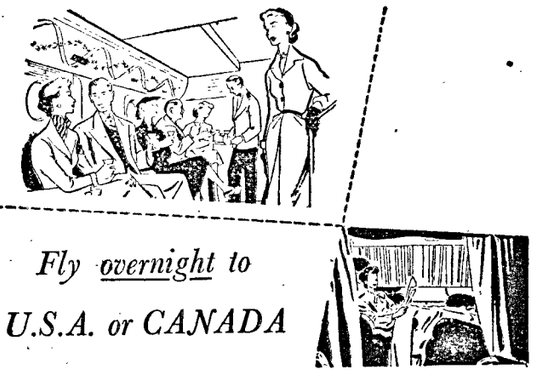
…te (1 = 1,000 francs (approximately) the two sets of figures can be compared directly.
…British figures are on the new rates proposed in the last budget.
…Read where only one person is earning in a family which includes dependents.
…varying according to whether the woman is working or not. In France, it makes no …ference.

…f the two schemes cover approximately the same ground, …y are essentially different in method and approach. …nce is proved to be a welfare state to much the same …gree as Britain, but the money for its welfare is raised …d distributed on utterly different principles. To take …ation first: of the total sum which passes through the …nch budget, only 29 per cent is raised by a direct tax …personal or company incomes; 10 per cent comes from …te properties, and 61 per cent from indirect taxes on con…mption and imports. Of the direct taxes, practically all …paid by employers on behalf of themselves and their …ployees. In addition, the employer has to pay the state …mething like 29 per cent on his basic wages bill in respect …social security contributions which are not included in …budget.

…Benefits as well as taxation in France have their own …syncrasies. Contrary to general belief, the French system …based on a comparatively small basic wage packet, and …mparatively large allowances from the state. With three …ildren, the regular allowances are 60 per cent of the basic …ge. Sick or healthy, employed or idle, the French …*ille nombreuse* has a fairly solid guarantee against …rvation before it starts claiming sickness or unemployment …nefits. It is, in fact, startlingly profitable to have children …France, with results that speak for themselves in statistics. …the years immediately before the last war, deaths, on a …rly average, were 20,000 more than births. Since 1946, …ths have exceeded deaths by more than 312,000 on a …rly average. The accompanying table clearly shows how …e office executive earning 850,000 francs a year loses …und by having only one child to the industrial worker's …ot. In comparison, the English are given half-hearted …couragement, though, as his food is cheaper, the additional …t of each child is probably less than in France.

Finally, there is a refreshingly un-egalitarian streak about the French welfare system which is entirely absent from the British. Within certain limits, the more a Frenchman earns the more he receives from the state. Up to 408,000 francs a year (34,000 francs a month), certain benefits are calculated on a percentage of the man's income, including old age pensions, sick leave and maternity allowances and death grants. Beyond that figure, the benefit does not increase with the income. But below it (and it is not as low in France as it would be in Britain) the French state actually connives at making the rich richer and the poor poorer. A degree of incentive remains cheek by jowl with a system of security and social welfare.



Nobody could argue that the French system in general is better than the British. In practice, it certainly does not work so well. But it does appear from this analysis that France as a whole is not grossly under-taxed. The incidence of taxation is such that French entrepreneurs are, at least in theory, quite heavily taxed when their payments on behalf of their labour force are taken into account; the French employee is, since the war, well cared for by the state; and the French government has devised a system of welfare which is not without advantages over the British counterpart. Like many things in France, it is more difficult to administer and less stifling in its effect. There is plenty of scope and every need to improve the extent to which taxes are paid; but the basis on which they are assessed, and the total burden, is not so uniformly inadequate as is sometimes believed. France is by no means backward in its social services and it is not entirely backsliding in paying for them.

Chops in the Sky

[FROM OUR WELLINGTON CORRESPONDENT]

THERE is a danger that the publicity given to recent agreements between New Zealand and the United Kingdom may arouse some premature and over-optimistic hopes about the extent to which New Zealand is likely to increase its meat exports to Britain in the immediate future. Setting aside, for the moment, materialistic considerations of price and terms of trade, there is unquestionably a great deal of goodwill towards Britain in New Zealand and a general desire, by no means confined to politicians, that if New Zealand can help Britain to improve its meat ration, it should do so. But it is doubtful whether good will and agreements will be enough unless they are reinforced by practical proposals which will first induce and make it possible for New Zealand's farmers to rear more store cattle, sheep and lambs, and then facilitate the preparation and shipment of this extra meat to Britain.

Britain, having given New Zealand an approximate 15 per cent increase in the current season's meat prices and followed this up with a guarantee that it will accept all the meat New Zealand can send for the next fifteen years, may well feel that it has done its part, for the time being, at least. Unfortunately for British purposes, however, the New Zealand Government has decided that it is not practicable to pay out the whole of this increase to the farmers this season, nor has it been able to give any guarantee that it will be paid out next year unless some acceptable formula can be devised. There are various reasons for this decision, but the chief of them is the undoubted difficulty in revising the fixed schedule of prices established at the beginning of the season last October 1st and of making retrospective payments to thousands of farmers who had sold their stock before the London meat price negotiations were concluded. Mr Holland is also bound to be concerned with the effect of a 15 per cent rise in export prices upon retail meat prices in New Zealand, particularly when the NZ Federation of Labour is waiting to make a fresh application for a general rise in wages based upon increased living costs.

In the meantime the undistributed balance—which may amount to anything from £1,750,000 to £2,500,000 for the whole season—will be paid into what is known as the meat industry reserve account. This was originally set up by the Labour Government as a bolster for price stabilisation, and now amounts to over £37 million. The Prime Minister, Mr Holland, like his predecessor, Mr Fraser, has given several assurances that the money in this reserve belongs to the New Zealand farmers, but these assurances are carrying less weight in view of the inability of the farmers to use it. Most of the funds are held in long-term stocks in London and, taken in conjunction with the dairy industry reserve account (now over £23 million), represent a large and accumulating indebtedness to New Zealand's primary producers. The New Zealand federated farmers' organisation which, under one umbrella, represents most of the producing organisations, has urged that the size of these reserves should be reduced and that the possibility of vesting their effective control, as well as their titular ownership, in the producers, should be considered. The effect of such a transfer and dispersal of funds upon New Zealand's overseas reserves creates difficult problems for the government and, somewhat understandably, Mr Holland has pushed the idea away from him—but only for the moment.

Reviving Chilled Beef Industry

The further United Kingdom-New Zealand agreement for an "experimental" revival of New Zealand's chilled beef export trade has also been played up rather beyond its immediate merits. There is no prospect of New Zealand resuming shipments of chilled beef to Britain on the substantial scale existing before the war (when they represented 60 per cent of New Zealand's export meat trade) unless and until it can reorganise its railway and wharf services, obtain ships equipped with "chiller" compartments and reorganise its refrigeration industry to prepare large quantities of chilled instead of frozen meat. Experimental shipments will not be difficult because they will involve only small quantities, but for some time to come the British people should not be encouraged to expect anything more. The immediate obstacles to be overcome are the shortage of refrigerated railway wagons sufficiently well insulated to carry chilled meat and the difficulties in the way of the prompt loading and despatch of overseas vessels from New Zealand ports. Even at the present time, when only frozen meat is being handled, there is very serious congestion and delay in despatching meat ships from both Auckland and Wellington. With chilled meat a strict timetable must be kept and, in the case of New Zealand, the period between the killing of the animal and the distribution of its meat in Britain cannot exceed fifty days, of which thirty to thirty-five will be taken up by the voyage. If the meat is not distributed within this period, it must either be frozen—in which case it loses its "chiller" premium—or it is likely to be condemned. It is nearly twenty-five years since New Zealand abandoned the chilled meat trade with Britain and it cannot quickly be resumed, even if the premium of £23 a ton offered by the United Kingdom is a sufficient inducement to the various interests concerned to reorganise the trade.

The general prospects for any substantial increase in New Zealand's export meat production are governed by several considerations. First, there is the extra capital, equipment and labour necessary to bring in further areas of marginal land. This is only now being investigated and results cannot be expected too quickly. Secondly, there is the shortage of sulphur and its effect upon artificial fertiliser production. The correction of this depends upon either finding larger supplies of imported sulphur (which is likely to be extremely difficult), or upon the establishment of new plants for the manufacture of phosphatic manures by non-sulphur burning processes—which will be expensive in money and electric power and cannot be achieved quickly. Thirdly, there is the chronic New Zealand farm labour shortage and the increasingly high cost of mechanisation as a substitute for labour. Fourthly, there is New Zealand's own increasing meat consumption and the extent to which it may encroach on export surpluses.

None of these problems are insuperable, but the solution of them will take time and co-operation. Probably one of the most useful suggestions made during the recent Anglo-New Zealand discussions about meat in London was that the British Minister of Food, or someone equally responsible, should visit New Zealand as soon as possible to discuss and assess the problems on the spot. The annual "price haggles" in London are not the most suitable occasions for explaining New Zealand's production problems because at these discussions it is always assumed that the seller has an axe to grind.

Belgium Looks East Again

[BY A CORRESPONDENT]

THE new Belgian Ambassador to Moscow, M. Wauters, is going to his post with every intention of trying to increase Belgian trade with Russia as much as possible. In this he has the keen support both of his fellow Socialists in Brussels and of Belgian business men. But there can be little chance of his succeeding without raising in an acute form some of the problems which have already given the American officials administering the Battle Act much cause for worry. Since it came into force in January, considerable efforts have been made to reach agreement between the United States, Canada and the European countries receiving American aid, on details of the extent and type of East-West trade now permissible without endangering the flow of dollars. Belgium is in a stronger position than most of its neighbours, in that it is not as dependent on American aid as they are. But nor is the Belgian economy as dependent, for instance, as the British on supplies of raw materials from beyond the iron curtain. While M. Wauters can therefore expect a freer hand than some of his other western colleagues in Moscow, any marked success of his efforts would unnecessarily prejudice the now agreed aims and interests of the western powers.

The Belgians, nevertheless, argue their case firmly. Some even go so far as to claim that, while present rearmament aims can only be achieved by fully maintaining the volume of external trade, a higher proportion of exports must be directed to the Russians, who pay in gold. M. Wauters' attitude has received the tacit blessing of the Belgian government and he is by no means just an idle talker. A few days before his departure for Moscow, the Belgian Socialist party submitted to the Socialist International a paper on balance of payments problems, in which it said that one of the three factors in a long-term solution is "a reconversion of trade aimed at the expansion of commercial relations between Western and Eastern Europe." Moreover, one of the last functions he attended before leaving Brussels was a meeting of the National Committee for the Study of Trade with Eastern Europe. Before a gathering which included the whole of the Russian diplomatic and commercial missions in Belgium, many leading Belgian industrialists and bankers and the heads of the government departments of Foreign Affairs, External Trade, and Finance, he spoke of pouring "oil in the gearbox" and of his ambition to "increase the volume of trade between Belgium and the USSR."

More Trade with Finland

Behind this new approach stand two interesting facts: that Russian-Belgian trade has declined in the last two years, but that Belgian exports to Russian satellite countries and to Finland have risen sharply. There was, for example, a drop of 60 million francs in the value of Belgian deliveries of iron and steel to Russia in the first eleven months of 1951, but an

increase during the same period of nearly 90 million francs in supplies of these commodities to Czechoslovakia. Shipments of copper and other metals to Russia were cut down by about 162 million francs, but a new item appeared, "naval and aviation goods," to the value of 246 million francs. In 1951, through considerable boosting of purchases in Belgium, Finland had run into a severe deficit in its balance of payments, and this threatened the conclusion of the new trade agreement. It has just been learned, however, that a "considerable effort" by the Finns has produced a solution and that quotas for 1952 will be increased all round. This is particularly significant in view of the fact that Finnish sales to Russia have also more than doubled during 1951, both under the commercial agreement and in reparations. Belgian sales to Finland had reached 1,574 million francs last year, compared with 635 million francs the year before. Iron and steel supplies moved from 222.9 million francs to 789.4 million, zinc from 28.3 million to 76.1 million, mineral oil, petrol and lubricating oils from 23.4 million to 111.5 million, and boiler plants and machinery doubled in value. In fact, the total value of Belgian sales to the Communist world and Finland is nearly back at that of 1949: exports worth 4,813.5 million francs in 1949 compared with 4,598 million francs in 1951, the only qualification being that between the two dates the Belgian franc was devalued by 12.5 per cent.

Cominform Gymnastics

Up to last week, fulmination against Anglo-American plans for the rearmament of Western Germany was one of the staple lines for Communist leaders and commentators. When, therefore, the Russians announced their new plan for a unified Germany equipped with its own national defence forces, they needed all their practice in mental gymnastics to put a good face on this Soviet change of policy. The Russians themselves have very much played down the military aspects of their proposals. A *Pravda* leader of March 12th, which commented on the Note, did not, as broadcast, mention the military clauses. For the first few days, at any rate, after the official announcement Moscow radio does not seem to have so much as mentioned the proposed German "national" army in its broadcasts to Eastern Europe. It preferred to concentrate on eulogies of the generous and enlightened attitude of the Soviet Union.

Most Polish and Czech commentators, however, grasped the nettle of Soviet-sponsored German rearmament more firmly,, although without doubt they must have been both shocked and humiliated by the Russians' failure to consult them beforehand. (If they had been honoured with Stalin's confidence the fact would certainly have been noisily published.) They managed to reach the satisfactory conclusion that the Soviet proposals would give their respective countries far more security than they enjoy at present. All Polish comment aimed at removing the fears of German revisionism which had been so sedulously fostered, when plans for open German rearmament were a monopoly of the western powers. The Polish paper *Trybunu Ludu* pointed out that the proposed withdrawal of all occupation forces within a year of the signature of the peace treaty will remove the numerous "Atlantic" divisions which form the "advance guard of aggression" in Western Germany; and that the Soviet proposals will eliminate for ever the possibility of a resurrection of a neo-Nazi Wehrmacht, of a *Drang nach osten* and of the use of Western Germany as a base for aggression by the western imperialists. Another Polish commentator said:

> The Soviet proposal firmly resists the resurrection of German aggressiveness and militarism, which are both instruments for preparing a fresh war. To the democratic and peaceful German state of the future, which will not anywhere furnish bases for the imperialists, it offers armed forces on the scale befitting a sovereign state.

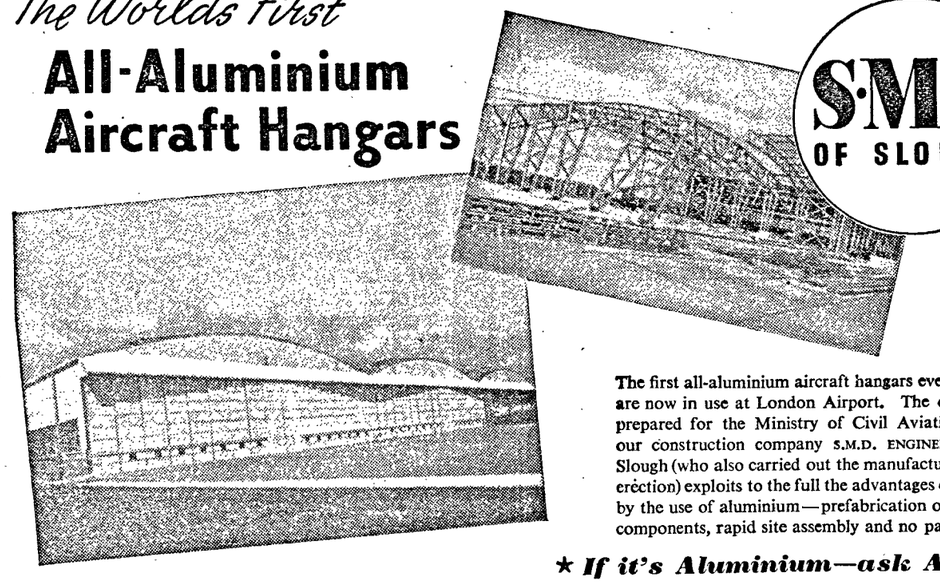
The Oder-Neisse Line

Both Polish and Czech commentators naturally emphasise the Soviet suggestion that Germany's frontiers should remain as agreed at Potsdam, although they no doubt privately regretted that the Soviet Note laid so little emphasis on the frontier *status quo*, and the comment from Moscow has held aloof from discussing the exact territorial provisions of the proposed peace treaty. A Czech commentator said:

> We know what a danger the Henleinist and vengeance campaign conducted in Western Germany against the Polish Oder-Neisse frontier and against Czechoslovakia's integrity constitutes. Hence, also, we realise how much the Soviet Note means for our security and that of the world, and for world peace.

The Polish youth paper, *Sztander Mlodych* (Banner of Youth), which, like the rest of the Polish press, printed the full text of the Russian Note, bravely dressed up the frontier clause in leaded type. But the insignificant placing and scant wording of this clause must have been clear to every Polish reader. There is no specific reference to the Oder-Neisse line, nor to the Polish-East German pact signed at Görlitz in June, 1950, which pdelged German acceptance of the "frontier of peace."

Western Communists were plainly taken aback by the Soviet move. In Britain, the *Daily Worker*, after printing the text of the Note, contented itself with a despatch from its Moscow correspondent which was largely based on the *Pravda* leader of March 12th. It waited a whole week before it ventured on any editorial comment. This draws a comparison between American and Russian policy towards Germany. The Americans are concerned solely with rearming the West Germans as quickly as possible so that they can help in an attack on the Soviet Union "in the next few years." The Russians are concerned only with creating "a peaceful Germany that will not be a pawn of any group of powers."



The French sympathisers with Moscow were particularly discomfited. Just before the Russian Note was published, a group of Frenchmen closely connected with the "peace movement" sent a letter to the French President urging that the French Government should declare its opposition to German rearmament "in any form or under any pretext." The French Communist paper, *Humanité*, plunged into print at once with what was clearly an attempt to bury its former principles respectably and decently. It stoutly maintained that there was all the difference in the world between the rearmament of a part of Germany which was thirsting for revenge and a member of an aggressive coalition, and the authorisation to be given to a united, democratic, peaceful Germany to raise a "national army," which was an "unquestionable attribute of sovereignty." The French Communist leader, M. Duclos, consoled his followers in a speech at Romainville, by pointing out that the nature of the proposed German army would be strictly regulated and controlled in the peace treaty; and that France as a signatory of that treaty would be able to make sure that the army was restricted to a purely defensive role.

In Eastern Germany the Communists have striven to remove any hopes their countrymen may still nourish concerning the return of their lost eastern territories. They have emphasised that the Oder-Neisse frontier is a "frontier of peace" which "cannot be abolished in peace or war." They have also been at pains to show that Stalin's proposal for a German army does not indicate any change of policy. To prove this point, Herr Grotewohl quoted the following passage from a speech by Stalin in November, 1942.

> The task is not to destroy all organised military power in Germany; for anyone with any intelligence will realise that this is as impossible in the case of Germany as in the case of Russia, as well as being inadvisable from the victor's point of view. But to destroy the Hitlerite army is both possible and necessary.

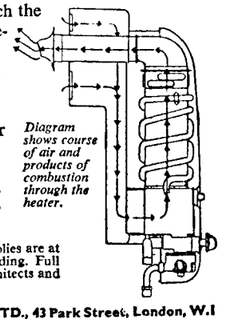
Ascot produce first BALANCED FLUE GAS WATER HEATER

ASCOT 715 Balanced Flue Multipoint Gas Water Heater

This is a significant achievement, for the difficulties of applying the "balanced flue" principle to instantaneous gas water heaters had hitherto defied solution.

The important advantage of the new Ascot 715 is that the air intake and flue circuit are sealed off from the room in which the heater is installed, thereby eliminating downdraughts and vitiation of the indoor atmosphere. There are no visible flue-pipes either inside or outside the building.



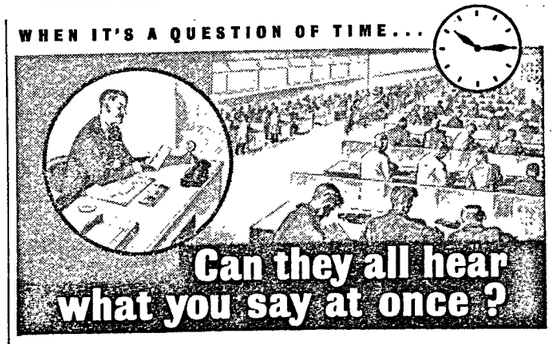


Diagram shows course of air and products of combustion through the heater.

Ten local authorities have already specified the Ascot 715 for their housing schemes.

As production is limited, supplies are at present restricted to new building. Full co-operation is offered to architects and all interested in new housing.

ASCOT GAS WATER HEATERS LTD., 43 Park Street, London, W.1

Elevating Bank Rate

SECOND thoughts about Mr Butler's budget have not led to any perceptibly different conclusions from those evoked by first thoughts, set out here last week. But one conclusion emerges with ever-increasing sharpness. Monetary policy appears as the central figure in the whole performance, and the part it may have to play, perhaps is intended to play, looms steadily larger. It is certainly an incomparably bigger part than anyone outside the official circle expected to see, and much bigger, too, than the Chancellor himself was envisaging when the first moves towards monetary orthodoxy were made last November.

Mr Butler then said that he did not believe that "in present circumstances monetary policy by itself can have decisive results"; that there was no need for any "dramatic process"; and that he was making a "clear change of emphasis" because he could not afford to neglect any measure that might help him in his task. The impression given—at least to those who judged from what the Chancellor said rather than by any conviction of their own about the potency of even a "change of emphasis"—was that monetary pressures would prove to be a relatively minor adjunct to the government's other measures when these had been worked out. Now the Chancellor has moved from changing emphasis to dramatic process; he describes the increase in Bank rate to 4 per cent as his chosen "decisive action" to impress overseas opinion with Britain's determination. But this elevation of Bank rate to first place among the psychological measures directed outwards is not the limit of its promotion. It also stands in lonely eminence among the measures directed inwards.

The budget debate has not contributed much to the previously available information—unusually sparse this year—about the technical structure of the budget or about the government's intentions in monetary policy. On neither theme has it produced any notably effective criticism from the Labour standpoint—as distinct from the criticism that arises from doubts, which are to be found among informed observers in all parties, about the wisdom of unexpectedly soft budgeting. One criticism voiced by several Labour spokesmen was, however, clearly well founded. This budget, as such, is a budget of income redistribution, not one that is demonstrably addressed to the problems of 1952. The Chancellor is fully entitled to retort that his "incentive" reliefs and his move towards realism in prices go to the heart of the fundamental problem—in so far as their beneficial effects are not neutralised by the disincentives of the new levy on profits and the cuts in the supply of physical capital for industry. But he cannot reasonably claim that any of his budgetary proposals, except perhaps the increase in the petrol duty, will have any perceptible effect upon the external balance of payments until after the end of the first critical period to which Britain's plans are now geared—the second half of this calendar year. These plans depend upon physical cuts in imports and efforts to expand exports by diverting capital goods from home industry; and neither objective, again excepting the petrol duty, will be directly promoted by any of the budgetary proposals—nor, even, will last January's project, of which little has since been heard, to divert £70 million of durable goods from domestic consumers. A budget that seeks to maintain consumption, and imposes no differential taxation of such goods, cannot be of any help here.

★

In short, except to the extent that physical measures and exhortation may play a part (they never played any very effective part in the hands of the Labour Government), the whole task of achieving the hoped-for diversion of capital goods and durable consumables from the home market has been handed over by the Chancellor to monetary policy. Moreover, monetary policy has not only to do in this sphere what budgetary policy refrains from doing; it has also to underpin the budget itself. Mr Butler's conclusion that consumption need not be cut does not derive from any budgetary action he has taken, but rests primarily on the assumption the stocks of imported goods will be run down by £150 million and that other civil investment will be cut, on balance, by £100 million. Most of the first cut will, no doubt, be ensured automatically by the running-down of the government's own stocks, but the non-recurring disinflationary relief from this would be diminished if other stocks rose. More important than this consideration is the fact that, if additional exports of £50 million are to be achieved, the diversion of plant and equipment from civil investment will certainly have to be much larger than the assumed net reduction of £100 million in civil investment in home-produced goods. The government is in effect assuming that the physical volume of exports of these vital supplies will expand not merely by £50 million but in addition by an amount sufficient to make good the loss of exports of consumer goods resulting from the import cuts made by sterling area countries. The assumption that civil investment in home-produced goods will fall by £100 million therefore seems to postulate a cut of a much bigger amount in essential investment, but one that will be partially offset, in the purely statistical reckoning of "investment," by an accumulation of unsaleable stocks of consumer goods.

The task of achieving these large "gross" cuts in investment outlay, upon which both the budget assumptions and the export plans depend, is assigned to monetary policy—with some assistance from physical controls and from Mr Gaitskell's decision eleven months ago to withdraw the initial allowances at the end of this fiscal year. Monetary policy, too, is the only instrument the authorities have in reserve if the assumptions that underlie the budget prove to have been too optimistic to prevent an excess of total home demand from attracting resources away from civil investment into domestic consumption. If consumption were to rise, or if the increase in production or the improvement in the terms of trade and invisible exports proves to be smaller than the Chancellor assumes, civil investment will need to be cut still further—with monetary policy again as the means of ensuring the increased cutting. Mr Butler is presumably satisfied that there is no danger of any such inflationary excess of demand. The deeper concern he has revealed this week for the difficulties of some consumer goods industries shows that he expects recession of demand in such directions to do the disinflationary work that would otherwise need to be done by the budget. But, without prejudging this question of the "danger of deflation," it is clear that any domestic recession of this kind could not of itself quickly ease the task of closing the external gap. An inflated demand for capital goods could menace the balance of payments at the same time as certain consumer goods industries were experiencing deflation. Continuance of a tough monetary policy would be needed to check the former at the very moment that symptoms of slack elsewhere in the economy might seem to be arguing for a more gentle policy. And if the gold reserves do not show from quarter to quarter the recovery upon which the Chancellor counts, a still tighter money policy may be the only way of preventing a dangerous reversal of the incipient revival of confidence in sterling.

★

For all these reasons, the part that monetary policy has to play is a crucial one. But it is clear, in any case, that Mr Butler's faith in its efficacy must now be much greater than it seemed when he first resorted to it. That in itself enhances its value, and strengthens the chance that it may be equal to the high responsibility unexpectedly thrown upon it. Orthodox monetary weapons wielded without conviction quickly lose much of their effectiveness, chiefly because a substantial part of the restraint they induce generally arises from the threat to lenders that they may be used still more vigorously. In the first four months after the first move towards orthodoxy, there was no certainty that the policy was rooted in any real faith. The Chancellor's explanation of it, and the fact that the measures were carefully devised to secure the biggest result at the minimum cost in terms of the Treasury bill rate, both seemed to imply that only limited objectives and limited techniques were in view. The recourse to the old unsatisfactory expedient of the "directive" on bank lending policy and the entirely novel request to the banks to raise their charges for loans pointed in the same direction, creating the impression that orthodoxy might be fettered by an undue solicitude for the Treasury's borrowing costs, and perhaps even by fear of left-wing criticism. Finally, the arbitrarily wide spread that the authorities were trying to ensure—and, over a considerable part of the borrowing field, did ensure—between the central structure of rates and the rates charged by the banks for advances left room for other lenders to accept business that the banks were turning down.

The significance of the sudden increase in Bank rate, therefore, does not lie only, and perhaps not mainly, in the fact that 1½ per cent is a "crisis" move; it lies also in its demonstration that the suspected inhibitions either never did exist, or have now been shaken off, as well as in the fact that at least the worst anomalies in the rate structure should now begin to disappear. It is significant, too, that this dramatic step—which has administered a violent shock to the banks and the money market, chiefly because of its severe impact upon the short bond market—was taken at a time when all the evidence showed the more limited policy to be exerting strong effects. As a note on page 754 records, the whole of the net rise in bank advances in the three months since last November was attributable simply to the fast-rising demands of the nationalised public utilities. This success of monetary policy, instead of being treated as an indication that no further toughening was needed, has apparently led the authorities to conclude that it can safely be entrusted with a much bigger task than was formerly intended.

It has been said in some quarters that this latest move, unlike the initial measures, will not exert much "quantitative" effect, because it does not of itself further tighten the banks' liquidity ratios; the impression is thereby conveyed that it will be less potent than might appear at first glance. This overlooks the fact, however, that the strength of the weapon of pressure on bank liquidity depends, first, on the firmness of the threat that it will be used fearlessly, in conjunction with other orthodox weapons, if need arises; and, secondly, upon the extent of the loss the banks will suffer if it is used. In both respects, the hands of the authorities are now seen to be much stronger than they looked a fortnight ago. Moreover, the technical limits to the use of this weapon are wider than they were at first expected to be. The fact that there is prospectively an "overall" surplus on the Exchequer accounts should mean that the Government can this year avoid making any net new sales of bills to the banking system without having to turn to the gilt-edged market instead—unless the external balance of payments actually develops a surplus. The strengthening of the technical position in these ways will certainly ensure a continued, and perhaps a more pronounced, toughness in the attitude of the banks towards borrowers. But beyond this is the even more important fact that the costs of borrowing are now rising to levels that should be a marked discouragement to marginal expenditures by businesses on fixed assets as well as on stocks, and by those individuals who are able to live on their capital.

The combined effects of the dual process of restraint by the banks and direct discouragement by higher interest rates could be very marked, especially when the secondary repercussions on the whole level of demand develop fully. It should not be supposed, however, that the monetary weapon, if thus firmly used, is likely to do more than ensure the capital cuts upon which Mr Butler's planning for this year rests. If it is to be employed for the more vital, ultimate purpose of redressing the fundamental disequilibrium that compels the national economy to draw upon capital, it will have to cut consumption as well. And it will not do that, to any perceptible extent, unless the credit screw is allowed to press upon the industries that are, or will be, in a position to release labour for more essential work. This is the ultimate question in economic policy. But Mr Butler's concern about the industries now coming under fire does not suggest that monetary policy will be allowed to answer it.

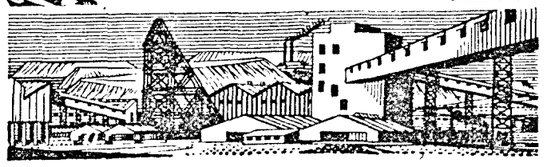
Cuts in Sterling Trade

THE size of the Australian import cuts and their effect on British exports were a painful surprise and caused as much bewilderment to the British as to the Australian public. At their meeting in London two months ago, the Commonwealth Finance Ministers subscribed to the broad principle that countries should live within their means. The cuts have upset those who fondly supposed that there were no limits to sterling trade, and also those who have blithely ignored the fact that Australia had been living so far beyond its sterling means that its imports from Britain would have to be reduced. But among the most astute British exporters, few can have dreamt that British goods would be reduced so drastically as the Australian announcement suggests. New Zealand and South Africa have also been obliged to reduce their imports, though less drastically. So the first task of the leading members of the sterling area is, apparently, to balance their payments accounts by reducing the total volume of their mutual trade—a policy that would certainly be nonsensical save as a drastic and temporary expedient. This chain reaction of import cuts, started last November by Britain and now extending far beyond the sterling area, poses two questions : First, whether these cuts are unavoidable ; and, secondly, what effects they may have on British production and exports.

Australia's imports have lately been running at an annual rate of £A1,100 million. They fell sharply in December, when the new monetary policy introduced by the Australian Government last autumn seemed to be taking effect, only to reach record heights in January and February. Exports for the current year are estimated at £A660 million, leaving a visible deficit of £A440 million, and a total deficit of £A600 million. This gap measures the order of the cuts that have to be made ; whatever may happen to the invisible deficit next year, there seems little chance of a major expansion in Australian exports. The Australian Government has divided imports into three categories. The first includes certain types of equipment and raw materials for industrial use ; these have been cut to 60 per cent of the 1950-51 level. The second category covers consumer goods ; these come mainly from Britain and have been cut to 20 per cent of the 1950-51 level. The third category consists of "capital development goods," including textile machinery, agricultural tractors and tinplate ; these items are to be subject to "administrative control," which will decide import applications on their merits. No exact measure of the impact of the cuts in each category can be made ; they are based on 1950-51 imports, but these have been greatly exceeded in 1951-52. A rough calculation indicates a saving of £A300 million on first category items, and £A200 million on the second list ; a further £A100 million will presumably have to come from the third category.

Britain supplies about a half of Australia's total imports ; it supplies nearly all the consumer goods in the second category—as can be seen from Table I—and a large proportion of industrial items in the first category. In all, Britain could lose as much as £250 million of its trade with Australia, for some of the restrictions, although equivalent to an 80 per cent reduction compared with 1950-51, may, in fact, represent a 90 per cent reduction in terms of current shipments, since Australian imports this year have been 50 per cent higher than in 1950-51. Australia is apparently unable to carry out an immediate pruning of its current dollar imports on the ground that licences for such imports run for twelve months ; it has also obtained one dollar loan from the International Bank and hopes to get another. But the severity of the cuts on those goods that come almost entirely from Britain remains surprising. On present reckoning, this country could lose £70 million of its Australian business in motor cars, £85 million in textiles, £55 million in consumer goods and £40 million in other goods.

★



New Zealand's difficulties are not so acute. Its total deficit for 1952, based on last year's trends, may reach £43 million, of which £40 million would arise from visible trade. For the twelve months beginning next June, New Zealand aims at a surplus of £25 million with the non-sterling area. Imports from the United States, Japan and other countries are to be cut, but motor cars are the only goods from the sterling area and Western Europe that will be subject to licensing, and even on these no specific quota will be imposed ; general restrictions on credit and other monetary measures are expected to be sufficient to curb imports from these sources. The demand for vehicles is already largely satisfied and stocks of consumer goods are heavy. In all, New Zealand imports are expected to decline by about £50 million, of which £30 million will be borne by the sterling area and Western Europe. The goods most affected will be vehicles and textiles. This country supplies more than 60 per cent of New Zealand imports ; the most important items are textiles and vehicles, which together account for between 40 and 50 per cent of the total. The effect of the New Zealand cuts on British exports will depend so largely on the degree of disinflation inside the dominion that it is difficult to guess. The total is not expected to exceed £20 million, of which about a half might be borne by textiles.

South Africa is aiming to cut its import bill by £70 million. Its total deficit in 1951 was about £55 million. It had a trade deficit (after allowing for net output of gold) of about £55 million and its invisible deficit of £68 million was offset by an equivalent inflow of capital. The impact of the South African cuts is even more difficult to assess than for the other two dominions, for the basic year is 1948 and the percentage cut gives only a broad indication of what importers can expect. A rough estimate of the effect compared with last year's supplies indicates that finished consumer goods will be reduced by approximately a third, and raw materials, semi-manufactures, and capital goods by 25 per cent. The cuts will be heavier on goods from the dollar area than on supplies from Britain or Western Europe. Some important British exports, including textiles and unassembled vehicles, are classified as "semi-manufactures" in South Africa because they have to be processed after importation before they can be sold. South Africa's stocks of consumer goods, and particularly of

GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand goldfield alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)
Head Office: 54 Lombard St., London, E.C.3

A MEMBER OF THE THREE BANKS GROUP

THE ROYAL BANK OF SCOTLAND

The Royal Bank of Scotland was incorporated by Royal Charter in 1727. Retaining its Scottish character and traditions, its influence, though deeply rooted in Scotland, now extends to every part of the commercial world. The Head Office is in Edinburgh ; the Royal Bank of Scotland is a member of the Three Banks Group.

textiles, are high. But the Union hopes to derive some benefit from the Australian import cuts; in the past year, it has been compelled to buy goods from the United States and other countries rather than from Britain because British delivery dates were too far ahead. The partial closing of the Australian market is expected to accelerate delivery dates so that to some extent South African buyers may be attracted to British exports. A saving of £15 million is expected on consumer goods, £30 million on textiles and £25 million on other goods. In the past Britain has supplied over a third and often nearer 40 per cent of South Africa's imports and theoretically the British share in the cuts in 1952 might reach £25 million. In fact British exports may not fall by more than £10 million.

The total cuts to be imposed by the three southern dominions might reach £550 million, of which, say, £280 million might fall on Britain. To assess the effect of such a reduction on British exports involves an estimate of the approximate size of cut for each of the main export items and such estimates can only be hazardous. But perhaps some £75 million of business in vehicles (particularly motor cars) may be lost, up to £100 million on textiles (this estimate takes account of the large stocks of textiles already existing in the three dominions), some £65 million on consumer goods such as pottery, vacuum cleaners and refrigerators, and £40 million on capital goods and raw materials, including chemicals. If these goods cannot be diverted to other markets, then Britain's exports for 1952 will amount to £2,300 million compared with £2,580 million last year and £2,171 million in 1951, and a total payments deficit of £300 million might be in prospect for this year. That is the worst picture and it is gloomy enough. What are the chances that these "frustrated" exports can be sold elsewhere?

The significance of the three dominions to Britain's export trade and the relation between total exports and output last year is shown in Table II. There should be little difficulty in disposing of the £40 million worth of capital goods, for demand in other markets is well maintained. A reduction of £75 million in vehicle exports would bring them back to the 1950 total of £405 million. Here the Australian cut will be severe, for last year that market took almost 30 per cent of British exports of cars and over 25 per cent of its exports of commercial vehicles. If the Canadian market could be reopened some £10 million more cars might be sold there and a determined sales drive ought to expand exports to Europe and to other parts of the world. But it would be dangerous to suppose that more than, say, £30 million of additional car exports to other markets could be achieved this year. In volume terms, there might be a fall in vehicle exports of some 10 per cent, with a proportionately greater fall for motor cars, outstripping the expected decline in car production resulting from the steel shortage.

*

Exports of British textiles last year amounted to £535 million compared with £415 million in 1950. A cut of £100 million means a decline of 5 per cent in output. Exports of both cotton and wool goods increased generally last year and it is difficult to see where new markets could be found. Australia took 20 per cent of British exports of cotton piece-goods and South Africa 13 per cent. British exporters might find larger outlets in Europe and South America, but it is unlikely that much more than £25 million worth of exports could be diverted.

For pottery and china there is no simple method of switching supplies from one market to another; much depends on design and pattern. In time such changes could be made for there is still room for increased exports to the western hemisphere and even to parts of Asia, but the development of these increased sales would be difficult and expensive. The export trade for many other consumer goods is still in its infancy. But if this experience has not frightened them away from exporting, it should be possible to find alternative outlets for about half of the loss they are likely to suffer at the hands of the three southern dominions. Australia was an important market last year for British pottery, washing machines and vacuum cleaners.

Any estimate of the extent to which exporters can switch their supplies from these Commonwealth countries to other markets must be rough and ready. But from the guesses that have been made above some £130 million out of the cut of £280 million might be diverted, leaving a net decline in total exports of £150 million. This figure is not put forward as a fact or a forecast; it merely shows the extent to which extra effort must be made to expand exports so that there will still be some promise that the British payments account can be brought into balance.

Business Notes

Markets and Policy

The City's second thoughts on the Budget have this week quite wiped out the effects of its spontaneous sense of relief at the absence of the expected severity in the Chancellor's proposals. The criticisms voiced only by the few last week have now become almost general. Virtually every City observer is acutely aware of the fact that the softness of this year's budgeting has been achieved only at the cost of severe cuts in the supply of capital to industry, and fears that the Chancellor has given hostages to fortune and will have to pay the price next year. From a City standpoint at least, a Budget that was intended to give incentive appears only an accentuation of the disincentive policies of these postwar years. And to these sources of depression there has to be added the widespread discussion, which the Chancellor himself provoked by his statements in the House last Monday, of the difficulties of certain consumer goods industries, and the possibility that they may generate a more general flagging of consumer demand.

Against this background, industrial equities and commodity shares have sagged further, but in the gilt-edged market the tougher monetary policy seems to have lost some of its terrors. At the end of last week, industrials had made a modest recovery, but early this week the more realistic attitude towards the Budget, combined with rumours of large

(*e*) Earliest date. (*f*) Flat. (*l*) Latest date.

impending industrial issues, brought a renewed fall in quiet markets. By Wednesday's close, the ordinary share index of the *Financial Times* had dropped by another two points, to 107.1, or 5.6 points below its pre-budget level. In textiles, and in some of the other groups that are vulnerable to the sterling area's import cuts and to recession of domestic demand, the declines have, of course, been more marked than that shown by this index.

In the gilt-edged market the most notable movement has been the further rally in short bonds. The rate established for Treasury bills at the first tender after the increase in Bank rate proved to be a little below the first expectations—the average rate was 2 5/16 per cent, compared with 1 1/32 per cent in the previous week—and the discount houses have also encountered easy conditions in the short loan market. This experience, combined with a rising strength of sterling in the foreign exchange market has served to lighten, though perhaps only temporarily, the gloom that greeted the new monetary pattern in banking circles. Among the short bonds, the most notable of this week's recoveries have occurred in the 1953 and 1954 issues of Funding Bonds. The 1954 stock had recovered by Wednesday evening to 97⅜, compared with only 96 at its low point a week previously. In the long term market, the dominant influence has, of course, been the strengthening of sterling, but the movements here have been small and indeterminate. Old Consols lost on Tuesday their fractional gains of the previous two days, but closed slightly firmer on Wednesday at 58¾, which is ⅝ above the lowest closing price since the Budget, but 2⅜ below the pre-budget level.

* * *

Stronger Sterling

The behaviour of sterling in the exchange market continues to provide reassuring indications that the favourable psychological implications of the Budget and the higher Bank rate have considerable substance behind them. This substance is nothing less than the substantial bear position in sterling which had been built up in various ways during the pre-budget weeks when rumours were rife of another devaluation of sterling or of a decision to let the rate find its own level untied to any rigid parity to gold and the dollar. This short position, the builders of which were aided and abetted by the relatively low level of short term money rates in London and by the freedom with which acceptance credits have been granted by London banks to overseas customers, is being rapidly reduced. The higher rates are proving some deterrent while the shortening of the period for which such credits can be extended, together with the stricter scrutiny of their commercial justification, have begun to cause considerable repayments of these facilities. In addition, the effect on confidence of the rise in Bank rate and of the reduction in food subsidies, two items which appeal with special force to the overseas observer, is causing the outright speculators in sterling to rush to cover. The result has been a steady demand for spot sterling which, this week, has risen to $2.80⅞. Most of the offering of dollars has come from New York but much of the business has been on Continental account. The authorities have no doubt been active in the market but their operations have been discreetly and effectively veiled. It would, however, be surprising if the trend of markets had not allowed the Exchange Equalisation Account to repurchase some of the dollars which it had sold in previous weeks while the range of market rates was squatting firmly on the Bank of England's selling price for dollars, namely $2.78.

The premium on forward dollars, though it has narrowed, is still as high as 3 per cent per annum, which is appreciably more than the present margin between short-term money rates in London and New York would justify. Forward sterling, in other words, is still under some suspicion. The rates for transferable sterling also show some improvement, the latest figure being $2.44-45 which is some 4 points better than the quotation on the eve of the Budget. The turnover in this market has been considerably reduced; this suggests that the commodity shunting operations based on cheap transferable sterling are declining, which should help the hard currency earnings of the sterling area. Another helpful development is the resumption of United States purchases of Malayan tin for which the equivalent of £2,500,000 has already been received in dollars since the Reconstruction Finance Corporation's ban on these purchases was lifted a few weeks ago.

EPL Again

The Chancellor of the Exchequer, in winding up the budget debate, added little to what had become known six days earlier about the Excess Profits Levy. He emphasised its weight—an extra burden of £100 million that would have ultimately to be borne by the ordinary shareholder. Mr Butler had no doubt that EPL would be followed, or ought to be followed, "by a sane policy of dividend limitation" with which he coupled "a restraint in demand for wages." No doubt if it were a matter of flat choice, EPL is somewhat to be preferred to any system of statutory dividend limitation, if only because it is in the nature of excess profits taxes to be mortal. No doubt, too, EPL is a fairly devised tax within the limits that the Chancellor has set himself. Only Dr Dalton, whose denunciation of excess profits taxes will always shine brightly in British fiscal history, was able to identify EPL as a "disincentive demagogic device"; only Mr Nicholson among government backbenchers expressed alarm at the weight of tax on profits placed to reserve. The average industrialist will not accept the proposition that EPL fulfils the Conservative election manifesto on the treatment of industrial profits.

More precise conclusions about the effects of EPL must await the appearance of the Finance Bill. It is already clear that no useful purpose is to be served by attempting to apply the basic rules to the cases of individual companies. Company accounts (particularly those of 1947) throw no clear light on profits as assessed for profits tax purposes—on which EPL is to be based. If they did, the investment statistician would still have the puzzle of equalising, or dispensing with, the initial allowances before striking his EPL computation. He would also have to include the 10 per cent "growth allowance," which might be possible for new share capital, but hardly for profits ploughed back in the business; on this latter, the tax authorities will have the previous figures of non-distribution relief from profits tax to guide them, and these are not to be found in published accounts. To attempt this kind of guesswork for individual companies without the proper information would be irresponsible.

One general point, however, can be made. Profits tax has had arbitrary effects on company finance in recent years; companies large and small have sought to avoid payment of full profits tax that would otherwise have been payable in respect of dividends on new preference and ordinary capital, and have resorted to debenture and loan stock issues. None of this new fixed charge capital is to count for EPL purposes in computing capital. Yet in many cases it will have made an appreciable contribution to the growth of earnings on which EPL is to be levied. This is a point of great substance which certainly demands reconsideration.

* * *

More EPL Examples

The table at the foot of this page provides a supplement to the examples of the minimum and maximum burden of EPL, on various assumptions about the growth of profits, that were presented on pages 660 and 663 of last week's issue of *The Economist*. Last week's examples showed the limiting rates of total taxation payable under the new company taxes and the old, when standard profits were earned and when double and treble standard profits were earned. These rates of total taxation are recapitulated in the short table below:

STANDARD PROFITS 100 THROUGHOUT

	Percentage of Chargeable Profits Absorbed in Total Taxation, with Profits of		
	100	200	300
(*a*) *Full Distribution* :—			
Under EPL and revised profits tax	61·10	72·75	75·10
Under old profits tax	66·25	66·25	66·25
(*b*) *Nil Distribution* :—			
Under EPL and revised profits tax	50·00	65·00	68·00
Under old profits tax	52·75	52·75	52·75

It is useful to consider in greater detail what happens to total tax rates and to free reserves on the more practical assumptions, not of maximum and zero distributions, but of distributions ranging between one-eighth and one-half of total profits. These rates are set down in column (1); in column (2) they are converted to the equivalent net rates after allowing for income tax at 9s. 6d. in the £. Columns (3) and (4) give the effective rate of tax under the old regime (income tax at 9s. 6d. and 50 per cent profits tax) and the net sums left for reserves. To use the example of a distribution of one-third of profits (before tax), the combined rate of income tax and profits tax was formerly 59.8 per cent, leaving 22.7 per cent (net) for reserves after distributing 17.5 per cent (net, after tax at 9s. 6d.). Columns (5) and (6) show what happens to this case under the new regime. There is no EPL to pay, since chargeable profits equal standard profits. The changes in profits tax reduce the combined rate of income tax and profits tax to 55 per cent, against 59.8 per cent on the old basis, and leave an increased sum for reserves of 27½ per cent of total profits, compared with 22.7 per cent.

Next, the assumption is made that chargeable profits equal one and a half times the standard profits. This results in 15 units being charged for EPL in respect of the excess of 50 units, or 10 per cent of total profits. Thus the tax percentage in column (7) are throughout 10 points higher than those in column (5) and the reserves percentages in column (8) are 10 points lower than those in column (6). For the case where one-third of profits are distributed, therefore, the impact of EPL on a company that increases its standard profit by a half is to increase its combined rate of taxation

EPL EXAMPLES

Proportion of Total Profits to be Distributed	Equivalent Proportion after Deducting Tax at 9/6 in the £	OLD BASIS *Income Tax* = 9/6d in £ Profits Tax = 50% with Non-distribution Relief of 40%		NEW BASIS (Standard Profit = 100) Income Tax = 9/6 in £ EPL = 30% of Excess Profits above Standard *or* 18% of Total Profits Profits Tax = 2½% net on Undistributed Profits and 17½% net on Distributed Profits							
		Total Profit = 100		Chargeable Profit = 100		Chargeable Profit = 150		Chargeable Profit = 200		Chargeable Profit = 300	
		Total Taxes	To Reserves	Total Taxes	To Reserves	Total Taxes	To Reserves	Total Taxes	To Reserves	Total Taxes	To Reserves
Per Cent (1)	Per Cent (2)	Per Cent (3)	Per Cent (4)	Per Cent (5)	Per Cent (6)	Per Cent (7)	Per Cent (8)	Per Cent (9)	Per Cent (10)	Per Cent (11)	Per Cent (12)
12½	6·6	55·4	38·0	51·9	41·5	61·9	31·5	66·9	26·5	69·9	23·5
25	13·1	58·0	28·9	53·8	33·1	63·8	23·1	68·8	18·1	71·8	51·1
33⅓	17·5	59·8	22·7	55·0	27·5	65·0	17·5	70·0	12·5	73·0	9·5
40	21·0	61·2	17·8	56·0	23·0	66·0	13·0	71·0	8·0	74·0	5·0
50	26·3	63·3	10·4	57·5	16·2	67·5	6·2	72·5	1·2	75·1*	Nil*

* Maximum distribution possible in this case would be 47·3 per cent of gross chargeable profit or 24·9 per cent net.

from 55 per cent to 65 per cent, and to reduce its net appropriations to reserves from 27½ per cent to 17½ per cent (the net dividend being 17½ per cent in each case). A further increase in tax and a corresponding reduction in reserves of 5 points occurs when profits rise to twice the standard, as shown in columns (9) and (10). Finally, the calculations are extended to cover the case where profits exceed two and a half times standard, and 18 per cent of total profits is substituted for 30 per cent of the excess over standard. These figures are shown in columns (11) and (12). The percentages in column (11) are 18 points higher throughout than those in column (5), up to the limiting point where gross dividends absorb 47.3 per cent of chargeable profits.

The penal effects of EPL on reserves—or alternatively the threat it provides for future dividends—can be measured by the differences between the figures in column (4) and those in columns (8), (10) and (12).

"Super-priority" in the Air

Presenting the Air Estimates to the House of Commons last Tuesday, the Under-Secretary of State for Air said that the Minister of Supply would shortly inform the aircraft industry of the steps to be taken in giving "super-priority" to the production of the new fighters. The first of these aircraft are due off the production lines late this year; it is therefore unlikely that any steps taken at this stage will bring them into squadron service any earlier. But if it is to have any meaning, "super-priority" must put the claims of the chosen aircraft ahead of those ordered at an earlier date. Aircraft production proceeds at inexorable pace; new capacity or new production lines sanctioned now would not begin to give results for a couple of years. This conclusion applies not only to the labour and machines needed in the aircraft factories, but also to claims on the capacity of sub-contractors. A large element in aircraft production is the machining and assembling of components that have been precision forged by specialist sub-contractors. In normal times the presses and other heavy plant used cannot be delivered in less than two to three years and hence capacity cannot be expanded at short notice. One of these specialist forgers, High Duty Alloys, is working now with plant that was ordered in 1947, long before rearmament was in prospect.

Because sub-contracting capacity is limited and heavily burdened with work, aircraft manufacturers tend to place their orders for components before they know their exact requirements and, for the same reason, place bigger orders than are strictly needed for the numbers of aircraft they expect to build. Hence the component makers and forgers quote exceptionally long delivery dates for urgently needed components for other aircraft. These delays have prompted some aircraft manufacturers to ask the Ministry of Supply for help in installing their own drop forging plant, though it is unlikely that, once the rearmament period was over, they could keep it employed.

If effective priority is to be given to individual aircraft, tools will have to be diverted from one company to another and specialised component-making capacity will have to be freed so that the requirements of the two aircraft manufacturers immediately affected can be met. Such steps would, it seems, inevitably affect the building programme of the Canberra bomber more than any other single aircraft. Three companies, A. V. Roe, at Manchester, Handley Page at London and Short Brothers at Belfast, are tooling up for production of the Canberra—a bomber that uses the same engine, the Rolls Royce Avon, as the two fighters, and uses two to their one. The Canberra is to be produced in the United States and Australia, so that the air forces are not wholly dependent on British production. Measures less drastic than these could hardly add very much to the output of fighters.

"D" Scheme in Operation

Vocal criticisms of the tax exemption levels for certain groups of articles have drowned the sighs of relief with which most industries have welcomed the ending of the utility scheme for clothing and textiles. Retailers generally consider that it provides the first opportunity for a return to normal trading or, as the house organ of a big retail group has put the point, "shopkeepers will once again be able to practise the gentle art of shopkeeping as it used to be practised before the war." The new purchase tax arrangements apply only to those goods that were delivered to retailers on or after last Monday, by which date most of the spring and summer stock had already arrived; retailers therefore have large supplies of untaxed goods. The withdrawal of the price control orders applies to goods in stock as well as to new deliveries. Together, these changes should mean that shopkeepers have considerable scope for averaging out the price of their taxed and untaxed stock and avoiding heavy losses on goods on which purchase tax has been paid at the old rate. No doubt the provisions against stocks made in the 1951-52 accounts of the big stores include some allowance for their tax losses.

A Board of Trade statement issued when the President made his announcement to the House of Commons ten days ago declared that it was impossible to give "any definite indication" of the effect of the D scheme on retail prices. Some speakers in the budget debate were less reticent. Labour members maintained that a man's suit which cost £12 9s. on Saturday would have increased to £15 10s. by the following Monday. It must be admitted that advertisements published by certain stores this week lend some support to this view. These announced that existing utility stock would continue to be sold at the "old" prices with a warning that new stock would be fifteen to thirty shillings dearer. This warning is entirely justified in the case of goods that previously sold at the top utility prices for their class, but such goods formed a small proportion of total sales of utility articles. Mr Thorneycroft pointed out that utility suits had a maximum price of £14 9s. 2d. but that many were sold between £10 and £12. The price of a £10 suit, now that it attracts purchase tax, would go up by precisely 1s. The same argument holds for the hotly disputed tax-free limit of £2 wholesale that has been fixed for shoes. Manufacturers and retailers have both protested that this low level victimises an industry already suffering from lack of orders. But for more than a year there has been only limited trade in shoes selling at the top utility price of around £5 retail; the price of the majority of shoes will go up by a few shillings at the most.

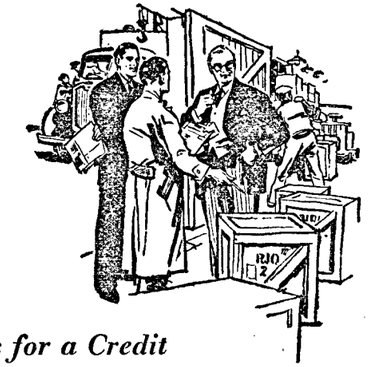
The indifference with which the public has received the news of last week's changes must be a disappointment to those who expected that the shops would now be filled with hunters after utility "bargains." In refusing to be stampeded into buying up utility stocks the public may in fact be showing not apathy but common sense, for consumers can see no sign that the fall in textile prices that started this year is likely to be decisively checked in the immediate future.

* * *

British Standards

An important section of Mr Thorneycroft's speech on the new "D" scheme was devoted to quality. It is proposed to lay down standards of quality, but the success of this project depends on a lively public interest and it has been received with an indifference even more chilling than that accorded to the changes in purchase tax announced by Mr Butler. It should not be difficult to get the three trade bodies, the Wool Textile Delegation, the Cotton Board and the British Rayon Federation, to agree with the British Standards Institution on a "British Standards" quality mark for wool, cotton or rayon textiles. Although manufacturers will be liable to prosecution for misapplying this mark, its use is to be wholly voluntary. Some manufacturers

IT BEGAN WITH THE CRUSADES



We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Bombay asks for a Credit

It is a simple matter for the Westminster Bank to establish local credits anywhere in the world, for there is no town of commercial importance in which it is not represented. Equally, the collection of funds due to you from foreign buyers presents no difficulties. The comprehensive service of information and advice which the Bank provides for those who trade abroad is fully described in a booklet called 'The Foreign Business Service of the Westminster Bank'. We shall be glad to send you a copy on request.

Head Office: Wellington, New Zealand

Branches also in
Melbourne and Sydney; Fiji and Samoa

Figures speak louder than words

For adequate control a typical intersection may need a minimum of two police officers if all-day point duty coverage is given. At £600 per head this would involve an annual expenditure of £1,200 *every year!* In comparison, an Electro-matic installation at an initial cost of £1,750 approx. — plus £175 p.a. for running and maintenance — can effect an economy of £300 in the *first two years* and a saving of £1,025 every year thereafter. Multiply these figures in ratio to a greater number of policemen needed, and the outstanding economies made possible by Electro-matic become even more impressive. All over the country thousands of Electro-matic installations are working full time providing an efficient, safe and reliable traffic control service on the most economical basis. May we — without obligation — call and discuss traffic control in *your* area?

Drawn by A. R. THOMSON, R.A.

A man of few words

Long before momentous events have become newspaper headlines, taciturn Tom Armstrong*, in charge of one of the paper-making machines at Bowaters Kemsley Mill, has run through the newsprint to carry the news.

At one end of the towering machine, a hundred yards in length, a sheet of liquid of the colour and apparent consistency of thin porridge is carried in by a moving belt. As it travels over a series of suction boxes this grey liquid quite suddenly whitens, for all the world like an egg beginning to poach. Almost instantaneously it has turned into paper, gliding on over steam-filled cylinders which carry it along to the roll.

If you can hear him above the noise, Armstrong will explain that four miles of paper are wound onto the roll every fifteen minutes throughout the twenty-four hours of every day. There are many such mammoth machines in the Bowater Organisation and this particular one happens to be the widest paper-making machine in the world. It is known, he will tell you, as "Bowaters' Number 5" — and it produces a roll 300 inches wide, which is cut into five to fit the printing presses. "Bit quicker than making papyrus," you shout. "What?" shouts Tom. "Quicker than making parchment," you bellow through your cupped hands. "No. 300 inches," Tom replies. "Widest in the world." And on a strip of newly-made paper he writes the figure down.

The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper — the 'know-how' in short — is freely at your service.

THE BOWATER PAPER CORPORATION LIMITED

*Fictitious name

believe that it is a sound advertisement to carry some kind of quality certificate and already submit their products to tests. But the widespread use of a quality mark depends upon the willingness of the public to recognise it and insist upon it. Mr Thorneycroft said that "the public can help themselves by demanding in future goods made in accordance with British Standards and bearing a certification mark, as they have in the past demanded goods bearing the utility mark." But utility goods were demanded because they were tax free, and the utility mark implied no clear assurance about standards of quality. It remains to be seen whether the public will show the same interest in a mark that offers a guarantee of quality without reference to the price that is charged.

The reform of the Merchandising Marks Act, to which the President of the Board of Trade referred, may prove considerably more important than these new standards. At present the Act provides a safeguard against false descriptions of weight, measure, materials and methods of manufacture, but not against misleading descriptions of goods such as claims to colour fastness, crease-resistance or waterproofing. Mr Thorneycroft promised that the Act would be amended in the next session to include misleading as well as false descriptions, but some retail traders question whether this will go far enough. It will then be possible to prosecute a manufacturer who makes claims of this kind for his goods when they have not gone through any recognised form of treatment, but, so long as treatment has been carried out, a manufacturer will still be able to claim that his product is, for example, waterproofed no matter how ineffectively it keeps the rain out. It is perhaps more important to protect the public from claims unjustified by actual performance than from the few open frauds to which they are still exposed.

Prosecutions for false descriptions are usually brought by the Retail Trading Standards Association, which has its own facilities for testing goods. The RTSA depends for its income on subscriptions from the big stores and from manufacturers. The average cost of a prosecution is about £120, considerably more than the costs awarded. The efficiency with which the revised Merchandising Marks Act is enforced may therefore depend on the RTSA's ability to increase its income by widening its membership or by the award of higher costs. It is, in fact, far simpler to draw up schemes for safeguarding quality than it is to make them effective, and there is some danger that lack of public interest, combined with the high cost of legal proceedings, will affect the successful enforcement of the "British Standards."

* * *

Improvisations in France

The European Payments Union has given M. Pinay a breathing space in which to struggle with his three-point programme to save the franc. Last week-end the Council of the Organisation for European Economic Co-operation agreed to put a special credit of $100 million at France's disposal. The whole of this loan, which is to be repaid on June 30th next, was swallowed up in helping to finance the French deficit with EPU in February. This deficit amounted to $128.9 million and it would normally have had to be settled by a $112.3 million payment in gold and a $16.6 million increase in France's overdraft with EPU; thanks to the special credit, the gold loss for the month was reduced to $12.3 million but France's overdraft has risen from $234.5 million to $351.1 million.

Internally as well as externally, French economic policy is still in the realm of day-to-day improvisations. The first point in M. Pinay's official programme is to check the upward trend of prices by reducing the profit margins of producers and traders. He has intimated, however, that he will eschew all forms of compulsion and will apparently depend for his success on enlisting the support of producers and other interests concerned. The second point in his programme is to reduce Government expenditure by the curious device of ejecting from the Budget the capital needs of the nationalised industries. He intends to force these industries to raise funds on the open market. Unless this means that the real investment programme is to be cut down, the net effect on the national economy of this juggling with Budget accountancy will be precisely nil. The third point in M. Pinay's programme is that of achieving a genuine balance of what might in Britain be called the "above the line" items in the Budget. If the tax proposals that led to the fall of the previous Government are abandoned, M. Pinay is faced with an "above the line" deficit of between Frs. 200 and 300 billion—and he has not yet made any specific proposals for filling this void. Meanwhile, the franc has temporarily strengthened on the foreign exchange market, thanks to covering of speculative positions after the EPU advance to France and the consequent postponement of expectations of devaluation. But it seems as if something more than M. Pinay's present programme will be needed if this recovery is not to be short-lived.

* * *

Britain's Deficit with Europe

The European Payments Union settlement for February reveals a welcome diminution in the sterling area's deficit with Europe; it fell from £54,060,000 in January to £22,351,428. Since Britain is now in the fifth slice of its quota, where 80 per cent of any deficit has to be met in gold, another £17,881,071 has had to be drawn from the gold reserves in London. The balance of the deficit was added to the United Kingdom's cumulative debit balance, carrying it to £217,574,000. The amount of gold lost to EPU to date totals £113,115,000. But the measure of the loss is also a measure of the gain that would be secured from a return to surplus with Europe. If, as is to be hoped, there is an early change in the account, thanks to import cuts and speculative

How OFTEN the happiness of a fisherman's family ends with those words!—and a bereaved wife or mother turns in bitter need to the Deep Sea Mission.

The Mission brings her God's message in her dark hours — provides comforts, aid, guidance if required. The happier side of the Mission's work includes social gatherings for fishermen's families, and the invaluable communication service that keeps them in touch with the fishermen as the fishing fleets journey from port to port.

The Mission is not state-aided. Its great work is paid for mostly by donations and subscriptions of devoted supporters. Won't *you* join them? Donations or requests for the free pamphlet *Stand by the Fisherman's Family* are welcomed by the General Secretary,

J. W. DONALD—

DEEP SEA MISSION

ROYAL NATIONAL MISSION TO DEEP SEA FISHERMEN
74, R.N.M.D.S.F. House, 43 Nottingham Place, London, W1

PLEASE do send any books or magazines that you can possibly spare for the fishermen—they are so VERY badly needed—to R.N.M.D.S.F STORES, QUAYSIDE, GORLESTON, GT. YARMOUTH

covering, gold recoveries should be proportionately large. Under the cumulative principle on which relative gold and credit payments are calculated a Britain in surplus would retreat down the various 20 per cent slices of its quota by retracing the steps with which it advanced. Thus, in the first instance, Britain would get back 80 per cent of any credit it accumulated in the form of gold and only 20 per cent would have to be devoted to repayment of its overdraft with EPU.

Restraint on Bank Advances

The latest quarterly classification of bank advances shows the restraint exerted by the new monetary policy to have been even more effective than appeared from the monthly statements of the clearing banks. These, as a note in these columns a fortnight ago pointed out, showed that in the three months to February 20th the total of clearing bank advances rose by only £8 million, to £1,933 million, whereas in each of the comparable periods of the two previous years it had risen by over £90 million. These totals, however, include advances made outside Great Britain, as well as some items that are not advances at all (notably cheques in course of transit between branches of each individual bank). The quarterly figures give a truer picture, since they relate only to domestic advances, strictly so defined, but include all members of the British Bankers' Association. This "clean" total rose during the three months to February last by only £39.6 million—though to a new peak of £2,056 million. This is by far the smallest movement at this time of the year since the quarterly series was started in 1946. In the corresponding period of 1950-51 the increase was no less than £123 million, in 1949-50 it was £113 million, and in 1948-49 £82 million.

Even more striking evidence of the effectiveness of the new monetary discipline can be seen in the classification of advances into 25 categories of borrowers. This shows that the whole of the quarter's rise in the total was attributable to the continued outpouring of credit to the nationalised electricity and gas industries that certainly account for the bulk of the advances classified under the heading of "Public Utilities (other than Transport)." Advances to this group have risen during the quarter by £41 million to no less than £135 million, easily a new high level. In the corresponding period last year, these advances rose by £14 million to £56 million. It will be seen, therefore, that the banks have succeeded, on balance, *in stabilising* the total of their credits to all other domestic borrowers—and, indeed, in fractionally reducing them.

* * *

The Medicine Works

This is a remarkable tribute to the strength of the new policy especially when it is remembered that under the former regime, when advances were going steadily upwards, the bankers all affirmed, with complete sincerity, that they were loyally observing the exhortations to them to lend only for "essential" purposes. This stabilisation has been achieved, too, at a time of strong seasonal demands for credit —chiefly for the payment of taxes, but also for other seasonal purposes. The new reluctance of the banks to lend even for the purpose of financing tax payments has no doubt exerted its effect on many categories of borrowers, but this effect is separately discernible only in the big category of Personal and Professional borrowings. In the past, these have invariably expanded at this season of the year, last year rising by £13 million; but in the first three months of the new monetary discipline, they dropped by nearly £7 million. At £429 million, they now represent hardly more than a fifth of total advances, whereas in the early postwar years they stood at not much under 30 per cent. Among other categories that normally make big demands at this season, the Retail Trade group has this time had to release £8½ million of credit, whereas last year it absorbed an additional £12½ million. Other notable declines are those of £10 million in borrowings by local authorities (raised by £10 million last year) and by the "Other Financial" group, which has repaid no less than £17½ million, whereas last year it borrowed £15 million.

The toughness in lending policy that these declines reflect has enabled the banks, without increasing their total credits to the private sector, to lend more to the active and expanding metal using industries. Thus the Engineering group has received an additional £15½ million, raising its total to £142 million, or 6.9 per cent of aggregate advances, compared with 5.5 per cent twelve months ago. Credits to the much smaller Iron and Steel group of borrowers have risen by more than one-third—by £6 million to £23.8 million. The additional credits have not, however, been confined only to these critical groups. An expansion of over £5 million in advances to the Cotton group, whose credits now total £19 million, plainly shows the part the banks are playing in financing the rising stocks of frustrated exports. Advances to the Wool Textile group, which in the corresponding period last year rose very steeply by £17¼ million in consequence of the soaring of wool prices, have this year contracted by £3 million, but the "Other Textiles" group has absorbed an additional £6 million. The moderate additional credits granted to two big groups—Food and Tobacco, and Agriculture—are well below the seasonal average.

Higher Building Societies' Rates

The Building Societies' Association has at last given ground before the rising tide of interest rates. Its council announced last Friday that it was recommending that members should consider raising the rates they pay on shares to 2½ per cent and on deposits to 2 per cent, and the rates they charge on advances to a minimum of 4½ per cent. After the previous increase in Bank rate in November, the council had recommended members to stand by the old pattern of rates of 2¼ per cent on shares, 1¾ per cent (with considerable variations) on deposits and 4 per cent on advances. The share and advances rates now suggested are those that two of the big ten societies—the Co-operative Permanent and the Temperance Permanent—had already adopted before the budget. It seems probable that, once due notice has been given to existing mortgagees and other legal formalities have been completed, the greater part of the movement will now follow suit. But the resistance of the giant of the movement, has often been able to attract savings at low rates) has estimated. The Halifax (which, as deposit rate and its announced that it is raising only its charge to new borrowers to the rate to existing mortgage charge to new borrowers to the present level; it is keeping its share rate and its charge to existing borrowers unchanged for the present.

With the commercial banks now paying 2 per cent on deposits and with some mortgage contracts making specific mention of Bank rate, widespread and enduring resistance would be surprising; since at least some housebuilding by the provided with an easy means of living off capital at a national present low rates, it may also be undesirable from an economic point of view. The real question may be, indeed, whether the movement has merely shuffled forward to a recommended pattern of rates that some societies may soon be prepared to abandon. With new money still coming in in ample quantity (some of it fleeing from low savings bank deposits at which the Inland Revenue is not casting an inquiring eye) there is no sign of any great urge to advance past the new pattern yet. It remains to be seen whether this attitude will long endure if there is any withdrawal of funds by surtax payers (who will lose their special advantages from building society investment after April 1st) or by investors tempted back towards the now friendless Stock Exchange later in the year.

Now your bicycle's all over my towel!

Young men of every generation are slow to realise how difficult it is to remove grime by washing. The housewife looking at her towels, has needed little telling. Within recent years sodium phosphates have come to her help. New washing powders, anonymously containing Albright & Wilson's phosphate products—although hardly abolishing washdays—are making clothes cleaner and whiter with much less effort on the housewife's part.

'ENGLISH ELECTRIC'

During 1951, 'ENGLISH ELECTRIC' turbo-alternators were supplied to many power stations all over the world, and ten new units went into service in the United Kingdom alone. These and other giant generators made by 'ENGLISH ELECTRIC' are making a valuable contribution to the supply of electricity to both industry and the home.

bringing you

In the field of television 'ENGLISH ELECTRIC' turbo-alternators often play a dual role, supplying not only the power to transmit the picture but also the power that enables television sets to receive it. The fact that many of these sets are also products of The ENGLISH ELECTRIC Company completes this further illustration of the ways 'ENGLISH ELECTRIC' brings better living to millions.

better living

Sun Life Dividend Cut

The reduction by the Sun Life Assurance Society of the next half-yearly dividend from 2s. per share net to 1s. 9d. per share net was an unpleasant surprise. In common with other purely life offices, the Sun Life declares a dividend after each actuarial valuation at a rate which it expects in normal circumstances to maintain until the next valuation ; the dividend in each of the next five years will, therefore, presumably be 3s. 6d. per share net. The shares were marked down on the announcement by 27s. 6d. to £8 ; at last Wednesday's price of £7⅞ they yield 4¼ per cent in line with other insurance shares. Reductions in insurance dividends are unusual, and speculation as to the reason is inevitable when one occurs. The whole of the 1941 valuation surplus of the Sun Life was carried forward and ten years' reversionary bonuses were declared at the end of 1946 ; the shareholder's proportion of the surplus then distributed enabled the dividend to be raised from the wartime level of 3s. 8d. per share gross to 4s. per share net, and this rate was maintained until the end of last year. Dividends during the last five years have, therefore, been swollen by what were in fact deferred payments for the war years when the dividend was sharply reduced from the prewar level. Whether or not this year's dividend could have been maintained had a transfer of £3,250,000 not been required for investment reserves cannot be ascertained until the 1951 accounts, the chairman's statement and further information regarding the basis of last year's actuarial valuation are published.

Under the provisions of the Assurance Companies Act, 1909, companies publishing an actuarial valuation of their liabilities (which need be made only once in five years) must certify that in the belief of the persons signing the balance sheet the assets are in the aggregate fully of the value stated ; the certificate need not be given by purely life offices in other years. Some strain on the inner reserves of the Sun Life is suggested by last year's replenishment ; in the absence of fuller information all that can be said regarding its extent is that all insurance companies have suffered depreciation of their United Kingdom Stock Exchange securities during the last five years and fixed interest stocks have fared a good deal worse than ordinary shares, in which the Sun Life has an exceptionally small stake. Examination of the profits statement suggests that a part of the transfer to investment reserves may represent actuarial reserves released by adjusting the valuation basis ; such a release would be wholly proper, for the rise in the rate of interest since 1946 has considerably reduced the present value of the liabilities of all life offices.

* * *

Delays in Port

Figures published by the Liverpool Steam Ship Owners' Association reveal a large increase in the weight of imports into United Kingdom ports last year, to 79.6 million tons compared with 63.2 million tons in 1950. If coal and petroleum cargoes are excluded, the comparative figures are 52.5 and 44.3 million tons respectively. It is estimated that 125 tons of cargo was carried per 100 tons net of shipping entrances, compared with 110 tons in 1950 and 98 tons in 1938. These figures suggest prosperous trading, but this favourable picture is clouded by port delays. In fact, five cargo liners are now required to do the work of four, and consequently there is more congestion in port for the same amount of cargo handled.

The association's annual report gives some examples of the delays suffered by liner companies in various trades during 1951. One company trading with India and the United States used to average three voyages a year with each ship before the war ; in 1951 the average was no better than 2¼ voyages, although most of the ships were faster and had greatly improved gear for handling cargo. United Kingdom ports compare unfavourably with those on the Continent and in North America. The average rate of discharge for bulk grain in Hamburg, for instance, was 128.22 tons per hour in 1951, compared with only 71.41 tons in London. Another operation involves the discharge and loading of general cargo at four separate American ports, at only one of which loading and discharge can proceed simultaneously. This operation, which includes steaming 900 miles, was performed in 17½ days. By comparison, 22 days were required to load one general cargo in two United Kingdom ports. Of the total time spent in West African ports, one fifth is spent merely waiting for berths, and the round voyage in this trade is taking 25 per cent longer than before the war. This involves one company in a loss of nearly 30 round voyages a year. Six weeks are entailed in turnround at several West Indies ports, which before the war cleared the ships in four weeks. The time occupied in loading and discharging in Liverpool, Glasgow and London is twice as long as before the war, and the same is roughly true about Santos and Rio de Janeiro. Thus ships trading between these ports are making only two voyages a year instead of about three and a half before the war. In some ports abroad freights have been subject to a special surcharge, because of inordinate delays. It does not say much for the efficiency of port operation in the United Kingdom that demands from continental shipowners for a similar levy on cargoes to be discharged in the United Kingdom are being resisted with difficulty.

Egyptian Cotton in Trouble

The Egyptian Cabinet decided on Monday night to come to the rescue of the Alexandria cotton market where business had been at a virtual standstill for some time. The Government is to buy Karnak (the long staple cotton) at 60.58 pence a lb, and Ashmouni (shorter staple cotton) at 34.89 pence a lb ; it will accept any quantity that is offered in order to clear stocks of old cotton before the new crop reaches the market. The crisis in the cotton market was a legacy from the Wafdist Government which adopted various measures to keep cotton prices up, despite the large stocks of cotton that it had to dispose of, at a time of falling world demand and of expanding American exports. Last summer the Egyptian Government of that time proclaimed minimum levels for the futures market of 74.58 pence a lb for Karnak and 39.78 pence a lb for Ashmouni, which were far in excess of current quotations. Demand evaporated and many operators in cotton futures were exposed to serious losses. By last month heavy stocks had accumulated and the new Government, in an effort to solve the deadlock, abolished the minimum prices fixed by their predecessors. This resulted in heavy losses for those holding cotton, but little response in demand. Prices declined sharply, because buyers continued to hold off expecting further falls. Whereupon the government introduced new minimum prices the only virtue of which is that they are much lower than the old ones.

Even these new prices will mean severe losses for some traders and will probably result in losses for the Government when it resells, because most buyers are still unwilling to pay the Government's price. Admittedly, the Government price for Ashmouni (which in American currency is equivalent to 40.71 cents a lb) is below the New York quotation for approximately similar grades, which was around 42.10 cents a lb this week. But the market in Alexandria is seriously overladen with supplies and exporters will probably look for much lower prices before they can be induced to buy.

Britain has bought little cotton from Egypt in recent months. Imports of long-stapled cotton between October, 1951, and January, 1952, amounted to 8½ million lb compared with 72 million lb in the same period twelve months earlier. On the other hand supplies from the Sudan have increased from 2½ million lb to 27½ million lb during the same period. In the case of medium stapled cotton (equivalent to Ashmouni), British imports from Egypt this season amounted to 16½ million lb against 47¼ million lb twelve months ago ; in contrast, supplies from the United States have increased considerably.

Freedom for Tea?

The tea trade is hopeful that rationing will soon be ended but these hopes seem to be built on a slender foundation. The Chancellor has decided to abolish the subsidy, a move that certainly suggests the first step along the road to freedom, but his words implied that even this step would not be immediate. Meanwhile tea merchants are watching the larger imports coming to this country and the growth in the Ministry's stocks and they assume that freedom might descend upon them any day.

Nobody knows how the public will react to the rise in the price of tea from 3s. 8d. a lb to 4s. 4d. On prewar experience, consumption should not decline significantly, but other food prices are also going up. The first stage is to see what happens when the subsidy is abolished and that step will no doubt be taken with an eye on the political atmosphere. Again, nobody knows for certain what the free demand for tea will be. Most guesses put it a little above 2½ oz a week; the present ration is 2 oz. The Ministry could test this by increasing the ration to this level and watching what is tecchnically known as the "off-take." Current shipments and stocks would seem to be adequate to make this experiment, but it would have to wait until the subsidy has been abolished.

The road to freedom therefore would seem to be marked by a series of milestones. First, the retail price must be increased so that the public is paying the world price. Then two or three months later, an increase in the ration to 2½ oz a week and possibly for a shorter experimental period to 2¾ oz would test the demand. Finally, a fairly accurate assessment of supplies in the new season will be needed, and that means waiting until the late summer. If the public shows that it will consume not much more than 2½ oz a week at the world price and if supplies are at least as plentiful as at present, then freedom in the tea market might become a possibility during the last three months of this year.

* * *

Steel Companies and the Public

The annual meeting of Dorman Long last week lasted barely a minute. Sir Ellis Hunter, as chairman, presented the brief directors' report and accounts to Sir Ellis Hunter, as representative of the sole shareholder, the nationalised Iron and Steel Corporation; in this capacity, he approved them. This cursory occasion marked the first disclosure to the public of a complete reorganisation of the company's capital structure, by which in September last the company repaid its debenture loan capital and converted the whole of its share capital into £1 ordinary shares. Its 6½ per cent first and 8 per cent second preference shares thus disappeared without trace. It is believed that Dorman Long is not alone in making such radical changes in its share capital, and that other steel concerns have also eliminated high-dividend preference capital, for obvious reasons. The company's trading profit in the year ended September 29, 1951, was £6,076,744 against £6,216,485 in 1949-50; its stocks and work in progress during a year in which two rises in steel prices took place, declined from £8,130,000 to £7,813,000. The company's procedure complies with its obligations; but apart from the public interest that might be assumed in the operations of publicly owned companies, Dorman Long's directors have presumably in mind some process of return to private ownership. They might have been expected, therefore, to afford some explanation of their policies and operations to the investing public whom they hope sooner or later may participate in the enterprise.

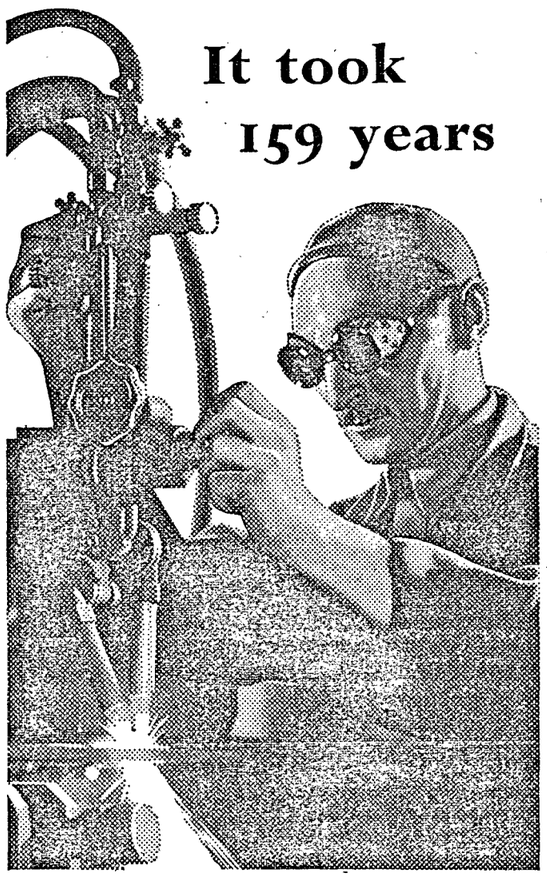
The contrast between Dorman Long's discretion and United Steel's detailed account of its operations in the year to end-September last is most marked. All that the Dorman Long report lacks in information about production, profits and finance is set down in great detail by United Steel. This is surely right. So far as is known, the Iron and Steel Corporation, as sole shareholder in the steel companies it owns, has left them free to draw up their reports and accounts as they think fit, subject only to the adoption of a standard balance sheet date at end-September. The investing public will surely hope that no other steel company follows the Dorman Long precedent of extreme reticence.

* * *

The Navy's New Engines

The First Lord of the Admiralty told the House of Commons during his statement on the Navy estimates that a new light-weight, high-powered diesel engine had been on test for the past year and is at present undergoing sea trials. Plans are being made for the "large-scale production" of these engines, which will be used in a new class of fast patrol boat. Little else has been released about these engines, but they appear to represent a radical advance on present design.

This research, as well as that on gas turbines, has been stimulated by the need for fast and comparatively small craft, and the emphasis in design has been on weight-saving; the majority of the new ships being built are either frigates or minesweepers. Like the new diesels, the gas turbines have the advantage of providing more power for less weight; they have the added advantage of requiring few spares and little maintenance. A number of experimental gas turbines of varying power are on order and some are already at sea; during the summer two motor torpedo boats were launched that are generally regarded as prototypes for a gas-turbine class. They are fitted with a combination of gas turbines and diesel engines. The diesel provides economical cruising power; the gas turbines provide power at full speed.



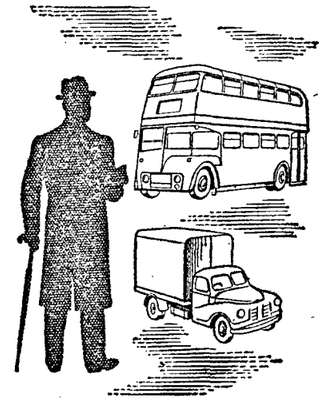
Two other new types of power unit are still in the research stage; one involved the use of atomic power and the other oxygen-bearing fuels. This second project is unlikely to be of much practical value. Fuels like these are the basis of most rocket propellants, as rockets—like submarines—have to carry their own oxygen. They are highly explosive, and their use would only add a further unnecessary risk to the many hazards of submarine operation. The atomic pile is a more attractive engine for this purpose; it needs no oxygen and infrequent re-fuelling. The Ministry of Supply commissioned design studies for such a reactor nearly two years ago, and the Navy has given its own contracts for design studies for the propulsive machinery.

Shorter Notes

The market received the news of a one in four scrip issue by "Shell" Transport and Trading with distinct relief, for the fear of a large cash issue had depressed the shares in the last week or so. The new shares will require the capitalisation of £10.9 million from share premium reserve, and they will not rank for the final dividend in respect of 1951 which is due to be announced in two months' time.

*

Last month the Indian Government halved the export tax on hessian to £56 a ton. Calcutta hessians are now cheaper on the American market than the local Osnaburg cottons that are used as a substitute, but American buyers have not resumed buying from India because they expect a further cut in the tax. The reduced demand for jute manufactures has depressed the price of raw jute to £120 a ton against £170 a ton two months ago. The Indian Government has this week abolished the export tax on groundnut oil, raw wool, kardi seed and niger seed; the duty on raw cotton has been halved to 200 rupees a bale and that on soft cotton waste reduced to 30 per cent ad valorem.



A keen eye and a steady hand guide the brilliant oxy-acetylene flame—and the metal is cut with astonishing ease and exactness. This modern craftsman works with care and skill, just as did six generations before him at Newton Chambers. It is a tradition with him to do a job just as well as it can be done and as well as it has ever been done. *At Newton Chambers every present-day development rests on the sure foundation of 159 years of hard-won experience.*

Look down the street

across the fields

...you see DURALUMIN

REGD. TRADE MARK

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

While shortages exist at present, this is a passing phase. Now is the time to consider the use of aluminium alloys in your business so that your plans may be complete when the needs of re-armament are satisfied. Our development department will advise, entirely without obligation.

JAMES BOOTH & COMPANY LIMITED
ARGYLE STREET WORKS · BIRMINGHAM, 7

Company Notes

International Nickel.—Last year International Nickel secured its two principal objectives. Production was increased to meet the flood of orders for nickel and copper swollen by industry's defence requirements, and the long-term programme to switch from surface to underground mining was brought much nearer completion. Everywhere, in fact—except in nickel deliveries—new records were set up. Nearly 11.8 million short tons of ore, against 9.8 million short tons in 1950, were mined—the increase coming entirely from the underground workings, where ore production increased to 7.8 million short tons. As production could not be augmented by drawing upon previously accumulated stocks—as was possible in 1950—nickel deliveries fell from 256.4 to 243.8 million lb; but there was an increase in refined copper deliveries from 212.9 to 236.9 million lb. From its sales, International Nickel earned nearly $286.8 million, compared with $228.1 million in 1950.

Operating costs, of course, continued to increase, from $130.3 million to $150.1 million; wages were raised twice during the last year and for some employees the working week was shortened. These increases in costs, however, were more than compensated by a

Common stock	60,766,771	60,766,771

Common stock at $5¼ yields £5 8s. per cent.

rise in the price of nickel in the middle of the year and by the economies associated with greater production; as a result operating earnings advanced from $86.9 million to $124.9 million and earnings per common share rose from $3.21 to $4.17 a share. This enabled the company to pay a record common dividend of $2.60 a share, compared with $2.0 in 1950.

Dividends in the next few years will depend in part upon the company's success in damping down the rise in costs that will inevitably follow the conversion from opencast to underground mining. By the end of next year, an annual production of 13 million tons is expected from the underground workings, and thereafter no more surface ores will be mined. Last year's progress towards this objective absorbed $15,888,942 of $23,737,575 spent upon capital developments and improvements, at least another $20 million of capital expenditure is planned this year, most of it to the same end. Already, however, the emphasis is beginning to shift away from capital costs towards operating costs. Mining by caving methods at the newly opened Creighton mine is but one instance of the efforts that are being made—and that will be progressively needed—to keep a tight rein upon working expenses.

★

De Havilland.—Production rather than development is De Havilland's immediate concern, and the directors have felt able to break with the very conservative dividend policy that they have pursued for some years past. They have been encouraged to take this step by an advance in group profits before tax from £1,071,101 to £1,773,594 in the year to September 30th; the rise in net profits from £421,983 to £639,290 certainly enabled a higher distribution to be safely made. In 1949-50 a dividend of 10 per cent was paid on an ordinary capital of £1,827,275. After this payment, the ordinary capital was increased by a 50 per cent scrip bonus to £2,740,912 and at the same time there was a rights issue of 1,644,547 new £1 ordinary shares. The directors now propose a distribution of 7½ per cent on the capital of £2,740,912 and a payment, as promised when the issue was made, of a quarter of that percentage on the new ordinary shares. In effect, the new rate of payment is equivalent to 11¼ per cent on the original capital. Subsidiary companies have held back £324,019, against £178,094, in their accounts, while £200,000, against £100,000, has been transferred to a general reserve.

As a progressive company whose profits have grown rapidly since the war, De Havilland will be hard hit by the excess profits levy, and equity shareholders might be unwise to look beyond a dividend of 7½ per cent on the revised ordinary capital of £4,385,459 in the immediate future. At the current price of 25s. the £1 ordinary shares yield 6 per cent.

★

Woolcombers and Illingworth, Morris.—The precipitate retreat in wool prices from the giddy peaks reached a year ago and the virtual drying up of new orders in the last half of the year mean that differing profits experience reported by leading woollen manufacturers are often a function of differing accounting dates. The business of Woolcombers, for example, fell off so sharply in the last six months of the financial year ended December 31st last, and especially in the last quarter of the year, that trading profits fell from £727,657 to £530,417. On the other hand, Illingworth, Morris, whose accounts were drawn up three months earlier on September 30th, report an "exceptional but nevertheless satisfactory" trading year; group trading profits jumped from £777,056 to £1,317,538. In view of the transient and exceptional nature of this increase, the directors of Illingworth, Morris have left the ordinary dividend virtually unchanged; in 1950 a dividend of 20 per cent was paid on an ordinary capital of £460,000, and in 1951 an interim dividend of 6½ per cent was paid on the same capital—now a final dividend

	Years to September 30, 1950	1951

of 6⅞ per cent is to be paid on the ordinary capital of £1,000,000, as increased by the recent 100 per cent scrip bonus and a cash issue of 400,000 4s. ordinary shares. Woolcombers have left their dividend unchanged at 13½ per cent.

Once the "complete and unhealthy, yet universal scramble for wool, yarn and cloth" was over and wool prices began to fall, very few fresh orders were placed with the woollen spinners and manufacturers. Fortunately, Illingworth, Morris, had sufficient orders in hand to keep its mills in full production until the end of last December, and even now "short-time running is not severe." In the factories owned by Woolcombers, however, orders in hand seem to have been insufficient to cushion profits against the sharp fall in new orders.

THE BOWATER ORGANISATION

A Policy of Continuing Development

AT THE ANNUAL GENERAL MEETING of The Bowater Paper Corporation, held in London recently, the Chairman, Sir Eric Vansittart Bowater, reviewed the consolidated Balance Sheet and Accounts of the company and its subsidiaries of which a summary is given below.

A substantial part of the earnings was attributable to extraneous profits arising from inflation but the higher level was also attributable to increased production generally, to achieve which the Organisation has spent during the last five years on plant, machinery and development generally some £9 million, of which only £3,200,000 was new money.

The overseas companies, from which so substantial a part of the revenues is derived, achieved record results, particularly the Canadian Company which shared in the great prosperity of the North American continent, and achieved all-time high records in the production of newsprint and pulp.

The business of the Organisation is such that it depends for its prosperity on high consumption and quantity production and the plants are laid out and designed to that end; it is one which has and should continue to have an ever increasing demand for its products, and the policy is of continuing development for so long as the market for increased production exists.

To that end plans for another newsprint machine at the Kemsley mills had been approved and orders placed for the plant and equipment; current plans include new steam and power plants at Kemsley mills and Thames mills, speeding up existing paper machines in the United Kingdom and development of the plants of the converting companies.

With regard to the United States, Sir Eric reported the successful conclusion of negotiations for the erection of an integrated newsprint and kraft sulphate pulp mill in Tennessee with an annual capacity of 130,000 tons of newsprint and 50,000 tons of pulp, to be constructed and operated by Bowaters Southern Paper Corporation. All the necessary governmental consents, including that of the U.K. Treasury enabling the parent Corporation to acquire the entire equity capital, have been obtained and the output of both newsprint and pulp covered by forward contracts.

The Canadian Company also continues its policy of development and plans for speeding up existing plant to maximum possible capacities are in course of implementation and orders for the replacement of two of the vessels lost during the war have been placed with a British firm. These developments will be financed out of the Canadian Company's own resources.

With regard to the future, Sir Eric said it was impossible under current conditions to make any detailed forecast, but in saying that the immediate future for the Organisation would appear to be not unsatisfactory, he had in mind that the earnings to date had been running at a reasonable level and so far as can at present be seen there is a fair prospect of maintaining full production of the plants in this country, and more than probable that the overseas companies would again enjoy a satisfactory year.

The Bowater Paper Corporation Ltd and Subsidiary Companies

Summary of Profits for the Year ended 30th September 1951

1950 £			£	£	
		PROFITS after deducting depreciation and interest on Loan Capital of overseas subsidiaries but before charging taxation		8,564,729

COMPANY MEETINGS

IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

SUBSTANTIAL ADDITIONS TO RESERVES: A PRUDENT AND NECESSARY PROVISION

TAXATION'S DEPRESSING AND DAMAGING EFFECT ON INDUSTRY

SIR ROBERT SINCLAIR ON THE RESULTS AND PROSPECTS

The fiftieth annual general meeting of the Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held on March 18th in Bristol.

Sir Robert Sinclair, KCB, KBE, the chairman, who presided, said: Before proceeding to comment on some of the more important aspects of the accounts I would invite your attention to that paragraph in the report which refers to the directorate.

Mr Stephen Mitchell, who died last June, was for many years associated with the branch which bears his name and, after retirement from active work, he continued to serve on the board; on both business and personal grounds we shall miss him greatly. Mr A. B. Mitchell, who resigned during the year, had been one of the managers of the W.D. & H.O. Wills branch; he was a valued colleague and we are sorry indeed that the time of his retirement from the board has come. Mr Charles Broadhead has been appointed a director since the last meeting; he has rendered outstanding service to the company as personnel manager; he still holds that office and his experience and general ability will, I am sure, be of great value to our board.

THE STOCK POSITION

Turning now to the accounts, you will observe that the comparison of our balance-sheet figures with those of last year is dominated by the increase of some £15,300 000 in stock-in-trade. In paragraph 3 of the directors' report it is stated that the value of stocks of general materials and stores has increased, but that is mainly because of higher prices, and the effect, though substantial in itself, is small in relation to the increase in the value of our tobacco stocks. These stocks consist of unmanufactured leaf in bond and in transit, leaf in course of manufacture, and our manufactured goods. In the value of the two last the major element is, of course, duty. During the year in question the rate of the duty was unchanged, and the amount of tobacco in course of manufacture and in the form of manufactured stock at the end of the year was very much the same as it was at the beginning. Thus it is that the predominant reasons for the substantial increase in this item are, as indicated in the report, firstly, larger quantity, and secondly, higher average price, of the unmanufactured leaf tobacco in stock.

Dealing firstly with the physical quantity of the leaf stocks, I would explain that we were enabled in 1951, for the first time for some years, to buy from the United States and Canada quantities considerably in excess of a year's using, and thereby to go some way towards putting our stocks in a healthier position. During and since the war we have been for most of the time leading a hand-to-mouth existence as regards supplies of dollar tobaccos (although, I am glad to say, gradually building up a better position in regard to sterling area tobaccos); but last year's tobacco crops in North America were large and contained a good proportion of desirable tobacco, and with the dollars available our leaf buying organisations there made purchases that were satisfactory in quality and quantity.

LEAF PRICES

I come now to the other point, namely the increase in price of our leaf stocks—this increase is largely accounted for by the fact that at October 31, 1951, the quantity of leaf in stock which had been purchased before devaluation was very much less than at October 31, 1950. Indeed, it had very nearly been exhausted; that is to say, practically the whole of the stocks of dollar tobaccos at October 31st last were purchased after devaluation, whereas a year before there remained a substantial quantity purchased before devaluation. But the increase in value is also a reflection of the higher prices paid on most of the markets last year. The dollar prices of our purchases in America were rather higher than in preceding years, but the rise was not as much, grade for grade, as might have been expected or as, in fact, was experienced in some other markets. In my speech last year I commented on the fact that it might well give cause for concern that the price increase in many sterling area markets had been as great as it was. Southern Rhodesia is the most important of these markets, and it so happened that last year the flue-cured tobacco crop there was short and of relatively poor quality by reason of adverse weather conditions. No doubt that fact helped to put up prices, grade for grade, somewhat abnormally, although it is, in general, true that the level of prices in sterling area markets has been a reflection of a world shortage of suitable leaf tobacco which is only gradually being remedied. Fortunately, as I have indicated, our stocks of tobacco from these markets had been comparatively good so that our manufacturing programme in the year under review was not restricted by last year's short crop in Rhodesia. Moreover, it is not, I think, unreasonable to hope that, with more favourable growing conditions this year, there will be an opportunity to restore the position by a greater purchase of suitable Rhodesian tobacco.

The increase of some £3 million in the debtors item is due, firstly, to the level of sales at the end of October last being somewhat higher than in October, 1950; secondly, though to a small extent, to the higher price; and, lastly, to the normal fluctuations in the proportion of accounts outstanding.

PROFIT AND LOSS ACCOUNT

The trading profit of the parent company, taking into account the special surplus, shows a small decrease of £500,000, while the income from dividends and investments is slightly more. For the group there is a net increase before taxation of £1,700,000. The difference is accounted for by higher earnings of subsidiary companies, for some of which trading conditions in the past year have been exceptionally favourable. The parent company consists of the tobacco manufacturing branches, our leaf buying organisations overseas, and our headquarters organisation. The subsidiary companies are, in the main, companies whose primary function is to supply the parent company with essential supplies — packing materials, cigarette paper, etc. But they do a considerable amount of outside trade and operate on a competitive basis. The dividends received by the parent company from these subsidiaries amount to £828,000, as compared with £946,000 in 1950, and the balance of their profit, after taxation, has been put to reserve to help towards meeting increased replacement costs.

CAPITAL AND RESERVES

You will observe that we have again thought it prudent to transfer to leaf replacement reserve the special surplus which arises from the conversion to sterling at post-devaluation rates of exchange of the cost of such of our pre-devaluation stocks of dollar tobacco as we used during the year. The quantity of pre-devaluation tobacco used was in total substantially less than in the previous year, and, as I have already explained, by October 31st last the stocks of that tobacco had virtually been exhausted. Thus it is that the transfer to reserve on this account is this year £1,344,000, as compared with £3,073,000 in the previous year.

The use of the description "Special Surplus" has, I am afraid, given rise to some confusion of thought even to the extent of an inference that it is in some curious way a profit which arises from devaluation. To this company, which has to purchase part of its raw materials in dollars and sells only in a sterling market, devaluation of the £ represents a very substantial additional expense. It has been, and is, a substantial addition to our costs, requiring us not only to put our brands on a basis which currently can carry that extra cost, but also to provide additional finance to cover the dearer stock we need. It was for these reasons that we thought it fitting and prudent to put to reserve before considering any other appropriations the net amount of the profit which represented the difference between post- and pre-devaluation cost of the dollar tobacco purchased before devaluation and used during the year. But it is unfortunate and, as I have ventured to suggest, unreasonable that amounts of this nature, and applied in this way, should be subject to the severe deduction represented by profits tax and income tax.

It will be noted that bank overdraft and acceptance credits are, taken together, higher than last year, despite the fact that this year the balance of money due on the loan stock issue has been brought in. This increase is, of course, a reflection of the increase in the quantity and value of stock-in-trade to which I have already referred. For reasons which I will explain later the capital required for stock-in-trade at October 31st next will probably be appreciably less.

As is noted in paragraph 7 of the report, £1,344,000 is put to leaf replacement reserve; £800,000 is transferred from the balance of the parent company's profit, after taxation, to that company's general reserve; just over £1 million, after tax, has been added to the reserves of the group from profits of subsidiary companies; and the carry-forward of the group is increased by

£120,000. As a group, therefore, we have added this year some £3,300,000 to reserves apart from the provision for future income tax. It is perhaps too much to expect that we shall succeed in doing as much every year, but, so long as present conditions persist, we must regard a substantial addition to our reserves from the year's profits as a prudent and indeed necessary provision.

TAXATION

The charge for UK taxation in the parent company's accounts is about £1,300,000 more than last year, but this includes nearly £400,000 provided to cover the additional 6d. on the standard rate of income tax imposed in last year's Budget and payable on the 1950 profits. For the group the total charge, including the figures I have mentioned, is £16,166,000, or nearly £3 million more than last year.

You will not, I am sure, expect me to give any precise estimate of the effect on this company of the excess profits levy introduced in the Budget last week. It would be premature to do so until there has been an opportunity of studying the detailed proposals which in due course will be disclosed in the Finance Bill. Nevertheless, looking at the general rather than the particular position, I cannot refrain from saying that however grave the country's economic situation may be—and no one can deny that it is very grave—and however courageous are the measures to deal with it, it is a pity if the great contribution that industry can make to our national recovery is to be hindered by additional costs and taxation which combine to increase the difficulty of maintaining the capital which is the real structure of industry.

I am sure that industrial firms generally—certainly the overwhelming majority of those engaged in their management—are very conscious of their responsibilities in these critical days, and will not waste time by protesting against the new tax being given general application, on account of the physical impossibility of segregating those profits that are directly or indirectly derived from the re-armament programme. There may well be important points of detail which require further consideration when the text of the Finance Bill is available. But two facts cannot in my judgment be over-emphasised. The first is that some way has got to be found of making it less difficult than it is for industry to maintain its capital. I mean by that some revision of the basis on which profits are computed for tax purposes and some reduction of the weight of taxation so as to diminish the inflationary effect which it undoubtedly produces at present. The second is that some real reward, other than tax reliefs in limited cases or increases in remuneration which are in effect mainly increased contributions to the Exchequer, should be possible for greater ability, for better and more skilful application of scientific knowledge or management technique, and for increased responsibility or for risks successfully undertaken. Sooner or later the depressing and damaging effect of present taxation in this respect will receive recognition, and the sooner that happens the better for industry as a whole and for the increased productivity of the country.

DIVIDEND

The rate of dividend on the ordinary stock is the same as last year. I need hardly remind you that this rate is less than it was a few years ago, and that the working capital has very substantially increased. Moreover, the gross amount distributed in dividend is slightly less than it was before the war, and with the higher rate of income tax which now operates the net amount is, of course, appreciably less than prewar. When the purchasing power of the £ declines, as it has done in recent years, the investor might look for the number of pounds that he receives in dividend to be increased in some rough proportion to their fall in purchasing value. And he might the more reasonably expect this when he knows that operating costs including the remuneration of the other partners in industry—the salary and wage earners—have increased, and when he sees the increased money value of most of the items on the assets side of the balance-sheet. But, of course, the fact is that under present conditions many businesses, including our own, can do little if any more than earn a profit sufficient after taxation for some substantial annual provision towards meeting the steeply rising replacement costs and for the distribution of approximately the same amount in dividend, even though the purchasing power of that amount is much reduced. I hold no brief for any rigid limitation of dividends—a policy which is the antithesis of the encouragement to enterprise and efficiency which we need so badly today. Yet, in these critical times, I could not advocate, in the interests of higher dividends, a policy which increased profits to a point which prejudiced our goodwill or helped even in some small degree to fan the fires of inflation into stronger flame. Although tobacco may not be, strictly, a necessity of life it is perhaps more than a luxury, and we cannot ignore the fact that with the present very high rate of duty it is an item which has some weight in the official index of retail prices.

When all things are considered and regard is had to the considerable financial burden we have to carry, I hope that our stockholders will feel that the results of the year's operations are not unsatisfactory.

GIFT TO STAFF AND WORKPEOPLE

As will be seen from the report, the directors have decided once again to recognise loyal and efficient service by making a gift to staff and workpeople over and above their ordinary salary and wage.

The conditions of the gift are unchanged. It is paid as a percentage on total salary or wage received during the year ended October 31, 1951. This year the rate will be 14 per cent and the cost at that rate will be not less than the cost at 15 per cent last year, and, of course, substantially greater than it was a few years ago. It will be clear that this is the result of general increases in salaries and wages during the year.

The directors reserve to themselves a discretion to grant or withhold a share in the gift in any case that may appear to them to require exceptional treatment.

The results which the company has achieved reflect good team work. My colleagues at headquarters and I endeavour to visit all our factories and offices frequently—and, I may say, derive very real pleasure and benefit from so doing—and I can assure you that the conditions under which the work is carried on are good, that efficiency is all the time improving with advances in machinery and technique, and that we are a team. Efficiency, good working conditions (and that includes welfare), and the preservation of a really happy spirit among all our employees are the constant care of our branch managements, and there will be no disposition to rest on our laurels.

THE OUTLOOK

On our particular section of the front the outstanding features are, firstly, leaf supplies, and, secondly, costs, including duty.

The curtailment this year of the imports of dollar tobaccos will mean a return to the position where the stocks of these tobaccos in this country are at the bare minimum, even allowing for our considerable and increasing using of tobaccos of suitable quality produced in the sterling area. But we will do everything possible to meet public demand, and meet it with brands that continue to be very acceptable to the smokers of this country. In course of time as the country's economic situation improves we may reasonably expect that the stocks we hold in this country will gradually be restored to a satisfactory level for all the growths that are needed to maintain good quality blends in our products.

While it lasts, the reduction in leaf stocks will, of course, correspondingly reduce our need for finance so that, as far as we can see, the extent of our short-term indebtedness should be less next October than it was in October last.

Duty is, of course, the chief element in the cost of tobaccos and cigarettes. Frequent allusion has been made in the past to the undoubted dangers—to the industry and to the revenue—which must arise from too long a continuance of a rate of duty which is a very real deterrent to new smokers and imposes a severe penalty on those who now smoke. There can be no doubt that each year that passes, with prices as high as they are, does tend to sap the foundations of the trade and the contribution it makes to the national revenue. We may perhaps be somewhat reassured, if not consoled, by the fact that the Chancellor indicated in his Budget statement that he is alive to these dangers. Our fortunes as a company are very closely linked to the economic strength of the country, and in the present critical state of the country's finances it is, I think, our job to make the best of the situation and, despite all the difficulties, do our utmost to maintain production and sales and therefore the duty revenue.

At this meeting a year ago I referred to several factors which were increasing our costs, but I added that we would avoid as far as we could increasing the prices of our products to the public, and, where that was impossible, would keep the increase to the minimum. Unfortunately, during the year under review our costs, apart from duty, continued to rise in all directions. I have referred to the increases in the cost of our raw materials, but practically all other costs also rose, and all that we were able to do by way of increased efficiency—and there have been, I am glad to say, still further improvements this year—did no more than prevent the burden we had to carry increasing by more than it otherwise might have done. As you may remember, we made some small price increases in certain pipe tobaccos more than a year ago, and by last summer it was clear that we could not avoid some increase in the price of cigarettes. The increase made, however, was as small as possible, and it has had no adverse effect on the popularity of our brands.

Only some 2½ months of the new cigarette prices are reflected in the accounts before you today, and we would anticipate that a full year's benefit of these prices will, in general terms, offset the increases in costs. I think that, unless some entirely unforeseen complications arise and subject, of course, to further examination of the excess profits levy proposals when the Finance Bill is available, there are good grounds for hoping that the results of the current year's trading will not be very different from those we now present. But I would not feel justified in these uncertain times in pitching my hopes higher than that.

JUBILEE OF CORPORATE EXISTENCE

In conclusion, may I draw your attention to the fact that this is the fiftieth annual report of the company. It marks the jubilee of our corporate existence, and, with the account of the proceedings of this meeting, stockholders will receive a booklet describing and illustrating some of the company's present activities and telling something of its history. The tobacco manufacturing branches are, of course, the successors of firms of considerable antiquity. For more than two centuries, the names of some of them have been household words. And I think events have shown that those who formed the company 50 years ago last December were wise in their adoption of a policy which preserved the trading identities of these firms, while giving them the strength of cohesion and a pooling of resources and experience.

Confronted as we now are with altogether abnormal conditions, with recurring economic crises, with a rate of duty that only a few decades ago would have transcended the wildest flights of human imagination—we may be tempted to look with envious eyes on what, from this distance, seem to be the smaller problems of earlier years. Yet, in facing up to the difficulties of the present we can fittingly acknowledge our debt to the past. At the company's formation and at various times in its history problems that were formidable by any standard were successfully solved, and we may well be thankful today that there are, built into the structure of our company, the beneficial results of 50 years of prudent administration. Nor are such benefits purely material, or capable of precise evaluation. They include manufacturing experience and technical skill that have been accumulated over many years, and traditions of loyalty and service that had their origin in the constituent firms long before the company was formed. Moreover, I think we can justly claim that throughout the years there has been a steady enhancement of the goodwill of our trading branches with the public who buy their goods. These are assets of great price.

I now have pleasure in moving "That the report and accounts for the year to October 31, 1951, now presented be received and adopted."

I will ask the deputy chairman, Sir Wilfrid Anson, to be good enough to second that resolution and, in doing so, I am sure you would like me to say how very pleased we all were when, in the Birthday Honours last year, we saw the announcement of the Knighthood conferred upon him in recognition of his great services to the country and to this industry in particular.

Sir Wilfrid Anson seconded the resolution, which was carried unanimously.

The chairman then moved "That the payment of dividends of 5½ per cent on the 'A' 5½ per cent cumulative preference stock of the company, 6 per cent on the 'B' 6 per cent non-cumulative preference stock of the company, and 10 per cent on the 'C' 10 per cent non-cumulative preference stock of the company for the year to October 31, 1951, and the payment of an interim dividend of 13½ per cent on the ordinary stock of the company on September 1, 1951, be and the same are hereby approved and confirmed."

The resolution was seconded by the deputy chairman and carried unanimously.

The chairman then moved: "That a final dividend of 18½ per cent on the ordinary stock of the company for the year to October 31, 1951, be declared and be paid forthwith."

The motion was seconded by the deputy chairman and carried unanimously.

RE-ELECTION OF DIRECTORS

The chairman continued: The next resolution, ladies and gentlemen, is one of which notice was contained in the paper sent to you summoning this meeting and it reads: "That Mr George Adolph Falk, who is aged 75, having been born on June 2, 1876, and who is retiring from the board by rotation under the Articles of Association, be and is hereby re-elected a director of the company."

Although Mr Falk retired from active work at the end of the war, he retains a very keen interest in our affairs, keeps in close touch with many of us and is a most regular attender at our meetings. He has a very great knowledge of this industry and his wisdom and judgment are great assets to our board. For these reasons, as well as on personal grounds, I have the greatest possible pleasure in proposing this resolution, and I will ask the deputy chairman to second it.

The deputy chairman seconded the motion and it was carried with acclamation.

On the proposal of Mr A. G. Thomson, seconded by Mr C. H. Clements, the other retiring directors were unanimously re-elected.

The chairman announced that the auditors, Messrs Deloitte, Plender, Griffiths and Company, would continue to act in that capacity, their reappointment being automatic under the provisions of Section 159 of the Companies Act, 1948.

VOTE OF THANKS

Proposing a vote of thanks to the chairman, Mr S. G. B. James said that his personal association with Sir Robert had extended over 30 years, and in his opinion the chairman's outstanding quality was leadership. In so many aspects of national life leadership had been sadly lacking, and the company was most fortunate to possess a man so gifted in that respect. Some might say that the chairman had a tremendous driving force, but that so often suggested a picture of a man behind urging his team on. That was not so in this case, for Sir Robert was always out in front leading. Results were achieved by his inspiration and by the example set not only to his colleagues on the board, but to the most junior employee in office and factory.

At the end of next week their chairman was due to start on a tour of the company's African organisation, and he was sure that all stockholders would wish him a happy and successful trip.

Seconding the resolution, Mr R. M. E. Reeves said that he also had known the chairman for over 30 years and had always admired his never-failing calmness and steadiness even when things were very difficult, as business life had been in postwar years.

The motion was put to the meeting and carried with acclamation.

In brief acknowledgment, the chairman thanked the meeting for their reception of the motion and said how much he was indebted to the splendid team whose loyalty, knowledge and help in every possible way had brought about the results shown.

The proceedings then terminated.

ALDERS (TAMWORTH) LIMITED

STRONG POSITION

CONFIDENCE IN FUTURE

The sixteenth annual general meeting of Alders (Tamworth) Limited, was held on March 14th in London.

Mr E. B. Montesole, JP (the chairman), presided and, in the course of his remarks, said: During the year under review trading conditions have been greatly influenced by the wood-pulp market, which resulted in steadily increasing costs, and prices by the end of 1951 had reached an all-high level. Scarcity and heavy demand added to the inflated selling prices of paper. Her Majesty's Government has now taken action, and by currency allocations and by fixing a ceiling price on wood-pulp it is hoped the widely fluctuating conditions which have existed will disappear.

The accounts reflect the abnormal trading conditions and are no true criterion of the future; in support of this view your board recommends an appropriation out of taxed profits of no less a sum than £120,000, which should be adequate to meet any possible fall in stock values. So far as home-produced materials are concerned the price of waste-papers has risen between two and three times its former figure, but these stocks are quickly turned over and there is no insuperable difficulty in meeting such a situation.

As pioneers in the use of waste materials, including straw, we have increased production so as to establish a record for all our mills. This result has only been attained by the loyalty and fullest co-operation of our colleagues, staff and employees, who have made an outstanding contribution to our own and the national needs both as regards rearmament and export.

The last few weeks have shown a recession in trade, and while it is dangerous to prophesy, your board has confidence in the future; the fact that our plant and machinery at the various mills is entirely modern and economically run encourages us to think that we are in a sound position to meet the ever-changing conditions and whatever competition may arise.

The report was adopted.

BIRMINGHAM CITIZENS PERMANENT BUILDING SOCIETY

A YEAR OF CONTINUED PROGRESS

The annual general meeting of the society was held at the Imperial Hotel, Birmingham, on Wednesday, March 5, 1952. The chairman, Mr George Howe, presided, and in moving the adoption of the report and accounts said:—

The year under review is one which again records steady progress. The total amount invested with the society during 1951 was £490,646 and after allowing for the withdrawals there is a balance of £3,118,518 due to members, an increase of £190,247. Interest at the rate of 2¼ per cent tax paid by the society has again been paid for 1951, and it is proposed as and from April 1, 1952, to increase this rate by ¼ per cent making a total yield of 2½ per cent equivalent where tax is paid at the rate of 9s. 6d. in the pound to a gross return of £4 15s. 3d. per cent. The restrictions as to amounts which could be invested had been removed.

Advances during the year amounted to £772,390. The balance now due was £3,681,743 an increase of £179,325. Applications from sitting tenants formed a substantial part of the mortgage advances. Investments in Government securities and cash at bank amounted to £453,141 which represents 11 per cent of the total assets.

The profit and loss account shows a gross income of £156,827. After allowing income tax and profits tax £35,037, which is approximately 20 per cent of the society's gross income, management expenses £18,924 and other outgoings, the net profit was £84,328 out of which £67,018 was paid to shareholders at the rate of 2¼ per cent tax paid, and £15,000 transferred to general reserve fund. Total reserves and carry forward are £139,866. The total assets now amount to £4,144,644, an increase of £276,278.

The report and accounts were adopted and the retiring directors, Messrs. J. B. Chatterley and W. H. Madin were re-elected. The manager and secretary, Mr Leslie Goode, was also co-opted to the board of directors as a mark of appreciation for twenty-one years' service.

THE EASTERN BANK, LIMITED

A BUSY YEAR

The forty-second annual general meeting of The Eastern Bank, Limited, will be held at 2 and 3 Crosby Square, London, E.C., on April 9th

The following is an extract from the statement of the chairman, Sir Evan M. Jenkins, GCIE, KCSI, circulated with the report and accounts for the year to December 31, 1951:

The balance sheet total at £29,325,664 is higher by £1,666,271 than that of 1950. Current, deposit and other accounts show an increase of £1,617,051, and on the other side cash and bills receivable are up by £1,098,826 and advances by £2,526,970, while investments are down by £2,298,157. Net profit is £124,763 against £123,928 for 1950.

CHANGING TRADE TENDENCIES

The year 1951 was, like 1950, a busy one, but as the months passed signs began to appear of what may be a real change in trading conditions. Commodity markets were weaker and, though the demand for manufactured goods remained generally high, sellers were probably less comfortable than they had been at any time since the end of the war. These tendencies have continued into 1952 and will need careful watching.

The appropriations made from net profits are the same as those for 1950—£30,000 to premises and £60,000 to reserve for contingencies, and the final dividend recommended is again 3s. 6d. per share, less tax. We shall shortly be building premises at Aden, Baghdad and Karachi, and a reasonable appropriation to premises is desirable.

There has been little change in the conditions in which our Eastern branches work. The cost of living is still very high and is reflected in salaries and allowances, and building is as expensive as ever.

CONDITIONS IN THE EAST

In Iraq the outstanding event of the year was the negotiation of agreements between the Iraq Government and the companies concerned with the production and distribution of oil. It has always been the policy of the Iraq Government to apply almost the whole of the oil revenue to permanent development, and with the large resources available under the new oil agreements the Development Board and certain departments of the Government—to which 30 per cent of the resources will be allotted—will be able to undertake a really comprehensive programme of development. Business in Iraq in 1951 was satisfactory.

In Bahrein and the Persian Gulf business was well maintained during 1951 with steady prices and a lively demand for Continental and Japanese goods. The revenue derived from oil made it possible for the Ruler of Bahrein to carry out extensive improvements. Progress during the past few years has been impressive and is continuing.

In India the favourable swing of trade continued for the first quarter of 1951; thereafter, except in May, monthly balances were adverse. Economically, Pakistan has had another very prosperous year, with buoyant revenue and a favourable trade balance. Imports remained high and overbuying of piece goods led to a fall in prices which proved embarrassing to some importers. Ceylon has had another prosperous and tranquil year with a markedly favourable trade balance. Imports continued at a high level, assisted by some reductions in duty. Plans for the further development of the island are in hand.

CENTRAL LINE SISAL ESTATES

MR E. W. BOVILL'S STATEMENT

The fifteenth annual general meeting of Central Line Sisal Estates Limited was held on March 12th in London, Mr E. W. Bovill (the chairman) presiding.

The following is an extract from the chairman's statement which was circulated with the annual report and accounts for the year ended June 30, 1951:—

The consolidated accounts show a profit for the year of £155,111, after providing for rotation planting, London administration expenses and depreciation on buildings, machinery, rolling stock, etc.

Taxation absorbs £82,775. Much progress has been made during the year towards the settlement of the company's taxation liabilities; in fact, we are now almost up to date. Last year you will remember that I referred to the provision for taxes in dispute amounting to £15,700 in respect of the appropriate relief for payments of East African income tax and expenditure on native housing. On the advice of counsel we have reluctantly accepted the Inland Revenue's decision regarding the basis of relief for East African tax, and accordingly the relative provision of £6,400 has been transferred to current taxation liabilities. With regard to expenditure on native housing, the Inland Revenue have agreed that the amount expended for the year 1948 should be allowed as a charge in that year and therefore the relative provision of £2,222 has been transferred back to the profit and loss account. The balance of the item "taxation in dispute," amounting to approximately £7,000, has now been transferred to current taxation liabilities, pending the outcome of our continuing negotiations with the authorities.

The directors of the subsidary company have transferred £25,000 to general reserve and the general reserve of the parent company has been increased by £5,000 making in the aggregate £100,000. The board recommend the payment of a final dividend of 30 per cent, less tax, making with the interim dividend paid on June 29, 1951, 35 per cent, less tax, for the year. This will absorb £35,832. The balances to be carried forward to next year in the books of the parent company and the subsidiary company will be £4,117 and £3,053, respectively.

Our production of fibre totalled 2,032 tons, of which 1,124 tons came from Pangawe and 958 tons from Kingolwira. The big difference between the amount of fibre produced in the year under review and in the previous year is largely due to our now operating only two estates.

LABOUR POSITION

When I was in East Africa a year ago I naturally gave considerable thought to our labour problem. The conclusions I reached were not reassuring. Every estate was short of its needs. Our estates were worse off than some, but better off than others. Wherever I went I heard complaints of inequitable allocations of labour. I formed the opinion that the labour bureau were doing their best in an impossible task. We Tanganyika sisal growers have to face the basic fact that there is not enough labour to go round. Today there are 100,000 more wage-earning Africans in Tanganyika than before the war, but this increased labour supply is more than off-set by a greatly increased demand for labour, notably for Government-sponsored development schemes, but also for the planting industry to which high commodity prices have given a great stimulus.

WATER SUPPLY AT PANGAWE

Our other major problem has been the inadequacy of the water supply at Pangawe. There is probably no estate in East Africa which can produce sisal to equal that of Pangawe, but owing to an inadequate supply of water the quality of our fibre suffers and our costs are far too high. Great efforts have been made to improve the estate's own water resources, but we have been forced to the conclusion that no matter what we do they will never prove fully adequate. Happily the estate has been granted a permit to draw water from the Ngerengere River which lies on the far side of Kingolwira from Pangawe, and the work of laying down a pipe line and erecting a new pumping station is now in hand.

We have had under consideration the building of a central electric power station for the two estates in order to free ourselves from dependence on a number of prime movers. This project has been postponed in the hope that a public supply will become available before long at reasonable rates. If we are disappointed in this hope we shall have to proceed with our central power station project.

As shareholders are aware, our admirable Pangawe estate is a little handicapped by lack of land for new development and for providing gardens for our labour force. Two alternative ways of overcoming this shortage of land are now open to us: which we adopt depends upon negotiations which are now proceeding.

THE WAMI FARM

Although our Wami Farm incurred a loss of £3,603 in the year under review there is no reason to regret our having embarked on this venture. It was, and still is, our intention that it should pay its way, and this we hope it will do. But its real object was to ensure an adequate supply of food for our labour force in the famine years which periodically afflict East Africa and which, in the face of increasing population and chronic soil erosion, are likely to become more frequent.

A year ago I told you that we were still suffering the consequences of the disastrous drought of 1949. We are still feeling its effects. Our young areas are more backward than they should be and our nurseries are not adequate to our needs. Consequently our future production may be prejudiced, but not, I think, to a serious extent, especially as recent rainfall has been unusually heavy.

EFFECT OF CLIMATIC CONDITIONS

Considerable publicity has in recent weeks been given to the damage done to the sisal industry by the flooding of estates and by sun-scorch. These two evils have in my view been greatly exaggerated. Few sisal estates are so low lying as to be subject to flooding and our two estates are not among them. Sun-scorch has, for climatic reasons, been unusually widespread in the last year, and we have not escaped. In consequence the quality of our fibre will suffer a little in months to come, but the effect of sun-scorch is temporary and not a reason for alarm.

A matter which is causing the board some concern is our high cost of production. Official wage rates have recently been greatly increased by as much as 55 per cent. for one category of labour, and in East Africa, as in this country, practically all other charges tend steadily to rise. Nevertheless we consider our costs too high. Our new water scheme should help to bring them down.

Finally I must pay tribute to our general manager, Mr A. J. Marr, and his staff. Their burden is no light one. The problem of the competing demands on our inadequate supply of labour—for production, maintenance, planting, building, etc.—imposes on them a heavy burden of responsibility, but they are discharging it in a manner which does them credit.

The report was unanimously adopted.

SIXTY MINUTE CLEANERS

RECORD TURNOVER AND TRADING PROFIT

MR J. WILSON NICOL'S STATEMENT

The eighteenth annual general meeting of Sixty Minute Cleaners, Limited, was held on March 18th at the company's registered office, Annfield House, Maule Street, Carnoustie Mr J. Wilson Nicol (chairman and joint managing director) presiding.

The secretary (Mr Alex J. Hay) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended November 16, 1951, and was taken as read:

I have pleasure in submitting to you the eighteenth report of the directors of the company, together with the balance sheet of the parent company, and the consolidated profit and loss account and balance sheet of the parent company and subsidiaries for the year ended November 16, 1951.

The trading profits of the group this year amount to £159,312. Last year, when there were no profits brought in from the newly acquired subsidiaries, the trading profit for the year amounted to £101,926, but, of course, the figures are not comparable.

DRY CLEANING BUSINESS

So far as the company's principal business of dry cleaning is concerned, the year under review again constituted a record in the company's history in turnover and in trading profit. The net profit from dry cleaning is £28,113, as against £27,865 last year, depreciation having taken £24,154 (against £19,768).

Income-tax, £41,000, and profits tax, £36,000, for the year are not comparable, as the group has been treated as a whole for profits tax purposes.

During the year, your directors have opened a new branch at Chelsea, and the Galashiels branch has been operating throughout the year. The company is restricted in the opening of new branches by the limitations imposed by the Government on building licences, and shortage of raw materials for dry cleaning, but new ideas have already been put into operation for overcoming part or all of these difficulties. Shareholders may, therefore, rest assured that no opportunity of obtaining suitable new premises will be overlooked.

SUBSIDIARY COMPANIES

You will expect me to say something of the experiences of your subsidiaries during the first year of trading. As shareholders will know, the clothing and other textile trades have in recent months, been going through a difficult time. The turnover for the companies for the year under review was a record, and until the autumn months of 1951 very gratifying profits were being earned; but owing to certain irresponsible utterances, and to the general shortage of money, coupled with the fluctuation in wool prices, some sales resistance was encountered during the latter months of 1951, and the trading profit for the full year was disappointing in that it fell below the average for the two previous years.

Your directors are hopeful that as these subsidiaries produce essential articles of children's outer wear, trade will again improve in the spring of this year. In order to strengthen the position for the future as far as possible, your directors have written down the stocks in the subsidiary companies, by what is considered to be a reasonable sum, namely an amount equivalent to an overall reduction on cost price of approximately 18 per cent, which includes a sum of £10,000 provided as a fluctuation reserve. Shareholders will appreciate that such a rate of depreciation is quite considerable, and they should know that wool, which has fluctuated very sharply in price during the course of 1951, forms only a small percentage of the cost of a finished garment.

FUTURE OF CLOTHING INDUSTRY

The future of trade in the clothing industry is very difficult to forecast, but your directors will energetically pursue a policy of good service, confident that they have a first-class factory producing in Peter Pan coats and accessories the ultimate in value for money. The export market is also being increased as much as possible.

During the year it was decided, in order to raise further capital to finance stocks in the subsidiary companies, to dispose of the heritable properties in Edinburgh, Aberdeen, Dunfermline, Galashiels and Perth. These properties were sold for a total consideration of £91,000, which was in excess of the prices paid for the properties, and it was a condition of the sale of these properties that the purchaser should grant very long leases extending to 99 years at what are considered to be very reasonable rentals. The company is thus assured of security of tenure, while at the same time they raised capital which has been, and can continue to be usefully employed in the group.

DIVIDEND MAINTAINED

In view of the considerable appropriations which have been made for depreciation on all the companies' assets, and the sums which they have been able to place to reserve, your directors consider they are fully justified in maintaining the dividend on the increased capital at 7½ per cent for the year.

The old service agreements having expired, the joint managing directors have signed new service agreements for a further period of five years, thus assuring continuity of the policy and administration which has proved so successful in the past.

TRIBUTE TO STAFF

The results obtained, which your directors in the circumstances consider reasonable, could not have been achieved without the active co-operation of the staff and, on your behalf, I should like to thank them for their efforts during the year.

The report and accounts were unanimously adopted and a final dividend on the ordinary stock of 45 per cent, less tax (making 75 per cent, less tax, for the year) was approved.

The retiring directors, Mr Horace Bell and Mr Andrew R. Wylie, were re-elected; the appointment to the board of Mr Ronald H. S. Anderson was confirmed; and the remuneration of the auditors, Messrs G. and J. McBain, CA, having been fixed, the proceedings terminated.

BRITISH HOME STORES LIMITED

GROWING FINANCIAL STRENGTH

The twenty-fourth annual general meeting of this company was held on March 19th in London, Mr Horace Moore, the chairman, presiding.

The following is an extract from the chairman's circulated statement:

The profit for 52 weeks, against 53 in the previous year, before taxation, was £1,063,619, against £959,239. Provision for taxation takes £625,000, compared with £542,500, leaving the profit, after taxation, £438,619, as against £416,739.

To general reserve is placed £274,649, bringing the total to £1,125,000. The proposed final ordinary dividend is 9d. per stock unit, less tax.

The Capital Issues Committee have given permission to capitalise the sum of £496,493 14s. from the company's general reserve and distribute two new ordinary shares for every ordinary stock unit of 1s. held. The issue will be made by renounceable allotment letter to stockholders on the company's register at the close of business on March 17, 1952, and the new stock units will rank for dividend as from January 6, 1952.

TRADING CONDITIONS

In 1951 we again had a large increase in turnover, but profit margins were lower as we had to meet substantial wage increases and rising costs of operation. A year ago I commented on the abnormally high costs of commodities and expressed the view that such levels would not be permanent. Towards the end of 1951 the shopping public became very price-conscious and refused to pay the prices then ruling. This resistance quickly brought about a reversal of the former price trend. Fortunately we are solely retailers, so that our losses, while considerable, have been limited. However, we have been able to end the year with clean stocks and a low forward order position.

The old saying "The customer is always right" begins to mean something again, particularly in textiles, and I believe that this reversal from a sellers' to a buyers' market will finally bring benefits to the community. If present conditions continue, from now on all concerned will have to be on their toes, the efficient will prosper, the inefficient may not survive.

A GROWING OUTLET

We have a very large and continually growing outlet to the public for the sale of low-priced quality goods of many types in everyday demand. I have welcomed the action taken in removing controls and, in my view, some of those remaining, particularly in clothing, could now safely be dropped. Such a course would tend to reduce the costs of production even faster.

Our new store at Southampton, the largest in our chain, was opened in November. Business there has been satisfactory. The Government have many serious problems to deal with, but we do enjoin them to show every possible sympathy to the quick restoration of the shopping facilities of the cities and towns, which have suffered so long in the cause of freedom.

The year has been particularly trying and difficult, but as always our staff have responded and given of their best.

The way in which we have been able to meet and surmount the manifold problems which have arisen encourages me to hope that next year we may once more report progress and a satisfactory year's trading.

The report was adopted.

MITCHELL COTTS AND COMPANY

ANOTHER RECORD YEAR

The annual general meeting of Mitchell Cotts and Company Limited will be held on April 9th in London.

The following is an extract from the statement by the chairman, Mr Leonard Aldridge, CBE, FGS, which has been circulated with the report and accounts:—

The year was a period of continued progress for your company and your directors are pleased to be able again to show a record profit and a correspondingly strengthened position.

During the year to June, 1951, there was a considerable increase in the turnover of nearly all companies in the group. This was due not only to rising price levels, but also to an increase in the volume of business. The group's exports from the United Kingdom alone amounted to about £6,600,000 for the year and during the current year have been running at a level equivalent to about £9 million per annum. Imports of produce and other materials into the United Kingdom were in excess of £2 million, and trading between overseas branches of the group has been at an increased level.

Under more stable conditions your directors might have felt that the overall position justified an increase in the ordinary dividend. You will recall that the 25 per cent rate has been maintained since 1947, although in 1949 an issue was made at par of three ordinary shares for every seven held. However, after careful consideration, the board decided that the interests of the company and shareholders would best be served by maintaining the same distribution.

OVERSEAS INTERESTS

Both our South African and East African groups of companies showed substantially improved results and their trading since the close of the year has been fully maintained.

It is interesting to record that one of our companies in South Africa will make a major contribution in the development of projects for the production of uranium by several of the large South African gold mines. Our subsidiary has been awarded very important contracts for the design, supply and erection of uranium plants and additional large orders are under negotiation.

In the Middle East there was also a very marked improvement and up to the present time political disturbances have not greatly affected our business in that area.

Our Far Eastern, Italian and American subsidiaries have shown better results and rendered useful service to the other members of the group. Our United Kingdom subsidiary, Alexander Young (London) Limited, trading in the Far East, has also increased both its turnover and earnings. In London the parent company has had an active and satisfactory year, most departments showing increased turnover and profit.

The expansion of our business, which has continued in recent months, has called for additional finance. Your board, who are carefully studying the present position, may decide that an increase of permanent capital is advisable. With this possibility in view you will be invited at the annual general meeting to pass the necessary resolution to increase the authorised capital to £3 million by the creation of 3 million ordinary shares of 5s. each.

Preliminary figures for the current year are promising and if conditions remain no less favourable in the coming months I am sure we can look forward to another satisfactory year.

BORAX CONSOLIDATED, LIMITED

FURTHER EXPANSION

The fifty-fourth annual general meeting of Borax Consolidated, Limited, was held on March 18th in London, Mr D. Abel Smith, MC (the chairman), presiding.

The following is an extract from his circulated statement:

Our expansion during the year is evidenced by a further increase in the trading profits, which have risen from last year's figure of £1,407,774 to a new record of £2,043,621. At the same time our investment income has risen from £260,397 to £367,425. After charging directors' remuneration, depreciation and debenture interest, the profits before United Kingdom taxation are £2,049,391, compared with £1,558,601 last year. The charge for taxation totals £1,258,000 against last year's figure of £907,000. This leaves a net profit for the parent company of £791,391 compared with £651,601 in 1950, the Group figures being £892,462 (1951) and £687,662 (1950).

CAPITAL EXPENDITURE

Capital expenditure during the year amounted to just over £1 million. We increased productive capacity in the case of some products, whilst in the case of others we modernised plant and machinery. Our overall aim has been to mechanise and reduce the cost of labour wherever possible. We have been successful in this, and the beneficial effects of some of this expenditure were already felt in the year under review. The increased output assisted us materially in holding down production costs.

The sellers' market continued during the period under review. Demand was stimulated by some of our buyers stockpiling to protect themselves against possible future shortages. This caused our plants to be operated at top capacity, with the result that production everywhere broke all records. I must point out, however, that since the end of our financial year conditions have changed again, and we are now in a buyers' market. The demand has fallen off considerably, and we do not expect it to pick up again until the rather large stocks built up by many buyers during 1951 have been reduced. In order not to accumulate stocks ourselves, we have had to ease output, which the flexibility in our productive capacity permits us to do without great penalty in the cost of production. For the foregoing reasons we do not expect to repeat this year the remarkable record which we have achieved in the year under review.

US POTASH COMPANY'S GOOD YEAR

The increase in the income from our trade investment came from the United States Potash Company, and this company has had another very good year, their production and sales having achieved a very high level.

I feel sure you will wish me to express our great appreciation to our executives, both at home and abroad, for the excellent results obtained during a difficult year. Our thanks are due to them as well as to all our agents in Britain and overseas. Their extensive knowledge of the varying requirements and individual characteristics of each consuming centre has always been and is of the utmost value to us in maintaining the high demand for the products sold under our famous 20 MULE TEAM brand.

The report was adopted, and a final dividend of 5½ per cent (making 7½ per cent for the year) and a bonus of 2½ per cent on the deferred ordinary stock was approved.

NATIONAL MORTGAGE AND AGENCY COMPANY OF NEW ZEALAND

A GOOD YEAR

The seventy-sixth annual general meeting of National Mortgage and Agency Company of New Zealand, Limited, was held on March 18th in London, the Rt Hon Lord Glenconner, the chairman, presiding.

The following is an extract from his circulated review:—

In spite of abnormal conditions the company has had an exceptionally good year, ending September, 1951. Wool has played an important part in the profits earned. The year 1951 was, in fact, the most remarkable one in the long history of the wool trade. Great as the advance in prices had been before Christmas, 1950, it was eclipsed when sales were resumed in the New Year.

A second important influence was due to the widespread publicity given to the rise in prices. As a result the public bought clothing and other textiles, so that a record output of the world's textile industries in 1950 was cleared without difficulty. Then came a sudden and a dramatic change.

It was announced in Washington that the stockpiling had been suspended and there was no buying for current military needs in the United States for the next few months. The civilian trade, too, became very quiet and there was nothing to prevent a headlong slide in prices.

The mercantile side of the company's business has once again had a most successful year. Turnover has been exceptionally large. Net trading profit for the year at £108,643 shows only a small increase over last year.

The report was adopted.

BREVITT LIMITED

ANOTHER SUCCESSFUL YEAR

The third annual general meeting of Brevitt Limited was held on March 17th in London, Mr E. S. Harding (the chairman) presiding.

The following is an extract from his circulated statement:

I am once more pleased to be able to report a successful year's trading by the group, the accounts showing a net profit of £211,104 before taxation. The difficulties and uncertainties of trading conditions, to which I referred in my review last year, have continued, and I think, therefore, you will regard the results of the year as satisfactory.

An important factor contributing to the trading result which has been achieved is an expansion in turnover, and that this has been possible reflects great credit upon the factory staff, who have obtained the additional production by efficient management. The increase in turnover represents an increase in trade both at home and overseas, and "Brevitt" is proud to be by far the largest exporter of women's shoes from this country to the United States of America.

The directors recommend the dividend on the ordinary shares be maintained at the rate of 20 per cent per annum (less tax) for the year.

The balance of the profit and loss account to be carried forward to next year amounts to £46,443, of which £24,103 has been retained in the accounts of the subsidiary companies apart from the reserve for future taxation, now totalling £85,000.

All the company's factories are employed to full capacity and our order book is full.

The report was adopted.

SCOTTISH AMICABLE BUILDING SOCIETY

DIAMOND JUBILEE ANNUAL GENERAL MEETING

The sixtieth annual general meeting of the shareholders of the Scottish Amicable Building Society was held on March 17th in Edinburgh. The President, Lord Inverclyde, KStJ, DL, said in the course of his speech:

During the year business conditions in a troubled world have proved perhaps more favourable for building societies than might have been anticipated. We have been told that 1952 will be a hard and difficult year, and this has been confirmed by the Chancellor of the Exchequer.

The President made reference to the encouragement given by the Government to local authorities to increase the grant of licences to would-be owner-occupiers of newly built houses, a welcome policy to the many thousands who wish to become home owners. He also referred to the national necessity for thrift, pointing out that building societies will continue to be a very popular medium for savings, and this has been proved by the very satisfactory increase in the Society's investment department.

STRONG LIQUID POSITION

The President continued: I would draw your attention to one or two of the more outstanding figures in the annual report. The sum at the credit of shareholders and depositors has increased by £1,445,460. Investments in trustee securities and cash at bank amount to £3,644,216, representing 20.8 per cent of the amount standing at the credit of shareholders and depositors. The Society invested considerable sums in Government securities during and after the war, thus forming a sound liquid position. Owing to the decline in the gilt-edged market, the valuation of Government Stocks at the end of the financial year was less than the "book value"; your directors point out, however, that the Society's holdings consist solely of trustee securities, redeemable at par, and the redemption value exceeds the amount at which they stand in the books. A special investment reserve account has been created in recent years and now amounts to £150,000.

Mortgage assets show an increase of £1,481,554 to £14,372,250, and it is worthy of note that interest accrued and in arrear amounts to only £2,478. Share investors, depositors and borrowers now total 53,123. The assets have increased by £1,513,674 to £18,342,943.

After allowing £51,500 for depreciation and reserve funds, equivalent to 15.2 per cent of the divisible profits, the directors recommend allocating interest to unadvanced shareholders at the rate of 2½ per cent, income tax paid by the Society, leaving a balance of £13,160 8s. 6d. to be carried forward. Intimation has already been made of the board's recommendation that as from 16/2/52 the rate of interest on share investments be increased to 2½ per cent, income tax paid.

The president then stated that it was a fitting opportunity to pay tribute to the chairman and managing director, Mr Wm. S. Allison, who has completed thirty-one years' service; he has made the interests of the Society his life's work and is an acknowledged leader of the Building Society Movement.

The president referred to the exceptional strength of the Society's financial position enabling the future to be faced with well-founded confidence.

The report and accounts were approved.

ARISTON GOLD MINES (1929) LTD

The twenty-second annual general meeting of Ariston Gold Mines (1929) Limited was held on March 18th in London, Major-General W. W. Richards, CB, CBE, MC, chairman of the company, presiding.

The following is an extract from his circulated statement:—

Production and Ore Reserves.—328,370 tons of ore of an average grade of 7.134 dwts were milled during the year, against 293,000 tons of 7.564 dwts grade milled for the previous year. In addition, 5,402 tons accumulated concentrates were re-treated; 808 ozs of gold was produced from the special treatment of slags.

The total amount realised for the year was £1,327,446, against a total of £1,286,506 for 1950, an increase of £40,940. The ore reserves at September 30, 1951, were computed at 2,933,991 tons of an average value of 6.73 dwts, showing a decrease of 191,353 tons and an increase in value of .07 dwts. as compared with the preceding year's figures.

UNDERGROUND DEVELOPMENT

On the recommendation of the general manager and the technical advisers after a careful assessment of the company's ore reserves position in conjunction with the available supplies of labour and materials, it was decided to limit expenditure on development work to the exploration of the North Ore Body, where development on the 24th level has proved its downward extension with the consequent indication of a considerable further tonnage of payable ore. This is a development of major importance.

The tonnage sent to the mill from the mine is within the present 30,000 tons per month capacity of the plant. A final milling unit is now in course of shipment, to bring the total milling capacity up to 40,000 tons per month. Delivery of the winding engine necessary for this higher milling rate is expected in approximately 12 months.

The gross revenue at £1,327,446 is again a record, from the treatment of a record tonnage of 328,370 tons. Costs show a progressive increase at a total of £771,948, or 47s. per ton, against £659,387, or 45s. per ton for the previous year, despite every effort made both technically and administratively to reduce expenditure wherever possible.

The net result of our operations is a profit of £332,424 before taxation, being a reduction of £163,281 against the previous year. Ore development redemption at £61,245 is £17,834 more than last year. The cost of development redemption averaged 3s. 8d. per ton.

TAXATION

Although the company obtained some relief from taxation on the year's profits from initial allowances in respect of capital expenditure incurred during the year, the total charge for taxation (including gold duty) absorbed 62 per cent of the company's profits against 51 per cent in the previous year. The Gold Coast Government alone took some 38 per cent of the company's profits for Gold Coast income tax and gold duty, the total amount of which exceeds the distribution to members.

Dividends.—We have a total available for disposal of £240,548, out of which an interim dividend of 7½ per cent, less tax (2¼d. per unit) was paid on May 11th last. Your board now recommends the payment of a final dividend of 17½ per cent, less tax (5¼d. per unit), making a total of 25 per cent (7½d. per unit) for the year (less tax).

The report and accounts were adopted.

GOLD COAST MAIN REEF

CONTINUED PROGRESS

The eighteenth annual general meeting of this company was held on March 17th in London, Major-General W. W. Richards, CB, CBE, MC, chairman of the company, presiding.

The following is an extract from his circulated statement:—

The financial year ended on June 30, 1951, was one of continued progress. The net profit, after writing off £24,109 for depreciation and £31,060 for development expenditure, amounted to £34,413, as compared with the previous year's net profit of £9,937. We maintained the unbroken series of dividends since the year 1940-41 by the distribution of 5 per cent, less tax; and this has been followed very recently by an interim distribution of 5 per cent, less tax, for the current year ending on June 30, 1952.

Our mining activities extend over a length of four miles, from the Tuappim Mine at the south western end of our concessions running through the Bondaye and Ekotokroo sections up to our common boundary with the Ariston Mine. We are on the same line of quartz reef as Ariston, and it is very desirable that our two companies should work in the closest harmony to the best advantage of each. I have stressed this policy in my annual reviews during the past two years, and I am pleased to report that the liaison between the two mines has advanced quite materially since I last addressed you. This has permitted the introduction of various economies.

The liquid position of our company is distinctly more favourable than for some years past, and we can look forward with hope and confidence to the future.

The report was adopted.

HILGER AND WATTS

WORLD MARKET FOR PRODUCTS

The fourth annual general meeting of Hilger and Watts Limited was held on March 20th in London.

Mr G. A. Whipple, MA, MIEE (chairman and managing director) who presided, said: The accounts show an available surplus of £37,118, against £35,373 for the previous year. The trading surplus amounts to £162,006, against £145,528. The directors again recommend a first and final dividend on the ordinary shares of 7½ per cent, less income tax.

Difficult trading conditions persist, but we are fortunate in that our products have a low raw material content with a high conversion value. They are therefore viewed with especial favour by the Board of Trade and other interested departments.

Our associate company, Scientific Exports, will shortly be sending three specially trained University Graduates to strengthen their existing technical sales staff in Canada. North America is now our largest single market, and when I was there last autumn I formed the opinion that its capacity to take up our products is almost unlimited. Whilst still maintaining its export sales, your company is nevertheless contributing to the rearmament programme.

Our instruments continue to find favour throughout the world. Several very important new instruments have been put into production during the year; others are in course of development.

Great credit is due to our production staff in maintaining current output whilst planning and organising for the new factory; nevertheless, the coming months will be difficult.

The report was adopted.

CHURCHILL & SIM LIMITED

A GOOD YEAR

The fourteenth annual general meeting of Churchill & Sim Limited (timber brokers) was held on March 18th in London.

The report and accounts for the year ended December 31, 1951, showed a consolidated net profit, before taxation, of £155,365. A final dividend of 9 per cent is being paid on the ordinary shares plus a bonus of 10 per cent, making a total for the year of 25 per cent, compared with 15 per cent for 1950.

The following statement by the chairman, Mr J. C. C. Sim was circulated with the accounts:—

I greatly regret that it is my first duty to refer to the death of your late chairman, my father, Mr A. Chatterton Sim, who died in July last year. Mr Chatterton Sim was one of your founder directors and served with your company and its predecessor for over 50 years. Messages of condolence were received from all over the world.

HIGH LEVEL OF TIMBER PRICES

You will see from the accounts that our profits for 1951 are considerably more than for the preceding year. As mentioned by my father in his statement to you last year, this is, to some extent, due to contracts which were intended for 1950 shipment being shipped in 1951.

The very high level of timber prices ruling during the year contributed to the increase and, in addition to this, the company considerably expanded its trading activity.

After making provision of £75,640 for taxation, £30,000 is being placed to reserves, bringing the total of reserves up to £200,000.

Your directors recommend that a final dividend of 9 per cent be paid on the ordinary shares and, having regard to the trading result, they also recommend the payment of a 10 per cent bonus dividend, making a total payment of 25 per cent for the year.

TRADE'S HEAVY BURDEN

Although it was expected by many that all imported softwood buying would be handed back to the trade at an earlier date, it was not until the commencement of the current year that the Government took this step; in doing so, they imposed individual import quotas which will considerably reduce softwood importers' purchases from abroad. Even so, with the high prices ruling for softwood, hardwood and plywood and the present tendency to restrict borrowing powers, the trade will carry a heavy financial burden.

I record with much pleasure our sincere thanks to the assistant directors and members of the staff who have given your company such loyal support; this has greatly contributed to an excellent year's trading result.

The report and accounts were approved.

AMENDED

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES. The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1952. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1952, may eventually be announced. Successful candidates may be appointed immediately. The Scientific posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first or second-class honours in an appropriate scientific subject (including engineering) or in Mathematics, or equivalent qualification, or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1952 may be admitted to compete before the result of their degree examination is known.

Age Limits: Senior Scientific Officers, between 26 and 31; for Scientific Officers and Patent Classes, between 21 and 28 during 1952 (up to 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales: Senior Scientific Officers (men) £812-£1,022; (women) £681-£917; Scientific Officers (men) £440-£707; (women) £440-£576; Patent Examiner and Patent Officer Classes (men) £440-£655. (Rates for women under review.) Somewhat lower rates in the provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S. 53/52 for Senior Scientific Officers and S. 52/52 and S. 128/52 for the other posts.

THE ACCOUNTANCY OF CHANGING PRICE LEVELS
PUBLIC MEETING

arranged by the London Area Committee of the Institute of Cost and Works Accountants, to be held at Beaver Hall, Great Trinity Lane, London, E.C.4, at 5.15 p.m., on April 1, 1952, under the Chairmanship of Sir Henry Wilson Smith, K.C.B., K.B.E., a Director of Powell Duffryn Ltd., and late Second Secretary H.M. Treasury.

Mons. Francois-M. Richard, an eminent French accountant, will discuss French fiscal policy in an inflationary economy, and will show how the problem is being handled in France. The talk is addressed to business men, accountants, and economists.

Tickets of admission are free and obtainable from the Director of the Institute, 63 Portland Place, London, W.1.

SALES ADMINISTRATION.—A large firm of Paint Manufacturers (Public Company) in the London area has a vacancy for a Sales Executive with wide experience in Sales Administration. Knowledge of the technical side of paint selling is desirable but not essential. The person appointed will act as assistant to the Managing Director with special responsibilities in connection with Sales, and should be of a calibre suitable for eventual appointment to a Directorship.—Write in the first instance to Box L.337, c/o Streets, 110, Old Broad Street, E.C.2.

GRADUATES in Psychology required, aged 24-30, by large business organisation in London. He is required to assist in the work of a small group, under an experienced social psychologist, concerned with the development of methods for assessing attitudes and opinions. He should be interested in, and familiar with, qualitative methods and able to handle such data. The work involves the study of consumers by continuous contact, and will give ample opportunity for experimental work. The post is progressive, and the company operates a contributory pension scheme.—Write giving brief particulars of age and qualifications to Box 890.

FERRANTI LTD. have an important vacancy for a man of suitable qualifications and experience to study the uses of the Ferranti Electronic Computer in large-scale accounting and statistical calculations. He will be required to prepare detailed reports on systems now in operation and to work with mathematicians on the problems which arise in the application of new techniques.

Permanent staff appointment with superannuation benefits and generous salary according to qualifications.

Forms of application from Mr. R. J. Herbert, Staff Manager, Ferranti Ltd., Hollinwood, Lancs. Please quote reference DC Comm.

ACCOMMODATION AVAILABLE for conferences and summer schools at Needler Hall, Cottingham, during the months of July, August and September, 1952. Hall of Residence with facilities for 68 residents. Further particulars from The Registrar, University College, Hull.

BERTOLA is the Cream of Sherries.—Ask for BERTOLA CREAM.

ORGANISATION and methods man (39), of wide experience, administrative and journalistic ability, seeks responsible position anywhere.—Box 912.

UNIVERSITY OF ADELAIDE

Applications in writing are invited for the position of Reader in Commercial Studies. The appointment carries the status and superannuation benefits of a Reader in the University. Particulars of the general conditions of appointment of Readers may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The salary range is £A1,250—£25—£A1,450 a year; in addition, it is confidently expected that as from January 1, 1952, a cost-of-living allowance of not less than £150 a year will be added to all academic salaries in the University.

The Reader will be under the Professor of Economics for administrative purposes. His duties will include the teaching of some courses in Accountancy and the supervision of all courses in Accountancy and of those courses in Law which fall within the curriculum of the Faculty of Economics.

Applications in duplicate should (a) give particulars of age, nationality, academic qualifications, practical experience, war service (if any), and a list of publications (if any); (b) give the names and addresses of two referees of whom confidential enquiries may be made; and (c) be accompanied by copies of testimonials from persons other than the two referees, by a recent photograph and by a medical certificate of health. They should reach the Registrar, the University of Adelaide, not later than March 31, 1952.

A. W. BAMPTON, Registrar,
University of Adelaide,
North Terrace, Adelaide,
South Australia.

RHODES UNIVERSITY, GRAHAMSTOWN, SOUTH AFRICA

Applications are invited for the posts of:
SENIOR LECTURER IN ENGLISH
and
LECTURER IN ECONOMICS AND ECONOMIC HISTORY
from July, 1952.

Salary scales:

Senior Lecturer:	Men	—£600 x £25—£850 p.a.
	Women	—£550 x £25—£700 p.a.
Lecturer:	Men	—£550 x £25—£700 p.a.
	Women	—£425 x £25—£575 p.a.

Plus a variable cost-of-living allowance, at present about £109 p.a. for single persons and £256 p.a. for married persons. Previous experience and academic qualifications may be taken into account in fixing the initial salary.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is *April* 15, 1952.

ACCOUNTANT (Chartered or Incorporated) required as Assistant Secretary to a large public Company in the textile trade in Manchester. Age 30 to 40 years. Commercial Experience desirable. Excellent prospects.—Write Box 246, Wheelers Advertising Agency, 18, Pall Mall, Manchester, 2.

WILL any company employ barrister, Oxford graduate, as understudy to company or assistant company secretary with view to his assuming position in due course?—Box 910.

BRITISH CELANESE LIMITED require a Statistician with some years' experience in industry for work based on London. Age between 27-32 years. Qualifications required equivalent to Association of Incorporated Statisticians Final standards. This is a new post and offers good opportunities to the right man. Applications, enclosing full details of age, experience and qualifications, should be sent to the Personnel Manager, British Celanese Limited, 22 and 23, Hanover Square, London, W.1.

ACTUARIAL STUDENT, preferably having passed Part II of the examination, required to assist with consulting work in Johannesburg. Generous salary and excellent prospects. Apply stating age, qualifications and experience, to Messrs. Shepley, Fitchett & Eriksen, Consulting Actuaries, P.O. Box 6831, Johannesburg.

A.C.A., A.C.W.A., N.A.C.A. (45), experienced in standard costs, budgetary control and management, accounting generally, at present Secretary/Chief Accountant, requires post with more scope.—Box 893.

"SHE is a woman, therefore to be won." Advertising to women is an art in itself—a mixture of insight, experience and exact knowledge of their tastes and buying habits. You draw on many years of experience of advertising to the feminine market when you consult SAMSON CLARK & CO. LTD., 57/61, Mortimer Street, London, W.1. MUSeum 5050.

LADY, 36, B.Sc. (Econ.) Hons., 15 years' administrative, executive and statistical experience, industrial and organisational, in U.S., Europe, China, seeks permanent responsible post in London. Initial salary less important than assurance of advancement when merit proven.—Box 901.

UNIVERSITY OF LONDON
LEON FELLOWSHIP

Applications are invited for the Leon Fellowship for Research (preferably in the fields of Economics or Education) for the Session 1952-53. The Fellowship is of the value of not less than £500 a year, and is tenable in the first instance for one year. It is not essential that candidates should be members of a University, but they are expected to put forward a programme of research of an advanced character and to produce evidence that they can carry it out. Selected candidates will be required to attend for interview. Further particulars should be obtained from the Academic Registrar, University of London, Senate House, London, W.C.1, and applications for the Fellowship must be received not later than April 1, 1952.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Assistant Lecturer in Government. Salary scale £450 to £500 per annum with membership of FSSU and Children's Allowance Scheme. Applications should be sent not later than May 12, 1952, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF LEEDS
DEAN SCHOLARSHIPS

It is intended to appoint one or more suitably qualified graduates to Dean Scholarships, of an annual value of £300, ordinarily tenable for two years. Scholars are required to undertake research on a subject related to the history and economics of the wool textile industry.

Applications should reach the Head of the Department of Economics and Commerce, The University, Leeds, 2 (from whom further particulars may be obtained), not later than June 1, 1952.

CIVIL SERVICE COMMISSION. SPECIAL DEPARTMENTAL Classes (i.e. H.M. Inspectors of Taxes; Cadet Grade, Ministry of Labour and National Service; Probationary Assistant Postal Controllers; Grade III Officers, Ministry of Defence). The closing date for the receipt of completed application forms from candidates under Method I who are otherwise eligible has been extended to May 31, 1952.

For particulars and application forms write (preferably by postcard) to Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 17-20/52.

SECRETARY FOR A COMPANY NORTH OF MANCHESTER

A vacancy occurs, due to retirement, in a firm established over fifty years. The Secretary will be required to advise Technical Directors on financial matters, company taxation and economic trends, and to take complete control of the offices. Applicants should be worth not less than £1,500 per year. The successful candidate will be required to collaborate with consultants now developing budgetary control routines. Acquaintance with price fixing and sales forecasting methods an advantage. Age limit 45 years. Closing date for applications March 28th.—Box No. 905.

30-YEAR-OLD Cambridge Graduate (Economics), single, ex-Naval Officer, and with 3½ years' good commercial experience, seeks worthwhile and interesting post, preferably on Continent. Travel, long hours, and hard work welcomed.—Box 909.

EXPORT.—Honours Graduate Economics (30), with full export experience up to executive level, seeks change offering scope in home and export sales. Member Institute of Export, knowledge of German, French, Spanish. Keen interest in current affairs.—Box 904.

EXPERIENCED practical economist (36) offers his services as adviser (full-time or part-time) to a firm, group of firms or to an organisation. Specialised knowledge of raw materials, international trade and overseas economic affairs; skilled negotiator, flair for organising and capable of handling people. Write Box E511, L.P.E., 110, St. Martin's Lane, London, W.C.2.

YOUNG man (36), of proved ability, capable of assuming position of the greatest responsibility, trust and initiative, seeks appointment in London offering opportunity at a higher level. Cambridge science tripos, law degree. Wide production research and commercial experience in industry. Interested general economic questions related to trade and industry.—Box 906.

MALE (26), experience Commerce home and abroad, B.Sc. (Econ.) specialising in statistics, speaking Portuguese and Spanish, seeks opportunity with scope for training and talents.—Box 902.

THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country-house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London.—Write Major B. Carnegie, "Stronvar," Balquhidder, Perthshire.

GOOD FOOD

We specialise in catering for industrial canteens, offices, and luncheon clubs. Our organisation is not too large or unwieldy and we can give personal supervision to all our contracts. Write for testimonials from our clients; addresses given on application to:-

Slump or Solvency?

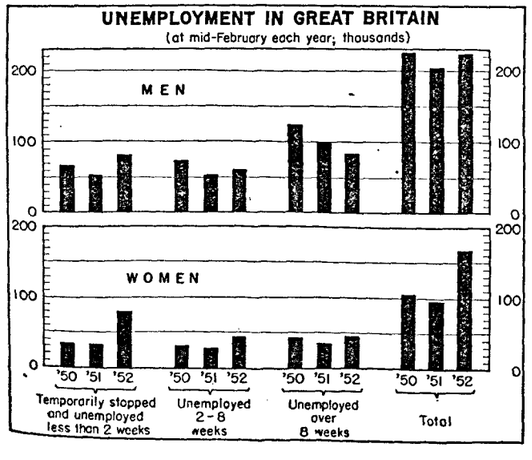
IS the task of economic policy this year still to combat inflation or will it have to guard against a slump? The Chancellor has nodded gravely and the general assessment of the economic outlook has undergone a revolutionary change. Before the Budget there was disagreement enough on what should be done about inflation and rising prices, but that this was the danger was agreed by most people from the Bevanites to the far Right of the Conservative party. It was certainly Mr Butler's own view two months ago, when he presented the second instalment of his economic programme. But the Budget implied that after all there was little inflation to fight, and in replying to the Budget debate the Chancellor last week made explicit his fears of a recession of trade. Outside opinion has, for the most part, obediently taken his word for it.

That is natural. The Chancellor's view, based on fuller information than anyone else can get, is in itself important evidence—even though the Treasury's forecasts have shown such a consistent bias of error in the past. And it has the force of novelty. Mr Butler is the first Chancellor for a long time to base his policy on the belief that deflationary forces may soon be pressing on the economy. Reluctant and unsuccessful as the Socialist Chancellors have been in combating inflation, they have not shown much doubt that it was the enemy. It is true that in 1948 Sir Stafford Cripps's economic planning involved an assumption that unemployment would rise by the end of the year to 450,000—rather higher than it is now, and an appreciably bigger proportion of the labour force. But that was to have been the deliberate by-product of a disinflationary policy greatly increasing the Budget surplus; it was the measure of his determination to make sure that inflation was headed off. Mr Butler is, by modern standards, unique in his assumption that little or nothing needs to be done about inflation—at least in the Budget itself.

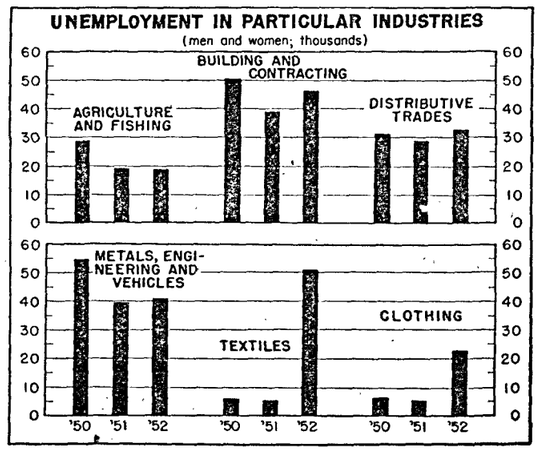
No one in his senses would wish to take the risk of unemployment lightly; certainly no politician can afford to do so. There is no other issue of public policy, except only that of war and peace, that is charged with half the emotional content that the inter-war years injected into employment policy. The more is the necessity, not indeed to forget the personal miseries that are involved in any degree of unemployment, but to insist that policy should be governed not by fears and shadows but by analysis and reason.

There are several points that public opinion, in its sudden alarm over unemployment, is overlooking. The first is that nothing very disquieting has happened yet. Unemployment last summer was lower than ever. In the autumn it increased rather faster than usual, but it was not until last December that the unemployed became as numerous as at the same time a year before. At the turn of the year the rise was noticeable but still gentle. By last month unemployment had climbed to 1.9 per cent of the civilian working population. Not only is this slight—in 1938 unemployment was about 10 per cent—it is also

essentially a particular, not a general, recession. The latest figures show scarcely more unemployment among men than there was a year ago. There are 168,600 women out of work, compared with 97,800 in February, 1951. The number of men unemployed has risen only from 204,200 to 224,900. It is true that there is appreciably more short-time working, not reflected in the official figures. But it is also significant that the number of people who have been unemployed for more than eight weeks is still a little smaller, even if men and women are reckoned together, than it was a year ago. People have been temporarily stopped or have been unable to find a new job within a week or two. And even this short-term unemployment is heavy only in the textile and clothing industries. There unemployment has increased, compared with a year ago, by 62,600. That accounts for two-thirds of all the extra unemployment (91,500). If there were no recession in textiles, there would be no talk of a slump. The few men and women who have lost their jobs in other consumer goods industries are almost balanced by expanding employment elsewhere.

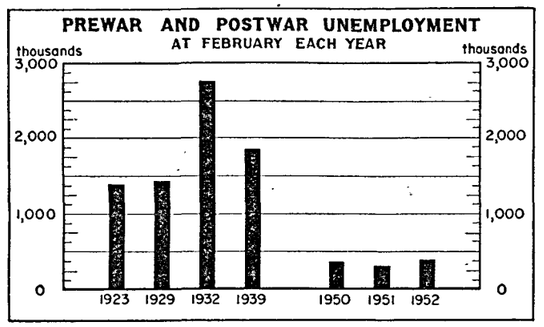


These figures are not intended to suggest that there is nothing needing to be put right. But it would be ridiculous to judge the state of the economy by one industry. There is nothing that ought to make anyone get into a panic. The over-full employment of the past five years as yet remains almost undisturbed. The recession in the textile and clothing trades is the only considerable change. That recession is world-wide; it means that the very high prices of textile raw materials, when supplies were short, did their work of choking off consumer demand. It is hard to detect any reason why demand should fail to revive when prices in the shops are seen to have settled down again to a lower level of raw material prices. It is true that the textile trades are unlikely to enjoy again the sellers' markets of the postwar years. It may well be that in the boom both they and some other consumer goods industries have been over-expanded and must now permanently lose some workers. But that is the sort of structural change that must be made in an economy which tries to give people what they want.



It is true that even this special variety of unemployment could conceivably be put off for a time by re-inflating the pressure of consumers' demand. If people are given enough money to spend, they will eventually buy enough textiles to employ all the industry's present workers. But the price of such a policy would be very heavy. The British people spend roughly one-tenth of their disposable incomes on clothing. To increase the demand for textiles by £10 million by reversing the policy of disinflation would, therefore, involve allowing consumption in total to increase by £100 million. Whatever good the £10 million did in textiles would be much more than outweighed by the harm that the £90 million would do in pressing on other industries where there is no unemployment. It would produce all the familiar consequences—shortages, higher prices, queues, frustrations and low productivity. Worse than all these, it would obstruct defence production and exports.

General economic policy can only be based on the general economic health of the country—and that, it is necessary to insist, is still much closer to the danger of inflation than to that of deflation and slump. The main aim of financial policy is that demand in general should balance supply in general, leaving the supply of particular things free to adjust itself to changing demands. Judged by that test, there can be no doubt whatever that the greater general danger is still that demand, the burdens laid upon the economy, may outrun supply, its capacity to perform its tasks.



★

But circumstances may change. Even if this is still the present position, perhaps it may be that there is some reason to expect the present difficulties in textiles to widen out, in the course of the year, into a more general inadequacy of demand? So far as the domestic scene is concerned, it is difficult to see how that could be so; there are many reserves of purchasing power, now held back by controls. No one doubts that the capital goods industries will remain "hard"—that demand for their products will continue to outrun supply. What of consumption? Incomes are higher than ever and wage-rates, at least, will certainly continue to rise. Mr Butler thinks that it will be possible to expand production, and incomes should increase for this reason as well. General demand in the British home market can fall this year only if people begin to save more out of their larger money incomes. That they will do this, to any great extent, seems most unlikely; Mr Butler himself does not expect it. How, then, can there be any considerable or prolonged slump?

Many practical men will point in reply to the fact that firms in other industries besides textiles are feeling an unaccustomed financial pinch. That is true. It will force some firms to scale down their investment plans and many more to stop building up their stocks, or even to run down present stocks. The cut in investment is necessary to match the Government's enforced diversion of engineering products to export; the pressure against stock-building is necessary if supplies for home consumption are to be kept up, as Mr Butler's budgeting assumes. These are the ways in which the tighter monetary policy, on which the Government has chosen to rely, must work. They are not signs of a slump unless the Government's whole policy is misconceived.

The chart shows the number of registered unemployed in Great Britain. The prewar and postwar figures are not strictly comparable, since the scope of the insurance scheme has been greatly widened; if the prewar figures had been compiled on the present basis they would have been appreciably higher, and the chart therefore somewhat overstates the relative size of postwar unemployment.

As far as can be seen now, the only danger of any substantial falling-off in demand in Britain this year lies in a contraction of exports. It is, in fact, the Australian import cuts that have induced the gloomy prophecies of the last fortnight. The reality of the sterling area cuts cannot be denied. But, again, their proportions should be kept in mind. First, they also are a special situation; there is little or no sign of any sharp change in the economic climate of the world as a whole. That depends, more than on anything else, on the course of events in the United States. The Americans have been fairly successful in what everyone was urging on them a year ago—not to rush the free world to ruin by inflation. But that is all. There is no sign of anything worse than a slight recession in America this year—and perhaps not even that. It should follow that some of the British exports that are lost in the sterling area can be sold elsewhere. There may, of course, be further blows still to fall upon British exports. But so far from justifying a reversal of policy, a relaxation of disinflation or a soft budget, this prospect rather calls for a reinforcement. The last thing this country can do—unless it wants heavy unemployment and acute distress—is to give up the struggle for solvency. If there is danger of British goods becoming uncompetitive, or if the present export markets for some consumer goods are closing, then it becomes more necessary than ever to find new markets and to divert other products—even coal—to export. And the only way to make that effort is to reduce demand at home, not to let it rise in order that any industry which is losing export business may keep its workers on by immediately selling more in British shops.

The difficulties involved in trying to increase exports by disinflation, by reducing demand at home, are well known. They are no greater now than they were when the franker Conservatives urged such a policy on the last Government. When the Government reduces home demand, the things people give up are not—in general—the things that can be exported. Disinflation can work only by forcing some people to change their jobs. That takes time, and, therefore, causes some temporary unemployment. If the Government means what is implied by a 4 per cent Bank rate and by its determination to balance external payments, it will cause transitional unemployment to rise this year—just as Sir Stafford Cripps would have made it rise if the first year of disinflation had worked out according to plan in 1948. Disinflation is undertaken not because anyone wants unemployment but because there is every reason to think that over the next five years it will on the average cause less unemployment than anything else. It is not a perfect policy, but the Conservatives certainly have no other; to draw back from it at the first signs of unemployment would be to have no policy for solvency at all.

★

Solvency, after all, is not an alternative to full employment. On the contrary, the only real risk of large-scale unemployment in this country in the near future lies in the possibility that the battle for solvency may be lost and the imports on which British industry depends may be cut not with caution and by plan but arbitrarily and catastrophically. The fact that the British public has never been led to believe in the reality of this threat may make things difficult for politicians. But the threat is terribly real and terribly near. Indeed, so real is it that even if there were a general inadequacy of demand, it might still be necessary to put the balance of payments right before releasing a Keynesian flood of demand.

But that painful choice does not present itself now. The right policy for the domestic economy is also the right policy for external solvency—and that is to keep demand down to the capacities of supply. If within this general framework, patches of softness appear, they should be treated as special situations to be dealt with by special methods, of which the most important is to move some of the workers affected as quickly as possible to the "hard" industries that need them. To deal with the special problem by the general method—to inflate demand in general to the point at which the home market will absorb all that the present labour force of the textile industry produces—is simply to invite the mass unemployment of insolvency. Its folly is not less patent because it is the policy that much current discussion, on both sides of politics, implies.

Whatever its political difficulties, the Government cannot be so short-sighted as to intend to encourage this attitude. It may be, of course, that the situation will soon change, that a general slump may after all threaten. There are no signs of it now. All that is visible is that exporting needs more effort—but is not yet hopeless—and that monetary policy is beginning to put some restraint on domestic business. It is not a slump. It is what the doctor ordered. The last thing ministers ought to think of, and the last thing to earn them any political credit, is to put people into a panic and make their own task more difficult when they have barely begun it.

SECRETARIAT LIBRARY 2644 HM TREASURY GOVERNMENT

South Africans Entrenched

IT is already clear that Dr Malan's chief weapon in the present constitutional struggle in South Africa is to be the charge that the United Party, which is leading the opposition to him, is trying to keep the country tied to British apron strings. This charge was not made openly in the National Party manifesto issued on Monday; but every South African knows exactly what the manifesto meant by such phrases as "the struggle for freedom," "a revival of the attacks of imperialism on nationalism," and "the old bitterness of the imperialistic period." The implication is that to oppose the Malan government's assault on the constitution is to deny that South Africa is as yet wholly free from the tutelage of Whitehall. This is an ingenious tactic, for nothing could do the United Party more harm than its identification in the mind of the average South African, whether Afrikaans or English speaking, with any limitation of the country's full sovereignty.

Outside the ranks of his own fervent supporters, however, Dr Malan is unlikely to find many people ready to believe that South African independence is in danger. South Africa enjoys all the rights of a modern sovereign state. Neither its Supreme Court nor its parliamentary opposition is seeking to void a jot of that sovereignty. All that has happened is that the court has found that the Act of 1951, by which Coloured voters in the Cape Province were deprived of the full franchise assured to them by the original constituent Act of 1909 and were transferred to separate electoral rolls, was not passed in accordance with the procedure laid down in the constitution.

Nor is the National Party justified in asserting that either court or opposition has challenged the supremacy of Parliament within the Union. The Chief Justice has pointed out that the court is in no way attempting to control the legislature, and Mr Strauss, leader of the United Party, has given even more explicit assurances. What is in dispute is not the sovereignty of Parliament, but the manner in which that sovereignty is to be exerted. South Africa is not a federal state, and there is no question of a separation of powers. But it is a state based on a written constitution, and in that respect fundamentally different from the United Kingdom.

★

The South African constitution was drawn up at a national convention held at Durban in 1909, by delegations from the four colonies which thereby agreed to form the Union. It was approved by the British Parliament in the form of the South Africa Act, and the British Government thereby assumed a responsibility for ensuring that it was not violated, which lasted until the passage of the Statute of Westminster in 1931. That statute acknowledged South Africa's full sovereignty, but in no sense vitiated the constitution of 1909, which remains to this day the whole basis of the Union's political life. Being essentially an agreement between South Africa's "founding fathers," and not an Act of the Union Parliament, the constitution is not a document which can be arbitrarily revised by any South African government. British precedents are obviously misleading here, for no document of this kind is known to the law of the United Kingdom. And there is a certain irony in the fact th Dr Malan has fallen back upon the opinion of the Dow ing Professor of the Laws of England as support for h thesis that the Union Parliament may do as it pleas with the constitution. It is a bold man who, while d nouncing his antagonists for their alleged subservience Whitehall, appeals to Cambridge.

The constitution of 1909 can, however, be amende and the supremacy of Parliament is fully preserved i that it alone can amend it. Moreover, it can effect mo amendments by a simple majority vote. But the constitu tion itself expressly provided that its "entrenche clauses," which guaranteed the equality of the Englis and Afrikaans languages and the non-European franchis in the Cape Province, could only be amended by a two thirds majority of both Houses of Parliament in join session. Here again the sole authority of Parliament i preserved, but the right of a bare majority of its member to amend the clauses is explicitly denied. The mere existence of the entrenched clauses is clear evidence that the founding fathers did not intend that any future government should act as Dr Malan wishes to do.

While denying the Supreme Court's right to pass judgment on Acts of Parliament, the government is, paradoxically, resting part of its case on that court's judgment in the Ndlwana case of 1937. On that occasion the court ruled that Mr Hertzog's Representation of Natives Act of 1936 was valid, although, like the Act of 1951 which has just been invalidated, it amended the entrenched clauses of the constitution. But Mr Ndlwana's appeal was based on a technical point of procedure; the Act of 1936 had been duly carried by a two-thirds majority in a joint session of both Houses, while that of 1951 scraped through with a bare majority.

★

Logic and legal authority are therefore now united in demonstrating the invalidity of last year's Separate Representation of Voters Act, which transferred to a separate electoral roll the 40,000 Coloured males qualified by literacy and property to vote in the Cape Province. But, far from ending the conflict on this issue, the court's decision has intensified it. Dr Malan's announcement that he would at once introduce legislation to strip the courts of all power to test parliamentary Acts has aroused greater alarm among non-Nationalist South Africans than any of the present government's previous actions. This alarm is justified. Although there is an element of truth in the Nationalist argument that the proposed change in the franchise would leave the Cape Coloured voters with just as much representation as they now enjoy, the issue at stake is a much deeper one. It is, in fact, the whole issue of basic constitutional guarantees in a plural society.

It is undeniable that the whole trend of the policies of Dr Malan's government, and of his predecessors, the Afrikaner Nationalist leaders of prewar years, has been toward the exclusion of all non-European groups from the main political structure of the country. Hitherto the entrenched clauses have formed a limited but rigid barrier against this movement. The political segregation of the Cape Bantu in 1936 was achieved by the mobilising of the necessary two-thirds majority in Parliament, but

Mr Hertzog was forced to abandon the idea of treating the Coloured voters in the same way at that time. The relative strength of the Coloured vote was, however, reduced by its restriction to literate, propertied males when the franchise was extended to all Europeans of both sexes. The Act of 1951 would have completed the work of segregation; had it taken effect, not a single non-European would thereafter have taken part in the same poll as a European. But the consequences would have been even more far-reaching if Dr Malan had succeeded in overriding the entrenched clauses. Not only the clause guaranteeing linguistic equality, but the whole tenuous fabric of the civil rights possessed by non-Afrikaner South Africans would have been left at the mercy of the present parliamentary majority.

Here there is a deeper distinction between South Africa and Britain than the possession or lack of a written constitution. A homogeneous society like that of these islands may find it possible to entrust a bare majority of its legislators with absolute, if temporary, power. No nation divided like South Africa into antagonistic groups, no one of which can hope to maintain its supremacy indefinitely, has ever proved stable enough to take such a risk and survive. South Africa's plural society has had less than fifty years' experience of complete independence. It is clearly neither willing, nor suited by its present circumstances, to surrender its fate entirely into the hands of a party which represents less than one-tenth of its population, and barely half even of its white population.

In neighbouring territories, moreover, it is precisely over the lasting validity of guarantees to racial groups that the liveliest doubts have arisen to block political progress. For this reason alone British opinion cannot remain indifferent to the outcome of the present conflict in South Africa. But, whatever Dr Malan may think to the contrary, British intervention in the purely internal affairs of South Africa must remain a Nationalist myth. It is entirely up to South Africa whether that country becomes a model, or an object lesson for its neighbours.

Red Flannel or Ice Cream

NO official statistics are more widely used than the index of retail prices. And few statistics have come in for more criticism. It is not, to any great extent, criticism of the scope of the index—the items included in it—or of the methods of measuring changes in the prices of those individual items; the main objection is that they have been combined, in order to make the total index, according to a prewar pattern of consumption. Now, in the index for February which has just been published, a more up-to-date basis of combining, or "weighting," has been introduced; the voices of the critics should be at least fainter. They are unlikely to be entirely stilled, for grievances can be found with any price index, and this one depends, for lack of direct information, on a number of assumptions about spending habits. Arguments about the technical niceties of calculation tend, however, to obscure two simple but very important issues—issues that are in no way settled by the present refurbishing of the index. What exactly does this index measure? Is it the right one for the uses to which it is put?

The level of retail prices in this country has been officially measured in one way or another for sixty years. The first index, which lasted from 1892 to 1914, was a scanty affair. It covered food, coal, clothing and rents, but food and coal for London only. Then came the long life of what has become known as the old cost of living index. Even when it started, the basis of this index was not entirely happy; it depended on rather fewer than 2,000 budgets which had been collected in 1904 and afterwards revalued at 1914 prices. By 1947, when it was abandoned, nobody could be in doubt that the serge, red flannel and candles of over forty years before were absurd indicators of the current changes in prices. So came the interim index of retail prices, based on budgets collected in 1937-38 from 10,700 working-class households and afterwards revalued at 1947 prices. Now the fourth stage has started. With only some small changes in the items included in the index, the prices are combined together according to the estimated pattern of working-class consumption in 1950, but valued at January, 1952, prices.

One conception has remained unaltered throughout this series of price measurements. It is that the index should first of all measure the cost of an assorted basket of goods at the starting date and then the cost of this same basket of goods at monthly intervals afterwards. It has never, therefore, been an index of the cost of things actually bought at the time, for then the basket of goods would need to be varied with changes in spending habits. Each time there has been a break in the series, however, the goods have been changed both in their relative amounts and in their assortment. Table I shows the proportions—that is the weightings—given to each of the main groups of items in the various index numbers.

I.—WEIGHTS USED IN THE INDEX NUMBERS
(As Percentages of the Total)

	1914 Cost of Living Index	1947 Interim Index	1952 Price Index
Food	60·0	34·8	39·9
Rent and rates	16·0	8·8	7·2
Clothing	12·0	9·7	9·8
Fuel and light	8·0	6·5	6.6
Total of above	*96·0*	*59·8*	*63·5*
Household durable goods	0·5	7·1	6·2
Miscellaneous goods	1·5	3·5	4·4
Services	1·2	7·9	9·1
Drink	...	10·1	7·8
Tobacco	0·8	11·6	9·0
TOTAL	100·0	100·0	100·0

The fact that the share going to items other than food, rent, clothing and fuel was increased from 4 to 40 per cent when the interim index appeared in 1947 reflects in part the improvement in working-class standards of living. But it was not all due to this. Some of the less essential goods were left out of the 1914 index. It tried to record changes in the cost of buying the most necessary things, with a few others thrown in for good measure.

But the interim index embraces the whole field of working-class expenditure, since, although it cannot measure the price of every single item, representatives of each group are chosen and given the weighting corresponding to the full spending on that group. And so, into the index in 1947, came—alongside beer and whisky—such things as radio sets, vacuum cleaners, admission to cinemas and football matches, and hairdressing. The new index carries the process a little further. In case it should not fully represent the typical working-class budget, it adds chocolate-covered biscuits, ice cream, children's toys and comics, hair cream and motor-cycle insurance.

This is the index to which the wage-rates of some 2 million workers are directly tied by sliding-scale agreements. These agreements vary as to exactly how and when the changes are applied. There are a large number of purely local arrangements within small industries. But there are also some national contracts, notably in building, civil engineering, the iron and steel industries, footwear and furniture manufacture. The effect of the index on wage-rates does not, of course, stop with these automatic adjustments. Its upward movement was quoted as the main justification for most of the other wage claims. And, for want of anything else, salary earners also used it to support their petitions for higher pay.

★

The sponsors of the interim index deplore its description as a cost of living index. They argue, rightly, that it is imposible to define such a term. Yet, however colourless its official label, nine out of ten people still refer to it by the old title, and they judge that they are being hardly done by if it rises more than their income. It is important to be quite clear about what such a hardship may entail. A rise in the index may reflect higher food prices or it may be due to an increased tax on smoking or cinema-going. If the Chancellor were to increase the duties on tobacco so that 20 cigarettes cost 4½d. more, the total index would move up about one point. It would go up by the same amount if a 1¾ lb. loaf of bread cost 1½d. more or a pint of milk 1¼d. more. Nobody disputes the desirability of keeping up the standard of living to which people have become accustomed. Yet, if the welfare state is to use its limited resources to help people as much as possible, there is surely need to distinguish between two forms of hardship: it is one thing to compel the majority of people to sacrifice a little from the full variety of their present spending; it is quite another to raise the price of essentials for people living near the subsistence level. To make any judgment about the adequacy of national assistance payments and small pensions, the existing index should be supplemented by a much simpler one measuring only the prices of essentials. Food, rent, clothing and fuel should obviously be included, and there, probably, the list ought to end. Table II shows, for three different measures of retail prices, the total index and a comparable but narrower index based only on the subsistence items; in each case these are combined in the same relative proportions as in the original index.

The index of national consumption prices is derived from the figures given in the national income white papers, and covers the whole field of consumer expenditure. Subsequent revisions are likely to raise the index a little in the last few years. The working-class index is the one published by the London and Cambridge Economic Services and uses the interim index from 1947 onwards.

II.—Changes in the Cost of Subsistence

Date	National Consumption Prices 1938=100		Working Class Index 1938=100		Interim Index June, 1947 =100	
	All Items	Subsistence Only	All Items	Subsistence Only	All Items	Subsistence Only
Average, 1938..	100	100	100	100	...	...
June, 1947..	169*	149*	161	138	100	100
Average, 1948..	181	160	173	148	108	107
,, 1949..	185	166	178	155	111	113
,, 1950..	190	172	184	164	114	118
,, 1951..	205†	189†	201	181	125	131
December, 1951	...	...	210	192	130	138
January, 1952..	...	...	213	196	132	142

* Average for 1947 † Unofficial estimate.

As would be expected, in the two series which are carried back to 1938, the cost of subsistence has risen less than prices as a whole. But the gap has narrowed considerably in the last few years. Indeed, the interim index shows that since 1947 the subsistence items have risen more sharply than the rest. Indeed, the total cost of food, as measured by the index, was nearly 50 per cent higher in January this year than in 1947, while beer and tobacco, taken together, had risen in price by less than 9 per cent. Compared with 1938, of course, the prices of beer and tobacco have risen much more than food. But in general, the prices of essential goods which had fallen so much behind the general level at the end of the war have since been catching up.

The statistician may well question whether there is any significance in the idea of a cost-of-living index which tries to measure something more than the cost of subsistence. But if such an index is legitimate at all—and in practice it must be used—why should it stop at the working classes? The argument that the middle classes have too much spare money to give any meaning to an average budget has worn much thinner now that there is also quite a lot of elbow room in the working-class budget—and little more in many middle-class budgets. The cost of living for the middle classes has never been measured officially and existing information only allows of very rough estimates. Table III shows a set of such estimates, using as basic material some prewar surveys carried out by the Civil Service Statistical and Research Bureau. These figures indicate, of course, that since 1938 the higher income groups have fared worse than others.

III.—Estimated Middle Class Cost of Living Indices

Date	Prewar Income Group			
	£250–350	£350–500	£500–700	£700 and over
Average, 1938...	100	100	100	100
December, 1948...	183	191	198	203
,, 1949...	187	196	204	211
,, 1950...	195	204	214	223
,, 1951...	219	228	241	253

The new index which has just been launched is certainly an improvement on the old. The weighting is more up to date and changes in rents are measured more realistically by bringing in the higher rents of newly built houses and flats. Although the index numbers for the separate groups of items start again at 100 in January 1952, the total index is linked to the previous one. This continuity is necessary and though it may introduce some error it should not be serious. For most purposes the new index can be accepted as a reasonable enough measure until the new enquiry into family budgets has been made. Then it may well be appropriate to ask whether the budgets could not be kept up to date and a current weighting given to the index to reflect the cost of the goods and services actually bought at a particular time.

It is, however, less important to refine the one index than to fill in the gaps that it inevitably leaves. The main need is for two auxiliary index numbers, to show the cost of living on the one hand at a subsistence level and, on the other hand, at a middle-class standard of living. When the results of the new budget enquiry are available—which is unlikely before 1954—there will be more information from which private research workers can make their own estimates of these things. But it would surely be better to make them officially, at the source of the information—where it is likely to be so much more complete.

Communists and Peasants

THROUGHOUT Eastern Europe the worker-peasant alliance, which is intended to be the corner-stone of the new "popular democracies," is showing obvious signs of strain and stress. The peasants are not playing the part planned for them; and if they do not produce anything like enough food for the growing army of industrial workers, then it is hopeless to expect the latter to go on playing their part either. Few have the revolutionary enthusiasm to sweat and toil indefinitely merely to fulfil production plans that are impossibly high when they know that the effort will do little to restock their larder. The Communist leaders of the Soviet satellite states cannot, however, afford to slacken the present rapid pace of industrialisation. They know that their own position depends on the success with which they can secure the fulfilment of the economic plans recommended and supervised by Moscow with the primary object of building up the military strength of Eastern Europe.

It is likely that the present emphasis of Soviet propaganda on the desire for east-west trade is due to Moscow realising that these economic plans would have a better chance of success if the satellites could get bigger supplies of raw materials and machinery from the West. Although the operation of the Battle Act is bound to deprive them of many strategic supplies, they must realise that they are more likely to get something of what they want if they can offer Western Europe grain, meat and other food supplies. The trouble is that the food surpluses that Eastern Europe exported in prewar days are no longer available. Agriculture has not kept pace with industrial development and Poland, Czechoslovakia and the rest are hard put to it to feed their industrial workers, let alone find food for export.

It was Mr Hilary Minc, Poland's chief economic planner, who was the first to stress publicly last October that serious supply difficulties were bound to result from the different rates of development of industry and agriculture. He pointed out that industrial production would by the end of 1951 be about 168 per cent above the 1938 level, whereas agricultural production would not even achieve its modest target of a six per cent increase over the 1938 level. In the event, Polish agricultural production was nearly five per cent less than in the previous year, and the Poles do not attempt to throw the whole blame on bad weather conditions.

The cue given by Mr Minc has since been followed by official spokesmen elsewhere in Eastern Europe. In Czechoslovakia agricultural production last year was actually below the prewar level, while industrial production was said to be about two-thirds greater. Whereas the Poles and the Hungarians can, in theory at any rate, deal with the discrepancy to some extent by curtailing their normal food exports, the Czechs are forced to import additional supplies. According to Mr Zapotocky, their Prime Minister, half the grain and a large part of the meat now being consumed in Czechoslovakia are being imported from the Soviet Union and the other "people's democracies." This dependence on food imports makes the Prague Government particularly vulnerable to Soviet pressure.

In Poland, Czechoslovakia and Rumania an ineffective rationing system adds to the workers' discontent. The dissatisfied peasants have been quick to turn the situation to their own advantage by withholding supplies from the official government collectors in order to speculate with them on the free market. The authorities have thus been unable to get hold of enough grain and meat even to meet the ration quotas; the town worker has therefore been forced to buy what he can on the free market at extortionate prices. A bad situation has been made worse by the extraordinary complication of the rationing systems. Instead of regarding rationing simply as a means to secure the fairest possible distribution of supplies, the Communists have tried to turn it into both a bait and a weapon of coercion. Both manual and intellectual workers are supposed to receive varying rations, graded accorded to their estimated contribution towards building the national economy. In Poland there are as many as nineteen different categories. Bureaucrats may revel in these methods but they add to the resentment and exasperation of the ordinary worker.

Unfortunately for the Polish and Czech authorities, the supply situation in these countries is probably too patently bad for them to follow the Hungarian example and cut a way—for themselves if not for the workers—out of their distribution difficulties by abolishing official rationing in favour of what amounts to rationing by the purse. When Mr Rakosi announced the end of most food rationing in Hungary last December, he admitted that the methods restored at the beginning of 1951 had been wrecked beyond repair by the orgy of speculation and black marketeering into which the farmers had plunged. Like Mr Minc, he attributed the supply difficulties to the

disproportionate development of industry and agriculture; but, unlike his Polish and Czech colleagues, he professed to find the remedy in less rather than more rationing. In the middle of last month the end of meat rationing marked the freeing of all food in Hungary. The event was celebrated with official rejoicings and praises of the peasants' conscientious fulfilment of their duties. But if Hungary's supply situation is really as good now as it is made out to be, and if the peasants are really behaving so well, it is difficult to understand the reason for the government's latest decree on agricultural deliveries. This abolishes all voluntary deliveries and increases compulsory deliveries so steeply that it was thought necessary to publish it two months earlier than usual in order to give good warning of what was expected from the farmers.

*

Why are the Communists in Eastern Europe failing to secure adequate food supplies? The fundamental reason is that they cannot treat the development of agriculture as a purely economic problem. They are obliged to make things much worse for themselves by pressing on so rapidly with industrialisation and by shifting more and more people to the towns. Agriculture is not given a chance to catch up with the additional burdens laid upon it. But the political and ideological subservience of the satellite governments to Moscow models prevents them from going slow with their industrial plans. They are therefore forced to antagonise the farmers by demanding impossibly high delivery quotas and by introducing a growing measure of compulsion and an increasingly stringent supervision by officials into their dealings with the rural population.

Again, the Communists' attitude towards the countryside is governed not only by the wish to extract from it as much food as possible for the urban workers, but also by the need to extend and consolidate political control in the villages. In the long run they plan to achieve this through large scale collectivisation. Although they disclaim any intention of forcing the peasants into the collectives, they are clearly trying all the time to prepare the way for collectivisation. This desire for political control determines their attitude towards different classes of peasant. The poorer and more backward the peasant the more likely is he to be persuaded that his future lies within a collective. The small farmer, therefore, is regarded as the pillar of the Communist regime; the medium farmer as a possible ally to be won over at all costs, the kulaks or village rich as its sworn and inveterate enemies, because they would undoubtedly be worse off within collectives than they are at present.

The result is that those farmers who from the size of their holdings as well, perhaps, as by their general alertness, could do most to increase food supplies quickly are those whom the Communists are doing their best to ruin. Two years ago the Polish currency reform was largely aimed at the destruction of the kulaks' savings. Last month the Rumanian currency reform had the same principal object. The richer farmers are awarded disproportionately high delivery quotas which they can only fulfil by supplementing the produce of their own land with purchases on the free market. In Czechoslovakia, if they do not meet their quotas they get no sugar or soap. If a kulak slaughters illegally one of his own animals to feed his family, he is liable to be clapped into jail for considerable periods. Unfortunately for the Communists the difficulty of clearly distinguishing the kulaks has misled them into antagonising many medium farmers as well.

The same anxiety to strengthen their political hold is seen in the Communists' attitude towards mechanising agriculture. Increased mechanisation is obviously the key to increased productivity; and in the long run the small farmer is more certain of a fair deal if he can hire machinery from a cooperative than from his richer neighbour. But if the immediate problem is to get more food as quickly as possible, the common sense course is to let the richer farmers have the fullest use of what machinery is available. But this would run directly counter to the Communists' political plans. It would strengthen the class they wish to destroy, and would delay the development of the machine tractor stations which, following the Soviet model, are designed to be powerful centres of political control in the countryside. In recent weeks both the Poles and the Czechs have been considering ways of improving the work of the tractor stations which in an official Czech report were described as the most important instrument for developing socialism in the countryside.

It may be asked whether the Communists will not soon be driven to go back on their promises and embark on forced collectivisation. Mr Zapotocky's most recent speech, in which he called for a reorganisation of agriculture but denied that he wanted to change the government's agricultural policy, seemed to come near to advocating this. It is clear that the Communists will continue to use every form of pressure, direct and indirect, to push peasants into collectives; but they seem likely to stop short of using brute force.

The Fight is On

It is now obvious that a general election is immediately impending, and that, whatever efforts the Ministry may make to prevent it, that election will mainly turn upon the question of Free Trade or Protection. We have no fear whatever as to the result. We do not believe in retrogression. It is not the habit of Englishmen to retrace deliberate steps; and a country which has basked for three years in the sunshine of prosperity and plenty, and should then voluntarily fling itself back upon restriction and scarcity, would assuredly stultify itself more completely than we are in the habit of doing.

Oh! who 'mid the shadows of night would abide
That can taste the pure breezes of morn;
And who that hath drunk of the crystalline tide
To the feculent flood would return?

Still it is annoying enough to have to buckle on our armour and furbish up our weapons to re-contest a victory long since won; to have to re-tread the weary ground of reiterated arguments, and of objections repeatedly and triumphantly demolished; and to defeat over again antagonists who, like the Duke's soldiers at Waterloo, do not know when they are beaten. . . . To the Conservative Free Traders—a most numerous and respectable class, we would say . . . *Protection is the Jonah which Conservatism must throw overboard before it can hope to arrive in the haven of administrative power.* However much you may hate the Leaguers, join their ranks and fight their battle now, that you may join your own friends and fight your own battles ever after.

NOTES OF THE WEEK

Reply to Moscow

Having received from the western powers their reply to its Note proposing a peace treaty with Germany, Moscow has now to say whether it will or will not allow free elections throughout the country for a government of unity. The key question has been asked and possibilities of future negotiation depend on the way it is answered. The outlook is not promising, if only because of the manner in which Soviet and East German propaganda has been clarifying the original Soviet Note.

It suggests that it is Soviet policy to get back to the Potsdam basis; and this would mean that a peace treaty would be negotiated with a provisional German administration, not with a freely elected government. This administration would have at least one-third representation from the Communist-controlled eastern regime of Pieck and Grotewohl, doubtless with the purpose of aligning westerners and easterners on a common patriotic platform during the peace negotiations. The merger of the zones would follow gradually, under four-power supervision. This is strikingly different from the picture that some comment has painted—a picture of free elections bringing about a Communist collapse in Eastern Germany and a triumphant absorption of its economy by Western Germany.

If this is the Soviet intention, then certain phrases in the original Note take on a new significance. It is nowhere stated that the new German state will have sovereign independence. Instead it is said that a peace treaty with an all-German government

> will be conducive to the development of Germany as a united, independent, democratic and peace-loving state in accordance with the Potsdam decisions.

Likewise there is nowhere any suggestion that the occupying powers would withdraw completely; it is only their "armed forces" that would be withdrawn a year after the peace treaty. Is it possible, after all, that the Russians offer nothing more than limited sovereignty and limited forces to a united Germany whose "development" would be watched over by some four-power body? The next Soviet Note should make this clear.

* * *

The Odds in Europe

General Gruenther has spoken to Congressmen about the defence of Europe honestly and clearly, as is his way. He has laid to rest the phantom army of the Lisbon conference and said that about half of the fifty divisions planned this year for the North Atlantic forces under General Eisenhower are now ready. That leaves open the question of how soon, and in what condition, twenty-five reserve divisions would appear. If, as he claims, a deliberate Soviet attack on Europe is unlikely this year, it might even be said that the half-ready reserves are in "appropriate conditions of combat readiness." But that is only worth saying in order to acquit the drafters of the Lisbon communiqués of deliberate falsehood.

Those who maintain that there is no Soviet threat of aggression, or that it has been overestimated, or that rearmament goes too fast will draw their own conclusions from what the Chief of Staff told the House of Representatives Foreign Affairs Committee. On the question of Soviet strength his authority is exceptional. He stood firmly on the figure of about 175 divisions, 20,000 operational aircraft—of which about 4,000 are jets—and 300 submarines. Mr Bevan will have to say either that these figures are untrue and produce better ones, or that the Soviet Government has maintained these forces with no intention of using them. It will be difficult to accept the latter argument, in view of the sacrifice the Russian consumer has had to make to pay for such armaments.

Current controversy often loses sight of the main object of General Gruenther's staff: to prevent Europe being suddenly overrun and again submitted to the ordeal of liberation. For this there must be ground troops that people on the Continent can count and see. One day, if all goes well, there will be over thirty divisions in the line and full reserves behind. Even that may not be enough to frighten the Russians; but clearly the prospect of putting them into a compromising frame of mind is greater the more imposing is the programme of western rearmament. That may be happening now; and Mr Bevan and others do no service to peace by prescribing sedatives for the Kremlin.

* * *

Labour Starts to Agree

The disagreements of the past month seem temporarily to have driven the Labour party to a state of emotional exhaustion, at least in its members' attitude to each other. The new code of Standing Orders for Labour MPs was settled with remarkably little fuss on Tuesday. Members are now required to keep to the line laid down at party meetings, with the one exception that they may abstain from voting "on matters of deeply held personal conscientious convictions." This is somewhat more elastic than the previous definition of matters of conscience. The anxiety to judge whether it represents a victory for Mr Attlee or for Mr Bevan has caused its main significance to be ignored. On paper, at least, Labour has disciplined itself into some sort of formal unity without making its MPs complete robots. For the sake of Parliament and democracy, this concession to individual freedom of opinion, small though it is, must be welcomed, whether or not it aids Mr Bevan.

His supporters seem satisfied that this compromise will give them adequate elbow room—at least until the party's next annual conference, when they hope to upset the official policy on rearmament. But the party leaders now have a fixed disciplinary code to support their authority and it may be rather stronger than it looks, especially since the new rules apply the conscience clause only to individual members; any attempt to organise group action by the Left would invite sanctions. Tuesday's meeting seems to have passed off in an atmosphere of geniality, if not cordiality, in marked contrast to the tension and anger of recent party meetings. The suggestion from the Left that Mr Attlee should yield the chairmanship of meetings to a backbencher, as was usual when the party was in power, was manifestly so naïve (or so cunning) that it was rejected unanimously—a result which presumably means that its sponsor shunned his own proposal.

In part, this pacification within the Parliamentary party means that Mr Attlee has reasserted his control—at Westminster. Its main significance, however, is that the struggle for power in the Labour party will now be transferred from Westminster to the constituencies. Mr Attlee and his colleagues have, over the next six months, to mount their campaign for support at the party's annual conference at Morecambe. The speeches last weekend by Mr Gaitskell and Mr Wyatt, vigorously defending rearmament, were the first shots in this counter-attack. The orthodox leaders can count on the majority of trade union votes, but they cannot feel safe unless they can also secure support from a substantial section of the constituency parties—support not only in the votes on policy but also in the election of leaders. An extension of last year's Bevanite victories in the voting for the seven constituency representatives on the Executive would undermine the authority of Mr Attlee and his colleagues, whatever the disciplinary rules for MPs.

The Local Elections

Increasingly, of recent years, the shadow of national politics has fallen over the local government elections. The parties more and more regard these events as "tests" of public opinion and as exercises for tuning up their machines. This process has gone furthest in the large towns, where the old appellation of "independent candidate" has virtually disappeared.

The results have been higher polls and, according to local party leaders, a heightened public interest in the processes of local government. In fact, this claim is spurious. Questions of local significance get thrust aside in a slanging match over national issues, such as food subsidies and the Budget, which are only very indirectly the concern of local authorities.

The elections for the County Councils, which fall next week, are usually somewhat staid and apathetic affairs, but this year there are more signs of party fever. Possibly, too, the public attention has at last been caught by the much enlarged powers of county councils gained at the expense of the smaller local authorities. Traditionally, polls for county councils are exceptionally low, but this time a higher vote may be expected.

This year, moreover, the steep rise in some county rates —amounting, for instance, to 2s. 4d. for Dorset, 1s. 10d. for Gloucestershire, 1s. 4¾d. for Kent, and 1s. 4d. for Lancashire—may impel the public to investigate the reasons. A surprising contrast is offered by those counties, including London, which have managed to keep the rate unchanged or actually, as with Norfolk and East Sussex, to reduce it. A partial explanation of the discrepancies is the extent to which some counties have drawn on their working balances, together with the strange effects of the Exchequer Equalisation Grant. But it is noteworthy that education has become much the costliest county service, absorbing over half the rate revenue in many cases. The alternatives of drastic economies in education or a stiff rise in the rates pose the biggest real issue in the county council elections.

In the special case of London, more definite local controversies do exist. Two prongs of the Conservative attack are the heavy losses incurred by London's civic restaurants and the doubtful educational merit of the comprehensive high school. On housing and planning, the Conservatives skate round the issues, refusing to accept the need for rent adjustments to offset the enormous burden which housing will increasingly put on the rates.

Little Money and Fewer Teachers

When the House of Commons debated education on Tuesday, the Opposition's denunciation of the economies turned out to be little more than a mild, humorous and not very effective speech by Mr Chuter Ede. He brought up instances of the harmful things that some local authorities were doing in the name of economy, the implication being that they were glad of the pretext to cut even the "essential fabric" that the Minister had said must be preserved. He asked Miss Horsbrugh to define this now famous phrase more closely. But the Minister was not to be drawn into definitions; she merely replied that she was not going to be coerced by local authorities or anyone else. Yet her critics are on firm ground in suggesting that she should be more specific about what she thinks should or should not be cut. The obvious candidates, such as recreational classes, were mentioned in her circular, but as these do not account for the required 5 per cent, some further guidance would have been useful. She might have said more on the possibility of administrative saving by abolishing most of the divisional executives, a step that is being taken in Hertfordshire with every prospect of success and of a saving of £15,000.

Miss Horsbrugh had, however, an effective reply to some of the criticism about the restrictions on school building, much of which concerns the need to reduce the size of classes. The size of classes obviously depends as much on the supply of teachers as on the supply of classrooms. To keep the teaching profession at its present level about 10,000 entrants a year are needed, and to maintain the existing staffing ratio with the larger number of schoolchildren will require a further 3,000, rising to 4,000.

Two-thirds of the teachers are women, and it is they who are in short supply. Yet 60 per cent of the girls who stay at school after fifteen become teachers, and against the attractions of more highly paid and less exacting occupations this is already a high proportion. Teachers are to be recruited as fast as possible, but it is clear that, with all the school building in the world, there could be little or no reduction in the size of classes before 1961, when the school population begins to fall.

* * *

The Saar Needs Time

The German Chancellor is learning not to be too optimistic in his statements. On his return from Paris last week he deprecated any attempt to label his talks with M. Schuman on the Saar a "success" or a "failure." The Saar, he said, was a matter which could only be settled slowly by Germany and France together. Dr Adenauer had taken a risk by agreeing not to raise Germany's memorandum on infringement of democracy in the Saar before the Council of Europe. The Council was to have been asked to consider the law passed by the Hoffmann government which effectively hinders, if it does not actually ban, parties that oppose the Saar statute. Dr Adenauer and M. Schuman have now agreed to hold an inquiry into the conditions for holding free elections this year, together with Herr Hoffmann. What the Chancellor has achieved by this is hard to say. According to French comment, the results of the inquiry will bind nobody and the law restricting political parties will stand. The Saar premier can produce a number of reasons why the law is justified, but they do not make it good politics. Action against the revisionists should not be necessary if, as Herr Hoffmann contends, the Saarlanders are content to remain under their present regime of economic union with France and political separation from Germany

As matters stand, there is a danger that events will take the same course as they did during the period between 1919 and 1935, when the Saar population swung back into a chauvinist Reich as soon as their standard of living was affected by the slump and a glorious future was offered by Hitler. There is, however, no need for history to repeat itself. On both sides there is now a body of opinion in favour of something vaguely called the "Europeanisation" of the Saar. The chauvinists have not yet secured a hold on public imagination, and "Europe" is popular.

As a result of Dr Adenauer's talks in Paris, the possibility of placing the disputed territory in some way under the Council of Europe will be examined. Clearly such ideas demand time for their realisation. Even the Schuman heavy industry pool, which should create a free market for the steel and coal of France, Germany and the Saar, has not yet begun to operate. Until the machinery of co-operation begins to turn, Dr Adenauer and M. Schuman will have a hard task in controlling the forces on both sides which tend to wreck their efforts.

* * *

Trieste for Italy

Since the Jugoslavs occupy Zone B of the Free Territory of Trieste, there is no logical reason why the Italians should not now occupy Zone A. They were not originally permitted to do so because Italy was an ex-enemy and, in addition, possessed inadequate forces to hold a potentially dangerous frontier with the Jugoslavs. Today Italy is a fully fledged partner in the Atlantic Pact and the position has entirely altered. Moreover, if Britain and America were to withdraw from Zone A in favour of Italy they would at least be going as far as is readily practicable towards implementing the clear and categoric three-power declaration made by Britain, America and France on March 20, 1948. This stated that the whole of the Free Territory, including Zone B, should be returned to Italy. It is understandable, therefore, that on the fourth anniversary of that declaration last week, serious riots broke out in the city of Trieste and that demonstrations have since taken place in Rome and other parts of an exasperated Italy.

The position is complicated by several other factors. It is arguable whether an Italian occupation of Zone A could be made legally watertight without the consent of the Russians and the other signatories of the Italian peace treaty. Nor would occupation of Zone A necessarily satisfy extreme Italian nationalists; they consider themselves entitled to part at least of Zone B on ethnic grounds, and they might bitterly oppose Signor De Gasperi if his government appeared to abandon all claims to Zone B by settling with Britain and America for Zone A now. Last, and not least, Marshal Tito would to some extent be affronted by such a partial settlement, because he has counter claims to Zone A.

The present situation cannot be allowed to go on. For the last few months negotiations have in any case been taking place to settle the whole question of Trieste over the heads of the Russians. And Marshal Tito has only himself to blame for failing to make any material concession in the direct negotiations with Italy during the winter, from which at one time there were modest hopes of a final settlement which would have covered both Zones.

It may be that the idea now attributed to the former Italian ambassador in London, Duke Gallarati Scotti, would be the best first step—namely, that Italy should forthwith participate in the occupation of Zone A under Nato auspices. But, whether a total settlement can ever be negotiated or not, only the Italian Communists will gain if the Rome Government can obtain no advance on the present situation by agreement with Britain and America. For Signor De Gasperi the events of the last few days are damaging portents for the coming regional elections and the Italian general election within a year. Marshal Tito, whatever his difficulties at home, should reflect on what his situation would be if the strictly Stalinist Italian Communist Party got into power next year.

* * *

The Paris Agenda

The Council of Ministers of the Organisation for European Economic Co-operation has a full agenda for its meeting this week. The items cover all the major projects that OEEC has undertaken. The future of the European Payments Union is one of the first subjects to be discussed (a new Belgian settlement is expected to be announced) together with the once famous scheme for freeing European trade from quota restrictions. The future of this scheme, which has been mutilated by the recent attacks from Britain and France, is closely allied to that of EPU. If a method could be found of preventing the chronic creditor from amassing too much gold and the chronic debtor from paying too much gold, liberalisation might be provided with more secure foundations.

Other topics are a study of the working parties' reports on expanding European output by 25 per cent over the next five years; the coal report, with its recommendations on increasing coal production and reducing Europe's dependence on American supplies; the operation of the International Materials Conference in Washington; a further survey of Europe's progress towards financial stability; and, finally, the future of the organisation itself.

The long agenda may simply be a way of showing that it has many important projects in hand which could not be easily taken over by other organisations. Much of the spade-work on them has been done, and it could be argued that it should complete these tasks before becoming another exhibit in the museum of experiments in co-operation. The future of OEEC is a serious matter. Part of its functions —in particular the distribution of dollar aid—has been taken over by Nato, while other parts will come more and more under the various new European organisations that are sprouting up—the Schuman Plan, the defence community and the so-called "green pool." Even EPU has technically a separate existence and a separate staff.

The fact that of all these bodies only EPU covers all the countries that are at present in OEEC is not alone a sound argument for retaining the organisation in its present form. But if Europe is to be afflicted with a variety of independent organisations, there will clearly be a need for co-ordination which might be the job of a smaller OEEC secretariat. In the final analysis the decision about its future will depend on political considerations, especially on whether Britain wishes to be more closely aligned with Europe in economic affairs. And on this the evidence is uncertain.

* * *

Award for Doctors

There must be wry faces at the Ministry of Health this week. The long dispute with the British Medical Association over general practitioners' pay has ended—in favour of the doctors—and it is a reasonable assumption that if the doctors' claim had been settled earlier by negotiation it would not have cost so much as the present award. But in the autumn of 1949 Mr Bevan, then Minister of Health, turned the claim down outright. Over a year later his successor, Mr Marquand, admitted that it had some justification, but it was not for some months, and then only after much temporising, that he agreed that the claim should go to arbitration. This week, the adjudicator—a High Court judge—has determined that in the year 1950-51 the general practitioners should have been paid nearly £10 million more than they in fact were. This is an average of about £500 per doctor. Underpayment in the year and nine months preceding, and in the year following, is likely to bring the total cost of the award to about £35 million.

The British Medical Association has based its claim on the recommendations of the Spens Committee. These were that general practitioners in the national health service should have the incomes which it thought should have prevailed in 1939 written up to allow for the fall in the value of money since then and having regard to the increases in the pay of other professions. The association has consistently held that the Ministry of Health has failed to apply the Spens recommendations properly in determining the total sum of money from which individual doctors are paid. In particular, it has argued that the Ministry ought to have applied in 1948 a betterment factor of 70 per cent for gross incomes, in order to compensate fully for the change in the value of money since 1939. For 1951 it asked for a betterment factor of 120 per cent. The Ministry has applied 20 per cent for net taxable incomes, and its percentage of earnings to be treated as practice expenses was less than the figure claimed by the doctors. Its argument was that doctors' earnings from all sources are high enough to justify its assertion that the Spens recommendations were being carried out.

Mr Justice Danckwerts has agreed with the doctors on the percentage to be taken for expenses. But he has applied a betterment factor of 100 per cent in determining his award for 1950-51 and has suggested one of 85 per cent for 1948.

Health Service Costs

There is, on the face of it, no reason why the award to general practitioners should be taken as an example by other professions. The British Medical Association has not obtained a cost of living increase in an agreed standard of pay, but an independent ruling on what that standard of pay should be. It does not even follow that other practitioners in the health service whose pay is also related to the Spens Committee's recommendations, and who have agreed to that pay, will be eligible for increases. There was nothing in the committee's reports to suggest that pay under the health service should be regularly tied to the cost of living.

Nevertheless, the award puts the Government in an awkward position. Will it fix a new limit on the cost of the health service and spread the cost of the award over the general body of taxpayers, or will it keep to the limit of £400 million and confine the cost to the patient by imposing new charges? Mr Crookshank refused to commit himself this week. Were it not for the back pay involved, he could almost apply the award without exceeding the limit. If the cost of civil defence is excluded from the health service estimates for 1952-53, their net total is £392 million, compared with £398 million in the year just ending.

Yet, even without the increased cost of the general practitioner service, the finances of the health service are still precarious. As the table shows, the cost of the hospital service continues to increase. Some of the additional £20 million can be accounted for by higher prices for food, fuel and power, and drugs, but the biggest single increase in maintenance expenditure—over £6 million—is attributable to the cost of the nursing staff. This, presumably, implies some expansion of hospital services.

HEALTH SERVICE ESTIMATES
(£ Million)

	1951-52	1952-53
Net Total Cost	**398**	**392**
Of which :—		
Advances to hospital boards	262	282
General practitioner service	48	48
Pharmaceutical service: gross cost	44	48
Less Receipts from patients	...	*8*
	44	40
Dental service: gross cost	41	31
Less Receipts from patients	*5*	*11*
	36	20
Ophthalmic service: gross cost	19	11
Less Receipts from patients	*5*	*5*
	14	6

What is also clear from the table is the extent to which the bill for drugs has got out of control. The gross cost of providing spectacles has fallen to about half the actual cost in 1950-51, and there is no doubt that, apart from the natural fall in demand, the charge has acted as a deterrent. But the cost of drugs goes on rising. It is possible that the proposed charge will have a bigger deterrent effect than has been allowed for in the estimate. In any case, its size is determined by the general practitioners who write the prescriptions. Now that they have received their award they have a special obligation to reduce unnecessary and unnecessarily expensive prescribing.

* * *

Sponsored Television?

Rumours that Conservative backbenchers, impatient to see something denationalised, are urging the Government to admit a commercial element into the television service, have stirred up a number of impressive protests. There is one powerful argument in favour of permitting some "sponsoring" (that is, payment by commercial firms for the right to attach advertising appeals to some of the programmes) in television, and that is that television is an extremely expensive service to provide. It is the more necessary to make this point first, since so few of those who have raised their voices against "sponsoring" have seen fit to face the financial alternative. If television is to be financed out of revenue derived from licences then either the service will be starved of funds, or the present television licence fee of £1 a year (in addition to £1 for sound broadcasting) will have to be sharply raised, or else television will have to continue to be subsidised out of the fees contributed by the sound listeners who never see it. If the Post Office refrained from keeping for itself part of the licence revenue, the position would be eased, but not very much, as most of this "retained" revenue ought to go to sound broadcasting, whose listeners provide it.

Nevertheless, in spite of this financial difficulty, it would be a retrograde step to permit advertising in television. One reason for this is the distaste that most people in this country feel for the commercialisation of what should be a public service. Another reason is that, unless sponsoring were also to be allowed in sound broadcasting, it would inevitably lead to some degree of separation of the two services, which would run counter both to the technical requirements and to common sense. If the two techniques had been perfected at the same time they would never have been separated, and the obvious course of future development is for them to grow together.

This is not, of course, to say that the BBC's monopoly is a good thing. There is a third way of organising broadcasting which would have neither the commercialism of "sponsoring" nor the stiffness, the inhibitions, and the political dangers of monopoly. The ideal solution would be to have several competing public-service corporations, each embracing sight and sound and none accepting money from advertisers. It would cost more than the present BBC, but in any case, if British broadcasting is to be both adequately financed and free of commercial taint, the public will have to be persuaded that it would be worth paying, say, 3d. per day per household (instead of the present ¾d. for sound and a further ¾d. for sight) for a complete service.

* * *

Report on the Colombo Plan

This week the first annual meeting of the consultative committee of the Colombo Plan has been taking place in Karachi. Its purpose is to review the progress so far made, to reach as much agreement as possible on certain immediate problems, and to maintain the dynamic behind the plan. Unfortunately the meeting will not be able to report any great progress of a nature likely to capture the imagination of either Asia or the West. And it is above all by its impact on public opinion that the eventual success of the Colombo Plan will have to be measured. At best, the achievements of the first year in a six-year programme of capital development can hardly be conspicuous. Nor is the programme in any case big enough to do more than lay the foundations for greater investment later on. It is, nevertheless, no small achievement to have established during the past year a new technique of consultation in Asia, to have proceeded with a number of specific development projects which depend in part on external economic aid, and to have added Burma and Nepal to the list of participating countries.

Among the problems for the future discussed in Karachi three in particular will affect the ultimate influence of the Colombo Plan. One is to decide what type of work by the permanent secretariat is most likely to lead to American investment, either through increased government aid or through the World Bank; in this respect it is unfortunate that, while Washington takes part in the running of the Colombo Plan, American influence in Jakarta is reported to be working against Indonesia joining the plan. Other problems are the role of Japan in furthering the work of the plan and the effect on South East Asia of the current recession in the world prices of raw materials. While the latter may be temporary, in the long term Japanese industry is clearly in a position to do a great deal for the whole area. Japan ought to be invited to attend next year's meeting.

Russians in Tokyo

The impending (though still delayed) transition in Japan from occupation status to normal sovereignty has raised delicate questions about the future of the Soviet military-diplomatic mission in Tokyo. Although the Soviet Union did not provide any troops for the occupation (which it refused to do unless its contingent could be independent of General MacArthur's command), it has been represented throughout the occupation period on the Four-Power Allied Council. It has maintained in Tokyo a large mission with a military guard, nominally as staff for the Soviet member of the Council. Soon, however, a new situation will arise. When the peace treaty comes into force, there will no longer be any occupation regime or Allied Council, while the Russians, not having concluded any peace treaty with Japan and not having any diplomatic relations with its government, will no longer have any recognised right to remain in a large building with extraterritorial juridical status for its inhabitants and armed guards at the door.

It is nevertheless expected that the Russians may refuse to withdraw. As far as they are concerned, nothing done at San Francisco has any legal validity; treaties concluded with Japan by the United States and others do not bind the Soviet Union, which remains technically at war with Japan until a peace treaty between them is concluded. No doubt the Soviet mission could be removed by force, but such action would aggravate an already tense situation. The Japanese may take the less provocative course of sealing off this Soviet outpost from its contacts in the country.

One solution, of course, would be to resume Soviet-Japanese diplomatic relations, even without a formal peace treaty; the Soviet mission could then become a regular embassy. The Japanese Government is reported to be not unwilling to have such diplomatic relations, but to insist that there must first be a satisfactory settlement of Japan's two principal grievances. One is the Soviet failure to account for 300,000 Japanese prisoners of war who have not been repatriated; the other is the Soviet seizure of some small islands off the coast of Hokkaido, on the pretext that they belong to the chain of the Kurile Islands annexed by the Russians in accordance with the wartime Yalta agreement.

Like Peter, like Paul—like Perón

Peronistic autarky has become a contagious disease in the southern hemisphere. The two latest victims are Australia and New Zealand. New Zealand at the moment seems to be only a mild case, but the Australian symptoms show all the signs of a deep-rooted infection that may be suppressed from time to time but not cured. The disease, admittedly, is an economic malady as far as the two southern dominions are concerned and not a political one.

A few months ago the New Zealand Government asked for and got an increase of 15 per cent in the price of meat it sells to Britain, despite the fact that the existing long-term contract contains a clause limiting the annual variations in price to 7½ per cent either way. It had a strong case, for Britain had agreed to much larger increases in the price for both Argentine and Australian meat. Taken by itself this manœuvre contained nothing sinister. But the New Zealand Government has now decided that "for administrative reasons" it cannot pass on the higher price to its farmers. It is true that most of the livestock has already been slaughtered and much of the meat shipped and that retrospective payments would require a more elaborate accounting system than exists. But the New Zealand Government could at least promise that it will pay farmers the higher prices next season. This technique of exacting higher prices from its buyers and refusing to let those higher prices encourage an increase in output has been used by Argentina ever since the end of the war.

Australia is in a much more serious plight. It, too, with its various produce boards, has not passed on to producers all the increases in price it has exacted from its customers. But that is not all. As in Argentina, Australia's secondary industries have been artificially stimulated and supported to the detriment of agriculture. Agricultural output has been declining and it may not be long before Australia becomes a net importer of food. Farmers consider that their profits, except in recent years from wool, are too low. The drift to the towns has made labour scarce and costly, and agriculture has not been fully mechanised.

This development was just beginning to be corrected in 1951 when the flood of imports made the Australian people realise that their domestically produced goods were, on the whole, of poorer quality and of higher price. Now, however, the new import restrictions will not only give domestic industries a new lease of life but also every incentive to expand since incomes are not being cut. If the Australian Government really intends to foster agricultural production, it should introduce fiscal and monetary measures that will make any increase in secondary industries impossible. If it fails to do that, it will be only a matter of time before Australia (like Argentina at present) suffers all the impoverishments of autarky.

More room in Oxford

The Randolph Hotel in Oxford has in the past three years been almost doubled in size; extensively improved and largely re-furnished. It now offers accommodation of the high standard expected by visitors to the University City both for overnight and for restaurant meals. There are bedrooms, many with bathrooms en suite, for 180 guests and the restaurant services have been increased in size and modernised. The finest Assembly Room in the City provides for banquets and balls and smaller functions. A Garage adjoins, with entrance in Beaumont Street.

Resident Managers: Major & Mrs. Stewart

No Retrenchment in Ireland

The Irish Budget which is to be introduced on Wednesday, a month earlier than usual, is likely to provoke intense controversy. The Minister for Finance contemplates an expenditure of about £135 million in 1952-53, of which £94 million has to be found for the supply services. Both government and opposition seem to wish to confuse comparisons between these estimates and the budgetary provision for the current year. The inter-party innovation of dividing the budget into current and capital accounts has been abandoned. Last year, Mr McGilligan's budget provided £71 million for the supply services, £10 million for the central fund services and £29 million for capital development. There have been supplementary estimates for about £11 million since then; and it is an issue between government and opposition how far the necessity for these should have been foreseen in May last or how far they are a result of *Fianna Fail's* return to office in the following month.

Mr MacEntee has said that he will have a gap of £50 million to cover, but it is possible that this estimate was stretched to the limit and that there will be some contraction on budget day. Nevertheless, Mr MacEntee's task will be formidable. A year ago, the counterpart fund from Marshall aid helped to provide for schemes of capital development through the budget. It has now disappeared; and the need is even greater than it was twelve months ago, since the government has retained the development schemes that it inherited and has added some of its own. There is certainly no sign of state economy; indeed, the government has issued, since the publication of the estimates, its scheme for social welfare which is to cost another £4 million.

There will, no doubt, be some borrowing, but increased taxation also seems to be inevitable. Income tax, at first sight so much lower than in Great Britain, is in practice borne by a comparatively small—and vocal—section. There is room for increased taxes on consumption, and ministerial speeches have foreshadowed some reduction in the food subsidies. The government may feel that its majority is too undependable, for bold measures to be possible, but it is to be hoped that the opposition will admit the need for greater flexibility in the public finances, and refrain from opposing measures that it would find inevitable if in office itself. So far the emphasis is on economy by the public rather than on economy by the state, and it is discouraging to learn, in view of the protectionist leanings of *Fianna Fail*, that a list of import cuts is being prepared. In agriculture, the government is taking the first steps back to a policy of self-sufficiency which would reduce the capacity to export. The Irish economy badly needs reduced consumption and increased production, and it is to be hoped that Mr MacEntee will apply the remedy all round.

Equality and Equidistance

The economics of rail transport can be relied on to exert a peculiarly addling effect on the minds of those called on to discuss them. Last week's debate in the House of Commons was no exception. Mr Hector Hughes proposed that, in the interests of the Scottish fishing ports, there should be "standard freight charges irrespective of the distance covered." The simplest element in the argument was the analogy with the Post Office: if a flat rate is economic for letters, why not for consignments of fish? The answer, indeed, emerged clearly enough: terminal costs, independent of distance, are most of the total cost of the postal system, while the cost of actual carriage, varying with distance, constitutes the greater part of the cost involved in freight in general.

But equity, as well as economics, was heavily involved. Anything but a flat rate is, according to Mr Hughes, scandalously unfair. "Mileage is made a deity, while the unity of our country is repudiated" and the community is denied "equality of opportunity." He might have carried this novel concept of equality much further; it is, after all, a shocking denial of the "unity of the country" that some regions should be more fertile, or rainier, or hillier, than others, with corresponding advantages or disadvantages to their inhabitants. Should there not be compensating levies and subsidies? Once one has exalted equality unconditionally above the rational use of resources, why stop at transport?

Other considerations were eloquently adduced by Mr Grimond on behalf of his distant constituents. Transport costs, increasingly penalising remote areas, accentuate the drift to the crowded and vulnerable mainland towns; they should therefore be equalised. Economists may ask why people should be, in effect, paid to live in these areas. The answer may be strategic: "Because their presence there is a source of national strength." Or it may be social: "Because a community is more than an economic organisation, and changes its nature for the worse when it loses its outliers." These may be arguments for a subsidy, but there is no conceivable reason for making that subsidy a charge on rail users in particular. Still less can they be generalised to make economic equidistance an essential ingredient of social justice.

Traffic in Footballers

The high salaries that are paid in the top flights of the entertainment industries do not extend to professional football. In the 1949-50 season the matches of League first teams draw attendances totalling 44 million. Yet the idols of these vast crowds are paid a maximum of £14 a week during the winter and £10 a week in the summer. They also get bonuses for matches that they win, and a benefit of £750 for five years' service may be granted, at the discretion of their club employers. But in all, the earnings of a star footballer are unlikely to exceed about £900 a year—and after a few years he normally has to find a new occupation.

Differences between the players and their employers caused the late Minister of Labour to appoint a committee of investigation. Its report*, published last week, makes it clear that the players are not being exploited for private gain. Under the rules of the Football Association, to which all League clubs subscribe, a club's maximum dividend is 7½ per cent, and club directors, as well as those of the League Management Committee, are unpaid. But some clubs are certainly making very large profits, and the fact that they have few outlets for their surplus cash is, in the opinion of the committee, the reason why transfer fees have risen so high. The committee proposes that in future transfer fees should be limited to £15,000, one-third to be handed over to the Football Association for the advancement of football, one-third to a benevolent fund for professional footballers, and only one-third to the club. The committee did not recommend the abolition of the maximum wage, as this enables even the poorer clubs to have their share of the best players; but it thought that some recognition of star performances could be given if much larger bonuses were paid for appearances in the most important matches.

These proposals, which the disputing parties are free to reject if they choose, meet only part of the players' case. When a player's contract expires he is not free to leave. His club may, if it chooses, retain him at the minimum wage of £332 a year; or it may charge a fee for releasing him. This fee may be so high that no other club is willing to pay it, so that meanwhile he is without a job and without wages. The economic and social principles involved in tying a man so closely to his club surely need a more thorough revision than the committee proposes.

DECCA LONG PLAYING RECORDS

UP TO 50 MINUTES MUSIC ON ONE 12-INCH RECORD

This is Long Playing: Beethoven's Fifth Symphony, Grieg's Piano Concerto, Tchaikovsky's "Pathétique", "The Eroica", Gilbert & Sullivan's "Trial by Jury", The "Nutcracker" Suite—*each on one twelve-inch long playing full frequency range record.** Then the great operas: La Bohème, Die Fledermaus, The Mikado—*each on two;* Carmen, Butterfly, Tales of Hoffmann—*each on three;* Parsifal and Die Meistersinger *each on six.* Already there are 473 of these sensational 33⅓ r.p.m. Long Playing records, providing something for every musical taste—revolutionary in their playing time—transcending all others in their quality of reproduction—records which will never cease to thrill you, your family, and a host of envious friends. Decca Long Playing 33⅓ r.p.m. records may be played through your existing 78 r.p.m. radiogramophone or *a radio receiver* by the use of a Decca L.P. player costing from as little as nine guineas. The Decca Long Playing Advisory Panel (address as below) will gladly help you to choose the right one. Send the name of your instrument and its model number.

**Full frequency range recording is exclusive to Decca. It captures every musical frequency audible to the human ear, giving a brilliance of reproduction unobtainable by ordinary recording.*

The Decca 102 page L.P. catalogue, 1/6 from your dealer or direct from us.

the world's finest quality record

THE DECCA RECORD COMPANY LTD., 1-3 BRIXTON ROAD, LONDON, S.W.9

Are you bothered by your boiler?

You can soon put a stop to that and have all the hot water you want, as easily and quickly as you like it, if you install an

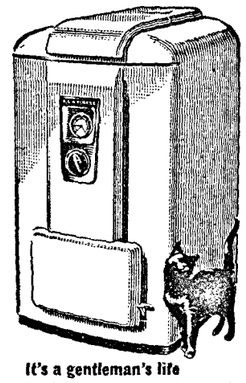
AGAMATIC

THE AGAMATIC is a water heater that *always works* and need never go out. It is cleaner than you would think possible. It heats your water quickly, cheaply, automatically.

It has a thermostat to give you hot water whenever you need it and to damp the fire down when you don't.

The circular grate makes riddling a simple job, over in a moment. It is as dustless as can be: the ashpit door fits like the breech block in a gun.

The whole casing is heavily insulated: no heat is wasted.



It will burn any type of solid fuel and most kitchen refuse.

Price £50 . 0 . 0 ex works, which is very reasonable indeed.

This is the new **AGAMATIC**

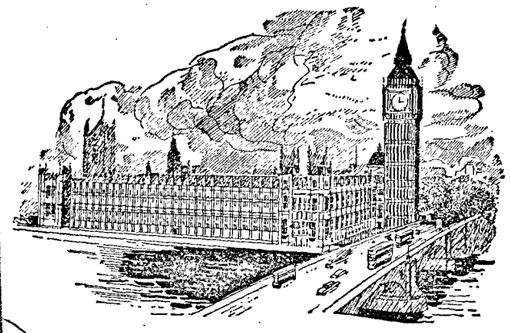
There has never been a boiler like it. It has:

- a built-in thermometer, grouped with the thermostat control in a single panel
- a foot-pedal to release the ashpit door
- a full-depth top-cover, hinged at the back, which you can raise with one hand, making stoking easier
- a most elegant appearance—which comes as an agreeable surprise in these thin times

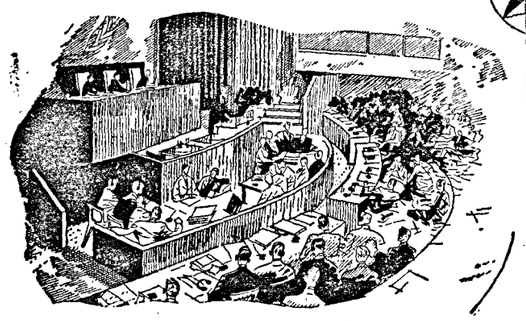
It's a gentleman's life for the stoker of an Agamatic

For full information, visit the London showrooms, or write for the illustrated Agamatic leaflet to:

AGA HEAT LTD



134 ORCHARD HOUSE, ORCHARD STREET, W.1



(The Agamatic is another splendid fuel-economy appliance from the Allied Ironfounders Group)

The word 'Agamatic' is a registered trade mark of Aga Heat Ltd.

MARCONI

serves mankind

Marconi was a lone thinker who revolutionised communications by methods "the entire meaning of which no one before him had recognised.". There is a great contrast between his crude copper-sheet aerial and the Marconi equipment which televises such programmes as the opening of the new House of Commons and the sessions of the United Nations. But there is also a great similarity—Marconi's tradition of service to mankind.

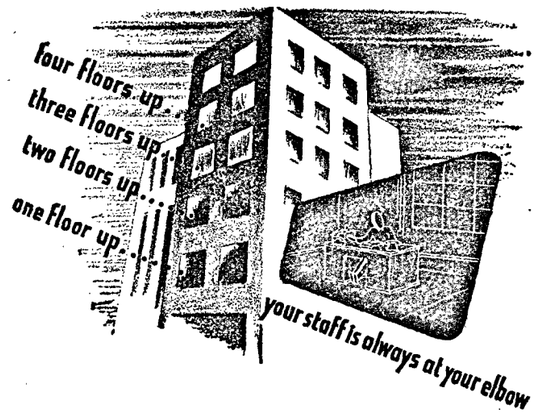
Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.



As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

Allies or Enemies?

German-Soviet Relations Between the Two World Wars, 1919-39. By E. H. Carr. The Albert Shaw Lectures on Diplomatic History. *Oxford University Press.* 146 pages. 18s.

Between the wars Germany, so long as it was weak and subject to the Versailles Treaty, needed the support of Russia. Russia, so long as it was weak and shared neither fear nor friendship with France and Britain, needed the support of Germany. Once Moscow had made up its mind that there would be no revolution of the proletariat in Germany, the People's Commissariat of Foreign Affairs put the still hopeful Comintern in its place and worked with Stresemann for the Berlin treaty of 1926, which made it certain that the Soviet Union would stand aside from any military or economic action against Germany—and *vice versa*. And once Berlin was certain of the Locarno Treaty and American financial aid, heavy industry and the Reichswehr put the German Foreign Office in its place and looked to the Soviet Union for markets and secret military aid. Frederick the Great had advised Prussia "to cultivate the friendship of these barbarians" and Bismarck never forgot what united Germany owed to Russia's benevolent neutrality while Austria and France were being defeated in 1866 and 1871. William II thought he knew better, and Hitler hovered between accepting and resenting this tradition of statecraft. Disaster was the result in 1914 and 1941. The question now is, as Mr Carr says in his concluding paragraph, whether the policy of Bismarck will be rejected a third time. He might have added, if he had not so scrupulously eschewed, comment of topical relevance, that Bismarck's view, were he alive, might be much modified by the presence of American power on the continent.

Some of the factors have changed in Central Europe, but sufficient remain to make this book of lectures before the Page School of International Relations at Johns Hopkins University not only remarkably well-timed but highly stimulating. It is cool, clear and readable. It is not the last word on the subject because the full personal records of General von Seeckt and Stresemann have not yet been published. It will add weight to the Butterfield-Kennan advocacy of a less emotional approach to international affairs, and it should be prescribed reading for under-secretaries in Washington, London and Paris who did not experience the middle twenties. History, of course, does not repeat itself; but it is salutary to compare the Central European situation seven years after the first world war with the situation seven years after the second. The parallels are instructive.

Much has been written already about the covert and tortuous moves that led to the Ribbentrop-Molotov negotiations of 1939. What is less well known is the scheme of events between 1921 and 1926, which produced first the Rapallo Treaty of 1922 and then the Berlin Treaty of 1926. The western nations were so obsessed with the Bolshevik bogy that they almost drove the Russians into an understanding with the Germans. And when Pilsudski attacked the Ukraine in 1920, only to be thrown back by a Soviet army which looked at one moment like "liberating" the territory that Germany had lost, the generals of the Reichswehr realised two things: that the Red Army was to be reckoned with and that Russians and Germans had a common interest in checking the Franco-Polish alliance.

From then onwards, unbeknown to government and Reichstag, Moscow made "concessions" which enabled von Seeckt's secret general staff to organise training, scientific experiment and arms manufacture in Russia. Mr Carr quotes from the Trotsky archives to show that the Soviet government, unlike the German, knew well what was going on. He shows, too, in some fascinating passages, how Radek had earlier held a political salon in Berlin while detained by the German Ministry of War, talking at length with politicians, soldiers and industrialists like Rathenau. It only needed Rapallo to show the scandalised West in 1922 that "the two outcasts from the Versailles system had joined hands." Brockdorff-Rantzau, who had made a dramatic protest in 1919 against the peace treaty, now went to Moscow as ambassador, resolved that "the evil of Versailles can be corrected from Moscow." One wonders whether we shall hear of a German ambassador going to the United States, resolved that the evil of Potsdam can be corrected from Washington.

By 1926 Stresemann had shown that he could combine the policy of Locarno with a friendly adjustment of relations with the Russians. He understood that it was possible, as well as necessary, for Germany to face both east and west. At the moment Germany does that by being divided. The question of the future is whether, with no independent Poland interposed between Berlin and the Soviet frontier, Germany can be left again in this central position of manœuvre unless the United States is present in Europe in force.

Problem Island

Report From Formosa. By H. Maclear Bate. *Eyre and Spottiswoode.* 210 pages. 16s.

Mr Bate was brought up in China and last year he went back to the Far East as a newspaper correspondent, visiting Formosa, Hong Kong, Macao and Manila. The book which is the sequel to this trip bears the marks of hasty writing, but it is as up to date as such a book can be, and the account of Formosa is a valuable piece of first-hand reporting, though rather confusedly mixed up with the author's own speculations and comments. He enjoyed special facilities while in Formosa on account of personal friendships with Chinese naval officers who were trained in Britain during the last war and are now in charge of the Nationalist fleet. He had interviews with the principal figures of the residual Nationalist regime—Chiang Kai-shek himself, General Chen Cheng, Dr K. C. Wu and Mr George Yeh—and with their American military advisers, Major-General Chase, Admiral Cooke and the "Flying Tiger" Major-General Chennault.

Mr Bate makes it clear that, as far as the Nationalists themselves are concerned, Formosa is not simply a refuge, but a base for ultimate counter-attack. All their talk is of "the Return" and their troops are being trained in offensive tactics. American policy so far has been to help them to hold Formosa, but not to support them in any attempt to return to the mainland. Nationalist officers told Mr Bate of their fear that their army's morale would decline if it had no chance of fighting; as one of them put it, "You don't train a horse for steeplechasing and then keep it all the time locked in a stable." Since the defeat of the Kuomintang on the mainland, its principal military test has been the defence of the island of Quemoy, which is only two miles from the coast of the mainland; its garrison has so far repulsed all Communist attempts to capture it, and Mr Bate, who flew there and saw the place under bombardment, considers that this has been a substantial achievement. He believes that the Kuomintang really has reformed itself in Formosa, for the opportunist elements in the party have deserted to the Communists and the corrupt parasites have fled to America, leaving only a hard core of anti-Communist resistance, and enabling the best men of the regime, such as Dr K. C. Wu, to exercise a power which they never had in the old days. Mr Bate claims that a genuine land reform has now been carried out in Formosa and even if it is regarded as a mere deathbed repentance, he thinks its political effect locally has been considerable. The author's own political sympathies are not left in doubt, and from contact with American Service representatives in the Far East he has acquired much of their point of view. On a visit to the ruins of the fortress of Corregidor in Manila Bay, where the Americans in 1942 made their desperate last stand against the Japanese, he reflects that this battle "has probably done more to promote the United States' present attitude towards Asia than any other single factor" and that Corregidor "symbolises to many the fate of all efforts to appease a ruthless and unappeasable foe."

Constitutional Model

Government and Politics in Ceylon (1931-46). By I. D. S. Weerawardana. *Ceylon Economic Research Association.* 207 pages. Rs. 8.00.

Ceylon's constitutional development has been model. Everything has been settled quickly and by agreement. Mr Weerawardana's book covers the crucial fifteen years, the years from the inauguration of the Donoughmore constitution to just before the attainment of Dominion status. He has not only read all the documents, he has also talked to all the people ; this is perhaps more important in a case where so much has depended on the growth of conventions—conventions which sometimes made nonsense of the formal statutes. The result is a book that, with a wealth of scholarly detail, really explains. We are enabled to see the constitutional process unfolding itself in a way that is rarely possible with constitutions of the British type, with their emphasis on the unwritten adjustment and the casual compromise.

Mr Weerawardana obviously has no great love either for the Colonial Office or for the Ceylonese politicians now in power. Yet his book is in fact a sustained tribute to the moderation and reasonableness of both. The Donoughmore constitution itself helped in two ways. It gave Ceylon adult suffrage ; and a bigger electorate means less corruption and more consideration for the interests of the people as a whole. And it refused to grant communal electorates, so that at a time when India was moving towards division, the communities of Ceylon were, on the whole, coming together. Otherwise, that constitution, because of the lack of organised parties in Ceylon at that date, combined the pattern of an English county council and its executive committees with the usual pattern of a colonial constitution, with its reserved powers and its dyarchy.

Mr Weerawardana's book shows how the pull of the British constitutional tradition was too strong for these arrangements. The reserved powers, in the usual way, gradually slipped into disuse. There was an occasional minor crisis. But the power of disallowance was never used once ; by the time the war came the power of reserving legislation was exercised only formally ; and the common objective provided by the war finally brought the ministers fully into foreign affairs and defence, despite a momentary possibility of friction when Admiral Layton was first given overriding powers as Commander-in-Chief. On the other hand, the Legislature's executive powers fell into disuse almost from the beginning ; the committees were more and more content to leave day-to-day administration to their chairmen, thus making them ministers in fact as well as in name ; and the ministers, although they were separately elected as chairmen and had no organised party behind them, tended increasingly to become a Cabinet. By 1946 Ceylon was not only almost governing itself, it had established that its model would be Westminster and not County Hall.

The Diplomatic Dollar

The Diplomacy of the Dollar. By Herbert Feis. *Johns Hopkins Press.* (London: *Geoffrey Cumberlege.*) 81 pages. 18s.

By "the diplomacy of the dollar" Mr Feis, who was adviser on International Economic Affairs to the State Department from 1931 to 1943, means "the way in which we use our power to make gifts or loans to serve our ends in our dealings with other peoples"—a concept which he distinguishes sharply from the odious "dollar diplomacy" of 1908-12. In this book, which began as a lecture series in 1950, he casts a backward glance over the first era of the diplomatic use of American lending power, the period 1919-32, and contrasts it with the present time.

The book begins with a brief sketch of the attitudes which led to American faith in private foreign investment as the cure for the world's problems, and to the first attempts to control this investment in the interests of American foreign policy—if "control" is the right word for a policy so lightly applied for fear of public censure. After underlining the inconsistency of heavy foreign lending, high tariffs, and insistence on payment of war debts, Mr Feis examines the success of the policy in attaining its main objectives: to prevent loans for the finance of budget deficits or armaments, loans to foreign monopolies, and loans to unrecognised or defaulting governments. He then deals with the special cases of Germany, France and Russia, and the oil of Mosul —the last of which scarcely justifies Mr Feis's new concept.

In relating this experience to American postwar lending, Mr Feis is emphatic about the main lesson: without a clear and consistent foreign policy, supported by an integrated foreign economic policy, the use of American foreign lending to back up American diplomacy is apt to prove a dismal failure ; even with these things it is a chancy business. Writing in 1950, he says much whose relevance has increased with the passage of time: that America must not be impatient with its debtors, that insistence on repayment of loans may defeat the purpose for which the loans were given, and that the economic commitments imposed on borrowers must be kept consistent with the political and military commitments imposed by diplomacy. Though the signs are hopeful, it remains to be seen whether "the diplomacy of the dollar" will live up to Mr Feis's conception of it.

Pseudo-Insurance

The Economics of National Insurance. By Alan T. Peacock. *Hodge.* 126 pages. 8s. 6d.

It is in the field of public finance, more perhaps than in any other, that the science of economics and the kindred acts of political economy and administration are most practically and fruitfully allied. Mr Peacock's study of the economic implications of the national insurance system is an outstanding example of this alliance. Described in the author's introduction as "a by-product of a wider study into the effects of income redistribution," it is limited in its scope, deliberately disregarding or treating only very briefly such traditional questions as the incidence of social security contributions or the particular effects of the social security scheme on "mobility of labour, on the incentive to work, on trade union policy, and so on." It concentrates rather on the significance of the scheme's finance to the magnitude of income flows, and so to public finance, and in general, and especially, to the management of the national debt.

It is a most penetrating, and probably to many readers, a highly disconcerting, study. Mr Peacock demonstrates that national insurance is not, by any reasonable standards, insurance at all ; that its autonomy *vis-à-vis* the fiscal apparatus as a whole is a legal fiction, serving a useful psychological and political purpose but economically non-existent ; that the scheme's reserve funds are for all practical purposes indistinguishable from other forms of Government debt, from which they differ only in that contributions to them are compulsory. The various strategic uses to which they can be put are enumerated, but described, owing to the secrecy surrounding them, as mostly hypothetical. The picture thus unanswerably presented differs almost diametrically from that generally drawn, on the analogy of private insurance, by the scheme's beneficiaries. Once the insurance fiction is swept away the scheme appears as a social service like any other, financed by an earmarked and grossly regressive tax, and illogically overlapping both the system of income tax reliefs and the social services outside its nominal scope.

Mr Peacock outlines proposals for reform which follow logically from his analysis. They have a good deal in common with the plans suggested by Lady Rhys Williams, Professor Meade, Mr F. P. Chambers, and the Liberal party ; they abolish the contributory system, the structure of income tax reliefs, and the food subsidies, substituting a personal allowance, a basic tax, and a surtax over £600 a year. His final chapter, in the nature of a postscript, assesses and approves the pension changes in the 1951 Budget. Events have outstripped him, but the Budget of 1952 appears, in the light of this study, all the more clearly as a step in the right direction.

Shorter Notices

The School of Salamanca : Readings in Spanish Monetary Theory, 1544-1605. By Marjorie Grice-Hutchinson. *Oxford University Press.* 134 pages. 12s. 6d.

The highly specialised but highly readable study explores an unfamiliar but significant subject, of interest both to economists and to historians ; the impact on Spanish law, custom and economic theory of the great changes brought about by the sixteenth-century inflow of treasure from the New World. That impact took effect on a legal and theoretical structure rigidly determined by the doctrines of the Church with regard to the just price and to usury, and not the least interesting part of Miss Grice-Hutchinson's study is that which describes the efforts of the theologians and jurists of Salamanca to reconcile these doctrines with economic reality. In the

Persian Lamb in Africa

THAT THE HUDSON'S BAY COMPANY has a subsidiary company in S.W. Africa, farming Karakul sheep for "Persian lamb" is disclosed in *New Commonwealth*. Moreover, "Persian lamb" production of 2 million skins, worth over £5 million, represents over half S.W. Africa's total exports.

It is one of the romances of Commonwealth trade that this should have been achieved in the tropics by a Company usually associated with the arctic circle!

It is also one of those interesting and valuable pieces of trade information that can only be found in *New Commonwealth* — the publication which helps you to sell to the Commonwealth.

course of these efforts they recognisably anticipated some of the leading ideas of modern theory. Nearly half the book is devoted to texts, here made available for the first time to the English-speaking reader.

A Short History of Ireland. By J. C. Beckett. *Hutchinson.* 208 pages. 8s. 6d.

Mr Beckett has performed, with great success, the difficult task of disentangling the numerous threads in the pattern of modern Irish history. Although his book briefly covers the history of the country from the earliest times, the main emphasis is on the events since the Act of Union. The interplay of the political, religious and economic forces at work in the nineteenth century is skilfully traced, with particular regard to the changes that took place in opinion in Ulster. The greatness of O'Connell, who founded modern Irish nationalism, and of Parnell, who united the constitutional, revolutionary and agrarian movements, emerges from the narrative. The origin and growth of the numerous streams—the IRB, the Gaelic League, Sinn Fein, the Irish Volunteers and the Citizen Army—whose confluence led to the rising of 1916, are clearly explained. The events which preceded and followed the Treaty of 1921 are described with a remarkably correct perspective. Mr Beckett concludes that the relations between Irish Catholics and the Protestant minority and between Great Britain and Ireland have not yet been settled. Since the treaty, Irish politics have remained static. "In both north and south the public is compelled to judge men and events according to the politics of thirty years ago." This little book should be read by all who wish to understand modern Irish politics and particularly by Irishmen.

World Political Geography. By G. E. Pearcy and R. H. Fifield. *Constable.* 653 pages. 45s.

This symposium, edited by the Geographic Attaché to the State Department and Professor Fifield of Michigan University, provides some information on new trends in American views on geopolitics. The first of seven parts deals with the definition, history, and scope of political geography, which the authors suggest, rather surprisingly to British geographers, is synonymous with geopolitics. Part seven considers some special aspects, such as boundaries, population factors, grand strategy, and geography in future world politics. The greater part of the work consists of studies of the principal political divisions of the world. The geographical situation, historical development, and economic resources of each area are examined, with the aid of small but adequate inset maps, in order to determine its status in world politics. These studies will provide a useful source of reference.

The analytical parts of the work are, however, regrettably short, and the definition of the central concept of the book, national power, lacks the rigour which is essential in so large a symposium. Thus the studies are interesting, but the conclusions about countries and their foreign policies tend to be vague, and often far removed from the fundamental elements on which national stability and development must depend.

Letters to the Editor

Will France Face the Facts?

Sir,—In your leading article of March 8th you stated that "France is not at all heavily taxed . . . or perhaps it would be more exact to say that the amount collected in taxation is not high." This is ambiguous. As M. Gérard Silhol complains in your issue of March 22nd, nearly a third of the French national income is earmarked for revenue, a burden theoretically greater than that borne by the United Kingdom and the United States. In practice, however, the yield is poor because (as every tax collector admits) several hundred milliards annually escape the Treasury's mesh as a result of fraud on income tax and sales tax. Now the worm at the core of the French political economy is social unrest stimulated by inflation. Price rises have several causes, a budget deficit among them; but France's real *spécialité de la maison* among inflationary pressures seems to be the operations of countless middlemen who make large profits per unit on a small turnover and then pay incommensurate taxes upon them. It is surely the ever blossoming *commerçants*, not the employers, still less the wage-earners with known fixed incomes, who are at the root of the bubble. Each year, under rearmament, an ever more inflated expenditure may be met only by ever more exorbitant direct taxation on consumption and imports (now 60 per cent of all taxation). This progressively unjust pattern of taxation seems inescapable so long as direct taxes give an insufficient yield and the state has no credit. Whether M. Pinay can substantially reduce the cost of living by direct agreement between economic groups remains to be seen.

The postwar scissor movement between agricultural and industrial prices, to which M. Silhol refers, will, as he says, certainly have reduced the taxable profits of the farming community. But when has the French state been able to count on the farmers to swell its budget?
—Yours faithfully,

YOUR CORRESPONDENT

Paris

New Zealand's Reserves

Sir,—In your comments on the deterioration in the position of the Australian pound, on page 550 of *The Economist* of March 1, 1952, you write:

> The same factors are also at work in New Zealand where fairly sharp import cuts are now inevitable. The Reserve Bank of New Zealand's sterling balances (which, in the past, have represented about two-thirds of New Zealand's total overseas assets), had fallen from a peak of £87 million last August to £21.5 million by the end of January; last year these balances recovered rapidly from a seasonal nadir of £47½ million from the end of December onwards, but there has been no sign of such a recovery so far in 1952.

The figure of £21.5 million for the reserves in January is too small by £32 million. Since August 15, 1951, one of the main reasons for the steady decline in the Reserve Bank's holdings of sterling exchange has been the purchase of overseas investments.

Normally the Reserve Bank's sterling exchange is held in the form of British Treasury Bills; as a matter of policy it was decided to invest part of these funds in short and medium term British Government securities, which are included in the Reserve Bank's investments. Between August 15th and November 14, 1951, overseas investments rose from £1.9 to £32.1 million; no further additions to this portfolio seem to have been made between then and March, 1952.

Taking this adjustment into account, total New Zealand foreign exchange reserves have moved as follows:

	(in £NZ million)		
	1950-51		1951-52
August	78.4	...	117.9
September	71.0	...	110.7
October	68.8	...	98.0
November	63.5	...	86.3
December	73.0	...	81.8
January	90.9	...	81.6

There has been no significant deterioration in the position since January. While the general trend of events in Australia is applicable to New Zealand, it can be seen that the omission of the change in the Reserve Bank's investment policy creates a picture which does not reflect the greater stability of the New Zealand economy.—Yours faithfully,

W. ROSENBERG

Canterbury University College, New Zealand

Planning in Practice

Sir,—In your issue of March 22nd, Mr Buckatzsch makes three points about the recent demolition of some brick and concrete structures in Oxford—that they could be used for hospital accommodation, that the conversion of the site to landscape gardening is economically wrong and that the whole is an example of vagarious planning. That is not, surely, the whole story.

The Oxford hospital administrator is reported in the press to have made a statement that evinces very little enthusiasm for the use of these buildings for hospital purposes, and presumably he knows whether they are conveniently sited in reference to the present layout of the Oxford hospitals.

In attempting an economic evaluation of landscape gardening one should surely take into account the previous uses to which the site was put. It may be that by change of use the community may attain a greater degree of utility, move to a higher indifference curve or to a "preferred position" (one has a choice of jargon for this purpose) than by retaining the previous uses of the site.

Finally, is this perhaps not an example of planning but of an attempt to get free from planning, to enable the uses of resources to be determined by the free play of consumer choice, expressed through the blind machinery of the market-place rather than through the wide-awake calculations of economic satisticians?—Yours faithfully,

E. M. HUGH-JONES

Keble College, Oxford

AMERICAN SURVEY

Unmilitary Revolution

Washington, D.C.

IN 1939 the United States Army, which then included the Air Force, had a total strength of about 268,000. At the end of 1951 the Army and the Air Force between them mustered 2,458,000, and by the middle of 1953 it is planned that they will have a combined strength of 3,160,000 men and women. The Defence Department is now not only the largest department of the US Government, but probably the largest single organisation in the world, and in the coming financial year the United States will spend about 70 per cent of its budget on national security. No General has been President of the United States for sixty years, but of the four Generals of the Army (a rank which did not exist in 1939) two are at present actively involved in the forthcoming presidential elections; one has a good chance and the other an outside chance of becoming the next President of the United States. These are only a few examples of the size and scope of the revolution which has taken place in the relationships between the American people and their armed forces.

Before the Second World War few of the professions counted less in the social pattern of American life. There was no connection, as there was in Britain, between the upper middle class and a military career. The Civil War, by keeping the US Military Academy at West Point closed to the sprigs of the Southern gentry for many years, broke the older connection between the Army and the plantation aristocracy, although Virginia Military Institute, where Stonewall Jackson taught and General George Marshall studied, provided some able officers. The young man of energy, outdoor tastes and independent means, upon whom the British Army has always relied, did not normally take up soldiering and the wealthy sportsman who was also a fine professional soldier, such as George Patton, was very much the exception.

By and large the officer class of the prewar American Army was drawn from all levels of society, including the farming and poorer sections, under the system of nomination to West Point, which brings cadets from every Congressional district. A high percentage of officers were of German and Irish descent and they formed a caste not, as in Germany, because they had a monopoly of power, but because they were literally a class apart. The most likely reason for going into the Army was because one's father had been in it. Military service was confined to Washington, to a string of isolated camps and forts across the country, and to the Pacific garrisons. There was no foreign service other than in the Pacific, and the overseas possessions of the United States provided few of the minor proconsular jobs to which a moderately capable British General could aspire. The points of contact with a civilian society engaged in very different purposes were few; West Point gave a cadet a good education but it was not of a kind to give young men a very profound grasp of or interest in the affairs of a civilian community—although the Academy can claim Edgar Allan Poe and James McNeill Whistler as alumni. Promotion was even slower than in the British Army and after twenty-five years of service Lieutenant-Colonel Omar Bradley was still thought too young for a Brigadier-General's command.

Nor were the enlisted men held in very high regard. During the twenties they were despised for "riding on *Uncle Sam's back*" instead of making a living, and in the thirties they were reviled by liberal opinion for keeping order in the hunger-marching riots. One of the ablest of today's young General officers started life as a juvenile delinquent in a Pennsylvania coal town and was offered by the police the alternative of jail or the Army. Unfortunately America had no Kipling to give the Army a place in the ballads, and therefore in the affections, of the American people.

★

Has the pendulum swung in the other direction? Are Americans in danger of glorying in their new-found military strength, of worshipping their Generals, of abandoning their old civilian tradition for a Prussian concept of the all-wisdom of the military leader? This would be the logical antithesis of their prewar attitude, but only the professional fellow traveller can find evidence to support the view.

While the armed services now provide wider opportunities, greater prestige and relatively better pay than they did before the war, there is no indication that soldiering has overtaken the law or any other of the professions in popularity. Reserve officers accept their recall with duty rather than enthusiasm. Certainly the draft of about 35,000 young conscripts a month rates second only to high taxation as a grievance against the government and as the most distasteful obligation in contemporary American life. There is no sign that "I did not raise my son to be a soldier" has ceased to be the theme song of the American mother. The Air Force remains the favourite service amongst the public because there is a widespread feeling that a strong Air Force is not only the best method of exploiting America's technological supremacy, but represents the best hope of diminishing the size of the Army. It is the Army with its casualties, its hardships, its periods of service in foreign parts which is not only unglamorous but disliked by civilians.

In *Look* magazine of March 11th Justice William Douglas of the Supreme Court said "the formulation of our foreign policy has slipped more and more into the hands of a military clique that has possessed Washington, D.C." That is the view of many troubled American liberals and there is some truth in it. The Pentagon, the Department of Defence, not only has a great stake in the formation of foreign policy, but is also well aware that, since the Korean outbreak began, it is more readily listened to by Congress and the public than is the State Department. The Administration's policy on German rearmament is constantly cited as an instance of the undue influence of the Pentagon on policy, although an investigation into the growth of this particular policy actually reveals as much enthusiasm for it among the civilian officials in the Pentagon as among the Generals themselves.

The influence of the Pentagon is certainly considerable, but belief in the power of a military clique overlooks the diffidence of the American military mind when faced with the business of civil government. One of the strongest traditions in the armed forces before the war was that officers and men had no concern whatsoever with politics, that the services were the pawns of the politicians. They extracted a kind of wry pride from their subjection to the civil authority and even a general interest in world affairs could bring raised eyebrows from commanding officers; this is one reason why Army intelligence was so inept in the early years of the last war. The result has been to produce a generation of senior officers who are nervous of the higher ranges of strategy where economic, political, military and psychological factors combine.

But the military men in Washington, who express their distaste for politics with such vehemence, are somewhat disingenuous, for many of them know every trick of the most seasoned political boss when it comes to advancing the cause of their own particular service. No one who witnessed the debates three years ago on unification of the armed forces can really believe the man from the Pentagon when he says that he only obeys orders and does not understand politics.

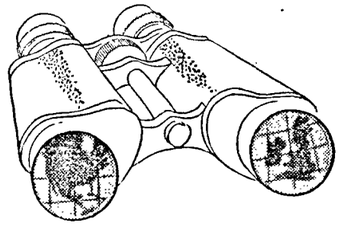
Nevertheless, the general neglect of the health of the prewar American Army did thwart the existence of the "military intellectual," the staff planner with an extensive grasp of non-military factors. This is a lack which is keenly felt today. The recent disclosure that General Walter Grow, while Military Attaché in Moscow, kept a diary peppered with naïve and belligerent comments, which have fallen into Soviet hands, is less a reflection upon that hapless officer, for he was a brave and capable tank commander during the war, than upon the shortage of American senior officers suitable for such specialised military posts. This shortage is, however, slowly being overcome by the excellent work of the National War College in Washington, where Colonels and Navy Captains go for a year, mingling with State Department officials and professors, to learn that most international problems are insoluble even by force and that black and white are not the only colours on the strategists' palette.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Good Enough for Farmers?

[FROM A SPECIAL CORRESPONDENT]

IN September, 1948, President Truman, with the polls and the prophets all against him, went to Dexter, Iowa, primed to "give 'em hell." Before an assembly of farmers, whose prosperity was illustrated by the private aeroplanes in which many of them had come, he inveighed against "the gluttons of privilege," insisted that "the notorious do-nothing Eightieth (Republican) Congress . . . has already stuck a pitchfork into the farmer's back," and swung the decisive middle-western farm vote into his column, thus, as it later turned out, winning the election for himself.



Recently a reporter, who wanted to find out where that farm vote is today, went to the grass roots across the Mississippi River, and asked a farmer about his voting intentions next November. He replied that he would vote for Mr Dewey; when reminded that Mr Dewey will not be a candidate this year, he insisted on his preference. Trying a new tack, the reporter listed the possible candidates for both parties.

> Young man, you heard me the first time. I'm gonna vote for Dewey. I voted for him in '44 and in '48, and I ain't never had it so good.

The story is not only an extreme example of the confusion in the current presidential picture but also perhaps a statement of the one clear fact about the agricultural vote: farmers, like most other people, appreciate "having it good." Apart from this the political confusion is nowhere greater than in the farming sections of the country. In July, when the parties choose their presidential candidates at their Chicago conventions, some of this confusion will be cleared up; in August estimates of the farm vote can at least be based on known alternatives. But other questions will remain.

In 1948, farm prices were falling. Farmers were anxious about the future and were especially worried about two pieces of legislation passed by the Republican Congress. The charter of the Commodity Credit Corporation had been amended, to restrict the building of storage facilities for surplus grain, and the principle of flexible, instead of fixed, price supports for agricultural products had been written into law. Actually the Democrats were similarly committed to a sliding scale for farm price supports; but it was the Republicans who had made them official. These grievances were undoubtedly in the minds of the farmers who listened to Mr Truman at Dexter. But another factor was active too—their suspicion of Mr Dewey as a Little Lord Fauntleroy, the man on a wedding cake, the candidate who was not the Midwest's kind of fellow.

Flexible supports for agricultural products are still on the

Clear two-way view... of transatlantic trade

The Chase National Bank is well situated to assist British businessmen engaged in trade with the United States. As an established American bank in Britain, the Chase affords a service based on clear understanding of British requirements and thorough knowledge of business and trade conditions across the Atlantic.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON—6 Lombard Street
31 Berkeley Square Bush House, Aldwych

books and they will be the chief farm issue again this election year. An alternative method of ensuring prosperity for farmers has been developed by the Secretary of Agriculture, Mr Brannan; he would allow prices to seek their market level and provide supplementary government payments, if necessary, to bring farm incomes up to standard. The Brannan plan was greeted with some enthusiasm in the cities, where the prospect of only having to pay market rates for food was attractive, since it might be somebody else's taxes which helped the Treasury to meet its part of the grocery bill. But among farmers, the plan ran into heavy opposition and, as farm prices rose after the Korean war began, discussion of the proposal died down.

Now, however, the Brannan Plan is in the news again, somewhat restyled so that the average level of price supports under it would be higher than at present. The Farmers' Union—which, of all the farmers' organisations, is the one most sympathetic to the Truman Administration—has just voted for higher price supports and President Truman, in a congratulatory letter to the Union's Golden Jubilee Convention, said:

> We ought to strengthen our system of farm price supports and remove the sliding scale before it penalises farmers who are answering the call for bumper crops to aid defence.

Mr Brannan put his plan to the session in a fighting speech and, at a press conference, charged that Mr Allan Kline, head of the American Farm Bureau Federation, had had a deal with Mr Dewey in 1948, under which he was to deliver the farm vote in return for the Secretaryship of Agriculture, and that he now has a similar deal with Mr Taft. Mr Kline issued a resounding denial (many members of his Federation are working for General Eisenhower) and the season for agricultural politics was officially open. The Farm Bureau supports the principle of flexible price supports applied to a limited range of agricultural products.

*

This year, however, it seems likely that many farmers will be more concerned with the broader issue of inflation in general than with the narrower one of special programmes for agriculture. The ratio between maize and hog prices has turned in an unprofitable direction and sows are going to market before farrowing. Widening price margins for food processors have reduced the share of the consumer's dollar that goes to the farmer. Rising costs of machinery, fertilisers and labour are bearing down on net farm income. Political candidates who say they are for a balanced budget will therefore have strong agricultural appeal. With self-conscious righteousness the Farm Bureau is demanding a cut of $10 billion in federal spending; $200 million would be taken from the Department of Agriculture, the axe biting into all activities except research, the farmers' advisory service and the Office of Foreign Agricultural Relations. With the demands of the tax collector breaking all peacetime records, the issue of corruption in government will be very useful in farm areas, as Senator Kefauver proved by his victory over Mr Truman in New Hampshire.

Beyond these general matters, farmers have a special share in the nation's discomfort at life in a garrison state. When conscription takes a farm boy, the impact is sharper than in the cities; his productive manpower is used within sight of his family and the loss is felt directly. A truce in Korea, unless it is followed at once by a new outbreak elsewhere, could be an important electoral asset for the Democrats.

On these issues, which candidate will make the best showing? And will it be the same man in both of the country's chief agricultural regions, the South and the Middle West? So the question shifts back to the possible candidates again. The Republican primary elections in Minnesota and New Hampshire have put real steam in the Eisenhower bandwagon and the results of the contest in Iowa for membership of the Republican National Committee will also be worth watching. The fight will be between a Taft admirer and an "Ike-liking" candidate put up by progressive young farmers; the odds favour the latter. The Wisconsin primary will be another significant indication of how the agricultural vote will go. For if General Eisenhower is strong in the farm states west of the Mississippi River, Senator Taft is formidable in the five to the east of it—Wisconsin, Illinois, Indiana, Michigan, and his own State of Ohio. If Wisconsin abandons the Senator, the Republican party may well abandon him too, even if reluctantly, in order to save itself from once more sinking into defeat.

This year, the traditionally Democratic South presents more possible presidential permutations than any other area. Mr Truman's unpopularity hangs like an albatross round the necks of the few Democrats who co-operate with the Administration and cements the separatist movement under Senator Russell. If Mr Truman is the Democratic candidate there may well be a bolt from the Democratic party. If he is not, Senator Russell and his group are unlikely to take the risk of seceding, but they will probably be lenient towards those members who stray from the fold into the Republican wilderness. And if General Eisenhower is the Republican nominee, there will be many such strays. For the southern farmer, an Anglo-Saxon who still admires the eighteenth century, likes somebody with a touch of the grand manner, and he feels that he belongs to the Atlantic community. He would support a southern regional party, if there is one, but otherwise he will be tempted by General Eisenhower.

So at this early moment in the election campaign, when the General's views on domestic matters are still unknown, it looks as if the two great farming regions might vote against each other, if Senator Taft is the Republican candidate and if the Middle West supports him. But if General Eisenhower is the Republican candidate they might vote together, as they might also do if the Democrats choose a midwestern-southern combination for their presidential and vice-presidential candidates, and not Mr Truman. Above all, the farmers might vote together if it is once more brought to their attention with sufficient force that under Democratic Administrations they "ain't never had it so good."

American Notes

Steel Dilemmas

The steel workers, jubilant at the recommendations of the Wage Stabilisation Board on their dispute with the steel companies, have once more postponed their strike, until April 8th, to give the industry and the government a chance to struggle off the horns of the dilemmas on which they are now even more firmly impaled than they were before the board issued its report. The union itself is taking its stand on the board's recommendations—for wage increases in three stages, amounting to 17½ cents an hour by next January, for "fringe" benefits which add up to another 5 cents an hour, and for a union shop. These are far more favourable to the union than had been expected; apparently the public representatives, who make up one third of the board's membership, made concessions to the labour point of view because they found themselves quite unable to compromise with the industrial representatives, who voted against the report, and were anxious that the board should not collapse entirely at its first important test.

Under the recommended settlement the union would get

more than it could have hoped for under collective bargaining; at least so the steel companies allege. They claim that they cannot accept the proposed wage increases unless they are allowed to raise the price of steel by $12 a ton (the average price is $110 at present) instead of the $6 which was their estimate before the report was issued. Their dilemma is that they do not want to increase prices, for in the present state of the steel market a fall in demand would almost certainly follow. The economic stabilisation authorities insist that steel profits are far too high to permit any such increase under the formula which allows higher prices to be charged if an industry's earnings fall below 85 per cent of the years 1946 to 1949. An increase in steel costs could hardly fail to force up the price ceilings on many manufactured articles, just as an increase in steel wages would make it almost

impossible to resist the claims for higher wages already put in by such important groups as the oil and aluminium workers. The WSB, however, maintains that steel workers are in a different position from other trade unionists because it is so long since they have had a wage rise; as the chart shows, hourly earnings in the steel industry have remained steadier than have those in manufacturing generally.

The government's dilemma is that the rearmament programme, already seriously delayed, cannot afford the disruption of a steel strike; yet if a strike is avoided by the only means by which it apparently can be avoided, an increase in the price of steel, not only will the inflationary spiral be set spinning again, but a disgusted Congress will probably also abolish the Administration's powers to control prices and wages. There is some excuse at the moment for feeling that the economy would be more stable if left to itself than if guided by the government, for the WSB's proposals for increases in steel wages coincided with a fall in the cost of living, the first since last June and the sharpest since the end of 1949. The wage stabilisation policy is supposed to be linked with the cost of living and the fall is expected to continue; if it does, it will mean wage reductions for several groups, notably the automobile and electrical workers, whose pre-stabilisation contracts are tied to the consumers' price index; already the wages of over one million railwaymen have dropped by one cent an hour. No wonder Mr Charles Wilson, the defence mobiliser, with a few unhappy remarks about the generosity of the WSB, flew off to consult the President in Florida.

Taft at Bay

In Minnesota last week over 100,000 voters went to the polls, through a storm and with little urging, to perform the complicated feat of writing in, on voting-machine ballot papers, the name of Eisenhower—or some variation of it, such as plain Ike or General Izehauer—as their choice for Republican presidential candidate. This spontaneous proof of the General's popularity, coming just after the discovery that in New Hampshire Senator Taft had lost votes in the places where he appeared personally, convinced the Senator that he would be unwise to challenge the General directly in future. Their next meeting was scheduled for the April 15th primary election in New Jersey, where Governor Driscoll had just led the state's Republican officials over to the Eisenhower side, and Mr Taft attempted to use this affront as an excuse for withdrawing from the primary. But the General's supporters had no intention of allowing the Senator to avoid open contests and take cover amongst the party machines in states where there are no primary elections to give voters a say in the choice of delegates to the nominating conventions, or in the choice of the presidential candidate. The New Jersey courts have now ruled that Mr Taft's name must stay on the ballot and April 15th may well be the day on which the Senator is finally brought to bay.

Meanwhile, however, the Republicans of Nebraska and Wisconsin have an opportunity to make a fool of him on April 1st, when both these states hold primaries. He is not entered in Nebraska, but his supporters there, hoping to cancel out the Eisenhower success in Minnesota, are organising a write-in vote for the Senator. In Wisconsin his reputed strength is such that anything but an overwhelming victory will look like a defeat. General Eisenhower is not entered in this contest, but Governor Warren and Mr Harold Stassen are. Both of them, obviously convinced that Mr Taft's days are numbered, are manœuvring for good positions at the kill. Mr Warren has long promised his convention delegates to General Eisenhower if he does not need them himself, and Mr Stassen has now offered to hand over at once half of any delegates he may win in Wisconsin. If he can thus collect enough votes from Eisenhower supporters to defeat Mr Taft, Mr Stassen will hope to claim a reward from the General for having saved him the trouble of finishing off the Senator.

For the present Senator Taft is still alive and kicking hard and shows no intention of giving in. Even if he does so, General Eisenhower cannot be sure that the convention will fall at his feet, for there are indications that the Republican Old Guard is preparing to set up General MacArthur in Mr Taft's place. However, the Eisenhower managers, after a professional reorganisation of their operations, are wooing the organised politicians with reminders that General Eisenhower has always been a loyal team-mate and is unlikely to change now that he has joined the Republican party. It looks as if the General will be back to make promises on his own behalf by the end of May; the Minnesota voters seem to have given him the "clear-cut call" to political duty that he had not expected until the Republican convention.

Trouble in Local 600

To Mr Walter Reuther, head of the United Automobile Workers, the end evidently justifies the means, for he has seized upon hearings of the House Un-American Activities Committee as an excuse for taking over the largest and noisiest branch of the UAW, Local 600, with about 50,000 members at the River Rouge plant of the Ford Motor Company in Detroit. Mr Reuther is ambitious to head the national Congress of Industrial Organisations after the retirement of Mr Murray, its present chief, and wants to reinforce his claim to this eminence by putting his own house in order. He had largely succeeded in unifying a trade union noted for its factionalism until the big Ford branch last year became the centre of opposition with the desertion to the enemy of Mr Carl Stellato, president of Local 600 and at one time a Reuther lieutenant.

The House committee brought Mr Reuther a chance to regain control of Local 600 when, at sessions in Detroit, it called witnesses who said the branch was infiltrated by Communists. Mr Stellato, who was refused permission to

testify, wrote the committee that the union constitution barred Communists from office and he would remove any officer proved to be a Communist. But two days after the hearings adjourned, without giving Mr Stellato a chance to carry out his pledge, a six-man board headed by Mr Reuther took over the administration of Local 600 and has called for new elections of officers in May.

In the curious politics of the volatile Ford branch, stemming from the aggressiveness developed in the bitter fight to conquer this last outpost of resistance to trade unionism in the motor industry, Mr Stellato heads a coalition of forces that include the once-powerful left wing. Although twice elected on an anti-Communist platform, his last victory was a narrow one and he has since consolidated his position by concessions to the left which have placed him in opposition to Mr Reuther. Damning the devil has meant damning his works, so Mr Stellato for the past year has vociferously condemned Mr Reuther's wage policy; this is embodied in the "escalator" contracts he steered through the automobile industry in which wages are tied to the cost-of-living index. As part of the fight against Mr Reuther, last June Local 600 invited his old enemy, Mr John Lewis of the independent United Mine Workers, to speak at an anniversary celebration. Mr Reuther refused to share the rostrum and Mr Lewis had an undivided spotlight and an enormous audience for his attacks on escalator contracts, the automobile companies—and Mr Reuther.

While Mr Reuther's tactical move has left him in temporary possession of the field, winning the branch election may be more difficult, especially if his opponents swing attention away from which side is the more anti-Communist by centring their fire on the wage contract. Working Detroit is already concerned about its pay packet with over 100,000 men laid off from the motor factories, although this situation is likely to improve now that more materials are available. But if the consumer's price index continues to fall, it may mean that wage cuts for UAW members will coincide with the election, which would hardly help Mr Reuther win.

Southern Strategy

The determination of the South to prevent Mr Truman's renomination and to reassert its influence on Democratic decisions has already put Senator Russell of Georgia in the electoral field. Steps are now being taken in the South to make it possible to punish the Democrats if they disregard this warning. If General Eisenhower is the Republican candidate, southern reprisals will hardly be needed; a recent Gallup poll showed that twice as many Southerners would vote for the General as would vote for Mr Truman. But if the battle is between Mr Truman and Senator Taft, or some other Republican unable to split the traditionally Democratic South, the southern leaders themselves hope to teach their party a lesson.

Under the Constitution, voters choose, not the President, but delegates to the electoral college. In modern times it has come to be taken for granted that electors will vote for the national candidates of their party. But the election of 1948 showed that this was not necessarily true. President Truman lost the electoral votes of four southern States to the Dixiecrat party, hastily thrown together by rebellious Southerners after the Democratic convention took its stand on a strong Negro rights plank.

If the able and respected Senator Russell should lead a similar walk-out this year, he could count on the electoral votes of at least eight, and perhaps more, States. In Mississippi and Georgia the election law has recently been changed to make it legally watertight for Democratic electors to withhold their votes from Mr Truman and cast them for Senator Russell—or perhaps even General Eisenhower. In Alabama, one of the secessionist four in 1948, the courts have refused to allow Democrats loyal to the Administration to require delegates to promise to support the candidates chosen by the convention. The Supreme Court is to hear arguments against this refusal next week. In Louisiana the newly elected Governor, Judge Kennon, has promised that none of Louisiana's electoral votes will be cast for Mr Truman if he is the Democratic candidate.

These signs of revolt raise the possibility that the election may have to be decided by the House of Representatives, something which has not happened since 1824. For the Alsop brothers have calculated that if Senator Taft runs, he will, at best, be 17 votes short of a clear majority in the electoral college, while Mr Truman, if he runs, cannot hope to win without the electoral votes of the South. In that case the House, with each State delegation voting as a unit, would choose among the three top candidates. The small States would come into their own and, although Southerners imagine they might be able to hold the balance of power, the result could hardly fail to be a Republican victory. The South is so bitter against Mr Truman, however, that it seems perfectly prepared to cut off its nose to spite his face. The threat of such a split in the party if he runs again must weigh heavily with the President—as it is meant to.

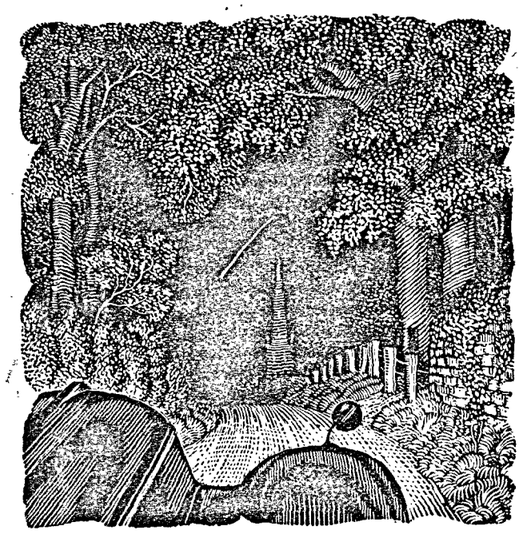
The Taxpayer's Burden



This month the historic movement of Europe's cultural treasures across the Atlantic was significantly reversed: the Rosenbach collection of Shakespearean volumes was sold to a Swiss for his personal collection. The excuse given by the rather embarrassed firm which made the sale was that high taxes had left individual Americans too poor to support even public institutions; private buying on a large scale is alleged to have ceased to all intents and purposes.

A few days later nearly half of the 156 million Americans were in a position to appreciate the truth of this remark, for March 17th—the official March 15th date fell on a Saturday—was the final day for making, and paying on, 1951 income tax returns to the federal government. The Treasury was expecting to collect over $50 billion this year in personal and corporate income taxes, compared with less than $40 billion last year. In New York alone over $1 billion was taken in from taxpayers who had to struggle through the St. Patrick's Day celebrations to hand over anything from 22 to 91 per cent of their earnings. Two of the collectors' offices in the city received cheques of record size as instalments on corporate payments, one for $144 million, another for $55 million.

Nowadays, even in America, it is not only the rich who are weighed down by taxation, and many citizens carry a heavier tax burden than they realise. In a majority of states state income tax must be paid as well as federal; in many towns both state and city sales taxes are levied in addition to federal excise taxes and there are, of course, other state and local taxes. Althogether these now take nearly $20 billion a year of the taxpayer's money, quite apart from the various federal collections.

It is estimated that 32 cents out of every dollar earned by the average American is now handed over for taxes, compared with only 25 cents in 1949. Nearly everywhere more than half the amount paid for a packet of cigarettes (about 20 cents or 1s. 5d.) or a gallon of petrol (about 25 cents or 1s. 9½d.) is tax. The liquor tax usually accounts for more than three-quarters of the retail price of a bottle of whisky, selling at around $5.60 or £2; a whisky tax of 3 cents a gallon started a rebellion 160 years ago. The Tax Foundation has calculated that a family of 3.2 persons with an annual income of $3,500 (a skilled workman's earnings) pays $798 in indirect taxes, including social security, and only $299 in income tax. On $15,000 a year the family's income tax would be $2,606 and other taxes $4,012. The taxpayer today has only one comfort: Congress is determined to add nothing to his burden this year and some State Legislatures have actually been trying to reduce it.

NICKEL

NICKEL is sometimes found in meteorites, alloyed with iron, but in the earth's crust it does not occur in the metallic state. More than four-fifths of the world's supply of this valuable element is mined in the Sudbury district of Ontario from deposits of "pentlandite"—a mineral containing sulphides of iron and nickel. A corrosion-resistant silver-white metal, nickel is well known in the form of nickel-plating, but it is far more important as a constituent of alloys. It is used for example in stainless steels and to add strength and toughness to alloy steels for motor cars, aircraft, armaments and machine tools. It is alloyed with copper and other metals to make condenser tubes and coins. Together with zinc and copper it forms nickel silver, the basis of plated tableware, and with chromium it is used extensively in gas turbine engines and to make heating elements for electric fires. Nickel and its salts are also used in alkaline storage batteries and in the manufacture of enamels.

Besides producing large quantities of wrought alloys containing nickel, such as nickel silvers and cupronickels, I.C.I. uses a nickel silver alloy to make 'Lightning' slide fasteners, and nickel catalysts in the manufacture of cyclohexane, one of the intermediates from which nylon is produced.

Shorter Notes

Now that the Senate has ratified the Japanese peace treaty and the accompanying security pacts with a minimum of controversy, Mr John Foster Dulles has decided that his Republican party needs his help more than does the State Department, and has left his post of special adviser to Mr Acheson. There is much speculation as to which Republican candidate for the Presidency will promise Mr Dulles the Secretaryship of State in return for his support; but it may well be that Mr Dulles himself feels that, in a campaign in which foreign policy is bound to play a large part, he can best serve his country and his party by independent and constructive criticism.

★

Leading boxing promoters have an unscheduled match on their calendar with the anti-trust dvision of the Justice Department. The International Boxing Clubs of New York and Illinois, two of their officers, and the Madison Square Garden Corporation are charged with maintaining a contractual hold over champions and chief contenders in all major weight classes, tying up the sale of radio, television and film rights for important boxing bouts, and having a monopoly on promoting matches in all the main arenas. The government states that the defendants have participated in the presentation of 90 per cent of all championship contests since 1949, and that the effects of such control have been to exclude other promoters as well as limit the opportunities of boxers. An important legal issue at the trial will be to determine whether boxing falls under federal jurisdiction as interstate commerce; in any event, the defendants will claim that sports are exempt from the anti-trust laws.

★

Natural and synthetic rubber are both becoming cheaper. On March 7th the price of synthetic, still under complete government control, was reduced from 26 to 23 cents a pound, as the result of increased output and new techniques. During April and May, government-owned natural rubber will be sold to private buyers at 48.5 cents a pound instead of 50.5; a much sharper reduction had, however, been expected, in preparation for the time when the natural rubber trade is returned to private hands, for this latest US price is still well above world prices.

★

The threatened budget deficit in New York City, which provides 56 per cent of the state's tax receipts, but is scheduled to receive only 44 per cent of state budget expenditures, has been postponed through a series of eight emergency measures passed by the Republican State Legislature. The temporary financial programme, while not giving the city more of the state's money, will enable it to levy special taxes that will provide $234.8 million toward balancing the $1.5 billion city budget for the fiscal year starting July 1st. The proposals include an extension of the city sales tax and authorisation for city bonds to finance transit deficits so that fares need not be raised.

★

Scientists in Boston have developed a new method of removing salt from sea water by means of an "ion exchange" instead of distillation. The old method was too expensive for anything but emergency use, while the cost of the new process compares favourably with that of transporting water from distant rivers to sea-coast cities in dry areas, such as Los Angeles, which is rapidly outgrowing its potential water supplies. Where electricity is plentiful, the new process will cost from ten to twenty cents a thousand gallons, as soon as the equipment can be mass-produced. It has great importance for industrial and agricultural purposes, as well as for human consumption, but it is likely to be used first to purify brackish water in places where the water table has fallen so low that sea water is seeping into the wells.

THE WORLD OVERSEAS

General de Gaulle and His Troops

(From a Paris Correspondent)

FUTURE historians who have to estimate the place in history of General de Gaulle will agree that the peculiar vigour of his mind was one of his main characteristics. They will be divided between those who think it was his principal merit and those who consider it reduced his usefulness to almost nothing. Many men trust their hunches. The General belongs to the class, small even in France, who require no moral support to believe in their own reasoning.

His first speech broadcast by the BBC on June 18, 1940, is indeed a passionate document, but it is the passion generated by the effort to think clearly and logically against a tidal sweep of other people's emotions. It is a short statement of a staff officer's estimate of a strategic situation. The conclusion is—amongst other things—that all his superior officers are wrong. They nearly all were. It is a situation to which General de Gaulle was already becoming accustomed as a colonel. But this very attitude of the stubborn individual mind refusing to adjust itself to other people's errors and emotions has limited his ability to apply even the truths he sees. In that first broadcast he declares "Car la France n'est pas seule. Elle n'est pas seule. Elle n'est pas seule." Such emphasis on the fact of alliance was a curious prelude to four years' battle with France's allies. Throughout his career he has seen the necessity of united action, but the union is apt to become all the more difficult because of the mathematical violence with which the General conceives it. France, one sentient individual person, constantly replaces in his thought the reality of the French people consisting of an infinite variety of men and women.

At least three times his country has owed a most valuable impulse to his single-minded purpose—in 1940 when he created a centre about which resistance could be crystallised; in 1944-45 when he restored civil government and democratic process (raising, when most people criticised him for it as pernickety, the question whether Communists could be trusted with the ministries of defence or the interior); and in the autumn of 1947, when, at the head of his newly formed French People's Rally, he more than anyone else was responsible for preventing the gradual Communist conquest of France through the municipalities. Fifty-two of the ninety-two departmental capitals had Gaullist mayors, including the thirteen largest towns of France. The percentage of the electorate that had followed him was put as high as 38 per cent. His organisation had only been in existence six months. "The wave is launched," he commented on November 12, 1947, "I repeat to you that it will grow and burst. I can only pity those who refuse to understand. If they insist on struggling against this force, they will be swept away by it."

After 1951 Elections

It sounded very convincing, but in the elections of June, 1951, the Gaullist votes were far from reaching 25 per cent. The General had indeed at last a parliamentary party not absurdly out of proportion with the strength of his supporters. What is more the parliamentary system which he had so shrewdly criticised and denounced really did seem on the point of breaking up. The Pleven government seemed only able to survive as long as it took no responsibility for the Assembly's legislative activities. The Assembly's preoccupations had for long no relation to any sane person's standard of priority. M. Faure, in spite of all his personal brilliance and courage, survived forty days without getting a single bill turned into law. Some of the most level-headed French republicans were beginning to say that the only possibility of having a government at all would be to accept the leadership of the General. In spite of the decline in his electoral support his hour seemed approaching.

Yet the next turn of the wheel was the revolt of 27 of the General's sworn supporters in the Assembly determined to vote for M. Pinay. His next public appearance was a bitter if still resolute press conference at which one could only wonder whether it was the perverted minds of his political opponents still leading the country to perdition, or the refusal of the Gaullist deputies to accept his assessment of the situation that most troubled him. The General has always stressed that the Republic is the nation's as a whole, and not merely the parliamentarians' or the parties'. More than ever on this last occasion did he speak of the masses. Yet the one man in France who at that moment was showing a curious knack of establishing contact with at least large sections of the nation across the barriers of party (including the barriers of the General's party) was a small provincial industrialist whose position in the previous governments nine Frenchmen out of ten could not have named with any certainty.

M. Pinay's Success

To explain away M. Pinay's political success—undoubted, though possibly momentary—by his promise to try to balance the budget without new taxes, is to leave unasked the question why, when he says that prices will be held and probably brought down, a very large number of Frenchmen begin to think it likely. They would never have believed the same statement if made by M. Faure, M. Pleven or M. Queuille, all of them able men and two of them much more eloquent. Part of his secret is no doubt that he has never acquired a politician's professional manner in any sense. He does not even look at ease on a platform. Still more important is that he does approach the political problem from the angle of the small man's worries. This is exactly what the General has never done and seems intellectually incapable of doing. It is almost chance if his analysis of historic processes brings him to the same point on the same day as the French man in the street. It is in moments of stark crisis that they concur. His followers in the Assembly discovered that if the collapse of the franc was the only way to bring to an end the present regime, he envisaged the possibility with calm. To change the regime was their agreed aim. To a good many of them this seemed like insisting on a surgical operation when the family doctor simply recommended a strict diet and a holiday at a spa.

The General may thunder and he may plead, but until the dieting and the Vichy water has been tried his parliamentary party cannot be used for the historic purpose to which he dedicated it. Little more than half can be relied on if its whips tell it to vote against M. Pinay. The General's moment, which seemed so near when M. Faure fell, is now farther away than ever. This is not to say that it might not come back rapidly. The French parties have not shown themselves so wise that they can be trusted not to prove him right. Few even of M. Pinay's warmest political

admirers would assert that his policy of "confidence in confidence" is more than a bet—a bet in which he has a great many of the experts against him. But even if the General's hour does come back his will be the same isolated revolutionary mind, prepared to accept as providential catastrophes what most other men will wish to avoid.

This is not to deny the contribution he has made and may yet make to his nation's survival. There is more folly than wisdom in those of his fellow citizens who talk of him as only a public danger. There is indeed more than a little truth in his warning that if the present regime collapses and the French People's Rally has been compromised in it, the greatest surviving force might well be the Communists. But the logic of that must surely be to reconsider the negative policy that has split his party, and use it so that it contributes to avoidance of what the ordinary man considers catastrophe. The break up of the French People's Rally may make it easier to run the Fourth Republic, but it would also deprive the country of the only non-communist party which is not run by a headless committee.

Belgium Fears a Slump

[FROM OUR BELGIAN CORRESPONDENT]

CLEAR signs that economic activity in Belgium is slowing down have been appearing since the beginning of the year. The result must be to force Belgium increasingly into co-operation with the other members of Nato with inevitable effects on the external economic policy of the country. Since the Lisbon conference the Belgians have shown their willingness in principle to increase their defence effort, and to adopt in part the recommendations of the Three Wise Men, by their proposal to grant a loan of $20 million to Europe and to make purchases in EPU countries to the amount of $40 million in the shape of reserves of weapons and munitions for the Belgian army. Belgium was also prepared to agree to a loan of $100 million to France within the framework of the EPU, but this was turned down by the American authorities.

Belgium was encouraged to make these concessions largely by its anxiety over the future of its exports. But the avoidance of any further increase in the defence effort and an undiminishing distrust for international commitments remain as the central preoccupations of both government and public opinion. Belgium, in fact, is torn between its traditional policies of monetary restriction at home and minimum co-operation abroad on the one hand, and, on the other, the necessity of some economic expansion at home and collaboration in Europe forced on it by the dangers of severe recession. This is the background to the rumours, which started at Lisbon, of a Belgian plan for an international economic conference under the auspices of Nato, with the object of combating the dangers of a world economic crisis.

Consumer Industries in Trouble

An important indication of Belgium's economic predicament is the number of unemployed, which exceeded 300,000 in February, 1952, in contrast to 200,000 in February, 1951. In the same period figures of unemployed women rose from 57,000 to 100,000, for the recession has hit the textile and clothing industries worst. In these two industries alone unemployment rose from 45,000 at the end of 1950 to 85,000 at the end of 1951. Out of a peak total unemployed of 320,000 it looks as though about 70,000 have been thrown out of work by general business conditions; 100,000 by seasonal factors; while frictional unemployment—that is temporary unemployment of people who are changing jobs—remains at about 60,000. The index of total industrial production remains high, in the region of 128 (1939=100). But this is due to the activity of the capital goods industries, in sharp contrast to the consumer goods industries, where the indices of production fell from 124 in November, 1950, to 112 in November, 1951. Retail sales remain slack and the financial markets, as in the United States and Switzerland, have sagged noticeably since the end of January.

On the other side, there is still no solution to the problem of financing Belgium's exports to Europe. At the end of February the sum of the credits granted to the EPU since 1950 reached 20 billion francs*, and Belgium's surplus with the EPU during March looks as though it is going to be as high as the February surplus which was still running at 2.4 billion francs. But this growing surplus cannot really be accounted for by genuine business conditions—which have, in fact, been deteriorating—but rather by the uncertainty which still surrounds the monetary policies of certain European countries. It is estimated in Brussels that the Belgian surplus with Europe is inflated by about 4 billion francs simply because doubts about the pound and the franc are making British and French importers accelerate their payments, and Belgian importers delay theirs. On top of this, short-term flight capital from France alone amounts to at least 3 billion francs.

The slackening in economic activity at home does not seem to be leading the Belgian Government to a fundamental modification of the restrictionist monetary policy which it has pursued since 1944. These restrictionist tendencies, indeed, have been encouraged by the measures taken in the Netherlands in February, 1951, and in Great Britain in the last few months, which have been interpreted as reinforcing the arguments in favour of an orthodox monetary policy. As the Belgians see it, an expansionist internal monetary policy would be all the more dangerous in Belgium since the financing of the surplus with the EPU is already a major source of inflationary pressure. During the second half of 1951, the volume of money increased by 13 billion francs—that is by about 8 per cent. The Belgians, therefore see the improved functioning of the EPU as essential for their economy and as the condition of maintaining their rearmament effort—as their delegation to Lisbon was at pains to point out.

New Employment Policy

On the other hand, the increase in unemployment is going to require some degree of economic expansion but it must be expansion without a direct inflationary effect. A new employment policy in process of preparation by the Ministry of Economic Affairs will contain the following elements: aid to new industries and new investments, in the form of state guarantees or tax relief; the provision of work for the unemployed by the municipalities; some substantial new investment in the coal industry and communications; a dollar export drive; and increased investment in the under-developed regions. The increase in public expenditure made necessary by the rearmament effort and by an employment policy on these lines would be financed not by a monetary expansion but by public borrowing and, eventually, by an increase in indirect taxation. Indeed, the restriction of credit has become even more severe since March 23rd when it was decided to throw a large part of the cost of financing exports on to the private exporter. Henceforth 25 per cent of the proceeds are to be blocked, thus relieving the strain on the Treausry and helping to reduce this source of inflation.

The basic issue is whether these developments are peculiar to Belgium or whether they are the first signs of a general recession in the western world. What is happening seems to be this: the Belgian economy has proved once more that it is exceptionally vulnerable. It is more sensitive than all other European countries to the effects of even a moderate slackening in world economic activity. For Belgium's problems are by origin international; they are common to all countries—allowing for a difference in timing—and their solution is only to be found in international co-operation.

* 50 Belgian francs=approx. $1.

The peculiar character of the 1950 boom which accompanied the beginning of rearmament accelerated the demand in the investment industries; but the consumer goods industries, especially textiles, having flourished in the hot house conditions that have prevailed since 1950, are now feeling the cold in Belgium, in the Netherlands, in Great Britain, as they are in Australia and even in the United States. The rapid fall in the price of primary products, the large stocks built up both by consumers and retailers, and the difficulties of financing business, are all contributing to make these industries particularly vulnerable.

Thus there is a real danger of an economic depression in certain industries in many countries, though world demand as a whole remains generally strong. What can be done about it? Recent developments in currency restrictions and the return to bilateralism suggest that there are two points at which the weakness is being unnecessarily exaggerated and at which something might well be done to produce new strength. First, the effort to increase production and rearmament is badly distributed within the Atlantic community; and, secondly, the means of international finance are insufficient to permit an optimum distribution of this effort between countries according to available productive capacity. The best solution from the Belgian point of view would be to prolong and reinforce the functions of the EPU through additional American aid.

It is because these difficulties are for the moment felt most acutely in Belgium that Belgium is so much preoccupied with a solution to the problems with which Nato in its wider and less military sense is concerned. The Belgians, in fact, are convinced that the success of Nato from the political and social point of view, and even from the point of view of rapid rearmament, will depend largely on its capacity to organise foreign exchange and to utilise to the full the industrial capacity of various countries.

Black Year for Argentina

[FROM A CORRESPONDENT]

BOTH before and after the Argentine elections of last November, General Perón assured his people that the country had "no economic problems"; and he maintained this blithe attitude until the end of January, despite storm warnings at home and abroad. Then the storm broke. A weekly meatless day was imposed on February 1st; the freezing of all prices was ordered on February 12th; and on the 18th the President spent forty minutes at the microphone announcing a "policy of austerity." Many Peronistas must now be wondering why this abrupt transition was necessary; and the official press is having some difficulty in explaining away that part of General Perón's speech which contained the ominous word "sacrifices."

Much of the President's new prescription is surprisingly orthodox in style, when compared with his usual bold verbal ventures into the realms of economic surrealism. His "economic plan for 1952" comprises a national wage freeze, curtailment of expenditure on public works, drastic cuts in consumption, and demands for greater production, higher savings, less waste, and bigger exports. Two meatless days each week are now the rule, and on one day of the week all cattle slaughtered must be reserved for export. Apparently doubting whether his first appeal to the nation had had all the effect desired, General Perón went on the air again on March 5th with a further demand for production and economy, and denounced all who did not produce at least as much as they consumed as "parasites and public enemies." Blame for all Argentina's difficulties is still laid on foreign machinations and on the droughts of the past two years. But the sudden abandonment of almost all the policies of the past five years amounts to a tacit admission of the regime's share in responsibility for the disaster.

General Perón's call for more agricultural production is a welcome return to reality, for agriculture was the Cinderella of the recently concluded Five Year Plan. As a fresh incentive to growers, prices of grain—except maize, the price of which will probably be adjusted later—have again been raised by from 35 to 50 per cent. And immigration is to be restricted to people who "without possibility of doubt" will settle on farms, or to specialists. But it remains to be seen whether the farmers will greet the higher prices any less sceptically than last year or the year before, when increases granted early in the year were eaten up by mounting costs long before harvest time.

Grain Production Falls

Argentina's economy has always been dependent on the products of its fruitful soil, and if sporadically affected by climatic and other reverses—droughts, locust plagues, even the vagaries of politicians—has always shown remarkable powers of regeneration. In the early part of the past century the country's economic life was closely tied to the products of pastoral farming in its more primitive form, wool, hides and dried meat. As population increased and the railways opened up the fertile black-earth lands, arable farming came into its own and Argentina became one of the world's great granaries, besides building up an immense export trade in meat and cattle. During the last war, however, grain exports were of necessity restricted, and at one time, as in the early thirties, surplus grain was being burnt in factory furnaces. On the other hand the war had a stimulating effect on meat exports and on cattle-breeding, and this continued after 1945, with a diversion of arable land to pasture, and a tendency for forage to supplant non-forage grains. In the five prewar years roughly 66 per cent of the area sown to grain comprised non-forage crops; in 1949-50 the percentage had fallen to about 49, while the total area sown to all grain crops had also fallen by 30 per cent.

But the decline in grain production since the war is not due to the loss of markets alone. Government policy during the first years of General Perón's rule denied the farmer any share in the golden harvest then being reaped by the State Trade Promotion Institute ((IAPI)), whilst at the same time it estranged many of Argentina's former good customers by exorbitant price damands. Even today, the Argentine farmer is only receiving about one-third of the world price of wheat. And of recent years Argentina has been hit by a succession of droughts. The 1949-50 summer drought, the most devastating in living memory, caused an almost total loss of the maize crop and seriously depleted cattle herds, although sheep were not so badly affected. This was followed by further dry spells culminating in another severe drought in the mid-1951 winter, prolonged into the current summer season.

Ten Million Cattle Lost

Cattle herds were estimated at 31.46 million head in 1942, the 1947 census figure was 42.26 million, and a ministerial statement put the 1949 total at 45 million. The extent of their subsequent decline is not known exactly, estimates of their present size varying from 35 million head to as low as 27 million. The seriousness of the situation was pointed out by a Buenos Aires financial journal early in 1951, but it was not until late in the year that any official action was taken to restrict slaughterings and exports; and about the same time General Perón discovered that Argentines habitually ate too much meat, and the propaganda machine was turned on to preach the advantages of a balanced diet.

It has been suggested that land under cultivation in Argentina, at present about 58 million acres, could be extended to about two and a half times that figure, at the cost of tilling natural grass lands. This would entail an enormous outlay,

and Argentina has not now the capital resources and under the present regime does not offer an attractive field for foreign investment. As regards beef, it is unlikely that Argentina will ever recover her position as a major exporter, however temporary the present decline in cattle stocks may be. Domestic consumption has increased considerably, and may be expected to increase further as population rises. The population was 17,885,000 in 1951, and at its actual rate of increase should reach 21.5 million by 1959. Equally ominous for agricultural and pastoral farming, too, is the tendency for the arid dustbowl regions in the west of the republic to spread eastwards. This tendency is not yet of major importance; but its potential danger should not be ignored.

Prospects for Exports

Prospects for exports of foodstuffs in the current year are depressing. Argentina has no export surplus of wheat; linseed also suffered from the drought and available stocks will be low; maize possibilities are still somewhat of a mystery, but undoubtedly the crop suffered from the hot dry winds during January, and any estimates made before that month must now be drastically revised. Pig-breeding is closely linked to maize production, and stocks must by now be affected by the failure of the maize harvest two years ago. Prospects for beef are conjectural. It is hoped that the meatless days will result in a saving of 250,000 tons in the year, but only if this saving is fully achieved can exports be maintained at more or less last year's level. However, about 140,000 tons of mutton and lamb should be available for export, if, as is estimated, present flocks of sheep are still near the 1947 level of 50 million head, and the price of wool does not soar again.

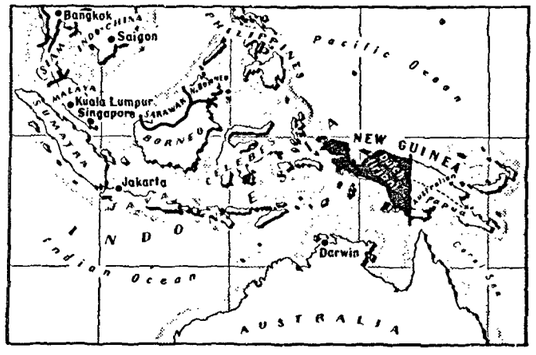
In the meantime the President has made his own renunciatory gesture by turning his salary over to the Treasury; official cartoonists and slogan-writers work overtime at making the public austerity-minded, production-minded, savings-minded, and anti-saboteur-minded; and bread is getting noticeably darker. If the reasons for putting the elections forward from late February of this year to early November of last were not evident before, they are plain as any pikestaff now.



Cold War over Dutch New Guinea

[FROM A CORRESPONDENT IN THE HAGUE]

THE latest conference on the future of Dutch New Guinea which began in The Hague on January 15th was temporarily suspended a few weeks ago because of the Indonesian Cabinet crisis. For six years the Dutch and the Indonesians have been wrangling over this problem. Neither side has given way one inch, and a cold war has alternately waxed and waned according to political winds and government temperatures.

Patient observation of this strange conflict makes one wonder why either the Netherlands or Indonesia wants this unattractive territory. Barely five per cent of its 132,000 square miles has been explored, even by aerial survey; its economic resources are largely a matter of guesswork or hope; and of its estimated 1 million inhabitants not one per cent is literate and less than one-third have been brought under official administration. The territory has an annual deficit of about 25 million guilders (roughly £2.5 million), and even preliminary exploitation of its known resources has been variously estimated to cost from 30 million guilders (£3 million) to 100 million guilders (£10 million) a year for at least ten years.

Why, then, this constitutional battle which threatens to sever the last ties of political and economic co-operation

between the two countries? Holland claims it has a legal, scientific, international and moral right to exercise sovereignty over the area until the people are able to decide, democratically and freely, their own political future. Indonesia maintains that as western New Guinea was an integral part of the former Dutch East Indies it should have been included in the territory over which the Dutch transferred sovereignty to the Indonesian republic in 1949. At the Round Table Conference in that year a dangerous and unstable compromise was eventually reached by maintaining the status quo of New Guinea until special negotiations between the two countries within a year determined the future status of the area. During most of this period each side reiterated its inflexible attitude. The Dutch put a new constitution for New Guinea into operation and the two countries formed a fact-finding commission to provide material for the proposed negotiations. Then, as the sands of the stipulated period were running out, a conference was hurriedly called in The Hague to consider the Commission's report. But as the Dutch and Indonesian members had been unable to reach any form of agreement or put forward any practical proposals, the two-sided report proved merely an incomplete, unscientific, politically-flavoured, and therefore almost useless document. In these circumstances it was not surprising that the conference made no progress. The Indonesians offered blandishments to the Dutch in the form of special economic concessions and guarantees if sovereignty over New Guinea were transferred even nominally. The Dutch declined the bait on the grounds of moral duty, and in return offered to transfer sovereignty to the Netherlands-Indonesian Union, that well-intentioned but anaemic effort at co-operation which is at this moment on the operating table in The Hague to see if it can be transformed into a bilateral treaty. The sole result of the 1950 Conference was agreement that for the time being no form of solution was possible.

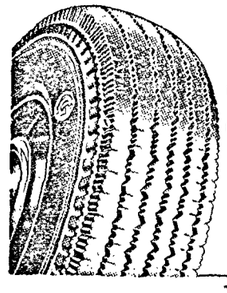
Indonesia has now tried a new line of approach, or attack. Declaring that it was dissatisfied with the whole Netherlands-Indonesian Union, the government suggested a conference with the Dutch to discuss the advisability of changing the Union into a bilateral treaty. The Dutch agreed to talk things over, but when the Indonesian delegation arrived in The Hague last December, they sprung a surprise on the Dutch by bringing forward the New Guinea problem again. They suggested that if the Dutch agreed to transfer New Guinea, they would remove a great obstacle to co-operation and encourage Indonesia to be more accommodating in agreeing to the new treaty relationship.

But the Dutch remained adamant. They were prepared to continue talks on New Guinea, but made it clear they were determined not to relinquish sovereignty. Nor could they make the revision of the Union Statute conditional on agreement over New Guinea. Contrary to general expectations, this firm Dutch attitude did not make the Indonesians pack their bags. In a sort of exploratory atmosphere discussions were started and satisfactory progress made on the Union problem. It seems that the Indonesian delegates have been instructed to concentrate on this problem and apparently forget New Guinea for the time being.

From this two possibilities emerge: either the Indonesian Government is convinced of the uselessness of trying to get sovereignty over New Guinea, or it feels the economic and political benefits of a treaty with the Dutch in place of the Union will outweigh the admittedly doubtful benefits of possessing New Guinea. Indonesia obviously does not want to fall out with the Dutch. Many observers believe it is more anxious to receive co-operation from the Netherlands than from any other country.

Signs of Change in Dutch Opinion

Meanwhile in New Guinea the Dutch administration has got slowly to work. In these days of economic stress, with so many urgent calls for home defence, the Dutch admit they have not the money to spare to get anywhere near fulfilling their self-chosen obligations towards this territory. It seems, indeed, they are almost afraid to count the cost, or, if they have done so, fear to tell the Dutch people just how much this generous interest in the Papuans will ultimately drag from the citizen's purse. This side of the problem is, however, beginning to cause both interest and anxiety in Holland, especially as it is realised that the Netherlands will, sooner or later, have to give up New Guinea either to Indonesia or the local people, and thus get little material return for its present and future philanthropy.



There are also other indications of a slow but steady change in Dutch public opinion. Not only is the glamour of retaining a foothold in the Pacific beginning to dim under the shadow of the heavy financial cloud, but its effect on Dutch-Indonesian relations is also causing anxiety. The bulk of the Dutch people are still against the immediate transfer of sovereignty, but there is a growing desire to find some way by which the faces of both countries can be saved. Even if an international court ruled in favour of the Dutch attitude, many Netherlanders feel it would not improve the position. Britain's oil dispute with Persia is

Britain's Great Chance as an Air Power

TO be a power at all Britain must be an air power.

No air force can be strong without a world-flying merchant air service to back it up, any more than a navy could be strong without the backing of a merchant shipping fleet. The industry sustaining the air services must be broadly based on world-wide sales.

Thus, whether we consider rearmament alone, or the export trade to pay for it, or Britain's status in the years ahead, it is vitally necessary to build up our air transport operation, production and exports. To build military aircraft alone is not enough.

Aircraft exports rank high for priority with our other exportable products. This becomes doubly evident when we realise that we stand on the very threshold of the air age. The gas turbine is heralding a new and historic advance in the movement of loads into the air. With such aircraft as the Comet, Britain holds the lead in turbine airliner development—our first opportunity of regaining world markets which we were forced to relinquish in the nineteen-thirties.

In many classes of merchandise we are meeting increasingly severe competition in the world markets. In the expanding field of civil aviation we are at present well placed—if we can produce. To foster a British response which will help us towards economic stability is in the interests of our allies as well as of ourselves.

We are presented with what may be our unique chance in history of firmly establishing our influence as an air-faring nation.

To disregard this great occasion would be as disastrous as would have been the neglect of our maritime calling when Elizabeth I was queen.

DE HAVILLAND

being quoted as an example of what poor consolation and profit there can be from juridical justification.

Dutch socialists would prefer some international intervention, either in the form of combined mediation or multinational responsibility. In this connection Australia's great interest in the strategic value of New Guinea is fully noted, and although Australia has recently emphasised again its support of the Dutch in this matter, neither Australia nor the Netherlands seems too happy over the other's attitude. Australia fears the Dutch will weaken; Holland wonders just how far Australia would translate its wishes into deeds if it came to a show-down.

Can Indonesia Pull Its Weight?

The Dutch Government has promised parliament not to make any change in the status of New Guinea without giving both Chambers an opportunity to debate it. And if it is just a question of complete and unconditional transfer of sovereignty, it is most unlikely that the required two-thirds majority of parliament would be obtained to sanction it. Many members of the major political parties fear that Indonesia will be clever enough to get nominal sovereignty, and then leave the Dutch to foot the bill and shoulder the blame if progress is slow. It is evident that the Indonesian Government is in such a difficult political, economic and administrative position that it could not spare more than a very nominal staff and budget for New Guinea for many years. This confirms the Dutch in their determination to "stay put" in the interests of the local people, unless Indonesia proves that it can pull its weight.

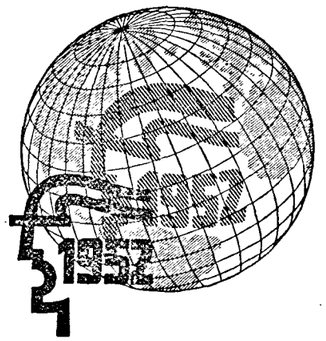
But there is also a strong body of Dutch opinion that still refuses to listen to any transfer of sovereignty, international intervention, or even international help in solving the problem. It will heed no argument, financial or otherwise, probably because it feels that as long as the Netherlands has New Guinea, the Dutch will have a right to representation in the various South East Asia and Pacific organisations which in one way or another affect the extensive Dutch commercial interests in that region.

On the Indonesian side the desire for a transfer of New Guinea is unabated, although the practical difficulties that would follow seem to be becoming increasingly plain. But for the present the Indonesians can take refuge behind the useful fact that there is to be a Dutch general election in June, followed certainly by a new government. So it is not to be expected that the outgoing government will at this stage make any important decisions. That is probably why the present Hague talks have not broken down over the supposedly vital New Guinea question, but are concentrating on a settlement of the Union-or-treaty problem. There seems little doubt that the Union will go and that a reasonably satisfactory treaty will take its place. Both countries have many good bargaining points, and as both agree that a stultified or unwilling Union would kill future relationships, every effort is being made to draw up a treaty that will produce much more friendly co-operation than the Union has done.

Europe's Green Pool

On Tuesday, there opened in Paris a preparatory meeting for a European conference to consider the integration of European agriculture. It is attended with varying degrees of enthusiasm by all members of the Organisation for European Economic Co-operation, including Britain, with France and the Netherlands in the lead.

The present meeting is preparatory in more than a formal sense. It has been called to consider no plan. It is an open question whether a supra-national body, an inter-governmental organisation or nothing at all will emerge; whether and how far any possible scheme would include the reduction of tariffs as well as of quantitative restrictions; whether it should provide for a central pool which would subsidise the inefficient producers; whether there should be long-term and intra-European market guarantees for surplus produce. This is not because there are no plans. There are plenty: M. Pflimlin's plan, M. Mansholt's plan, not to mention the epic and unsuccessful attempts to create a customs union between Belgium and the Netherlands, and between France and Italy, which broke largely on the issue of agricultural tariffs. The truth is that all such plans have raised insuperable difficulties and objections. The enthusiasts were forced to realise that there would be no conference unless it started from scratch. Thus the ostensible purpose of the Paris meeting is to decide the "procedure, terms of reference and objective of a conference to be held later, on the unification of European agricultural markets."



The project is, perhaps, the most necessary and least hopeful aspect of European integration. It is most necessary, because only through international (or rather supra-national) action can most European countries hope to make progress against the inefficiency and firmly vested interests of their agricultural producers. It is virtually hopeless, because the walls of protection are higher, the effects of knocking them down more devastating, the structural difficulties greater than for any other sectors of European economies.

This is not to say that some progress may not be made in several directions. There may be some adjustments of tariffs; there may be some new intra-European marketing agreements. There is certainly scope for negotiation. But, unless Europe becomes politically more united than now seems likely, there can be nothing approximating to a single market for agricultural produce. In the first place, the political objections to an agricultural High Authority are very powerful. Of the eighteen countries attending the present meeting, only France, Western Germany, Belgium and the Netherlands would seriously consider a supra-national body on the lines of the Schuman plan. For the protection of agricultural communities has traditionally been the most lively issue in internal politics on the Continent; and the surrender of sovereignty on such an issue would amount to political suicide for practically every government except the Dutch.

Britain's Position

In the second place, the protection of agricultural tariffs has been traditionally so complete that the dislocation which would follow from their removal—except in a very gradual form over many years—would be prohibitive. Even Britain, which has a shorter history of agricultural protection than any other European country, has so far insisted that continental agricultural produce on the liberalised list should be excluded during the periods when home output is at its peak. In the third place, there is already, in contrast to the coal-steel industries, a problem of agricultural surpluses. New arrangements for the disposal of these, which would be an integral part of the green pool as envisaged by its sponsors, would work directly contrary to the reduction of tariffs and the attempt to create a single market.

Thus, through no virtue of its own, Britain has a comparatively easy hand to play. It could not deny that Commonwealth preference and its own domestic price-support policy would make it difficult for it to join any green pool. But it may never be faced with the necessity of excusing itself. In the meantime, it can fairly promise, as Mr Nutting did on Tuesday, that it is in favour of any scheme which would increase European production and reduce European prices, and that it will undertake to provide an expanding market for European agricultural produce. For the initiative must in this case rest with the Continent as being the worst offender. If the Continent reduces its tariffs, then Great Britain must certainly follow. But so far, the question has not arisen.

THE BUSINESS WORLD

Sterling since the Budget

THE short-range objective of the Budget, and especially of the simultaneous dramatic rise in Bank rate, was to arrest the speculative pressure against sterling and to turn the short-run psychological factors to its advantage. The urgency of such stop-gap relief was starkly demonstrated by the ominously low level to which the gold and dollar reserve had fallen by the end of February and the frightening rate at which it was being encroached upon. Judged by this criterion of reviving confidence, how far are the Budget and the Bank rate proving effective?

The first statistical measure will become available towards the end of next week, when the figures for the gold and dollar reserve at the end of March will be announced. Any verdict based on these figures will, however, be inconclusive. They will not show any reflection of the fundamental effects that the Government expects to flow from the decisions announced on budget-day. The relief to Britain's current balance of payments from the rise in money rates and the latest cut in non-sterling imports cannot begin to show itself for some time. In February gold was being lost at the rate of $66 million a week; and although since then the effects of the earlier import cuts should have become more apparent, the Exchange Equalisation Account has had to transfer a further £18 million of gold to the European Payments Union for the February settlement. Whatever items may have come to the support of the gold and dollar account in March, it is unlikely that they will have fully offset both this loss and the momentum of the adverse payments to the dollar world that was running so strongly in February. The figures for end-March are likely, therefore, to show a further reduction in the gold and dollar reserve, though the rate of loss should have diminished appreciably as compared with that shown by the February figures.

In this crucial phase of the battle for sterling, before the fundamental measures can show their full worth, psychological influences have however a great part to play. If the psychological factor can be turned to Britain's advantage and kept so for the next few critical months it may hold the line and keep the gold reserve at the level adequate to meet the essential day-to-day working needs of the sterling area until the major forces are sufficiently mobilised to permit the indispensable forward movement. From this point of view there can be little doubt that the tactics of the British authorities have met with some success. Foreign opinion has undoubtedly been impressed by the rise in the Bank rate and, given the atmosphere thus created, has also been reassured by such decisions as the cut in the food subsidies and the concessions in direct taxation. These are moves that have made their impression abroad; and there was, from the outset, ground for hoping that their psychological effects might quickly be reflected in a demand for sterling and in some consequent accretion of gold and dollars to the reserve.

The main reason for this hope lay in the existence of a substantial bear position in sterling. The size of that position cannot be accurately measured; even in the best informed quarters in the City and Westminster, widely varying estimates of its magnitude are current. But the general drift in the months before the Budget was clearly apparent. Sterling was under suspicion, and in consequence every foreign trader having sterling payments to make was postponing those payments to the last possible moment, raising sterling credits and using every other possible device for this purpose. On the other hand, everyone in the sterling area having foreign currency payments to make was covering his needs as quickly as possible. In addition, there have been outright speculative forward sales of sterling and these have an immediate impact on the gold and dollar reserve. Past experience suggests that the swing of the semi-speculative, semi-commercial psychological pendulum from one extreme when sterling is being "beared" to another when sterling is being "bulled" may amount to as much as £500 million—not an implausible figure when it is realised that international trade financed in sterling amounts to over £10,000 million a year. On this assumption it might be said that the short position in sterling, i.e., the extent to which the normal incidence of sterling payments and receipts had been shifted adversely by anticipatory exchange operations, might perhaps amount to £250 million. It might be hoped that the combined effect of the higher Bank rate and the Budget would rapidly reduce this short position and thus bring into the reserve the gold and dollars due from current transactions but not previously paid into it.

★

So far these hopes of a major psychological swing do not appear to have been realised, although some bear covering has taken place. Some weeks before budget-day the Bank of England imposed various technical measures to promote this highly desirable objective, by putting severe restrictions on the acceptance credit facilities accorded by British banks to foreign customers. The term for such credits was brought down to a maximum of 90 days; all "pre-finance" or refinancing credits were forbidden; and steps were taken to ensure that acceptance facilities were provided only for goods actually afloat. These technical measures have already begun to bear fruit. As ineligible credits mature, they are not being renewed and the covering operations involve a corresponding purchase of sterling. An appreciable part of the short position in sterling had been founded upon such acceptance facilities, and furthermore these had been granted on the basis of the inordinately low discount rates that prevailed in London before the latest increase in Bank rate.

The tendency to repay these credits has inevitably been encouraged by the increase in Bank rate and the steep increase in discount rates for commercial bills. But the extent of the covering movement seems so far to have been modest, and limited to the virtually enforced response to the technical measures instituted by the Bank of England. It is not altogether surprising that the foreign trader should keep his short position in sterling open until he is compelled to close it. He stands to lose nothing by doing so, since there is no possibility, in existing circumstances, of any appreciation of sterling beyond the official buying rate for dollars, $2.82 to the £. As long as there are fixed parities, these swings of speculative sentiment for and against a currency must involve the grant of a one-way option to the operators concerned. They cannot lose, and may gain, by swimming with the prevailing tide.

Nor is any scarcity of sterling in the near future likely to compel the foreign trader to cover his position. There is too much sterling in non-residents' accounts—more than £3,500 million of it, of which such components as the total of over £100 million held on Japanese account is very unwillingly held, and is being pushed into international circulation by every conceivable device. In addition, sterling can be made automatically available to Europe to the tune of £450 million through the machinery of the European Payments Union. Britain has now almost exhausted its credit facilities and stands in debt to the Union to the amount of over £217 million. If the balance of payments in EPU swings in favour of Britain this will, in the first instance, involve a welcome recouping of gold previously lost; but it will also involve an extension of sterling credit to EPU member countries on a gradually expanding scale. There are, therefore, well-filled cushions that must for a time soften the impact of any courageous policy to make sterling scarcer. There can be no early relief from that direction.

Nevertheless, it is quite evident that a change for the better has occurred in the sterling position. The most telling evidence of it is the fact that during the past two weeks sterling has held itself not merely above $2.78, the Bank of England's selling rate for dollars, but above the parity of $2.80. This is a reliable indication that the demand for and supply of dollars in the market have kept in balance without the aid of market purchases of dollars from the Bank of England at its official rate. The fact that the market rate has not yet risen to the Bank of England's buying rate for dollars, namely $2.82, does not, however, necessarily signify that no dollars have gone back to the reserve via official purchases on the open market. The authorities are normally big users of dollars; and if their needs exceed the amount maintained as a working balance with the New York Federal Reserve Bank, that balance must be reinforced by transferring gold or by buying dollars in the market. During the past two weeks it is quite certain that official needs for dollars have been satisfied by purchases in the market and not by transferring gold, which on the basis of current rates would have been the more expensive operation. It may be that official purchases of dollars have exceeded current requirements and have gone to rebuild the British dollar balances in New York or the gold held in reserve. But, if so, the net gains must have been small. The indications of market turnover do not justify any more optimistic interpretation of recent developments. Nor do the weekly figures of United States gold reserves and foreign-held dollar balances suggest that—in the first week after the Budget at least—any substantial accretion can have taken place in the British gold or dollar reserves.

In the phase that lies immediately ahead, the movements in the gold and dollar reserve should depend not only upon the psychological factors but increasingly upon the effects of the cuts on dollar imports decided upon by Britain and other sterling countries; later on, the more positive measures, notably the effort to expand exports, should begin to exert their effects. It is reassuring to note that United States purchases of sterling area commodities have been resumed on a larger scale than in 1951, although satisfaction at this tendency should be qualified by the knowledge that part of the sales of such materials as tin have come from the British stocks that will later have to be replaced. The reserve should also benefit in the second quarter of the year from the larger sales of South African gold to Britain announced in this week's South African budget—though here, too, the benefit is likely to be a non-recurring one. There may also be some help to be gleaned from the International Monetary Fund if, following the new directives issued by its managing director, Mr Rooth, that institution decides to raise the shutters that have denied facilities, for the past four years, to recipients of American aid.

All these factors, reinforced by continued bear-covering, may change the trend of gold movements during the second quarter of the year and cause the June 30th figure—generally regarded as the crucial "hump" in the balance of payments crisis—to show some improvement on that for March 31st. The improvement cannot be massive unless the more fundamental measures provoke a rush to cover bear positions in sterling. It is unlikely that Australia, despite its heroic though belated import cuts, can be prevented from dipping heavily into the gold and dollar reserve in the months to come. India is likely to run a chronic and considerable dollar deficit, with substantial dollar expenditure on foodstuffs as the only condition of avoiding famine. Ceylon, that traditional dollar-earner, has recently seen its dollar surplus vanishing.

★

The restoration of the gold reserve is also at the mercy of operations in cheap sterling. Their volume has been growing. A Dutch trader—to take a familiar example—buys a sterling commodity such as wool, pays for it in sterling obtained from his central bank, which ultimately finances its sale through the EPU compensation. The wool is then sold in the dollar markets and the dollar proceeds are used to purchase cheap sterling and thus reconstitute the original sterling position. The sequence of these transactions depends on one important link—the readiness of a resident in the Netherlands to exchange his sterling for dollars at the rate of say $2.45. It is through such transactions that the bulk of certain sterling commodities—including hemp, sisal, flax, and certain edible oils—are financed when sold to the United States. The dollar proceeds of these sales escape the reserves of the sterling area altogether. Furthermore, these commodities are being sold to their ultimate buyers in the dollar markets at lower prices (since they are sold at $2.45 or whatever the rate for transferable sterling may be) than those paid by competing British firms. This market in cheap sterling has been growing. One small but significant pointer is that there is a newly established exchange in Milan that specialises in the many varieties of sterling. Such sterling is being used not only for "shunting" commodities but also in settlement of shipping freights, insurance premiums and other items of "invisible" income.

How can such dealings be stopped? They will not be

stopped by trying to plug the holes through which the cheap sterling goes out. The efficiency of exchange control for an international currency such as sterling depends partly on the co-operation of other central banks and on their willingness and capacity to establish in their countries systems of exchange control comparable with the British. To demand such controls would be asking for the impossible and for the unreasonable.

The long term remedy is to make sterling so scarce that no foreign holder of sterling is prepared to exchange it for dollars at less than the official rate. But so long as sterling remains inconvertible it must be expected that some discount will establish itself on non-convertible sterling held on foreign account. Such sterling will, in effect, seek convertibility as it is doing now through commodity shunting and comparable transactions. Non-resident sterling is in fact convertible today, not at the official rates, but at the various rates that emerge from these arbitrage commodity deals. The true remedy for the present ills, therefore, is to make non-resident sterling convertible—to fortify the balance of payments and to create conditions in which the jump into true convertibility can be made without risk of disaster. This might require new arrangements with overseas holders of sterling balances; it might require greater freedom for movements in exchange rates; it would certainly call for a strengthening of the domestic measures already taken to make sterling a scarce and strong currency. But in envisaging this step it should be recognised that such sterling is already convertible through cheap sterling transactions and that this is a convertibility from which the sterling area gets all the disadvantages and none of the benefits—all the odium of seeing sterling quoted at debased rates and none of the hard currency earnings that should by rights be accruing to the sterling area from which the commodities that are "shunted" are derived. No position could be less desirable or, in the long run, more untenable than the present.

Reverses for Rubber

NO primary commodity better illustrates than rubber the influence of American buying on prices and on the dollar earnings of the sterling area. In the short space of twelve months rubber has fallen by half from the wholly abnormal peak of 6s. a lb. to 2s. 9½d., a level that on all present prospects cannot be regarded as abnormally low. Indeed, the prospects for rubber this year are dismaying. Consumption is falling, and a surplus of perhaps 250,000 tons of natural rubber may well occur. What happens to rubber this year depends on the answer to a dual question: will American buying for strategic stocks absorb the threatened surplus or will American policy allow an increase in the civilian consumption of natural rubber? Without help of one kind or the other, natural rubber and the economic condition of South East Asia are likely to suffer severely.

At this moment, the usual statistical tests for rubber can easily mislead. The 1951 figures of world output—natural and synthetic—show a rise from 2,400,000 tons to 2,800,000 tons. In fact, the whole of last year's increase in output was of synthetic rubber. Natural rubber output was scarcely changed at 1,862,500 tons in 1951, compared with 1,855,000 tons in the previous year, and the year's total actually conceals a sharp fall in the second half of the year. Nothing could hold synthetic output; it rose consistently throughout the year, reaching a total of 908,300 tons—slightly above the wartime production record in 1944 and 80 per cent above the 1950 level. Some American forecasts suggest that the output of synthetic rubber throughout the world may reach a million tons this year, including a possible 10-15,000 tons from Germany, where production is starting again.

All producing areas marketed less natural rubber during the second half of last year. This was a natural reaction to falling prices, and since rubber has dropped from 3s. 6d. to 2s. 9½d. in the last three months, the fall in production must still be going on. The effect of price movements is most clearly visible in changes in smallholders' production. For example, total production in Indonesia last year rose by 100,000 tons to 792,000 tons; output from smallholdings increased by 58,000 tons to 579,000 tons, and output from estates by 41,000 tons to 213,000 tons. In the second half of the year, total output fell by 20 per cent, but whereas smallholders' production fell sharply, estate output continued to increase. Total production in Malaya, affected by increased banditry, showed falls in estate output of 48,000 tons to 329,000 tons, and in smallholder output of 41,000 tons to 277,000 tons. There was a slight improvement in estate output in the second half of the year, but smallholders' output fell by 8 per cent. Stronger military measures might bring production in the areas affected virtually to a standstill; in any case, on present assumptions Malayan output is not put higher than 575,000 tons this year.

Falling prices tend to increase the proportion of estate-grown rubber in total output. Roughly one quarter of world output consists of No. 1 grade rubber, and this comes almost entirely from the estates. Conversely, almost all the "off-grade" rubber is produced on the smallholdings. A falling price cuts down the output of low grade rubber but has markedly less effect on the output of No. 1 grade rubber. This feature, already apparent in the later months of last year, is likely to be accentuated this year.

*

World consumption of natural rubber fell sharply last year from over 1.7 million tons to less than 1½ million tons because the United States used much less. British consumption increased by 15,000 tons to 234,000 tons, and European consumption rose by 30,000 tons to 380,000 tons. But consumption this year in both Britain and Europe is more likely to fall than to rise, if only because of the decline in motor car production. Net imports into Britain in 1951 amounted to 299,000 tons of which 65,000 tons went to government and private stocks. The government is now liquidating part of its stocks and industry will no doubt be inclined to reduce its own holdings. Net imports this year may not exceed 225,000 tons, and France and Germany are also likely to reduce their imports. As Britain and Europe mainly use the better grades of rubber, such reductions in imports may affect the price of No. 1 rubber. On the other hand Russia buys only No. 1 grade and its purchases this year are expected to increase to 100,000 tons, which is considered to be a normal civilian requirement; in 1950 Russia took only 67,500 tons.

The United States is the largest single user of natural rubber and the cut in American consumption last year was the more painful for that reason. Indeed, the fall in consumption of natural rubber more than offset a sharp increase in the use of synthetic rubber; total consumption of rubber of both types fell from 1,260,000 tons to 1,215,000 tons. Smaller production of motor-cars leading in turn to reduced output of tyres (which account for about 70 per cent of civilian use of rubber) outweighed any increase in requirements for defence, apart from stockpiling. The United States Government imposed control on the civilian use of natural rubber at the end of 1950. This policy was intended to release a maximum quantity of natural rubber for the stockpile and in fact it did; indeed, some manufacturers last year did not take up the whole of the rubber which they were allowed. As a result, some 300,000 tons of natural rubber went into government stocks last year compared with 100,000 tons in 1950, while commercial use of natural rubber fell from 720,000 tons in 1950 to 456,000 tons. Consumption of synthetic rubber showed exactly the opposite movement, rising from 538,000 tons in 1950 to 759,050 tons in 1951. A further increase is expected this year. A recent American trade estimate puts rubber consumption in the United States as high as 1,336,000 tons for this year. This figure may prove too high, for defence needs have recently been cut back. But its significance lies in its assumption that synthetic consumption will reach well over 850,000 tons, leaving a mere 465,000 tons for natural rubber. In fact, official allocations for the first three quarters of this year have been made at an annual rate of 475,000 tons. Fortunately for natural rubber producers, American imports of rubber may not be limited to this meagre total. The Administration has promised to continue to purchase rubber for the stockpile but the stockpile has already reached its minimum limit of one million tons, and further purchases are unlikely to exceed 250,000 tons. Even if the whole of this amount were bought in 1952, imports of natural rubber this year would be a little below last year's figure of 730,000 tons.

*

In the past the rubber market has been supported by American stockpiling. In future it can count on no more than limited support from that direction and it faces a serious threat from synthetic production. The United States Government is expanding synthetic output to the limit, ostensibly as a matter of defence policy, and the plants have been given priority for raw materials. In the first quarter of this year the American Government has issued licences for the export of 16,000 tons of synthetic rubber. Such a policy is within its competence but the rest of the world might think it odd since natural rubber is not allowed freely to compete with synthetic rubber in the American market. But it is important for producers of natural rubber to recognise what free competition now means. They cannot complain merely that American tyre manufacturers are forced to use a large percentage of general purpose synthetic; they must also recognise that the American rubber manufacturers have acquired much skill in using synthetic rubber and have learned to appreciate the advantages of a homogeneous producer. The United States was formerly one of the main markets for off-grade rubber; in future it is likely to call for more No. 1 grade and to be less willing to pay dearly for it.

If the United States in future takes less off-grade rubber, the consequences for South East Asia could be serious. During the past eighteen months, the American stockpiling authorities have been buying rubber without close regard to quality. Their previous policy of buying only top grade rubber, because it stored better, was abandoned. But with the reaching of the minimum limit of the stockpile, the authorities have reverted to "top grades only." This change of policy has depressed the price of rubber. The off-grade rubber in stock has to be turned over more frequently and is at present being sold spot. But No. 1 grade rubber can only be bought forward, except in small quantities; as a result, rubber prices, particularly for lower qualities, have fallen sharply. Moreover, the American Government has reduced the price of general purpose synthetic from 26 cents a lb to 23 cents—and has thus widened the margin below the current price of 38½ cents a lb for natural rubber.

These changes promise little relief from the pressures to which natural rubber is now subjected. Supplies of natural rubber this year are likely to exceed requirements unless the United States adds the final instalment of 250,000 tons to its stock. In that event, there may be a squeeze on the top grades later in the year. But the pressure of supplies will be felt by the lower grades, which means that the smallholder in South East Asia may suffer rather than the estates. This fact may prompt the United States Government to reconsider the present controls on the use of natural rubber. Assistance for its domestic synthetic rubber industry on grounds of defence would be a doubtful gain if it indirectly affected the economic and political stability of Malaya and Indonesia.

Business Notes

Counterpoint in Markets

The dominant movements in stock markets this week have nearly all of them taken the form of some accentuation of tendencies that were beginning to show themselves in the second half of last week. The most noticeable general characteristic has been the re-emergence of an inverse relationship between prices of gilt-edged and of equities. Immediately after the budget, when the rise in Bank rate was by far the most potent influence, the whole market tended to move together—not only on the sharp downswing, but also on the first slight rally. Since the end of last week, however, a notable strengthening of gilt-edged prices has combined with a further sagging of industrials and commodity shares. The equity markets were, of course, under the shadow of uncertainties about the effects of the new Excess Profits Levy—uncertainties that, to judge from Thursday's confusion in the markets, are not likely to be quickly resolved by the terms of the Finance Bill. Apart from that, the main preoccupation of equity investors has been with the rising tempo of public discussion of the likely effects of "recession" in consumer goods industries. Reflections on these themes drove the ordinary share index of *The Financial Times* down another 1.6 points in the four business days to last Tuesday, when the index touched 105.5, less than 6 points above the nadir reached in 1949. It rallied by 0.5, however, on Wednesday.

GILT-EDGED SECURITY YIELDS

In the gilt-edged market the dominant influence was quite evidently the continued firmness of sterling in the foreign exchange market, a firmness that has generated hopeful forecasts—probably too hopeful ones—of the end-March statement on the gold reserves due to be issued shortly. On each day up to last Wednesday some gains were shown in the gilt-edged list; the individual movements have been small, but over the week the whole range has been lifted slightly. In the irredeemables, the advance has not exceeded ½ point, but the longer dated stocks showed gains ranging to 1⅛. Even so, the smaller movements recorded among the short bonds were relatively more significant. The longest of the three 1¾ per cent Serial Funding stocks (1954), which had slumped to 96¼ on the day after the budget, rose in the week by ¼ to 97⅜—a movement that represents a decline in the gross redemption yield from £2 13s. 8d. to £2 11s. 10d. per cent. Over the same period the flat yield on 3½ per cent War Loan fell by only 3d., to £4 11s. 7d., and that on Old Consols by 10d., to £4 4s. 4d. per cent. The net effect, therefore, has been to add a little to the spread in the spectrum of yields—a spread that has, of course, been drastically narrowed since the steep rise in Bank rate.

Market observers long accustomed to the distortions caused by cheap money policies are now finding it hard to recall the relationships appropriate in conditions of orthodox monetary discipline. The task will be eased for those who have access to the well-known, though privately-circulated, "Gilt-edged Securities in the Twentieth Century." The chart above adds the movements since the end of 1949 (up to the middle of this week) to the second half of a revealing diagram included in that invaluable source-book.

* * *

Alarm in Lancashire

The House of Commons expressed its concern with Lancashire's present trade recession in a discussion that lasted throughout Wednesday night and Thursday morning. Most of the speakers called for government action to relieve growing unemployment and short-time working in the industry, and suggestions for assistance ranged from increased government orders to a temporary lifting of the purchase tax on textiles. The industry's difficulties are not yet fully reflected either in the export returns or in the rate of cloth production, because short-time working on a significant scale did not begin until Christmas. By the beginning of March, twenty-eight mills, employing 6,390 workers, were closed down for the week, and output of yarn, including spun rayon and mixtures, came to just under 17 million pounds compared with nearly 22 million in the same week last year.

This unemployment is the direct consequence of the fall in world demand for textiles that became evident last summer; most members of the industry would now agree that they completely misjudged both its scope and its duration. The Korean war led to a wave of panic buying by consumers that ended as suddenly as it had begun, leaving retailers and wholesalers with heavy stocks, but leaving manufacturers with long order books that prevented them from feeling the effects of the rapid fall in demand until shortly before Christmas. In consequence, few attempts were made during this period to adjust prices, delivery schedules or styles to meet the arrival of a buyers' market. This is true of the home market, which takes 70 per cent of the cotton industry's production, as much as it is of the export markets; it also affects the cotton industries of the United States and Japan, which were hit harder and earlier than Lancashire.

The scope for direct government action, given these circumstances, is limited. The one positive step announced by the President of the Board of Trade was the temporary withdrawal of licences to import grey cloth for finishing in this country. This grey cloth represents about one-fifth of British cotton supplies, but as large stocks have been accumulated, it is unlikely that much is still being imported. The effect of government defence orders upon employment is small. The combined requirements of the Army and Air Force during the rearmament period amount to only 160 million square yards of cotton cloth—the equivalent of ten per cent of Lancashire's output in a single year—and 114 million square yards of wool and flannel. Orders for about half the cotton cloth, including 42½ million square yards of canvas and 23½ million square yards of drill, were placed abroad last year because the British industry was working to full capacity and could not promise delivery. As late as November, British mills were still quoting delivery in 1953 for some of the cloths needed for defence purposes. A few outstanding orders in the United States have been cancelled, but most of the cloth ordered abroad has arrived in this country. All orders for wool cloth have gone to the British industry; with the exception of orders for 10 million blankets, the bulk of them have already been placed.

Attacks made by some speakers on the "D" scheme were not convincing. The tax-free limits tend, if anything, to favour cotton and rayon cloth rather than other materials; and the ending of price control, which enables traders to average the prices of old and new stock, is one of the surest ways of moving the high-priced stocks that are generally believed to be blocking the pipeline between the mills and the consumer. Retail sales in the past few weeks appear to have returned to their normal level. Retail stocks in January were down from 223 in November and 190 in December to the more reasonable figure of 178 (1947=100). If the clearing of stocks has continued at this rate a revival of orders in the early summer might be in prospect.

* * *

Cuts in Rayon

The plight of the cotton industry has dominated the discussion of unemployment in the textile industries. But the decisions of Courtaulds and British Celanese to cut rayon output is a no less painful matter, particularly after the stratagems to which rayon producers resorted last year to get enough sulphuric acid to maintain production. Rayon production recovered from 28.5 million pounds in December to 34 million pounds in January, and production during February continued at the same rate. But Courtaulds have recently put three of the company's factories on short-time working and is now expected to close down for two weeks during Easter. The big Spondon factory of British Celanese is to introduce a short-time rota, varying from one week in four to one in twelve in different parts of the plant.

These measures which are in line with those introduced by the other rayon producers, have been introduced because of the rate at which yarn stocks have accumulated. Although rayon could not expect to escape the general textile slump of last year, the state of the producers' order books throughout 1951 held no threat of so sudden a reversal in demand. British rayon is still the cheapest of the textile fibres, and its prices are well below those of its foreign competitors. These prices, moreover, have been free from the violent fluctuations that have disturbed the market for cotton textiles. Sales of rayon may have been affected by a swing in fashion in favour of cotton cloths that has resulted from the cotton industry's energetic research into improved finishes.

The decision to follow the example of the cotton mills and adopt the uneconomic expedient of short-time working to avoid dismissals suggest that the rayon producers do not expect the present setback to last. A speech made in Manchester by the chairman of the Cotton Board early on Wednesday afternoon was also in marked contrast to those made later in the day at Westminster. Sir Raymond Streat spoke of the need for the "utmost realism" and "realistic decisions," by which he must have meant adjustments in price and profit margins, as the necessary equipment for a trade revival. If a return to a normal rate of retail buying is clearing the stocks of goods in British warehouses it is reasonable to hope that the same process may take place in some export markets. But so many countries now impose quotas on textile imports that the flow of foreign orders to British mills cannot again reach the levels of 1950 or 1951. Unless the Government is able to bargain for the raising of these quotas with more success than in the past, the British textile industries may find themselves largely confined to the home and colonial markets where, Mr Thorneycroft hinted, they might be given some element of protection against foreign competition. In that event the scope of any trade recovery to be expected this summer will be limited.

EPU Mark III

The Council of Ministers of the Organisation for European Economic Co-operation has this week begun its consideration of the report of the management board of the European Payments Union. EPU comes to the end of its second year of operation on June 30th. Whether to extend it for a third year and if so subject to what amendments, have been the ground for considerable discussion in Paris in recent weeks. The conclusions reached in this debate have now been summarised in the report that is the main item on the agenda of the Council of Ministers. The board of management of EPU is strongly in favour of continuing the system, it points out that its disappearance would represent a serious setback for the twin causes of convertibility of currencies and liberalisation of trade. It goes on to point out that experience gathered over the life of EPU so far suggests certain flaws. The first of these is the inadequacy of the Union's working capital. The Union was endowed at its start with US dollars made available by ECA to the amount of $350 million. The strain on these resources may be gauged from the fact that, since the beginning of EPU operations, the gold that has been paid out to creditor members amounts to $638.9 million and the gold received from debtors to only $444.5 million. Had it not been for supplementary dollar receipts represented in the main by payments into EPU of direct dollar assistance given by the United States to certain member countries such as Turkey and Greece, familiarly known as "the wards," the cash reserve of EPU would by now be virtually exhausted. At the end of January it amounted to $294 million.

The board of management suggests that this working capital should be increased by $200 million in order to meet far greater fluctuations of payments than were originally contemplated. This increase can be provided only by further American assistance, though the problem of equilibrating gold receipts and payments could be eased by changing the sliding scale on which debtor countries have to pay gold as they incur deficits with EPU. The board of management of EPU also stresses the need for a permanent solution to the problem of the persistent creditors such as Belgium, Italy, Portugal and Switzerland which are at or near the full extent of their quotas. At present, when a member country exceeds its quota, its relations with EPU are subject to special individual arrangements. The need for some unification of these arrangements is self-evident. The report of the management board touches the real fundamentals of the problem when it calls for a greater harmonisation of the financial and economic policies of member countries. In their disharmony lies the main cause of the disequilibrium in balances of payments with which EPU has had to contend.

* * *

The Persistent Creditor

Try as they will, the Belgian authorities are unable to abolish their payments surplus with other members of the European Payments Union. For February that surplus amounted to $48.2 million. Of this, $20 million was taken in gold, in accordance with the special arrangements with EPU covering the first quarter of 1952. These arrangements, made after Belgium had exhausted its EPU quota, provide that, for the first quarter, a maximum of $60 million of gold can be withdrawn by Belgium from EPU in respect of its surplus. Any excess of the Belgian surplus over this figure must be granted to EPU in the form of an additional credit. The maximum gold that may be withdrawn for the second quarter of the year has been raised to $80 million.

The Belgian Government is redoubling its efforts to bring its surplus down to the dimensions of this gold ceiling. The feature of its latest proposals is the substantial increase in the proportion of Belgian export proceeds subject to blocking. As in the past, this blocking is to be operated on a discriminatory basis and will apply only to exports to,

EPU countries. But the rate of blocking will in future be adjusted to various types of exports. For such essential goods as steel, non-ferrous metals and cement, the rate goes up from the previous uniform figure of 5 per cent to 25 per cent. For fertilisers it rises to 20 per cent. For most chemical exports the rate becomes 10 per cent, while for textiles—now increasingly unsaleable—the rate remains at 5 per cent. Belgian exporters are being encouraged to invoice in dollars even when selling to EPU countries. If they succeed in getting payment in dollars, the proceeds of their exports will not be subject to blocking. The amounts that will be collected from the increased rates of blocking are expected to provide the approximate counterpart of the additional credits that Belgium will have to grant to EPU during the next six months, thus neutralising the inflationary effect of this extension of external credit. Belgian exporters have, however, discovered that in many cases they can add the blocked portion of their export proceeds to the prices they charge to the foreign buyer. The blocking provisions are, therefore, helping to improve the terms of trade of Belgium and thus to increase the very malady against which they are directed.

* * *

"Super-Priority" Defined

Details of the new "super-priority" scheme published by the Ministry of Supply this week show that its scope has been greatly widened since the Prime Minister announced on March 5th that special priority was to be given to the production of fighter aircraft. In its final form, "super-priority" applies to roughly one-sixth of all rearmament production. It covers bombers as well as the new fighters; the Gannet aircraft for anti-submarine work; aircraft ammunition; radar equipment; Centurion tanks; guided weapons and certain mine-sweeping plant. When the scheme is in operation the Minister of Supply will tell direct government contractors which orders rank for "super-priority." Contractors will then classify their orders to sub-contractors in the same way, and the sub-contractors will do the same with their orders for components or materials. Any order classified as "super-priority" must then take precedence over all other work, including other defence work or export orders. It is hoped that the dislocating effect on industry as a whole will be slight because these orders will not employ more than 2½ per cent of the metal-using industry's capacity.

There is much to be said for a scheme that introduces some order of priorities into arms production, provided that the price of success is not a widespread interference with the expansion of defence production as a whole. The first orders placed for equipment may absorb capacity that could be better employed in making recently developed or more essential equipment. Competition between companies engaged in defence production for limited resources of labour, supplies and components is particularly apparent in the aircraft industry. The "super-priority" scheme is intended to speed up the rate at which new fighters and bombers are put into production; it covers all those aircraft ordered or about to be ordered in any quantity within the last year. It appears to involve nine aircraft production lines and six or seven engine lines. Conceivably it may be found that the physical resources at the disposal of the aircraft industry are insufficient to give "super-priority" to so many producers at the same time. Specialised sub-contracting capacity is limited. Recruitment of labour in some districts is almost at a standstill—though the further requirements for aircraft are now put no higher than 75,000 workers by early 1955. Deliveries of certain special machine tools are late; only about 10 per cent of those ordered have been delivered whereas about a quarter of the more general tools are in position. The Ministry has also taken an evident risk in giving the same "super-priority" rating to all the aircraft powered by the Rolls-Royce Avon engine. Production of axial flow engines is going through a difficult development period, and it will be a considerable feat if the production of Avon engines keeps in step with the output of the various airframes.

More ruthless classification of aircraft, giving perhaps a lower order of priority to some of the four Canberra lines, might have inspired greater confidence in the promise of this scheme to give results. In some other directions such determination has been shown. The proposal to give aircraft ammunition "super-priority" over all other types should end a bottleneck that has recently developed in ammunition supplies. Priority for radar equipment may have similar results. But this is a scheme that will need to be closely watched to ensure that it gives results and at minimum cost in terms of less-eligible defence equipment and exports.

* * *

South Africa's Budget

South Africa is not one of the countries that has led the sterling area into economic crisis. It has merely trotted along somewhere near the tail of the procession. In the budget that he presented on Wednesday Mr Havenga therefore felt it adequate to raise the Reserve Bank rate from 3½ to 4 per cent and to aim at a neat balance in his budget, by accelerating the collection of £12 million of income tax arrears and imposing £11 million of new taxes. The tax levied on industrial, commercial and base mining companies has been raised by 6d. in the £, that on diamond mines by 1s. in the £, and the rebate on personal income tax (equivalent to tax allowances here) has been lowered; excise duties on beer, cigarettes, soft drinks, sweets, films and domestic whisky have been raised and an increase in imports of whisky should increase the yield of customs duties. The only tax rebate goes to shareholders of private companies, which will now be taxed in the same way as public companies; the previous system of apportioning their earnings among shareholders (and thus levying some super tax as well as income tax on them) was a badly constructed device to cure a rush of ingenious tax-dodging during the war. It should have been ended long ago. The gold mines, which had expected some tax reliefs, will be disappointed with this budget. Mr Havenga chose to couch his usual references to the need for an increase in the dollar price of gold in the tones of a man impatiently urging on the inevitable instead of in those of an irritated special pleader. This probably represented a change in methods of diplomacy rather than in assumed prospects for success.

As had already been intimated, South Africa's imports are to be cut by about £70 million to £400 million this year. This will not necessarily lead to a serious increase in domestic inflationary pressure since much of the cut will fall upon textiles with which South Africa is now grossly overstocked. The main reason for the cut is that credit restrictions in Britain are likely to reduce the flow of capital with which the Union has hitherto bridged the persistent deficit in its post-war balance of payments. Earnings from wool exports are also likely to fall substantially, but this may be counteracted by increased exports of uranium (on which Mr Havenga sounded a soberly optimistic note) and, above all, of gold; three new gold mines are now in production, six more are expected to begin production in 1953 and thereafter production will start from two or three more each year. One corollary of the present situation is that this year's import cuts may fall more heavily on Britain than the United States, but another—and more important from a national point of view—is that a greater proportion of the Union's imports will be financed by gold and foreign exchange and less by sterling capital. In consequence, Britain may be able to earn more gold from South Africa this year even though it may sell less goods to it. To allow this gold to come to London at the time that it is most needed the Reserve Bank is making an immediate advance sale of £10 million of gold to the Bank of England against sterling. Present political tensions should not obscure the fact that the Malan Government is playing a notable part in the fight for sterling's recovery.

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.
Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA
(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

FRENCH RAILWAYS NEWS

POLL-AIDED COACH DESIGN

Modern methods ensure streamlined services

Realising that passengers are the best judges of rail services, French Railways organised in 1946, a passenger's quiz to find out the sort of things they liked. This inquiry revealed widespread preference for many features consequently incorporated in the French railway system since the war.

The coaches are roomy and temperature controlled, with comfortably upholstered seats. A special study concerned the ideal inclination of the back. All classes have head and elbow rests. Lightweight metal coaches with controlled ventilation give increased comfort and more coaches per train.

Electrical signalling and track switching devices have largely superseded the old manual methods, resulting in quicker and safer traffic handling. As the *Manchester Guardian* said in their January 15 issue—"Travel . . . is improving every year. Great progress has been made in building a new railway system from the ruins left by the war; and what is more they make a fetish of running trains to time."

THAT £25 LIMIT

Your railway fare does *not* reduce your currency allowance so you are not restricted by distance. And travel-wise folk can still have a modestly enjoyable holiday in France if they avoid the peak of the summer season or choose a place off the beaten track.

BUSINESS OPPORTUNITIES

The Continental trade fairs and exhibitions can help British enterprises seeking new contacts abroad. Business men should study the following calendar of principal events—all of which are well served, in whole or part, by French Railways, who offer special concessions to exhibitors and buyers. Details from French Railways Ltd., Freight Dept., Room 118, Victoria Station, London, S.W.1.

APRIL Milan Samples Fair—*April* 12–29. **Lyons Fair**—*April* 19–28. **Basle, Swiss Industries Fair**—*April* 19–29. **Turin Motor Show**—*April* 23–*May* 4. **MAY Bologna Exhibition of Electrical Appliances**—*May* 13–27. **Paris International Fair**—*May* 17–*June* 2. **Lucerne Photographic Exhibition**—*May* 15–*July* 31. **Frankfurt, Achema Chemical Exhibition**—*May* 18–25. **JUNE Milan Traffic and Safety Exhibition**—*June* 1–30. **Padua Samples Fair**—*June* 7–22. **Bordeaux Fair**—*June* 8–23. **Barcelona Samples Fair**—*June* 10–30 **Casabianca Fair**—*June* 14–20. **Lille Fair**—*June* 14–29. **Trieste Fair**—*June* 29–*July* 13.

Ever heard of Tweed Heads...

. . . a New South Wales town that grows pineapples? Perhaps not, but it is one of many comparatively unknown places which together form the Australian market. Tweed Heads has something particularly its own . . . other than a branch of the Commonwealth Bank, that is. Its social and economic conditions are individual. And so are those of all the other towns and cities throughout Australia which the Commonwealth Bank knows as intimately as it knows Tweed Heads. This detailed yet nationwide knowledge is essential to British business houses viewing the Australian market from 12,000 miles away. It can be easily obtained from our Financial Information Service at Australia House which will be glad to assist you in every possible way.

Chartered Accountants on Taxation

Of all the evidence submitted to the Royal Commission on Taxation, none is more clear and comprehensive than the memorandum of the Institute of Chartered Accountants. It provides a valuable exposition of the present system of taxation on individuals and companies and offers a well-argued series of submissions for desirable changes. It rejects on grounds of definition and of equity the proposition (which on the statement of the former Chancellor is within the ambit of the Royal Commission's terms of reference) that capital profits should be brought under tax. It reviews at length the rules governing deductions for expenses, drawing the familiar contrasts between the rules affecting Schedule D and Schedule E incomes and proposing reasonable alleviation in the latter case. The memorandum argues for a greater number of reduced rates of income tax to make the progression towards the standard rate more smooth—a point which the Chancellor has in some measure taken in his budget; it also claims that the level of income on which earned income relief is granted should be raised (the budget, by a mere arithmetical adjustment, has conceded this principle to the meagre extent of £25) and that surtax on earned income should be charged at a lower rate than on unearned income.

If the sections on rising price levels still exhibit great caution, they suggest at least some modification of emphasis compared with the Council's previously declared views. The memorandum summarises the suggestions that have been made, such as additional charges against profits to meet higher costs of replacement, and the revision of asset values to current price levels. It admits the need for some measure of relief from taxation of retained profits, but it also admits that in practice relief might have to be related to actual expenditure on fixed assets. This cannot be done, at present, through initial allowances, for the former Chancellor of the Exchequer killed the Tucker Committee proposals on this point almost as soon as they appeared; and there are many others apart from the Council who "would not urge the reintroduction of initial allowances"—particularly on the lines advocated in the Tucker report. Arguments on grounds of complexity are put forward against adjusting replacement allowances to current prices. The Council does, however, give its approval to the "renewals method" for replacement of fixed assets. This is already available to the taxpayer, and was formerly widely employed by railway companies in this country. It has its limitations in cases where plant is not renewed save at long intervals and then often enough by new equipment of a somewhat different character from the old. Whether this goes sufficiently far to satisfy those who argue for relief based on current replacement costs is questionable. But there will be general approval for the terse submission that "the profits tax should be abolished and at the same time all liability to the future withdrawal of non-distribution relief should be cancelled." Here, at any rate, all accountants and all industrialists will be in common accord.

February Trade

The trade figures for February show a fall in the value of exports of £22 million to £228 million, largely because of the shorter month; the daily rate of exports was more or less maintained at the January level. Imports, however, fell more sharply by £60 million on the month to £297 million, the lowest total recorded for a year. Re-exports rose by £2 million to £16 million, so that the excess of imports (valued c.i.f.) over total exports (valued f.o.b.) amounted to no more than £53 million, the lowest visible deficit for any month since the end of 1950.

So far as they go, the export figures for January and February are favourable; the total is £506 million or £100 million more than the first two months of last year. But these figures (as conceivably those for March will be when they appear) are as yet unaffected by cuts in imports imposed by Commonwealth countries. The metal-using industries again showed the biggest increase over a year ago, maintaining the high rate recorded in January. Exports of vehicles were £10 million larger than in February, 1951, though they were lower than in January; shipments of cars and chassis dropped from 37,926 in January to 29,216, and the decline was evenly spread over most markets. Machinery exports were £12 million larger than in February, 1951, and only slightly below the January level. Iron and steel manufactures were £14 million above the February total of last year. Textiles are still a black spot. Exports were £500,000 less than in February, 1951; the decline of £3 million in wool manufactures more than offsets the increases in cotton goods and other textiles. The most striking feature among re-exports was the shipment of 7,500 tons of Malayan rubber valued at £2 million to the United States; this shipment represents part of the sale of rubber from British stocks.

Smaller imports in February apparently show the first fruits of the Chancellor's cuts. Food imports show only a slight decline on the month, but they cost much more than a year ago, chiefly because of larger quantities of wheat and maize bought at higher prices. Raw material imports were £37 million smaller than in January and only £9 million larger than in February, 1951. Arrivals of coal, cotton, wool, hides and skins and rubber were all down on last year, reflecting both lower prices and smaller quantities.

* * *

Terms of Trade Improve

In February the terms of trade again moved in favour of this country. A favourable movement, which first appeared last summer, means that imports have become cheaper in relation to exports and it is on the continuation of this movement throughout the year that Mr Butler is counting so heavily in his policy for restoring the external balance of payments. In December and January it seemed for a time that such calculations might be too optimistic, for during those two months the terms of trade moved slightly against this country. The February figures revive the hope that the improvement may be more persistent.

The improvement in February was entirely due to the slight increase in export prices. The Board of Trade's index of export prices (1951 = 100), which had fallen back to 105 at the end of last year, rose to 106 in February. The lower prices for textiles were offset by higher prices for metals and engineering products and for other manufactures. Import prices have, in fact, remained steady since November, the slight rise in food prices at the end of 1951 being offset by reduced prices for raw materials and manufactured goods. Between January and February food prices remained unchanged, but raw materials increased slightly.

Buying Experience in Big Aircraft

Now that the Air Ministry has decided against using the Princess flying boats as troop transports, only the first of them is likely to be completed. The Minister of Supply announced in the House of Commons last week that all work on the second and third hulls, as well as on the second Brabazon airliner, has been suspended at an estimated saving of £2 million in the coming financial year. A report of the Comptroller and the Auditor General since published shows how expenditure on the two projects has increased since the end of the war. In 1944, when work started on the Brabazon airliner, the estimated cost of building two prototypes and their hangars and runways was put at £8 million. The final bill for the runways and buildings came to £6 million instead of the original figure of £3.4 million and by March, 1951, more than £4 million had been spent on building the aircraft. The total cost of completing the two Brabazons now would exceed £14 million. Three Princess flying boats were ordered in 1946 for the South American services at a combined cost then put at £2.8 million; four years later the estimate had risen to £10.8 million. If the five aircraft were ever to be completed their cost would exceed £25 million, of which much has already been spent.

Sir Frank Tribe's report does not cite any departmental explanation why estimated costs should have more than doubled in a few years; delays in completing the projects must account for much of the increase. Unexpected difficulties in developing the turbo-prop Proteus engines held up work on the airframes, but a sense of urgency needed to push these projects ahead seems to have been absent. Had there been a prospect of either the Brabazon or the Princess going into service on May 2nd instead of the de Havilland Comet, the airlines might have shown more interest in them. There is an ironic lesson in the fact that the second Brabazon will be stored in a corner of the huge Bristol hangar while work goes ahead in the assembly shops on the smaller and promising Britannia airliner. The first Princess flying boat will be completed and flown experimentally. The cost may be justified by the experience of designing, building, and gaining experience with big aircraft. But no one would deny that it has been heavy, and in the nature of the experiment difficult to control and too slow to give really valuable results.

* * *

The Latin American Market

The twenty republics of Latin America stand high on the list of the non-sterling countries where British trade lagged badly last year and where improvement this year must be both rapid and marked if British solvency is to be restored. Unfortunately, a great opportunity was missed last year when, despite high local spending generated by the 1950 commodity boom, the volume of British exports to Latin America was 10 per cent lower than in 1950, and thus only at about the same level as in 1949. British imports from Latin America, on the other hand, were 14 per cent higher by volume in 1951, and no less than 81 per cent higher by value than in 1949; in consequence Britain's adverse balance of trade with this area rose from £48 million in 1949 to £171 million in 1951.

The latest issue of the *Fortnightly Review* of the Bank of London and South America includes a valuable series of charts and statistics that illustrate the fluctuations of Latin American inflation and demand for imports. In the republics of the south, especially Argentina and Brazil, the prospect does not seem very bright. Some of these countries show high earnings of foreign exchange when commodity prices are at their peak, but they use this exchange for imports of capital goods for their industrialisation programmes; British textiles may have lost much of their old market here for ever. When commodity prices turn downwards, these countries resort to more and more stringent import controls; these in turn reduce customs receipts, drive the local budgets into deficit, and add fuel to the fires of inflation, further restrictions and, eventually, currency depreciation. The best prospect for British exporters, as the Bank of London's chairman, Mr Francis Glyn, pointed out recently, may lie in the markets to the north of the sub-continent. In Venezuela, Ecuador, El Salvador, Guatemala and Nicaragua there is no exchange control worthy of mention—but in some of these countries (and also in Colombia, which does prohibit imports of some consumer goods) retail shelves are now full and demand shows signs of flagging.

Any new British export drive to these markets must therefore be both determined and selective. It must recognise, as Mr Glyn pointed out, that Latin American import requirements "are changing more and more from the consumption goods of the past to industrial and agricultural machinery, transport equipment, and many other types of heavy capital goods, chemical and fuel." At the moment British goods are competitive in price with American goods in these markets—though not necessarily with those of Japan and of a Western Germany whose exports to Latin America have been increasing by leaps and bounds. "But in sales technique, knowledge of the market, servicing, supply of spares, adapting designs and materials to the needs of the market, eagerness to sell and delivery dates," reported Mr Glyn, "we are continually being told that we are behind the United States." These easy-going failings are at once the fruit of six years of domestic and sterling area sellers' markets, and one of the explanations of recurrent crisis.

* * *

Long-term Contract for Tin

The United States has signed a three-year contract with Indonesia for 18,000 tons of tin a year. This agreement may mark an important move in American commercial policy. For the first two years the price has been fixed at $1.18 a lb (equivalent to £965 a ton in London) which is the same as that agreed with Britain for the recent bulk sale of 20,000 tons. The price for the third year will be negotiated later. The contract contains the usual undertaking that if the United States agrees to pay a higher price to any other supplier before next March the Indonesian price will be adjusted accordingly. Indonesia has the option to offer a further 2,000 tons of tin a year at the agreed price.

This agreement will no doubt encourage all those who believe that the sterling area's dollar troubles can be cured if the United States can be persuaded to buy the primary materials it uses regularly and over a period of years. In the past a long-term contract in American terms meant an agreement for twelve months. In international conferences American delegates often argued that it was politically difficult to commit the United States for any longer period. That attitude will now presumably be discarded and conceivably the United States will come to play a leading role in international conferences for those commodities which it buys, in the same way that it has always co-operated in conferences concerned with the commodities that it sells.

The new tin agreement means that the United States has contracted to buy this year nearly a quarter of the world's output at $1.18 a lb.—20,000 tons of Malayan tin from the United Kingdom and 18,000 tons from Indonesia. This price should thus set a floor to the tin market for the next two years, and give producers confidence to maintain and even expand output. Prices in the London market, which since the beginning of the year have been nearer £1,000 a ton than £950, dropped this week to £961 a ton, which is in fact a little below the equivalent of $1.18 a lb in the Far East.

Contrasts in Copper and Lead

The allocations of copper for the second quarter made by the International Materials Conference are to be cut. World production has not increased as expected and the quotas for the first quarter proved to be too generous. A coal shortage is recurring in Rhodesia and the output at Mufulira is "considerably below normal." These reports will no doubt put an end to the belief, hitherto based on America's smaller requirements for defence, that the copper shortage is passing. In fact, copper, nickel and molybdenum remain the scarcest of non-ferrous metals.

Lead provides a sharp contrast. Supplies in the United States and Britain are ample and both countries have now formally ended restrictions on use. British consumption has been so low that, following the sale of 30,000 tons to America in February, another 23,000 tons have been sold during the past fortnight. Together, these two parcels of lead will earn $22 million and bring the total sum realised from sales of tin, rubber and lead to about $100 million. By the end of January, stocks of lead held by the Ministry of Materials increased to over 68,000 tons. Part of the increase was due to abnormally large imports under contracts placed by the Ministry during the worst period of the shortage last year—and these shipments will continue for a time. On the other hand, consumption in January was only 11,800 tons, compared with 16,300 tons twelve months earlier and a monthly average of 13,600 tons over the whole of last year. February consumption was also small and manufacturers may have been delaying purchases in the hope that the Ministry might reduce its price.

The Ministry has now done this. Two days after the announcement about the sale of lead to the United States it reduced its selling price from £170 to £163 a ton, which, incidentally, is still above the current continental level of £155 a ton. World prices of lead have been falling for some time, but the Ministry's price has not kept pace, and already British manufacturers are finding themselves at a disadvantage with continental competitors.

* * *

Higher Bank Salaries

The big clearing banks have now completed the long-expected revisions of their salary scales. Up to now the young bank clerk of 16 or 17 has received a basic salary of between £135 and £150 a year; this has risen to between £475 and £500 a year at the age of 32, with increases thereafter related to the degree of responsibility assumed. In addition, the banks have paid a cost of living bonus, which seems to have been rising sufficiently fast in the last three years to effect some increase in his real income—compared with 1946, though not with 1938. By the end of last year this bonus amounted to 27½ per cent of basic salary. The method of salary revision now chosen by most of the banks has been to consolidate 17½ per cent of this bonus into basic salaries, and to add a bit of "sugar" besides. The average bank clerk can now expect a salary of £170 a year at 16, and (in the case of male clerks) of £600 at 32, plus a variable cost of living bonus now at 10 per cent of this new salary. Pensions and "large town allowances" have also been increased (London allowances are up to about £50 a year), but the advantages of the new scale seem to taper off slightly for those in the higher executive posts.

The exception to this general pattern is Lloyds Bank, which announced at the end of last year that it was pioneering a new method of salary incentives. Its new salary scale for male clerks goes from £150 at 16 to £650 at 39, plus a variable cost of living bonus now at 25 per cent of basic salary; when pensions contributions are taken into account, this is not very different from the new scale of remuneration in the other banks. But the distinctive feature of the Lloyds scheme is that clerks who have been with the bank for three years, who are aged 24 or over, and who are regarded as potential managers, will be elevated to one or other of two higher grades, one of which reaches £600 a year at the age of 28 and the other at 31. These scales are better than many university graduates can expect in teaching and some other professions, and they seem to be clearly designed to attract university men into banking. With a higher proportion of the best type of secondary school pupils—from whom the banks used to recruit in the past—going on to university, and with banking becoming an ever more complex business, this is clearly a desirable trend for the future. It remains to be seen how it, and the method of salary revisions chosen by the other banks (where promotion, of course, also depends upon merit), will fit in with the staffing traditions of the past.

* * *

Safety of Welded Ships

Two of the advantages of welding in shipbuilding are to make full use of prefabrication and to speed up output. These arguments justified the extensive resort to welded construction for the vast shipbuilding programme of the United States during the war. The policy was justified by urgency, but it carried risks. Welded shipbuilding had not been fully developed, and large numbers of part-skilled workers had to be recruited. As early as 1943 several welded ships fractured, some in port and others in fair weather conditions. The American Bureau of Shipping immediately investigated these defects and steps were taken to remedy them in all vessels in service. In June, 1943, the Admiralty Ship Welding Committee was set up on this side of the Atlantic. It was found that defects might be caused by unsound workmanship, unsuitable steel, or possibly by the injudicious distribution of cargo and ballast in the ship, and steps were taken to avoid these risks. Lloyd's Register rules for welded ship construction govern the materials used and the standard of workmanship in welding and also in fabrication and assembly. In addition, guidance is given to shipowners on the most suitable methods of loading to minimise longitudinal hull stresses in severe weather.

The structural failures which occurred during the heavy winter weather experienced in February naturally aroused some anxiety about the reliability of welded ships, particularly as so many shipyards since the war have been completely reorganised and re-equipped for welding. Lloyd's Register of Shipping, therefore, has issued a statement asserting its complete agreement with the findings of the Admiralty Ship Welding committee that "welding as a process for building ships has been entirely vindicated" and that "given sound design, good workmanship and tough steel, the reliability of welded ships is beyond question." It points out that the recent failures occurred entirely among war-built ships, and the few failures must be related to the large number of more than 3,000 ships in this class. No major failures have occurred so far in welded ships built since the end of the war. Marine underwriters, it is fair to note, have shown no discrimination against welded ships, and treat a claim through failure of a welded structure in the same way as any casualty through stranding, fire or the like. Individual shipowners may have their own views as to the relative merits of welding and riveting, but these views are formed after consideration of cargo carrying capacity, speed, cost of building and repair, fuel consumption, and other operating factors. Questions of safety and durability can safely be left to the experts in the classification societies.

Shorter Note

The production of cars in January reached only 36,270 vehicles, 3,000 fewer than in December. Weekly output averaged 9,070 cars, a reduction of 350 a week on the average for the last quarter of 1951. Production of commercial vehicles was also slightly lower than in December, but output of tractors rose from 9,837 to 10,727. The output of the industry was running at a much lower rate than in January, 1951, but in each case exports were higher than they were a year ago.

Company Notes

A. W. Gamage.—Not many retail stores scraped through last year's recession in prices—a recession that put no brake on the increase in wages and other costs—without reporting a fall in trading profits. Gamages belong to the unhappy majority. Its profits fell from £362,964 to £311,532, despite an increase in the monetary value of turnover; the board reports that a fall in prices in the last few months of the financial year compelled the company "to write substantial amounts" off the value of certain stocks. The ordinary dividend has been maintained at 25 per cent, but shareholders will have to wait a full year—a year certainly not free from anxiety—for their next dividend cheque. The chairman, Mr. E. M. Gamage, has announced that the company will not pay any interim dividends in the future, on the extraordinary argument that as "very few members hold more than a relatively small amount of stock, the directors feel that the work and cost involved in paying an interim dividend is really not worth while." If this explanation were carried to its logical conclusion, it would seem that the board considers that the greater the number of capital owners, the less their convenience should be studied.

	Years to January 31, 1951	1952
Earnings :—	£	£
Trading profit	362,964	311,532

Revenue reserves	500,000	500,000
Ordinary capital		

10s. ordinary stock at 23s. 9d. xd yields £10 10s. per cent.

The company has been able to plough back only a small proportion of the year's earnings, and the increase in the book value of stocks from £492,776 to £526,490 and in debtors from £209,348 to £244,092, amply explains the fall in cash balances from £484,117 to £403,451. Costs are still rising and customers are still refusing to pay the high prices charged on certain goods. This year's risks may not be altogether discounted in the yield of 10½ per cent that the 10s. ordinary shares offer at a price of 23s. 9d. xd.

★

Ford Motor.—Last year the Ford Motor company—in common with the rest of the motor industry—had to contend with shortages of sheet steel and other raw materials and with growing consumer resistance abroad; it had also to grapple with the problems arising from changes in factory layout and the introduction of new models. In view of this, the chairman warned shareholders at the general meeting last May that the high level of profits earned in 1950 was unlikely to be repeated in the year to December 31, 1951. In the event, however, profits before tax and depreciation (but after allowing for special credits and debits) show only a slight fall, from £11,410,000 to £10,995,000. Taxation takes £5,460,000 (against £4,730,000) but this increase is counterbalanced by reductions in pension fund allowances and in the provision for depreciation. A detailed survey of fixed assets has shown that the accumulated provision for depreciation is £2,512,000 higher than was considered necessary, and this amount has therefore been transferred to a fixed assets replacement reserve. Together with the massive appropriation of £2,750,000 against £2,000,000) from profits, this transfer brought the amount held in the replacement reserve at the end of the year to £11,806,000.

The result of all this is that that group net profits, after allowing for all charges, including taxation, have actually risen, from £3,774,000 to £3,985,000. The directors have therefore felt able to raise the ordinary dividend for the second year in succession, this time from 12½ to 15 per cent. At the current price of 43s. 6d. xd. the £1 ordinary shares yield 6.9 per cent.

★

United Sua Betong.—When they announced an interim dividend of 20 per cent last October, the directors of United Sua Betong were able to report that they had already sold a good two thirds of the current year's crop at the high average price of 3s. 10d. a lb. They, therefore, felt able to forecast an increase in profits over the 1950 level despite a fall in output, caused by attacks or threatened attacks by bandits, and despite an increase of 100 per cent in f.o.b. costs (including the Malayan export duty). The results now published show that profits, before tax and the export duty, have in fact risen from £1,626,193 to £1,932,282, but that once the export duty of £401,696 (against £143,381) has been paid and once £912,374 (against £833,095) has been put aside for British and Malayan taxes, net profits have fallen from £649,717 to £618,212. Distributable earnings have fallen even more sharply as £250,000 has been earmarked for replacement reserves and another £56,311 has been written off the company's holdings of government securities. Nevertheless, the year's total distribution on equity capital has been left unchanged at 50 per cent, and £100,000 (against £425,000) has been added to general reserve.

	Years to December 31, 1950	1951
Earnings :—	£	£
Profit before tax	1,626,193	1,932,282
Malayan export duty	143,381	401,696
Taxation	833,095	912,374
Earnings for ordinary stock	*649,717*	*311,901*
Ordinary dividends	236,250	236,250
Ordinary dividends (per cent)	50	50
Replacement revenue	—	250,000
General reserve	425,000	100,000
Added to carry forward	*Dr. 11,533*	*Dr. 24,349*

£1 ordinary stock at 42s. 6d. yields £23 10s. per cent.

The directors of United Sua Betong tend to be more cautious about dividend payments than the boards of many other rubber companies. But as gross profits are threatened by the fall in rubber prices and distributable earnings by the excess profits levy, there are good reasons for conservatism this time. The market is clearly not optimistic about future prospects for the £1 ordinary shares, at the current price of 42s. 6d. give the very high yield of 23½ per cent.

★

Cammell Laird.—The increase in the ordinary dividend of Cammell Laird from 12 to 14 per cent is clearly justified by the advance in trading profits from £661,058 to £888,317; the latter figure includes some profit on work in progress. After providing £777,000 (against £566,000) and £60,000 for stock depreciation, net profits have fallen slightly, from £465,299 to 463,550. The directors have appropriated £200,000 (against £250,000) to general reserves which have also been fortified by £200,000 previously over-provided for taxation and now written back. In the year the company's capital reserve has increased by £5,840,884, representing the surplus of £6,008,008 on the transfer of the company's holdings in English Steel to the Iron and Steel Corporation less a loss of £167,124 on the sale of government securities. Shareholders can now concentrate their interest on the prospect of a return of the holding in English Steel. At the current price of 10s. 9d. the 5s. stock units yield 6½ per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended March 22, 1952, total ordinary revenue was £70,001,000, against ordinary expenditure of £69,925,000 and issues to sinking funds £280,000. Thus, including sinking fund allocations of £26,962,000, the surplus accrued since April 1, 1951, is £444,453,000 compared with a surplus of £757,122,000 for the corresponding period of the previous year.

COMPANY MEETINGS

ASSOCIATED PAPER MILLS, LIMITED

FACTORS CONTRIBUTING TO SATISFACTORY RESULTS

DEMAND CONTINUES TO EXCEED SUPPLY

MR L. W. FARROW ON NEED FOR CONSERVATION OF RESOURCES

The thirtieth annual general meeting of The Associated Paper Mills, Limited, was held on March 21st at Winchester House, Old Broad Street, London, E.C.2, Mr L. W. Farrow, CBE (the chairman), presiding.

Mr Barrington C. Gain (deputy chairman and secretary) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended September 29, 1951:—

I am pleased to be able to put before you trading results which I think you will agree are very satisfactory.

The greatly increased profits have been made possible by a variety of reasons, one of them being an exceptional one—namely, that selling prices have had to be raised several times to meet the greatly increased prices of raw materials and each time this has occurred a certain amount of profit, additional to the normal percentage, has accrued to the company on paper made from stocks of raw materials bought at lower prices.

The question of the stocks of raw materials to be held and the contracts to be entered into for future supply is one that has occupied the constant attention of your directors and managers throughout this period, bearing in mind, as I said last year, that your board felt there was bound to come a time when there would be a steep and sudden drop in raw material prices. During the past year we have, I think, maintained a satisfactory balance between the dangers of being committed too far ahead and on the other hand of not always having sufficient raw material on hand to keep the mills supplied.

I have mentioned above one exceptional cause of the increased profits and I do not want you to infer from this that your directors consider there is any reason why the company should not continue to make a satisfactory profit when more normal conditions return.

Improved efficiency of the mills consequent upon plant improvements and the carrying out of much overdue repair work has been another contributory factor to the trading results. Continuous research and experiment has led to the commercial development of a number of new and profitable lines. The demand for all types of paper, particularly of board for packaging, has again been much in excess of that available.

RAW MATERIAL PRICES

The prices of our principal raw materials during the latter part of the year reached levels which were the highest on record. However, the Government have recently fixed ceiling prices for the purchase of woodpulp from abroad, which are approximately 25 per cent lower than the peak prices to which I have referred.

We managed to get through the year to September 29, 1951, without any stoppages due to lack of coal or power cuts and have taken steps to improve our power generating units at certain of the mills.

As you will see, the group had capital commitments at September 29, 1951, for some £84,000. About £80,000 of this is for new plant and when we receive this and instal it a further improvement in efficiency should result.

During the year a general wage increase has been granted to all workpeople together with the right from 1952 onwards to six additional days' holiday per annum with pay, making twelve in all. The workpeople have agreed to make up the production time which would otherwise have been lost by these six additional days' holiday.

It has for some time past been your company's practice to grant pensions to those (both staff and workpeople) retiring from companies in the group after long service, each case being considered as and when it arose. The directors have now decided to institute pension schemes for the staff and workpeople on a regular basis, that is, everyone who is now in or later enters the company's employment will know that they are entitled to a pension on a basis laid down if they are still in the company's service at retirement age and qualify by the requisite number of years of service. Negotiations in connection with the schemes with the Inland Revenue are well advanced, and it is hoped that we shall be able to commence them as from April 1, 1952.

You will doubtless have observed that we have transferred £50,000 to pensions reserve out of the 1950-51 profits.

THE YEAR'S RESULTS

If you will turn to the consolidated profit and loss account you will see that the trading profit of the group, after providing for depreciation, is £800,537 higher, at £1,128,228 than for the year to September 30, 1950, and that the net profit (before taxation) is £799,318 higher, at £1,105,341.

Out of this sum we have to provide £591,346 for our sleeping partner, the Inland Revenue, and £18,874 to spread the income tax on initial allowances over the appropriate years. This makes the total tax charge £610,220 (against £161,618 for 1949-50), representing over 55 per cent of the net profits.

The present inflated prices make it necessary for more capital to be retained in the business, and we have accordingly increased the sum transferred to general reserve from £25,000 in 1949-50 to £100,000 for the past year.

We have transferred to contingencies reserve no less a sum than £250,000, against £50,000 the year before, bringing the total of this reserve up to £480,000. This is available to meet any contingencies, but in making the large transfer this year the directors had particularly in mind the likelihood of substantial losses arising from falls in raw material prices. The reserve should be adequate to meet these.

I have already referred above to the transfer of £50,000 to pensions reserve. Your directors feel that the inauguration of these pension schemes should do much to ensure the continuance of the happy relations with the staff and workpeople which have subsisted for many years past.

To the other two items under this heading—namely, amount written off goodwill and the increase in the profits balance carried forward, I do not think I need refer in detail. The way in which these have been shown in the accounts this year has been altered so that it can easily be seen, without any calculations, how much out of the year's profit has been (*a*) provided for taxation, (*b*) retained in the business, and (*c*) provided for dividends.

You will observe that the directors recommend a final dividend which will make the total ordinary dividend the same as for the previous year—namely, 25 per cent. They recommend, in addition, a bonus dividend of 7½ per cent, making a total distribution on the ordinary shares for the year of 32½ per cent.

INFLATIONARY EFFECT OF TAXATION

I have no doubt that many shareholders will feel that, having regard to the amount of the profits, the directors might well have been more generous in their recommendations, so I will mention one or two of the reasons which have led to this decision.

Taxation, in addition to taking its irreducible minimum, penalises the payment of ordinary dividends very heavily, as the profits available for them have to bear in effect not only the additional 40 per cent profits tax on ordinary distributions, but also that on the preference dividends. Thus any increase in the ordinary dividend entails providing a further 40 per cent of such increase for additional profits tax. This taxation aspect makes the raising of additional capital unduly costly, as prospective investors naturally look to the return on their money they can expect after the payment of profits tax. Therefore, it becomes all the more necessary to retain profits in the business to enable it to have the capital which has become so costly to obtain from outside sources. This capital has to be obtained, not for expansion, but, under existing circumstances, to maintain the buildings, plant and machinery and to carry the stocks and debtors with which the company earns its profits, and to maintain the necessary liquidity to carry on the business. Furthermore, at the time the directors made their decision as to the dividends to recommend they knew that there was to be an excess profits tax, but they had no information as to what the rate of this will be nor on what basis any "excess profits" are to be computed—that is, what year or years will be taken as a standard.

So it comes to this, that in order to pay on a prudent basis £78,000 in dividends to the shareholders, it has been necessary to earn £1,105,000 profits and I venture to suggest to you that this provides a very positive example of the inflationary effect of taxation at the rate it stands today.

In the face of these figures and my remarks above, I cannot but feel that, in the case of your company anyway, exhortations to be moderate in the declaration of dividends are unnecessary.

I give below the table which I have included in my statements in past years showing how the profits for the year to September 29, 1951, as compared with those for 1938-39 and 1949-50, have been dealt with, taking the total net profits before taxation as equivalent to 100 per cent.

	1938-39 %	1949-50 %	1950-51 %
Taxation	39.6	52.8	55.2
Retained in business	22.8	25.5	37.7
Dividends to shareholders (net) ...	37.6	21.7	7.1
	100.0	100.0	100.0

STRONG FINANCIAL POSITION

From the consolidated balance-sheet you will see that the financial position of the group continues to be strong. Current assets at £2,071,708 exceed current liabilities by over £1,517,000 as compared with an excess of £767,000 at September 30, 1950, but provision for future taxation has increased from £143,000 to £531,000.

Current assets include an amount of £21,488 which is on deposit with solicitors pending the completion of the purchase of certain leasehold reversions and water rights pertaining to the mill of our subsidiary company, Cooke and Nuttall, Ltd., at Horwich in Lancashire.

The increase in the value of stock and debtors is again mainly accounted for by the higher prices prevailing. This increase amounts to £691,000 as compared with September 30, 1950, and to £965,000 as compared with October 1, 1949, and emphasises what I have said above as to the necessity for retaining substantial profits in the business.

THE CURRENT YEAR

With regard to the results for the current year, the profits for the first four months to January 31, 1952, are in excess of those for the corresponding period of the previous year. A form of rationing by reference to money values of certain raw materials which have to be purchased abroad has been introduced recently by the Government. The fixing of ceiling prices for woodpulp, which are below the peak prices which were in force when the form of rationing was introduced, should enable more of that material to be purchased. It is too early to say what the effect of these changes will be. While I think it unlikely that profits on the same scale as for the past year will be earned, I look forward to another successful year.

Once again it is my pleasant task to express the thanks of the directors, and I am sure of the shareholders also, to the managers, staff and workpeople of the whole group for their continued loyalty and hard work during the past year.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said: We have asked our accountants to make an estimate of the standard to which we will be entitled for the purpose of the new Excess Profits Levy. This estimate must of necessity be a very approximate figure in view of the meagre details given in the Government White Paper. Fortunately your company is quite well placed, as it can continue to pay the same dividend and bonus as it has paid for the past financial year of the company and have a moderate balance to place to reserve, provided of course your company earns profits at least equal to the standard to which I have referred.

I am pleased to inform you that the profits for the first five months of your company's financial year have already exceeded the standard.

The report and accounts were adopted and the final dividend of 15 per cent and bonus of 7½ per cent, making 32½ per cent for the year, was approved.

The retiring directors, The Rt Hon Viscount Margesson, PC, MC, and Mr A. P. Jackson, were re-elected, and the remuneration of the auditors, Messrs J. B. Boyd Wrigley and Company, having been fixed, the proceedings terminated.

THE STANDARD LIFE ASSURANCE COMPANY

SUBSTANTIAL PROGRESS

MR G. P. S. MACPHERSON'S ADDRESS

The one hundred and twenty-sixth annual general meeting of The Standard Life Assurance Company was held in Edinburgh on March 25th with Mr G. P. S. Macpherson, OBE, TD, CA, in the chair.

The general manager and actuary having read the auditor's report, the chairman said:

REDUCTION IN EXPENSE RATIO

I think you will agree that the report and accounts now before you present an encouraging picture. Our premium income is shown in the revenue account to be £12,895,000, representing an increase of £1,638,000 over the previous year. This increase has resulted in a reduction of our expense ratio from 9.6 per cent to 9.3 per cent, the lowest expense ratio in the history of the company. During the last war our expense ratio fell to 9.5 per cent, but at that time new business was practically at a standstill and many of our staff were absent on National Service; to have worked on as low a ratio last year as 9.3 per cent is therefore a real achievement.

Our interest income, amounting to £3,466,000 represents a net rate of interest earned on the funds of £4 0s. 4d. per cent, an increase of 3s. per cent over the rate earned in the previous year. This is more than double the very stringent rate of 2 per cent which we adopted some years ago for the valuation of our assurance liabilities, so that the margin between the rate assumed and the rate actually earned is very substantial.

ASSETS OVER £98 MILLION

From the balance sheet you will see that our total assets, at over £98 million, show an increase of more than £11 million over the previous year's total. Despite the severe depreciation which took place in investment values last year, which could not but affect the company's portfolio in some degree, the value of the assets as at November 15th last exceeded in the aggregate the amount stated in the balance sheet.

RECORD NEW BUSINESS

You will also see from the report that the new life assurance business written last year amounted to £28,851,000, a figure which, for the sixth successive year, constitutes a record in the history of the company. Included in this total is a sum of £12,454,000 representing group life assurances. For many years past, as you know, the company has made a feature of pension business and our new pension business last year, namely £6,336,000 per annum, also constitutes a record. The increase in new business has been contributed to not only by our home branches, but by each one of the countries in which we operate overseas.

The increase at home is particularly satisfactory for two reasons. In the first place, in the difficult economic circumstances of these days, it is vitally important to the nation that savings should be increased, and premiums paid to life assurance companies represent savings by the community. Secondly, this increased business has been written in spite of some uncertainty surrounding the taxation position of policies effected by self-employed people who wish to make provision for benefits on retirement. I hope that before long the Millard Tucker Committee which has been set up by the Government will issue its recommendations and that, as a result, facilities for the provision of pensions will be extended to a wider section of the public. To those in salaried employment the same uncertainty does not apply and I would recommend anyone interested to ask for a copy of the company's leaflet entitled "Pension Arrangements for Directors and Senior Executives." This leaflet has proved of great service to many.

OVERSEAS

In Canada the company continues to give the service traditionally expected of the Standard, and its business continues to increase. By reason of the rapid growth of its premium income and of the large funds of which it therefore disposes in Canada, the company's importance as a financial institution in that country is steadily growing. We are much indebted to our Canadian Board and staff for the care and skill which they devote to our Canadian investments. It is now widely realised that mineral deposits of great size and importance are in course of development in Canada which will greatly enrich the country and progressively improve the balance of its economy. It is our intention steadily to expand our business there and to open up, as soon as practicable, additional branch offices so that we may take our part in the country's economic development.

The striking increase in our West Indies business achieved during recent years was more than maintained last year. Our house mortgage business in the West Indies has developed under the careful supervision of our local board there, and we believe provides a valuable service to the community. We have been glad to note the recent moves for industrial development in Jamaica, and to take some financial interest in particular projects.

You will also be interested to know that our branch in Uruguay, although the smallest of our active overseas organisations, is at present showing a rate of progress which is not exceeded by any other branch.

STRONG AGENCY CONNECTION

The new business results at home and overseas afford proof once more of the strong agency connection which has been built up over the years, and we gladly acknowledge the loyal support which we continue to receive from our agents. These agents are served by members of our own outdoor staff, who are experts in the intricacies of present-day assurance and pension business, and our outdoor staff in their turn are supported by a hard-working and efficient indoor staff, from whom also great skill and up to date specialised knowledge are required. I take the opportunity of thanking, on behalf of the directors, all members of the staff at home and abroad for the efficiency with which they discharge the responsibility which the community's confidence places upon them and for maintaining so well the Standard's tradition of service; and I congratulate our general manager on the results of his first year in office.

NEXT BONUS DECLARATION

The year upon which we have entered will end another triennium for the company, and the next declaration of bonus will fall to be made as at November 15, 1952. Much will

depend, of course, on economic and other developments during the year, and with so many uncertainties I decline to prophesy; but I would remind you that my predecessor stated last year that, despite our growth in a short span of years to one of the largest assurance companies in the kingdom, we had not outgrown our strength and we had never been in a more favourable position to serve the public.

I now move the formal adoption of the report, revenue accounts and balance sheet submitted.

Mr Kenneth W. Deacon, FCA, in seconding this motion, said:—

My Lord, Ladies and Gentlemen,—The statement which we have just heard from our chairman and the figures which are now in our hands should be a cause of pride and satisfaction to all the members of this company. As well as being a member of the company I am, myself, one of the agents to whom the chairman referred. I pursue my professional activities in a thriving Midland industrial city where all life offices are represented; needless to say, as one who is in a position to influence business, I have been approached by the majority of them. I am well content with the Standard, its record, its service and the proud position it holds.

I have much pleasure in seconding the adoption of the report and accounts for the past year.

The report and accounts were adopted.

SCOTTISH AMICABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

MR HOWARD CUNNINGHAM'S SPEECH

The one hundred and twenty-sixth annual general meeting of the Scottish Amicable Life Assurance Society was held in Glasgow on Wednesday, March 26th, Sir Lynden Macassey, KBE, QC (president of the society), presiding.

In moving the adoption of the report and accounts, Mr Howard Cunningham, MC, CBE (chairman of the ordinary board of directors), said that it had been a remarkable feature of recent years that, while other forms of saving had displayed disappointing trends, the volume of new life assurance had shown continued expansion. Life assurance now represented the principal channel of personal saving in this country and contributed a substantial element of stability to the national economy. Thus, in the case of the Society, the net new sums assured amounted last year to more than £10 million, as compared with rather less than £3,500,000 in 1946. The effect of this rapidly increasing new business during the past five years was reflected in the total annual premium revenue which amounted to almost £3,500,000 in 1951—the comparable figure for 1946 being approximately £1,250,000. Each of these figures had reached a new record last year—a comment that applied equally to "ordinary" life assurance business and to "group" pensions and life assurance business which now represented a very important part of the Society's activities.

Although the total amount paid by way of death claims during 1951 was 25 per cent greater than in the previous year, the incidence of these claims was such that once again the mortality experience had proved very favourable. The upward trend of expenses had, however, continued during 1951.

INCREASED INTEREST YIELDS

During the past year there had been a considerable rise in the market rate of interest and a substantial fall in the market value of all fixed interest securities. To the Society, with a fund increasing at a rate of more than ten per cent per annum—the increase last year amounted for the first time to more than £3 million—the opportunity to invest this large annual increment of new money on favourable terms was clearly beneficial, despite the consequent depreciation in the current market value of existing investments. By reason of the higher rate of interest now obtainable on new investments and of the wider spread of investments made in recent years, the gross rate of interest earned on the Society's funds during 1951 rose to £4 16s. 2d. per cent, as compared with £4 8s. 5d. per cent in 1950. The depreciation in the market value of existing investments had been covered by inner depreciation reserves and had not necessitated any change in the balance sheet valuation of the assets as a whole.

At this early stage in a new quinquennium it was not possible to make any useful assessment of bonus prospects, but, as already indicated, the effects of increased interest yields were fundamentally favourable. A new form of "Double Bonus Policy" had recently been introduced which offered two units of profit-sharing for each unit of basic assurance to any member who wished to avail himself of this opportunity to double his participation in the Society's bonus prospects. This offer was open not only to new members but also to existing participating members of the Society whose policies might, in most cases, be converted to the new "Double Bonus" system at an appropriately increased premium.

The report and accounts were adopted.

JEREMIAH ROTHERHAM AND COMPANY, LIMITED

SOUND POSITION

The fifty-fourth annual general meeting of this company was held on March 26th in London, Mr Joseph Hockley (chairman and managing director) presiding.

The following is an extract from the chairman's circulated statement:—

Although the trading for the first half year to July 15, 1951, resulted in a satisfactory increase both in sales and profit, the autumn half year, however, was somewhat disappointing. The announcement in the press of falling prices, and exhorting the public to withhold buying, practically caused a cessation of business both in the wholesale and retail trades.

Taking this into consideration and the adjustment of certain stocks which had to be made to meet the lower values, the result which we now place before you may not be considered unsatisfactory.

The financial position of the company is still very sound, the excess of current assets over current liabilities amounts to £585,685.

After crediting interest on investments, and an excess provision of taxation, and providing for profits tax and income tax on the current year's profit amounting to £52,809, there remains a balance of £29,786, adding to this amount the balance brought forward from last year, viz., £70,631, gives an available total of £100,417, which we recommend be applied as under: To a dividend of 6 per cent and a bonus of 2½ per cent, making 8½ per cent for the year, less income tax.

With regard to future prospects, it is impossible to make any forecast whilst the present condition of affairs remains.

SCOTTISH MUTUAL ASSURANCE SOCIETY

NEW BUSINESS AGAIN A RECORD

The sixty-ninth annual general meeting of the Scottish Mutual Assurance Society, Limited, was held on March 26th in Glasgow.

Mr David T. C. Sloan, who presided, said: Sir John Craig, chairman of the society, is at present in New Zealand and greatly regrets that he is unable to be present today. In his absence it is my privilege to preside at this meeting.

As you are aware an extraordinary general meeting of the society was held last month to approve the draft bill which is being submitted to Parliament to make the society completely mutual. We hope that all the necessary legal processes will have been completed by the early summer. Almost the only outward sign of the change will be the dropping of the word "Limited" from our name but the administration will be much simplified and the members of the society will be the policyholders instead of the shareholders.

Once again we have to congratulate our field staff on a record amount of new business and to thank our broker friends and agents up and down the country for their continued support. The net ordinary life business was nearly 8 per cent higher than in the previous year, which was itself a record. Unfortunately the group business shows a fall, but we look forward to better results in this class of business this year.

THE ACCOUNTS

The net premium income has increased by the record figure of £131,941 and exceeds £1 million for the first time. Gross interest exceeds £500,000 for the first time and gross rate earned on the funds is up from £4 9s. 10d. per cent to £4 16s. 10d. per cent, an increase of 7s. per cent. This is accounted for partly by the fact that our funds were more fully invested during the year and partly by increased dividends received on our holdings of ordinary shares. The net rate of interest is up from £3 9s. 10d. per cent to £3 18s. 2d. per cent, an increase of 8s. 4d. per cent, the higher increase in the net rate than in the gross rate being mainly due to the increase in expenses of management.

On the outgo side, claims by death are up by £15,155 but are still well within the amount expected by the mortality table used in the valuation. Sums payable on maturity are down by £16,502. Sums paid on surrender are up by nearly £15,000 and are at the highest figure for many years. This is a most disappointing feature but it is largely beyond our control.

The life assurance fund has increased by £488,926 exceeding the record increase of the previous year by over 10 per cent.

The balance sheet is in much the same form as last year, but following on the calls on the shares made in January, 1951, on the advice of counsel as a first step in the procedure for mutualisation the issued capital is now £100,000 in 100,000 shares of £1 each fully paid. Going back to the profit and loss account, you will see that as a result of the increase in capital, the amount of the net dividend is increased from £688 to £2,625 but of this amount only the trivial balance of £4 3s. is paid to outside shareholders.

I now formerly move the adoption of the report and accounts with a declaration of the usual dividend of 5 per cent on the paid-up capital.

THE SCOTTISH LIFE ASSURANCE COMPANY

ANOTHER YEAR OF CONTINUED PROGRESS

RECORD NEW BUSINESS

Mr Charles R. Munro, CA, Chairman of the board, presided at the annual meeting of the Scottish Life Assurance Company, Limited, held in Edinburgh on March 26th.

In moving the adoption of the report and accounts for the year 1951, the chairman said:

1951 has been yet another year of continued progress. Once again both the gross and the net new business broke all previous records for the company. The new life assurance business at £4,500,000 gross showed an increase of over £200,000 on the previous year, and the net new business retained by the company at £4,175,000 was also in excess of the record figure of 1950.

There has been a considerable increase during the past year in the demand for our scheme for providing pension benefits for employees of commercial and professional concerns of limited size. The company has so far not undertaken "Group" business but has specialised in providing pension schemes for undertakings where for size or other reasons the "Group" type of scheme is unsuitable. Experience in this class of business has shown how desirable these schemes have become, particularly in the past year or two, and it is opportune for me to say that our branch officials are always glad to receive inquiries from employers and to advise them how their requirements can best be met.

In these days emphasis tends to be laid on provision for old age, and adequate security for dependants in event of early death is apt to take the second place. It is satisfactory therefore to know that a very substantial proportion of the company's business is written under the whole life assurance plans, which, especially if family income benefits are added, supply the best provision for dependants which can be secured for a given annual outlay.

ADVANTAGES OF LIFE ASSURANCE WITH PROFITS

It is appropriate that I should draw your attention to the advantages of life assurance with participation in profits as a hedge against inflation. So long as a substantial proportion of a life office's funds is invested in real values, such as equity stocks and shares and property, a life policy which shares in profits gives, not only security for dependants in the event of early death, but a measure of security against the fall in the purchasing power of the £. No other form of saving provides this dual security. I referred last year to the inflationary tendency of the national economy and to the steps which the directors proposed to take in order to counter this tendency by increasing the proportion of our funds invested in equities. The balance sheet shows what has been achieved in this direction, to which I would add that our investment in equities includes moderate holdings in both USA and Canada.

The life premium income, which reached the million mark a year ago, has advanced to £1,194,000. The life fund has increased by £500,000 to a new level of over £12 million. The gross rate of interest earned on the life fund during the year has increased from £4 9s. 3d. per cent to £4 13s. 5d. per cent, and the net rate after allowing for income tax, from £3 14s. 7d. per cent to £3 17s. 10d. per cent. Claims by death were again low, being 61 per cent of the amount expected by the mortality table as against 76 per cent last year.

The main changes in the balance sheet as compared with 1950 are a reduction of £383,000 in British Government and Government guaranteed securities, and increases of £150,000 in debenture stocks, £526,000 in ordinary stocks and shares, and £240,000 in mortgages on property. There was a heavy fall in British stock markets towards the end of the year, and this affected the values of our investments at the date of closing our books; but the market values were still in excess of book values, although the margin was of course reduced.

The motion having been seconded by Mr G. T. Chiene, DSO, MC, WS, was adopted.

SUN LIFE ASSURANCE SOCIETY

RECORD PREMIUM INCOME

MR W. M. PRYOR'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63 Threadneedle Street, London, E.C.2, on Tuesday, May 6, 1952.

Mr W. M. Pryor, DSO, DL, chairman of the Society, has issued a statement to shareholders, which in outline is as follows:—

DIRECTORS

During the year Mr R. M. M. Pryor and Mr C. H. Villiers were appointed directors, and you will be asked to consider their re-election at the forthcoming general meeting.

FUNDS, INCOME AND OUTGO

The total funds of the Society increased by £5,095,000 during the year and amounted to £83,298,000 as at December 31st last.

The total income for the year amounted to £14,156,000, the premium income of the life assurance fund reaching the record figure of £10,786,000.

The gross interest income of this fund amounted to £2,817,000, representing a gross rate of £3 19s. 4d. per cent which, I am pleased to record, shows an increase of 2s. 8d. per cent over that for the previous year.

Claims by death at £2,292,000 exceeded those of the previous year by £291,000, but I am glad to be able to report that the mortality experience has again proved favourable.

NEW BUSINESS

I have once again to report a successful year as regards the transaction of new business. The total new life assurances granted during the year consisted of 28,800 policies for sums assured of over £41 million. The sums assured represent an increase of nearly £6 million over those granted in the previous year, while the yearly renewal premium income in respect of the new assurances effected last year reached the record figure of £1,840,000, compared with a little under £1,500,000 arising from the previous year's new business. The new sums assured include a considerable amount of endowment assurance business effected in connection with the many staff pension schemes which we operate.

INVESTMENTS

The outstanding feature of investment conditions during 1951 was the substantial fall in the market prices of fixed-interest securities. On many occasions since the war I have drawn attention to the difficulty of securing an adequate income from investments owing to the continued pressure of the cheap money policy. This situation no longer exists, as the fall in the market prices of medium and long-term British Government securities, which illustrates the general trend of prices of fixed-interest securities, has been rather more than 12 per cent during 1951.

The higher yield obtainable, especially from the large number of new issues made during the year, enabled the Society to make investments on more favourable terms than those available for many years.

It has long been the policy of the directors to confine investments, in the main, to fixed interest securities possessing a final date of redemption, although in current conditions it has been considered prudent to increase our holdings of ordinary shares by about £1,250,000 during the year. Nevertheless, practically 93 per cent of our stock exchange investments comprise redeemable securities of an average term of about 22 years. The depreciation which has occurred in the value of these investments will ultimately be recovered as the securities approach their final redemption date, provided, of course, that they are held until maturity. In view, however, of the extent of the depreciation which has occurred, the directors thought it right to set up an investment reserve fund by the transfer from the assurance funds of amounts aggregating £3,250,000.

QUINQUENNIAL VALUATION

The results of the quinquennial valuation made as at December 31st last are given in the report by the general manager and actuary, and the board has adopted the recommendations set out therein. The present distribution of profits is in respect of a period of five years (1947-1951) whereas the last distribution covered a period of ten years (1937-1946), no distribution having been made as a result of the wartime valuation as at December 31, 1941. It is not surprising, therefore, to find that the total amount of the surplus is less than in 1947. I am pleased to say, however, that the bonuses now declared are at higher rates per annum than those declared in 1947, notwithstanding the fact that the large sum already referred to was transferred in 1951 to the investment reserve fund. The amounts of the bonuses to be allotted to individual policies are being calculated and will be notified to policyholders as soon as possible.

DIVIDEND

The proprietors' share of the divisible surplus is £328,232, which, for the reason just explained, is less than the share apportioned to them in 1947 (£443,477). This fact, coupled with the effect of profits tax on the proprietors' fund, has caused the directors to reduce the half-yearly dividend from 2s., free of income tax, to 1s. 9d., free of income tax. A dividend of the latter amount has been declared and will be payable on June 30th next.

TRIBUTE TO THE STAFF

I am sure that you will wish to be associated with the board in paying tribute to the staff for their excellent work during the past year. The results which I have placed before you are a testimony to the zeal and energy of the general manager and of the staff throughout the whole of our organisation.

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

G. R. HERRON AND SON, LIMITED

(Wool Merchants and Topmakers, Wool Combers, Wool Scourers, Fellmongers and Leather Dressers)

SATISFACTORY RESULTS

CATASTROPHIC FALL IN WOOL PRICES

MR F. J. HILL ON THE OUTLOOK

The forty-ninth ordinary general meeting of G. R. Herron and Son, Limited, was held on March 26th in London, Mr F. J. Hill (the chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended October 31, 1951:

Looking back over the twelve months trading of the company which ended on October 31, 1951, I can say without fear of contradiction that we have witnessed in that period the most violent fluctuations in the price of wool ever experienced in the trade.

In the first five months of the financial year the price of wool continued the rise which had been set in motion by the devaluation of sterling in the autumn of 1949 and to which fresh impetus had been given by the breaking out of the Korean war in July, 1950. In the late autumn of 1950 the fires were further stoked following the announcement by the American Government of their intention to stockpile 1,500,000 bales of wool. The incredibly inept method of acquiring this wool encouraged many firms in the primary markets to compete one with the other for the same wool to reoffer to the Americans.

PRICE FLUCTUATIONS

By the end of March, 1951, the price of 64's Merino tops had reached 350d. per pound and of 50's crossbred tops 240d. per pound, or more than twice the price these qualities had ever reached in any previous boom. The percentage rise over the five months was 50 per cent on 64's tops and 60 per cent on 50's tops. At this point the Americans, evidently appalled at the juggernaut which they had created, suddenly stopped buying and the market collapsed. In the next six months the fall was even more spectacular than the meteoric rise had been and by the middle of September the price of 64's tops had dropped to 120d. per pound and 50's tops to 65d. per pound.

This situation would have been serious enough if trading had remained reasonably active, but as nearly always happens when a market collapses, business dried up and for long periods there were no buyers. This accentuated stock losses which have proved exceedingly heavy. If a futures market had existed in Bradford during this period it would have been of inestimable benefit to top-makers and stock losses could have been considerably minimised.

The creation of a futures market in Bradford is, I believe, under discussion at the moment, and although there are certain objections, I consider that the advantages far outweigh the disadvantages.

Although it is true that dealings in the Antwerp and New York futures markets are possible, such dealings are in tops which are not Bradford standard type and this is a considerable drawback. Furthermore, the business is hedged round with restrictions.

Fortunately the profit earned by the company in the first five months covered by the accounts was exceptional, so that despite the catastrophic fall in prices in the second half of the year, the results can, on the whole, be considered satisfactory.

THE ACCOUNTS

I will now turn to the accounts which have been prepared to show the consolidated position of the company, that is to say, including the subsidiary, Walker, Holdsworth and Company, Limited.

After allowing for all items of expenditure, but before providing for taxation, the net profit is £156,955, compared with £389,623 for 1949-50. Income tax and profits tax require £94,388 and £1,842 is retained in the accounts of the subsidiary company, leaving £60,725. The amount brought in from the preceding year is £19,810, which, together with the net profit for the year, after taxation, makes a total available of £80,535. Your board recommend a final dividend of 9 per cent, which, with the interim of 6 per cent paid in October last, makes a total of 15 per cent for the year. This, together with the dividend on the preference shares, absorbs £15,844. A transfer to general reserve of £30,000 has been made, increasing this to the substantial sum of £330,000, which is now well in excess of the paid-up capital of the company. This leaves £34,691 to be carried forward in the accounts of G. R. Herron and Son, Limited, to the current financial year. The value of group stocks at £1,200,809 compares with £1,377,266 at the end of the previous financial year. These stocks, both sold and unsold, have been conservatively valued on the basis of prices ruling at October 31, 1951, and the bulk has since been disposed of at a satisfactory margin of profit.

WALKER, HOLDSWORTH AND COMPANY, LIMITED

The reorganisation and re-equipment of our subsidiary's mill continued during the year, and although the work proceeded more slowly than was hoped, it is now practically completed. The mill has been brought up to a high state of efficiency with up-to-date machinery and is a combing establishment from which first-rate production can be guaranteed.

CENTRAL MILLS

The re-equipment of this mill is also now practically complete and the potential output has been considerably increased, which will enable us to take full advantage of any revival in trade when it occurs.

MONKMOOR MILLS, HEREFORD

New machinery has also been installed during the year for the fellmongering and leather dressing section, and is giving highly satisfactory results.

CURRENT FINANCIAL YEAR

Since the end of the year under review, the price of wool has remained fairly stable, fluctuating about 10 per cent either side of a mean price, and it appears as though a basis is being established. Trade, however, still continues exceedingly quiet and, as a consequence, we have for the present been compelled to reduce the running of our two combing mills to four days and nights a week, at which level of activity they only just break even. Profit margins on new wool purchases are also infinitesimal due mainly to the cut-throat competition caused by the general short-time running throughout the trade. At the moment there is no sign of any improvement, but full employment in the country as a whole seems likely to continue with the consequent maintenance of purchasing power, and there seems little doubt that the rearmament programme in Europe and America will proceed without curtailment. With the lower price of wool, the influence of these factors upon the home and export trade gives reason for expectation that there will, before long, be a change for the better in the present state of affairs. While it seems improbable that the level of last year's profits will be maintained, I am hopeful that the current year's results will prove to be reasonably satisfactory, always provided of course that we do not experience a further substantial fall in wool prices.

TRIBUTE TO MANAGEMENT AND EMPLOYEES

I have much pleasure in again paying tribute to the very high standard of service given to the company by the management and its employees. The entire absence of any labour dispute throughout the year is testimony to the spirit of co-operation which exists between the officials of the company and all those who work under their direction.

The report and accounts were adopted.

At a subsequent extra-ordinary general meeting a resolution was passed changing the name of the company to G. R. Herron and Son (Holdings), Limited.

INTERNATIONAL COMBUSTION (HOLDINGS)

A TRIPLE RECORD

The eighteenth ordinary general meeting of International Combustion (Holdings) Limited, was held on March 27th, in London, Mr G. R. T. Taylor (chairman) presiding.

The following is an extract from his circulated review:

Once again a larger output and increased profits of subsidiary and other companies in which we are interested have served to make the profit of the group a record in its history. The preference dividend and an interim dividend of 7½ per cent on the ordinary stock having been paid, your directors have transferred the sum of £350,000 to general revenue reserve and recommend that a final dividend of 17½ per cent be paid on the ordinary stock, leaving a balance of £185,868 to be carried forward.

With the inclusion of valuable export contracts our order book constituted a new high record at the end of the year under review. During the current year good orders have been received from sources at home and abroad. I mention above that our output for the past year is larger. Up to the present no perceptible slowing down of our activities has occurred due to lack of raw materials, but it would be rash to predict whether or not the shortage will ultimately affect our output.

The achievement of a triple record, order book, output and profit is one which seldom occurs and it calls for the greatest measure of gratitude from the Board of Directors to all workers in the group on your behalf.

The report was adopted.

ENGLISH ELECTRIC COMPANY

ALL PREVIOUS RECORDS SURPASSED

SIR GEORGE NELSON ON THE GROUP'S CONTINUED EXPANSION

The thirty-third annual general meeting of the English Electric Company, Limited, was held on March 27th in London.

Sir George H. Nelson, FCGI, MIMechE, MIEE (chairman and managing director), in the course of his speech, said: Turnover and production have again been substantially increased in volume and value during the year and the net profit has risen by £203,984 to £1,132,550, thus in all respects creating records over past achievements. The consolidated net profit has risen by £276,829 to £1,326,721. These figures show that the subsidiary companies have more than maintained their earnings during the year.

It is proposed to transfer £550,000 to the general reserve, and to pay a final dividend of 10 per cent, less income tax, on the ordinary stock, making a total of 15 per cent, less income tax, for the year, leaving the carry forward at £477,186, which is £188,434 more than last year.

Inflation remains a serious threat to our national economy. Workpeople are often misled into thinking that high profits are the main cause of inflation, by those who are either ill informed or mischievous and anxious to disturb the stability of industrial relations. We wish it to be widely known that the level of profits in our company is extremely modest and does not contribute to the lowering of the purchasing power of the £.

TAXATION

Some of Mr Butler's proposals for the coming year are encouraging steps to better things.

In industry, I feel convinced that the proposed changes in allowances must encourage the workers to give all the overtime and week-end work that is asked of them, enabling the man who does not at present pay tax to provide himself with extra income to meet extra costs consequent upon the reduction in subsidies on foodstuffs; in other words, beat the crisis by longer hours and more output.

STABLE EMPLOYMENT

I would remind you that our policy for over twenty years has been an endeavour to provide stable employment for our employees. To do this our manufacturing range has been widened and our distributing activities spread all over the world in such a way as to ensure that a fall in demand for any particular product, or isolated political, financial or economic disturbances in any part of the world should not have a serious effect on the company's activities.

I must, however, point out that since we initiated this policy a state of national full employment has developed which has contracted the pool of available labour and the pile of unabsorbed materials. The possibility and tempo of further industrial expansion will, therefore, be difficult and slower, and the problem for the future will be the integration of production resources with labour supplies to meet the needs which may arise. This must involve controls of one kind or another from time to time, or perhaps continuously, but it is essential that they should be skilfully applied, so as to avoid either the discouragement of initiative or the development of a feeling of disappointment and depression among administrators arising from the apparent frustration of their efforts by people who have no direct responsibility for results. Furthermore, workers in all industries must also realise that full employment cannot mean that they will continue to be employed on the same job in the same place indefinitely. This would entail national stagnation.

INCREASED MANUFACTURING FACILITIES AT HOME

The demands of the defence programme have presented us with the problem of maintaining a just balance between the immediate demands of rearmament and the country's vital need to earn income from overseas—particularly dollars—while following a course which enables us to fulfil our basic policy of stability of employment for our staff and workpeople when rearmament work declines. In the solution of this problem we have had the valuable advice and support of the Treasury and the other Government Departments concerned.

Extension of our manufacturing facilities undertaken during 1951 and the acceptance of long-term business have both been related to these considerations. We have added a large, new bay to our Liverpool works, while at Netherton, near Liverpool, work is at present in progress on the erection of a large, new factory, the cost of which is being provided jointly by your company and the Ministry of Supply.

GROUP ACTIVITIES

The accounts of D. Napier & Son, Limited, show a substantially increased net profit. The company has a substantial part to play in the country's rearmament programme, including the production of Rolls Royce "Avon" aero-engines.

The Marconi's Wireless Telegraph Company, Limited, and the Marconi International Marine Communication Company, Limited, have both again had a successful year. The Marconi Companies' leadership of research, in their special electronics field, is acknowledged all over the world, and has been maintained in 1951.

RESEARCH, DEVELOPMENT AND TRAINING

By far-seeing research, intensive development, the provision of the most up-to-date manufacturing facilities, and the training of engineers and skilled craftsmen, we feel we have done everything humanly possible within our own organisation to provide for the future. Although we can play some part in inspiring future progress, its speed is not entirely in our hands, but depends largely on the action of Governments, both in encouraging the production of basic materials and in the furtherance of the economic integration of the British Commonwealth. We are not pessimistic about the future, provided that everybody in the country plays his part in checking inflation and that a solution is found to the country's problem of balancing its external payments. If these two essentials are not dealt with, the outlook is very obscure.

TRIBUTE TO EMPLOYEES

In conclusion, I wish once more to express on your behalf and that of the board our great appreciation of the efforts of our staff and workpeople, and also of the way in which so many of them have sacrificed their personal time to bring about an increase of several million pounds in our output, which has resulted in the notable achievements laid before you at this meeting.

The report and accounts were adopted, and at a subsequent extraordinary general meeting the proposed increase of the company's authorised capital to £10 million by the creation of a further 2 million ordinary shares of £1 each was approved.

MARCONI'S WIRELESS TELEGRAPH

TURNOVER AGAIN LARGER

The fifty-fourth annual general meeting of Marconi's Wireless Telegraph Company Limited was held on March 27th in London.

Sir George H. Nelson, FCGI, MIMechE MIEE, the chairman, in the course of his speech, said:

A satisfactory increase is again recorded in turnover with a corresponding rise in our trading profit achieved against growing competition and continued rising costs.

The profit for the year, after deducting all charges, but before making provision for taxation, etc., is £74,490 higher than in 1950 at £356,381. Tax provision, however, is £89,132 heavier at £171,714, and after allocating a further sum of £25,000 to the depreciation equalisation reserve, the net profit for the year is £159,667, which, due entirely to increased taxation, is £4,642 less than in 1950. Your directors recommend a dividend of 7 per cent less tax on the ordinary shares.

The double load of increasing exports and preparing for defence weighs heavily on all branches of our national activity. In times like these the load falls very heavily on firms like our own which possess research, development and engineering productive capacity and in these respects your company stands second to none.

The value of our export sales in 1951 was nearly 50 per cent greater than that of the previous year, which was itself a record year. Inquiries for our products continue from all over the world, but raw materials are getting harder to come by. At the same time competition in overseas markets is also in many respects keener now than ever before.

CONTINUED DEMAND

Sales of our radio communication equipment in 1951 were again greater than in the previous year, and the demand for our well established high-frequency point-to-point communication equipment continues, together with the demand for our very high frequency multi-channel radio telephone communication systems. Offering as they do the advantage of modern trunk communications in district where line telephone systems are economically or geographically impracticable, the demand for these equipments should continue.

Our aircraft radio compasses are giving reliable service all over the world. Several foreign air lines will shortly be using the latest types they have recently purchased here, and which have been specified for new British airlines. The age of supersonic speeds continually poses the most complex problems in connection with the responsibility for making flying safer, and our AD200 very high frequency direction-finder is astonishingly effective.

Since we introduced wireless for safety at sea, it has shown a steady improvement, and in 1951 has sustained this advance.

The outstanding television event of 1951 was the opening of Britain's third great television station, at Holme Moss. The occasion made history of a special kind, for this was the first time that the entire design and manufacture of a complete television station had been entrusted to any one firm—Marconi's Wireless Telegraph Company.

Ten years have now passed since Marconi Instruments, Limited, became a wholly owned subsidiary of the M. W. T. Company. I feel sure you will be gratified to know that this company, with its ever widening range of electronic and electro-medical apparatus, now has a turnover of more than £1 million a year.

The report was adopted.

TATE AND LYLE, LIMITED

MODEST REWARD FOR HUGE TURNOVER

LORD LYLE ON CONTROLS

The forty-ninth annual ordinary general meeting of Tate and Lyle, Limited, was held on March 26th in London.

The Rt Hon Lord Lyle of Westbourne, the president, in the course of his speech, said:—

Last year the dark cloud of nationalisation was still threatening, though there were signs of a change in the weather. Now I hope we may have a few years respite from the oppressive and retarding atmosphere of threats and vituperations.

Thinking back on those years, one good thing did come out of them—Mr Cube. He has been a real asset to us and to others. We are not going to see him squeezed into the background. Mr Cube must keep in training. He will always be ready and willing to enter the ring to fight for those principles and ideals which in the past have made our country great. He will constantly be proclaiming his belief in free enterprise.

TURNOVER £99 MILLION

Our turnover this past year was £99 million. This huge total resulted from refining nearly 2 million tons of sugar—more than 4 tons a working minute, of which a third was exported. The very modest reward to the owners will be £590,000 in dividends after deduction of tax. This dividend is equivalent only to 1¼d. in twenty shillings of turnover or 1/28th of a penny per pound of sugar sold. The increase in turnover is reflected in the substantial increase of £670,000 in trading profit.

It is much to be regretted that circumstances have caused the Chancellor to feel it essential to burden industry with an Excess Profits Levy, under which it is possible that 80 per cent of all profits earned above the standard figure will be taken by the total charge of Income Tax, Profits Tax and Excess Profits Levy. Until the Finance Bill is published and there has been an opportunity of studying all the provisions of what I think is bound to be complicated legislation, a precise estimate of the effect of the new scales of taxation on your company cannot be made. From a preliminary examination, however, it would not seem likely that your company will be adversely affected.

The company's very large turnover was due to the spectacular export trade, which reached the record of 720,000 tons. Thus my fears of last year were proved groundless, partly because the panic buying after the start of the Korean war continued longer than we expected.

As under the present restrictions on home trade one-third of our output is exported, and as this third earns about a half of our profit, it will be clear to all that a drop in quantity or value of exports would affect us very seriously.

SUGAR RATION PROSPECTS

Now you would like to hear my views on the prospects of taking sugar off the ration. I will no doubt be accused of mixing business with politics. But nowadays politics intrude into every aspect of business. The business man who says "I am not interested in politics" will soon find that politics are certainly very interested in him. The centre of economic power today is no longer the City of London but the floor of the House of Commons. Socialism has always proclaimed itself the open enemy of Free Enterprise. This springs partly from a love of power but fundamentally from the inferiority complex of the unsuccessful wishing to destroy what they cannot emulate. Industry must drop the pose that it must not be interested in politics.

But I must not make a political speech. Let us get back to sugar. Last year Empire exports and home grown production of sugar came within 100,000 tons of the unrationed requirements here of 2½ million tons. This year the gap will be larger because of poor crops, particularly in Australia. Even so, the gap is a relatively small one and could easily be bridged if we were the only people being considered. The snag is that the rest of the sterling area (composed mainly of Dominions and Colonies) is making ever-increasing demands on the available supplies. The Ministry of Food for many years past has undertaken to supply the sterling area. If the requirements of these countries continue to be filled with Empire sugar before the requirements of the United Kingdom—the gap will grow wider, unless there is yet another cut in the ration at home.

DOLLARS THE CRUX

Dollars, therefore, are again the crux of the affair, not only here but in the importing Colonies and Dominions. We can only spend the dollars we earn. Some go to buy coal, some to buy films, some to buy tobacco, some for steel and some for food of which a few are spent on sugar. It is all a question of priorities. I am extremely doubtful whether the priorities that have been given so far are the right ones.

I hope that some dollars can be found for sugar, but dollars should not be relied on for ever and every effort must be made to gain freedom from dependence on dollar sugar. A step towards this end has been taken in the signing of the Commonwealth Sugar Agreement. In this, Empire producers are offered certain guarantees and they in return intend to expand their production from the present 1,700,000 tons to 2,375,000 tons. It will take a little time to achieve this target and my own forecast is that before the target is achieved the top limit will be raised.

CONTROLS SHOULD GO

If, despite everything, de-rationing cannot be achieved at home in the near future, some steps should be taken to remove some of the controls which at present prevent refiners from fulfilling completely their true functions.

The parlous condition in which the country finds itself is not to be cured by a continuation of controls. Higher output through more efficient management will only be achieved by freeing industry. In this way will both capital and labour be put on their mettle. There is ample evidence that enlightened trade union leaders are ready to join hands with those employers who have cast aside restrictive practices. But controls are restrictive in themselves.

I cannot end my speech without attempting to convey our intense appreciation of the sense of partnership which is an outstanding feature of the day to day life in refineries and offices.

This sense of partnership has been of tremendous benefit to the public and all concerned in the welfare of our industry. But I do not feel that it is built on solid foundations as long as we are still menaced by the whims and fancies of unbridled bureaucracy.

The report was adopted.

NORTON INDUSTRIES LIMITED

VERY SATISFACTORY RESULTS

MR JOHN NORTON ON RECORD OUTPUT

The fourth annual general meeting of Norton Industries, Limited, was held on March 26th at the Registered Office, Priorfields Foundry, Spring Road, Ettingshall, Wolverhampton, Mr John Norton (the chairman) presiding.

The secretary (Mr R. C. Page) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:—

I would like to welcome to this meeting all those shareholders now present and who have been able to be here and support the directors at this fourth annual general meeting of the company.

A copy of the accounts of the group for the year ended October 31, 1951, has already been circulated to members, together with a report of your directors, and are self-explanatory, and I think show a very satisfactory result of the year's working.

In addition to the matters covered by your directors' report there are one or two points to which I would like to draw your attention.

Production—The mechanised foundry plant to which I referred in my last speech to you has helped to make this a record year for output, and the other departments of the foundry have also contributed to the increased production. The scrap metal section of the group has considerably increased its turnover despite the general shortage of materials and the quest for scrap metal continues unabated. The engineering and drop forge sections have also maintained increased output during the year, the majority of which is exported and assists directly the export drive.

Extensions—During the year the extensions to the drop forge department were completed and additional plant put into production. Further expansion of other departments is in hand.

REPLACEMENT OF FIXED ASSETS

The problem of providing for the replacement of fixed assets, particularly plant, in view of the ever-increasing costs, is still a real difficulty. There appears to be no hope in the immediate future of the present excessively heavy burden of taxation being reduced, and together with the present inflationary tendencies this makes replacement increasingly difficult, and with this problem in mind your directors have considered it prudent to increase the provision for depreciation.

Supplies—During the year under review we have experienced some difficulty in obtaining supplies of raw materials, but we were able to maintain our plant on full production by careful planning. It is hoped that this position will be maintained during the current year.

Reserves—The general reserve account in the consolidated balance sheet has been increased to £80,000, and the shareholders' funds now amount to £220,395.

PROSPECTS

The company's order books are satisfactorily filled with normal work, and with the prospect of additional orders due to the rearmament programme now getting under way, the future may be looked to with some confidence. The continuance of increasing costs must not, however, be overlooked.

On behalf of myself and my co-directors I would like to express our appreciation of the loyalty shown by the whole of the staff and work-people during the past year, and look forward to continued good relations between management and employees.

The report and accounts were adopted and a final dividend of 12½ per cent, making 20 per cent for the year, was approved.

The retiring director, Mrs M. Norton, was re-elected and the other formal business having been transacted, the proceedings terminated.

BOWMAKER LIMITED

RECORD TRADING RESULTS

The twenty-fourth annual general meeting of Bowmaker Limited was held on March 27th at Bournemouth, Mr E. R. Bardsley (the chairman) presiding.

The following is an extract from his circulated statement:—

The accounts show further improvement on the good result of the previous year and, indeed, constitute a record in the history of the company. The consolidated profit has increased by over 70 per cent, from £160,131 to £277,003. Taxation, at £153,687 on the profit for the year, leaves us with the sum of £123,316, as against £72,244 last year.

The consolidated balance sheet, showing an increase in total assets of over £1 million, reflects, in addition to the greater activities of the parent company, the expanded operations of the active consolidated subsidiaries and the increase during the year of a little over £113,000 in total capital and revenue reserves.

Your board has felt it desirable to maintain interest in those other activities which are within our knowledge and experience and which, having helped the company in the difficult times of the last war, might well again prove useful if further difficulties arose through different or similar causes. Even now, the latest of the postwar recurring financial crises can hardly be regarded as encouraging to the immediate prospects of those engaged in hire purchase.

In spite of all the difficulties, I am confident that the unrequited demand for our services will ensure that we shall get at least our share of the business available.

The report was adopted and a dividend of 10 per cent was approved.

WILLIAM BEARDMORE AND COMPANY LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of William Beardmore and Company Limited was held at 207 Shettleston Road, Glasgow, E.1, on March 13, 1952. Sir Alexander Williamson, chairman and managing director, presided, and Mr A. R. Robertson represented the Iron and Steel Corporation of Great Britain.

The report and accounts for the nine months ended September 29, 1951, which showed a net profit for the period of £121,272 after providing for depreciation, taxation and other charges, as compared with £144,074 for the preceding twelve months to December 31, 1950, were adopted.

A dividend on the ordinary stock for the nine months to September 29, 1951, at rate of 17½ per cent per annum (less tax) under deduction of the amount already paid for period January 1 to February 14, 1951, was declared.

The retiring directors, Dr A. S. MacLellan and Sir William Wallace were re-elected and the remuneration of the auditors, Messrs J. Wyllie Guild and Ballantine, was fixed.

A vote of thanks to the chairman concluded the proceedings.

HARRODS LIMITED

RESULTS OF A DIFFICULT YEAR'S TRADING

SIR RICHARD BURBIDGE'S STATEMENT

The sixty-second annual general meeting will be held in Brompton Road, London, S.W.1, on April 21st.

The following are extracts from the chairman's statement circulated with the report and accounts:—

TRADING RESULT

Trading conditions during the year followed the pattern that I forecasted in my review last year. The underlying feature was that consumer resistance to the increasing prices continued to grow although there were several periods of rush buying. On the other hand, the Festival of Britain celebrations undoubtedly brought a large number of visitors to England and especially to London. We made a great effort to cater for them and the extra trade resulting from our efforts was very satisfactory, our export trade at Harrods increasing by 50 per cent to £763,000. As a result of the above factors, trade in all the stores during the first six months of the year showed a satisfactory increase. During the second six months, trading conditions deteriorated. There was the period of uncertainty caused by the General Election and then the continued warnings that were given as to the condition of the country's finances and the steps that were necessary to put them on a sound basis. The result was that sales were adversely affected—particularly of furniture, men's wear and luxury articles, and the total trading for the second six months was less than for the previous year. However, the value of the sales of the group for the whole year showed a slight increase and as you will see from the consolidated profit and loss account, the gross profit on trading at £5,768,484 was £93,138 more than last year. Owing to the sale of some investments in Government stock and a decrease in rents due to the derequisitioning by the Government of some of our floor space, other income was £40,649 less than last year, so that the total gross profit £5,849,957 showed an increase of £52,489 on last year.

EXPENSES AND NET PROFIT

Expenses of the group amounting to £4,500,141 continued to increase in spite of all our efforts and were up by £229,636. Salaries and wages, including pension funds accounted for over 60 per cent of the total expenses and were £161,565 more than last year. Although the net profit before taxation was £177,147 less, taxation on these profits absorbed slightly more than last year owing mainly to the increased rate of distributed profits tax, with the result that the net profit of the group after taxation was £179,018 less than last year at £470,829.

You may remember that I told you last year that the directors considered that the reserves of the subsidiary companies had been built up to a point that enabled a larger proportion of their profits to be taken by the parent company. Consequently, although the net profits of the subsidiaries were less than last year, the same amount has been received by Harrods Limited by way of dividends, with the consequence that the amount of the year's net profit retained by the subsidiaries, namely, £18,807, is less by £65,597.

APPROPRIATION ACCOUNT

After allowing for the dividends on the preference shares of the subsidiary companies the amount of net profit to be dealt with by Harrods Limited is £438,446, a decrease of £112,835 compared with last year. The directors recommend that £50,000 be placed to buildings reserve, and that after payment of the dividend on the preference stock, the dividend on the ordinary stock be made up to 20 per cent for the sixth year in succession, by the payment of a final dividend of 10 per cent and a bonus dividend of 5 per cent.

Because of the strong feelings aroused by the seemingly never-ending rise in the cost of goods, necessities and luxuries alike, charges are often made that the profits made by retailers are excessive, and the dividends paid to ordinary stockholders, declared, as they are, as a percentage of the issued capital, are quoted as evidence of this. I should like to emphasise, therefore, that the gross dividend of 20 per cent paid to ordinary stockholders of this company represents only 7 per cent (equivalent to less than 3½ per cent net) on the written down book value of the net tangible assets attributable to the ordinary stock.

EXPORT MARKET

It is certain that this country must export more goods, and it is equally true that the first essentials of these goods are that they should be of good quality and reasonably priced. Without the Home Market, in which to test their goods, the manufacturers will have great difficulty in maintaining, or improving this quality.

Again I say what we need is more freedom, not more restriction. Do not restrict the output of consumer goods to the Home Market too much, for by so doing, the freedom of the manufacturers to produce the goods required for export will also be restricted.

PROSPECTS

The economic difficulties and uncertainty prevailing in the months prior to the Budget had a serious effect on our trade, with the result that we have got off to a bad start; particularly as at this time last year, there was a rush of buying in anticipation of increased prices. Furthermore, the expenses have continued to rise and the Budget will place upon us further burdens by way of increased charges for petrol, national insurance, telephones and postages. On the other hand the present Budget proposals will provide us with some relief this year as the distributed profits tax at a rate of 50 per cent hits your company very hard.

The Chancellor of the Exchequer has told us that we must face up to the realities of the times, and at least we now know more clearly where we stand and the task that lies in front of us. Certainly the Government has already dealt in a rapid and resolute way with some urgent trading problems. Price controls which were out of date and had become a serious handicap to orderly distribution have been abolished, with the effect that the retailer is now stimulated to develop better values and lower prices.

The adoption by the Government of the proposals of the Douglas Committee will also have a very beneficial effect on the range of merchandise in the shops. The blind spot which existed between the highest prices in the Utility range and the lowest prices in the non-utility field cramped both manufacturer and retailer in their efforts to provide a range of goods to suit all purses. We are disappointed that greater relief from tax has not been given to those items which we find from experience are most keenly sought by our overseas visitors. I refer more especially to articles of fine craftsmanship which need a more generous home market to develop the demands of the export trade.

This will be a difficult year, but now that the Budget proposals are known and in view of the changes made, I hope trade will improve and help us to meet our rising costs. I can assure you that your businesses are in fine fettle and I have faith in our ability to meet the challenge of the times.

TEMPERANCE PERMANENT BUILDING SOCIETY

A PERIOD OF CONSOLIDATION

TOTAL ASSETS NOW £27,043,715

MR CYRIL W. BLACK ON THE SOCIETY'S PROGRESS

The ninety-eighth annual meeting of the Temperance Permanent Building Society was held on Thursday, March 20th, at the Caxton Hall, London.

Mr Cyril W. Black, JP, MP, FRICS, chairman of the society, in the course of his speech said: The year which has recently ended has been in the main a period of consolidation. In view of the manifold difficulties and uncertainties of the times it was considered expedient not to strive after any spectacular expansion in our business but to concentrate rather on strengthening still further the very strong foundations on which your society is built.

INCREASE IN ASSETS AND MORTGAGES

The total assets at the close of the year amounted to a record figure of £27,043,715, showing an increase of £1,131,915 on the corresponding figure of the previous year. On the liabilities side of the balance sheet the amount standing to the credit of shareholders and depositors was £25,161,876, an increase of £1,024,113. The total amount advanced on mortgage was £5,070,645, approximately 80 per cent being secured on properties where the advance did not exceed £2,000. Of the total amount outstanding on mortgages at the date of the balance sheet, £23,887,657, little more than £500,000 was owing in respect of mortgages where the debt exceeded £5,000. The average amount outstanding on the mortgages of the society was only £890.

Probably sooner, rather than later, a fall in property values will take place, and this possibility has been ever present in the minds of your directors. They have accordingly subjected all mortgage applications to the most careful consideration, and have pursued the policy of only accepting business in cases in which they have been thoroughly satisfied of its soundness.

RESERVES, LIQUIDITY AND TAXATION

It is hardly necessary for me to mention the great importance attached by your board to the strengthening and building up of the reserves of the society. During the past year we have made appropriations of £50,000 to general reserve account and £22,408 to contingency account, raising these reserves to all time high records of £1,250,000 and £280,000 respectively. The total of the general reserve account, contingency account, and balance of profit carried forward amounts to £1,558,853, representing 6.19 per cent of the aggregate share and deposit capital. Our cash and Government and municipal investments amount to £3,026,581, this impressive figure representing, in the view of your board, a satisfactory degree of liquidity for a society of our character and size.

I must again direct attention to the crippling burden of taxation by which, in common with other building societies, we are afflicted. For the first time in the history of the society the total amount payable in respect of income tax and profits tax amounted to a figure in excess of £300,000. Taxation on this penal scale makes it increasingly difficult to augment our reserves. Such balance of profit as has been made available for strengthening our reserves has only been secured as a result of the most rigid scrutiny by your directors of the various items comprised in our management expenses.

INTEREST RATES

I desire to refer now to important decisions taken by your directors towards the end of the year regarding the interest paid to shareholders, and the interest charged to borrowers. It is common knowledge that for some time past we have been passing through a period of rising interest rates, and it may well be that the end of this phase has not yet been reached. Your directors have been conscious of this trend for a considerable time past and in July last they increased by ½ per cent the rate of interest charged on new mortgage loans. Later in the year the decision was taken to increase the rate of interest both to existing and new shareholders as from January 1, 1952, by ¼ per cent to 2½ per cent, income tax paid by the society. This new rate is equivalent, in the case of an investor liable for income tax at the standard rate of 9s. 6d. in the pound, to a gross yield of £4 15s. 3d. per annum, which is a little in excess of the rate obtainable from investment in Government securities. From past experience it would appear that, if a satisfactory volume of investment money is to be secured, it will always be necessary for building societies to offer a rate of interest a little higher than the yield obtainable at the time from Government securities.

The decision to increase the rate of interest payable to shareholders necessitated in turn an increase in the rate charged to those borrowers who had elected to take up their mortgages at an interest rate which they knew was liable to be increased, in preference to fixed interest mortgages at a higher rate. Our decision to increase the rate of interest charged on our variable rate mortgages has not been operated so as to increase the monthly repayments, but by extending slightly the term of repayment, the monthly instalments remaining unchanged.

GOVERNMENT HOUSING POLICY

Towards the end of the year a change of Government brought with it a change of national policy in regard to housing. Neither the building society movement in general nor your society in particular is concerned with party political matters as such; we exist to serve the interests of the nation and our members irrespective of the political complexion of the Government in power at the time. Evidences are not lacking that a new approach is being made to the housing problem. Greater freedom is now promised to the citizen who desires to erect his own home for his own occupation, and local authorities who desire to do so are to be permitted to sell council houses to the occupiers. This new policy not only recognises the desirability of encouraging home ownership on the widest scale possible, but it also holds out the hope of some relief from the very heavy charges on the public purse involved in the subsidies payable on council houses.

The new Government's policy on housing appears to be more in line with what the building society movement has been advocating ever since the end of the war, and is accordingly to be welcomed. The building of new houses for private ownership, as it materially increases the supply, will have the effect of bringing down the prices of existing houses, a consequence much to be desired. We believe, therefore, that our society will have the opportunity in the future of playing an increasingly significant part in the solution of the grim housing shortage which affects the nation; it is a challenge to which we are willing to respond to the utmost of our resources.

The report and statement of accounts were adopted.

UNIVERSITY OF BRISTOL

Applications are invited for the post of TUTOR IN SOCIAL SCIENCE (with the status of Lecturer, Grade II). Salary scale £550 to £900 per annum, with membership of the F.S.S.U. and Children's allowance scheme. Applicants must have considerable experience in practical social work and in directing students' work.

Applications should be sent not later than April 30, 1952, to the Registrar, the University, Bristol 8, from whom further particulars may be obtained.

THE International Labour Office invites applications from men and women of United Kingdom nationality, aged not less than 21 and not more than 30 years (excluding war service) for a post of Library Assistant in the Library and Periodicals Service of the International Labour Office, Geneva, Switzerland.

Qualifications required: (1) Library school diploma, or at least three years' practical experience in technical processes in a modern library. (2) Good knowledge of French; a knowledge of other languages would be an advantage.

Further particulars and application forms may be obtained on application, with stamped, addressed foolscap envelope, from: The International Labour Office, 38/39, Parliament Street, London, S.W.1.

The closing date for the receipt in this office of completed application forms is April 30, 1952.

ROBSON, MORROW AND CO. invite applications for positions on their staff from qualified accountants between the ages of 28 and 38 who have had executive experience in industry. A four-figure commencing salary will be paid with substantial annual increases.—Applications, giving details of age, education, qualifications, experience and salaries, should be sent to 59 New Cavendish Street, London, W.1.

SECRETARY, part-time or temp. Own machine.—Box 911, or 'phone CAN 5330.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships, tenable for one year in the first instance, but renewable for a further period not exceeding two years. The studentships are normally of the value of £250 or £300 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University. Applications should be sent not later than May 31, 1952, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

BRITISH CELANESE LIMITED require a Statistician with some years' experience in industry for work based on London. Age between 27-32 years. Qualifications required equivalent to Association of Incorporated Statisticians Final standards. This is a new post and offers good opportunities to the right man. Applications, enclosing full details of age, experience and qualifications, should be sent to the Personnel Manager, British Celanese Limited, 22 and 23, Hanover Square, London, W.1.

ACCOUNTANT (Chartered or Incorporated) required as Assistant Secretary to a large public Company in the textile trade in Manchester. Age 30 to 40 years. Commercial Experience desirable. Excellent prospects.—Write Box 246, Wheelers Advertising Agency, 18, Pall Mall, Manchester, 2.

EXECUTIVE (32), Cambridge graduate, wide knowledge marketing, advertising and market research; five years' experience, including managerial responsibility, with well-known manufacturer, seeks position in any field offering opportunity to exercise proven initiative and ability.—Write Box 914.

PLACE your Publicity in experienced hands.—Copyvets Press and Publicity, 316 Vauxhall Bridge Road, London, S.W.1. VICtoria 4189.

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH ESTD.

ANNUAL GENERAL MEETING

Notice is hereby given that the seventy-fourth ORDINARY GENERAL MEETING of the Shareholders will be held at the Company's Offices, 61 Avenue Fouad 1er, Alexandria, on Wednesday, April 23, 1952, at four o'clock in the afternoon, for the transaction of the ordinary business of the Company, pursuant to Act of Parliament.

Holders of share warrants to bearer desiring to attend or to be represented at the Meeting must deposit their share warrants in London before April 9, 1952, or in Alexandria before April 20, 1952, until after the Meeting, at the National Bank of Egypt, 6 King William Street, London, E.C.4, or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

A Member of the Company is entitled to appoint a proxy to attend and vote at the Meeting in his stead and any proxy so appointed need not be a Member of the Company.

Dated, Alexandria, Egypt, February 16, 1952.

By order of the Board,

ROBERT WALTON, Managing Director.

YOUNG administrator (31), British, wishes to contact now in the U.K. active expanding British or Canadian Company who in two years' time may require in the U.S.A., Canada or possibly U.K. a man of the following qualifications: Public School education, fluent French, trained as an executive by big international Company in the U.S.A., some foreign business experience, three years active selling in the U.S.A. in highly competitive field. Admitted to the Harvard Graduate School of Business Administration for commencement September, 1952; graduating September, 1954.—Box 907.

THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country-house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London.—Write Major B. Carnegie, "Stronvar," Balquhidder, Perthshire.

POSTAL TUITION for B.Sc. ECON.

The London University B.Sc. *Econ.* Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 760 Successes at Lond. B.Sc. Econ. Final Examinations, 1925-51.

Prospectus from the Director of Studies, Department P17 — WOLSEY HALL, OXFORD

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. Postage on this issue: Inland and Overseas 2d.—Saturday, March 29, 1952.

THE HISTORY OF ZINC

China knew ZINC more than 300 years ago

The illustration shows Zinc smelting in China as described in the T'ien Kung K'ai wu A.D. 1637

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last 30 years a great Zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal, include the production of Sulphuric Acid, Zinc Pigments, Fluorine and Fluorine Compounds and ancillary products.

Allied Commanders

IT now seems virtually certain that General Eisenhower will give up the post of Supreme Commander Allied Forces in Europe in order to become a presidential candidate in the United States. Already people are asking who shall succeed him, and there is a natural tendency for American politicians to say that it should be an American. There is an equally natural tendency for British politicians, like Mr Shinwell in the House of Commons this week, to protest that this is not a hereditary American office but one for which a European should be eligible. Certainly, if the fighting records in the last war are to be taken first into account, British candidates would have a strong claim. In fact, however, to be Supreme Commander in Europe in peacetime has not so far demanded a fighting man's qualities. It has been more a job for the organiser, the co-ordinator, the team leader, the enthusiast; and in the early stages of Atlantic defence planning only an American could bring sufficient power and authority to such a role. The major purposes of the Atlantic Pact were to spread the American umbrella over Europe and to harness the Europeans together; and it happened that the obviously right man to hold both the umbrella and the reins was General Eisenhower.

The question now is whether the requirements have changed. Must General Eisenhower be succeeded by an American? And what kind of a man should he be? Clearly the essential factors remain the same. It is still the contribution of the Americans that is the core of Atlantic defence, and their authority in the Supreme Headquarters helps considerably to maintain the interest and goodwill of Congress. To switch at this stage to a non-American Supreme Commander would be to jeopardise this goodwill and provoke an unseemly competition between French and British claims—for there are no other obvious claims. Where outstanding ability is not available, supreme command is a function of superior power, and there is no doubt where in the western alliance that lies.

What sort of man should the new Supreme Commander be? Obviously not an imitator of General Eisenhower. Europe was willing to accept from the Generalissimo of the liberating armies of 1945 the kind of leadership that would have been resented coming from anyone else. As he himself said in his report, published three days ago, the problems he has dealt with have been economic, political and psychological rather than purely military. His is a performance that cannot be repeated. What is now needed is that SHAPE should become more military and less political, more of a headquarters and less of a court. Much that it has been dealing with lately is better left to the new permanent organisation of Nato in Paris under Lord Ismay. Defence plans have been laid and the task is how to carry them out as fast and as thoroughly as possible. The need is for efficient staff work by a chief of operations who knows from experience exactly how much and how little the Supreme Headquarters can accomplish—and that rules out such men as Generals Ridgway and Collins. The omens,

in fact, all point to General Eisenhower's present Chief of Staff, General Gruenther, who is much liked and respected by all Nato members and has lately impressed Senators by his manner of presenting the case for aid to Europe.

This is a matter in which it is the interest of the British to be generous. The argument which justifies the choice of an American for supreme command in Europe also justifies the choice of an American for supreme command in the Atlantic. It is that American power, in case of war, would be clearly preponderant in areas where American interests are greatest. If the British stand firmly on this argument, they are respecting realities and strengthening their claim to high command in the Mediterranean and Middle East, where both the interests and the forces of the Commonwealth are—or could be in time of war—preponderant.

★

Recent events in the Mediterranean suggest that this claim will have to be vigorously defended, if it is not to go by default. On March 6th, there ended a four-power exercise under the direction of the American Admiral Carney. Some two hundred warships, a thousand merchant vessels and five hundred aircraft were engaged, while American, British, French and Italian airmen and seamen experimented in working together under near-war conditions. By normal standards Exercise "Grand Slam" was a success; but in one respect it came very near to being an over-bid. Any layman who had been following the reports of the non-British press would have assumed that Admiral Carney is officially master of the Mediterranean. He directed the manœuvres; his spokesmen ran the publicity; he, according to many reports, controls forces including both the Home and Mediterranean Fleets of the Royal Navy. The impression was left that he had taken over the vacant Mediterranean command about which there has been so much dispute.

Admiral Carney was doubtless innocent of any attempt to give this impression. Nato having been unable to decide on the Mediterranean command, somebody had to organise joint manœuvres, and who better than the man who simultaneously commands the carrier striking force of the US Sixth Fleet and acts as General Eisenhower's lieutenant in Southern Europe? But the real problem in the Mediterranean remains. When General Eisenhower set up his headquarters in 1951 he appointed General Juin (France) to command the Nato land forces in Central Europe, and Admiral Brind (Britain) to command the naval, air and land forces of Nato in Northern Europe. He found the task of organisation in Southern Europe complicated by the fact that Britons, Americans, Turks, French and Italians all had different ideas about the main purposes of defence in the Mediterranean.

France thought in terms of protecting its south coast and communications with North Africa. Turkey was, and still is, anxious to see the Americans committed up to the Black Sea. The Americans looked at the Mediterranean primarily as the southern flank of General Eisenhower's position in Europe, on which air power could operate from carriers and land bases. The British thought far less in European terms and far more of the West's communications with the Middle East, with the Canal base, and with the Commonwealth, passing within easy range of Russian submarine and air bases in the Black Sea. For them the primary task in the Mediterranean is to guard these lines and to think of the Middle East as the bridge between Asia and North Africa. A commander thinking in European terms would not think in these terms; and in the British view Shape has no business east of the Adriatic; Europe ends where the Near East begins.

Unfortunately Egypt's attitude has held up all progress with the organisation of a Middle East command which might make clearer the division of responsibility in the Mediterranean. The idea is that this command should not be subordinate to Shape but on a par with it. The three Supreme Commanders—Europe, Atlantic and Middle East—would report to the Standing Group of Nato with its representatives of the American, British and French chiefs of staff capable of taking wider strategic views. Lately, to complicate matters further, Greece and Turkey have become full members of Nato and their forces had to be put under someone's command. Their preference was for an American and for as close a link as possible with General Eisenhower himself, in spite of the obvious fact that their real interest lies in links with a strong Middle East defence organisation.

★

The result is a thoroughly unsatisfactory and muddled situation. Admiral Carney's command is European and covers the coastline from Trieste to the Spanish frontier on the north and the communications with the North African coast, including Algiers, on the south. It does not extend to the Eastern Mediterranean but it does cover, for the moment, the land and air forces of Greece and Turkey. In short, the command of the Eastern Mediterranean, including the Greek and Turkish naval forces, is vacant, and the responsibility for naval defence of the sea as a whole is undecided. It would be only too easy for Nato to decide that Admiral Carney, having done two-thirds of the job, should take on the other third as well. But it is most important that the British Government should stand firmly by two points in its case against such a decision. The first is that the Supreme Commander in Europe (to whom Admiral Carney is responsible) has already too much to do, and an extension of his subordinate's authority to the shores of the Black Sea would be pure empire building; the second is that it is a vital interest of members of the British Commonwealth that Mediterranean communications and the Middle East land position should not be considered from the point of view of a headquarters whose main task is to defend Western Europe.

It has taken *years* to convince American strategists of the importance of the Middle East and the Mediterranean, and it remains for them an unfamiliar problem. Neither their interests nor their power are preponderant there; nor are they likely to become so in the state of protracted cold war with which western defence policy is concerned. A clear recognition of this by the Americans and other partners in Nato would underline what is in any case the manifest fact: that, of all the western powers, Britain is the one that is most able and willing to act as the chief agent of the alliance in the Middle East. It would also serve to remove a growing suspicion that the Americans are not prepared to permit any sharing of the supreme commands, that they will always accept command over others but that they will never enter into arrangements that might bring their own forces under a British or European commander.

The Siege State

SECRETARIAT LIBRARY GOVERNMENT

MR ANEURIN BEVAN'S much-heralded political testament has been published this week. If it often seems that his views get too much attention, on this occasion at least the attention is deserved. They are flexible views. It is an entire misjudgment to treat his book primarily as a contribution to the stale controversies of the past twelve months. It seeks to widen the opposition to rearmament by a more general exposition of a foreign policy than Mr Bevan has previously attempted. But the exposition tails off into the woolliest advocacy of something to follow rearmament.

> At this stage it is not possible to put forward some novel proposal that will command immediate and universal commendation. . . . Suppose we fix a date—towards which we should at once begin to work—when a definite percentage of what we are now spending on arms shall be set aside for the peaceful development of backward parts of the world.

Bevanism as it has existed since April, 1951, will no doubt continue to exploit the latent pacifism and the anti-Americanism within the Labour movement. But it becomes increasingly unlikely to remain a sharp issue of principle. It becomes merged in Mr Bevan's wider struggle for the Socialist soul of his party.

The essence of that struggle is simple. Labour came to power as the party of rebellion against the conditions of the thirties. That task is done. Mr Bevan's views are of first importance not because he is an ambitious politician but because he crystallises in a remarkable fashion the tensions of a conservative society. What do rebels do when rebellion has achieved a bloodless victory, when their most popular tenets have become the orthodoxy of their opponents—and when, nevertheless, the economic foundations of the new society that they have built are unsure? If they are wise, they turn to strengthening the foundations, to consolidation. But while that is politically realistic, psychologically it requires that the leopard should change his spots. Consolidation may be philosophically distinct from conservatism, but emotionally it is much the same. It cannot satisfy a party that is more of the Left than of the Centre, because the Left must have something to change just as much as a bicycle must move in order to stay upright.

This is the dilemma of the British Labour party. Mr Bevan's distinction is that, in face of this dilemma, he is the party's emotional conservative. He maintains the attitude of rebellion. He insists that the world is still pretty much what he always thought it was. His philosophy remains rooted in the human and material decay of the Welsh mining valleys between the wars. To dispute that philosophy intellectually is beside the point. The formulation of its ideas still reflects their origin in the Tredegar Workmen's Library. But the ideas themselves reflect the common experience on which the growth of the Labour movement was based. In the two inter-war decades, capitalism seemed to be losing the efficiency, the capacity to provide employment and an expanding economy, that had been taken as the justification of its inequalities. It was natural, if superficial, to believe that the problem of production had been solved, that the main economic need was to distribute more justly what Mr Bevan still identifies as an economic "surplus." It was at least superficially reasonable to think that plenty could be achieved by throwing out the bosses and legislating for equality.

Postwar experience has destroyed the intellectual framework of this attitude but not its emotional content. The country has moved a long way towards equality but many workers are disappointed with the result. After the disillusionments of six years in office, envy of the rich and hatred of the Tories are the main parts of the traditional impetus of the Labour movement that survive. They may still be powerful if they are given a new intellectual framework. That is the task Mr Bevan has set himself. While other leaders of the Labour party are looking for a new impetus, Mr Bevan is trying to whip up the traditional impetus. While they are looking for new policies adjusted to a new society, he is merely looking for new forms in which to keep the revolution against the old society going. He feels no need to offer a cure for the Labour party's disillusionment with the simple blacks and whites of its old doctrines. He simply denies that there is any reason for disillusionment.

> Whenever the Labour party has made a mistake, it has not been in consequence of pursuing its principles too roughly or too far, but by making too many concessions to conventional opinion.

Mr Bevan is the high priest guarding the written tablets of the fathers' faith in a naughty world. It is an easy role, the one that guarantees a fair minimum of support in the constituency Labour parties. Yet the simple assertion of faith will not satisfy many even of the zealots. Mr Bevan's doctrines and emotions gain in immediate appeal by being ready-made, but the test of his real success or failure is the extent to which he seems to offer a policy relating them to concrete action in the future.

★

The test is obvious in principle but it is hard to apply with confidence. Whatever Mr Bevan's strength as an orator, as a writer he is ineffective. "In Place of Fear"* is less a book than an extended and diffuse pamphlet, in which meaning is often hidden in a Celtic twilight and a rare devotion to long words for their own sake. This obscurity may sometimes serve Mr Bevan well, but it can hardly distract attention from the two obvious weaknesses of his position. The first is that even he now finds it rather hard to hate the Tories as they are. He has to suggest, in effect, that they will become more reactionary. "The crisis in British politics" is bound to deepen and will endanger democratic practices. "A number of people" are questioning "a constitution which erects no barriers between privilege and the popular will." Praise of the House of Lords is an instrument in "the struggle once more to enthrone the principle of authority as a barrier against movements of mass opinion." It is hard to imagine a less convincing attempt to find something to hate and sweep away. If the rebel has to find his justification in fears of a counter-attack so divorced from political reality, he has been driven a long way from the traditional doctrines and attitudes of the British Labour movement. He will not by this means win to his side any but the most fanatical near-Marxists.

But this false note in Mr Bevan's structure of assumptions is trifling by comparison with the central

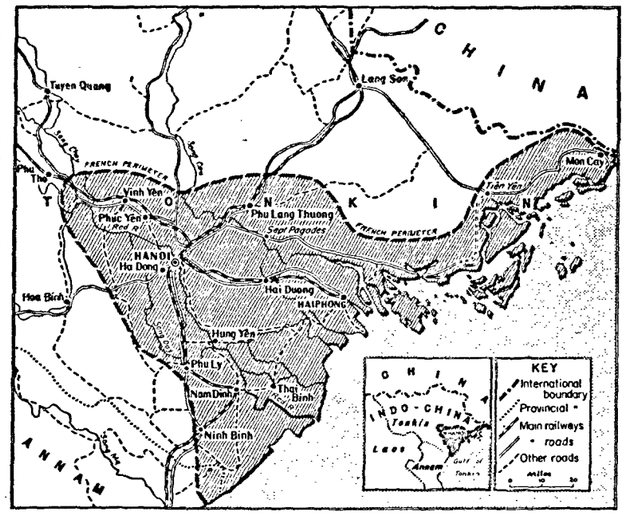
* "In Place of Fear." By Aneurin Bevan. Heinemann. 201 pages. 10s. 6d.

inconsistency in his policy. He starts by identifying private property, poverty and democracy as the three main "social forces." Poverty is the universal and justifiable conviction that in modern industrial societies the lot of the ordinary man is "much worse than it need be." But, later, Mr Bevan maintains that "professional" standards of living ought not to be further reduced. Presumably, therefore, poverty is to be removed (by definition it is removable) by increasing the country's real income and seeing that the "ordinary man" gets all the increment. Further squeezing of the shareholder alone can hardly be supposed to free much consumption for the workers. Indeed, the limitations of taxation as a means of redistributing income are pointed out with some force. The cure must go deeper. There should be a "radical extension" of public ownership, so that public property predominates over private property. But at this point the argument ceases to be one for creating more wealth. The emphasis is on drastically altering "the power relations of public and private property."

The rebel has come into his own again, but where now is the social reformer? It is true that "private economic adventure" is condemned for becoming too cautious: "We had organised scarcity and high profits instead of expanding production and the acceptance of risk." But there is no serious argument that more nationalised industries (to be run as government departments, not public corporations) would be more enterprising, that they would rapidly produce more wealth and banish artificial poverty. If they did, Mr Bevan would surely have to condemn them. For his main charge against capitalism is not that it is restrictionist but that it is too expansionist. Private enterprise grows fat by burning up the dwindling supplies of metals and other materials without thought for the future; they are running so ominously short that capitalism may soon have sawn off the limb on which it is sitting. Mr Bevan offers no statistical evidence to support this variety of Malthusianism. More important, its obvious implication is ignored. If Mr Bevan seriously suggests that the world ought to use its natural resources more slowly, he is urging it to reduce production and create more poverty. The motive is plain enough. Fears of increasing scarcity make more plausible Mr Bevan's vague generalisations about priorities, about the need to transfer the pattern of consumption from private to public decision. A siege economy is welcome because in a siege the state necessarily gathers all power into its hands.

This is the position to which even so agile a brain as Mr Bevan's is driven by his determination to carry the Socialist revolution further. It will not meet either the needs or the wishes of the British people. Any policy for preventing poverty and fear must be a policy for creating more wealth in these islands. The British electorate may be reluctant to believe that the creation of more wealth is worth any disturbance either to worker or to manager. But if it is aware of the choice it certainly will not prefer organised scarcity as the alternative. Mr Bevan wisely does not try to define the machinery by which the state would determine and enforce its economic and social priorities; if the mechanism were defined, it would certainly have no more electoral appeal that the (also unspecified) agenda for continuing nationalisation.

All this is so plain that the realists of the Labour party should take heart. The confusions of Mr Bevan's policy admittedly do not destroy his appeal to the easy emotions and stock attitudes of his party. But they do mean that his strength lies primarily in the vacuum about him. He has no policy capable of winning new supporters. The fervour with which he points to the Left does not hide his inability to say where he wants to lead the party. If no one else has a frankly expounded policy either, he will continue to capitalise all Labour's discontents and disillusionments, to thrive on the thwarted emotions of a party that has lost not only its constructive faith but the genuine social idealism that was once so large a part of its inspiration. But that is all his strength.



It still requires courage and a clear head to stand up in these circumstances for caution and charity, to insist that Labour's new policies should be politically liberal and should meet the need for a more efficient and flexible economy rather than promise more even shares of state bounties. But the alternatives can surely be set confidently beside Mr Bevan's nihilism. What do the other Labour leaders prefer to crude class war, to the omnipotent state and the economics of organised stagnation? If they know, and will say, neither they nor the country need pay much more attention to Mr Bevan.

Indo-Chinese Dilemma

EVENTS in Indo-China have now produced a grave situation. Recent setbacks to the French and the Vietnamese forces of Bao Dai have made a military stalemate the best that can be hoped for in the foreseeable future. This prospect is renewing the sense of frustration and defeat which Marshal de Lattre de Tassigny had managed to sweep away for ten brief victorious months last year. It has invalidated his timetable for building up an effective Vietnamese national army capable of taking over major defence responsibilities and allowing the French to return home. It has provoked, instead, talk of an armistice with Ho Chi-minh which could be concluded, if at all, only on exceedingly disadvantageous terms. It has even led to serious suggestions in Paris that the French should abandon the struggle altogether.

It is not always recognised that this deterioration in Indo-China affects the British more adversely than any other western power. Any failure there, even the drawing of a truce line across the middle of the country on the 16th parallel, would be likely to have serious repercussions on the Siamese, and so on the war in Malaya. As it is, General Templer is hard put to it to stop the slow decline in the morale and economic resilience of Malaya. Anything which tipped the scale enough to make his task impossible could have untold economic consequences for the whole sterling area. Compared with such possibilities, the French have less to lose. The war in Indo-China is at present a tragic drain on their resources; its ending, even by defeat or withdrawal and however great the shock to national morale, would by definition stop that drain. And the Americans, although they justifiably point to the dangerous effects a Communist success in Indo-China would have on their positions in the Philippines and Japan, are in reality no worse placed than any of the western powers with interests in Asia.

In Indo-China itself the military situation is clear-cut only in the north. There, in the province of Tonkin, the French and Vietnamese national army hold a perimeter 250 miles long, based on the sea and running in a squashed semi-circle round the provincial capital of Hanoi. Almost the whole of the area contained within the perimeter is the rich, rice-growing delta of the Red River. There are about six battalions of Vietminh Communist rebels operating as guerrillas within the perimeter. Outside it French writ no longer runs at all; the frontier with China is wide open except for a tiny stretch at Moncay. Down to the south in central and south Vietnam—which covers all the eastern seaboard of Indo-China and contains the bulk of the population—there is guerrilla warfare with, in some areas, the French in control only of the towns. Lately, however, the critical struggle in the other delta, that of the Mekong round Saigon, has gone slightly in favour of the French.

The main battle is at present in the north, where the French profess confidence about holding their perimeter. But at the end of January shortage of troops for dealing with the guerrillas within the perimeter forced them to withdraw from Hoa Binh to shorten their line; this town had been occupied some months ago to cut the north-south highway, down which supplies were pouring in to the Vietminh from China. The fruit of this withdrawal has been seen this week, however, in Operation Mercury when the French appear to have been strong enough to trap most of the Vietminh 320th Division, operating in a guerrilla role round Thaibinh. As a result of these two engagements the French claim to have inflicted some 12,000 casualties on the Vietminh, with much smaller losses of their own, and thus to have prevented the possibility of any major Communist offensive before the five-month rainy season begins in May.

If this turns out to be correct, it is a considerable achievement; but that it should be counted as such shows how hard the French are being pressed. All the time the war is costing the French exchequer something over £400 million a year, with American military aid in addition at the current annual rate of about £175 million. Moreover, one regular officer in every four and virtually half the cadre of regular NCOs are now in Indo-China, where the French expeditionary force numbers about 175,000 men; French killed and captured since the beginning of the campaign amount to over 30,000, which is slightly more than America's equivalent losses in Korea. With the French, there is a Vietnamese national army of about 110,000, and some 60,000 auxiliaries; against them, the Vietminh have a well-equipped force of 300,000, much of it trained on regular military lines by the Chinese. Thus there are now well over half a million armed men locked in the battle for Indo-China.

In theory, provided neither side wins outright, this situation could endure for another five years; the war has already been raging since the end of 1946. But in practice this is impossible for three reasons. The whole scale of the fighting in Indo-China is constantly increasing; a year ago neither Chinese aid to the Vietminh nor American aid to the French and Vietnamese was as large as it is today. In France, the re-emergence of the German problem and reaction against the Schuman policy of reconciliation have greatly stimulated growing doubts about French ability to carry a mounting burden in the Far East for less and less apparent advantage to France; the demand to end the war is now heard in Paris not only from the Left but from a Right which might feel differently about Germany if the 12 French divisions in Indo-China were back at home under General Eisenhower. And, of paramount importance on the spot, there is the constant threat that decisive Chinese intervention may start a new Korea in the south—a threat which has already brought the western allies to a dangerous division of views on the whole strategy and tactics of their containment policy in the Far East.

What, then, should be done? For the French first need is to ensure that the war is not abandoned or a truce concluded on hopeless terms, simply through a crisis of will and fears about Europe. The danger of this is real and there may not be much that Britain can do about it directly. Certainly no British forces exist which could be thrown into the struggle in Indo-China to turn the scale, even if the French were willing to admit them. On the other hand, British public opinion can still provide a buttress which may not be without its effect in France, and there can be no question but that a more positive British attitude towards European co-operation and defence would help the French to overcome their fears of Germany. Britain's refusal to take more than an external benevolent interest in the European army, inevitable though it may be, has certainly weakened the will of many Frenchmen to keep the flower of their army locked up on the other side of the world in the jungles and rice plains of Indo-China.

In the Far East itself, however, specific steps are possible. For months the French have been asking the Americans—and the British—to give an undertaking that they would come to the assistance of Indo-China if

it were invaded by the Chinese. The State Department and the Pentagon are by now fully convinced that the United States cannot be indifferent to what happens in Indo-China, but they hesitate, in this election year, to undertake a commitment with the clarity and emphasis that are needed if it is to have the best chance of being effective as a deterrent. Moreover, they have made it clear that the United States cannot, in any case, undertake to send ground troops to Indo-China. If they gave a guarantee and had to implement it, they would do so by bombing Chinese communications and blockading the Chinese coast. And this in its turn alarms both the French and the British, who see in it, as they do in all American proposals to "take the war to the Chinese," the risk of a new world-wide conflagration. So that American policy on the one hand, and Anglo-French policy on the other, are as much out of harmony at the southern end of the Far Eastern front as they are at the northern end, and for much the same reasons.

Perhaps the most immediate danger in Indo-China is that the Chinese will greatly increase their aid to the Vietminh without making any overt act. Yet it should not be impossible to define a limit beyond which their actions would constitute clear aggression or too difficult to remove the differences between the western powers about an agreed, if flexible, policy of retaliation. There is, undoubtedly, on both sides of the western argument, a lack of courage in framing logical conclusions from agreed facts. On the American side, it is clear that open Chinese aggression on Indo-China would in fact be resisted. Why not therefore say so in all clarity in advance and therefore help to prevent the contingency from ever arising? On the European side, there is a similar unwillingness to face the facts. If the Chinese Communists do invade or infiltrate into Indo-China in force, Britain and France will in fact be compelled to hit back in the way that is most likely to be effective. That cannot be by sending ground troops to Indo-China, since the ground troops do not exist. It would have to be by using the means that do exist, that is, by using naval and air power. If China starts a war on its southern frontier, these are the means by which it will have to be fought. Why not say so now? It was this logic, applied to Korea, that forced the Labour Government to agree that, in certain eventualities, China might have to be attacked, though they also, for reasons of domestic politics, deprived their decision of the publicity that might have made it effective.

The cold war is the same in character in the Far East as in Europe, and the same in Indo-China as in Korea. Any cold war must necessarily be very embarrassing to democratic governments responsible to peace-loving public opinions. In Europe, the elementary lessons of how to deal with the threat of aggression have, on the whole, been learned, and there is a willingness to take a calculated risk of provoking aggression by preparing to resist it. There, the nations have on the whole been willing to ask themselves what they would do in the ultimate analysis and to declare their intentions beforehand. In the Far East, none of them has yet been willing to do so, to the great advantage of the potential aggressor. An agreed Franco-British-American policy for the whole of the Far East, based on the facing of unwelcome facts and the running of calculated risks, might indeed not be enough to save the situation, first in Indo-China and Hongkong, then in Siam, then in Malaya and the archipelago. But without such a policy it is becoming clear that the situation cannot be saved.

Straining at GATT

IN the past few weeks many people have been urging an increase in Empire preference and suggesting that the Government should cut Britain adrift from the General Agreement on Tariffs and Trade which limits its freedom to extend preferential tariff treatment. The problems that provoke these suggestions are real enough. They are the growing evidence of economic difficulties and of the painful process of adjustment which the British economy is being called upon to undergo in the struggle for solvency. In these circumstances, and with unemployment in Lancashire mounting, there is no more natural reaction than to attempt to draw a web of preferences and protection a little more thickly round the economy. It is a reaction common to some members of both the main political parties. Mr Shinwell, speaking last week-end, said that he was afraid it had now become essential "to exclude our competitors from Empire markets. We exhausted ourselves in defeating the Japanese and Germans and now we are allowing them to capture our markets with goods made by cheap labour." This week the House of Lords has debated a motion by Lord Balfour of Inchrye arguing the desirability of "amending international agreements entered into by Britain which, in their present form, have the effect of limiting the extent and restricting the development of inter-Commonwealth and Colonial Empire trade."

The aims of these two extremists are fundamentally similar, though the spokesman for the Left stated his with the greater candour. Mr Shinwell seems to find no difficulty in reconciling Britain's trusteeship of the colonial territories with a demand that the people of Malaya, for example, who are at this moment saving the mother country from dollar bankruptcy, should be prevented from buying cheap Japanese textiles in order to prop up Lancashire. Nor does he appreciate what a double-edged argument he is using when he condemns Japanese and German goods as the produce of "cheap labour." Could this not apply to British motor cars and textiles trying to make their way into dollar markets?

In this crude form, the arguments for more protectionism can be dismissed as nonsense. But that is not the end of the matter. The specific enemy which Lord Balfour of Inchrye had in mind was the General Agreement on Tariff and Trade, a shortened version of the code of conduct for non-discrimination in international trade which was expressed in the charter of the International Trade Organisation. That charter was stillborn because the United States has been unable to ratify it. Without this lead, the other signatories have let the matter drop. But the immense labour put into the drafting of the charter has not been altogether wasted. Most of the sections establishing a code of commercial behaviour were incorporated in the General Agreement on Tariffs and Trade signed in 1947. This was intended to be the precursor, but it has become the real thing, the sole repository of the hopes once placed on ITO. The philosophy of GATT is directly that of the draft charter —the creation of a system of freer and nondiscriminatory world trade, in which quotas and other quantitative restrictions to trade would be prohibited save in defined circumstances; and such quotas, if applied, would have to be operated on a non-discriminatory basis, again save in defined circumstances. It is quite true that large segments of the charter were not incorporated in the General Agreement. Those dealt with the maintenance of high employment, the development of backward countries, monopolies and cartels and commodity agreements. They were in large part the expression of general hopes and promises of good behaviour, making strange companions for the other sections of the charter which dealt in precise lawyer's language with tariffs, preferences, quantitative restrictions and the deviations from the code permitted in order to safeguard the balance of payments of signatory countries.

★

The usefulness of GATT is not likely to suffer from the accidents which caused much of the ballast to be thrown overboard. Nor has the prospect of useful life for GATT suffered from its small beginnings—which mean that it can build itself up by a slow process of adaptation. It may thus avoid that curse of so many postwar international organisations, the imposition of enormous administrations on inflexibly elaborate charters.

The work put into the draft charter has also produced substantial practical results. It was wisely decided at an early stage of the discussions that the participants should match action to words in their devotion to the ideals of freer and expanding world trade. They conducted a series of negotiations to reduce their tariffs and margins of preferences. The first negotiations at Geneva in 1947 were followed by a second tariff conference at Annecy in 1949, and the last of the series was held at Torquay in the winter of 1950-51. There were 23 governments concerned in the Geneva negotiations and the number had grown to 34 at the Torquay meeting. The result of this bargaining has been to reduce the average level of tariffs in the world and to extract from all participants a guarantee that they will not increase tariffs by unilateral action save in very exceptional circumstances. This undertaking to "bind" existing rates of tariffs, at least until the end of 1953, applies to more than 55,000 tariff rates covering a very large part of world trade.

If tariffs were the main obstacle to international trade, the efforts made under the ægis of GATT could already be counted a major victory. Unfortunately, in the prevailing unbalance of international payments it is the scarcity or abundance of currencies which chiefly determines the distribution of world trade. Quotas and import licensing are the main visible obstacles against which such trade has to battle. The General Agreement provides abundant exemptions from its rules for countries in trouble with their balances of payments, but it must be admitted that this world of chronic payments instability is not that for which GATT or ITO was conceived.

The cause which GATT represents has suffered not merely from the stubborn refusal of economic realities to return to the "normalcy" of a world of convertible currencies and non-discriminatory trade; it has also suffered from some backsliding by the United States, its main sponsor. The American decision to abandon the draft charter was a serious disappointment, particularly to many of the less developed countries which seemed to derive considerable encouragement from the sections dealing with employment and development and the other more nebulous chapters of the charter. Moreover, the Americans have conducted their tariff negotiations under GATT in a tough bargaining spirit, extracting a very full price for any concession granted by them and, in general, failing to live up to the role of the world's greatest creditor and exporting country. The United States has also had recourse to escape clauses in GATT, and in its own Trade Agreements Act, to increase import duties on hats and to threaten increases on other goods, including motor bicycles, bicycles and chinaware, all of which touch Great Britain at particularly sensitive spots. Another serious blot on United States fiscal policy was last year's amendment to the Defence Production Act, which put quotas on dairy produce on the ground that they were essential to the defence of the United States. Finally, Congress has failed to make any progress with the Customs Simplification Bill, which is the real test of American sincerity in letting in additional imports of manufactured goods. But in judging these shortcomings of the United States it would be well to keep a sense of proportion. This is an election year; and the higher duties on hats and the quotas on cheese do not loom large in comparison with the solid tariff concessions the United States has made to the rest of the world over the last five years.

★

The limitations on GATT's achievement so far are real, but they are certainly no reason why this country should want to throw over all that has been done. The case for leaving GATT must be an argument that it has done too much—an allegation that it puts intolerable restrictions on Britain's and the Commonwealth's freedom to discriminate in favour of sterling trade. But what are these restrictions? The rules of GATT fully entitle the sterling countries, in their present balance of payments difficulties, not merely to impose quotas but to make them as discriminatory as they choose. There is no restriction here. The only real restriction is on Britain's freedom to increase its tariff preferences in Commonwealth trade. But what is this freedom? It takes two to make a preferential agreement. Most of the evidence of recent commercial discussions with Commonwealth countries suggests that their fervour for preferences is waning fast. In its last agreement with Great Britain, Pakistan took the initiative in reducing certain margins of preference on British goods. India has expressed its intention to do the same at the earliest opportunity. Canada is clearly in favour of seeing what remains of the preferential system wither away and tends to blush at the very name of the "Ottawa Agreements." Australia's unofficial flirting with the dollar countries has similar implications. The colonial territories are, it is true, markets in which margins of preference could be increased; but such a move dictated from London would

hardly be consonant with Britain's wider responsibilities for these territories or with the honourable traditions of British colonial administration.

Lord Cherwell, replying for the Government in the House of Lords on Wednesday, defended GATT against some criticisms but stalled on the main issue: he left it open for the Government to decide to withdraw later. Yet the sphere of international and inter-Commonwealth trade that is really governed by preferences is steadily narrowing. This clutching at the straws of preference, in which the young Tories and the new Socialist imperialists are strangely joined, reflects an equally strange and defeatist view of the British economy. Abroad, it would certainly be interpreted as this country in its senile decay propping up inefficient industries at the expense of its overseas dependants. It also disregards all that would be thrown away in terms of the promise of expanding trade with Europe and the dollar countries if GATT were to be sunk without trace. It is often enough that immediate circumstances give this country no choice but to pursue trading policies contrary to liberal principles and its own long-term interests. It is the more important to make no unnecessary departures from those principles. In the long run, no country stands to gain so much from GATT. In the short run, the advantages gained by throwing it over would be slight if they ever in fact materialised at all and even if they provoked no retaliation.

There is scope for further amendment of the General Agreement—for attuning its basic provisions rather than its exceptions to the kind of world in which the contracting parties will have to live and trade in the years ahead. But there is no valid ground for throwing the whole thing overboard and incurring the consequent ill-will of the United States, Canada and most of the countries of Europe. Any such counsel smacks of irresponsibility. Indeed, it smacks of lunacy if it is prompted by visions of the comfortable haven of preferential protection from which GATT is allegedly excluding Britain. There is no such haven.

NOTES OF THE WEEK

Nato Birthdays

This week has witnessed a concentrated celebration of Atlantic occasions: the third anniversary of the signing of the North Atlantic Treaty; the first anniversary of General Eisenhower's assumption of control over Western Europe's defence forces; and the formal installation of Lord Ismay as secretary general of a streamlined organisation. Each event well deserved a toast, and public attention has been called to the remarkable progress that Atlantic co-operation has made in preparing Europe's defences. Nato itself is developing power and personality; indeed, one of the most remarkable things about it is the way in which it has outstripped the organisation of Europe, about which there has been in the past far more discussion, research and propaganda. Being at this early stage primarily a military organisation, it has grown stealthily and at times has enjoyed all the advantages of being a cabinet without the disadvantages of being responsible to a parliament. It has developed novel methods of consultation and persuasion, and it has now come to the point where it will have a permanent headquarters in Paris and a central team to do its work.

No one really knows in what direction Nato is heading. So far it has developed by trial and error. First it swelled; now it is contracting. First it was vastly ambitious in its armament and economic plans; now it has become more modest. It represents a compromise between Mr Bevin's taste for "functionalism" and the American taste for organisation as such. Its leading statesmen declare that they aim at an Atlantic community; but when its minor statesmen try to find out how the small nation would fare in such a community they find ideas still vague. Indeed, there has been little deliberate thought about the institutions that such an experiment would require. For Nato has concentrated quite properly on defence in its widest aspects.

Two things, however, are certain. The organisation is not consciously moving towards either federation or confederation. Nothing it has done, or proposes to do, involves formal modification of the sovereignty of national governments; on the contrary this sovereignty is jealously guarded. Yet in some respects it is a tighter body than the Commonwealth. There is no voting in the executive body of Nato, the Atlantic Council, and decisions are unanimous. If the seed of the Atlantic community is to be found anywhere outside the many common interests of Nato members, it is in the habits of work that have developed between ministers, ambassadors and permanent officials. On many matters there is now a Nato as distinct from a national point of view. Whether the 14 nations can advance far beyond this depends above all on their ability to help one another in economic matters, both during and after rearmament.

* * *

Cold War Broadcasting

During the debate on the overseas information services last Wednesday, the House of Commons was told that the BBC's grant in aid from the Treasury would be increased as much as is necessary to cover its anti-jamming activities without affecting its existing services. This is a welcome announcement. It should prevent an intolerable situation in which the Russians could to some extent dictate the size of the BBC's overseas broadcasts. For the considerable success so far achieved, at great expense, by the BBC in countering Soviet jamming of its broadcasts to Eastern Europe and the Soviet Union is not likely to discourage the Russians from bigger and better efforts in this direction; and if the BBC were forced to finance its countermeasures from its static Treasury grant it would be bound to do so at the cost of existing services.

The debate betrayed a lively anxiety on both sides of the House lest the proposed cuts in the information services should prove serious handicaps in the cold war without making any noticeable contribution towards restoring Britain's economic position. Such anxiety is justified; but it tends to become exaggerated by a failure to distinguish clearly between which information services can properly be classed as vital in the cold war and which can not. The provision of news and information to Western Europe is not in the same category of urgency as broadcasts to Communist-dominated countries, however true it may unfortunately be that Britain's case can seldom be allowed to go by default even with its closest friends and allies. When it is a case of deciding between these two priorities, it is clear which must come first. Broadly speaking the Government seems to be making the right disposition of its information resources.

All the same, Mr Nutting was quite right when he said it was high time that there was an inquiry into the political and strategic aspects of the whole range of Government information activities. But it is a pity that this inquiry should be restricted to the Government departments concerned, together with the BBC and the British Council. An independent inquiry would be much more worth while. If a new and coherent policy is to be worked out it is neither fair nor satisfactory to ask the interested parties to be judges in their own cause.

* * *

The Tory Backbenchers

The excellence of Mr Iain Macleod's speech in the debate on the health service has caused its significance to be overlooked. He deployed from the Conservative back benches an unusually powerful argument against Mr Bevan. But his speech was also a most important piece of Tory internal politics. Mr Macleod's attack on the Opposition diverted attention from the fact that his real victory was not over Mr Bevan but over his own front bench. The Bill which Mr Crookshank, Minister of Health, commended to the House was no longer the Bill which the Government suggested two months ago. It was more Mr Macleod's Bill. The back-benchers' health and social services committee, of which he is chairman, had secured big modifications by getting the exemption age for dental treatment raised from 16 to 21 and by securing free dental inspection. This type of back bench activity may well score another victory within the next week or so, if the Cabinet yields to the equally insistent and well-organised demand from another group of its supporters for sponsored television. Such pressure is also apparent in the drafting of the Transport Bill.

Mr Macleod's grasp of the problems of the health service goes back to the days when he was one of Mr Butler's chief staff officers at the Conservative Central Office. His speech was so much better than that of most that are made from the Government front bench that it revives more sharply than before the question of last October—why he and several like him were not given at least junior ministerial posts. Mr Macleod is only one of a number of back benchers of known ability who were left out of Mr Churchill's government. The most remarkable aspect of the continuing high morale of the Conservatives in Parliament is the fact that these men do not show the sense of growing frustration which in the Parliament of 1945 so quickly became apparent on the Labour back benches, and which helped to bring some members into open and repeated conflict with their leaders.

There are several reasons for the difference. Some are personal, and it is also important that the Tory party has always secured greater solidarity from its rank and file. It has, too, organised an effective system of thirteen back bench committees, including the 1922 committee, through which the energies of the more active back benchers can be canalised. But probably the chief reason is essentially the simple one. Every Tory back bencher knows that the present pattern of the Government cannot remain fixed for very long. Sooner or later Mr Churchill is bound to make way for someone—almost certainly for Mr Eden—and Mr Eden's government will certainly draw less heavily on the Lords and on the party old stagers and more readily on the men of talent. Moreover, Mr Butler, the leader of the party reformers, is now so firmly installed in one of the citadels of power that the battle can confidently be regarded as won. The younger Tories can afford to wait and to occupy themselves in the meanwhile trimming their elders' bills and baiting their opponents.

* * *

Wages and Salaries

The TUC has declared that the "inequity" of the Budget will compel trade unions to demand wage increases; Mr Deakin's encouragement for a forward wage policy is all the more significant by reason of his reputation as a responsible moderate; and the moral support provided for a new and ambitious round of wage claims by Mr Gaitskell's speech in the Budget debate is not likely to have been wasted.

Any argument which justifies wage increases by reference to the Budget is an argument from the hardship of the lowest-paid worker; but wage increases in practice cannot be limited to those for whom the net result of the Budget is genuinely a reduced standard of living. The principle that differentials must be retained can be counted on to ensure that any increases justified by the appeal to hardship will be matched sooner or later by claims on behalf of the higher-paid beneficiaries of Mr Butler's tax reliefs. The notion of a proper hierarchy of incomes does not, however, extend to the professional classes. Mr R. G. D. Allen's memorandum of evidence, which formed part of the British Medical Association's case before Mr Justice Danckwerts, showed in a nutshell the economic decline of the professions, relatively and absolutely, since the war. Real disposable national income per head increased by 7 per cent between 1938 and 1950; wage earners gained between 20 per cent and 25 per cent without counting benefits under the social services; and property incomes and professional earnings declined by roughly 25 per cent apiece.

The Danckwerts award, interpreting the recommendations of the Spens Committee, ensures that the medical profession shall be no worse off than other professions; it does not by any means restore the family doctor as such to his prewar place on the economic ladder. Even this measure of improvement, however, has been enough to draw from Mr Bevan the extraordinary statement that "the gap between professional awards and manual workers' standards is getting too wide." (The appropriate comment, after all the levelling of the past twelve years, is that made by the Red Queen to Alice: "I've seen hills compared with which this is a valley.") Of course an average increase of £10 a week looks large to workers whose total earnings fall short of that sum.

A great idea...a
DAKS
town suit

This town suit is an asset to any business man. Superbly tailored in the finest worsted, it gives you the comfort-in-leisure for which Daks are renowned. Choose in a single-breasted style also if you wish—from a wide range of cloths specially woven for Daks in a variety of patterns. And remember the handsome reduction in cost to conform with revised Purchase Tax.

SIMPSON TAILORED

But objectors to any perpetuation of the differential between professional and manual earnings should ask themselves whether a community urgently needing high professional skills is likely to get them from professional workers reduced, over years of attrition, to the artisan's economic level. Too high a price can be paid for the equalitarian's "social justice"—or class animosity.

* * *

The Exile of Seretse Khama

Two British governments have now decided that Seretse Khama cannot be chief of the Bamangwato tribe in Bechuanaland because he has a white wife. The present government was in no way committed to the action of its predecessor; on the contrary, while it was in opposition it was critical of Labour's handling of the affair, and Lord Ismay righted the wrong which the Labour government had done to Tshekedi Khama. But even he, who in order to do justice to an individual dared to go against the advice of independent observers, was convinced that Seretse ought not to go back to his native land as chief. When his tribe has settled down under a new chief he may return, like his uncle, as a private citizen, provided he gives a similar undertaking not to engage in politics—an undertaking which so far Seretse has refused to give.

This unanimity of Labour and Conservative governments, when a change of government would have allowed a change of policy without loss of face, makes it clear that there are strong reasons for Lord Ismay's decision, which is now supported wholeheartedly by his successor, Lord Salisbury. What is so perplexing about the whole affair is that no convincing reasons have ever been made public. If Seretse's tribe had persisted in its original opposition to his marriage, that would have been reason enough. But all the reports go the other way. The tribe apparently will have no one but Seretse, and it is far from certain that Lord Salisbury will be able to persuade the deputation of Bamangwato elders now on its way to England that they must choose another chief. There would also be good reasons, though not so good, for excluding Seretse if the government feared resentment and trouble among the other tribes of Bechuanaland and in Basutoland were Seretse to return as chief with a white wife. If this is the case why not say so?

There remains the effect of his return on opinion in South Africa. Lord Salisbury denied emphatically in Monday's debate that there had been any communication with the Union government or that the decision was taken to placate extremist opinion in the Union. No one would seriously make either suggestion. But has the Government been influenced by a desire to strengthen the position of the moderates in the Union, who, as Lord Salisbury himself pointed out, would see a rallying of opinion in favour of the extremists were Seretse to return? If so, then it is a bad reason for excluding him, because it is a reason that no British government would want to make public; and in a case like this, where both individual rights and tribal wishes are being denied, the Government's reasons should not only be convincing to itself, they should be clearly and publicly stated.

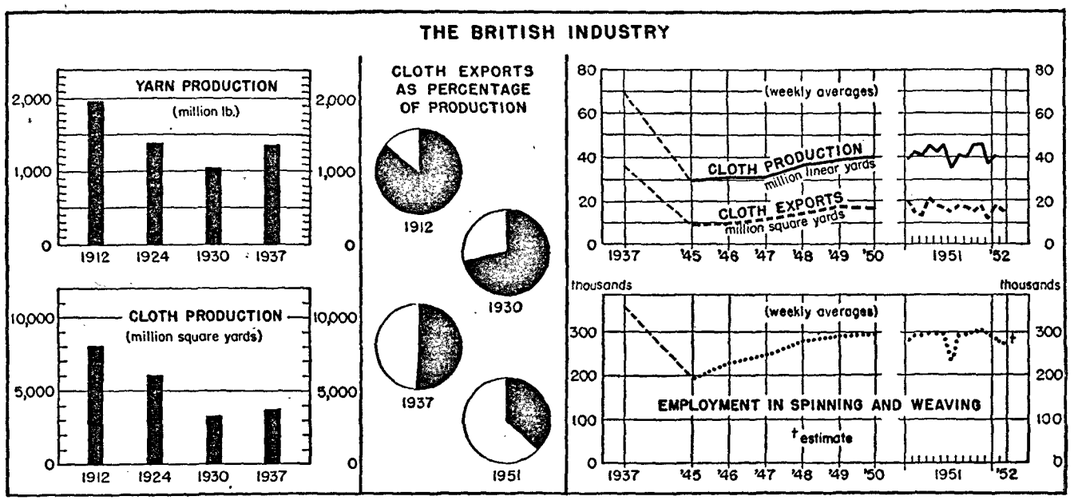
* * *

London Talks on Trieste

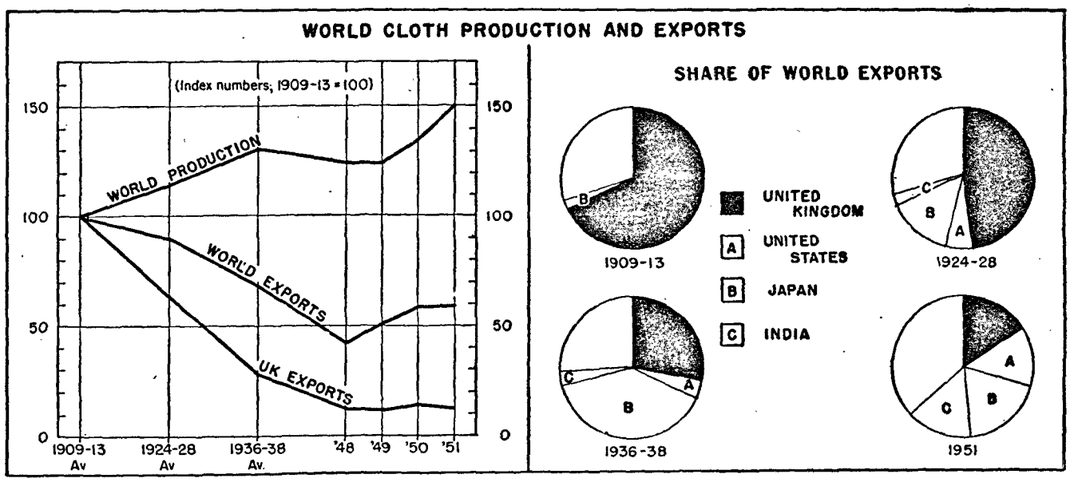
The past week has brought nearer a basic change in the administration of Zone A of the Free Territory of Trieste, but it has probably seen the ultimate solution to the problem of the two Zones pushed still further away. Talks began in London on Thursday between the Americans, British and Italians about giving Italy a greater share in the administration of Zone A, and possibly, later on, in the military responsibility for it. On Monday Marshal Tito made a brilliant but bitter speech, rejecting the allies' right to make any change in Zone A without his consent. The London talks can hardly fail to bring the Italians into it in some way or other, but this very fact prejudices their case with Jugoslavia. The justice of Italian claims at least to share in its administration is now generally recognised.

Marshal Tito has created new difficulties by his uncompromising attitude. There is no wish whatever in the west to add in any way to his internal difficulties, whatever they may be; but his assertion that nothing should be done in Zone A without his consent is against the logic of present events and against every western interest. Action is now being taken only because the long drawn-out failure to reach general settlement has created an intolerable atmosphere in Zone A. In his speech Marshal Tito went out of his way to attack the view expressed in *The Economist* that the acceptance of Italy as an ally of the west has changed the situation in Trieste; by refusing to face this fact and by calling Signor Gasperi—of all men—a Fascist, he showed less than his usual realism.

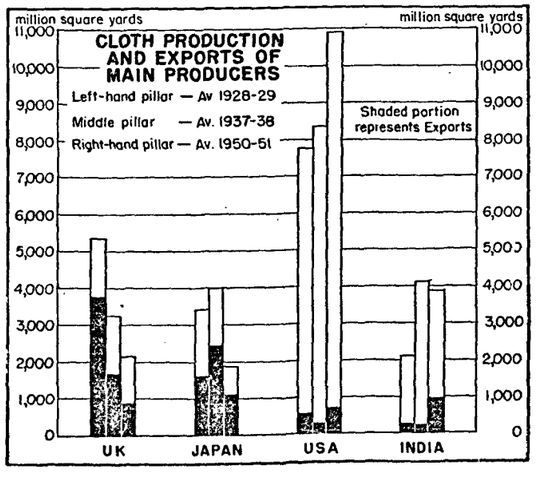
Every effort must now be made to ensure that creation of a new regime in Zone A does not wreck the chances of a final settlement. This depends in the last resort on relations between Rome and Belgrade. To Marshal Tito's heartfelt but unfair question: "Why do you want us to be always the ones to pay out of our blood and material resources?" the Italian Prime Minister has replied that the London talks are "prudent and limited in scope," that Italy wants, "in the case of the Free Territory, no renunciation but also no adventures," and that "as far as we are concerned, we ask of you nothing which humiliates you, nothing of that which belongs to you, nothing which can prejudice the hoped for collaboration between (our) two peoples." This was a statesmanlike approach in very difficult circumstances, and some of Italy's own hotheads would do well to ponder over it. Likewise Marshal Tito should understand that what he says and does will deeply influence the prospects of maintaining a reasonable and democratic government in Rome.



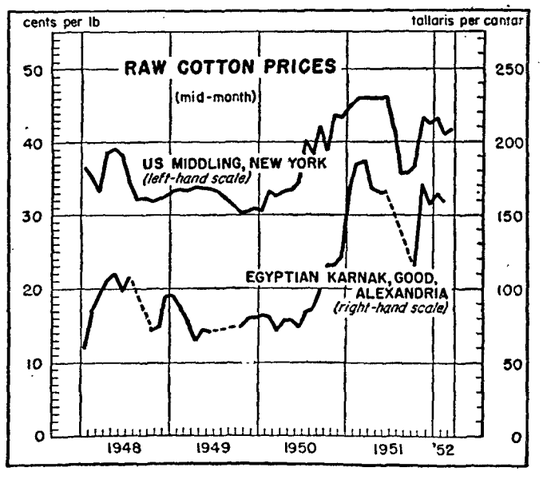
* * *



New Stage in Tunisia



The new French reforms proposed for Tunisia run the risk of proving too little and too late. That is not because they are inherently unreasonable, but because they have been made only after riots and arrests have embittered nationalist opinion; proposals that might have had a fair chance of acceptance in December look quite different the following April. At the same time, it is worth a good deal to have brought to an end the indecisions of successive gove[illegible]om [illegible]ared in Paris and for the new Resident-General, M. [illegible] BBC [illegible]anised cloque, to have taken bold and successful action[illegible]s static [illegible]tees, in has the reputation of being progressive as w[illegible]e cost of [illegible]rie[illegible]ell intelligent as well as confident. If, as he [illegible] [illegible]belie become as impossible to bridge the gap betw[illegible] [illegible]r[illegible]een the Neo-Destour ministry of M. Chenik as for the British and the late Wafd government in Egypt to meet on common ground, the unfortunate events which have led to the designation of M. Baccouche as the new Prime Minister may yet prove the beginning of a measurable step forward.



Meanwhile, the approach of fifteen Arab and Asian states to the Security Council has yet to be accepted or rejected. Even the acrimonious international debate as to whether the Tunisian dispute is admissible to the Council's agenda or not can hardly fail to fan the flames of nationalist irritation in Tunisia itself. On purely legal grounds the French are certainly justified in denying the Tunisian right to be heard, and some recognition of this fact appears to be shown in Syrian and Lebanese hesitations about backing the claim. On the other hand, as its Pakistani sponsors in effect assert, a move forward in the political evolution of North Africa is now inevitable and, if it cannot be achieved through negotiation and agreement by those on the spot, there is a case to be made for focusing on it the attention of others. Once Libya had achieved independence, some change in Tunisia became

THE COTTON INDUSTRY

only a matter of time. It is a direct interest of the free world that this change should take place peacefully.

The only way in which this can now happen in the foreseeable future is for the new French reforms to be accepted and made workable. It may be said in their favour that they at least reaffirm the sovereignty of the Bey and accept the principle of gradually creating a responsible Tunisian Government. The Resident General's powers are to be restricted and Tunisians are to assume much greater responsibilities in the civil service. These proposals do not meet Tunisian claims for an immediate national assembly based on universal suffrage. But it is unlikely that this demand would receive the support of all the more moderate elements in Tunisia at this stage, provided that a sincere advance is begun in other ways. A solution in Tunisia is not unattainable, if both sides can be brought to respect each other's intentions.

* * *

Ignoble Economics

The Lords had intended to debate the economic situation on Tuesday, but they fell to quarrelling instead. Lord Pethick Lawrence made the now familiar attack on Lord Woolton for having promised that the food subsidies would not be cut. Whatever the truth about whether or not Lord Woolton offered his resignation, and whether if offered it should have been accepted, Lord Swinton's defence of him hardly helped Lord Woolton or the Conservative party. He claimed that the Government had to change its mind when it discovered what a "terrible mess" the country was in. "Never," he added, "was a country kept so much in the dark." When this statement was challenged by Lord Pakenham he lost his temper.

However annoying Lord Pakenham's interruptions, they had right on their side. It was during the month of the election campaign that the gold and dollar reserves ran out most rapidly. The normal information was published, the gold and dollar reserve once a quarter and the balance with the European Payments Union once a month. Mr Gaitskell did not minimise the dangers in his speech to the bankers early in October. It is true that the electioneering speeches of Labour candidates did not stress this uncomfortable aspect —but, though there were honourable exceptions, the majority of Conservative candidates also ignored realities in favour of vote-catching promises about housing, food and the social services. It is good party politics to be shocked at one's opponents' party politics; but a more constructive debate was to have been expected from the House of Lords.

Only one or two peers considered seriously whether the Budget was adequate for its task, and these were not among the chief spokesmen of either Government or Opposition. If the Conservatives were unconvincing in their defence, Labour peers were even more so in their effort to reconcile the claim that the Budget is inadequate with the claim that it was wicked to cut the food subsidies.

* * *

The Logic of Steel Prices

In moving that the Order raising iron and steel prices should be annulled, Mr Strauss, the former Minister of Supply, made a triple attack on his successor. He claimed, first, that Mr Sandys's statement that he had had no disagreement with Iron and Steel Corporation was untrue; he challenged the Minister to deny that Mr Hardie had written to him on January 24th, on behalf of a unanimous corporation, opposing an immediate rise in steel prices. Mr Sandys refused to produce this letter; his summary of the correspondence was a strange story of Mr Hardie's changes of mind and still did not make clear what the rest of the corporation had thought. Mr. Sandys seemed to be unnecessarily secretive, but at least there is no doubt that his only final disagreement with the corporation concerned the subsidy on imported finished steel.

As the second part of his attack, Mr Strauss accused the Government of having political motives for raising steel prices; it was trying to increase the profits of the steel industry so that it would be easier to sell back to private owners. Even if this were true would it not be a fair retort to Mr Strauss, who made the stock almost unsaleable by announcing that it would be renationalised at the original compensation price when Labour was again in power? But Mr Sandys had no difficulty in showing that, to set against gross profits of about £60 million, the industry would have to meet increased costs of about £70 million on home and imported supplies. At least it will be granted that he is under no obligation to make the industry less profitable.

Finally, the Opposition maintained that the price increases were bad for the economy. Their arguments were childish. Higher steel prices in the home market will check demand and help to divert supplies to rearmament and to the engineering exports on which solvency depends. While demand for capital goods is so strong in export markets, and while British steel prices will still compare favourably with those of other countries, it is clearly nonsense to talk of impairing Britain's competitive power. With the balance of payments in its present state, British exports should be sold as dearly as possible. A more proper criticism of the Government would be, as indeed Mr Sandys himself said, that the increase in steel prices is too little and too late.

* * *

Conflict over Farm Prices

The schedule of agricultural prices for 1952-53 has been delayed far beyond the normal date because the Government and the farmers' representatives cannot agree. The deadlock is hardly surprising. The farmers' unions have been pressing for a substantial increase in prices in order to offset a substantial rise in costs whose existence the Government cannot deny. The Treasury, however, has had the best of reasons for opposing the farmers' claims with all its might. Not only is the Government pledged to a general policy of financial retrenchment, but large concessions to agriculture are especially awkward when they come so soon after the cut in the food subsidies. To give the farmers their way would necessitate further rises in food prices beyond those now allowed for—with obvious effects on the Government's popularity.

This year's price negotiations have been a version of the irresistible force meeting the immovable mass—and at the time of writing it is uncertain which will prevail. At any moment a compromise may be reached which receives at least the grudging acceptance of the National Farmers' Unions, and in any case the announcement of the new prices cannot be much longer postponed—the delay is already vexatious to farmers.

Whatever the result, one point requires immediate emphasis. It is under the Agriculture Act the exclusive responsibility of the Government to determine farm prices each year. The Government's obligation to the farmers' unions is limited to preliminary consultation, and its final decision is meant to be made in the interests of the nation as a whole, not a bargain struck between equals. The late Minister of Agriculture allowed a convention to grow up that the price schedule should be such as to obtain the blessing, or at the least the acceptance, of the farmers' representatives. This is an objectionable convention from a constitutional standpoint. It means in effect that a Minister who flouts the farmers' wishes will lose his prestige with the industry for which he is responsible—and therefore may well find his office almost untenable. This year's conflict should at least have removed all doubt that the whole system of agricultural price-fixing needs overhauling, both from the farmers' standpoint and in the interests of good government.

* * *

The Base at Antwerp

At the end of last month the Belgian Parliament became strangely absorbed with the question of "Operation Gondola," the proposed British military supply base at Campine, behind Antwerp. This will be in future the main and only British base of its kind in Europe. The installations to be built at Campine will, in fact, be Europe's main assurance of the permanence of Britain's military commitment on the Continent. It is important because it enables the British to shorten and strengthen their lines of communication, which at present lie through the strategically vulnerable ports of Bremerhaven and Hamburg. It is, or has been, controversial because Communist and ex-Fascist ("Dinaso") circles in Belgium chose to make it so.

The arrangement, which was agreed in principle by the two countries eight months ago, means that Belgium will provide four thousand acres free of charge and one-tenth of the cost of the installations (about 130 million Belgian francs) in return for an immediate gain in morale and security—since the defence of Belgium becomes more obviously important. In the case of American-financed infrastructure on the Continent, the country of location has to contribute at least 20 per cent of the cost. There is also a future gain in the installations themselves (warehouses, workshops, fuel tanks, dock and railway improvements, etc.) in the event of an east-west *détente*.

The Belgian Government tried to complete the transaction without reference to Parliament, on the grounds that it was covered—which it clearly was not—by the clauses in the 1946 Anglo-Belgian agreement concerned with the communications of the British army of occupation in Germany. But extremist agitation, and the underlying dislike even in moderate circles of assuming international obligations, forced them into last month's debate. The result was an almost unanimous and cordial welcome when the benefits to Belgium became as clear as the benefits to Britain.

Delhi Faces Economic Facts

Although the recent shake-out in Indian prices has sometimes been referred to as a slump, it has in reality been no more than a healthy readjustment which has done more good than harm. It is partly a reaction to the government's more determined deflationary policy following the agreed decisions reached at the Commonwealth Finance Ministers' Conference last January. Indian wholesale prices have now fallen by about 20 per cent from their peak to a level around the average before devaluation in September, 1950. The main results have been to catch out the speculators and, so long as the present trend back towards stability continues, to put the economy in a better state to meet a real slump if it comes. The only lasting damage of any importance may be the falls in the prices of jute goods and cotton textiles, which imply an adverse movement in India's terms of trade.

The government in Delhi has done well to stand fast on the main lines of policy that it has been developing over the last few months, in spite of strong representations in the early stages of the recent "crisis" to reduce taxation, to abolish export duties and internal controls, and to make money more readily available. Admittedly, certain export duties have been reduced and import cuts have now been made in order to bring overseas payments into balance. But in general the government has, since last year, pursued a policy which has been consistently deflationary. It has produced a large budget surplus, raised the bank rate, stopped the Reserve Bank buying government securities at fixed rates, and tightened private bank credit, all at a time when industrial production and the output of cash crops has been rising.

These are bold and realistic policies, which suggest that the administration in Delhi is prepared to face economic realities with skill and determination, in spite of pressures from both the business Right and the political Left. What will be even more difficult for the government to decide, however, is the future division of resources between capital development and the meeting of current needs. Much of the American aid so far provided for India has had to go on food. If aid is to be increased in the coming years—as it is likely to be—courage will be needed to see that the maximum possible amount goes into capital development. Per-

Commercial History and Review of 1951

This week's issue of the *Records and Statistics* Supplement to *The Economist* includes the third part of the Commercial History and Review of 1951—the 89th of the series which began in 1863.

Part III consists of overseas economic reports and completes the review of 1951. Part I, which was published on February 16, provided a general review of British economic developments last year, and special articles on finance, investment, overseas trade and agriculture. Part II, published on March 15th, contained articles on all important British industries.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

Charges and the Ceiling

A year ago, Mr Marquand's balance between the total health service estimates and the ceiling of £400 million was very small, and it became even smaller in the course of the year with the arbitration award of £1 million to Scottish dentists. This year, it looked as if Mr Crookshank was going to have a bigger balance in hand but since the publication of the estimates the arbitration award to doctors, for which he has to thank his Labour predecessors, has knocked it for six.

Last week, in the second reading of the delayed National Health Service Bill, Mr Crookshank announced how the award would affect the ceiling. On the assumption that Parliament votes the money needed to implement the award, the back payments will be taken out of the account altogether. In other words, Mr Butler's surplus will be run down to the amount of some £30 million. When it is decided what doctors' remuneration should be in the new financial year, 1952-53, in the light of the Danckwerts award, the limit will be extended accordingly, and presumably a revised estimate will be submitted.

Mr Crookshank's nominal balance of about £8 million justifies his assertion that the new limit will not be very much higher than the old in the year 1952-53. But there is every prospect of higher costs next year. For one thing, the raising of the age limit for exemption from the charge for dental treatment to 21 and imposing no charge on examinations will cost about £1 million. More important is the steady increase in the cost of the hospital service. As the following table shows, the advances to hospital boards (for which incorrect figures were given in *The Economist* last week) have gone up inexorably from year to year:—

(£ Million)

	Total Advances	*Of which for Maintenance*
1949–50*	220·7	*210·0*
1950–51*	251·1	*244·0*
1951–52	274·4	*260·8*
1952–53	295·7	*285·7*

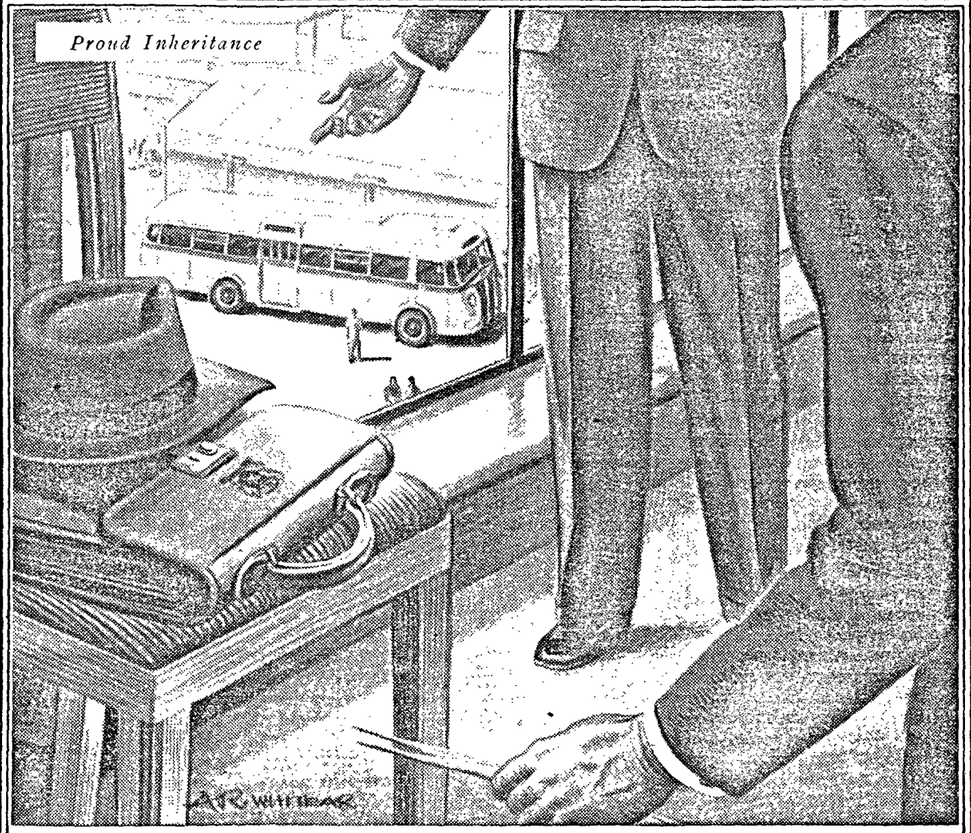
* Actual advances, except advances for maintenance, which are estimated.

Mr Crookshank has decided that the award to doctors should be borne by the taxpayer and not by the patient in heavier charges. But what is he going to do next year if the hospitals submit higher budgets merely to keep pace with higher prices? It may be that the charges will exercise a greater deterrent effect than has been allowed for in this year's estimates—from Mr Crookshank's speech it appears that the deterrence of the prescriptions charge is valued at about £5 million. But the margin in hand cannot be large, and there can be no confidence that Mr Crookshank can spare the taxpayer from yet more burdens without imposing further charges on the patients.

* * *

Constables and Congestion

The Association of Chief Constables, at a conference in Warwickshire last week, discussed the ever-growing traffic congestion in big towns. The improvements that they could urge upon the Government would touch only the fringe of the problem, which can hardly become less acute while the policy of reducing capital investment lasts. The Ministry of Transport, it is true, will be spending more on the roads this year; the estimate of £34 million shows an increase of £3½ million over the estimate for 1951-52. But the extra expenditure will be absorbed by higher costs and does not allow for constructional work that could help to relieve traffic jams.



A little can be done by applying the traffic regulations more widely. Waiting on both sides of the road slows down the traffic on the main streets and, in side streets especially, petrifies it into immovable blocks. The Minister of Transport's announcement on Monday that he is considering plans for extending "unilateral waiting" is welcome, though the designation of the streets in which waiting on one side only is permissible involves lengthy negotiations with the local authorities. It is to be hoped that the matter will be pursued with as much speed as possible.

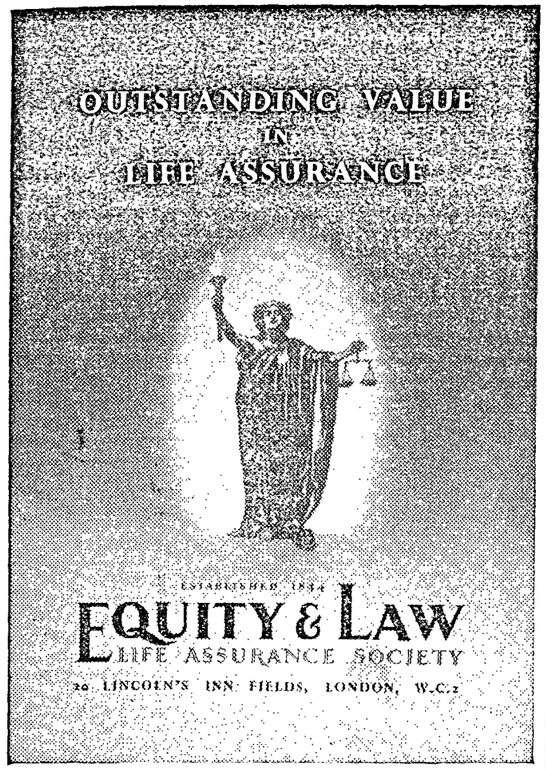
Any extension of the regulations involves another problem—the shortage of police to enforce them. For the sake of convenience, many motorists are prepared to run the risk of being fined for obstruction, and even to flout such regulations as the complete ban on waiting in "yellow band" roads. The existing police would be more effective if the fines that followed their prosecutions were heavier. But is it fair to impose heavier penalties for illegitimate parking while the facilities for legitimate parking are so inadequate—and are, if anything, becoming more so as bombed sites are returned to their owners? A census of parking in the City of London on a day in 1949 showed that the accommodation was just about half what was needed. But all the same, it was not fully used. If that were generally true of the big towns there would certainly be a case for sterner treatment of the unprincipled parkers who are a small proportion of motorists but who cause a disproportionate amount of trouble.

Party Issues

There is much in the present posture of affairs that is both annoying and perplexing to sincere and conscientious men of all parties. Few can feel that they have a perfectly clear and satisfactory path before them, in which they can walk without *some* degree of doubt, some regret, some feeling that they are sacrificing one object to another. . . . Those who love Free Trade much, but who love Conservatism more; those whose hearts are with Mr Cobden on one question, and with Lord Derby on all others . . . those, again, who desire a progressive policy on the whole, but who are favourable also to a fixed duty and to indirect taxation; those, finally, who deem the general views of the late Ministry to be sound, but who are dissatisfied with their style of administration, and who are anxious for a stronger and more comprehensive Government; are all more or less puzzled and uneasy as to the course which it behoves them to pursue in the impending contest. . . . We can keenly sympathise with the perplexities to which many earnest and excellent patriots will be exposed by this circumstance. We can well imagine that a Free-Trade candidate nominated by the revived League, and sound and strong upon this one question, but narrow, extreme, and incompetent on every other, might be opposed by a man whose general views were wise, moderate, and statesmanlike, but who had a special crotchet in favour of dispensing with the income tax by raising a revenue from imported grain. To thoughtful and honest electors who are environed with difficulties of this nature, we offer our full sympathy and our true appreciation. But we would say to them: Define distinctly what it is you wish, and what it is that is attainable. Ascertain clearly to your own mind what is your chief purpose, and then consider in what way that purpose can be best achieved. Is not the irrevocable establishment of our Free-Trade policy the first, the most urgent, and the most paramount object of the day?

The Economist
April 3rd, 1852

I shall recommend my Government to order more than a thousand!



It was one of the biggest orders for passenger vehicles that a British company had ever received; and coming as it did soon after the second Great War it showed the whole of Britain that her great reputation for quality was still intact. When the Netherlands Railways were faced with supplying their country with a completely new passenger vehicle system after the German occupation, they came to Crossley and ordered well over a thousand chassis from them . . . not because they had heard of the superlatively built vehicles produced for the Allied armies, nor even because of the fame Crossley engineers had won for advanced design (they built for example the very first British oil-engined bus in 1931): but because for more than forty years a policy of the highest possible mechanical standards had been faithfully pursued by the Company; a distinguishing quality which has always been associated with the famous name of Crossley.

Letters to the Editor

Equality and Equidistance

Sir,—A Note in your issue of March 29th criticises my speech in the House on March 21st. The amusing and untenable argument you adumbrate seems to be that because some parts of this island are rainier and hillier than others (features which man at present finds uncontrollable) therefore this island should not be treated as a unit for transport (which is controllable). Is there not a *non sequitur* here ?

You ask "Once one has exalted equality unconditionally above the rational use of resources, why stop at transport ?" Surely this not only begs the question but is also open to the grave objection that it imputes to me views (by both extension and limitation) which I did not express ; which are not necessary to my argument which was solely on transport and not on other things ; and which tend to mislead persons who have not read Hansard. Indeed, your question reminds me of the story about the man who jumped on a horse and rode off furiously in all directions at once.

My argument was confined to transport and was, simply, that it would be rational to treat this island as a unit for the fair distribution of essential resources, e.g. food and heat. This island is a unit in many ways, e.g. geographically, politically, economically and culturally as well as for defence purposes. Surely it is irrational to treat it otherwise than as a unit for the distribution of essential resources especially when this penalises its various parts and groups in a variety of ways: the fishermen, whose skill in naval warfare is an important feature of our defence ; the railways, for at present less fish is carried than is caught ; and the consumers who get less fish than they otherwise would get and pay more for it.

Perhaps I may venture to quote a brief extract from my speech, which you criticise, on the present system which damages our unitary community,

> economically, for the reasons I have indicated ; ethically, because it is wrong ; politically, because it is separatist ; and strategically, because it is a military and naval danger.

You ask "why stop at transport ?" My answer is, I did not say a word to affirm or deny stopping at transport ; transport is the matter we are discussing ; and other applications of the doctrines of equality can with more relevance be discussed in their proper places. One might perhaps, with equal relevance ask "why should outliers pay taxes for services which are in the main spent for the benefit of the large urban centres" but that, too, is another question to which a variety of other considerations apply.

Permit me to add, with respect, that it ought to be possible to discuss this matter without an observation like that which impairs the objectivity of your opening sentence.—Yours faithfully,

HECTOR HUGHES
House of Commons

A Swedish Contribution

Sir,—The review of our little symposium on "Wages Policy under Full Employment," in your issue of March 8th, contains a serious error. To imply that Professor Lundberg's liberalistic outlook is that of a Swedish Social Democrat must give people a very peculiar idea of our party.—Yours faithfully,

G. REHN
Swedish TUC

Sponsored Television ?

Sir,—In saying that sponsoring in television "is payment by commercial firms for the right to attach advertising appeals to some of the programmes" I think you encourage the confusion which has muddled recent controversies on all forms of broadcasting. You permit advertising in *The Economist*, but you do not conclude your leaders with the ejaculation "*Somebody's Mother isn't using Persil*," nor announce that your American Survey comes to your readers by the courtesy and at the expense of Stork Margarine. Yet that is what "sponsoring" commonly means,

Good fare can be appreciated more after a glass of DRY FLY SHERRY. It is the best appetizer at cocktail time.

HOLLIS & CARTER

and what the writers to the press have very properly condemned.

If the BBC were broken up into several competing bodies it would be quite possible (as the recent Royal Commission fleetingly mentioned) for advertisements to be allowed under the same restrictions as to honesty and propriety as all decent newspapers enforce today. The advertiser would no doubt be charged varying rates equivalent to "solus position," "against reading matter" or "classified," but that could have no effect on the character and nature of the programmes.

Anyhow, what is most essential is to discover some financial means of ending the existing monopoly. Historically, it is an accident; at present, its complacency strangles enterprise and new ideas, both intellectually and in entertainment. In television, which you were discussing, one of the most important officers proclaims a preference for stupid programmes with a sincerity that has to be heard to be believed. But those who could substantiate these charges most enlighteningly cannot speak for fear of retribution.—Yours faithfully,

AN OCCASIONAL BROADCASTER

Books and Publications

Mr Truman's Testament

Mr President. By William Hillman. *Farrar, Straus and Young.* New York. $5.00.

"Never," says the note on the dust-jacket of this remarkable book, "has a President allowed such a personal revelation while still in office . . . ." and this may well be one of the rare occasions when a publisher has more understated than overstated his case. Now that Mr Truman has announced that he will not stand for the presidency again, there is no longer any reason to regard the work with the suspicion accorded to campaign documents. It must be accepted as the gesture of a President who, feeling that he has nothing to apologise for, is anxious that the record should show the well-spring of his effort.

What Mr Truman did was to give to Mr William Hillman (an experienced newspaper correspondent who has had the self discipline and good sense not to attempt to improve upon Mr Truman with fine or fancy writing) a catholic collection of jottings in his diary, unpublished letters, memoranda and other private papers, such as a biographer years hence might have counted himself incredibly fortunate to discover and obtain permission to use. The President supplemented these documents with much intimate and often uninhibited talk with the compiler of the book, and this, too, was faithfully set down.

The object of the exercise is thus set forth in Mr Hillman's first sentence:

> President Truman said to me: "I want the people to know the presidency as I have experienced it and I want them to know me as I am."

There seems to be no good reason for doubting that this is indeed Mr Truman's motive. Moreover, many of those who have had other opportunities of verifying the accuracy of his instinct are likely, after reading this book, to conclude that this is one more instance when he has broken the accepted rules with considerable skill and to great advantage.

For the total effect is to present, with such plain truth that its authenticity cannot be doubted, the character of a man whom the American millions (and millions beyond America for that matter) will take to their hearts as a good man, a genuine man, a man of courage and conscience, who has brought to high office a faith and serenity that have been proof against every assault of sophistication.

There are sentences in the printed extracts from the President's diary which read like lines from a sentimental song. "I am always so lonesome when the family leaves," he unashamedly writes; and "I cannot help wanting to talk to my sweetheart and my baby every night." He writes out a prayer that

> . . . has been said by me—Harry S. Truman—from high school days, as window washer, bottle duster, floor scrubber in an Independence, Mo., drug store, as a timekeeper on a railroad contract gang, as an employee of a newspaper, as a bank clerk, as a farmer riding a gang plough behind four horses and mules, as a fraternity official learning to say nothing at all if good could not be said of a man, as a public official judging the weaknesses and shortcomings of constituents, and as President of the United States of America.

Nobody he has met in the White House or on the way to it has altered his belief in the Christian verities and in the power of goodness. "I hope," he told Mr Hillman, "we can make Stalin realise that we believe in that Sermon on the Mount and that as a realist he ought to do as he would be done by." And again: "What we are trying to do . . . is nothing in the world but gaining happiness for everybody."

In a fragment of talk on the folly of "preventive war" he says: "It is not war that is going to solve this thing, but morals and ideas." On atomic energy: "Ever since the cessation of hostilities I have had the Atomic Energy Commission busy seeking peacetime uses of the immense energy realised by the splitting of atoms." On his Point Four plans:

> How do you think this country was developed? England and France and Germany and Holland furnished the money for the opening of the West, for the building of the railroads. . . . I have talked to the Presidents of Brazil, Uruguay, Chile, Ecuador, Venezuela and Mexico and urged them to help find some way for the protection of proper investments, not on the basis of colonialism, not even on a guaranteed return basis, but merely that capital investment ought not to be confiscated when used to develop new resources and areas. We must do everything we can to help people everywhere get what they want in the way of modern goods to make their lives easier, and this would keep our industrial plant running to supply them. But they must get a chance to earn something so they can pay for what they buy. We want to help them to help themselves and in that way the whole world can prosper.

These were some of the big ideas of a man who has now been big enough to yield the presidency of his own accord.

The Stalinist Purges

Conspiracy of Silence. By Alex Weissberg. *Hamish Hamilton.* 509 pages. 21s.

Mr Weissberg, a former Communist of Polish-Austrian origin, was involved in the Stalinist purge trials of 1936-38, went through the ordeal of GPU interrogation during the ill-famed Yezhov period, "confessed" to all sorts of imaginary crimes, withdrew his "confessions," then, in 1939, was extradited into the hands of the Gestapo and has lived to tell the story.

His narrative has the ring of absolute authenticity. His explanation of the techniques by which the GPU extracted the confessions, although by now familiar from other sources, is still baffling in its simplicity. Unlike the Holy Inquisition and the Gestapo, the GPU did not as a rule inflict any violent torture upon its victims—only exceptionally did crude beatings occur. The modern version of the rack was a plain chair, on which the prisoner was made to sit for many days and nights, being constantly subjected to interrogation by examiners who worked in relays, until sleeplessness, pain in his muscles and dullness in his mind made him sign a "confession." Mr Weissberg describes these sessions with vivid realism and even humour so that the reader gets an almost physical sensation of being present at the scene. The book is also remarkable for the picture it gives of life in the prisons and for a long gallery of striking character sketches. As an account of an eye witness and a document of the time this is a first rate work.

When, however, the author attempts to draw the general background or to offer an explanation of the purges he is disappointingly unhelpful. He maintains that all the victims were in fact pro-Stalinists, and that the purges were reduced to an absurdity by design of the first defendants, who deliberately implicated Stalin's most ardent supporters. Such cases may have occurred. (Mr Weissberg illustrates the incongruity of the purge procedure by the story of a Kharkov doctor, who, when charged with the standard crimes and asked to name his accomplices, at once gave the GPU the names of all the doctors practising at Kharkov.) But surely the scale and momentum of the purges cannot be explained in this way. What is striking in Mr Weissberg's narrative is how many of the defendants, including Mr Weissberg himself, had in fact been "deviationists" at heart, Bukharinites or Zinovievites. This does not mean that the treatment to which the GPU subjected them was less criminal than Mr Weissberg asserts. But it does mean that the GPU and Stalin, if their objective was to destroy every potential nest of opposition—as it undoubtedly was—did not strike quite so blindly as Mr Weissberg believes.

Apart from this, his evaluation of the result of the purges is, not unnaturally, exaggerated and lacking in perspective. He repeatedly claims that the purges had destroyed the basis of Soviet industrialisation just as collectivisation had destroyed the basis of agriculture. Such statements may have seemed true in the thirties, especially to the victimised industrial and scientific managers, of whom Mr Weissberg was one; but they cannot be accepted as true in 1952. Nor can one seriously maintain that in the process "all these [national] minorities were liquidated." Finally, the author tells us that up to 1950 he still believed, in spite of all he had seen and gone through, that Russia was "the land of socialism." He does not explain what made him stick to this belief for so many years after his ordeal and what finally made him abandon it. But political theorising is not Mr Weissberg's strong suit.

Methods of Mapmaking

The Story of Maps. By Lloyd A. Brown. *Cresset Press.* 398 pages. 50s.

Cartography has recently been defined by a United Nations commission as covering all the stages in the making of a map—from the field to the printing press. The number of technical operations involved, ranging from astronomy and geodesy to offset colour printing, is large, and to explain them within the covers of one book requires wide knowledge and ability to co-ordinate. If it is proposed not merely to explain modern procedure but to trace its historical development, the task is probably beyond the resources of a single author. It is no doubt for this reason that no satisfactory comprehensive history of cartography exists. Clearly a selective approach and an acute sense of proportion are indispensable. Mr Brown states, rather disarmingly in view of the title he has chosen, that he will describe "how the job was done, stressing methods and apparatus rather than the end product, the hundreds of thousands of maps and charts produced."

This he proceeds to do with gusto and at considerable length. Though he begins with the astronomical knowledge of the Babylonians and ends with the experiences of the United States Army Map Service in the last war, his arrangement is not strictly chronological. Prominent among the topics he has chosen for detailed treatment are the geographical work of Claudius Ptolemy, the development of the sea chart, progress in the determination of latitude and longitude, and the history of national topographic surveys. This arrangement entails a certain amount of overlapping; at no point does an integrated impression of the process of map-making at any given period emerge; and the "end product" is buried under somewhat lengthy accounts of sextants, chronometers, wind-roses and so forth. No mention is made, incidentally, of modern developments such as wireless time signals or mapping from air photographs. Precise instruments certainly assisted in the production of more accurate maps, but the details of their evolution do not constitute the whole story of maps. Here and there throughout the book there are brief passages which do something, but not enough, to restore the perspective. The reader will scarcely realise that cartographers do not confine their labours solely to the production of topographical maps.

The author writes easily and with humour, and has the merit of recognising that he is narrating the works of individuals, with all their aspirations and shortcomings. His text is based on a wide reading in the voluminous literature of the subject, largely that published in English. There are numerous notes to each chapter and in addition a bibliography extending to thirty-two pages. There are too many slips and omissions for a work of this type, and there is one "howler" regarding representative fractions. It is doubtful whether the book will meet "the new interest in world cartography" to which he refers, and it must be concluded regretfully, in view of the enthusiasm and industry which have gone to making this book, that a history of cartography remains to be written.

Australia's Economic Difficulties

Inflation and Expansion. Essays on the Australian Economy. By D. B. Copland. *F. W. Cheshire*, Melbourne. 130 pages. 14s. 6d.

The somewhat insecure foundations of Australian prosperity, to which the recent import cuts have directed attention, give added interest to this collection of addresses by Sir Douglas Copland, who is as well known in this country as in his own for his outspoken beliefs.

The Australian postwar economy has been noted for its lack of balance—too much emphasis on the production of "inessentials" and too little attention to the basic industries. In brief, Australia's difficulties arise out of the over-ambitious policy of expansion almost at any cost—the attempt to do too much too quickly. But Sir Douglas rejects as a solution the suggestion that investment and migration should be slowed up. He thinks the cause of the trouble lies in inadequate productivity Moreover, his wool levy scheme as a means of immobilising inflated pastoral incomes deserved a more sympathetic reception than it got.

What of the other remedies? It is probably Sir Douglas's advocacy of dollar loans that has received most publicity in this country. The big question here is whether Australia could service them itself or whether it would have to draw on the resources of the sterling area as a whole. Wool and meat are possible dollar earners, but surely not on the scale that would be required. On the other hand, Sir Douglas is inclined to dismiss large-scale migration as a major source of strain and to overlook the problems of digesting this rapid inflow. Nor are his arguments against the revaluation of the Australian pound—at a time when it might have done some good—completely convincing. By itself, appreciation could not have stopped inflation, but as part of a concerted disinflationary programme it might have done more good than harm.

This is a thought-provoking book, but it is spoiled by too much repetition of insufficiently developed arguments. It would be remarkable, too, if Sir Douglas has had no second thoughts on at least some of the subjects he has discussed.

Town and Country

The Making of Our Towns. By Sir William Savage. *Eyre and Spottiswoode.* 189 pages. 21s.

The English Village. By Victor Bonham Carter. *Penguin Books.* 249 pages. 3s.

Sir William Savage has combined a career of eminent service in public health administration with long and close study of local history. The title of his latest work is misleading, for the book is concerned largely with the origins of the towns and the processes of their early growth. He gives in these pages no more than a quick glance at the consequences of the Industrial Revolution. Many of his conclusions will be familiar to readers of some of the individual town histories, but a merit of this book is its treatment of town life as an institution reflecting many of the forms and much of the character of English living.

The changing fortunes of the towns chart the country's history. The decay of the towns, for example, at the end of the Roman period, and their revival under Alfred, resulted from a combination of military requirements and economic and political factors, which transformed the English scene. Again, the absence in this country of the continental type of city state was not surprising in view of the greater centralisation of government. The corporate character of the English borough community in the Middle Ages served certain social and economic purposes, whose supersession led to the creation of a new type of urban organisation and society, only the beginnings of which are described in this book.

Mr Bonham Carter writes as a farmer with a sense of mission, who wants more people to know and understand the countryside. He deplores the disappearance of the village as a self-contained community, but he does not hope, romantically, for substantial redress. In his highly readable book, he urges measures to stem the migration from country to town. He appeals for greater diffusion of industry and the erection of more dwellings away from towns. Village craft industries ought to be encouraged. He examines the extent to which the countryside shaped English national character in the past, and believes it may, to the advantage of the health, good taste and stability of the nation, regain some of its lost influence. If only, he pleads, more people would take an intelligent, as distinct from a passing sentimental, interest in its former strength and present problems.

Many of those who are interested in local administration or English social history will find pleasure in reading these books, and some may find illumination. Both volumes are admirably illustrated and contain useful bibliographies.

Shorter Notices

Forms of Public Control and Ownership. By E. Goodman. *Christophers.* 142 pages. 8s. 6d.

The renewed debate about the best form of the public control of the steel industry and the promises of the Conservative Government to review the organisation of all nationalised industries makes the publication of an objective examination of the wider issues particularly welcome. Moreover, the most doctrinaire Socialists are beginning to doubt whether the centralised large-scale corporation, the "chosen instrument" of the Labour Government for the nationalisation of the basic British industries, is capable of realising their expectations for the democratisation of industry. The report on "Public Control of Industry" approved by the Trades Union Congress in 1950 and, more recently, various pamphlets of the Co-operative Movement, indicate a greater receptivity to alternative approaches.

The present short volume can obviously do no more than sketch out the main lines of development and illustrate the variety of forms evolved in this country for a flexible relationship of Government and industry, ranging from representative trusts to supervisory boards and development councils. But, within these limitations, it is a helpful and readable introduction for the general reader. The appendices, which include a list of institutions and organisation charts together with a selective booklet, will be appreciated by students of industrial organisation and by the adult education movement, for whom this book is the first postwar attempt to present these controversial issues in a broader and historical setting.

Handbook on the Income Tax Act, 1952. Prepared by Butterworth's Legal Editorial Staff. *Butterworth.* 395 pages. 27s. 6d.

A Comprehensive Index to the Income Tax Act, 1952. By A. C. Monahan. *The Solicitors' Law Stationery Society.* 160 pages. 15s.

These two publications provide valuable guides to the new Income Tax Act which comes into force tomorrow. That monumental statute incorporates in logical sequence all the statute law on income tax from the labyrinths of the foundation Act of 1918 and of Finance Acts ranging over more than thirty years; it has long been needed. The 1952 Act is still only a consolidating Act and makes no changes in the existing law. Nevertheless the mechanical feat of consolidation—if that is not too depreciatory of the care and ingenuity that went into the preparation of a Bill greater in length but less productive of controversy than any in modern times—calls in turn for effective signposts to the new arrangement of the income tax law. Conceivably, even the tax practitioner might get lost in its 26 parts, 532 sections and 25 schedules. Both of these works provide him with efficient indexes to the new Act, the text of which is reproduced in the "Handbook." It is an advantage to be able to turn so quickly to the right section of an Act that contains so much pain and obscurity. Yet, no sooner have the consolidators done their job than another Finance Bill appears to mar their work by proposing to repeal some sections of the new Act. It is almost enough to make the average taxpayer despair of ever knowing the tax law.

The United States in World Affairs 1950. By Richard P. Stebbings. *New York: Council on Foreign Relations. London: Royal Institute of International Affairs.* 500 pages. 35s.

The latest volume in the series of annual surveys of American foreign policy, and of the world events in which the United States is involved, covers a particularly complex period and is chiefly concerned with three problems: the increasing tension in the relations between East and West, concentrated on military collisions in the Far East as Communist China became the new centre of the struggle; the growing strain in the relations between America and the other countries of the free world at the same time as the North Atlantic alliance was being strengthened; and the internal divisions inside America over foreign policy which grew as the international commitments developed in complexity, and as American military strength increased. A true perspective of all these world events is perhaps impossible at such short range, but this is a remarkably dispassionate and comprehensive appraisal of a new phase in American foreign relations.

UNITED NATIONS

NEW BOOKS FOR BUSINESS EXECUTIVES

Economic Survey of Europe in 1951

243 pp. 11s. (11s. 7d. incl. postage)

Prepared annually by the Secretariat of the U.N. Economic Commission for Europe, the *Economic Survey of Europe* presents an authoritative review of current European economic problems and trends. Special attention is given in the present *Survey* to such problems as inflation and the continuing dollar shortage.

Statistical Yearbook 1951

617 pp. Cloth Bound: 55s. (56s. 3d. incl. postage). Paper Bound: 45s. (46s. 1d. incl. postage).

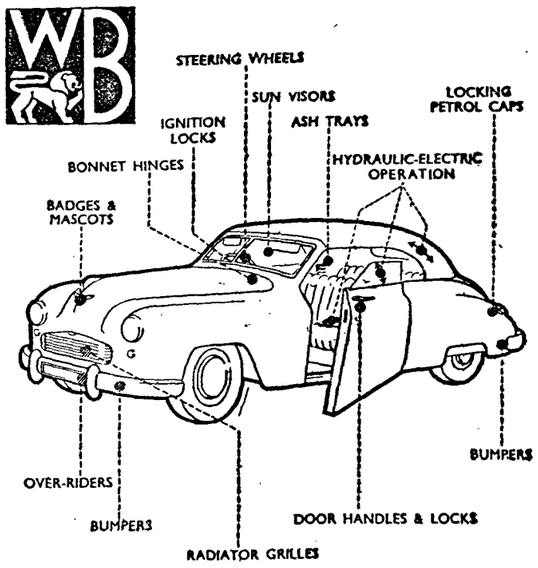
For your desk or library, a current source book of official facts and figures on world economic and social conditions. Information is included from 250 countries and territories on such subjects as manpower, agriculture, consumption, industrial production, mining, manufacturing, transport, communications, internal and external trade, wages and prices, finance, public finance, social statistics, etc.

Demographic Yearbook 1951

603 pp. Cloth Bound: 55s. (56s. 3d. incl. postage). Paper Bound: 45s. (46s. 1d. incl. postage).

The insurance actuary or the business librarian will find constant use for this collection of the latest available data on the world's population and its trends. The volume includes information on births, deaths, marriages, international migration and total population for the major countries and areas.

Measures for International Economic Stability



48 pp. 3s. (3s. 2d. incl. postage).

Prepared by five independent experts, this report on methods of dealing with the international impact of economic recessions has been the subject of world-wide press comment. The experts make a number of recommendations concerning international action to reduce fluctuations in the volume of trade and in the prices of primary commodities.

AMERICAN SURVEY

Aid for Senator Connally

Washington, D.C.

THE Administration began its attempt to get $7.9 billion, or a reasonable proportion of it, for next year's Mutual Security Programme on March 6th when the President sent his message to Congress. That evening in a broadcast he tried to take the programme out of party politics. A week later, when the hearings started in Congress, the four biggest guns—Mr Harriman, Mr Acheson, Mr Lovett and General Bradley—fired a salvo, on the first morning. Since then the artillery has been strengthened by the arrival of Mr Bruce and General Gruenther from France and Mr Batt from England.

Last year it was possible to say, and many of the officials concerned were prepared to admit, that the Administration's case had not been well prepared and that its presentation was slipshod. It would be impossible to say the same this year. All concerned were only too well aware of the danger to the programme in an election year and at a time when the public is just beginning to feel the effects of higher taxes, when the President is asking for still more and when the domestic military budget is over $50 billion. The strategy was carefully planned. The President started the campaign with a speech written in the language of extreme urgency—but delivered, in the opinion of many, in a voice which betrayed his misgivings about its probable impact—and the statements of the big four were alike in the earnestness with which they tried to impress the committees that, as Mr Harriman put it, this was one of those "moments in history when acts of omission are as fatal as acts of commission."

Next day Mr Harriman went alone to the Senate committee, the first of the witnesses to undergo cross-examination. No doubt he was ready for any questions that he thought might come his way. If there was a weakness in his case, it was one inherited from last year's artificial separation of military and economic aid for those countries, chiefly the North Atlantic Treaty group, which had embarked on rearmament programmes of their own. "Economic aid" had, in an attempt to recover some of the lost ground, been rechristened "defence support," but the new name did not deceive Senator Tom Connally for a minute and he immediately asked how much of the $7.9 billion was going to be spent on "economic aid," such as aircraft, tanks and guns.

Everybody had expected that the $1.8 billion of "defence support" would meet with stiff opposition and would have to bear the brunt of any reductions. Great stress had therefore been laid on its importance in all the prepared statements. General Bradley had pointed out that the tools of mutual security are military, economic and technical assistance used in varying combinations, where they would do the most good, and Mr Harriman had offered to show that for a fraction of the amount we are spending for our own military establishment we are assisting in the development of military forces with more men under arms—in Europe alone—than are in our own services.

But nobody had expected that it would be necessary to teach Mr Connally the elementary facts which had, incidentally, been clearly explained in an official document prepared by the staff of the committee of which he is chairman.

*

As things have turned out so far, indeed, the careful and detailed preparation of the Administration's case has been a waste of time. Senator Connally has shown no interest in eliciting the kind of information which a committee should, and most of the other members of the committee do, want to know. He has given nobody else much chance to ask serious questions, but has made the hearings into an integral part of his campaign for renomination in Texas. It has always been accepted that the tariff is a local issue, in the eyes of the Congress of the United States; that the Mutual Security Programme should become one too is new.

The Senator will be 75 in August, and was first elected to the House of Representatives in 1916, moving up to the Senate after the elections of 1928. If he is younger than some of his colleagues and not yet past the age when many men have done useful work, he has at least reached the moment when he could retire with what laurels he has been able to collect. And, thanks to the care with which his important speeches have been written since time brought him the chairmanship of the Foreign Relations Committee, the laurels would not have been inconsiderable. But he is now trying to throw them all away in order to meet the first serious challenge he has ever had to face for the Democratic nomination in the Texas primary election. Senator Connally may be right in thinking that his state is tired of foreign aid, hand-out programmes and all the other policies he is now denouncing. But he helped most of them through the Senate, his votes on them are a matter of record, and it is hardly likely that Texas is too stupid to see through his present manœuvre.

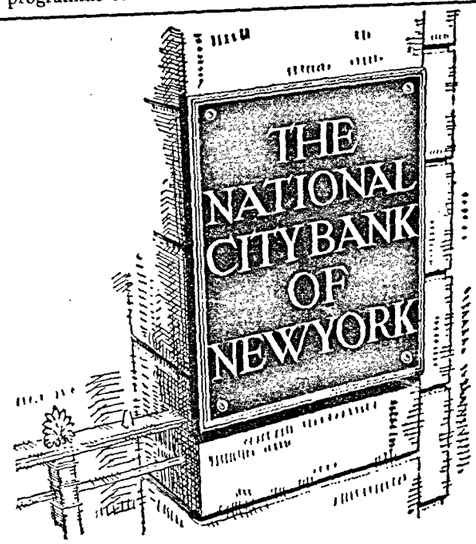
Senator Connally's trouble is that Texas has changed a great deal since it first sent him to Washington and that ten-gallon hats and flowing white manes no longer represent it. He has seldom taken the trouble to go back to study the new cities of Houston and Dallas, the spreading oil industry, and even the modern cattle ranches which have turned Texas into an industrial state, to whose inhabitants Mr Connally is an anachronism. As he is being opposed by a young man—Mr Price Daniel, the Attorney General of Texas—able to express the southern conservative philosophy with considerable vigour, his present moral somersault may not do him any good. He may well lose both his Senate seat and his reputation in his urgent desire to come back to Washington for another six years and decay in harness.

As long as Senator Connally carries on his present circus, and his is the committee which makes news, the Mutual Security Programme can hardly be treated seriously in any committee. Argument is not over whether $7.9 billion is too much or too little to carry out its aims, something of which nobody can be sure, but over the size of the cut which will be imposed and where it will fall. There are plenty of people who understand that, from the point of view of American self-interest, the largest amount of "defence support" that Europe can digest should be provided first, that as many arms as Europe can use should be the next priority, and that the domestic military budget should take third place. But nobody dares to say so and, if anybody did, the three Services would rise to defend their own vested interests.

The pattern of the Administration's presentation has, indeed, for this reason, among others, become somewhat stereotyped. So many inconvenient problems have been evaded ever since the first days of the Marshall plan, and so many half-truths have been accepted as dogma, that advocates of the case now have to work and argue in a restricted field. And familiarity with the advocates themselves has bred something like indifference to their arguments. There was a time when the Chairman of the Joint Chiefs of Staff had a visible and immediate effect when he appeared before a committee to champion any legislation. But General Bradley has been used too often. He is now treated like any Cabinet officer when he speaks to committees, and suspected, like them, of trying to further some slightly nefarious cause of his own.

It was no doubt the novelty of General Gruenther's face rather than anything new he had to say—it is hard to see what startling news he could have brought from Paris—that made such an impression. The General, alone among the Administration's witnesses, has not, in the past, taken a hand in selling those policies which are now causing Mr Connally so much trouble back home. The Senator was publicly polite to him, and that makes the General unique at the moment in Washington. But it remains to be seen whether General Gruenther's arguments will succeed in holding the cuts in the programme to a reasonable figure. He may well find, in the end, that the result of his trip has been that Congress will insist that he must succeed General Eisenhower in command of an army whose effective strength it has deliberately undermined.

Despite all the talk of cutting this year's Mutual Security Programme to ribbons, however, its fate probably depends on the progress of General Eisenhower's presidential candidacy between now and the time when the votes in Congress are taken: nobody wants to be in the position of destroying the policy of the man who may be his party's candidate. After the New Hampshire and Minnesota primary elections, the Republican threats against the programme became muted, and nothing that happened in Wisconsin or Nebraska is likely to revive their previous stridency. So the reductions, although considerable, may not be so great as was once feared, or as Senator Connally's side-show would suggest.



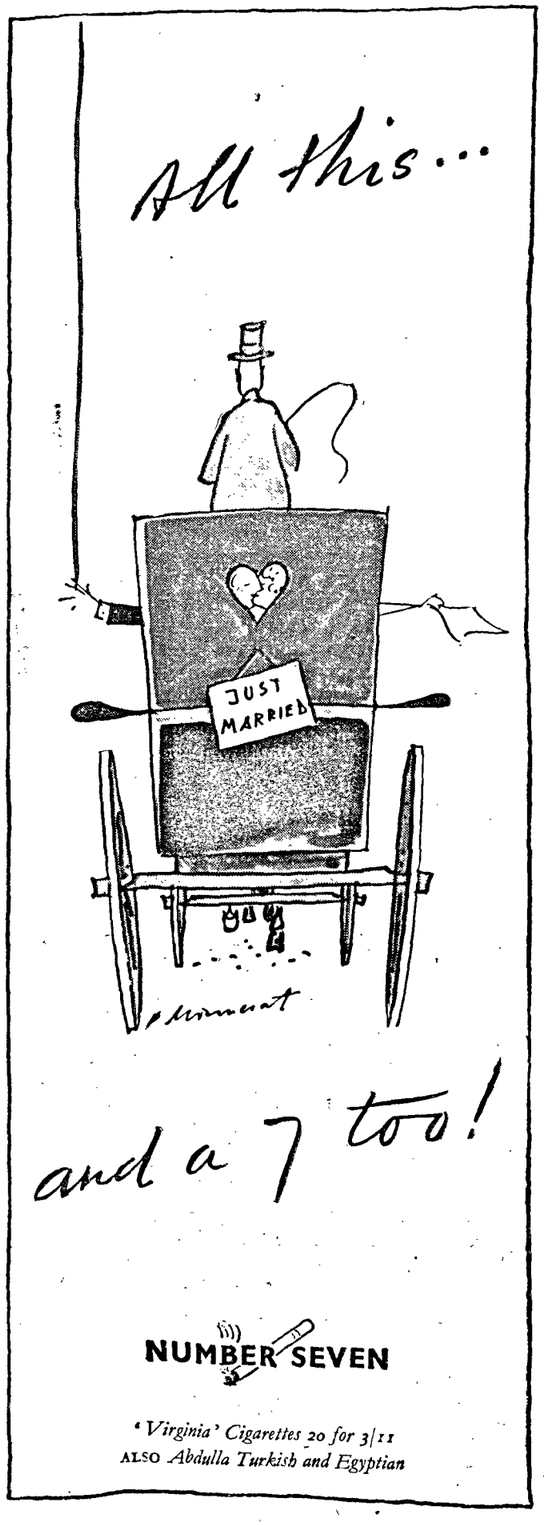
"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

American Notes

Mr Truman Steps Down

Mr Truman's decision not to run for the Presidency is in keeping with the good sense, modesty and courage with which he has met most of the big problems of his period in office, and his last months may be marked by a revival of the good feeling which welcomed him when he was catapulted into the White House in 1945. Nearly eight such tumultous years are trial enough for any man, and whatever the domestic failings of his Administration, Mr Truman's place in history has been made more secure than his enemies will admit by the revolution in America's international role which he helped to bring about. The likelihood that General Eisenhower, and not Senator Taft, will be the Republican candidate, and that therefore there will be no reversal of his foreign policy undoubtedly helped the President to lay down his burden with an easy conscience.

A great deal of political bitterness, both in the country and in the Democratic party, will evaporate now that the President has made it clear that he does not consider himself



World-wide banking

Businessmen with international interests rely on a bank whose services are world wide. The National City Bank of New York provides a global network of 54 branches, as well as banking correspondents in every important centre of the world.

The staff of the London branches are experienced not only in British banking, but also in the financing of overseas trade, and are uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, a world-wide organization stands at your service.

THE NATIONAL CITY BANK OF NEW YORK
(ESTABLISHED 1812)
Incorporated with limited liability under the National Bank Act of the U.S.A.

LONDON OFFICES: CITY: 117 OLD BROAD STREET, LONDON, E.C.2. WEST END: 11 WATERLOO PLACE, LONDON, S.W.1

indispensable—a temptation from which even greater men have not been immune. The Democrats are free to set about repairing the split in their southern ranks which, had Mr Truman run again, might have gone beyond mending, and to make a new start with a candidate completely divorced from the scandals which have weakened the present Administration.

The field is thrown open to a whole host of Democratic candidates, something which has not happened since 1933, when Mr Roosevelt first entered the White House. Senator Kefauver and Senator Kerr, clashing in Nebraska, have the advantage of being the first to show their paces, but most observers give a better chance of winning the race to Governor Stevenson of Illinois, the President's own choice to succeed him and a man whose qualities have won him the esteem of southern politicians as well as the votes of workers in the vital industrial cities of the north.

Mr Stevenson is thought to be genuinely reluctant to run and sincerely anxious to finish his job of reforming the government of Illinois. With some reason, he may also regard the Democratic nomination this year as a rather barren honour. For Mr Truman's withdrawal and the probability that the Democrats will enter the campaign a united party may persuade even the most hardened Republican politicians that the only candidate who can assure them victory is General Eisenhower. A contest between General Eisenhower and Governor Stevenson would take place on a high level and be a refreshing change from the stale and unprofitable arguments between Senator Taft and Mr Truman which have become so familiar during recent years.

* * *

Taft Holds His Own

Even Senator Taft's manager had admitted that, if the Senator did not do well in the Republican primary election in Wisconsin last Tuesday, he "might as well get out" of the contest for the presidential nomination. For in Wisconsin, and Nebraska too, the Senator is almost as much a "favourite son" as in his own State of Ohio and if he could not win there, he could not win anywhere. In Wisconsin he had the whole-hearted backing of the local Republican machine and he fought with even more thoroughness than usual. He held his own in that round and in the one in Nebraska, which had its primary election on the same day, he gained a few points.

In Wisconsin Mr Taft obtained 24 of the State's 30 delegates to the Republican nominating convention, after having cautiously announced that he would regard anything over 20 as a victory. The other six have gone to Governor Warren of California; if he does not need them, they are promised to General Eisenhower, who was not entered in Wisconsin and has therefore lost little by Mr Taft's far from overwhelming success there. The General's supporters are claiming that the Senator was in fact defeated, for the combined total of voters who preferred Mr Warren or Mr Stassen (who had also associated himself with the General) for the Republican nomination was over 100,000 more than the number who chose Mr Taft. But there is truth in the Senator's contention that a proportion of Mr Warren's supporters were Democrats, taking their chance of getting in a blow at Senator Taft. For in Wisconsin voters can participate freely in either party primary, and in the Democratic contest there was no serious rival to Senator Kefauver.

In the Democratic primary in Nebraska Mr Kefauver did, however, have a full-strength opponent, Senator Kerr of Oklahoma, originally fighting as a stand-in for Mr Truman, but all out for himself once the President retired. Senator Kefauver added to his reputation by winning handsomely. Neither Senator Taft nor General Eisenhower was entered in the Republican primary in this State, but supporters of both spent a great deal of energy and money urging voters to write the names in on the ballot papers, a practice not permitted in Wisconsin. Write-in votes gave the General his triumph in Minnesota, but in Nebraska it was Senator Taft who did best out of them, and here he can claim a clear victory over General Eisenhower. Mr Harold Stassen, the official Republican candidate in Nebraska, got fewer votes than either the Senator or the General. Mr Stassen's overwhelming defeats there and in Wisconsin—he won both in 1948—have knocked him right out of the Republican ring.

* * *

Wilson Through the Ceiling

Mr Charles Wilson, as head of the Office of Defence Mobilisation, was responsible both for mobilising and for stabilising the economy during the rearmament period. In his judgment a stoppage of steel production would do more harm to that economy than would an increase in steel wages and prices. He came back from his hasty visit to the President in Florida a fortnight ago under the impression that he had authority to prevent a strike by promising such increases in steel prices as were unavoidable, but no more, if the steel companies were to be induced to accept the Wage Stabilisation Board's recommendations for higher pay for steel workers. There is much argument about the exact amounts that would be involved. In Mr Wilson's opinion the recommendations broke through the ceiling on wage increases, supposed to cover rises in the cost of living, and therefore justified breaking through the ceiling on price increases, supposed to be allowed only when a company's profits had dropped to 85 per cent of the 1946-49 base period.

However, when President Truman got back to Washington, he was besieged by outraged stabilisation and price officials, nominally subordinates of Mr Wilson's. They explained that the board's recommendations did not, in their view, go through the wage ceiling and that, in any case, the steel companies' profits were quite big enough to enable them to pay the increase. Higher steel prices, these officials insisted, would make a mockery of price control. The President then decided that the possibility of an increase in steel prices should be considered only after an agreement on wages had been reached, instead of the two being negotiated at the same time. Since the trade union so far refuses to budge from the board's recommendations and since the company refuses to pay higher wages unless it is guaranteed much higher prices, this makes a settlement difficult. Collective bargaining is going on but, at the time of writing, a steel strike seems very possible next Tuesday.

Meanwhile, however, Mr Wilson himself went through the ceiling, in a dignified manner, and resigned. He felt that it had been made impossible for him to do his work and that, in over-riding him, the President had given in unfairly to pressure groups. The most noticeable pressure in this case came from labour, always suspicious of Mr Wilson's sympathy for big business. But the President was also under pressure from Congress to try to settle the steel dispute without a price increase, which would give a new twist to the inflationary spiral and make Congress feel that it was useless to renew the Administration's power to control wages and prices.

* * *

Investigators Fall Out

Hot water seems to be the only ingredient of federal housecleaning available to Mr Newbold Morris, the President's special investigator of corruption. Mr McGrath, the Attorney-General, whose assistant Mr Morris technically is, has told a Congressional committee that he may refuse to answer the sixteen-page questionnaire which Mr Morris is sending out to all top government servants, and may not permit other officials of the Department of Justice to answer it either. This defiance on the part of a man whose department needs to be cleared of suspicion, and who himself was nearly replaced two months ago, would avail little if it were not that many other department heads and civil servants resent the questionnaire and share Mr McGrath's open doubts about Mr Morris's suitability for the task of rooting out corruption.

The questionnaire requires federal employees to disclose, under oath, their total incomes (from both government and outside sources) and expenditures over the past five years, bank and savings accounts, net worth (including furs which, as Mr Morris humorously remarked, are almost legal tender in Washington), relations with convicted felons, if any, and even what schools their children attend and the fees paid. Few believe that wrongdoers will make a clean breast of their crimes; it is the honest and innocent who will spend hours detailing their most private affairs.

If Mr McGrath persists, the President will have to choose between his Attorney-General and Mr Morris. Congress has already denied Mr Morris the broom he needed, the power to subpoena witnesses and documents, if he was to investigate the pressures brought on government employees by outsiders. If he is to lose what he himself has called his feather duster, his power to examine federal servants, he will have no choice but to throw in his hand, and there will be few others willing to take his place.

The refusal of the Senate Judiciary Committee to grant Mr Morris subpoena powers was based partly on jealousy and a fear that he might tie up witnesses and documents sought by Congressional investigators. There may also have been some anxiety that the corruption trail would lead back to Congress, instead of the White House. Even the Congressional bloodhounds are already sniffing politely at Senators Bridges and Brewster. But Mr Morris's outburst of indignation, at the "diseased minds" of Congress engaged upon character assassination, made it certain that he could expect no co-operation from Senator McCarran and Senator

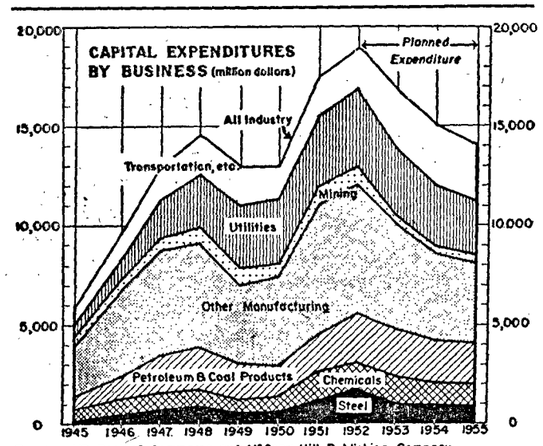
McCarthy. The outburst was one which could be applauded by indignant spectators of Congressional procedure, but it was ill-timed, and his answers to questions about his part in a deal in surplus ships and the sale of oil to China might well have puzzled and irritated more even-tempered and judicious questioners than Senator McCarthy.

* * *

The New Refugees

President Truman has made a first allocation of Mutual Security funds to help able-bodied men escaping from behind the Iron Curtain join the defence forces of the West. The Kersten Amendment to last year's Mutual Security Act authorised up to $100 million, but for the present only $4,300,000 is to be used, supplemented by $2,900,000 contributed by private sources and other governments. The Kersten Amendment was the first substantial recognition, and one quickly resented by the Russians, that a new flood of refugees was taking the place of the victims of Nazi oppression. Some 20,000 a month are slipping across the border into Western Germany; and another 1,000 or so every month escape further south. Many are encouraged in this hazardous flight by American propaganda; far too many of these, after they have been sucked dry by the intelligence authorities, are left to fend for themselves in countries ill-equipped to help them start a new life.

In a recent message to Congress on refugee problems, the President asked for money to assist fugitives unable to join the US forces under the Lodge Amendment, or the forces of the North Atlantic powers under the Kersten Amendment. In addition, he pointed out that Europe needs relief from over-population; it is estimated that 5 million Europeans should be resettled during the next five years. The United States cannot open its doors to more than a few of these. But unless something is done, it will not be able to help at all. The Displaced Persons Act, under which 400,000 refugees have already been admitted, expires in June, and after that the old rigid quota system will apply, with the added obstacle that, under the DP Act, many of these quotas have been mortgaged for many decades ahead.



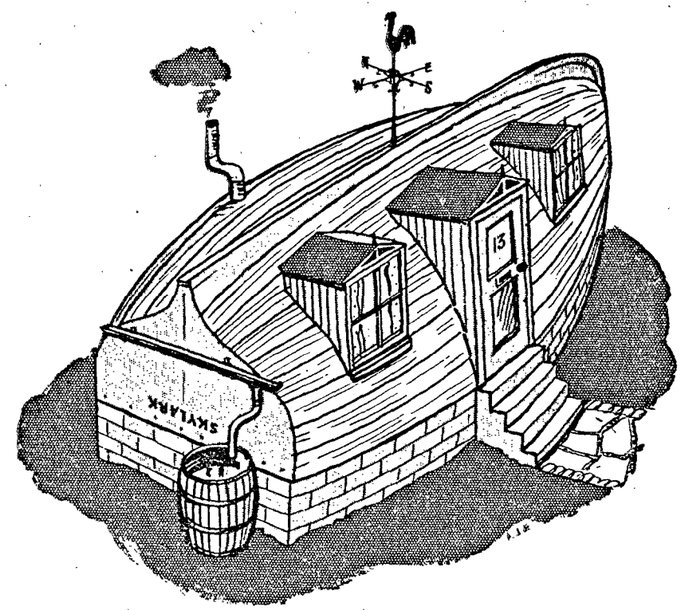
The revision of the immigration law now before Congress does not permit even the transfer of unfilled quotas to rescue fugitives from Communist tyranny. Senators Lehman and Humphrey are now drawing up a more generous substitute for the McCarran and Walter Bills, which are better described as exclusion, rather than immigration, measures. But in case they fail—and their prospects are not bright—the President asks that during the next three years 300,000 refugees and surplus persons be admitted, and that the United States should support a permanent international resettlement organisation. Unfortunately even a temporary programme must run the gauntlet of Senator McCarran's Judiciary Committee, and it is not certain that, despite his harrying of supposed Communists at home and his friendship for General Franco abroad, Senator McCarran will prove more kindly disposed toward Stalin's victims than he was toward Hitler's.

* * *

Plans for Prosperity

After breaking all records last year for expenditures on new plant and equipment, American industry plans to do so again this year, although by a much smaller margin. On this the annual surveys of proposed capital spending, conducted by both the McGraw-Hill Department of Economics and the Department of Commerce and Securities and Exchange Commission, are agreed. The latter puts the total at about $19 billion (with another $5 billion for commercial and miscellaneous expansion), rather less than in the McGraw-Hill estimate and probably more accurately; shortages of materials for construction and of components will almost certainly prevent some of industry's dreams from coming true this year, as they did last. By the end of 1952, however, America's manufacturing capacity will have doubled since 1939; the greatest increases have been in facilities for producing transport equipment (including aircraft but not cars), electrical machinery, and chemicals, in that order.

This year's record is in prospect, in spite of anticipated reductions in expenditure by a number of civilian industries, because it is the year in which spending for the expansion of industry for defence purposes is to reach its peak. Last year there was much concern about the inflationary consequences of these heavy outlays, but now there is more concern about the deflationary effects of their completion, which in most cases will come in 1953, and about whether many industries may not find that they have grown out of their civilian markets once the rearmament build-up is over. Here the McGraw-Hill survey was most encouraging. Businessmen



were asked how much they proposed to spend on new plant and equipment in coming years; most of them were found to have every intention of continuing to pay out substantial sums, even if less than at present, for these purposes until 1955, at least. An increasing proportion of this expenditure will be for replacement and modernisation rather than for expansion; at present the money is about equally divided between the two. But the plans also include plants to serve new markets and to make new products.

It is thought that these programmes are likely to grow rather than to contract as the time comes for putting them into practice—on two conditions. There must be potential customers for the output of the new plants and the money to finance them must be forthcoming. The businessmen questioned were told to take it for granted, when outlining their plans for the future, that consumers would be reasonably prosperous and that the excess profits tax would be abolished. The demand for reductions in corporate taxation is already being reinforced by the suggestion that without them capital investment will dry up, as it did in the depressed thirties, once the defence boom is over, with disastrous results for the country's prosperity.

Shorter Note

The Bureau of Labour Statistics has begun to calculate its wholesale price index on a new base; the average of the years 1947-49 now equals 100, instead of the 1926 average. The new index also includes about 1,900 items, more than twice as many as the old; amongst them are such modern products as plastics, anti-biotic drugs and television sets. On its last day of official life, December 31, 1951, the old index stood at 178.2, while the level of the new was 113.2.

It would be a

A Growing Contribution to Britain's Overseas Trade

THE BRUSH ABOE GROUP can report a continuing increase in Overseas sales:

1949 £10,400,000

1950 £15,300,000

1951 £17,700,000

Sales figures for 1952 already show a rise in the monthly rate over 1951.

THE WORLD OVERSEAS

Ambitions in the Sudan

WHEN the Anglo-Egyptian conversations begin, the question of Middle East defence is bound to take first place. It ranks as a natural first in the eyes of all the world outside the Nile Valley. Yet the problem of the Sudan's path to self-determination, which progressed apace on Wednesday when the new draft constitution was laid before the Sudanese Legislative Assembly, may well turn out to be of equal importance to the world as a whole. For, though the two questions are unconnected and could, in theory, be settled separately, they have become so united in Egyptian minds that the one cannot be resolved without the other. It is conceivable therefore that any points ceded by the Egyptian negotiators on the one score may be made more palatable to the Egyptian public by a display of intransigence on the other.

On a long term basis, there is—at least on paper—no Anglo-Egyptian disagreement as to the Sudan's future. The common aim is "to enable the Sudanese to choose freely for themselves the form of government and the relationship with Egypt that will best meet their needs." Both negotiators agree that a special relationship goes without saying—that it is inevitable on account of the dependence of the two peoples on the same river. The only variance is over a matter of opinion: most British observers think, as do a few Egyptians, that the Sudan will opt for total independence; whereas many Egyptians do not even contemplate such a verdict because, meeting as they do only the pro-Egyptian Sudanese who visit Cairo, they assume—to quote one of them—that "on the day that the Sudan becomes autonomous, its foreign policy as well as its defence would become identical with that of Egypt."

Such divergences of opinion will in due course be settled by events. Where more fundamental and less soluble differences arise when questions are asked about two shorter term arrangements; the first, what shall be the King of Egypt's title pending the final decision of the Sudanese as to their country's status and form of government? The second, by what means shall they make their decision?

Kingship for Egypt?

The title is the more delicate matter. Egypt's demand that it be recognised is a reflection of Egyptian bitterness at the way in which the condominium has been run by its British servants, ever since the removal of Egyptian troops and officials from the Sudan after the murder in Cairo of a British governor-general, Sir Lee Stack. The demand reflects, also, Egypt's belief that it is part of British policy to "separate the Sudan from Egypt." The Egyptian argument for unity is based principally on history, and omits to notice that history cuts both ways. For instance, the best Egyptian debating point is the fact that Kitchener, confronted with the French at Fashoda, flew only the Egyptian flag and spoke in the name of the Khedive; but against it must be set the fact that the Egyptians are fair-weather cocks who claim the Sudan only when its prospects are bright, since they did nothing when it was invaded by the Italians in 1940.

The legal question of sovereignty presents complications because—in the words of Lord Cromer—there was invented for the Sudan "a hybrid form of government hitherto unknown to international jurisprudence." Common sense therefore suggests that the title question had best be settled on a basis of present and future realities. What do the Egyptians mean when they demand kingship? Do they want it conceded temporarily, and as a mere matter of form? Or do they seek some gain of substance, such as the permanent hold upon Sudanese finance, defence and foreign policy with which they endowed their King by the law which the Wafd parliament—now dissolved—passed in November, 1951? If conceded have they reflected on the blow to royal pride which will ensue if the Sudanese vote against the link? Have they, and have the British, reflected upon the hard fact that, if conceded, the concession is likely to affect the plebiscite since the Sudanese are largely an uneducated people; they do not understand subtle distinctions between sovereignty and kingship, and may well reflect that a king is a king and therefore a person for whom it might be prudent to cast one's vote? If this is so, concession even of the formal title can hardly be reconciled with Mr Eden's promise of November 15th that the Sudanese shall be left "to exercise their choice in complete freedom."

Britain's Point of Honour

Amidst a forest of question marks, two points only are certain. The first is that the issue involves the personal reputation of two important men—the King of Egypt on the one hand and, on the other, Mr Eden, a person with a deserved reputation for sticking to his principles. The second is that if an Egyptian demand for temporary recognition were to become the price of some compromise on the defence question, some of the other parties involved in defence, notably the United States and France, would consider the British mad to insist on what is in some, though not all, foreign eyes a quite minor point. Both Americans and Frenchmen believe that if there is any trouble in the Sudan over temporary recognition, it will break out because the British there took no pains to avoid it; some Asians, by contrast, think that the British will be breaking their word to the Sudanese if they humour King Farouk's whim.

The question of how the Sudanese are to settle their future is, though problematic, less intricate. Broadly speaking, the difference of opinion between Britain and Egypt on the subject is that the former—along with many other observers including a recent American two-man mission of investigation—thinks that a plebiscite is not a particularly satisfactory method of deciding the fate of a people some millions of whom are so backward that they cannot really grasp what they are voting about. The view of this group is that it would be better to take the decision through the medium of an assembly of representative and relatively educated people. Hence the haste with which the local administration is pressing on with the steps for attainment of Sudanese self-government in 1952. The Egyptians view this haste as proof that the British are exercising a piece of anti-Egyptian sharp-practice; they hold this view the more strongly because the pro-Egyptian Sudanese have boycotted the Sudan's present representative institutions and so have no voice there. The Egyptians want a plebiscite preceded by "the withdrawal of all foreign troops and officials." The drawbacks to them of a plebiscite which may go against them have scarcely occurred to them.

Sudanese friendship and confidence are necessary to Egyptian prosperity. The fact that the Egyptians are not doing much to woo either, and that they lately repelled both by passing imperialistic laws about the Sudan, would be much easier to bring home to Egyptians if the Sudanese knew—as they do not—what they want.

Japan Looks for a Change

[FROM OUR TOKYO CORRESPONDENT]

HARASSED by thunder on the right as well as on the left, Prime Minister Shigeru Yoshida is doggedly facing mounting difficulties in the Diet and on the industrial front as Japan prepares proudly to unfurl the Rising Sun of national independence after six and a half years of defeat and occupation. The contemporary scene is confused and confusing and heavily overhung with dark paradoxes that portend an end to most occupation reforms. The spectacle of United States army officers wryly bemoaning the effectiveness of their costly destruction of Japanese armament facilities, which must now be expensively replaced, is no less ironical than the repeated Diet scenes in which Mr Yoshida plaintively argues that Japan is not rearming, and does not intend to. Mr Yoshida's dilemma is a legacy of the occupation. The new Japanese Constitution, which General MacArthur reputedly wrote in large part himself, specifically prohibits Japan from rearming. Before his departure, however, General MacArthur called on Japan, in blunt defiance of his constitution, to rearm swiftly. The nucleus of its army is now being rebuilt in the guise of the National Police Reserve and Japanese factories are already producing armaments again. But Mr Yoshida, who does not wish to go to the country yet for a revision of the constitution on the rearmament issue, cannot constitutionally admit these facts and must persist in his argument that only a domestic police force is in the making and that Japan is far too poor to undertake rearmament.

The exasperated Prime Minister is now challenged by a constitutional approach to the Supreme Court by the left wing of the sundered Socialist party, seeking an injunction to dissolve the National Police Reserve as "unconstitutional." The plaintiff argues, not implausibly, that the police are armed with bazookas and trench mortars, not customary equipment for traffic control and other conventional police duties; and that the force is being trained by army officers in mass military manœuvres, in bridge construction and railway repair under artillery and aerial attack and in river-crossing exercises which appear remote from the accepted responsibilities of beat-patrolling. Simultaneously with these attacks from the left, Mr Yoshida is being assailed from the right and from liberal intellectual circles with denunciations of the provision in the United States-Japan security pact which gives to America military courts, and not Japanese civil courts, jurisdiction over American military personnel stationed in Japan after the peace treaty. The inflammatory cry of "extraterritoriality!" has been raised.

Against American Reforms

The significant common factor in these attacks on Mr Yoshida's Liberal Government is that, while they emanate from opposed political elements, they derive their strength and popular appeal from the resurgent "Japan-for-the-Japanese" sentiments now widespread among the people. The Socialists, for instance, object to rearmament generally, but they object particularly to the retention of American troops on Japanese soil—even although the presence of foreign troops could strengthen their general objection to Japanese rearmament. And the liberal intellectual, while intensely concerned with the preservation of Japan's new concepts of freedom against reaction from the extreme left or right, can make sincere common cause with the rightist or leftist reactionaries on the issues of extraterritoriality and national dignity and independence.

That popular feeling here should be in a hot, bubbling, patriotic ferment on release from foreign military occupation is not surprising. Notoriously touchy and prickly, the Japanese have borne the inhibitions of bland and blind obedience to the occupation with extraordinary discipline and humility. Their immediate reaction is bound to be a wild and instinctive emotional swing away from alien influences and occupation practices. The best-selling books in Ginza stores at present are the reminiscences of Japanese war leaders. Occupation-prohibited war songs are at present red-hot favourites on gramophone records and in radio request programmes. The lacquer-thin coating of occupation reform is cracking and peeling off in most places. General MacArthur's pet plan for deconcentration of the police force has been denounced by Cabinet Ministers (reasonably enough, the impartial observer is inclined to concede) as "uneconomic and inefficient." The Zaibatsu trusts, scattered by occupation directive, are already openly regrouping, led by the Mitsui and Mitsubishi interests. Occupation labour reforms and provisions for overtime pay, a 48-hour week and special protection for women and minors are under fire from employers' federations as "excessively democratic." Legislation has been drafted to restrict the right to strike and to lower occupation standards in labour and industry. It threatens to provoke widespread labour disputes which the Communists will gratefully exploit.

The tempo and enthusiasm of this "back-to-the-old" trend are being hastened and encouraged by the return to public life of "depurged" leaders in Japan's prewar and wartime industry, politics and public affairs, who—because of their superior ability and experience, enhanced by the prestige of occupation punishment—are naturally resuming their old positions of command and authority. There is also gathering criticism of the economic policy of Mr Joseph Dodge, the American banker, who killed all Government subsidies, revised taxation and imposed a programme of rigorous financial austerities which is now being branded as unnecessary and deflationary. Tanzan Ishibashi, former Finance Minister and likely next Finance Minister if Prime Minister Yoshida steps down for the "depurged" Ichiro Hatoyama, urges a special issue of Government bonds to meet Japan's lack of industrial capital.

Return to Prewar Cartels?

As surplus stockpiles mount, the Government has already been compelled to apply restriction orders against cotton textile production (40 per cent) and rubber manufactures (30 per cent), with the probability of further restrictions in the iron-and-steel and caustic soda industries. These restrictions will not only create unemployment (20,000 mill workers are likely to be laid off) but will also hasten the amalgamation or disappearance of small industries and an apparently inevitable return to the prewar pattern of huge cartel-like industries strong enough to withstand the financial strain of falling export markets, to command bank credits and even to attract foreign investment. Here, of course, is the end of another occupation dream of the dispersal of industrial management and organisation.

Against this turbulent background, there is evidence that, in the current national mood of change for change's sake, the Liberal Government under its present leaders is losing popular appeal. In two recent by-elections, Mr Yoshida's party lost almost 90,000 votes (compared with the 1949 election figures) to the split Socialists and to the new leaderless centre-of-the-road Progressive Party. Newspaper polls also show a decline in support for Mr Yoshida. This trend, if continued, does not presage any new political influences in Japan. There may be changes in leaders and even in parties but general policy is likely to remain conservative, expedient, tough and increasingly assertive. The Socialists still lack leadership and are hopelessly split. Communist strategy, which is expected to explode into violence and bloodshed combined with a strong Asiatic appeal to Japan to throw out the white man, is now being shaped by leaders who have gone underground. It is too early to discern any firm outline in foreign policy: until the negotiations with Chiang Kai-shek reach a presumably unhelpful conclusion, until some agreement in principle on reparations is reached with the

Shell Chemicals

Shell research has brought a new, improved technique to the laundry. The modern detergents are kind to all fabrics; their efficiency is unaffected by the hardness of water and they deposit no lime scum—a major cause of greying in white materials. Outstanding among these Shell products from petroleum is LENSEX — an all-classification detergent now being used on an ever-increasing scale in many laundries. Its versatility ranges from the safe washing of delicate fabrics to powerful grease-removing action on mechanics' overalls. LENSEX is also playing an important part in laundry economics, because with all types of laundering — light, heavy, white, coloured — it gives a cleaner wash on less fuel and water, and in less time.

Philippines and Indonesia, until Red China shows its hand, and until trade prospects in South East Asia harden, there will be no stable basis on which foreign policy can be developed. The only safe forecast is that it will be neither pro-West nor anti-West but exclusively pro-Japanese. A serious danger is that it may be influenced by a rash and ingenuous hope to do business with both the Communists and the West and to seek to play off each against the other.

Failure of Australia's Farms

[FROM OUR MELBOURNE CORRESPONDENT]

AUSTRALIA is facing a crisis in its farming industries. Their output has in general failed to show more than a token increase since 1939. In some of the most vital industries, moreover, there is an unmistakable tendency for production to decline. The overall output of Australia's farming industries has expanded only by about 1 per cent since before the war. Over the same period there has been an increase in population of about 3 per cent per annum. The demands for foodstuffs from Australia's rapidly increasing population are thus not being met by the increase in farm production. The inevitable result is that there is a smaller quantity available for export.

There has been a quite fantastic increase in the financial return from wool in the postwar years. This, however, has been achieved not by an increase in the volume of production, but by the sky-rocketing of prices in the postwar inflationary boom. The great increase in the return from wool has, in effect, been a purely monetary phenomenon; the fall in woolgrowers' returns since March, 1951, has also been caused by monetary factors.

In wheat, which ranks second only to wool as a contributor to Australia's export income, there has been a 25 per cent decline in acreage over the last four years. The area sown to wheat this season is only 10,434,000 acres compared with 13,880,000 acres four years ago, and is, in fact, the smallest in any peacetime year since 1925-26. As a result, wheat production this season is expected to be only 162 million bushels compared with the peak of 220 million bushels in 1947-48. Australia's domestic requirements are about 80 million bushels, and there is an export quota under the International Wheat Agreement of 88.7 million bushels. Because of declining production, Australia will not be able this season to meet more than 72 million bushels of its international commitments, leaving a very small quantity for carry-over and disposal on the free markets.

In dairying there has been an increase of only 1 per cent in wholemilk production since 1939. As more milk has been used for processing, there has been a substantial fall in the production of butter. Butter production in 1950-51 was 164,971 tons against 203,500 tons in 1938-39. Increasing domestic consumption has resulted in a very substantial fall in the quantity available for export. Only 55,635 tons were exported last year against 102,534 tons in 1938-39. There has been an increase in meat production in the last four years from 947,000 tons to 1,013,800 tons. Domestic consumption, however, grew in the same period from 739,400 tons to 847,900 tons, again resulting in less meat for sale overseas.

This, then, is the general picture of static or falling production of Australia's farm industries. This winter, New South Wales will have to import butter from New Zealand if last year's severe shortage is to be avoided. On present acreages, Australia could well become an importer of wheat if there should be a drought. Bounteous seasons in the last five years, in which the average yield has varied between 15.15 bushels to 17.83 bushels to an acre, have ensured ample wheat for domestic consumption and export, but the position could change overnight. The reasons for the tendency of farm production to decline rather than rise are many, but the concentration of the Commonwealth Government since the war on greater industrialisation and intensive migration rather than on the agricultural and pastoral development of the country has influenced the whole picture. The consequence of this, as Professor S. M. Wadham, Professor of Agriculture, University of Melbourne, has pointed out, is that farmers have found it most difficult to get materials or machinery, or even the all-important superphosphate to enable them to intensify their activities.

There have naturally been no complaints about the price of wool from sheepmen since the war, but production has not shown any significant increase since 1939 because of the tremendous stock losses in the great drought of 1944-46. Since then, flocks have been slowly built up. The tremendous increase in wool prices has been a potent factor in causing both wheat growers and dairy farmers to switch to sheep. There could well be a reversal of this trend with the fall of wool prices to levels more in keeping with those of other farm products. In both wheat and dairying, producers consider that they are not receiving returns to show a sufficient margin over production costs. Dairymen consider that adequate returns must be guaranteed to them by the Government if production is to be expanded, and the wheat men are resentful that they are forced to sell their grain for domestic consumption at 10s. a bushel, compared with 16s. 1d. fixed under the International Wheat Agreement and with the free market price of 20s. 6d. And overshadowing everything is the basic need for capital in large and continuing increments, not only to bring poor land into production but to raise the fertility of land already in use.

The Commonwealth Government is fully aware that it is faced with a crisis of great magnitude in the farming industries, particularly because of the need to increase Australia's export income as the only satisfactory means of surmounting the present balance of payments impasse. As a first step in a general plan to increase farm production, the Commonwealth has allowed certain tax concessions to farmers. Federal and State Ministers, at a special meeting of the Australian Agricultural Council in February, undertook to prepare measures, as part of a five-year plan, to step up the output of superphosphates to work towards the closer settlement of rural areas, to assist rural housing and to help farmers to obtain machinery and materials. These measures could well lead to considerable expansion of rural production, but they

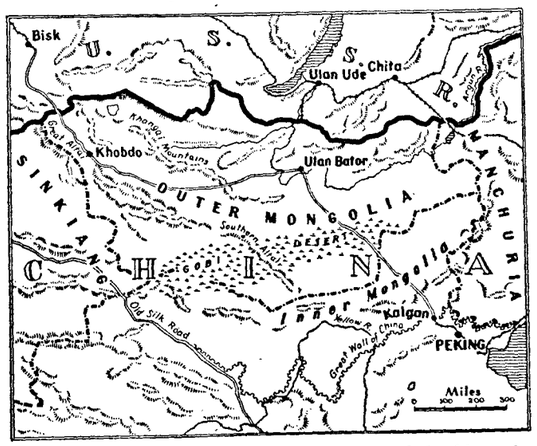
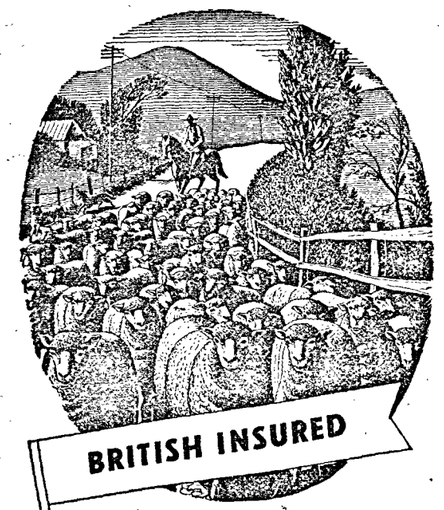
will take time to take effect. In the meantime, output remains basically static against a background of increasing demands for food and raw materials from home and abroad.



Between Russia and China

MARSHAL CHOIBALSAN, Prime Minister of Mongolia (the Mongol People's Republic), died in Moscow on January 26th, and his funeral took place with much ceremony in the Mongolian capital Ulan Bator (formerly Urga) after his body had been brought back from the Soviet Union. Soon afterwards the Mongols, "joyfully and solemnly" according to *Tass*, celebrated the sixth anniversary of their Treaty of Friendship and Mutual Aid with the Soviet Union and sent a message of greeting to Stalin, "the great leader and teacher of all workers, the standard-bearer of peace and friendship between peoples, and the best friend of the Mongolian people." In an editorial on the anniversary *Pravda* quoted Marshal Choibalsan as saying that Soviet aid and guidance had enabled the Mongols to jump straight from feudal backwardness to people's democracy, by-passing the capitalist phase of development.

The funeral was attended by the Ambassadors of the Soviet Union, China and North Korea, these being the three states which have diplomatic relations with Mongolia, and by special Soviet and Chinese delegations, the former headed by Marshal Budenny and the latter by General Nieh Jung-chen, Acting Chief of Staff of the Chinese army; another member of the Chinese delegation was Ulanfu, chairman of the Inner Mongolian People's Government, which forms an autonomous unit within the Chinese People's Republic. The composition of the Chinese delegation including a representative of the Mongols who are still Chinese citizens indicates the somewhat complicated relations which now exist between Russia, Mongolia and China.



Mongolia, in the sense of the whole region inhabited by Mongols, was formerly included within the Manchu-Chinese empire, except for the area of the Buryat tribes which has been under Russian rule since the seventeenth century. The Mongols did not regard themselves as subjects of the Chinese, but only as vassals of the Manchu imperial dynasty which they had aided in the conquest of China, and when the Manchu dynasty was overthrown by the Chinese Revolution of 1911, they declared their independence of China. However, only a part of the Mongol people was able successfully to resist incorporation in the new Chinese Republic. The old Mongolia was divided into two zones by the Gobi desert, known as Inner and Outer Mongolia respectively; the Outer Mongols were able to free themselves from Chinese rule with the support of Tsarist Russia; but the Inner Mongols, being closer to China and having lost much of their land to Chinese colonists, were held under Chinese control and their territory divided among several Chinese provinces.

This state of affairs has continued to the present day in spite of all Mongol aspirations for a reunification of the two halves of the Mongol people. The Soviet Government continued the Tsarist policy of supporting the Outer Mongols

against Chinese reconquest, but instead of backing the Mongol princes, as Tsarist Russia had done, aided the social revolutionary movement which was led by the Mongol People's Revolutionary Party (MPRP); this was formed by the fusion of two groups headed respectively by a soldier of the Outer Mongolian army called Sukhe Bator and by Choibalsan. Sukhe Bator was a nationalist first and foremost, though he also aimed at radical social changes, whereas Choibalsan's group operated in 1917-21 in the Russian quarter of Urga, where he was already in touch with Russian Bolsheviks. Sukhe Bator died in 1923, and after the withdrawal of Soviet Russian troops from Outer Mongolia (which they had entered to expel the White Russian forces of General Ungern) the MPRP governed the country as a one-party state, basing itself on Marxist principles, though without formally taking the name of Communist. The Soviet Government gave material and technical aid to the new regime and brought it under a kind of protectorate, without, however, repudiating Chinese nominal sovereignty over the country until 1945.

The Chinese were never strong enough after 1921 to enforce their claim to authority in Outer Mongolia, but from 1932 onwards a new threat developed in the shape of Japanese expansion based on Manchuria. In order to obtain Mongol support against the Chinese in Manchuria the Japanese detached the Mongol-inhabited districts and made them into a separate province with a Mongol administration. Thus a new Mongol national centre was created, but as the Japanese supported the old ruling class of the nobility and Buddhist lamas, the Japanese-protected

These facts are published to show what British ingenuity and skill can achieve in spite of difficulties

It can be done

Vacuum Oil Company's new refinery at Coryton will draw its cooling water—45 million gallons a day—from the lower Thames. A reinforced concrete caisson forms part of the intake jetty and houses the pumps and machinery.

Conditions prevented building the caisson in position within a cofferdam in the usual way. How else could it be done? "Mulberry" harbour suggested an answer. The unit was partly constructed in a dry dock at Gravesend. It was then towed—its topsides bristling with reinforcing rods—across to Tilbury and berthed among astonished ocean liners. Here the walls were concreted up to their full height. Then the whole structure—4,200 tons of concrete and steel with a draught of 29 feet—was moved again, under escort of four tugs, eight miles down river to Coryton; and there it was carefully sunk in position offshore. This epic voyage took place on March 6th 1952. Not even the Thames has ever seen a stranger craft. The operation, so far as is known, is unique in history. Design and construction were carried out in conjunction with the Lummus Company Limited, London.

LAING

JOHN LAING AND SON LIMITED, Building and Civil Engineering Contractors
London, Carlisle, Johannesburg, Lusaka. Established in 1848

Mongols of Inner Mongolia were inevitably in conflict with the Soviet-protected MPRP ruling Outer Mongolia, as well as with the Chinese. The Japanese hoped to gain control of Outer Mongolia and thus acquire a great strategic advantage against Russia; Russia, however, reinforced the MPRP with a Soviet army and in the great "unofficial" battle of Nomonhan in 1939 the Russian and Outer Mongol troops were victorious over the Japanese.

The increased dependence of Outer Mongolia on the Soviet Union brought Choibalsan to supreme power. His predecessor as Prime Minister, Gendung, was removed from office and liquidated, along with a number of other leaders regarded in Moscow as unreliable. Choibalsan went to Moscow and had an interview with Stalin in 1945; he subsequently commanded the Outer Mongol army in alliance with the Soviet Union in the brief August campaign against the Japanese, but he was not permitted to incorporate any part of Inner Mongolia in the Mongol People's Republic. Nationalist China was compelled to recognise the sovereignty of the Mongol People's Republic after a plebiscite on the question of formal separation from China had been held in Outer Mongolia, but there was no question of holding a plebiscite in Inner Mongolia, as Russia did not wish to alienate Chinese opinion too far, and Inner Mongolia was therefore left to China.

The Chinese Communists have now created an autonomous province for the Inner Mongols, but this is far from meeting Mongol aspirations for a unified national state. As long as the Russo-Chinese alliance persists, the Mongols have to be content with their present situation; if, on the other hand, there were to be a decline of the harmony between Moscow and Peking, Mongol irredentism remains always in reserve as a potential weapon for Russian use against China.

Pakistan and the Pathans

[FROM OUR CORRESPONDENT IN KARACHI]

AFGHAN propaganda for the setting up of an independent Pathan state continues unabated. The Pakistan Government seems to pay scant attention to it, and some observers fear that it is taking it too lightly. But the reaction of the average Pathan, when "Pakhtoonistan" is mentioned, is one of derisive laughter, for he has seen with his own eyes conditions on both sides of the border. He has seen on the Pakistan side a big programme of hospital and school expansion being put into effect—and the Pathan is avid for education. He knows that one of his rupees will buy about three Afghan rupees. He knows that the fine metalled road up to the Afghan border immediately becomes a dirt track for the remaining one hundred and fifty miles to Kabul. He can contrast the smart turnout of the Pakistan troops at the border posts with the shoddy, shapeless uniforms of the Afghan sentries. His Maliks are also well informed about world affairs, and are sufficiently intelligent to realise that an independent Pathan state would be quite incapable of economic and political survival.

According to reliable reports, the Afghans have recently sent secret emissaries to the Pakistan side of the Durand line in an attempt to seduce the Maliks by gold. Only one Malik, an Afridi, yielded to temptation. Having received a bribe of a million rupees Afghani he dutifully assembled several *jirgas* for the purpose of arousing interest in the "Pakhtoonistan" idea. But his advocacy was so half-hearted, his discharge of his obligations so perfunctory, that the Governor decided to take no action and to leave the matter to the good sense of the people. The upshot is merely that the Malik in question finds himself so much the richer and the Afghan exchequer so much the poorer. The danger in this, of course, is that other tribal leaders may be tempted either to take money from the Afghans or to blackmail the Pakistan Government for increased subsidies by pretending to espouse the cause.

If, however, the agitation does after all take hold, the Pakistan Government can very easily bring economic pressure to bear on Afghanistan, most of whose imports come through the port of Karachi and are passed, duty free, up to the frontier. If international interest is attracted the Pakistan Government would probably be only too willing to offer to submit to the verdict of a plebiscite held under United Nations supervision. There is no doubt whatever that the vote of the Pathans living between the Durand line and the Indus would be overwhelmingly in favour of Pakistan.

The visitor to the North-West Frontier Province, standing perhaps in the Khyber Pass looking over towards the snowy expanses of Kohistan, may well find it hard to convince himself that he can take a plane to Chittagong and still be in the same country. Pakistan is often described as the meeting place of the Middle East and South East Asia, but it is also a link between central Asia and South East Asia. The North-West Frontier Province and East Bengal are still poles apart, having nothing in common but religion; but the bond of Islam is a strong one and it is making the Pathans, no less than the Bengalis, conscious of the growth of a common Pakistani nationhood. The North-West Frontier Province now has an East Bengali Governor who, in his capacity as Agent to the Governor-General, is directly responsible for the administration of the tribal areas—an idea which must sound strange to the older generation of frontier administrators. But Khwaja Shahabuddin has been given a very friendly welcome by the Maliks.

Change of Spirit

Outwardly, the form of administration of the tribal territories remains unchanged. The garrisons have of course been withdrawn from Razmak and other stations in the area, but the same subsidies are being paid, the Khassadar system is still retained, and the militia formations (the Tochi Scouts, the Khyber Rifles, and so on) have not been reduced in strength. Yet the whole spirit has changed. The Afridi or Masood still humps his rifle and bandolier around with him—he would probably feel naked without them, and maybe he has a blood feud to think about—but he is no longer tempted to take pot shots at transport passing along the road beneath him. In the days of British rule, apart from being good fun, this could be regarded as meritorious; but there is no merit in shooting indiscriminately at one's own brethren.

The policy of the Pakistan Government is to further unobtrusively the cultural and economic fusion between the tribal areas and the settled districts. The process is inevitable, for the two have always been closely interdependent, and the connection has naturally grown even closer since the creation of Pakistan. The tribesmen, who number nearly two and a half million souls in the five Agencies, depend on the six districts for their main markets and find there opportunities for profitable work as cultivating tenants or as labourers. The districts, for their part, depend on the tribal areas for various raw materials, such as hides and skins, wool, charcoal, and timber. The big programmes of development and industrialisation in the settled districts, which are now being carried through under the energetic guidance of Khan Abdul Qayum Khan, the Chief Minister of the Province, are bound to have important reactions on the outlook and economic condition of the tribesmen. They will help to fortify their belief that Pakistan is a country worthy of their loyalty, and it is only a matter of time before economic fusion leads to a political integration. Already a pointer to the future has been afforded by the recent merging in the Province, at the request of the local inhabitants, of 287 square miles of tribal territory. The government has made it clear that it will take no initiative in this movement, which must gather its impetus entirely from the Pathans themselves; but it is confident that in time—say twenty-five years—the process of integration will be complete.

THE BUSINESS WORLD

EPL under Scrutiny

ANY notion that the Excess Profits Levy was to be limited to "the fortuitous rise in company profits because of the abnormal process of rearmament" was exploded by the Chancellor's Budget speech. It may catch "abnormal" profits generated by the defence programme. But it will catch much else besides—the adventitious effects of devaluation (still an important factor in the sterling income of many companies with overseas business); the paper profits caused by the rise in prices that occurred after the end of 1949 but before the war started in Korea and long before the defence programme itself had made any appreciable impact on the British economy; the fruits of hard work and postwar recovery; and the earnings of enterprise and expansion. Only in the smallest minority of cases will the amount of levy that is paid have any connection with "the abnormal process of rearmament."

It is on grounds of this kind that the rubber companies and a host of industrial concerns, ranging from the smallest to the largest, have every justification for their protests. All excess profits taxes are bad taxes; on this proposition *The Economist* is in complete agreement with Dr Dalton. The commonsense of monetary and fiscal policy should be to prevent "fortuitous" rises in profits caused by inflation, and to encourage the rises in profits that are the genuine earnings of enterprise. On this criterion EPL, so far from being limited to defence profits, is as bad as any excess profits tax could be. But in another respect also it fails to fulfil the claims that the Chancellor made for it. Mr Butler promised to simplify the new levy, and to avoid "the delay, complications and waste of manhours involved in the old EPT." But his draftsmen have produced twenty-seven sections and four schedules, together making fifty-two pages of gritty text, compared with the twenty-one pages (of larger print) that were needed to introduce EPT in 1939. Is it simplification to require that in certain cases average expenditure on repairs and renewals for the ten years 1940 to 1949 must be substituted for the actual costs in the standard period 1947 to 1949? Is the substitution of paid-up share capital for the familiar but more complex concept of "average capital employed" a fair exchange of simplification against equity for those companies that have to adopt a substitute standard? For every sign of simplification in the Finance Bill, there are half a dozen legal thickets to keep the taxpayer in his place. The greatest act of simplification is the omission of individuals from EPL; they were an administrative nuisance in EPT assessments and their omission is not an act of magnanimity that will cost the Exchequer dear, for what is not seized as EPL will be seized in surtax.

The anticipated net yield of £100 million is a mere shadow of the £470 million produced by EPT under full steam. This is a pitiable bag for such a legislative effort—an elephant gun has been used to shoot at rabbits. Those that are hit will be grievously hurt; the fixed profits standard, with no benefit of choice, of the average profits of 1947 to 1949 will see to that. This was a period largely governed by reconversion from war to peace, by delays to new buildings and plant, by the fuel and dollar crises of 1947 and by devaluation after the uneasy summer of 1949. The following profits records extracted from some recent prospectuses show a wide range of fluctuation in these standard years:

Company	1947	1948	1949	Average	*Average as percentage of best year*
	£	£	£	£	
A	79,667	111,275	97,883	96,275	*86·5*
B	162,966	220,560	293,240	225,589	*76·9*
C	88,695	70,828	52,652	84,058	*60·7*
D	191,510	423,674	420,589	345,258	*81·5*
E	42,811	46,891	46,928	45,543	*97·1*
F	239,294	215,286	253,482	236,021	*93·1*
G	104,161	176,100	194,318	158,193	*81·4*

This rigid standard is in marked contrast with the options that were offered under EPT—1935, or 1936, or 1935 and 1937 or 1936 and 1937. The American excess profits tax (which Mr Butler has in other respects so readily followed) offers a choice of the average of three years out of 1946 to 1949. Lack of choice will be highly disadvantageous, for the best-regulated concerns are liable to have off-periods during thirty-six consecutive months. The reliefs afforded by the share capital standard are unlikely to attract such companies, for the profits of the standard years must indeed be unsatisfactory before a company is tempted to substitute for them amounts equal to 8 per cent of its average paid-up share capital for the years concerned, and even worse than unsatisfactory before it would substitute 10 per cent of its share capital at the end of 1949. The percentages for director-controlled companies are 2 per cent higher in each case, and for metal mining and oil companies 4 per cent higher if the estimated life of the deposits is not longer than thirty years. (This last is the only concession for EPL purposes offered to mining and oil companies, and in many cases it will have a mere token value; the only positive gain held out to them in the Finance Bill lies in the income tax concessions, long overdue, which will enable them to write off expenditure on abortive exploration, and will provide more reasonable treatment for plant used for exploration, for expenditure on land abroad and on mining townships.) Standard profits, however arrived at, will be increased by 10 per cent of the profits retained in the business between January 1, 1948, and the beginning of the chargeable period, and further by 10 per cent on any share capital raised, including share premiums.

Resort to the concept of a percentage on paid-up share capital as a measure of excess profits has rightly aroused criticism. The 8 per cent that the Finance Bill offers is itself a mean reward for providing new capital and undertaking risks; and share capital, as distinct from capital employed, is a grotesquely inadequate basis for a substitute standard. It is worth recalling the two purposes for which capital was brought into EPT calculations. First, it was used where there were no profits, or where profits were so low that they were an unreasonable measure of the normal earning capacity of the business. In these cases, a percentage of the absolute amount of capital employed in the business was taken as an alternative standard. This exercise involved much research and calculation but the answer, once arrived at, gave the historical cost of the capital employed and provided a guide, failing anything better, to the normal base profit against which an excess could be measured. Secondly, changes in capital between the standard period and the chargeable period determined the additional allowance for growth. In these calculations the absolute of capital was not material; only the increase had to be measured and that involved no particular complication. Under EPT, it was possible for the taxpayer and the inspector to agree on a tolerable measure of capital employed. The substitute standard offered under EPL is a measure of nothing save the historical accident of how much of the real resources of a company happens to be represented by "paid-up share capital." Although the Bill is not entirely free from doubt, these words appear to exclude shares issued in the capitalisation of accumulated profits. Borrowed money is without question excluded; here the Bill chases back to the dim precedents of 1915 and the original EPD. To have issued loan stock for the legitimate purpose of avoiding profits tax, as many companies have done in recent years, now adds to the weight of EPL. In two major respects—the arbitrary character of the profits standard, and the manifest inequities of the substitute standard—EPL must stand condemned.

*

It is something, after this criticism, to record that the treatment proposed for small companies introduces a slightly greater degree of fairness. At first sight, the minimum standard of £2,000 proposed for EPL seems far from generous. The figure was the same in the closing years of EPT, and the value of money has shrunk appreciably since then. But minimum standards apply largely to small family businesses, where the directors have a controlling interest, and EPL (in contrast to EPT) will treat the remuneration paid to working proprietors as an admissible deduction, within the limits allowed for profits tax. These limits are extended in the profits tax sections of the Bill so that together with the minimum standard of £2,000 the effective amounts that can be earned, subject to directors' remuneration, before any liability arises for EPL are (in comparison with the corresponding limits for EPT) £4,500 (£2,500) for one, £6,000 (£4,000) for two, £7,500 (£6,000) for three and £9,000 (£8,000) for four working proprietors. These increases are welcome, for director controlled companies have suffered severely from the tax practice of disallowing excess remuneration in arriving at chargeable profit and then treating the excess as a distribution chargeable to profits tax at the full rate. It has meant that no controlling director dare presume to draw as remuneration anything like the salaries that are earned by employees of public companies with equivalent skill and responsibility. The Tucker Committee recommended more generous treatment; Mr Gaitskell made a start last year, and Mr Butler has continued the process. It could go much further without much risk of abuse, for the surtax provides the Exchequer with an effective long-stop; the only difficulty is to design safeguards to prevent the distribution of largesse among family directors who perform no services warranting the reward.

The period of charge for EPL is regarded as a homogeneous whole, beginning on January 1, 1952, "and ending with such day as Parliament may hereafter determine." This period, whatever it may eventually be, will be broken up into manageable units of a year for convenience of assessment and collection; but within the period, excesses and deficiencies of profits will be set off so that only if there is a net excess over the whole period of charge will EPL be payable. This fact has an important bearing on the prospective life of the levy, for at the first convincing sign of any general recession of profits below the level of the standard years, the Exchequer would be faced with the choice of repealing it, or repaying large sums in respect of deficiencies. For those concerns that establish a liability in 1952 there may thus be comfort in the fact that the levy acts as a cushion as well as a ceiling.

It has an important bearing, too, on the nature of the over-riding limit of charge of 18 per cent of total profits. It might have been supposed from the Budget statement that this limit would apply to the results of each single year. The Finance Bill makes it clear that the limit will not be calculated in this way, but upon the cumulative results for the whole period of charge. This scheme of things may indeed be logical and leave the taxpayer no worse off in the end, but it may lead to odd results during the lifetime of the levy. Suppose, for example, that a company with a standard of £20,000 earns £80,000 in year I and £20,000 in year II. In year I the excess would be £60,000 and the 18 per cent limit would apply, the EPL payable being £14,000. In year II there would be no excess profits, but the cumulative excess of £60,000 for the two years combined would now be taxable at the 30 per cent rate. Hence, in a year when there were no excess profits, an additional sum of £3,600 would have to be paid to bring the total EPL up to £18,000. This promises a contingent liability analogous to that which attaches to non-distribution relief from Profits Tax—no doubt carrying the same kind of financial and accounting complications. Accountants of companies that start off in the 18 per cent class might be well advised to reflect on the potential effects of future excess profits or deficiencies, in order to spare their directors from unpleasant shocks if events should switch the company into the 30 per cent class at a later date. On the other hand, pleasant surprises may be in store for the company that starts to pay at 30 per cent on a modest excess and is then suddenly elevated to bumper profits and an 18 per cent limit that holds good for successive years. On present prospects, there will be few such lucky ones.

In the adjustment of profits for the purpose of the levy, gross injustice is again meted out to investment trusts. It is no justification in their case to argue that as they were liable to EPT so they should be liable to EPL; that is safe precedent and bad tax administration. To include investment income whether received from sources that are themselves liable to EPL or not, means

that to a large extent the EPL paid by every successful investment trust (or every trust that has an unfavourable standard) will be double taxation. For companies that hold investments incidentally to their main purposes, there is not even the excuse of precedent, for they were not liable to EPT on their investment income, whereas they will be liable for EPL. This is not the only objectionable feature of the 8th Schedule to the Bill. The old formula that "no deduction shall be allowed in respect of expenses in excess of the amount which is reasonable and necessary" sounds fair enough; but it brings back memories of wartime negotiations on points that Morton himself would have loved to impale on his fork. The provision to average out repairs deferred from the war years will involve in many cases the disinterment of dusty records of ten years from 1940 to 1949; it will ruin the accountant's clothes even if it does not break his heart.

The only conclusion on the Finance Bill is that it marks the end of any hope that industry might have entertained of fair treatment for profits by either political party. The fiscal enormities committed against profits that passed muster during the war, and were speedily removed by the first Labour Chancellor after the war, are here repeated and enlarged by a Conservative Chancellor. He did not draw up the original formula in his party's manifesto, but he has chosen to interpret it in a manner that treats profits, whether earned by enterprise or generated by the deceptive process of inflation, as a social sin—with absolution at the extortionate rate of 84½ per cent. All this damage to the economy, all these ulcers for accountants, will produce next year a spurious benefit of £100 million. The best verdict on Mr Butler's first Finance Bill is Prince Hal's:

> Oh, monstrous! but one half-pennyworth of bread, to this intolerable deal of sack? What there is else keep close, we'll read it at more advantage. . . . I'll to the court in the morning.

The Future of European Payments

ON June 30th next, the European Payments Union will be two years old. When the Union was founded in 1950, no limit was set on its life but it was, in effect, put on probation until its second birthday. It was agreed that a comprehensive review of its operations should be made not later than March 31, 1952. This review was recently completed, and last week the managing board presented its report to the Council of Ministers of the Organisation for European Economic Co-operation.

EPU has not had an easy first two years of life. No heaven has lain about it in its infancy. European balances of payments have had to meet the combined impact of the wild post-Korean fluctuations in commodity prices and of the rearmament programme. These factors invalidated all previous estimates of probable "swings" in intra-European balances of payments and have placed far greater strain on the reserves of the Union than had been foreseen. The surprising thing is, therefore, not that many members feel that some amendments to EPU's structure are called for, but that none of them wants the whole experiment to be discontinued.

Whatever may be the differences of opinion about the future of EPU, there is now no serious criticism of the objectives for which it was launched. Its purpose was to establish for member countries and their associated territories a multilateral system of payments, in which members would no longer be bound to achieve approximate balance in their bilateral payments but could automatically use the surpluses earned with some members in order to meet the deficits incurred with others. This system of payments was designed to strike European trade free from the shackles of unnecessary import and exchange control restrictions, and it did in fact become the instrument through which trade liberalisation made considerable progress in the first eighteen months of the Union's life. Unhappily, some of the forward steps that were taken then have now had to be retraced under the stress of recent balance of payments difficulties, but there can be no doubt that the Union has played an important part in assisting the development of intra-European trade. The total trade between member countries rose from an annual rate of $8,800 million just before EPU was launched to an annual rate of $12,800 million in the third quarter of 1951; these figures do not include imports from the associated territories of member countries or from those countries of the sterling area that are not members of EPU. About half of this notable increase represented an expansion in the real volume of trade.

This expansion was due not only to liberalisation (that is, to the removal of certain imports from import licensing), but also to the automatic transferability conferred by the Union on the currencies of participating countries. Member countries were freed from the need to concern themselves with the balances on their bilateral accounts with each other, and this freedom contributed to the development of intra-European trade on a non-discriminatory basis and achieved a very welcome widening of the area of genuine commercial competition. Besides facilitating payments and trade in this way, the EPU has provided, through its managing board, an important focal point of European consultation and financial co-operation. As the result of such consultation, the economies of almost all member countries have been examined, and specific recommendations have been made and sometimes—though not always—acted upon. The way in which the managing board's recommendations helped to produce the remarkable turn-round in the economy and balance of payments of Germany is only one, though the most spectacular, example of the fruits of such consultation.

In broad terms, therefore, the story of EPU's first two years is undoubtedly a story of success—despite the difficulties that members have experienced in maintaining equilibrium in their balances of payments in the face of post-Korean price fluctuations and rearmament. But there is no doubt that the Union has also been used for one purpose for which it was never intended. The paucity of members' individual reserves of gold and dollars, which today represent only about 25 per cent of their annual imports (compared with 80 per cent before the war) has caused the Union to be looked upon by certain members as a mechanism for strengthening their gold

TRADE with SWEDEN

We offer a trade introduction service efficiently equipped to place British exporters and importers in touch with reliable Swedish firms engaged in foreign trade.

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Full particulars of the facilities offered may be obtained from

BLOCK & ANDERSON MEAN BUSINESS

Expand production! Increase exports! Defence and Economic Survival depend upon *more in less time*, but scarcity of manpower tends to limit possibilities. Speed up! Speed up the wheels of industry by putting B & A Machines and Systems to work in the office.

Banda *Spirit Duplicating—the modern method*—plus scientifically designed forms, with modern addressing and mailing equipment, *can speed up communication processes of business and industry.*

With B & A calculators, computations vital to business and production economy *are completed much faster.*

Records and instructions needed for planning and control can be prepared with B & A machines and systems *with minimum time lag.*

The installation of B & A machines and systems ensures readily available service from B & A Specialists and Engineers in seventeen branches throughout the United Kingdom and in Eire.

Write to-day for the address of your nearest branch, to *Block & Anderson Ltd., 58-60 Kensington Church Street, London, W.8. Telephone: Western 2531-6.*

Head Office: MONTREAL

Over 570 branches throughout Canada
Assets Exceed $2,000,000,000

Incorporated in Canada in 1817 with Limited Liability

We've solved some problems in our time!

TIME—1939 : PROBLEM—the magnetic mine. The answer came quickly: sweep with a loop of cable carrying heavy impulses of direct current, thus generating a magnetic field to detonate the mines. But the means ? Every available mine-sweeping trawler must be fitted *at once* with batteries capable of enormous output—3,000 to 4,000 amperes at 150 to 200 volts. That was Chloride's part of the problem.

¶ The trawlers got their equipment. Car batteries by thousands, with new connections hurriedly burned in to put the cells in series-parallel, provided each ship with a fearsome make-shift battery of 1,134 cells. Later, our special 400 volt mine-sweeping batteries, designed for the job and produced in very great numbers, made sweeping safer and more certain. But the magnetic mine, as a decisive weapon of war, was already beaten—by brave men and a battery that looked like an ' electrician's nightmare.'

¶ For over 50 years we have been designing & making special types of Chloride, Exide and Exide-Ironclad Batteries for every branch of industry, transport and communications. Our battery research and development organisation, the largest & best equipped in this country —if not in the world—is at industry's service always: ready at any time to tackle another problem.

and dollar reserves. Although no debtor country has exceeded its quota for long, some countries have remained almost continuously in surplus. Belgium and Portugal, for instance, have already run up an accumulated surplus in excess of their quotas.

The rock upon which the Union—in its present form —has come near to foundering is that the currencies within EPU membership are by no means equally hard in relation to the currencies outside that membership. This has tended to set up a cross-pattern of undesirable capital movements. Some members, notably Belgium, have been able to proceed much further than others in removing restrictions on their imports from countries outside EPU. Their currencies are thus more easily convertible into dollar commodities and tend to be in greater demand. These countries may incur substantial deficits with the dollar world, but they compensate this by the surplus they are running with their EPU colleagues and by the gold they extract from EPU. As the managing board of EPU points out in its report, it seems clear that the Union must always be in difficulties " unless member countries follow internal and external policies which will result in a reasonable parity between the ' nominal ' and the ' real ' values of their currencies "—which is asking a great deal. It is largely because of this that EPU has not fulfilled all the hopes that were originally placed in it. Many member countries, in view of their relatively small gold and dollar reserves, have had to retreat precipitately from trade liberalisation as soon as they have found themselves obliged to make substantial gold payments to the Union.

★

The unexpected difficulties with which the Union has had to contend have also been reflected in the reserve position of the Union itself. The initial capital of the Union was furnished by a grant of $350 million from the United States ; this has since been increased to $361 million as a result of the renunciation by Sweden of $11 million of conditional aid. The Union has also received $131 million of gold from the special resources provided by the United States to cover the EPU deficits of Austria, Greece, Iceland and Turkey, but it has lost $50 million of gold as a result of the fact that the initial credit balances established in favour of certain countries exceeded the initial debit balances by about $125 million—a discrepancy that involved a once-for-all drain on both the credit resources and the gold reserve of EPU.

The net effect of this initial subscription and of these special gains and losses of gold is that, by June 30th next, the Union can expect to have received a total " extraneous " contribution of $442 million to its gold and dollar resources. This reserve is the working capital of the Union from which gold payments are made to creditor countries and to which gold receipts from debtor countries are credited. Owing to the persistent creditor status of certain countries and to the differences in the sliding scales on which debtors and creditors respectively make and receive gold payments, the Union has so far been called upon to pay out more gold than it has received in the course of its normal monthly compensations. By the end of February, 1952, no more than $306 million of the capital fund of $442 million remained in its coffers. This figure may be considerably reduced in the next few months. The most persistent creditor, Belgium, has been guaranteed $80 million of gold payments in the second quarter of 1952 if, as seems virtually certain, its surplus exceeds this figure. France has been forgiven certain gold payments it would otherwise have to make and has received a special loan of $200 million from the Union. And, finally, if Britain should become a creditor in the next few months, it will recoup gold from the Union at the relatively high percentages at which it has recently been losing it.

If this happens, the Union will very soon face a crisis of liquidity. The managing board considers that a reserve of $200 million should be the minimum below which the assets of the Union ought not to be allowed to fall. It needs an ample reserve to cover its normal operations, to provide security for creditors who have granted credit to the Union, to ensure that there is general confidence in the solvency and continuity of the Union among traders and bankers of member countries, to pay gold to creditors that exceed their quotas, and, lastly, to provide for the needs of member countries that may encounter particular difficulties. The managing board estimates that, in order to secure all these objectives, the minimum additional amount of cash that the Union will require in the immediate future is $178 million. A subscription of this magnitude can come only from the United States and it is to be hoped that this suggestion, made with the utmost tact in the report of the managing board, will be duly heeded in Washington.

Can such a subscription from the United States be supplemented (or, if necessary, be replaced) by self-help? Two possibilities—one that debtors would like and the other that creditors urge—have been canvassed. The solution favoured by the debtors is that the quotas fixed in 1950 should be amended to take account of the subsequent rise in prices and of the great fluctuations in intra-European balances of payments. The managing board admits that the quotas are much smaller in real terms than they were when the agreement was signed, when the total value of intra-European trade was a third less than it is now and when the gold reserves of most members were much larger. Not unnaturally, however, the persistent creditor countries seem to have raised strong objections to such an upward adjustment of quotas, which would diminish the gold that they earn. These objections have had to be heeded. In its report the board does not recommend a general increase of quotas, though it implies that it might do so if it could count on a parallel increase in the convertible assets of the Union. The ball is, therefore, thrown back to Washington.

The solution favoured by the creditors is that there should be changes in the sliding scales of gold and credit payments on which debtors and creditors respectively settle their deficits and surpluses with the Union. At present debtors have to pay less gold than the creditors receive when both are in the lower tranches of their quota. The position of the Union would, therefore, be strengthened if the debtors had to make proportionately larger gold payments in the early stages of their overdrafts. Not unnaturally, however, the debtors have objected and, once more, the ball has had to be sent back into the United States court. The managing board has decided not to make positive recommendations to amend the scales of gold payments " until a decision is reached regarding the amount of convertible assets which will be available to the Union."

Whatever may be the United States answer to these implied and indirect invitations, there can be no doubt

that the life of EPU should and will be extended into 1953. The difficulties the Union has had to encounter should not be allowed to detract from the good work it has done. It stands today as the last bulwark that prevents the dollar-parched countries of Western Europe from returning to a system of bilateral payments even more rigid and restrictive than the system adopted immediately after the end of the war. The managing board has no doubts about what would happen if EPU were allowed to lapse. Its demise "would tend to upset and delay the defence effort, would destroy the wider market which has been created by the transferability of European currencies and would bring to an end the progress which has been made towards a general increase of productivity in Western Europe." EPU should be judged not solely by the limping liberalisation that it has achieved, but by the chaos and restrictionism that it has prevented.

Business Notes

Gilt-Edged and Electricity Finance

The rally in gilt-edged has become more pronounced during the past week and has been joined by a rebound in equities ; blue-chip industrials have now recovered almost three-quarters of their post-budget losses. These rather unrepeatable movements reflect the markets' mood in response to the continued firmness of sterling in the exchange markets and to governmental statements that have been construed as foreshadowing a heartening performance by the gold figures due to be published on Monday (together with the White Paper on the balance of payments during the second half of last year). A further consideration—and one of a somewhat contrary kind—has been the short-sighted hope that the Government may respond to the pleas for relief to the textile and other consumer goods industries. The rises in gilt-edged prices have not been large nor, despite the reappearance of some institutional buying, do they imply any real robustness in the underlying tone of the market. Everyone is well aware that the close season for new issues, inevitably ushered in by the uncertainties preceding the budget and the finance bill, is now about to end ; the tightness of the rein the banks are keeping on bank advances obviously leaves many industrial borrowers with no choice but to turn to the market in the fairly near future, and observers of the gilt-edged scene are conscious that the reverberations of any substantial revival of industrial borrowing, even by "rights" issues, are unlikely to be confined within the share markets.

A consideration of even more immediate relevance for gilt-edged is the possibility of the first big government operation since the launching of the new monetary policy. It seems that the authorities cannot delay much longer the overdue re-financing of the nationalised public utility industries. By February, bank advances to these groups had run up to the huge total of £135 million, most of which represented finance for electricity and gas, especially the former ; and, as noted below, it is probable that these advances have mounted further.

* * *

Difficulties of Funding

Given the objectives of the new monetary policy, and the manner in which it obliges the banks to watch very closely the ratio of their advances and investments to deposits, it would be utterly unreasonable to expect the banks to carry much longer the burden imposed by such large lendings to these privileged public borrowers. If their needs for cash continue to mount, one or more funding operations become imperative. The Gas Council secured £75 million from its issue of 3½ per cent stock, 1969-71, offered at 98 last July, and the proceeds of the last call were not received until late in the year (though a large part of the whole was bespoken for the repayment of earlier bank advances); but the Electricity Board has not approached the market since May, 1950, when it raised £150 million (also partly bespoken for repayments to the banks) in 3½ per cent stock, 1976-79, offered at 99. In these circumstances, whether or not the gilt-edged market looks robust, it becomes questionable whether the authorities can refrain from snatching the chance presented by the present appearance of relative firmness.

The problem that confronts them presents, however, some peculiar technical questions, quite apart from that of timing. Given the relatively high level to which long-term yields have risen, there has been some discussion in market circles about the reasonableness, on this occasion, of choosing a short or medium dated issue—despite the fact that the funds are needed for long-term purposes. On the other hand, unless the stock selected is one that stands the best chance of quickly finding a permanent home with private investors and with institutions outside the monetary circle, the effect will be to ease the pressure of monetary discipline on the banking system. That will happen to some extent in any case, because the loan will be used to repay bank advances ; but this effect would be re-doubled if any large portion of the loan had to be carried for long by the "departments"—since they would finance themselves by selling bills to the banking system, thereby expanding the banks' supply of liquid assets, now likely to rise seasonally in any case. If the authorities were concerned about this possibility—as, in present circumstances, they surely ought to be—they would have no alternative but to select a stock designed for the general investor, and to offer it on terms attractive enough to give a good chance of quick clearance. The worst of the several difficult choices would be to offer a short security of a kind that could not be financed without large recourse to bills, and otherwise could not be quickly shifted from the authorities without cajoling the banks into taking a direct participation. If that were the likely course, the banks would doubtless prefer even to carry the unfunded advances—for these, at least, do not involve a market risk and will soon, thanks to recent negotiations, be paying a rate roughly twice the very low one that obtained only a few months ago.

* * *

Budget Outturn

The 1951-52 financial year ended last Monday with an above-the-line surplus (after allowing for sinking fund expenditure) of £379 million and an overall deficit of £150 million ; these figures were, of course, a far cry from Mr Gaitskell's estimates (after allowing £160 million for defence supplementaries and taking credit for a reduced contribution to the National Insurance Fund) of an above-the-line surplus of only £79 million and an overall deficit of £417 million, but—as the accompanying table shows—they were only marginally different from Mr Butler's provisional figures of four weeks ago. It would be conventional to call such a heavy shortfall of the overall deficit below original estimate an "improvement," but in this case it was nothing of the sort. Income tax brought in £44 million more than was originally expected largely because inflation rose above estimate by more than production fell below target. Customs duties brought in £68 million more than expected because import values rose far beyond what the country could afford. The ruddy glow in ordinary revenue as a whole—which came out £197 million above original expectations—was a sign of high fever instead of health.

BUDGET OUTTURN AND ESTIMATE, 1951-52
(£ Million)

	Budget Estimate*	Outturn	
		Provisional†	Actual
Above the Line			
Inland Revenue	2,302	2,370	2,362
Customs and Excise	1,651	1,755	1,752
Other Revenue	283	315	319
Total Ordinary Revenue	4,236	4,440	4,433
Consolidated Fund Expenditure‡	584	592	592
Defence Expenditure	1,274*	1,112	1,110
Civil Expenditure	2,299*	2,370	2,351
Total Ordinary Expenditure	4,157	4,074	4,054
Ordinary Surplus	+ 79	+ 366	+ 379
Below the Line Payments (Net)			
Loans to Local Authorities	289	353	365
War Damage	87	77	77
Other Payments (net)	120	94	87
Net Below the Line Payments	496	524	529
Overall Deficit	— 417	— 158	— 150

* The £160 million margin for defence supplementaries provided for in the Budget (which included a small sum for civil defence) is here included in the estimate for defence expenditure, and the £40 million Exchequer contribution to the national insurance fund (the suspension of which Mr. Gaitskell announced in his budget speech) is excluded from civil expenditure.
† Provisional outturn estimated in the Financial Statement at the time of the budget speech on March 11, 1952.
‡ Including sinking fund.

On the other side of the account ordinary expenditure fell £103 million below the level that Mr Gaitskell envisaged in last year's budget speech. Defence expenditure was some £164 million below the original target but civil expenditure surged remorselessly upwards. Below the line, loans to local authorities were £76 million above estimate, thus more than offsetting the better showing of other extra-budgetary payments and receipts. In short, in nearly all the fields in which it was least desirable expenditure burgeoned beyond estimate—and 1951-52 must go down to history as the year in which Britain's "overall" deficit was much smaller than expected, but for all the wrong reasons.

* * *

Steel Prices Analysed

Perhaps the only useful result of this week's debate in the Commons on higher steel prices was that Mr Sandys gave the details of the increases in costs that he felt unable to disclose a month ago when the price went up. Home costs of steel-making, he explained, had risen since the earlier rise in price last August by £29 million a year: £4 million for rail transport, £6 million for home-bought scrap, £8 million for coal, coke, and fuel oil, and £5 million for other materials, with a wage increase of £1½ million a year and an increase in production costs of £4 million because more pig iron was being used in the making of steel. The earlier increase had allowed £35 million a year for the higher cost of importing steel and steel-making materials at the rate expected in August, 1951 ; but since then the steel from America obtained by Mr Gaitskell and Mr Churchill and the rises in price of imported materials generally had lifted the extra cost of imports by another £46 million. In total, the industry's costs are expected to be £75 million a year greater than were allowed for last year ; of this the increase in prices will provide some £56 million a year.

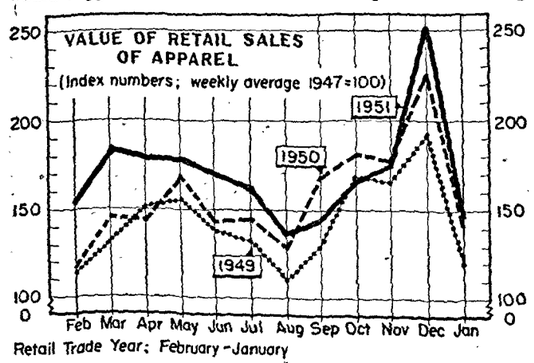
This leaves £19 million to be met from the profits of the industry, which at the end of September last appeared to be running at the rate of some £60 million a year and may, as Mr Strauss argued, have increased somewhat since. At least £8 million of these profits came as a windfall from higher stock values, as recent steel company reports would suggest, and more than £10 million from subsidiaries outside steel-making. Perhaps another £12 million a year arose from the premium earned by companies in exporting steel at prices higher than those charged at home—with exports during the period at a rate between 2½ and 3 million tons, the export premium was presumably something over £4 a ton. This government, like the last, considers that such premium earnings should not be taken into account in setting home prices. Taxation, the Minister had said earlier, reduced the proceeds remaining to the industry from the original £60 million to some £25 million and the service of British Steel stock costs the industry about £10 million a year. Its development programme commits it to an expenditure of about £50 million a year for several years to come. There is no more to be said.

In a written answer the next day, the Chancellor of the Exchequer stated that the subsidy paid to the iron and steel industry amounted to £7,900,000 in 1951-52 and would be £4,500,000 in 1952-53. Since the cost of importing expensive steel and steel-making materials is now wholly borne as a charge on home steel prices, this "subsidy" needs identifying. The amounts in fact cover remission of duty on iron and steel that has been brought in duty free. If the duty concession were to continue, the figure might be expected to increase with the much greater steel imports this year ; so it would appear that freedom from duty for imports of steel, as for machinery from abroad, is being brought to an end.

* * *

The Credit Squeeze

The evidence of the restraint exerted by the new monetary policy over the supply of credit to the private sector of the economy looks even more impressive in the clearing bank figures for March than it did in those for earlier months. In the four weeks to March 19th, aggregate bank advances rose by £13.6 million in contrast with a rise of nearly £51 million in February, 1951 and one of £29 million in February, 1950. Despite the fact that the new issue market has been virtually closed by the uncertainties surrounding the budget, this is a more marked contrast than was shown in February, when the month's expansion was £21 million compared with one of £62 million twelve months previously. It is noteworthy, too, that more than two-thirds of this latest expansion was attributable to an increase in the advances of the National Provincial Bank, whose business is well known to be susceptible to substantial short-term fluctuation. In addition, there is no doubt that there has been a further demand upon the banks from the nationalised public utility industries. It seems possible, therefore, that advances to all other domestic borrowers have remained more or less unchanged at the level at which they had been approximately stabilised over the period covered by the latest quarterly return, i.e., the period November-February.



Despite the firm hold that has been kept over advances, the banks' investment portfolios were reduced by a further £9 million during March ; at £1,935 million, aggregate investments are now almost £100 million below the peak figure touched immediately after the funding operations last November, though it should be noted that a substantial part of this reduction reflects a writing-down of book values. In consequence of the month's decline in investments—which may itself be partly due to writing-down—the additional advances have been accommodated without causing any perceptible rise in the ratio of "risk" assets to deposits ; this ratio now stands at the new high level of 65.9 per cent, compared with 65.8 per cent, in February. The liquidity ratio, however, is unchanged at 31.8 per cent.

Unfortunately, the effect upon the total volume of credit of the tightening of the credit rein upon the private sector of the economy has been more than offset by demands from the public sector. Aggregate net deposits of the clearing banks dropped during the month by only £11.8 million, compared with a decline of £27 million in March, 1951, and one of £59 million in March, 1950. This reduction by £15 million in the rate of decline in deposits contrasts very sharply with the slackening, by about £55 million, in apparent private demands for credit (as indicated by the fact that advances and investments combined rose during the month by only £4.6 million, whereas last year they rose by £59 million). These figures suggest that the seasonal repayments of Governmental indebtedness to the banking system amounted last month to little more than £16 million, whereas in March last year they totalled fully £86 million. It is very evident, therefore, that the recent tendency for Governmental demands to expand has become more marked during the past month. Over the whole period of four months since the launching of the new monetary policy, net bank deposits have declined by £289 million, or only £67 million more than they fell in the similar period of 1950-51—despite the fact that over the same period bank advances and investments combined have fallen by £77 million, whereas in the comparable period a year earlier they rose by £181 million. The implication of these figures is that over the four months the central government's dependence upon the banking system has increased by £191 million, partly in consequence of the rising pressure of armament expenditure but chiefly, no doubt, in consequence of the effort to reduce the rate of external borrowing from the catastrophic level obtained in the second half of last year.

* * *

Shoppers in Control

Retail trade reached its nadir in the autumn and early winter, and has since then been slowly returning to normal. The Board of Trade reports an average increase of nine per cent in the value of all retail sales in the year ended last January and of seven and a half per cent in sales other than of food. There was a twelve per cent increase in food prices and rises of from sixteen to eighteen per cent in the prices of clothing and many household goods in the year, which would suggest some fall in the volume of goods sold during

the year. The accompanying chart shows that sales of clothing, which are a sensitive indicator of retail trends, were consistently higher during 1951-52 than they had been in the previous year, except in the later summer and autumn months when a combination of unseasonably mild weather, sharp price increases, and over-buying in the spring combined to keep people out of the shops.

It begins to appear that the depression in retail sales, and the resulting lack of orders for the textile centres, may have been due less to sales resistance by the public than to misinterpretation by retailers of the outlook for trade at the beginning of 1951. They bought so heavily in the early boom months of last year that their stocks of clothing, to give one example, were still rising when the public had exhausted its buying spree; the "slump" in the second half of the year began when they slowly and painfully ran down their stocks and at the same time clamped down severely on their own buying. The accounts of some large stores, which are analysed on a later page, support these conclusions. Most of them ended their trading year with higher stocks and Sir Richard Burbidge, the chairman of Harrods, has declared that this company has "got off to a bad start." Like the other store chairmen, Sir Richard gives a qualified welcome to the D scheme, and a readier welcome to the ending of price control. But the department stores have problems of a special kind. They lost ground to the multiple stores throughout 1951; while the total value of sales increased by nine per cent, sales by the department stores remained unchanged, but those of the multiples increased by thirteen per cent and those of the co-operatives by eight per cent. Retail sales in Central London and the West End evidently felt a greater pinch than those for the country as a whole. This evidence from the Board of Trade's survey, combined with the heavy fall in the sales of furniture and furnishings, suggests that better quality goods have borne the brunt of the recession in retail sales. It remains to be seen how far the changes in purchase tax will assist in the coming year.

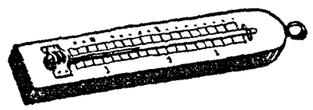
Coal after the Winter

Coal supplies this winter have managed to confound most of the prophets. In November total stocks of some 17 million tons seemed quite inadequate to the new Minister of Fuel and Power, who forthwith ordered coal from America; the coal merchants, alarmed because their stocks were 900,000 tons lower than at the same time in 1950, prevailed upon the Ministry to limit winter deliveries to domestic customers. Mr Lloyd felt that stocks at the beginning of the coal winter should be 19 million tons, since 9 million tons is the lowest level of coal stocks with which the economy can safely end the winter, and he thought stocks "normally" declined by 10 million tons during the winter. On March 22nd, with five weeks to go during which stocks are not likely to change much, there were 13,274,000 tons in hand, compared with 9,600,000 tons at the same period in 1951: stocks have in fact been reduced by little more than 3½ million tons during the winter. Though domestic consumers, since the restrictions were imposed, have received only about 12 million tons of coal and 880,000 tons of anthracite and boiler fuel, compared with nearly 13 million tons of coal and 960,000 tons of boiler fuels during the same period a year before, it cannot be said that there has been any very marked shortage of household coals; and the merchants' stocks of fuel are now about 50 per cent higher than at this time in 1951.

The industry is at present generally being commended for this improvement in supplies; and it is true that it is continuing to attract manpower—recently at the rate of 1,000 men a week—and to work Saturday shifts. But the transformation scene in coal seems in fact to be due to a much greater extent to the disappearance of the growth in inland coal consumption. During the last six months 111,908,000 tons of coal have been used in Britain, against 111,822,000 tons in the same six months of 1950-51; and even a moderate increase in exports and bunkers this year—2,894,000 tons in 12 weeks, against 2,086,000 tons in the same period of 1951—has hardly reduced the margin of 4 million tons by which stocks this year exceed those last year. It would be over-optimistic to attribute this stabilising of inland consumption to any sudden access of efficiency in the use of fuel; it has coincided, unfortunately, with a similar stagnation in the level of industrial output. Output according to the latest figures, continues to be hardly higher



THE National CLASS 31
'DIRECT ENTRY'
ACCOUNTING MACHINE

for all branches of
COMMERCE, INDUSTRY, GOVERNMENT & FINANCE

10 Totals each with direct subtraction.
ALL balances—positive AND negative—computed and printed automatically.
Feather touch, 'standard' adding keyboard for speed and accuracy.
All-electric typewriter for unlimited narrative description.
Constantly visible printing line gives confidence, aids speed.
Instantaneous and infinite adaptability to any accounting work.
Fluid-drive carriage moves automatically by oil pressure in both directions.
Simultaneous addition or subtraction in ANY combination of registers.

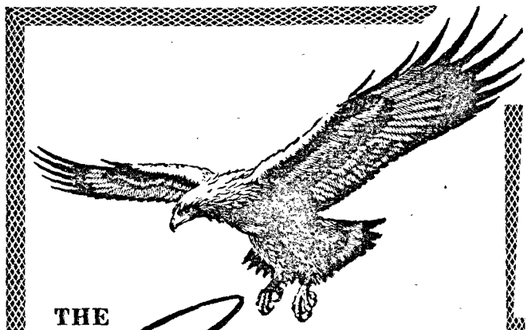
Thousands of duralumin rivets can be hardened in a single batch by heating them to 500°C. and then quickly "quenching" or cooling them to room temperature. At this stage they are still pliant enough to form or head, but only for a few hours.



That's where refrigeration steps in. If, after "quenching", the rivets are cooled still further and kept at 0°F., the metal will remain in a workable state for several days. Refrigeration is the answer to this problem and a lot of other people's problems too!

Loan Aid for Britain

Details were published this week of an Export Import Bank loan of $47.9 million to the British Government. This is not a cash transaction. The dollars in question have not gone into the reserves of the Exchange Equalisation Account. The total of the loan represents 16 per cent of the Mutual Security Aid of $300 million allocated to Britain for the year to June 30, 1952. Under the provisions of the Mutual Security Act this proportion of the aid had to be made available in the form of a loan. As in the case of the loans granted under the Marshall Plan, the Export Import Bank of Washington was made the agency for canalising this aid and making the contracts with the borrowing Governments. The dollars represented by this loan will be indistinguishable from outright aid dollars. They will not become available until the goods eligible for aid have been delivered in Britain and paid for by the British Government. At the end of this sequence the British Government will receive a reimbursement of its expenditure. Some Mutual Security Aid may have come into the gold and dollar reserve by the end of the first quarter, but it is unlikely to prove a large amount. Unless the rules of eligibility are widened considerably it may prove impossible to secure the whole of the allocated $300 million even by June 30th next. The part of this aid covered by the Export Import Bank loan will bear interest at 2½ per cent. Interest together with capital will be repayable in annual instalments which are due to begin on June 30, 1956.

* * *

Airline Finances

British Overseas Airways Corporation has made a clear profit in the past financial year and will not need to draw the £1 million subsidy for which allowance has been made in the Ministry of Civil Aviation estimates for 1952-53. Whether there is an element of subsidy in the increased mail payment awarded to the corporation last year can be left to others to argue. Last November the Post Office agreed to pay retrospectively from January, 1951, an extra 3s. 1d. a ton for first-class mail, bringing the rate up to 14s. 2d. a ton. This rate, however, is equivalent to no more than 4.17 gold francs compared with the international rate of 6 gold francs, so that BOAC can fairly claim that competing airlines are treated more generously by their postal authorities.

BOAC now starts on a year of great promise. The financial success of 1951-52 owes much to improved administration and to the fact that the corporation had sufficient modern aircraft to take advantage of the great increase in air traffic. This year the corporation has a lead over its competitors by introducing the world's first jet airliner passenger service. Starting on May 2nd with one weekly Comet service each way between London and Johannesburg, BOAC should be operating three weekly services by the end of June. Towards the end of the year, the Comet flights should be extended to Singapore.

While BOAC's finances have been stimulated by the delivery of new aircraft, those of its sister corporation, British European Airways, have been depressed by the lack of them. BEA expected to put the new Ambassador aircraft into service last summer, but a number of small but time-consuming adjustments delayed the introduction of the aircraft on scheduled services until the middle of last month. Seven of the 21 Ambassadors on order have now been delivered, and seven more are expected during the summer. In October, Vickers-Armstrongs should deliver the first of the turbo-prop Viscounts. Lack of the Ambassadors last year has cost BEA "many hundreds of thousands of pounds" for the services had to be run with Vikings and Dakotas that had become too small for the volume of traffic. By December, 1951, the corporation's accumulated deficit for the first three quarters of its financial year was more than £500,000, double the deficit for the same period of 1950, and the increased petrol tax, which does not seriously affect BOAC, will cost BEA a further £103,000 a year on its already uneconomic internal services. It is probable, therefore, that BEA will need most of the £1 million subsidy allocated to it in the civil estimates. The traffic results for January, one of the worst months for airlines, illustrate the main difficulty facing BEA. Total revenue, at nearly £652,000, was 30 per cent higher than a year ago, but total expenditure, at £1 million, was 24 per cent higher and the month ended with an operating loss of £353,000, 14 per cent higher than a year ago, when fewer passengers were carried and fewer ton-miles flown. The solution lies in a reduction of unit costs that should be steadily achieved with the new aircraft.

* * *

Building Societies' Rates

In response to the recommendation made by the council of the Building Societies' Association on March 14th, well over a hundred building societies have now raised their investment rates to 2½ per cent on shares and 2 per cent on ordinary deposits, and their charges to new mortgagors to 4½ per cent. There has been some variation in the date fixed for these increases—several societies will conduct operations at the old rates up to July 1st—and also in deposit terms. Exceptionally, the Halifax has decided to leave its rate on shares unchanged at 2¼ per cent for the present, but otherwise the new pattern can now be taken as more or less standard throughout the movement—so far as investors and new borrowers are concerned. For existing borrowers, however, there is no such uniformity. At the annual meeting of the Halifax Building Society last Monday Mr Algernon Denham reaffirmed that this society was leaving the charge to existing "occupier borrowers" unchanged at 4 per cent for the present ; he agreed that future circumstances might make a ½ per cent increase unavoidable, but seemed at least moderately hopeful that the line could be held. The Abbey National, on the other hand, which announced its decision to raise investment rates and charges to new borrowers on March 17th, has now decided to take the full plunge. Its existing mortgagors will pay 4½ per cent from July 1st next. Other societies that have been sitting on the fence in the last three weeks will now have to decide which leader to follow.

* * *

More Rubber for America

Relaxations in the control of natural rubber consumption in the United States announced this week mean that American consumption will increase by 15,000 tons this year to about 480,000 tons including latex. The quarterly allowance of dry natural rubber for industry has been raised from 105,000 tons to 110,000 tons for the last three-quarters of the year. In making the announcement Mr Kelly, director of the Rubber Division of the National Production Authority, promised that more relaxations will follow in the near future.

A month ago the US Government announced that on July 1st the Defence Production Administrator would cease to be the sole importer of natural rubber. The latest step increases the total amount of natural rubber that can be consumed and also raises the maximum percentage of natural rubber that may be used, particularly in tyres. The proportion has been increased from 14 per cent to 17 per cent for the smaller-sized motor-car tyres and from 20 per cent to 25 per cent for the larger sizes. Restrictions on the produc-

tion of "white sidewall" tyres have been removed; these luxury tyres, which use a fairly high proportion of natural rubber, can now be made again, although the pale crepe rubber, which manufacturers prefer to use for them, will still not be available.

These relaxations are a step in the right direction, and the pace at which the American government is at present carrying out its declared policy of removing controls is heartening. An extra 15,000 tons for civilian consumption scarcely represents the end of restriction for natural rubber; much remains to be done before it can compete freely with synthetic. Until July the effect of these relaxations will be blunted because the American manufacturer has to pay the government price of 48½ cents a lb for his natural rubber, which is far above the current market price of 32 cents. Perhaps after July the Administration will abandon a synthetic price for natural rubber.

* * *

World Steel Output Soars

World output of steel in 1951 rose by nearly 11 per cent to some 206 million tons, according to estimates of the British Iron and Steel Federation. This is the highest output ever, about 30 per cent more than in 1943, the peak year of the last war. The largest absolute expansion was in the United States, where output rose by more than 8 per cent to 93,870,000 tons; but greater proportionate increases among the large steel producers were recorded by Japan (34 per cent), Belgium (32 per cent), the USSR (13 per cent), France (13 per cent), and Western Germany (11 per cent). Britain had the dubious distinction of being the only steel producing country, not only among the major producers but among the small fry as well, in which output last year was lower than in 1950 (by some 4 per cent); even Norway managed to produce 80,000 tons compared with 70,000 tons the year before.

WORLD STEEL* PRODUCTION
(Million Long Tons)

* Steel ingots and steel for castings. † Czechoslovakia, East Germany, Hungary, Poland, Rumania, Bulgaria. ‡ Years ended June 30th.

With world output now 72 million tons, or 54 per cent, higher than in 1937, the best prewar year for steel output, and many countries continuing to expand steel capacity, it is not surprising that many in the industry apprehend a surplus not far off. Given the large imports expected this year, it seems likely that even in Britain steel of most types will be much less scarce by the third quarter. The immediate situation is somewhat paradoxical; consumers are still short of steel, and some are even complaining that their allocations cannot be honoured, yet supplies seem sure to increase within a few months. There probably remain fairly considerable stocks in consumers' hands, but not generally in the right places. Within the general steel shortage, however, the shortage of alloying materials and special steels is much farther from solution: and it seems certain that within the industry some special measures will be taken to deal with this much knottier problem.

Comparisons in Metal Prices

The Ministry of Materials has been busy this week. It has raised the prices of aluminium by £6 to £154 a ton and of copper by £4 to £231 a ton and has reduced tungsten by 35s. to 500s. per long ton unit. These prices seem to have no close connection with changes in the world market. The aluminium price has been raised because of the higher cost of imported supplies, but the Ministry's announcement makes it clear that the higher cost of home-produced aluminium has also been taken into account. Most of the imported aluminium comes from Canada under the new long-term contract; there has been no official mention of any increase in price to Canada this year. On the other hand the marginal supplies obtained from Norway and other countries could hardly account for a rise of £6 a ton; presumably the cost of home-produced aluminium has increased sharply.

The copper price was raised because of the higher "overhead charges (including refining) that the Ministry has to bear." Refined copper accordingly now costs £11 a ton more than the official American price—an ample margin, it would seem, for freight, storage and delivery to consumers' works. The Ministry's footnote to its announcement that its "selling price is still well below the free market price prevailing in many other countries" sweetens only one side of the pill.

* * *

Steadying the Jute Market

The reduction in the Jute Control's price for raw jute and jute goods this week has so far had little effect on the market. The cut was considerable; the main grades of raw jute were reduced by £50 to £164 a ton and corresponding reductions were made for other grades. Yet Dundee prices are still £20 to £30 a ton above present world levels. Three months ago raw jute was selling at £172 a ton; then the price fell until a fortnight ago it was down to £122 a ton. The Pakistan Government promptly imposed a minimum domestic price for raw jute and steadied the market, though there is still uncertainty because export prices have not been fixed. Prices are now around £125 a ton at European ports for export qualities, which is slightly above the equivalent domestic prices in Pakistan.

The demand for jute goods has been weak since the turn of the year—somewhat surprisingly in view of the heavy crop of cotton and wheat. All jute manufacturing countries have felt the reduction in orders but the Calcutta mills have had to bear the added handicap of a heavy export duty which made their hessians and sackings uncompetitive. The Indian trade was brought to a virtual standstill as American buyers had switched to the cheaper continental markets. The halving of the export duty in February has not helped greatly; the Americans have not resumed buying from the Indian mills and rumours of a further cut in the duty persist. Stocks of hessians and sackings have piled up and from the beginning of April, the Calcutta mills are reverting to a [illegible]

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SEVENTY-FIRST ANNUAL REPORT OF THE DIRECTORS FOR THE YEAR ENDED DECEMBER 31, 1951

TO THE SHAREHOLDERS:

For your railway enterprise, 1951 was a record year in tonnage carried, and gross earnings were at an all-time high. However, working expenses were also at a new high. In consequence of higher prices, wages and tax rates, working expenses increased at a greater rate than revenues and absorbed 94 cents of each dollar of earnings as compared with 90 cents in 1950. As a result, net earnings from railway operations were far below the level necessary to provide a sufficient contribution to dividends and a reasonable amount for reinvestment in railway property. The rate of return earned on investment fell to 2.4% from 3.5% in 1950.

The Income and Profit and Loss Accounts of your Company show the following results for the year ended December 31, 1951:

INCOME ACCOUNT

Gross Earnings			$428,911,639
Working Expenses			402,098,807
Net Earnings			$ 26,812,832
Other Income			29,343,635
			$ 56,156,467

Profit and Loss Balance December 31, 1951, as per Balance Sheet		$252,947,332

RAILWAY OPERATIONS

Gross earnings, at $429 million, were the highest on record and were $50 million, or 13%, greater than in 1950.

Freight earnings provided 82% of gross earnings, a larger proportion than in any previous year. There was an increase of $45 million over 1950, of which more than half was the result of increased traffic volume. Greater revenues were reported for all commodity groups except coal, coke, petroleum, livestock, and fruits and vegetables. Revenues from grain and grain products and from lumber increased by $17.5 million and $9 million respectively.

Traffic volume in terms of tons carried was at an all-time high, and was 12.5% greater than in 1950. Ton miles increased by 16.9%, and were at a level exceeded only in 1944 and 1945.

Net earnings from railway operations, at $26.8 million, were $11.2 million less than in 1950. The table on pages 36 and 37 shows that they were even less than in 1939, a year in which gross earnings were only a little more than one-third those of 1951. The table also shows that the ratio of net to gross earnings, at 6.3%, was lower than in twenty-seven of the previous twenty-nine years.

ERIC A. LESLIE,

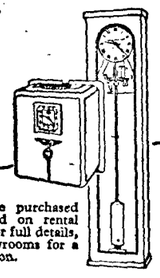
MY UNCLE JOE

by

STALIN'S NEPHEW

BUDU SVANIDZE

"I asked Molotov to pay half of it for it was really a private dinner to Churchill," complained Stalin when his daughter Svetlana told him that he had paid 10,000 roubles out of his budget for entertaining at the Kremlin.



So records Budu Svanidze, Stalin's nephew, who has written for the Sunday Express the fascinating, personal story of Stalin as seen in the intimacy of his home and family.

The first enthralling chapter on Sunday will tell how Stalin's pious conservative family forced him into a Church wedding at which he sang a love song and performed a dagger dance with his friend Prince Mdvani.

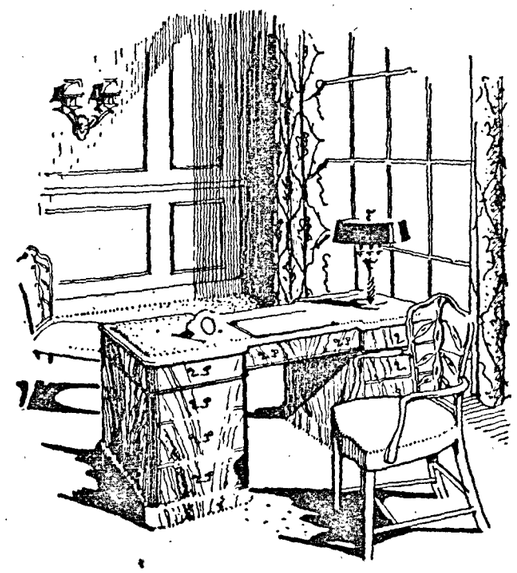
THE INDUSTRIAL BRANCH OF SMITHS ENGLISH CLOCKS LIMITED



STORY & CO. LTD.

Designers of Interiors

KENSINGTON · LONDON

EXPERIENCE gained over many decades in the design of interiors and the *actual* production of fine furniture together with suitable floor coverings and textiles, enables Story's Contracts section to give competitive estimates on a high level of quality and design, both in English Traditional styles and in the Contemporary manner.

Since 1945, Board Rooms, Directors' and other offices, reception halls, showrooms, restaurants, canteens, residential staff quarters, etc., have been successfully executed (many in collaboration with the clients' architects) for over 30 notable organisations, including Martins Bank Ltd., I.C.I. Ltd., Tube Investments Ltd., Kuwait Oil Co. Ltd., Kodak Ltd., Cyanamid Products Ltd., Dunlop Rubber Co. Ltd., Patons & Baldwins Ltd., Lever Bros. & Unilever Ltd., Ind Coope & Allsopp Ltd.

The latest forecast for the current jute crop is about 11 million bales, of which 6.3 million bales are expected from Pakistan and 4.7 million from India. In the present depressed state of trade it is doubtful if the whole of this amount will be taken up before June ; the balance remaining to be sold is, according to one estimate, about 2 million bales. Dundee has sufficient raw jute to last until October at a normal rate of consumption but with present short hours at the mills stocks could last until next year. If the world trade in jute does not soon improve, the Ministry of Materials may have to consider a further cut in price.

* * *

Higher Bill Rates

The discount market, on Thursday of last week, was unexpectedly forced "into the Bank"—for the first time since the increase in Bank rate to 4 per cent. That is to say, several discount houses found supplies of credit in the short loan market insufficient to enable them to finance their portfolios on that day without recourse to formal borrowings from the Bank of England. When the market seeks these emergency loans, it has to take them for seven days, and it is charged 3½ per cent p.a. if the collateral security consists of Treasury bills. This compares with the normal charge of 2 per cent for day-to-day loans on similar securities from the clearing banks. The market had previously hoped that the authorities would have left a longer period after the steep increase in Bank rate before allowing money conditions to tighten to the point at which this expensive supplementary finance had to be sought. As it was, the sudden strain was at once reflected in an advance in Treasury bill rates. At the following day's tender, the discount houses reduced their application price for the £210 million of bills on offer, with the result that the average rate of allotment rose from £2 6s. 3.64d. per cent to £2 7s. 3.61d. per cent. The clearing banks' buying rates for bills—and also that of the "special" buyer when he operated last Monday—have since been raised in conformity. Although money supplies have remained tight, the market has not been driven into the bank a second time.

* * *

Negotiations with Argentina

The annual Anglo-Argentine negotiations are proceeding quietly and apparently smoothly in Buenos Aires. Argentina is making a strenuous effort to catch up on its meat shipments to this country ; by mid-May the deficiency on last year's meat contract should not exceed a few thousand tons. The agreed amount was 200,000 tons of carcase meat and 30,000 tons of canned meat. But Britain has received more mutton than was expected and no chilled beef. Last year, Argentina insisted that Britain should accept chilled beef and pay a high price for it ; 35,000 tons were promised and Argentina was given the option to send more if it wanted to. In fact it sent none. The Ministry of Food may have been relieved at the consequent reduction in the average price for Argentine meat, but the British consumer had to be content with poorer quality.

At long last, the Argentine Government is taking steps to revive agricultural production and to curtail home consumption by introducing two meatless days a week. These measures will take time to produce their effect, but they may ultimately be important. Argentina could still offer and ship another 200,000 tons of carcase meat to Britain during the coming twelve months if exports to other countries were reduced. On this question, prices will give the answer. Argentina's opening gambit of £250 a ton has not been taken seriously ; nor was it allowed to be published inside Argentina. But it would be surprising if the Argentinian negotiators did not hold out for some increase on last year's figure of about £126 a ton, particularly if supplies have to be diverted from other markets.

Meat is only one of the items in this annual tussle. Coal, petroleum and tinplate are some of the others. Under last year's agreement Britain promised 500,000 tons of coal, 4 million tons of petroleum products and 27,000 tons of tinplate. Both the coal and the oil shipments will be completed by the end of this month but tinplate, although authorised by the Board of Trade, has been held up by shipping difficulties. These three products are scarce and could be easily sold to other markets. They may provide a lever for opening the door to British textiles, particularly if agreement could be reached on the price of meat.

* * *

Fiduciary Issue Increased

In consequence of the seasonal increase in the demand for notes the fiduciary issue has been raised from £1,400 million to £1,450 million ; the authorisation for this rise runs from April 1st for not more than six months. Although the Government did not find it necessary to make a similar "Easter increase" last year, it should not be assumed that this latest rise is a sign of newly mounting inflation. It is largely a backwash from the increase in money-holding habits generated by last year's increase in prices. At its August peak in 1951 the active note circulation was £65 million higher than it had been a year before ; by the time of the October "low" the corresponding rise on the year was £74 million, by Christmas it was £80 million, and by the time of the end-January low it was £72 million. Throughout this period (except for a temporary widening at Christmas time) the fiduciary issue was kept at only £50 million above the previous year's level. By the end of January, 1952, therefore, the reserve in the banking department, at rather over £46 million, was about £22 million less than at the corresponding period of 1951. Between the end of January, 1951, and the post-Easter peak £40 million of notes flowed into active circulation. The corresponding efflux will clearly be substantially greater this year, since it had already reached £40 million by last Wednesday and would have left only £6 million in the reserve if there had been no increase in the fiduciary issue. The assumptions behind Mr Butler's budget—that consumption should be about the same as last year and that prices and disposable increases may be about 4 per cent higher—do not suggest that any downturn in the active circulation is expected in the near future.

* * *

AEI and the Future

While the order books of many consumer goods industries continue to run down, the order books and the production of capital goods industries are still surging to record levels. Associated Electrical Industries is one industrial giant that can look back to the past with every satisfaction and forward to the future with every confidence. At the annual general meeting, the chairman, Sir George Bailey, revealed that last year the value of production jumped to the record figure of £61 million and that orders in hand, with contract dates spread over the next four years, are worth £135 million. In the last twenty years, the group has spent about £17 million on increasing the size and number of its factories, on improving its equipment and in ensuring greater productivity within its workshops. The original cost of fixed assets, valued in the balance sheet at £9,800,000, was £23,800,000 but these assets could only be replaced at the moment by spending £45 million. These figures bear out Sir George's contention that "to build a similar organisation from the ground upward . . . would be a practical impossibility under present circumstances."

Sir George is confident that the rate of expansion in electricity consumption, which has doubled in this country

in the last ten to twelve years, will continue for some time to come. Moreover, a market exists for the group's products abroad as well as at home; over three-quarters of the orders in hand have been placed by customers abroad, by the Government and by the nationalised industries. But two major problems remain. The first is the shortage of raw materials, which caused difficulties in every one of AEI's factories towards the end of last year. The second is the debilitating effect of high taxation on enterprise and expansion. Last year £5,400,000 of AEI's profits went to the tax collector against £673,000 to ordinary stockholders; this year EPL will take an additional £350,000, even if profits are only maintained. The logic of the present economic prescription for Britain is that capital goods industries should continue to expand, if necessary at the expense of consumption goods industries; the stick of EPL —which falls especially heavily on companies that have expanded in the last three years—seems designed to drive industry in the opposite direction.

* * *

Demand for New Ships

Despite an increase of 2.6 million tons gross in the size of the world's merchant fleet during the past year, the demand for new tonnage shows no sign of abatement, according to the annual report of Lloyd's Register of Shipping for 1951. The world fleet, including the American laid-up reserve, now totals 87,245,044 tons gross, some 27 per cent greater than in 1939. Ships registered in the United Kingdom now make up 21 per cent of the total, compared with 26 per cent before the war, while the United States, which had only 13 per cent of the prewar world fleet, now has nearly 29 per cent. The fact that the world fleet in being is expanding so rapidly might be expected to cause a decline in shipbuilding orders, but last year's prosperity kept in service many ships that otherwise would have been scrapped. The age of ships in service now suggests a fairly high level of shipbuilding work for some time in replacement. No less than 82 per cent of the American fleet, for example, is between five and nine years of age, and 50 per cent of the UK fleet is between five and 14 years.

Another factor affecting the size of the merchant fleet is the expansion of specialised tonnage. The seagoing tanker fleet now exceeds 18.2 million tons gross, compared with 11.4 million tons in 1939. Many ships are now being specially designed for carrying ore, and these carriers are showing the same trend towards bigger units displayed in the case of tankers. Some of the ore carriers under construction have a carrying capacity of over 30,000 tons, and a number of them are designed to carry heavy oil as an alternative to ore. Tankers and ore carriers for service on the Great Lakes are showing similar tendencies, and the interest being taken in the St. Lawrence Seaway project opens up new possibilities of trading that are likely to be reflected in the design of future ships.

As for methods of propulsion, nearly three-quarters of the world tonnage is still steam-driven, and almost half is propelled by steam reciprocating engines. While the tonnage of steamships has remained static in the last four years, that of motorships has advanced from 17.2 million tons gross in 1948 to 23.4 million tons in 1951. The tonnage of ships burning coal is declining rapidly, having dropped from 18 million tons in 1948 to 14.7 million tons in 1951, compared with a total of 31 million tons in 1939. The percentage of ships burning oil has increased from 54.7 per cent in 1939 to 83.2 per cent in 1951. No fewer than 500 steamships have been converted from coal to oil burning since the end of the war under the supervision of Lloyd's Register; the report states that there are now indications that this programme may be nearing completion. The dominant trend at present is undoubtedly the conversion or building of diesel engines to burn boiler fuel; despite the satisfactory results of the first voyage undertaken with a gas turbine tanker, it will probably be some time before this form of engine will become a general competitor with other types of prime mover.

Shorter Notes

Industrial output in January, according to the official interim index, was rather more than 3½ per cent higher than a year before, though the advance estimate last month had suggested that it would be no higher or even slightly lower. The provisional guess for January is 144, compared with 139 in December and 140 in January, 1951; between December, 1950, and January, 1951, no increase was shown in the index. According to early information about February output, the index for that month is expected to be 148-149, compared with 151 in February last year. It is worth noting that the "B" index of the London and Cambridge Economic Service shows industrial output in January as 138, compared with 137 in January, 1951.

*

As "a token of good will towards the holders of Japanese sterling bonds." Japan is to deposit £20 million from its sterling balance of about £100 million with the Bank of England; it is depositing $20 million with the Federal Reserve in a similar gesture to dollar bondholders. These deposits will be available for use if a settlement of the whole problem of Japanese indebtedness is reached within the next two years.

Company Notes

Canadian Pacific.—The opening of new industrial frontiers in Canada has brought booming business—but not booming profits—to the Canadian Pacific Railway. Last year more tons of freight were carried on its railways than ever before, and gross earnings jumped by $50.3 million to a new record level of $428.9 million. An expanding economy, however, has also brought with it a shorter working week, and higher prices, taxes and wages. The consequent increase in CPR's working costs has outstripped the advance in its revenue. Costs absorbed 94 cents of every dollar earned in 1951, compared with 90 cents in 1950, and net railway earnings fell from $38 million to $26.8 million. These earnings, in the words of the directors, are "far below the level necessary to provide a sufficient contribution to dividends and a reasonable amount for reinvestment in railway property." They represent a return of only 2.4 per cent on capital employed (as compared with 3½ per cent in 1950). The chief trouble was the long delay before the central authorities finally sanctioned an increase in freight rates to offset the rise in costs—and the fact that this permitted increase, when it did come, did not apply to rates charged on the transport of grain and grain products in Western Canada. This hidden subsidy to the agricultural interest, made at the expense of the rest of the Canadian economy, has a visible effect upon CPR's earnings. In 1951, for example, grain and grain products accounted for more than 40 per cent of the freight traffic in Western Canada, but for only 20 per cent of freight receipts. Although railway earnings are inadequate, the company spent about $72 million on railway extensions and improvements in 1951—and intends to spend more in the future. But the directors add the warning that "adequate rail earnings will be necessary to enable the company to finance the expenditures" envisaged in its five-year plan.

There is obviously a good deal of truth in the saying that "Canpacs" are anything but a railway stock; the company derives a substantial proportion of its profits from its shipping interests and the dividends declared by Consolidated Smelting. The 1951 result

	Years to Dec. 31, 1950	1951
	$	$

STARCH PRODUCTS

THE largest single use of glucose is to improve the products of the sugar-confectionery trade—boiled sweets, in particular. Every day, millions of young hearts are rejoiced by the sight of gay glass jars in sweet-shop windows, full of brightly-coloured 'cushions' of flavoured sugar, clear and translucent as the jars that display them.

But boiled sweets did not always shine so bright. Once (long ago, it is true) the sugar confectioners were vexed by the crystallising of the sugar in their sweets, which dulled their surfaces and spoiled their translucency. The first attempt to cure the trouble was by adding cream of tartar and so 'inverting' enough of the sugar to prevent crystallisation. That did stop the crystallising to some extent, but invert sugar is hygroscopic — it absorbs atmospheric moisture, and makes the sweets that contain it damp and sticky.

Glucose as a Crystal Inhibitor

Later, glucose was used instead of cream of tartar, with complete success. The glucose, itself an energy-providing food, affords a colloidal medium in which sugar crystals cannot form, and keeps the wares in the sweet-shop windows permanently bright.

The provision of glucose for confectioners to use as a crystal-inhibiting medium is one example of the varied services that the Brown & Polson Group performs for many widely different industries, and is ready to perform wherever opportunity exists. Enquiries will be answered by responsible experts. They should be addressed to:

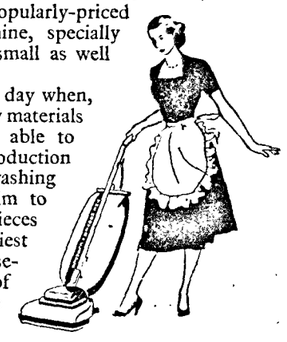
WOMEN IN THE FACTORY NEED HELP IN THE HOME



CONSTANTLY the call comes for more women to work in industry, to increase production both for rearmament and for the export drive.

But if a woman is to work in a factory and at the same time run a home, she needs—and deserves—the best possible labour-saving equipment for her domestic duties.

We at Hoover Limited derive satisfaction from the knowledge that our electric cleaners are doing so much to relieve unnecessary domestic drudgery; and we are proud that their average retail price, exclusive of purchase tax, is only 30% higher than before the war, despite the fact that both quality and design have been improved. We are equally proud of our popularly-priced electric washing machine, specially designed for the very small as well as the larger home.

We look forward to the day when, with free supplies of raw materials available, we shall be able to maintain maximum production of both cleaners and washing machines. It is our aim to supply these *essential* pieces of equipment at the earliest occasion to all housewives in all sections of the community at the lowest possible prices.

HOOVER LIMITED

Makers of Electric Cleaners, Washing Machines, Polishers, F.H.P. Motors, Commutators, etc.

Factories at: PERIVALE, GREENFORD, MIDDLESEX MERTHYR TYDFIL, SOUTH WALES CAMBUSLANG, SCOTLAND HIGH WYCOMBE, BUCKS.

show, however, that the fall in railway earnings, despite an increase in income from other sources, has reduced the earnings cover on the ordinary dividend to a level that is not altogether comfortable, in view of the developments on hand. Earnings per $25 share have narrowed from $3.32 to $2.98, but the ordinary dividend has been maintained at $1.50 a share—or 6 per cent.

★

Decca Record.—The case of Decca Record is an object study of the way in which EPL falls harshly on the enterprising and lightly on the sluggard. For a number of years the company has pushed forward determinedly with the development of new electronic navigation devices and long playing records—neither of which earned any profits until after 1949. The standard EPL period of 1947, 1948, and 1949 imposes a direct tax on these developments. Decca also fares badly under the alternative assessment, which is based, in the words of the directors' report, on "the dangerous concept that the real capital of the business is its paid up share capital." Such a standard takes no account of money raised by loans—and much of the working capital needed by Decca in recent years has been found by the £750,000 issue of unsecured notes, by a mortage of £40,000, and by borrowing about £1,000,000 from the banks.

As the company has made every effort to increase its exports sales, from which £1,896,000 was earned in 1951 compared with £758,000 in 1949 and with only £54,000 in 1939, the directors have every reason to complain that the company has been "penalised for its enterprise." The accounts published last week, which refer to a trading year that ended as long ago as March 31, 1951, show that the first fruits of development were beginning to emerge last year. Following a substantial increase in turnover,

1s. ordinary shares at 17s. 6d. yields £6 9s. per cent.

group trading profits jumped from £349,707 to £651,508 and an annual distribution of 112½ per cent, paid in 1949-50 on an ordinary capital of £99,246, was maintained on the increased capital of £109,167. In addition, an interim dividend of 25 per cent was declared on the new capital of £120,088, as increased by the recent rights issue of £218,264 1s. ordinary shares at 4s. 6d. each. the accounts for the year that ended on March 31, 1952—which, it is to be hoped, should this time be published with less than a year's delay—will apparently "show a further substantial improvement." They will, however, bear three months of EPL. It seems inevitable that the new tax will put a brake on further developments in this important export industry and will also postpone the day when the company can present a balance sheet in which intangible assets play a less dominant part.

★

Harrods and Lewis's.—Last year retail stores had to face both a sharp drop in sales from the summer and a heavy increase in working costs. It is the latter that shows up most noticeably in the accounts that departmental stores are now publishing for the year to last January; the drop in sales in the second half of the year was rather more than balanced by heavy custom in the first six months. The result is that nearly all the departmental stores have reported a somewhat unexpected increase, though a slight one, in annual turnover, but a fall in profits.

The effect of mounting costs upon profit margins is readily discernible in Harrods' accounts. Before charging for wages, salaries and other operating expenses, gross trading profits of the Harrods group are shown to have increased from £5,675,346 to £5,768,484, thanks to an increase in turnover. But once the increased charges for wages and salaries (up from £2,666,032 to £2,827,597), and for other operating expenses (up from £1,359,969 to £1,451,430) are deducted from earnings, trading profits show a fall from £1,649,345 to £1,489,457.

Although a common thread of bigger sales and lower profits runs through most of the departmental stores' accounts, there are variations within the pattern. The chairman of Harrods, Sir Richard Burbidge, for instance, reveals that sales fell more sharply in the north of England than in London, and that the departments hardest hit in the second half of the year were those selling furniture, men's wear and luxury articles. Confirmatory evidence that there has been less spending in the north can be gleaned from the accounts of the companies within the aegis of Lewis's Investment Trust. Its subsidiary, Lewis's Limited, trading in the north of England, has reported a fall in trading profits from £2,161,767 to £2,068,442, but its newly acquired London subsidiary, Selfridge (Holdings) has reported a slight increase in trading profits from £850,800 to £859,996. In a year when increases in prices were predominant, an increase in the book value of stocks was to be expected. In Harrods' accounts the increase from £3,036,585 to £3,409,138 represents "for the most part the increase in price level;" and very much the same can probably be said about the rise in the book value of stocks held by Lewis's from £1,368,492 to £1,765,580. Exceptionally the consolidated balance sheet of Selfridge (Holdings) shows a fall in stocks, from £874,309 to £783,442. Almost all the stores imposed a very tight control upon buying into stocks towards the end of the year, and it looks as if Selfridge's control was stricter than most.

Both Harrods and Lewis's Investment Trust have maintained their ordinary dividends, at 20 per cent and 25 per cent respectively. By freely admitting that Harrods' stores "have got off to a bad start" in 1952, Sir Richard has added to the doubts about the future of Harrods' dividends; the hazardous nature of the course still to be run is reflected in the yield of 7.8 per cent that is offered by Harrods' £1 ordinary shares at the current price of 51s. 3d. The 4s. ordinary shares in Lewis's Investment Trust offer a lower yield of 6¼ per cent at the current price of 16s. xd, but Lewis's dividend is more amply covered by earnings than is Harrods', and the company earns profits from other sources besides its retail stores.

Statistical Summary

EXCHEQUER RETURNS

For the 9 days ended March 31, 1952, total ordinary revenue was £123,713,000, against ordinary expenditure of £187,996,000 and issues to sinking funds £438,000. Thus, including sinking fund allocations of £27,400,000, the surplus accrued for the financial year was £379,733,000 compared with a surplus of £720,515,000 for 1950-51.

COMPANY MEETINGS

THE BRADFORD DYERS' ASSOCIATION LIMITED

ANOTHER SATISFACTORY YEAR'S TRADING

TEXTILE INDUSTRY'S DIFFICULTIES

RESUMPTION OF DEMAND EXPECTED

MR JAMES EWING ON THE OUTLOOK

The fifty-fourth annual general meeting of The Bradford Dyers' Association Limited was held at the Midland Hotel, Bradford, on April 3rd. Mr James Ewing (the chairman), who presided, in the course of his speech, said:—

I am glad today to present to you the results of the year's trading—a gross profit nearly equal to the record figure submitted to you for 1950. For the first nine months of the year there was exceptional activity, both in our home branches and in our associated companies abroad. During the final quarter of last year trade activity in textiles showed a rapid decrease; but fortunately, owing to a heavy accumulation of orders, our branches were kept fairly well employed even during the serious recession. Today we are passing through a difficult period, and the volume of available business has fallen considerably. The industry is suffering from the excess buying which took place, both here and abroad, towards the end of 1950 and early in 1951, when we were threatened with scarcity of materials which it was thought would be accentuated by the change over to defence work. Manufacturers and merchants everywhere were loaded with goods at high prices, and with the break in prices of wool and other primary products, after the orgy of buying, there was a very definite fall in production. Until all these high price stocks have been cleared, it is not to be expected that normal trading will ensue. On the whole, production in the United Kingdom is high, particularly in defence work, and the purchasing power of the public is well maintained and, as stated by the Chancellor of the Exchequer, it will not be diminished by the Budget. I believe, therefore, that before long there will be a resumption of demand for consumer goods, at any rate in the home market. The public, advised from many quarters that textile prices would fall, naturally have refrained from buying; and if we add to this the uncertainty of the trade in producing and stocking utility goods, because of the expectation of changes in purchase tax, it is not to be wondered at that textile sales during the past few months have seriously declined. Purchase Tax, despite the recent amendments is, I believe, a serious deterrent to the immediate recovery of the industry, and had the Government been realistic and courageous it would have taken the risk of abolishing that tax on textiles, thus giving the industry the opportunity to put forward all its energies to meet home and export needs. No other important textile producing country is trammelled as is the United Kingdom by such a handicap as this tax imposes. Surely it is axiomatic that our exports require to be buttressed by a sound home market.

TRADING RESULTS

The year's trading, both at home and overseas, has again been satisfactory. The total trading profit before taxation, at £2,051,062, shows an increase of £66,000 on the previous year. The charge for taxation at £932,000 is nearly £180,000 more than for 1950, but this has been offset by reductions in the amount of profit retained by subsidiaries and in the deduction for minority interests. The result is an increase of £76,000 in the available profit for the year.

The balance sheet of the parent company shows that our shareholdings in subsidiary companies have increased by £786,000 to £2,125,000. During the year, Beida Dyers, S.A.E., Egypt, increased its paid-up capital from £E.500,000 to £E.1 million. We subscribed for our proportion of the new capital, at a cost of £285,867. Our investment in the new Canadian subsidiaries required £463,107 in addition to $84,640 provided by Bradford Dyeing Association (USA), it being desirable, for administrative reasons, that the latter should have a shareholding in the Canadian companies.

In the consolidated balance sheet, the increase in stocks of £1,234,226 is due, in part, to the addition of the stocks of these new subsidiaries, to increased quantities of supplies rendered necessary by lengthening delivery dates and to increased prices. These stocks are all in current use and are held at favourable prices. Fortunately, our liquid resources are ample to provide the increased working capital which has been called for.

Our capital commitments amount to £950,000. We expect that this amount will largely be covered by provisions for depreciation and plant replacement reserve before the full amount has been expended.

OVERSEAS COMPANIES
BEIDA DYERS, S.A.E., EGYPT

This company had another successful year in the financial period ended September 30, 1951, despite considerable fluctuations in trade. The factory extensions undertaken in recent years have been completed and all sections of the plant are operating at a high level of activity. The constant aim of the company is improvement of quality, and in this it has the advantage of very close liaison and co-operation with Société Misr, Kafr el Dawar, which produces the bulk of the grey cloth processed by Beida.

The disturbed political situation recently has not been conducive to good trade. I am hopeful, however, that these difficulties will be soon resolved, permitting a return of the stability so necessary for the industrial development and prosperity of the country.

BRADFORD DYEING ASSOCIATION (USA), BRADFORD, RHODE ISLAND, USA

BDA (USA) achieved a better result on the year's trading than might have been expected in view of the depressed market conditions and the heavy increases in costs of labour and materials and higher taxes. It was not possible to increase prices to counteract these increased costs because of the Government Price Stabilisation Regulations. The high reputation of the company for good quality dyeing and finishing, supported by judicious advertising of its brand names and unremitting effort by a keen sales staff, enabled BDA (USA) to obtain a fair volume of civilian business notwithstanding severe price competition, particularly from the large vertical companies in the Southern States which have a marked advantage over their New England competitors in their cheaper labour rates. In addition to civilian work, bulk orders for dyeing and finishing cloth for the defence programme have helped to keep the work steadily employed. The "Rigmel"-Shrunk finish on cotton goods forms a big part of the company's output.

DOMINION SILK DYEING AND FINISHING COMPANY LIMITED
DOMINION SILK PRINTING LIMITED

In June, 1951, your managing directors, after several visits, concluded negotiations for the acquisition of a controlling interest in these two companies and their subsidiaries. The Dyeing Plant and the Printing Plant are situated at Drummondville, a small town in Quebec Province within easy reach of Montreal. The two companies are firmly established and have a sound trading record. The Dyeing Company was established in 1921 and today dyes and finishes piece goods composed of silk, rayon, nylon and wool or mixture yarns. The Printing Company was established in 1929 and is equipped to print silk, rayon, wool and mixture fabrics by the roller and screen processes. The processing of rayon fabrics predominates in the activities of the two companies. Production and consumption of rayon and rayon mixture fabrics in Canada have been increasing rapidly since 1939.

The price at which we acquired the controlling interest in these two companies was determined largely by current book value of their assets as disclosed in the audited accounts and balance sheets. The vendors thereby secured a fair price whilst we obtained an entry to this market far less costly than by the erection of a new works.

BRADFORD DYEING ASSOCIATION (CANADA) LIMITED, MONTREAL AND COBOURG

Since we acquired this business in August, 1949, conditions in the Canadian woollen and worsted trade have been very unpropitious. Domestic production fell seriously after devaluation of sterling in 1949. Fortunately during 1951 the output at our works was increased by cloth for the Government's defence programme, and during the past few months our works have been fairly well employed. We have taken the opportunity to instal new types of machinery, and we hope to be in a position to process on an adequate scale the latest types of cloths, 100 per cent spun rayon and mixtures of wool and spun rayon, in the development of which we shall be able to give to the Canadian market the benefit of our unique experience in this class of work. The trading results so far have been disappointing, owing to the depressed condition—the worst for many years—of the domestic industry, but your Board is satisfied that before long this company will be a useful addition to our overseas activities.

RESEARCH AND DEVELOPMENT

Research figures prominently in our own activities, and we are now engaged upon a programme of research and development more extensive than at any previous time in the company's history.

Our range of water repellent finishes has been extended by the use of silicones, which are new to industry. We have applied for letters patent for a unique method, superior to any other yet made known, of utilising silicones to the best advantage. This finish will be known in the trade as "Bradsylda."

New finishes on cotton fabrics are also making headway, and particular attention is being paid to developments which will lead to greater operational efficiency in established processes.

For our "Maxifix" finish we employ a new, patented method of producing unshrinkable effects on wool, wool and cotton or wool and viscose rayon materials. Older methods are discontinuous in operation and often have adverse effects on the cellulose constituents of materials. Our new method is continuous in operation and is exceptionally advantageous in that during the treatment neither the cotton nor the rayon is weakened in any way.

During the past year our branch, Oakroyd Dyeing Company Limited, Bradford, has been in operation. We have laid out this works to specialise in the dyeing and finishing of knitted and woven fabrics made from synthetic fibres only. Whilst it will eventually be capable of a large weekly output of such fabrics, it can also be considered a large-scale laboratory for dealing with all the dyeing and finishing problems which will undoubtedly arise with the growth of synthetic fibres, of which only two are at present produced in this country—nylon and "Terylene." On the other hand, in USA the weight of synthetic fibres produced annually is already substantial.

DYEING PRICES

Recently there has been some adverse criticism in the press of dyeing prices. It might be opportune, therefore, for me to indicate the policy of your company in regard to the determination of prices. We make no secret of the fact that there is the fullest co-operation in the finishing industries through their well-organised trade federations, not only in regard to prices but also upon many matters affecting the well-being and progress of the industry and upon matters requiring consultations with other sections of the textile industry and with government departments. Having accepted the principle of trade co-operation, we have to ensure that the interests of the community, our workpeople and our stockholders are safeguarded. In the cotton and rayon industries—in which lie our major interests—we support and co-operate with two national bodies, one statutory and one non-statutory, the Cotton Board and the British Rayon and Synthetic Fibres Federation. Throughout the war period and subsequently, the prices for dyeing and finishing in the main have been based on a cross-section of costs submitted by representative producers and checked by independent accountants. There is no room for speculative margins in the finishing industries, and our prices vary as costs rise and fall. Prices of our main commodities, coal, dyestuffs and chemicals, are subject to change at any time without prior notice, and also in wages, changes which are effected take place immediately. It is necessary, therefore, to make corresponding adjustments to our price lists. We regret we are unable to give our customers warning of changes, and we only hope that as stability returns these changes will become less frequent.

We believe it is in the best interests of our customers that the established practice of the commission dyeing trade, of basing its prices upon cost of production, should be consistently pursued. We neither advance prices because orders are plentiful nor reduce when business slackens. Memories are short, and when a depression takes place the finishing industries become the target of attack. The measure of soundness of our price policy must surely be an assessment of whether the industry is taking an undue toll as against the other sections. That charge cannot be levelled against your company if profits are related to the capital employed in the business or calculated per yard on the hundreds of millions of yards processed by the group. It should also be borne in mind, as I have already stated, that a very substantial proportion of our profits accrues from our overseas investments, in some of which we are partly interested as manufacturers and distributors, where margins have been better than those of the commission finishers.

JAPANESE COMPETITION

The matter of Japanese competition should receive unceasing and vigilant attention by our industrial organisations such as the Cotton Board, the British Rayon and Synthetic Fibres Federation, and the National Wool Textile Export Corporation in order to determine what concerted action might be taken to protect our export trade. It should be possible to establish a liaison between them and representative organisations of the Japanese textile industries with a prospect of reaching understanding on the limitation of Japanese exports to sterling area markets. On the other hand it might prove necessary to resort to restrictive measures such as quotas, and I hope the textile trade organisations will not hesitate to press the Government to take such steps as lie within its power, for undoubtedly the mass purchase of consumer goods by countries within the Commonwealth from Japan rather than from the United Kingdom could undermine the stability of the sterling area.

INDIAN COTTON INDUSTRY

The abnormal expansion of trade by the Indian cotton industry within the colonial markets of the Empire, resultant on the supply position during the war and after war period, is likewise calling for government attention. There are factors in connection with this, especially those of the price of raw cotton supplies and the high rate of duty levied on UK exports to India, which do not conform to that equality of trading conditions which should obtain within a well-balanced and ordered Commonwealth system.

Although I will not venture into the realms of prophecy, there is no doubt that conditions this year are showing signs of serious difficulty, but from the survey I have attempted to give you in this address of our national and international activities, our stockholders may be assured that the company is in a strong position, financially and technically, to meet the recession, and is ready, when trade does revive, to undertake its full share of the business available. Our interests are well spread, and it should also be borne in mind that, unlike other sections of the industry, we do not have to face extraordinary fluctuations in the prices of basic raw materials, although we cannot entirely ignore the effect of the price changes upon the manufacturing section and its repercussions upon the finishing section.

The report and accounts were adopted.

THE INVERESK PAPER COMPANY

MR B. H. BINDER ON THE EXCEPTIONAL RESULTS

The twenty-ninth annual general meeting of The Inveresk Paper Company, Limited, was held on March 28th in London.

Mr B. H. Binder, FCA (the chairman), in the course of his speech, said: The results for the financial year are exceptional; prices of woodpulp and esparto continued to rise until they had more than trebled, as a result of which sale prices of paper had to be increased from time to time to meet these and other increased costs. Under such conditions of inflation profits were made on the turnover of trading stocks.

The group's production for the year ended September 30, 1951, increased by about 12 per cent over that of the previous year, and production and profits should continue to be favourably affected by the benefits derived from the group's large programme of capital expenditure.

PROFIT AND LOSS ACCOUNT

The group's trading profits amounted to £4,760,000, and after charging taxation the net consolidated profits amounted to £1,890,000.

All companies contributed to the increased results and, as a result of the acquisition and development of additional undertakings, the basis of the group's earning capacity has been broadened, and a considerable proportion of the profit earned arises from paper conversion operations supplementary to papermaking.

Over £1,600,000, retained in reserves, was considered essential to provide cash resources to meet capital expenditure and working capital and as a precaution against a reduction in the present high prices of raw materials and paper stocks.

Having regard to all circumstances, it was considered that the payment of a dividend on the ordinary stock of 10 per cent, free of income tax, was reasonable.

Current assets total £11,300,000 and exceed current liabilities and provisions of £4,340,000 by nearly £7 million, about 2½ million pounds more than last year. The group's reserves now total nearly £5 million.

Although the liquid resources of the group as at September 30, 1951, are substantial, and include bank balances of £3,400,000, it is anticipated that all these resources will be required. Substantial capital expenditure still has to be met and in winter large stocks of raw materials have to be carried at prices which until recently have continued to rise, so that there has been a considerable drain on the group's cash resources since September 30th.

THE OUTLOOK

As a consequence of recent Government regulations, there will be a reduction in the price of future supplies of some of our raw materials. This will result in a fall in the sale prices of paper, which means that we may have to face some losses on our existing stocks, but it should ultimately lead to greater stability and to the mutual benefit of both papermakers and consumers.

For the first five months of the current financial year the group's profits have been satisfactory and, as a result of the cumulative benefits of continuing substantial capital expenditure, we can face the future with confidence, in the knowledge that our mills are well equipped to meet future competition.

I cannot stress too much that our present satisfactory position as regards financial resources and profit-earning capacity is due very largely to the conservative policy followed over a number of years. This has resulted in the group building up reserves now totalling £5 million, after capitalising £650,000 of reserves during the past year. Apart, however, from the accumulation of funds in this way it is the judicious use of them that counts and that is where our management comes in. It is their suggestions as to what should be spent on capital account and their supervision of the expenditure that has brought us up to our present satisfactory position.

The chairman concluded with a tribute to the managing director, management, staff and workpeople.

The report was adopted.

THE STEETLEY COMPANY

INCREASED GROUP TRADING SURPLUS

RESULT OF IMPROVED WORKS EFFICIENCY

DEMAND FOR HIGH-TEMPERATURE REFRACTORIES

MR N. M. PEECH ON THE OUTLOOK

The twenty-second annual general meeting of The Steetley Company Limited was held on March 31st at the Royal Victoria Hotel, Sheffield, Mr N. M. Peech, chairman of the company, presiding.

The acting secretary, Mr G. M. Norledge, read the notice convening the meeting and the auditors' report.

The following is the chairman's statement, which was circulated with the report and accounts for the year to December 31, 1951:—

In submitting the report of the year's operations, the board felt that those shareholders who have not long been members of the company would like to know more about dolomite and refractories and what Steetley does with these materials, so a more comprehensive report than usual has been prepared.

DOLOMITE

Dolomite is a magnesian limestone. The range of mountains known as The Dolomites in Europe are a familiar example of the rock formation. Dolomite from the Steetley Quarries at Worksop was used in the construction of the Houses of Parliament, York Minster and other well-known buildings.

At five strategically located quarries, Steetley extracts with large excavators, and conveys in diesel trucks, many thousands of tons of dolomite each week. The stone is crushed, graded and sold as raw material for seawater magnesia and stabilised dolomite productions, chemical uses and for neutralising explosive coal dust in collieries and for agricultural liming purposes. But the bulk of the production is burnt into a refractory product at very high temperatures in cupolas which resemble small blast furnaces.

REFRACTORIES

The word "refractories" is little known to the public mainly because such products are not advertised and sold across the shop counter but supplied in big tonnages to the heavy industries. Briefly they can be described as heat resisting materials and in one form or another are necessary for all industrial and domestic processes involving the application of heat. They range from the brickwork structure and hearths of a 250 ton steel furnace to the household firegrate. Their production is backed by substantial teams of research and technically trained management. Without refractories there could be no bridges nor battleships nor any other form of iron and steel; no glass and cement; no gas and electricity.

Steetley specialises in the production of high temperature refractories, in particular dolomite, magnesite and silica in granular and brick form. In the 1914-18 war, imports of magnesite were cut off with grave consequences to Steetley's long established customers. When the clouds of war again gathered in 1937, your company applied itself to the task of finding new domestic refractory raw materials. This was tackled, as a matter of great urgency, in two directions. First, a new process was initiated to stabilise the lime in dolomite so that bricks made therefrom not only had the essential refractory properties but also could be used after an indefinite period of storage. Second, another novel idea to produce magnesia from dolomite and seawater was explored. Despite many initial difficulties, the pioneering work and substantial expenditure proved worth while and by 1939 small commercial productions were being achieved.

INDEPENDENCE OF IMPORTED MATERIALS

The strategic value of these new domestic productions was quickly shown up in 1939 when magnesite was required not only for refractory brick and steel production but also as the raw material for magnesium metal and incendiary bombs. Stabilised dolomite and magnesite refractories now relieve this country wholly of the stranglehold held by the Austrians in prewar days whereby Britain's production of magnesite bricks was tied to the tonnage of imported magnesite from Austria and British export of bricks was not allowed.

Today the value of the refractories made in the United Kingdom from these domestic productions is £2 million per annum, and if Britain had to import and could obtain in these times the same tonnages, they would cost through higher prices another £1 million. Further, British exports now exceed £500,000 per annum, so that the total foreign exchange position has improved by £3½ million per annum.

It will thus be seen that the United Kingdom is well endowed with indigenous raw materials for refractories. Let me now refer to the individual activities of your company during the past year.

DIVISIONAL REPORTS

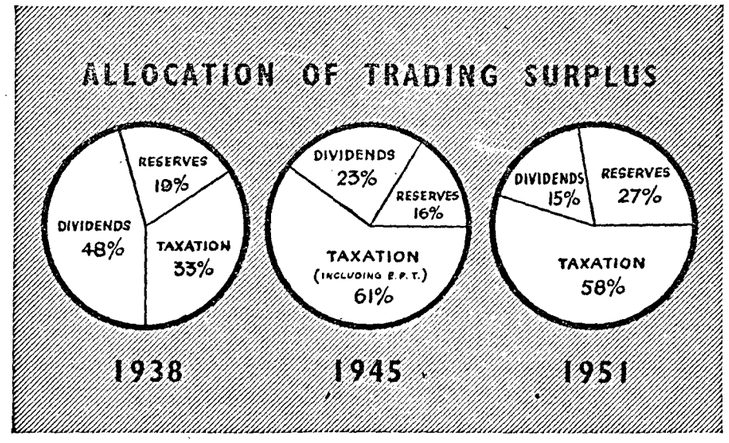
In the Dolomite Division, due to the lower steel production, outputs were a little lower but satisfactory results were obtained from the highly mechanised quarry and re-equipped processing works at Coxhoe (Co. Durham). Progress was made with the reconstruction of the Taffs Well (South Wales) Works and this should be completed in the current year. The agricultural limestone business is developing more slowly than anticipated mainly due to the abnormally wet weather in the spring and autumn which reduced liming operations.

In the Refractory Brick Division, at the Oughtibridge Works, benefit both in weight of production of silica bricks and efficiency was felt from recent capital expenditure. At the Steetley Brickworks, increased production of stabilised dolomite and other basic bricks yielded improved financial results.

In the Magnesia Division, mechanical teething troubles delayed full production of the extension to the Hartlepool Works of the Ministry of Materials for whom we act as managers. These, coupled with having to produce caustic magnesia for rearmament purposes and the rising home demand for dead-burnt magnesite, seriously upset the export programme.

THE HOLDING COMPANY

The Steetley Company Limited is now a holding company and all the works operations are carried on by wholly owned subsidiary companies.



Since the close of the financial year, the issued share capital of the Cleveland Magnesite and Refractory Company Limited has been acquired in consideration of an issue to the vendors of 46,666 ordinary shares in The Steetley Company. The board are satisfied that this acquisition will prove to be a good investment. The identity of the company is being retained and its business will be expanded.

GROUP TRADING RESULTS

The group trading surplus amounted to £599,627, which compares with £508,563 last year. This improvement arises largely from greater works efficiency due to new machinery that has been installed in recent years. It is also a tribute to the enterprise, hard work and loyal support of everyone who works for the company.

From the trading surplus of £599,627, £133,110 has to be deducted because all machinery wears out and provisions for replacement in due course must be made. Owing to the inflationary rise in prices, this sum for depreciation of plant is not sufficient to buy the new plant and we have to draw on reserves to meet part of the cost. Where do these reserves come from?

The trading surplus after depreciation is

£466,517, to which is added income from investments £4,788 and after deducting fees of £5,817 paid to directors whose experience and advice are most valuable to Steetley, and taxation amounting to no less than £271,976, the balance or profit is £193,512. The dividend to the shareholders who put up the money to form and expand the business costs £70,285 on the issued capital at December 31, 1951, of £1,163,760. (The recommended dividend rate is the same as last year.) We are thus left with only £123,227 for reserves from a year's successful trading.

RESERVES

These reserves are essentially used to finance:

Increased prices of stocks of raw materials, coal, etc., and products in course of manufacture and the difference between the money that is due to us from customers and the bills we have to pay. These items are the working capital required to run a business and the increase in the last five years has been from £146,026 at December 31, 1946, to £600,761 at December 31, 1951, an amount of £454,735.

Expenditure on new machinery and buildings, etc., to bring our works operations up to the highest state of efficiency and to maintain our position in the fields in which we are interested. In the last five years this has amounted to £1,264,365.

Thus we have had to find a sum of £1,719,100 over five years and this is how it has been done:

The depreciation, which compares closely with that allowed by the Inland Revenue amounted to	£536,447
Reserves, which have been taxed, have had to be fully spent and amounted to	£441,328
Shareholders invested a further	£700,000
Investment of tax reserve	£41,325

ESSENTIALS FOR FUTURE PROGRESS

The board do not regret their action in risking the substantial capital expenditure that has been undertaken, but the figures bring out the following important points if industry is to remain progressive in future, and let no one forget that the future standard of living in this country still depends on healthy commercial enterprise:

(i) The depreciation allowed by the Inland Revenue is inadequate, based as it is on the original cost of machinery and not the replacement cost today.

(ii) Commercial taxation, which is our contribution to the National Exchequer, has taken the sum of £893,314 over the last five years.

TAXATION ENDANGERING PRODUCTION

In 1945 with Excess Profits Tax at 100 per cent, necessary while the country was at war, taxation took 61 per cent of the profit, and in 1951 after six years of peace, it took no less than 58 per cent of the profit and an unknown amount of Excess Profits Tax is still to be imposed. To buy our machinery, however, in 1951 costs almost twice as much as it did in 1945, so that the company, in common with the rest of industry, is now in a far worse relative financial position than at the end of five years of total war. It should be clear to any government that taxation at the current rates is endangering both the volume of production as well as the competitive power of industry in Great Britain.

(iii) Due to the inadequacy of the depreciation allowed by the Inland Revenue and high commercial taxation, the whole of the reserves resulting from five years' good trading have had to be put back into the business. The result has been that it was not possible throughout this long period to retain any reserves for a rainy day, recession in trade, or for embarking upon new industrial developments which are badly needed by this country.

IMPORTANCE OF DIVIDENDS

(iv) The profits of the company have been the very minimum essential to meet necessary expenses of maintaining the business, and mischievous statements about exorbitant business profits are quite unjustified.

(v) Dividends are essential to the raising of new capital. Suppose no dividend at all was to be paid, the prices of our products would be reduced by only 2½ per cent, but the business would die like a human being without food. The dividend rate, in fact, is only one-sixth more than the prewar established standard, yet wages have increased by one and a half times since 1939. There has indeed been no profiteering. The dividend record of a company taking industrial risks, and the risks we have taken are clearly great, must be sufficiently attractive to encourage subscribers for new capital in the face of other investments open to them. It was satisfactory and essential to the future development of Steetley, that in recent years shareholders were prepared to make a further investment of £700,000 in the company.

PROSPECTS

The capital expenditure that has been undertaken over the last five years is yielding beneficial results and with the re-equipmer of the Taffs Well Works completed befor the end of the current year, the Dolomit Division will be exceptionally well equippe with very high productions per man em ployed. The Refractory Brick Division i solidly based to a great extent on domesti raw materials but the small extent to whic it still relies on imported materials which ar difficult to obtain even at high and still risin prices, is not satisfactory. This may hav some effect upon the profits of this divisio in the current year and research to overcom the difficulty is proceeding. In the Magnesi Division, greater production for refractorie and magnesium should be obtained.

The rapidly rising costs of machinery i this country, coupled with tremendous indus trial taxation, demand that the closes scrutiny be applied to future capital expendi ture which will yield less in results than i has done in the past.

Overall, the demand for our product remains good and the current year should show satisfactory results.

The report and accounts were adopted; the proposed final dividend of 11 per cent, less tax, making 15 per cent, less tax, for the year, was approved; the retiring directors, Mr A. J. Peech and Mr E. J. Pode, were re-elected and the remuneration of the auditors, Messrs John Adamson, Son and Company, was fixed.

JAS. WILLIAMSON & SON, LIMITED

(Manufacturers of Linoleum, Felt Base, Leathercloth and Lancaster Cloth)

TURNOVER AGAIN A RECORD

LARGE EXPORT TRADE

THE EARL PEEL ON THE OUTLOOK

The annual general meeting of Jas. Williamson & Son, Limited, was held on April 3rd, at Lancaster, The Rt. Hon. The Earl Peel, the chairman, presiding.

The following is his statement, which had been circulated with the report and accounts for the year to December 24, 1951:

For the third year in succession I am pleased to be able to tell you that the turnover of your company reached a new record. In 1951 we sold £1 million more goods than in 1950, and once again despatches overseas exceeded those to the home market. There was an increase in our profit from £601,000 in 1950 to £817,000. We have a first-class industrial unit, upon the improvement of which we have spent £218,000 in 1951, and we have also a first-class team of managers and workpeople to whom I know you would wish me to express your thanks for their fine and untiring efforts during the past year.

If it were possible to consider such evidence of progress in isolation and to exclude those difficulties which continue to beset all industries in this country we should have every reason for satisfaction. By no means all of this increase of turnover, however, can be attributed to the volume of goods despatched. Part of it is due to continued inflation, a state of affairs which affects every aspect of our national life today, and it is open to question whether the proportion of what appears to be a satisfactory profit which we are allowed to retain in the business is, in the light of this inflation, sufficient to maintain and replace our plant and carry out necessary development.

PROFITS, INFLATION AND TAXATION

It is the fashion in certain quarters today to decry rising profits. This is somewhat curious, as the people who do so are precisely those who wish to have at their disposal unlimited financial resources with which to indulge their extravagant fancies. We have, in fact, been told by such people that Government expenditure cannot possibly be reduced. It is difficult to reconcile this statement with the wish for an all-round lowering of profits. Inflation has brought about a continuous fall in the value of the £ with a consequent increase in the cost of everything affecting industry; raw materials, buildings, plant and machinery, salaries and wages. As an illustration of this tendency our own stocks of raw materials and finished goods have risen in value by over £1 million. In these circumstances it is only natural that profits should also have gone up and, indeed, it would be very serious, if not disastrous, if they had not. Even so, the present crippling rate of taxation and the high cost of replacing existing equipment, and of making any additions and improvements, are leaving first one industry and then another with insufficient financial resources to carry on properly.

I suggest that those who criticise the so-called high profits should consider what must of necessity be retained in the business and, therefore, what a relatively small proportion is paid out as dividends to shareholders. Out of each £1 of profit, 11s. 11d. is taken in taxes, 3s. 1d. is required for replacement of plant at higher prices than the original costs on which depreciation has been allowed, 2s. 5d. is required to provide a reserve against falling stock values, and only 2s. 7d. is left to be paid out as a dividend to shareholders.

At the end of 1950 your company had an overdraft with its bankers of £495,000. In order to correct this position, to finance our capital expenditure programme and the continuous rise in costs, the company in March, 1951, made an offer to shareholders of £1 million 4 per cent debenture stock, which offer was heavily over-subscribed.

DIVIDEND 10 PER CENT

Out of the year's profits your directors recommend that £125,000 be placed to the plant replacement reserve (previously described as the development reserve), bringing the total to £475,000, and £100,000 to stock depreciation reserve. The former is a calculated provision indicating the amount required to meet the increasing cost of plant replacements. The setting up of a special reserve to meet a possible fall in stock values is a measure of prudence. You will see in the directors' report that a final dividend of 7½ per cent is recommended which, with the interim dividend of 2½ per cent already paid, makes a total for the year of 10 per cent.

It is difficult to make any forecast for the current year. Many industries throughout the country are suffering from a trade recession and we have not entirely escaped. There was a marked falling away in orders for some of our products during the last six months of the year. There are a variety of causes for such a recession and in our case we believe that not the least of them is the incidence of purchase tax, which prices some of our products out of the market in competition with other products which, if taxed at all, are taxed at a lower rate. Our products are used in every home and would, I am sure, still be preferred if they were permitted to compete on equal terms. We have a large export trade which has, for over 100 years, been built up on the foundation of a healthy home trade. The artificial and sometimes capricious interference with trade in this country by price restriction and taxation cannot fail to make export more difficult.

CHANGES ON THE BOARD

As many of you already know, there have been some changes in the board of your company. I decided that, as from January 1st, I would relinquish the position of managing director, as the many calls on my time were making it increasingly difficult for me to give that appointment the time which it demands. Your board unanimously agreed that Mr C. H. Martineau, who has been with the company since 1939, and who was appointed a director in charge of the commercial department in 1946, should be offered the position of managing director. I am pleased to say that he accepted this new responsibility. At the same time, Mr I. D. Taverner, whom I mentioned last year had been appointed works manager, was elected to the board and you will be asked to confirm this appointment.

Last year I was happy to tell you that Mr H. E. Sier, the deputy chairman of your board, had agreed to continue to serve the company if re-elected, despite the fact that he had reached the age limit. He was, in fact, duly re-elected, but now I am sorry to have to inform you that he feels he must retire from the board after the annual general meeting. I would like to thank Mr Sier personally—and I am sure you will wish to join with me—for the guidance and advice which he has given to us for so many years, and to wish him every comfort and enjoyment in the future. He began his connection with my grandfather, the late Lord Ashton, in 1907, and so in one capacity or another he has served the Williamson family and this company for 44 years.

The report and accounts were adopted; the retiring directors, The Earl Peel, Mr F. E. Winmill and Mr G. G. Parkinson, were re-elected; the appointment to the board of Mr I. D. Taverner, was confirmed, and the remuneration of the auditors, Messrs Viney, Price and Goodyear, was fixed.

BANK OF SCOTLAND

SATISFACTORY RESULTS

LORD ELPHINSTONE ON NEED FOR GREATER PRODUCTION

The annual general meeting of the proprietors of the Bank of Scotland was held on April 1 within the head office, Edinburgh. The Rt Honourable Lord Elphinstone, KT, governor of the bank, presided.

In submitting the directors' report, the chairman, said:

It is unfortunate that the various proposals and actions of recent years intended to combat inflation have not proved fully effective. The continuous erosion in the value of our money calls for stern measures. A policy of dearer money might, with advantage, have been introduced much earlier—indeed I ventured to suggest this last year when I addressed you. I think Mr Butler is to be complimented upon his courageous and forthright budget proposals. With the bank rate once more exercising its corrective influence, and its traditional function as a stabiliser and a deterrent to over-expansion, interest rates are more realistic and the position is now healthier.

Loans and advances have increased by £4,300,000 during the year. A not inconsiderable part of this is represented by our quota of the additional borrowings of the nationalised industries and public corporations. These carry a low rate of interest and the earning capacity of "advances" is thus less than is sometimes assumed.

CREDIT RESTRICTION

The policy of credit restriction enjoined upon the banks by the authorities presents us with many problems and frequently it is the cause of disappointment and embarrassment to credit-worthy borrowers. The basic consideration in our lending under present conditions is that it should pass the test of being for "essential" purposes and, while responding to all legitimate or "permissible" applications for assistance, we endeavour faithfully to interpret the spirit of the Treasury directives in dealing with all requests for accommodation. We continue to find, however, that many of these are for purposes which, but for the heavy burden of taxation, would normally be financed out of the borrowers' own resources. Under existing fiscal arrangements the accumulation of adequate reserves for necessary replacements and renewals is practically impossible, and adjustments which will more nearly relate depreciation allowances to replacement costs are urgently needed if our industries are to have any prospect of maintaining their position—or even of survival. Unfortunately the proposed new Excess Profits Levy, which is in addition to an adjusted profits tax, will intensify one of the most difficult problems of industry, namely, the creation of that new capital which is so badly needed.

Unfortunately, large sections of the general public are apparently still not fully alive to the real cause of most of our difficulties, and the complacency which I have previously deplored is still too much in evidence. The cry for increased production has been so often repeated that it has come to be regarded with suspicion, but that call should be resounded throughout the length and breadth of the land. If the production of coal and food and manufactured articles could only be stepped up by even a modest percentage there would in a very short time be an amazing improvement in the situation.

The changes in assessment to liability for income tax which are proposed by the Chancellor in his Budget will, it is hoped go some way towards providing the much-needed incentive to additional personal effort, while the higher rate of interest now ruling should encourage saving on the part of those with an income surplus. Savings are entitled to be rewarded with a "living wage."

Throughout the year there has been recurring evidence of the influence which a small minority of irresponsible people have on the thoughts and actions of their fellows. Restrictive practices encouraged by these disturbing elements are a serious menace, while unofficial strikes introduce a canker in the economy of the country. It is obvious, too, that under present conditions we cannot afford the luxury of a five-day week. It must be the constant endeavour of us all to exert ourselves to the utmost in order that our country may again be deserving of the universal respect that honest hard work and integrity won for us in the past.

I feel I must again state my view that if this country is to recover its former prosperity there must be a return to the high moral standards which in the past actuated the great majority of our people. A country-wide revival of these old qualities and virtues would make a wonderful difference to our conditions and prospects, and to our status among the nations.

RESULTS FOR THE YEAR

After allowing for taxation and after making provision for contingencies and all known bad and doubtful debts, the net profits are £290,320; adding the balance from last year, £191,979, there is available £482,299.

Out of this there has been transferred: To reserve for contingencies, £110,000; to trustees for staff pension fund, £30,000; and after payment of a dividend of 12 per cent for the year (less tax) taking £151,200, there is left to be carried forward £191,099.

I think you will agree that, in the circumstances, these results are satisfactory.

The report and accounts were adopted.

ILLINGWORTH MORRIS & COMPANY LIMITED

The thirty-second ordinary general meeting of the company was held at the Midland Hotel, Bradford, on Monday, March 31st. The Rt Hon Lord Wilmot of Selmeston, PC, JP (chairman), presided.

In his statement to the stockholders, Sir Donald Horsfall, the retiring Chairman, described the year October, 1950, to September, 1951, as the most eventful in the history of the wool textile industry and the six months from April to September as probably the most alarming period the wool market had ever experienced.

Regarding the future, he said: It is my plain duty to utter a very definite word of caution. No optimist, even in his wildest dreams, could ever have expected the boom-like conditions in our industry during the five or six postwar years to have been maintained indefinitely. And just as the industry returns to more normal conditions so must more normal results be expected.

The future consumer demand is almost as indiscernible as the trend of prices. From all reports, however, one point is clear—the results of the panic buying on the part of the public nearly a year ago will have to resolve themselves before the demand returns to its normal quantity, but once that occurs I still have a great faith in the future demand for high-class worsted goods throughout the world, and I believe that this demand will tend in future years to increase rather than decrease.

The directors' report and accounts and dividend recommendations were approved, and the Rt Hon Lord Wilmot of Selmeston, PC, JP, Mr Mark Ostrer and Mr M. T. R. Hall were re-elected directors.

FORD MOTOR COMPANY LIMITED

YEAR OF ACHIEVEMENT IN SPITE OF DIFFICULTIES

DEMAND FOR PRODUCTS AGAIN EXCEEDS SUPPLY

CONTRIBUTION TO FARMING MECHANISATION

SIR ROWLAND SMITH ON IMMEDIATE PROBLEMS

The twenty-third annual general meeting of Ford Motor Company Limited will be held on April 25th at Grosvenor House, Park Lane, London, W.

The following is the statement by the chairman, Sir Rowland Smith, MIMechE, which has been circulated with the report and accounts:—

In the face of increasing difficulties 1951 was, nevertheless, a year of successful achievement.

Demand for our products again exceeded our ability to supply under conditions of increased material shortage. In spite of this, during the year 171,000 cars, trucks and tractors were produced, of which 125,000 were exported.

During the year costs increased substantially, particularly on imported material. There was also a general upward movement in salaries and wages, and in October our rates were liberally increased.

The maximum effect of material shortages which we had anticipated would occur during 1951 has not been felt until this year. Further, by reasons of delays in delivery of machine tools, the introductory date of the new tractor was postponed until the end of 1951. As a result, the higher costs associated with initial production were not felt during the year.

EXPORT TRADE

Compared with 1950, our total income increased in value by just over 5 per cent to £68 million despite the slight decline in volume. About 80 per cent of cars and tractors, and more than 55 per cent of commercial vehicles, were exported in the year, and the more recent severe reductions in the industry of annual domestic quotas (to 60,000 each for cars and commercial vehicles) will emphasise strongly the industry's increasing dependence upon the export market.

Australia again bought most of our own products, followed in order of importance by Ireland, South Africa, Canada and New Zealand, the latter greatly aided by the abolition of import licences.

However, in recent weeks in Australia severe import restrictions have been imposed to redress their adverse trade balance. We are assured that these restrictions will be removed as soon as practicable, but in the meantime the effect has been to restrict considerably our business in this our largest export market. It only serves to emphasise the difficulties under which we operate today and the importance of distributing our up to date and low cost products as widely as possible through the world-wide Ford sales and service organisation.

Our exports to North America were lower, mainly because of tighter credit restrictions there, but realised over $12 million.

Strong competition was again encountered from continental manufacturers, chiefly in Europe and South America.

Assembly of our products abroad has developed to a point where more than half the units exported now go for completion to 14 of the Ford plants throughout the world.

SUCCESS OF THE NEW TRACTOR

In the agricultural field the outstanding event was the advent of the new Fordson Major tractor, unique in that three alternative engines are offered—for diesel, petrol or paraffin. Many of the components are basically the same with a saving in cost and consequent low price, particularly of the diesel unit. This tractor, together with its range of new implements, has been enthusiastically received at home and abroad, and we are confident that it will enhance the high reputation of its predecessors.

The sales of the old Fordson Major tractor were well maintained until production ceased in December, export sales being almost 90 per cent of the previous record year. Nearly 5,000 were shipped to the Turkish Government as part of an intensive drive for agricultural development in that country.

We have received Government contracts for a substantial number of general service vehicles for defence purposes.

No record of our operations would be complete without reference to the servicing of our vehicles at home and abroad, on which we place great importance. At home the number of ageing Ford cars and trucks on the roads and the army of Fordsons in our fields bring demands for service and for reconditioned engines and parts which are met to the limit of our ability under the supply conditions today. Abroad, the sales of the past few years have brought in their wake a steeply increasing service demand.

THE ACCOUNTS

Turning to the accounts, a profit of 13.1 per cent (compared with 12.1 per cent in 1950) on sales yielded £8,907,848: of this, taxation takes 57.6 per cent, reserves 33.7 per cent, and 8.7 per cent goes to our stockholders.

This profit is determined after setting aside depreciation, conventionally based upon the original cost of our assets, which produces at the end of the life of each asset a provision equal to original cost. Were equipment costs static during the period, replacement could be afforded and the business continue unimpaired. Since the bulk of our assets were purchased, costs have more than doubled; therefore, if we are to continue operations on the same scale from our own resources, it is necessary to set aside, out of already taxed profits, further substantial amounts to cover the excess cost of replacement.

During the year a comprehensive study has been made to determine our position, and a further £2,750,000 has been set aside this year towards the £14,641,000 which we estimate as being the proportion, related to expired life, of the eventual excess replacement cost of our fixed assets at present price levels. An important by-product of our study has been the reassessment of our depreciation rates, and the revised rates have been applied since the beginning of 1951. From time to time we propose to make similar surveys to take stock of the position and to reassess the depreciation rates.

Our taxation laws, dating from the happy days of static prices, give allowances based only upon original asset cost. (This situation is unaffected by the palliative of initial allowances.) Unless tax allowances are based upon replacement cost values of assets, industry will progressively become less able to replace its assets from its own resources as it should.

This position is further aggravated by the introduction of the excess profits levy which may well impose a heavy burden on your company, and this would deplete still more the amount of profits which could be retained in the business.

MATERIAL SUPPLIES

Our immediate concern in the future is in respect of the adequacy of material supplies, the movement of costs, the maintenance and expansion of our export markets, and the prospect of supplying vehicles to the home market. All these factors are dependent upon the outcome of our threefold national economic battle—to direct resources to defence, to balance our external trade, and to defeat inflation.

The outstanding shortage is steel. While prospects have improved since the initial announcements under the new distribution scheme, there is no certainty that steel will be in sufficient supply to meet our export demand. As successful exporters, we hope to share in the additional imported USA steel later in the year and, indeed, to be enabled to make our full contribution towards closing the yawning gap in our country's trade balance.

The motor industry in 1938 exported £19 million worth of goods, or 4 per cent of the nation's total exports. Last year, the corresponding figures were £317 million and 12.3 per cent. In that period the industry has increased its exports (at 1938 prices) by more than 500 per cent, by far the greatest increase recorded by any one of our major exporting industries. It is, I believe, a principle accepted by all great generals that success should be exploited, and in this case I hope that our administrators will follow this axiom and give us the materials for the job, especially since exports from this company in the last six years have been £152 million, and our competitive position has been strengthened by the recent addition of two new cars and a tractor to our range.

It is to be hoped that, as a cushion for possible disruption in export markets, increased deliveries will be permitted in the home market; otherwise unemployment could arise.

It must be some consolation to motorists in this country that car taxation has now been placed on an overall flat-rate basis, in place of the previous inequitable dual system.

EXPANSION OF MECHANISED FARMING

We look forward to a long-term expansion of mechanised farming, particularly in the undeveloped areas where increased food production will help to raise the living standard, and as that standard rises, so will there be an increase in the general demand for goods. We shall contribute our new tractor and full implement range to this expansion.

When supplies are available in the home market we hope to meet the additional demands which will result from the drive to greater self-sufficiency in food production, as a means of reducing imports and balancing our trade.

Plans for capital expenditure amounting to some £14 million are envisaged during the next three years. Contracts totalling £3 million have already been entered into The programme includes a two-storey manufacturing building at Dagenham, with a floor area of 288,000 sq. ft., which is nearing completion, a new battery of coke ovens about to go into operation, replacing those erected 18 years ago, extensions to our power house equipment, improvements to our foundry, and further factory re-equipment.

We have now put into effect the pension scheme for hourly paid employees, to which I referred last year. A new contributory sick benefit fund is also in operation, which gives a man £3 a week for up to six months' absence through illness or accident.

Training schemes have been further developed to meet the wider needs of our employees; our service schools also have been well attended by representatives from Ford dealers and companies at home and abroad anxious to bring themselves up to date with our new products.

EXECUTIVE APPOINTMENTS

During the year the following executive promotions have been made:—

Mr J. L. Claridge—From Assistant Secretary to Secretary.

Mr A. Haselden—From General Works Manager to Director of Manufacture.

Mr J. M. A. Smith—From Secretary to Director of Finance and Administration.

Mr C. Thacker—From Managing Director's Executive Assistant to Director of Supply and Sales.

Mr Tom Williams, the former Minister of Agriculture, joined us in February of this year as adviser on all agricultural matters in which your company is interested.

You will have received with this statement a letter and notice of extraordinary general meeting concerning new company Articles of Association. These are brought up to date and into conformity with requirements of the new Companies Act, and current practice. They also incorporate certain other changes, as explained in the letter.

It is my privilege once again to express our grateful thanks to all members of our fine team who have given such loyal and strenuous service in the past year.

TRADE INDEMNITY COMPANY

SUBSTANTIAL PROGRESS CONTINUES

SIR JOHN MAKINS ON THE OUTLOOK

The thirty-fourth ordinary general meeting of Trade Indemnity Company, Limited, was held on April 3rd in London.

Mr A. E. Phelps (deputy chairman) presided in the absence of the chairman, Sir John Makins, through indisposition.

The following is an extract from the chairman's circulated statement: The 1949 underwriting account has been closed at the end of its third year with a favourable balance of £110,570, which has been transferred to profit and loss account.

The 1950 and 1951 underwriting accounts remain open and the balances of £175,518 and £85,268 respectively are carried forward. In regard to the 1950 account, it is unlikely that there is much in the way of additional premium income to come in the third year, but further claims are a possibility. Referring to the 1951 account, we expect to earn substantial additional premiums and, of course, there is plenty of time for claims. On the subject of claims I shall have more to say at a later date, but the state of both accounts can at this stage be considered satisfactory.

The profit and loss account shows that we made a net profit in 1951 of £61,713 after providing for taxation on profits credited in the account. To this must be added the balance of £172,534 brought forward from 1950, less £50,000 capitalised and applied in paying up 50,000 £1 shares issued to members in 1951. Against the total of £184,247 we have provided £7,043 for profits tax, less income-tax thereon, in respect of investment and other income for the two years ended December 31, 1950, with the result that our tax provisions now cover all ascertained profits of the company up to and including December 31, 1951. We have also written £50,000 off the value of our quoted investments to compensate for the heavy falls in Stock Exchange prices of which you will be aware.

This leaves an available balance of £127,204, out of which the directors recommend the payment of a dividend of 10 per cent, less tax, amounting to £15,750.

The carry-forward will then be £111,454, and I will anticipate the proceedings of the extraordinary general meeting, which has been called to follow the annual general meeting, by mentioning the proposal to increase the company's capital again this year to £350,000 by the creation of 50,000 fully paid £1 shares. If this proposal is agreed to, the balance brought forward in the 1952 profit and loss account will be £61,454.

AN IMPORTANT SERVICE

The substantial progress of your company continues and from some recent paragraphs in *The Economist* it appears that we are covering more than half the credit risks underwritten in the United Kingdom by the Export Credits Guarantee Department and ourselves. Of course, the total of one thousand million pounds of insured transactions given in *The Economist* is not large in comparison with the trade of this country as a whole, and there is room for much greater use of our facilities. Nevertheless, I think we can claim to be providing an important service for which in current conditions there is a growing demand.

I close these remarks on a note of caution and of faith. A year ago Mr Falloon referred to the rapid increase in the cost of basic materials used in industry and indicated that we were not unmindful of the danger which such a state of affairs presented. In certain directions the inevitable has happened. There has been a recession from high prices and this in combination with other factors has resulted in financial difficulties and actual insolvencies on a scale which, though still moderate, has been unknown for the last 12 years. The trend is unmistakable and we must expect it to show up in our claims figures in the next few years. We are not unprepared for this trend. We have enjoyed a long period of freedom from serious losses during which time we have built up our resources as far as the level of taxation has permitted. We are now in a strong position to help traders in limiting the effect of bad debts which cannot be avoided in the changed circumstances which we foresee. Furthermore, these circumstances will sharpen the edge of our propaganda and make it easier for us to cut through the remnants of opposition to the idea of insuring credit risks.

Credit insurance has been referred to as "a little known service provided by the insurance industry." I suggest that the description is out of date and, in any event, I am confident that future developments will lead to a much wider use of the facilities we offer.

The report and accounts were adopted.

ANGLO-MALAY RUBBER COMPANY, LIMITED

POSITION STRENGTHENED

The thirty-second annual general meeting of The Anglo-Malay Rubber Company, Limited, was held on March 28th in London.

Sir Eric Miller, the chairman, in the course of his speech, said: A year ago I referred to the profit then shown as being the highest the company had realised since 1920, and now, due to the higher prices fetched by our product in the year under review, the figures are better still.

Leaving out of account the small quantity of rubber purchased, the crop harvested on the company's estates totalled 2,240,000 lb some 50,000 lb short of the previous year's figures. This fall of only about 2 per cent reflects in the clearest way the loyalty and fortitude of our staff, for without their unrelaxed efforts in face of the strain and hazard which Malayan conditions continued to impose upon them, our crop would have been far smaller. Inclusive of all grades it was sold at an average price of nearly 3s. 7d. per pound (equivalent to 3s. 9d. per pound London landed), which was an improvement over the 1949-50 average of 1s. 6d.

But if income increased, so also did costs. The Malayan Government, which drastically increased the scale of export duty from January 1, 1951, took no less than 4¾d. for each pound of rubber exported.

RESULT OF YEAR'S WORKING

The proceeds from rubber sales plus interest on investments, etc., brought total profit before taxation to £219,416, which is reduced by taxation to £104,687. We are increasing our cultivation and replanting reserve to £80,000 (by a transfer from profit and loss account of £40,919, which sum includes the expenditure for the year on that account) and are placing a further £12,018 to special depreciation reserve (over and above a capital excess of £1,666) and a further £10,000 to general reserve. Having done that, we propose for your approval a final dividend of 12 per cent, less income tax, making 16 per cent for the year, against 12 per cent for 1949-50. If these transfers and proposals are agreed, we shall carry forward £45,715, compared with £37,307 brought in. Our financial condition has been substantially strengthened.

For the current year we are estimating for a crop of 2,400,000 lb. It is a figure well within the productive capacity of our estates, provided, of course, that Communist and terrorist activities are kept in check.

THE OUTLOOK

The immediate outlook is more subdued than it was a year ago, but the era of exceptional prosperity which we have enjoyed in the last year and a half was not an unmixed blessing. Some reaction in price was bound to come, but the rubber policy of the USA should have been less discriminatory against natural rubber, in view of its importance in the economy of South East Asia. Buying for shipment from the East after May 1st for manufacturers' actual requirements and to augment their depleted inventories is now in the hands of the trade. Some slight quantitative relaxation of controls over actual end use of natural rubber in the USA has just been announced, and we hope this may be the forerunner of further relaxation at an early date. The present GSA selling price of 48½ US cents for No. 1 sheet is, however, considerably higher than the current price in the open market, which should encourage manufacturers to place competitive orders with the trade for their future needs.

The report and accounts were adopted.

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

RECORD ORDERS

The fifty-second annual general meeting of Associated Electrical Industries, Limited, was held on April 1st in London.

Sir George E. Bailey, CBE, MSc, MIMechE, MIEE (the chairman) said that the net profit for the year at £2,524,000 was slightly higher than that for the previous year. The dividend of 20 per cent recommended might appear to be a generous return, but it should be understood that stockholders had invested large sums in the business by way of retention of profits. The return was, in fact, a very modest one, being slightly less than 4½ per cent on the total cash invested. The very conservative dividend policy adopted by the board was due to the calls made on the company's financial resources by the heavy burden of taxation, the high cost of replacements, the increase in the value of work-in-progress and the necessity of providing the extensions required to meet the ever-expanding demand for their products.

BURDEN OF TAXATION

How great was the burden of taxation was evidenced from the fact that during the year the company had had to provide £5,400,000 for taxation. Against that the ordinary stockholders would receive £673,000 net for the year. As to the effect of the budget on the profits for 1952, it was estimated that if the profits were the same as in 1951 the levy would amount to around £350,000. To that extent, therefore, there would be less available for ploughing back into the business. The great strength of the company had been built up by ploughing back profits and they therefore hoped that the Chancellor would be able to avoid sacrificing industrial efficiency on the altar of taxation.

The group companies continued to secure a large volume of orders for export, up to their maximum manufacturing capacity. This year's order book showed a wide distribution of business throughout the world covering all the group's products.

However, to fulfil their heavy obligations still greater efforts were needed. With the value of orders in hand standing at the record figure of £135 million he hoped their employees would realise that given the raw materials they need have no anxiety with regard to employment and would redouble their efforts to reduce that load, particularly as the budget proposals would mean less taxation on enhanced earnings. The combined efforts of management and workpeople, however, would be unavailing if the necessary raw materials were not forthcoming.

FUTURE OUTLOOK

The demand for electricity continued to expand throughout the world and with it the demand for their products. The total value of orders received in 1951 was 30 per cent higher than in 1950. The consumption of electricity per head of population in Great Britain was, however, still only about half the comparable figure in the United States.

In the past the tendency had been for the consumption of electricity in this country to be doubled over 10-12 years. All the available evidence tended to show that that rate of expansion at least would continue for some time to come. That meant that if the group was to maintain its premier position in the industry, they must continue to expand their manufacturing facilities. Much had been done in that connection, but much still remained to be done.

The report was adopted.

REFUGE ASSURANCE COMPANY LIMITED

TOTAL INCOME EXCEEDS £20 MILLION

MR J. WILCOCK HOLGATE'S REVIEW

At the eighty-eighth annual general meeting, the chairman, Mr J. Wilcock Holgate, in the course of his remarks, said:

I am glad to report a gratifying increase in the amount of new business, coupled with success as regards the avoidance of any increase in expense ratios: the latter representing a real achievement in these days. On the other hand, we, in common with financial institutions generally, have had to face a degree of depreciation in the value of securities, not only serious in extent, but also very rapid in its growth. This is a matter beyond our control, but we have been able to cope with its ill-effects, another proof of the wisdom of the company in building up over the years substantial reserves to meet such emergencies.

In the ordinary branch, new sums assured were nearly £12,500,000, an increase of more than £2 million, whilst in the industrial branch, new sums assured amounted to over £14 million, an increase of nearly £1 million. We can record an increase of £640,000 in total premium income, which now totals some £16 million.

LIFE ASSURANCE AND SAVING

These figures are of particular significance in these days, when the need of the country is to save rather than spend. It is our function, by dint of personal approach to the individual, to help to secure this object. When one considers that after full allowance for direct taxes and the increased cost of living, wage earners in 1950 were one-third better off than before the war, there is ample scope for all agencies of saving to intensify their endeavours. It is in this connection that life assurance offices assume particular importance. They assist the public to set aside monies for the future and, in their investment of these monies, they canalise, as it were, these savings in directions of real value to the community. During the year we paid on the average £30,000 each working day in claims. A large proportion of this sum was in respect of policies which became claims by death. In this connection, our services were particularly appreciated in the early months of the year, when heavy mortality, consequent on the influenza epidemic, gave rise to a greatly increased number of death claims. This is, of course, precisely the kind of personal disaster with which only life assurance can deal.

EXPENSES

I am glad to report that we have been able, by careful management, to hold our expense ratios at their 1950 figures. Following negotiations between the company and the staff associations, material increases have been granted to members of the staff, the full effect of which will be felt from the beginning of 1952. No aspect of the management calls for more continuous and watchful consideration than this matter of expense. Our business is concerned with a multitude of transactions, the majority of very small amounts, the whole making up large totals. Each transaction necessarily involves some expense, however small, and, unless carefully watched, these small items may accumulate to such a figure as seriously to affect the success of our work.

INDUSTRIAL BRANCH

In the industrial branch, the policies valued were 8,586,614, assuring £166,886,003. The premium income was £8,982,971 and the life assurance fund £53,443,032. In the ordinary branch, the life assurances valued were 523,859 policies, assuring £127,054,697. The premium income was £6,898,622 and the life assurance fund £56,238,232. The surpluses, which include sums released by changes in the valuation bases, have been dealt with as follows:

In the industrial branch, £3 million has been transferred to investments reserve, and it is proposed to grant additional benefits to existing premium paying policies (with certain exceptions) where death or survivance of the endowment term occurs within the twelve months commencing March 20, 1952, of amounts varying from £2 8s. per cent of the sum assured upwards. Certain additional paid-up policies will also be granted on whole-life assurances.

ORDINARY BRANCH

In the ordinary branch, £800,000 has been transferred to investments reserve, and, having regard to the uncertain investment outlook, it has been decided to declare, in place of a general reversionary bonus, a bonus on participating policies which become claims by death or survivance before March 20, 1953, at the rate of £1 6s. per cent on the sum assured in respect of each year's premium due and paid in 1951. The company is enabled thereby to carry forward the very greatly increased sum of £1,402,397, which will be available towards meeting any contingency which may arise, or to be dealt with subsequently as your board may determine. Until further notice, an interim bonus at the same rate will be paid.

INVESTMENTS

I have already referred to the considerable depreciation in the value of our Stock Exchange securities, which we, in common with other financial institutions, have suffered. In view of this depreciation and the uncertain outlook, our total investments reserves have been increased to £3,700,000 in the ordinary branch and £7,575,000 in the industrial branch.

Although British Government securities have decreased by some £4,750,000, the aggregate amount of British Government and British Government guaranteed securities is still some £55 million, and represents about 44 per cent of the total assets. Our holdings of debentures have been increased, and substantial expansion has also taken place in ordinary stocks. These latter now amount to over £7,500,000. "Cash in Hand" at the end of the year had increased to some £2,750,000. The bulk of this sum has been placed on deposit awaiting more favourable opportunities for permanent investment.

The total amount advanced during the year under our house purchase scheme was £2,782,502. Our total investments by way of mortgages on property are now over £11,500,000.

TRIBUTE TO STAFF

The chairman concluded his remarks by expressing appreciation to the staff, both in the field and at chief office, for their contribution to the increase in new business and the efficient administration of the company's affairs. He referred to the cordial relations which continue to exist with the staff associations and said that he would be sorry indeed were the time ever to arrive when the free interchange of opinion between company and staff should be restricted.

He affirmed his confidence in the unique advantages of life assurance to the public, and his pride in the part played by the company in providing that service.

RYLANDS AND SONS, LIMITED

SIR EDWARD RHODES' STATEMENT

The annual general meeting of Rylands and Sons, Limited, was held on March 31st at 6, High Street, Manchester. Sir Edward Rhodes (chairman and managing director) presided.

The following is his statement which was circulated with the report and accounts:—

At the end of my statement issued with the accounts for 1950 I gave as my opinion that the coming year was likely to be a difficult one. In truth 1951 was not only difficult but tantalising and disappointing.

The first half went fairly well and left us with an increase in profit as compared with the same period in the previous year. In the second half a complete change came over the whole field of operations and the active buying in the home trade and from overseas ended, to be followed by extremely cautious and very restricted purchases. Retailers were cramped by the fear of a drop in prices and by a doubt of the future of the Utility scheme, and especially of Purchase Tax. This uneasiness spread to the general public, with the consequence that our customers' shelves filled and buying continued to shrink.

The restriction of credit by the banks was another adverse influence. Because of this, where there had been heavy over-buying in the earlier part of the year, especially in cotton and rayon piece-goods, some of the buyers have been compelled to sell their stocks at prices much below the cost price and even below replacing cost. This, in turn, has affected values of the usual stocks held by wholesalers in anticipation of the seasonal requirements of their customers and has needed to be dealt with in the preparation of our accounts.

HOME AND EXPORT TRADE

As I have said already, the first half of 1951 was quite satisfactory, but the second six months were disappointing owing to the reduction in turnover, which was 18 per cent less than in the same period of 1950. Demand is still on a meagre scale, and it is thought that the general resumption of buying may be delayed until after the Chancellor's Budget speech, and a decision has been made concerning the new plan to replace the Utility scheme and the incidence of Purchase Tax. On the complex Douglas Report my only comment at this point is that, if it be adopted, it will add greatly to the work and responsibilities, as well as to the operating expenses, of general wholesale houses such as ours. It will also be, in my opinion, a hindrance to the export trade, as was the Utility scheme. It is therefore to be hoped that the President of the Board of Trade will have this in mind when the Report comes up for discussion in the House.

The promise of the early part of the year was not fulfilled in the later months. Just as in the home trade, so also in our overseas markets active demand died out, no doubt for the same reasons as at home—the fear that lower prices were imminent and also because of the restriction by the banks of accommodation with which to finance stocks and imports and, in addition, the lack of import facilities. Governments overseas arrange these matters to suit their own financial convenience. Thus the supplies we bought in anticipation of the usual seasonal requirements are still awaiting a resumption of demand. Therefore, in view of these facts and with the knowledge we have of the present weak textile market here, we have brought these stocks intended for the overseas markets into the accounts on a conservative basis. No reasonable man will cavil at the Chancellor's determination to increase the export trade, and to increase it quickly. It is of vital importance that this should be done. If, however, it is to be accomplished, then the present financial restrictions in our principal markets will need to be lifted and more generous import licences granted. We hope it may be so.

I have therefore to report with regret that, under these adverse circumstances, our export trade has not been as successful as in former years, but we are keeping a sharp eye on it and shall miss no chance of bringing it back to full prosperity.

MILLS AND WORKS

The result of the year's work at our three establishments is that our net profit is higher than last year. Whereas at our Wigan mills we have for many months past had to refuse orders because of our extended delivery date, we can now turn out orders for yarns and cloth quickly. The heavy demand of the first half of the year is over; instead some of our customers are asking that their deliveries shall be delayed and are seeking accommodation in the length of their terms of payment. This state of affairs is widespread.

In spite of the general reduction of demand throughout the floor-covering trade, our allied company, Thomas Witter and Company, Limited, had another good year and again paid us a highly satisfactory dividend. With their fine establishments at Heapey, Appley Bridge and Chorley, Witter's are ready to cope with any demand for linoleums and for their well-known British Balatum felt base floor covering. We are looking forward with confidence to the continued prosperity of this company.

ACCOUNTS

In Rylands' balance sheet the first item to which I need draw your attention is the amount due from our subsidiary company, the Overseas Company, £637,085, which covers their day-to-day trading and the stock here and abroad.

Under current assets appear stocks at £1,320,132 against last year's £1,106,458. The market value of our investments has fallen sharply, especially Government gilt-edged securities. These are, however, fortunately all well spread dated securities, which, together with our holdings in British corporations and public boards, comprise 83½ per cent of our investments. Tax reserve certificates stand at £22,550 and balance at bankers and cash in hand £164,850.

On the liabilities side our capital still remains at £3 million. Capital reserve has been increased from £534,666 to £570,075 by the addition of a transfer of £2,795 from War Refund Account and a surplus of £32,614 on sale of property. This property was our mill at Swinton which, owing to serious subsidence caused by coal mining operations, we could no longer use as a cotton manufactory. It was bought by the Coal Board.

The general reserve still stands at £200,000. The contingency reserve will be increased by £60,000 to £870,000 and the profit and loss balance carried forward will be £99,627, against £92,471 brought in, if the recommendations of the Board are approved. Revenue reserves and surplus will then amount to £1,169,627 against last year's total of £1,102,471.

Grants amounting to £4,512 from the staff consideration fund were made during the year to 85 retired members of the staff.

Consolidated balance sheet: All I need mention about this consolidated balance sheet is the value of the stocks, which at £1,917,636 includes the stock of our subsidiary, the Overseas Company.

Consolidated Profit and Loss Account: Profit on trading is £294,151 against £460,173 last year. This reduction has been mainly brought about by the falling off of trade in the second half of the year, and the necessary depreciations of our stocks. The dividend from our allied company, Thomas Witter and Company, Limited, is £57,143. We have brought in a net amount of £26,000 accruing from previous years, bringing the total profit to £432,349 against £571,875 last year. The net profit is £166,906 which, together with the balance brought forward from January 19, 1951, of £92,471, makes a total available of £259,377 against last year's £334,471.

Turning to the other side of the consolidated profit and loss account, directors' emoluments are £26,855. United Kingdom profits tax for the current year is £91,500 and income tax £115,908, a total of £207,408. The net profit, as I said above, amounts to £166,906 against last year's figure of £243,836.

The directors recommend: (*a*) That for the half-year ended January 19, 1952, a dividend of 6 per cent per annum, less income tax on the preference stock shall be paid. (*b*) That for the year ended January 19, 1952, a participating dividend of one per cent, less income tax, on the preference stock shall be paid. (*c*) That the dividend for the year ended January 19, 1952, on the ordinary stock shall be six per cent, less income tax. (*d*) That £60,000 shall be transferred to the contingency reserve, increasing it to £870,000, and, finally, (*e*) That £99,627 shall be carried forward to the next account against £92,471 brought in.

PROSPECTS UNCERTAIN

I have already dealt with the state of affairs during the past year at home and overseas. What now concerns us is the present and the future. The present offers little encouragement: Trade at home and abroad is in the doldrums. About the future it would be futile to speculate. All one can truthfully say is that the prospect is dim. We are, however, ready for any demand, whether in spinning and manufacturing, or merchanting for the home and overseas markets, and shall not fail to take advantage of the first moves towards normal conditions.

I wish to offer my sincere and grateful thanks to my colleagues on the Board and to the heads of departments and their staffs for their constant and loyal support.

The report and accounts were adopted.

Mr Oswald Fardell, Mr David Courtney Wybrants and Mr Charles Joseph Franklin were re-elected directors; and the auditors, Messrs Cooper Brothers & Co., chartered accountants, re-appointed.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

22 Ryder Street, S.W.1

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

NEW BUSINESS EXCEEDS £2 MILLION

Mr Kenneth A. E. Moore, FCA, presided on April 2nd at the one hundred and twenty-second annual general meeting of the National Mutual Life Assurance Society. In his speech to the members the chairman drew attention to the net new life assurances for 1951 which, for the first time in the Society's history, had exceeded £2 million, and to the continuing success of the Society's recently developed organisation for dealing with staff pensions schemes. The claims in the year had been light and in general the Society's mortality experience had not been more than about 65 per cent of the level expected by the mortality tables in current use.

Turning to the Society's investment policy Mr Moore told the members that owing to the shifting of emphasis during the year towards securities offering some protection against the serious depreciation which appeared likely, the Society had done better than the published Index, which showed that the price of 2½ per cent Consols fell by 13½ per cent and that other fixed interest stocks had suffered more or less correspondingly. The Society had been successful in limiting the depreciation of Stock Exchange investments to less than half that suffered by Consols and to no more than 3.8 per cent of the total assets. The chairman reminded the members that the Society was almost unique in the world of life assurance in showing the investments at market value in the annual balance sheet. He said: In the years when there is appreciation the gain is carried to the reserve fund and when depreciation is suffered it becomes a charge on that fund, which, on this occasion, and for that reason, is shown in the balance sheet as being reduced from £1 million to £581,000.

For the future the prospects of substantial new business are good and provided no new national crisis were to supervene the chairman said that the members could reasonably look forward to a favourable outcome of the biennial valuation and declaration of bonus due at the end of 1952.

THE BUDGET AND NATIONAL ECONOMY

The recent Budget and the rise in the Bank rate and other steps now in train offer some hope of a return to a sound economy, but the further increase in the burden of tax on industry to something over 60 per cent of its profits can only be regarded with misgiving, particularly as in an inflationary phase the profits chargeable to tax are arrived at before provision for the increased cost of replacements of plant and other fixed assets.

This debilitating taxation, coupled with the proposed diversion for export of plant and machinery badly needed for home industry are perhaps inescapable expedients for a limited period while our economy is undergoing drastic overhaul, but if perpetuated will amount to eating our seed wheat with all the consequences associated with that process.

But to return to our particular business. It is worth recalling that the work of this and other life offices is entirely in harmony with the needs of the moment, among which loom large the need for the State to spend less and the community to save more.

The work of the life offices is, in fact, one of the most important and effective branches of what is popularly known as "the savings movement." In this the life offices are performing a most useful and valuable service and our officials can go about their business encouraged by this fact.

The report was adopted.

EQUITY AND LAW LIFE ASSURANCE SOCIETY

SATISFACTORY NEW BUSINESS

STRONG POSITION

SIR RICHARD HOPKINS' SPEECH

The annual general meeting of Equity and Law Life Assurance Society was held on April 2nd at the Chartered Auctioneers' and Estate Agents' Institute, 29, Lincoln's Inn Fields, London.

The Rt. Hon. Sir Richard Hopkins, PC, GCB (the chairman), who presided, said:—Gentlemen,—I rise to move: "That the report and accounts for the year ended December 31, 1951, be received and adopted and entered on the minutes." These have been in your hands for several days and I assume may be taken as read. (Agreed.)

First, it is my very pleasant duty to welcome here today Mr Gerald Russell, of the firm of Charles Russell and Company, who joined the board on December 1, 1951. We are very glad that Mr Russell has agreed to join us, not only on account of his personal qualities, but also on account of the previous connection which his family has had with the society. Mr Russell's uncle, the Hon. Sir Charles Russell, Bt., KCVO, who was the founder of the firm of Charles Russell and Company, was a member of our board from 1899 until his death in 1928.

DEMAND FOR WITH-PROFIT CONTRACTS

I turn now to the report and accounts in your hands. Our new business continues to be satisfactory and, in particular, the trend shown by our new with-profit life assurance business is especially gratifying; for a number of years now this trend has been steadily upwards and indicates the growing appreciation of our with-profit contracts. This public preference is not surprising in view of our high rate of bonus—38s. and upwards—the strength of our actuarial valuation, and the strength of our general position disclosed by our annual report and accounts.

The surplus earned by a life office depends mainly on the interest earned, the mortality experienced, and the level of the expenses incurred. All these factors are, to a greater or lesser extent, under the control of the office concerned. We attach great importance to the interest earning power of our funds. An examination of the rate of interest since the end of the war shows a steady and satisfactory trend. The gross rate of interest has now risen to £3 6s. 6d. per cent and a detailed examination of our assets as at December 31st last indicates that this rate should be well maintained during the current year. Mortality is, of course, subject to quite wide variations beyond our control, but for many years now results from this factor, owing in some measure to care in underwriting in past years—which is still continuing—have been favourable.

GROWTH OF EXPENSES

In expenses of management, as you will see from the comparative figures in the revenue account, there has again been a substantial increase. The most important element in this item is salaries, and I am sure you will agree that the salaries of our staff must be maintained at a proper level relative to that of other similar institutions. The increase is largely due to the steady diminution in the value of the pound.

Let us hope that this decline will soon be arrested. We have recently heard the Budget proposals—the latest of a series of measures which the new Government deem requisite in the public sphere to rectify our trade balance and restore confidence in our economy. These measures include also the partial removal of some disincentives to private effort. It remains now for the community to play its part. If work and thrift have come in recent years to be thought a little outmoded, never was it more opportune to explode such heresies, for it is only by work and thrift that the country can now win through.

Turning to the balance sheet, there is only one item on which I wish to comment, namely, our wholly owned subsidiary, The Law Reversionary Interest Society, Limited. This old-established society, investing in reversions and life interests, was founded in 1853, and next year we celebrate its centenary. The Law Reversionary Interest Society forms a very important link between our own society and the legal profession, and if you observe the sums invested through this channel in the last few years you will see that it forms a very substantial investment outlet for our funds.

STOCK MARKET CONDITIONS

You will, perhaps, expect from me not indeed a review of stock market conditions during 1951, but some comment on the margins to which reference has been made in past years as existing between the values at which our assets appear in the balance sheet and their market values. A year ago I was able to tell you that an increase had occurred; I am even more pleased to be able to tell you today that, in spite of the very heavy fall in certain sections of the stock market during 1951, there was practically no change in the margin which existed at the end of the year as compared with that at the beginning, in fact, there was actually a slight increase.

Since the end of the year there has, of course, been a further substantial fall in markets, but as far as we can see our margin today is not dissimilar from that which existed at the end of 1949—the date of our last triennial valuation. That is an interesting comparison when one remembers that market values of long-dated fixed-interest securities have fallen by about 15 per cent since that date. You will realise the great importance of sustaining capital values during a period of rising interest rates—if successful this should result in a useful gain in income in the future.

THE OUTLOOK

That concludes my review of the present position of the society's affairs. Our new business is developing in the way we would wish, and you will observe that so far during this triennium our funds have increased by £3 million. Within wide limits we attempt to forecast and control both the rate and the nature of the expansion of our funds. Our asset position is strong; the actuarial basis on which we value our liabilities is searching—no office, as far as we know, uses a stronger basis. We look forward to placing before you at our next annual general meeting the results of the triennial valuation to be made at the end of the year. We, in fact, make a valuation for our own purposes every year and I am able to say that the surplus disclosed for the first two years of the triennium was undoubtedly sufficient to maintain the rate of bonus we are now granting to our with-profit policies.

Finally, I would draw your attention to our new rates of premium for non-profit life assurances. Hitherto our rates for such business have been entirely uncompetitive since we believe primarily in the advantages to all parties of with-profit life assurance. Our belief is unchanged, but we have recently revised our non-profit rates, with the result that for the shorter terms in particular they are now highly competitive.

TRIBUTE TO AGENTS AND STAFF

I cannot close without an expression of thanks to our agents for their loyal and continued support and to our staff for their good year's work. In the nature of things your directors' association is closest with the senior members of the staff, but it is obvious to your board from the way in which matters are placed before them that excellent work is done throughout the society at all levels, and on behalf of the directors I wish to take this opportunity of recording our most sincere thanks.

One final word to both our staff and our agents: if there is any validity in a remark I made earlier, this is indeed the time to put in some very solid work in the cause of thrift for the results of which we cater in a very attractive form.

The report and accounts were adopted.

BRITANNIC ASSURANCE COMPANY, LIMITED

£1,425,000 ALLOCATED TO POLICYHOLDERS

FUNDS OVER £74 MILLION

Mr J. A. Jefferson, FIA, presiding at the eighty-sixth annual general meeting, said:—

During 1951 the premium income in the life branches has well passed the tenth million milestone, and amounted to £10,335,000—an increase of £383,000 in the year. The total funds for the security of our policyholders at £74,891,000 rose by £4,346,000. The gross interest earned by the life funds amounted to £2,826,000, which was £265,000 more than in 1950. The premium income of the fire and accident branch increased by £48,000 to £562,000. The directors, therefore, are fully justified in saying there was good all-round progress made by the company in 1951.

We companies and societies, collectively known as "The Industrial Life Offices," have continued during the past year, through advertising and by other means, our policy of informing the public of our contribution to the promotion of thrift and the habit of regular saving through the home service which we provide. Today we are undoubtedly better understood and therefore more appreciated for our work than ever before. Our policyholders have always understood and respected the industrial assurance staffs throughout the country, and now those staffs are also recognised as worthy servants of the public by all who seek to understand our business. "Mutualisation" or some other form of interference still lurks in the background, but the industrial life offices are showing by their methods and results a continuing record of service, security, and fair dealing which no other system could equal, let alone surpass.

The ordinary branch premium income increased by £196,000 to £3,457,000 and there was an increase of £1,899,000 in the fund, which now amounts to £27,471,000. The net rate of interest rose from £3 2s. 5d. per cent to £3 3s. 6d. per cent, and the expense ratio from 11.91 per cent to 12.50 per cent. This rise in expenses is largely accounted for by the substantial increase in the new business procured. The new sums assured amounted to £8,414,000, compared with £7,031,000 in 1950. There was a gratifying increase in the average new life policy to just over £500 sum assured. Maturities were £1,077,000. Death claims rose by nearly £57,000 to £394,000, but were still within the expectation by the mortality table employed in the valuation.

Industrial branch premiums at £6,877,000 were up by £186,000 and the fund increased by £2,078,000 to £40,595,000. The net rate of interest at £3 14s. per cent showed a small increase over that for the previous year. Death claims were distinctly heavier at £1,732,000 and were up by £178,000. This rise was due to the influenza epidemic which started in the seaports of the north early in the year. Surely the way in which the Industrial Life offices quickly help to relieve the sudden and unexpected strains caused by these epidemics is a good example of the help we are to our policyholders at such times. Maturities also showed a substantial increase, being up by £116,000 to £1,690,000. The expense rate was somewhat higher than in the previous year, being 26.74 per cent compared with 25.72 per cent in 1950. Nevertheless, the rate is still moderate in a time of rising costs. Pure lapses continue to fall, although they have been low for a number of years. In every case where at least a year's premiums have been paid, the policy is dealt with under our automatic paid-up policy scheme and the policyholder receives either a paid up policy in proportion to the number of years' premiums paid, or a cash surrender value.

The valuation of our securities has this year had to be made against a background of rapidly declining security values and a changed governmental financial policy. Those of you who have followed my speeches over past years will remember my consistent opposition to the artificial "cheap money" policy. I cannot better express my views than in words I used at our annual meeting in March, 1947, when I said:—"Cheap money pushed to excess means valueless money. The credit of a nation is not to be measured solely by the rate of interest it has to pay on its internal loans, but in the final result by the productivity of its soil and hands and brains, and it is a fallacy to assume that a forcing down of interest rates can alone produce high productivity or prosperity."

I venture to suggest that now in 1952 you are at last seeing a return to what I would call a "healthy money" policy which will not only restore world confidence in sterling but will also restore our own sense of values which had become so sadly distorted by the strains and stresses of a wartime economy.

The effects of this changed atmosphere have been severe. In a short space of time we have seen a drop of anything from 10 per cent to 15 per cent in the Stock Exchange prices of the various classes of fixed interest securities. Applying these figures to our balance sheet will show you—particularly in relation to our £36,000,000 British Government or Government guaranteed securities—the magnitude of the depreciation which we have had to withstand. I make no complaint against something which I had expected, and I have no regrets, but only pride, at the millions of new money we provided for the Government during the war years—it was part of our national duty. We were, however, all through these years conscious of the dangers ahead, despite the song in a certain person's heart, and regularly we asked you to approve large appropriations of surplus to our investment reserve funds to buttress the company against the falls we foresaw. At December, 1938, against total assets of £32,272,000, we had investment reserves of £1,750,000—or 5.42 per cent. Since then we have sought your approval for appropriations of £3,550,000 to build up these reserves and now, against total assets of £76,260,000, we have reserves of £5,300,000—or 6.95 per cent. The position today shows how wise were these past appropriations; they have enabled us to more than cover all this depreciation without any abnormal transfers this year and without any weakening of our very strong actuarial valuation basis.

During 1951 there has been a growing demand for capital by industry, and I am glad that we have at last been able to assist in financing industry on terms which give a fair return to our policyholders. During the past few years much of this financing was done through the medium of fixed interest redeemable securities. Too much of this type of finance, with its obligation to redeem in a fairly short term of years, would not have been healthy for expanding industries in the long run, and I am glad to see our leading companies now financing their requirements by ordinary share issues. Whether the effect of the new Excess Profits Levy will reverse this trend remains to be seen. My own view is that ordinary shares of first-class companies still remain inherently sound. The policy of dividend restraint has been much criticised, but I take the view that the future will show it to have been a stabilising influence.

The annual valuation of the policy liabilities in each of the life branches was again made on the strong bases used in previous years, namely, by the net premium method at 2 per cent interest. The heavy falls in the values of Stock Exchange securities during 1951, to which I have already referred, mean that we shall have better opportunities for securing an improved yield on new investments, and therefore there should gradually emerge a bigger margin for profit.

In the ordinary branch the surplus was £1,103,117, inclusive of £276,516 brought forward. The directors have allocated £624,938 to with-profit policies which enables them to declare a reversionary bonus of £1 8s. per cent on the sum assured—the same rate as for 1950.

In the industrial branch the surplus was £2,161,876 inclusive of £670,549 brought forward. The directors have allocated £740,000 for bonuses to Britannic policies, which again enables them to improve the vested reversionary bonus scheme. The policies to which these bonuses have been added were all issued without any right to share in the profits.

New house purchase advances made during the year totalled 3,387 for just under £3½ million. These figures indicate the popularity of the scheme, and we are proud of the fact that since its inception as long ago as 1908 we have made 32,097 advances for a total sum of over £21 million.

It was with very great pleasure indeed that the directors were able, last September, to introduce a valuable extension to the company's non-contributory staff pension scheme in the form of widows' and orphans' pensions. Clearly no individual member of the staff could have stood the financial strain of providing such benefits, and naturally they add immediate heavy liabilities to the staff pension fund. We are therefore recommending a transfer to the pension fund of £200,000, which is £25,000 more than the amount transferred last year. Your thanks to the staff for producing such excellent results as these we have laid before you can be expressed in no better way than by your unanimous acceptance of this recommendation.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

SUBSTANTIAL PROGRESS IN ALL DEPARTMENTS

The one hundred and eleventh annual general meeting was held on April 1, 1952, Mr A. H. Sayer, MC, JP, the society's chairman, in the chair.

The chairman, in moving the adoption of the reports, said:

In October last, our general manager (Mr D. R. Woodgate) was honoured by being elected to the position of deputy chairman of the Industrial Life Offices' Association.

The special concern of the association is the industrial life (home service) side of our business, and it has done, and is doing, everything possible to ensure that the business is conducted in the best interests of the policyholders and all connected with it. The term "industrial" life assurance is possibly misleading, or is, at best, uninformative. I much prefer the term "home service" life assurance, which does accurately describe what in fact happens, namely, that representatives of the society and other offices make regular calls every week or every month to collect premiums, to pay claims, and to give the greatest possible personal help to policyholders.

INVESTMENTS AND VALUATION OF LIABILITIES

From 1931, when the United Kingdom departed from the gold bullion standard, until 1945, with but a temporary pause during the few years immediately before the outbreak of war in 1939, interest rates steadily fell. After the war until the end of 1946 the tempo was quickened. The steady fall in rates of interest made it necessary to strengthen the basis upon which these calculations of actuarial reserves were made, and it will be found that, since 1931 until 1950, the story is one of ever-increasing additions to the strength of the actuarial reserves. At the same time, the society did not neglect to add to the general reserve and the investments reserve, which were built up to the large amounts of £150,000 and £1,400,000 respectively.

The peak of the Stock Exchange market in fixed interest securities was reached by the end of 1946. Since then there has been a rapid fall in prices. But the threat—and a serious one—that it would only be possible to invest premiums at 2½ per cent or 2¾ per cent or 2 per cent, or perhaps even lower than that, was removed, and the basis of the valuation of liabilities which was quite proper for earlier years began to lose touch with reality. Accordingly, this year the actuary has reverted to the basis which was last used in 1946, namely, a rate of interest of 2¾ per cent for the ordinary department and 3 per cent for the industrial department. Investment conditions are in fact very considerably better for the investor now than they were in 1946. One would have to go back to 1931 to find comparable conditions.

The change in the basis of valuation has set free very large amounts of the actuarial reserves against liabilities, and these amounts fall into surplus. This year the surplus in the ordinary department is £593,782 as compared with £289,498 for 1950; it includes £288,614 which has been released by the change in basis of valuation. In the industrial department the surplus is £1,377,693 as compared with £187,964 for 1950; it includes £1,172,863 which has been released by the change in basis of valuation.

The large sum of £1,614,000 has been added to investments reserves from the ordinary and industrial departments—a sum which, it will be noted, is £152,523 more than the total amount released by the changes in the basis of valuation of liabilities. The investments reserve now stands at the figure of £2,950,000 and, when the general reserve of £150,000 is added thereto, total reserves at £3,100,000 are just double what they were twelve months ago.

The gross rate of interest earned on the whole of the funds was £4 0s. 3d. per cent, being 5s. 4d. per cent more than last year, and the net rate of interest was £3 14s. 4d. per cent, being 4s. 10d. per cent more than last year.

The Society's house purchase plans proved almost embarrassingly popular last year. The Society's assets increased by £957,794 during the year, whereas mortgages on property within the United Kingdom, now standing at approximately £6,300,000, rose by £830,181, thus absorbing a large proportion of the money available for investment.

ORIENT STEAM NAVIGATION COMPANY

MR I. C. GEDDES ON RISING COSTS

The fifty-second annual general meeting of Orient Steam Navigation Company, Limited, was held on April 2nd in London.

Mr I. C. Geddes said that the working profit was £1,143,929, showing a decline of some £180,000 on the previous year. Voyage earnings had, generally, been maintained, but running expenses continued to rise.

He thought shareholders should receive more this year, but in view of the unpromising outlook it was unwise to increase the regular dividend of 5 per cent tax free. Instead the directors recommended a special distribution of 5 per cent out of profits made on realisation of investments and standing in investment reserve account which, as capital profits, were not subject to income tax.

Commenting on rising costs, Mr Geddes pointed out that the price of oil fuel had, in general, risen more steeply than any other commodity, even before the disturbance brought about by the Persian dispute. Increases in the past year had added about £502,000 to operating costs. In addition, increases in seafarers' wages amounted to over £200,000. As to earnings, passage rates had recently been increased but fares had to be maintained at a reasonable level. The new Australian currency restrictions might well reduce passenger traffic.

Ships could not benefit from the increased freight rates owing to the slow handling of cargo in Australian ports, and the decline in the export of frozen produce. The cut in Australian imports would reflect adversely on earnings, but easement in the demand for labour might have a compensatory effect.

The increases in building and operating costs, together with the demands of taxation, were creating a dangerous situation, and shipowners felt that to preserve our position as a leading maritime nation, the rules of taxation should be adjusted so as to allow proper and adequate depreciation before revenue was considered to be profit. The period chosen as a basis for the new excess profits levy was particularly unsuitable for the company, but its effect could not be forecast until the promised special provisions were studied.

Mr Geddes warmly thanked the staff ashore and afloat for their loyal service during the year, adding a special word of appreciation to all those in the Services and in civilian life who had untiringly maintained the flow of traffic through the Suez Canal during the recent disturbances in Egypt.

The report was adopted.

LAW LAND COMPANY, LIMITED

INCREASED GROSS REVENUE

The sixty-ninth annual general meeting of Law Land Company, Limited, was held on April 2nd in London.

Mr M. E. F. Crealock (chairman and general manager), in the course of his speech, said:—On this occasion—our sixty-ninth annual general meeting—it is very pleasant to be able again to report to you a welcome increase in our gross revenue. The increase is not as great as last year (1950), which is in accordance with my forecast. We have completed many re-lettings during the past five years at moderate increases and there are now fewer tenancies to be revised each year, and those that do come up for revision are more recent and short tenancies which have already produced an increased revenue, so that there is little reason to anticipate any considerable rise in our income for some time to come.

LEASEHOLDS REDEMPTION ACCOUNT

Leaseholds redemption account has received out of the year's revenue a sum of £19,500, bringing the total of this account to £406,000. We have also out of the year's profits added £20,000 to the account for depreciation of flat properties, bringing the total to £100,000. At the end of the period under review there were only four flats unlet and negotiations with prospective tenants were proceeding. These four flats represented in rental value approximately one-half of 1 per cent of the company's properties. The office buildings were, and still are, fully let.

Mortgages and loans have decreased by approximately £27,000. Other liabilities have gone up by £23,000, which includes £5,500 for profits and income tax and £7,000 due to contractors for work done. On the assets side we have an increase in the amount due for war damage work of £6,000.

The balance available at the end of the year was £89,650. Out of this the dividend on the preference stock and an interim dividend on the ordinary stock have been paid, £19,554 has been added to the leaseholds redemption account, and £20,000 to the account for depreciation of flat properties. A sum of £50,096 is left for distribution and it is proposed to pay a balance dividend on the ordinary stock of 5 per cent and a bonus of 2 per cent as last year. If this is approved we shall carry forward £2,044 more than we brought in.

THE NORFOLK ESTATE

As I have mentioned in previous years, it has been very much in my plans for the future of the company to negotiate new leases or extension of existing leases from the Norfolk Estate. Some of these leases have a comparatively short time to run and it seems impossible to foresee an opportunity of rebuilding for some years. I should regard it as desirable to modernise some of the old buildings if leases or extensions could be negotiated at reasonable figures. But the Duke of Norfolk's advisers seem at present disinclined to quote or discuss terms. We shall, of course, continue to press for some indication of the policy which is likely to be followed, and if we are not able to obtain some more definite progress with the Norfolk Estate advisers we must consider seeking other properties in the neighbourhood of the Law Courts and the Strand.

Again I would like to thank all members of your staff for the way they carried out their duties during the past year. Without exception, the staff has been loyal and very hard working.

The report was adopted.

SISAL ESTATES LIMITED

(In Voluntary Liquidation)

BIRD AND COMPANY (AFRICA), LIMITED

STATEMENT BY THE CHAIRMAN

As I have not had an opportunity of addressing shareholders at an annual general meeting this year a statement from me on the general position to date may be of interest.

Last year I said that, subject to prudent provision to ensure the soundness of the business, we proposed to make as adequate a return as possible to shareholders, for only by such means could confidence be created in sisal enterprise; and that the importance of capital reorganisation was recognised. Sisal Estates Limited has since paid a 100 per cent dividend and on March 31, 1952, resolutions were passed providing for the liquidation of Sisal Estates Limited, the reorganisation of the capital structure of Bird and Company (Africa), Limited, a company incorporated over 30 years ago in East Africa, and the distribution of its shares to the shareholders of Sisal Estates Limited.

We have been specially indebted to the investment trust houses who over a long period of years, under uncertain and precarious conditions, gave our enterprise their support, and I am pleased to state that the repayment terms of the preference shares received understanding support from ordinary shareholders. I would take the opportunity of placing our present policy against the history of Bird and Company (Africa), Limited, over the last 30 years. Tropical enterprise in primary production is very different from business undertakings in the settled conditions of the United Kingdom, and different standards of incentive for the heavy risks involved are essential to success. In the past, the return on the capital invested in this enterprise was inadequate for the risk taken by the investing public. I am fortified to know that at last the tropical primary producer is coming into his own, and his economic importance more clearly and generously realised.

ACCOUNTS

The accounts of Bird and Company (Africa), Limited, for the year to June 30, 1951, show profits of £1,004,590 (£391,908 in 1949-50), from which £257,000 (£75,000 in 1949-50) is deducted for taxation, leaving a net profit for the year of £747,590, which, together with £378,918 brought forward, makes a total of £1,126,508. From the profit, sundry appropriations have been made amounting to £250,000 (£156,895 in 1949-50), made up of £130,000 for development and cultivation, £20,000 for staff fund, and £100,000 to general reserve. This leaves £876,508, from which £231,869 dividends are deductible, leaving a balance of £644,639 carried to the balance sheet.

Our current assets amounted at June 30, 1951, to £1,420,081 and included balances at banks and cash in hand of £1,164,974.

Since June 30, 1951, our output and scale of profits have continued to expand. We have repaid all balances of loans on account of estates purchased amounting to £354,845, and at December 31, 1951, our current assets amounted to £1,613,291, of which £1,413,969 was cash or short-term bills. That position has since been further strengthened.

PRODUCTION

Last year I estimated the 1950-51 production at 12,000 tons and we achieved 12,678 tons. For the coming year to June 30, 1952, I estimate 14,000 tons in spite of the torrential and unseasonal rains in the later part of 1951, which slowed down output, but which we are now steadily overtaking.

As a result of abnormal atmospheric conditions, we have also experienced some leaf blister, caused by the globules of rain on the leaves and in the atmosphere acting as lenses to the tropical sun's rays. A few areas looked as though a severe fire had passed through. This will cause in Tanganyika a fall in the production of higher grades, but we have ample leaf to maintain our estimates.

More serious factors in future production of sisal in East Africa are labour supply, and to a less degree internal transport and port facilities. These matters are receiving the attention of the authorities concerned.

The growth of Bird and Company business in terms of output may be seen from the following figures:—

	Average yearly Production
1920-30	3,240 tons
1930-40	5,476 „
1940-50	9,152 „
1950-52	13,000 „ estimated

Our planting programme provides for a steady increase of output up to 50 per cent in excess of the 1950-52 figure shown above. Our future production increase will be the key to our future prosperity.

The company is considering the development of tea production, and have acquired an area of suitable freehold forest land at 4,000 feet in the Usambaras overlooking our main estates. Heavy forest clearing is taking place and tea nurseries are being developed.

LABOUR AND STAFF

Increase in production is dependent upon increase in labour supply, and this may be the main limiting factor in the future to expanding production. I am glad to report, however, that the sisal industry is increasingly attracting labour, not only from all over Tanganyika, but from the adjacent countries. The increase in sisal prices has made it possible not only to increase wages, but to make up a great deal of leeway in housing and welfare of all kinds. Since 1941 we have spent about £400,000 in this way, mainly on capital housing construction and medical and other amenities. This has been a progressively annual figure. In 1941 £10,500 was spent, while last year's figure was £105,500, but that in my view is the peak.

Unfortunately, we are allowed for taxation purposes to depreciate this expenditure, as a charge against profits, only at the rate of 2 per cent annually, which is inadequate and a disincentive to progress in this direction.

Over the ten years from 1941-42 the cash wages of our field and factory workers rose by 295 per cent, and indirect expenditure charged to revenue in respect of amenities by 330 per cent. Most labourers complete their day's work, which traditionally starts at daybreak, between 9 and 11 a.m., and the average days worked are about 23 per month, or, in terms of an eight-hour day, 11 days per month. That is the tempo and tradition of tropical Africa, and the pace cannot, in my estimation, be forced. African economics are not to be judged by Western standards, and an increase in the wage rate generally results in a reduction in the hours worked, save for the gradually increasing margin of more skilled and responsible workers. The often-quoted solution of increasing consumer goods is in my view greatly overrated. In Tanganyika there has never been any unemployment problem and the number of Africans gainfully employed or seeking employment does not exceed about 400,000 out of a population of 7,500,000.

In the more skilled categories of African labour work is more sustained, and salaries range from £100 to £400 per annum, and in addition annual bonuses are received by an increasing number. Every encouragement has for years been given to training as mechanics, turners, welders, motor winders, electricians, dressers, field assistants, medical assistants, clerks, etc. I must say that the response is very encouraging. We also employ other skilled categories, in which the Sikh especially displays great technical skills.

Our major managerial positions are filled almost entirely by Europeans, but it is a remarkable fact that throughout the sisal industry of Tanganyika, whose exports last year were valued at over £24 million, or about 60 per cent of the total exports of the country, including gold, diamonds, minerals, etc., the number of Europeans is less than the present remnant which the Ground Nut Scheme is still carrying on its payroll. No wonder we are economic and they are not.

PRICE

I mentioned last year that owing to the established policy of forward sales we had not derived the full profit represented by the continued quoted rise in the sisal prices. On this question of sisal prices, I have read statements from various sources which are apt to be misleading, and I would like to make a comment.

Sisal, as you are aware, is not a seasonal crop but a continuous production. The established practice for years has been to sell ahead at least six months. Market quotations do not record the actual average price received by the producers. Generally speaking, they reflect special prices resulting from buyers who wish to cover current deficiencies or sellers who wish to offer sisal not already sold under long-term contracts. They therefore tend to represent marginal extremes only. For example, in mid-March, 1951, the price quoted on the London market for the December-February shipment of BEA sisal No. 1 was £243-248 per ton. The average import price, however, i.e. c.i.f. UK port of delivery, at that time, was £165.59 per ton, whilst the f.o.b. price at East African port was £154.3 per ton. The average net f.o.b. price which we received for our sisal during the twelve months to June 30, 1951, was £133 per ton. I may add that the average f.o.b. price received per ton for 142,111 tons of sisal exported from Tanganyika for the year to the end of December, 1951, which is the latest date to which we have returns, was £167, and the average for the last quarter £180. The average price of the Tanganyika Sisal Marketing Association (Tasma), through which we market the bulk of our sisal, was slightly in excess of this figure, and on the sale returns from January to June, 1952, up to which month practically all our sisal is sold, the price and our output will be still higher.

THE SISAL OUTLOOK

The supply and demand of world hard fibre, which includes sisal and manila, is

gradually moving to equilibrium, and by the end of 1952 availabilities should about meet current requirements, apart from the building up of stocks which any well-balanced industry needs. Exchange factors will be important, for manila is a dollar, and sisal for the most part a sterling commodity. During 1951 the world requirements of hard fibres were:—

	Including Stockpile	Excluding Stockpile
	%	%
North America ...	52.4	47.8
Continent	24.0	26.6
United Kingdom ...	14.7	16.3
Commonwealth ...	3.7	4.0
Other	5.2	5.3

Sisal, it will be seen, is a multilateral commodity. Since the war East African producers have done their best to prevent speculation, and have everywhere steadily met consumer demand for future delivery. Consumer demand is mainly determined by world harvests, shipping expansion, etc., and is therefore inelastic and not greatly influenced by particular price levels. The strength of demand is reinforced by the absence of stocks at most points of consumption and distribution. Apart from the world volume of credit, the stock position will be an important influence. During the next two years prices may decline, but, in my opinion, any fall is unlikely to be appreciably below the average price received by growers during the last twelve months. A somewhat lower basis of value will, in my view, be a more healthy one for all concerned, so long as steady forward buying and selling is continued. So far as your own company is concerned, the steady rise in our future output should to some extent counteract the effect of a price fall.

DIRECTORS AND STAFF

In addition to the chairman and the two local working directors who are resident in Tanga, the board of Bird and Company (Africa), Limited, has been strengthened by the addition of Mr Richard Gray, who has just retired after many years as Superintendent of the East African Branches of the Standard Bank of South Africa Limited. Mr Gray, who resides in Nairobi, will be readily accessible for the business of the board. I welcome his financial experience and great knowledge of East Africa.

Directors resident in the United Kingdom are Col. C. E. Ponsonby, TD, DL; and Mr A. A. Lough, FCA. They provide an invaluable link. Mr Clyde Higgs has resigned, but I am glad that his advice, especially on animal husbandry, will still be available. The appointments of Mr Humphrey Slade and Major F. H. de V. Joyce, MC, as members of the board of Sisal Estates Limited now lapse. I value their personal friendship and their judgment on East African affairs. To my staff on the estates, at head office, and elsewhere I render my sincere thanks.

BEANS INDUSTRIES

EXCELLENT RESULTS

At the eighteenth annual general meeting of Beans Industries, Limited, held on March 28th at Tipton, Mr J. H. Bean, CBE (the chairman), who presided, said: The net profits, after all charges except taxation, amounted to £393,331, an increase of some £172,000 on the previous year. The charge for taxation absorbs £228,150, compared with £117,300. In spite of the heavy burden of taxation which the company has had to bear, you will, I am sure, agree that the results are excellent.

This taxation burden has now been increased by the imposition of the Excess Profits Levy recently announced by the Chancellor of the Exchequer, and in my opinion taxes of this nature are wrong in principle as they stifle efficiency.

Your board recommend a final ordinary dividend of 27½ per cent, less income tax, making 37½ per cent for the year.

A considerable expansion of production has again been achieved in all sections of our business. This is specially gratifying when it is realised that it was attained despite shortages of essential raw materials which in some instances have been on a day-to-day basis, and a constant source of anxiety. Despite increasing costs we were able in most cases to maintain our selling prices at existing levels until quite recently.

The orders on hand, production and sales for the present year are satisfactory when compared with the year under review. I am hopeful that when next I address you I shall be able to present another satisfactory report.

The report was adopted.

BEAUMONT PROPERTY TRUST, LIMITED

SATISFACTORY RESULTS

The eighteenth annual general meeting of this company, was held on April 2nd in London, Mr Cyril W. Black, JP, MP, CC, FRICS, FAI, the chairman, presiding.

The following is an extract from his statement which had been circulated with the report and accounts: The net profit for the year ended September 30, 1951, including dividends received from the three subsidiary companies, amounted to £55,864, after providing £63,299 for income tax and profits tax. Compared with the previous year, the net profit shows a decline of about £6,000, and the amount payable in respect of income tax and profits tax an increase of about £4,000. To the profit for the year there must be added the sum of £34,500 brought in from the previous year, making a total sum of £90,364 available for appropriation.

Dividends on our preference capital were paid on the due dates during the year, and, if your directors' recommendation regarding the final dividend on the ordinary capital is approved, the ordinary shareholders will receive a total of 7½ per cent, less income tax, for the year. The directors hope that, having regard to the many difficulties of the period, the results for the year will be regarded as satisfactory.

ALLOCATION OF INCOME

During the past year, every £ received by us in respect of rental income was appropriated approximately as follows:—

	£ s. d.
In payment of ground rents and interest on borrowed money (less interest received)	4 5
In payment of general and water rates	1 8
In providing various services for the tenants, including landlords' repairs, administrative charges, and bad debts	5 8
Depreciation on leasehold properties and furniture	9
In payment of income tax and profits tax	5 5
Distributed to shareholders in Preference and Ordinary dividends	2 1

It will thus be seen that out of every 20s. we collect in rents, 17s. 11d. is paid out in the form of outgoings of one kind and another, and only 2s. 1d. distributed to the owners of the properties.

Your directors continue to be satisfied with the soundness of your companies.

The report was adopted.

THE HALIFAX BUILDING SOCIETY

TOTAL ASSETS OVER £177 MILLION

MR ALGERNON DENHAM'S REVIEW

The ninety-ninth annual general meeting of members of The Halifax Building Society was held in Halifax on March 31, 1952. The President of the Society, Mr Algernon Denham, JP, in moving the adoption of the accounts, said:—

Our experience in 1951 has on the whole been favourable and we are gratified to be able to report a record increase in assets, an increased volume of mortgage business, a reasonable yet adequate surplus and what is most important, the retention in full measure of the confidence of the investing public.

The total assets as at January 31, 1952, amount to £177,211,675, an increase of £11,723,892 in the year and a record in the Society's history.

The Society has 237,552 borrowers, with a total debt of £138,758,960.

Investments in corporation loans amount to £19,922,981. Our remaining assets consist of tax reserve certificates £1,250,000, balances at bankers and cash in hand £5,317,751, and office premises £490,450.

The reserves and carry forward at January 31, 1952, amount to £9,766,809, an increase of £169,467.

COST OF SUBSIDISED HOUSES

The late Government devoted the major portion of their housing efforts to fostering and encouraging the erection of municipally owned houses to let on a subsidised basis. This, in our view, was a mistaken policy which unnecessarily created through subsidies, future liabilities for rates and taxes far in excess of what need have been the case. As an indication of the saving to the state and local authorities I would mention that although since 1945 there have been erected only 188,000 houses for private owners, for a similar number of municipally owned houses, there would have been a future liability for subsidy of £248 million under the old rate of £22 per house per annum.

Favouring, as we do, a reduction rather than an increase in national and municipal expenditure, we welcome the announcement by the new Housing Minister that home ownership without subsidy is to be encouraged and that local authorities may subject to certain stipulations, sell their house properties to individual tenants, thereby reducing the local and national indebtedness.

GRAPPLING WITH INFLATION

During the postwar years concern with regard to the continuing inflationary trend has been voiced at succeeding annual meetings, and I welcome the attempt now being made to grapple with our present difficulties. It is vital that both our own nationals and the peoples of the dollar and sterling areas should have their confidence in the £ restored and until this is done there will always be the danger around the corner of a breakdown in our economy.

I would with all the strength and sincerity at my command, impress upon our depositors and shareholders that the Treasury is waging a battle for the country's survival as a first-class nation, and I regret more than I can express that at the present time there are some shallow thinking people still ready to assert that a dearer money policy provides some unspecified advantage for financial institutions, at the expense of the community.

CABLE AND WIRELESS (HOLDING) LIMITED

REMARKABLE PROGRESS

The twenty-third annual general meeting of Cable and Wireless (Holding) Limited, was held on March 28th, in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the governor), in the course of his speech, said:

The year under review shows remarkable progress. It is the best year so far that the company has experienced since the telegraph part of the business was nationalised.

The profits available to ordinary stockholders, before providing for taxation, have increased by £283,395, that is from £343,997 to £627,392, which is very nearly double.

This sum of £627,392 represents earnings of more than 12½ per cent on our ordinary capital of £5 million, whereas, you will remember, at the time of the reconstruction in 1950 we estimated that the earnings for this particular year would be not less than 8¼ per cent on that capital. The overall earnings of 12½ per cent this year have been achieved in spite of the fact that we have had to realise by sale investments to pay off £2,291,632 of the 3 per cent 3½-year unsecured loan stock.

REDUCTION OF EXPENSES

The administrative expenses have been reduced by nearly £30,000—a reduction of 25 per cent.

The market value of the portfolio of quoted investments compared with the book value shows an appreciation of £973,000 odd or 8.7 per cent, which is £720,000 more than the appreciation at the end of 1950.

The dividend and bonus, which you will be asked to pass later in the meeting, increase the total distribution for the year from 6 per cent to 8 per cent.

The carry forward is increased by £33,175 from £170,132 to £203,307 which more than covers a year's dividend at what I may call the basic rate of 6 per cent; in fact it very nearly covers a year's distribution at the rate of 8 per cent, as is being paid this year.

The capital and general reserves have been increased during the year by £133,000 odd and now amount, in the aggregate, to £2,266,152. If the profits carried forward are added to this figure there is a total sum of £2,469,459, which is only £30,541 short of 50 per cent of the company's ordinary capital. This figure, moreover, does not take into account any part of the appreciation in the value of the company's investments, which, as already stated, is some £973,000.

MAJORITY OF STOCKHOLDERS HOLD ONLY £200 OR LESS

It is interesting to note that we have 10,536 stockholders, 6,693 of whom do not hold more than £200 stock. We therefore have a special responsibility, which we fully recognise, to the small investor. I believe that well-managed investment trusts should be a great encouragement for savings and provide for those who are not experienced in investing a security with a wide cover which could not be obtained by other means. When I tell you that our portfolio consists of no less than 800 separate investments, exclusive of those held by our companies overseas, it will be realised what a wide spread of security the investor has by investing in such a company as this.

There is little more I need say on the company's activities except again to emphasise the fact that we do not visualise ourselves merely as a body collecting dividends from others and distributing them to stockholders, but as a body charged with the even more important duty of applying as great a part as possible of the company's funds to the best advantage for the development of industry and public works, both here and overseas; this is particularly so in South Africa and the Rhodesias, where four companies were formed in conjunction with our associates, The Globe Telegraph and Trust Company, Limited, and Cables Investment Trust, Limited.

To each officer and member of the staff I am sure you would wish to express your thanks for the loyal and untiring services, enthusiastically given, which have contributed in no small measure to the success which has been achieved.

These results in so short a time after capital reconstruction and distribution of capital arising from compensation and nationalisation are, I think you will agree, no mean achievement and must be highly satisfactory to those stockholders who decided to retain their interest in the company—they are also very gratifying to your court of directors.

EXCESS PROFITS LEVY

You will have noticed in the remarks which I have just made to you that there is no reference to the effect on the company of the Excess Profits Levy proposed by Mr Butler in his recent Budget. Until the publication of the Finance Bill it was impossible to ascertain the effect on your company of this levy. The Bill was only published yesterday and there has not been time to give more than preliminary consideration to it, but it is clear that as the Bill stands investment trusts are liable to the Excess Profits Levy.

When the White Paper was published after the introduction of the Budget, it was stated that assessments for the proposed Excess Profits Levy would be "computed in the same way as they are computed for profits tax purposes."

This was thought to mean that so far as investment income was concerned what is called "franked" income, i.e., dividends received from companies which had already been subject to Excess Profits Levy, would be exempted from assessment, as otherwise double taxation would arise.

Clause 1 of the Eighth Schedule of the Finance Bill which has now been published expressly stated, however, that the exemption given to "franked" income for the profits tax purposes shall not apply for the new levy, and the Chancellor would therefore seem to be deliberately imposing double taxation on part of our investment income, in spite of the fact that for some years past by negotiating numerous conventions with foreign countries it has been the policy of his department to remove this injustice where possible.

It is very much to be hoped that suitable amendments will be proposed during the passage of the Bill.

There are in our case other complications arising out of the peculiar position in which your company was placed in the three standard years—1947, 1948 and 1949 whilst awaiting compensation for its nationalised assets—and also as a result of the capital reconstruction scheme which took place in 1950.

The Bill will shortly be debated in the House of Commons and there is still time for amendments to be made in it. You may rest assured that your directors will take every step possible to protect your interests and will point out the special position of the company as it stands under the present Bill.

The report was adopted.

BIRMINGHAM AND DISTRICT INVESTMENT TRUST, LIMITED

MR H. C. DRAYTON ON THE OUTLOOK

The sixty-eighth annual general meeting of this company was held on March 25th in London.

Mr H. C. Drayton, chairman and managing director, in the course of his speech said: Our gross revenue for the year under review was £507,837, against £556,155 in the previous year, a decline of some £48,300. That decline is due to our receiving a smaller dividend from our associated companies. For the year under review we received £248,500 from those companies, as against £349,600 for the previous year, a decline of £101,100.

Those who read my speech last year will remember that I warned you that, owing to the increased petrol tax and increased wages, the income from our associated companies was liable to fluctuate. However, our general investments made up for a good deal of that loss of revenue, as they produced £254,000 in the year under review, as against £199,000 in the previous year, an increase of £55,100.

After deducting expenses, debenture interest, income tax and profits tax, we have a net amount available for distribution of £232,600. The preference dividend has already been paid and we recommend a dividend on the ordinary stock which, if you approve it, will leave £117,690 to add to our carry forward.

DIVIDEND MET BY GENERAL INVESTMENTS

An interesting point about our revenue account this year is that our income from general investments is more than sufficient to pay the dividend which you are receiving this year. In other words, if our associated companies had not produced any revenue at all, we should still have had sufficient—had we thought it wise—to pay you the dividend which you are going to receive. Further, if you look at the balance-sheet you will see that we have a large sum in cash uninvested. This sum, after deducting our creditors and the final dividend on the ordinary stock, amounts to approximately £520,000 and that sum up to the present is available for investment.

If you will turn to the investments, you will see that we have invested in general quoted investments £2,748,000 as against £2,644,000 last year and in unquoted investments £900,700 as against £913,800. The valuation shows that those quoted investments are worth £3,820,000 as against £3,534,000 last year, and the unquoted investments £1,059,000 as against £1,179,800.

THE CURRENT YEAR

As regards the current year, our investments are very widespread and we have no equity investments, with the exception of one in the textile industry. No doubt there will be some reductions in the dividends that we shall receive, but, on the other hand, we are of the opinion that we shall receive some increases. It may be that when we meet you next year we shall be able to show you the same revenue from our general investments though I do not think we shall show you an increase. When we come to our associated companies, it may be that there will be further decrease. Further than that I cannot go, but I do not think that you need have any worry as to maintenance of the dividend which we are paying you this year.

The report was adopted and the payment of a final dividend of 15 per cent on the ordinary stock, making 19 per cent, less tax for the year, was approved.

EBURITE CORRUGATED CONTAINERS, LIMITED

FURTHER EXPANSION OF BUSINESS

The annual general meeting of Eburite Corrugated Containers, Limited, will be held on April 24th in London.

The following is an extract from the circulated statement of the chairman, Mr J. F. Fielding:—

The year 1951 has again shown an increase and expansion of business over previous years, and the results of successful trading have been further applied in building up the financial strength of the company.

The net profit on trading for the year 1951, including dividends received from wholly owned subsidiaries, interest on investments, and after providing for all administration and other expenses and taxation on all profits earned to December 31, 1951, amounts to £277,781, as compared with £153,509 for the previous year. It is proposed to pay a final ordinary dividend at the rate of 1s. 9d. per share, less tax.

The consolidated balance sheet indicates a position of great strength.

INCREASED PROFITS

The increase in profits is due to an expansion of business. The results for the year include, for the first time, a full year's trading of Autolex, Limited, and its wholly owned subsidiary—Charles G. Donald and Company, Limited. These two companies have made satisfactory profits. Andrew Ritchie and Son, Limited, and Alfred Kent and Son, Limited, the other subsidiary companies, have again had a satisfactory year's trading and both have shown improved results during the year under review. It should be noted that, after making the appropriations already referred to, the carry forward in the consolidated profit and loss account is increased from £136,829 to £307,766, indicating the extent of the profits carried forward in the accounts of the four subsidiary companies.

Last year I made reference to the dividend policy of your directors as one of moderation and restraint, and I compared the year 1947, when dividends were voluntarily pegged, with the year 1950. In the year 1947 distributions equalled approximately 19½ per cent of the profit earned and 5½ per cent on the book value of assets employed. The figures for 1951 are approximately 9 per cent of the profit earned and just over 3½ per cent on the book value of the assets employed. As compared with 1950, the former figure is 5½ per cent lower and the latter 1 per cent lower, which again shows the continuation of this conservative policy.

NEW FACTORY AT MILNGAVIE

The new factory at Milngavie was formally opened on June 7, 1951, and full operations were commenced before that date. The addition of this factory to the group increases very considerably our productive capacity. The large extensions to the factories of Autolex, Limited, and Alfred Kent and Son, Limited, have now been completed, enabling these companies to increase their output materially. During August, 1951, Charles G. Donald and Company, Limited, moved to larger premises in Glasgow, and have also substantially increased their output for the year.

With regard to manufacturing costs, your directors believe that the very substantial rise in the cost of raw materials which has taken place during 1951 is coming to an end. Trading conditions may soon alter appreciably, but I feel confident that the strong position which has been built up over a number of years will stand us in good stead.

RUGBY PORTLAND CEMENT

ANOTHER RECORD YEAR

MR HALFORD REDDISH'S REVIEW

The following is an extract from the speech of the chairman and managing director, Mr Halford W. L. Reddish, to the forthcoming meeting of The Rugby Portland Cement Company Limited:—

We have another year of steady progress to report. All our works have again exceeded their previous best figures for production. Our total deliveries and our exports were again records, and our trading profit is a record for the sixth successive year.

The increased profit is entirely due to our expanding exports. The tonnage of cement sent abroad in 1951 was over 28 per cent up on 1950. It went to over 60 countries, and would have been substantially greater but for the troubles at the docks which affected our despatches for eleven out of the twelve months.

Although, as you will see from the accounts, our trading profit increased by some £76,000 to £541,356, or by £66,000 after depreciation, this increase was whittled down to a mere £14,000 by the big rise in the charge for taxation. Can any sane man, whatever his political outlook, really believe that British industry can continue to bear such an impossibly heavy burden?

In all the circumstances we have decided to recommend the same dividend, 1s. per share, less income tax, on the ordinary shares, together with the usual distribution of 3d. per share from capital reserves, which is of course not subject to income tax. The contribution made by each bag of cement sold in the home market to the total amount of the dividend on the ordinary shares is almost exactly one half-penny.

I know you will wish the congratulations of this meeting to go to all employed by the company on the continuing success of their team-work, which is so clearly reflected not only in the profit and loss account for 1951, but also in the financial strength shown by the balance sheet.

We hear a lot about the avoidable loss of working hours in this country today: but not in this company. Our percentage of such lost time in 1951 was .06—six hours in every 10,000—a pretty good record.

I apologise to no one for the increase in the profits, but I do express regret both to shareholders and employees that the heavy charge for taxation should prevent on this occasion an increase in the dividend.

DEVELOPMENTS ABROAD

We have made some calculations as to what it would cost us today if we had to build the whole of our plants and replace the remainder of our fixed assets at current prices. The total would be about £6,500,000. If we were to take this figure and then depreciate each asset for the number of years it has been in existence at a rate which would write it off over its useful life, there would be a surplus over book values of at least £1,500,000 at December 31, 1951. This would raise the net asset total to something over £4,300,000, which, after allowing for the preference shares, represents about 34s. for each ordinary share.

If we take the figure of £4,300,000 as the approximate amount of real capital now employed in the business, the net profit before taxation represents a return of 9.7 per cent thereon.

Towards the end of the year, following many months of technical investigation and of negotiations with the Trinidad Government, we registered a subsidiary company in Trinidad—Trinidad Cement Limited—to erect and operate a works in that colony. This is the subsidiary company referred to in the Consolidated Balance Sheet. It will have a capital (expressed in sterling) of £1,600,000—£1,150,000 in cumulative redeemable preference shares and £450,000 in ordinary shares.

A copy of the full speech may be obtained on application to the Secretary, Crown House, Rugby.

ERICSSON TELEPHONES

OVERSEAS TRADE MAINTAINED

The forty-ninth annual general meeting of Ericsson Telephones, Limited, was held on March 31st in London.

Sir Harold A. Wernher, GCVO, the chairman, in the course of his speech, said: At our last annual meeting I reported that export business had become more competitive and consequently there would be some recession in profits in the immediate future. I also anticipated there would be shortages of many raw materials, but despite these difficulties I expressed confidence that we would meet again this year with another satisfactory report. I think you will agree that the accounts fully justify that confidence; indeed, having regard to all circumstances, they are better than might have been expected. Total sales for the year were only slightly below those of 1950 and resulted in a trading profit of £1,009,101, compared with £1,188,223.

The telecommunication industry continues to make an important contribution to the country's export effort, and it is now just around £20 million per annum. Our own overseas trade has been well maintained.

Our time recorder, metal powders and specialised paints departments all increased their turnover during the year.

As to the current year's prospects, our order book is greater than at this time last year; to set against this there is the difficult raw material position, which I anticipate will not improve for some time. In spite of this and other factors, I feel justified in saying that we will meet next year with another satisfactory report.

The report and accounts were adopted.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit

22 Ryder Street, St. James's, London, S.W.1

UNIVERSITY OF BRISTOL
SENIOR AGRICULTURAL ECONOMIST

Applications are invited for the post of Senior Agricultural Economist in the Department of Economics (Bristol II Provincial Agricultural Economics Centre, Newton Abbot, Devon). An honours degree (or its equivalent) in Economics, Agricultural Economics or Agriculture is essential, together with some years of post-graduate experience in research problems in Agricultural Economics. Duties will include acting as Liaison Officer with the local N.A.A.S. Salary scale men—£880 x £30—£1,040, women—£780 x £30—£910. Application should be sent to the Registrar, The University, Bristol, 8 (from whom further particulars may be obtained), not later than May 17, 1952.

ASSISTANT COMMISSIONERS, NATIONAL SAVINGS COMMITTEE. The Civil Service Commissioners invite applications for approximately 10 pensionable posts.
Candidates must be at least 25 years of age on April 1, 1952, but candidates at least 21 and under 25 years of age on that date may be admitted if they have exceptionally suitable qualifications.
A University education and a knowledge of economics are desirable. Experience of public speaking, supervision of office procedure, and organisation of work with the public, will be an advantage.
Salary scale in London: £467 at age 25 and over on entry to a maximum of £933 (men); £445 at age 25 or over on entry to a maximum of £796 (women). Starting pay reduced by approximately £27 (men) and £22 (women) for each year of age below 25. The salary scale in the Provinces is somewhat lower. Prospects of promotion.
Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 154/52; completed application forms must be returned by April 22, 1952.

AN American Company in the pharmaceutical field offers a most progressive position to an Organic Chemist or Chemical Engineer between the ages of 30 and 35 years who has already embarked upon a career in commercial production. The Company is in early stages of production in the United Kingdom. Candidates should have a first-class general educational background, should possess a good University degree in either Organic Chemistry or Chemical Engineering and should have had some years' practical experience. Adequate training for this progressive executive position will be given and it is most important that the successful candidate should have the enthusiasm and ability to make the rapid progress envisaged by this Company.—Applications, giving complete details of education and career to date, to Box 909.

APPOINTMENT will fall to be made about July/August of Secretary to Hotel Company with Head Office in London. Applicant should be not over 45 years of age, admitted Solicitor, with Company experience. Letters will be treated in strict confidence and should state age and give particulars of experience and present remuneration, to Box 927.

PRINT and packaging buyer (32) presently engaged leading food manufacturers, seeks change where sound wide experience all purchasing and allied functions coupled with keenness, industry and initiative required and appreciated.—Box 895.

WOMAN ECONOMIST (30), seeks interesting post where extensive knowledge foreign countries, editing, press relations, research and general conference work can be usefully employed. Educated London (B.Sc.Econ.), Paris (Sorbonne), New York (Columbia post-graduate) Fluent English, French, Spanish, German, Russian.—Box 923.

BUSINESS EXECUTIVE with world-wide experience, fluent French, German, Spanish, seeks position entailing business journeys abroad.—Box 919.

OLD-ESTABLISHED highly reputable Company, with selling agencies abroad, has spare capital and some factory space available. Would like to meet man or small Company in need of finance and space to manufacture some commodity in demand abroad, preferably in dollar countries. Raw material must be readily available. Recommendation by Solicitors or Accountants would be required. Strict confidence.—Box 916.

CLOTHES LOCKERS, suitable factories, canteens, hostels, etc., any size and quantity to special requirements. Best timber only used.—Birney's Products Co., Swan Works, Fishers Lane, London, W.4. Tel.: CHIswick 6946.

PORTUGUESE Evening Classes, all grades. Term begins April 23rd. Summer Vacation Course at Coimbra University, July 14th-August 23rd.—Details from Portuguese Language Committee, 4, Upper Berkeley Street, London, W.1.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure: Economic Research Council 18, South Street, London W.1.

Carried unanimously

Some 50 Anglo-American Productivity Council Reports are unanimous in drawing attention to the importance of mechanical handling of materials.

To quote from one:

"We believe that substantial increases in production from existing plant and manpower in industry can be achieved by relatively little capital expenditure . . . . . by the current application of handling devices."

which echoes the statement of Mr. Cloud Wampler, President Carrier Corp., as quoted in "Factory," Oct. 1950:

"If I had just one choice as to technological improvements that could be adopted practically overnight to boost productivity, I'd take materials handling."

Pioneers of the small (diesel) fork lift truck—most versatile material handling machine available to industry.

Sheep, Not Lambs

A GOVERNMENT with a Parliamentary majority of a hundred would be disturbed by such a defeat as the Conservatives have suffered in the past week's county council elections. It is true that choosing county councillors is connected only indirectly with what people think of the nation's government at Westminster. But no amount of qualification can turn defeat into victory. For Ministers with a Parliamentary majority of only sixteen over Labour, it is acutely disturbing.

Three qualifications are important in an accurate interpretation of the defeat. First, the Conservatives had further to fall in the county elections than they have in Parliament. The previous councils reflected an outstanding Tory success in 1949. Labour was probably then in worse odour than it was on October 25, 1951, when the House of Commons was elected, and the Conservatives might, therefore, have lost some county council seats in the past week even if their support in the country was still quite as strong as it was at the general election. Secondly, all the efforts of the two big parties, and particularly of the Labour party, have still not made the county elections a pure reflection of national politics. Local issues retain some importance; even if they predominate in very few voters' minds, they may sometimes tip the balance and make waverers vote in local elections for the side they would still oppose at Westminster. And that is particularly likely to be true of dissatisfied Government supporters, who may be glad to register a harmless protest in the counties though they would not help Labour back to power at Westminster.

The third qualification is the most important. Labour has gained votes in the counties and the Conservatives have lost votes, but that is no evidence that many people have changed their minds. A party's success in local elections depends less on winning converts than on getting a good proportion of its known supporters to the polling booths. And the proportion is almost inevitably higher for the party that is in opposition at Westminster, the party that offers its supporters something to protest against, than for the government party. The change in the composition of the county councils reflects less the opinions of the British people than the fact that Labour was in power in 1949 and the Conservatives are in power now.

The county elections do not mean, therefore, that the verdict of last October has already been reversed. They do not prove that the Government has lost public confidence, that Labour could feel sure of winning a general election if one could be forced now. That is party propaganda, not statistical deduction. But the real significance of the results is great enough. When all the qualifications have been made, it remains true that the county elections could not have gone so badly for the Conservatives if there were not a real mood of dissatisfaction with the Government.

It is easy to see reasons why the Government was bound to lose favour with the public. Dearer food, higher fares, unemployment in

Lancashire and Yorkshire, import cuts and threats of greater austerity—all these things are little less disliked because they were in fact unavoidable when the new Government came into office last October. But the Conservatives will be unwise to shrug their shoulders and protest that it would all have been the same in any event. That is good logic but it is poor politics. The Conservatives can complain that Labour chose the right moment to get itself out of office; they can reasonably console themselves with the reflection that any Government is likely to be unpopular when it is coping with an economic crisis. But there are two other things also to be taken into account.

First, if ever there were discontents for which the government of the day should have managed to escape public blame, they are the discontents of the past six months. This is merely the other side of the proposition that higher fares, import cuts and the rest had become inevitable by last October. But it is the side that is hardly flattering to the Conservative party. It suggests a sharp failure in ministers' powers of political persuasion. If they cannot convince people that Labour is responsible for the hardships that immediately follow its six years in office, then there is nothing to come for which they can escape responsibility. At the best, political memories are short. From now on the weaknesses of the former government will be increasingly forgotten and any hardship or disappointment will produce proportionately more unpopularity for the Tories than has been reflected in the county council elections. If they have not escaped whipping in the past week, they must expect to endure flogging in the next twelve months.

The second consideration is no less disturbing for the Government. Not only is it allowing itself to be blamed for the consequences of the past, it has also so far failed to substitute any clear new policy for the old mistakes. The things that are making its supporters dissatisfied are not, for the most part, things that it has done. They are not the price of solvency, measures that will transform the British economy and within the possible lifetime of the Government remove the causes of dissatisfaction. The main charge against the Conservatives is what they have failed to do; they have disappointed the hopes of quick relief from austerity—hopes that much, though not all, of their election propaganda helped to create. The Tories baited the trap for themselves. They should be able to draw the plain conclusion now. They will not benefit themselves, even in the short run, by trying to meet criticism with further hopes of a miracle.

*

If ministers and their supporters in Parliament face these facts frankly, they cannot hesitate over the right course for themselves and for the country. They will not try to buy off criticism by rushing to relieve every cause of dissatisfaction. They will not try to arrest a growth in Labour's popularity by stealing more of their opponents' clothes and behaving themselves as a Labour Government might. Such a policy of concessions would perhaps be sensible if the Conservatives were losing popular favour because they had begun by embarking on a high Tory policy far to the Right of public opinion; it might be justified if they had undertaken a drastic economic policy that promised not merely to save these islands from insolvency but to do it with a margin in hand for contingencies. There are in fact no margins. In politics, the Tories have on balance tightened state controls over industry and have shown the greatest caution about disturbing the nationalised industries or any other creation of Socialism. In economics, they have taken the minimum of emergency measures that may stave off the immediate crisis—though the dollar deficit of $71 million in March was still perilously big and leaves the issue far from certain. They certainly have not as yet done much towards putting the British economy permanently on a sounder footing.

What, then, could concessions to popular feeling amount to? Should the Government seek to outdo the crudest of Socialist sentiments about soaking the rich by imposing a larger and yet more inequitable levy on "excess" profits? Should it put the draft Bills on steel and transport into pigeon holes? Should it restore the food subsidies—and drop the tax changes? Should it spend more on the health services than ever Mr Bevan did? Should it inflate money demand so that every man can, for a time, stick comfortably to the job he has? Should it slow down the defence programme still further? Should it squeeze industrial investment yet more tightly in order that consumption may increase? Should it go back on the credit policy that is in most industries the one strong weapon against further congestion of demand? Should it abandon as hopeless the programme to expand exports?

There are few of these things that the Government can think of doing at all. To combine even any two or three of them is entirely out of the question; it would invite swift and certain disaster for the country and incidentally for the Government. But if policy cannot be greatly softened, there cannot be even an immediate advantage in softening it at all. That would not sensibly reduce the present volume of dissatisfaction; on the contrary, it would encourage the Government's critics and confuse its supporters. If the Conservatives are unpopular after six months in office, nothing they can do will make them popular in the next two years. Minor concessions to shortsighted demands cannot offset the fact that all the time recollections of Labour's alternative mistakes will be growing fainter.

The lesson of the county council elections is therefore plain. At this stage, the Conservatives are bound to be unpopular. They should fully and honestly accept the fact. Their one hope of justifying the voters' trust in them last October is to set themselves to prove three years from now that they have given the British people new opportunities of wealth and better prospects of security. Since they have to be unpopular for the time being, it is political commonsense as well as national duty to concentrate on having something to show for it at the end. If they are to be hanged anyway, it may as well be for sheep as for lambs.

A government trying to prove that Tories are no longer Tories is defeating itself. If the British electorate decides again that it prefers Labour policies, it will vote Labour however much stealing of clothes has been done. The only type of success open to the Government is to show that there is a modern Tory policy which can in time get the country out of the frustrations of the past six years. The task of ministers is to do what they believe to be right and necessary for eventual safety and prosperity. As politicians frightened out of their own policies, they would invite slaughter; as courageous and competent statesmen, they may yet get the country's vote again.

Vendetta in Downing Street

DURING the last few weeks, British ministers have been scattering crumbs of comfort to their anxious audiences on the Continent of Europe. Mr Eden made an impressive statement to the Committee of Ministers of the Council of Europe which seemed to promise a new substance to the vague and over-worked concept of "close association" with European institutions. In another speech on April 3rd to the Foreign Press Association, the Foreign Secretary seemed at last to be subscribing to the solution that common sense has long demanded: "An inner European unity lying within a wider Atlantic unity, each interwoven with the other and each dependent on the other, is a prospect to which we can look forward with confidence." The previous weekend, Mr Butler had charmed and inspired his economic colleagues on the ministerial council of OEEC, leading them and the international press to believe that Britain was renewing its loyalty to the European, side by side with the Atlantic organisation. All this has sounded well and may have been meant well. But Europeans cannot so easily be flattered by fair words from Britain as once they could; they have learned to wait and see what action follows. And in the sphere of action, Britain is doing little at present to reassure its friends in Europe.

*

In the first place, there is the question of Britain's relationship to the proposed European Defence Community. The argument for the Schuman Plan is by now familiar; it is made up not so much of the merits of the Plan itself as of the dangers that will follow from its absence—dangers that were very clear a few weeks ago when recalcitrance in both the French and the German legislatures seemed to threaten its prospects. Then it was clearly seen that some sort of European army was a necessary means of holding the West European coalition together and in that moment of clarity British help in bringing it about was promised by ministers. But once the moment of crisis and clarity passed, the familiar sapping and mining started again at the official level. The desire of the French is to have an assurance that they will not be left alone in Western Europe with the Germans. As a minimum they ask for a British "guarantee" of the Schuman plan treaty. But they would be much better pleased by a British promise to provide some troops (by no means the whole of the British Army) for the European Defence Community, and to occupy a seat on the council of the community. And since British troops will in any event have to remain on the Continent for a long time to come, this would seem to the layman to be an easy concession to make. Towards a position of this kind, towards a definition in real terms of "close association" with the European Army, Mr Eden seemed to be moving in his speech to the Council of Ministers. But neither in that speech nor in subsequent discussions has he or his officials shown any signs of getting down to detail. The Foreign Office is picking away at the legal difficulties of defining a "guarantee" to the French, when if there was any warmth of feeling or elasticity of mind behind the promise of "closer association," they would have turned long ago to more active and positive means of giving the French what they want.

Another example of the same smallness of spirit can be seen in the question of the Organisation for European Economic Co-operation, whose future is now subject to one of the silliest compromises on record. To understand the story it is first necessary to know that for some time past the Foreign Office has had its knife into the OEEC. That this is so is a fact that one one connected with either body any longer troubles to deny. But if one asks the reasons, the only ones that can be discovered are almost inconceivably petty. They are compounded partly of the Foreign Office's dislike of anything European and partly of personal incompatibilities within the ranks of British officialdom.

The decision that the North Atlantic Treaty Organisation should have a full-fledged secretariat in Paris and that it should extend its activities into the general economic field would in any case call for some re-assessment of OEEC's work. Nato is now the British Government's favourite organisation, and its coming enlargement and translation to Paris were seized upon as an opportunity to give the *coup de grace* to OEEC, which was to be cut to ribbons. But the other nations concerned were insistent that some purely European body should continue to exist in the economic field. Clearly, the ideal solution was that OEEC should continue as, so to speak, Nato in special and restricted session, with some additional members, and that the same expert staff and the same national delegations should serve both. If that could not be done, the next best course was to define the ways in which, while remaining separate, they could assist each other. As it is, the decision has been reached to maintain two quite distinct international organisations, with separate staffs co-existing less than a mile apart, bumping and boring across each other's territory, with a waste of expertise and an expense of inefficiency. It would be wrong to suggest that British stubbornness was wholly responsible for this decision; there was opposition in other quarters to the right course of building a joint staff. But there can be little doubt that something much more sensible could have been achieved if the British had not been so determined that Nato should not be contaminated by any purely European economic organisation.

*

This squabble in itself is not very interesting to the public, which can never understand why officials get so worked up about the details of organisation. But it may go some way to explain to the puzzled British public—which knows only the benevolence of its intentions and the impeccable sentiments of Ministers' speeches—why British policy is now so widely distrusted in Western Europe. Most of the Europeans who have knowledge of international affairs, and almost all the Americans in Europe, believe that the British Foreign Office, for reasons of its own has sworn a vendetta against all forms of European co-operation. They do not trust the fair speeches of British ministers, because they think that any policy of "closer association" will be sabotaged in Downing Street. For a long time, the travelling Briton who heard these tales was inclined to pooh-pooh them, saying there must be some misunderstanding. Then as the evidence accumulated, it became the fashion to blame

the British attitude on to Socialist ministers' unwillingness to risk any disturbance to their precariously poised plans. But with the change of government, and with the spectacle of previously pro-European Conservatives suddenly singing a very different tune after they took office, one is compelled to admit that the Continentals are right. The Foreign Office has sworn a vendetta against Europe.

If one asks why, it is quite extraordinarily difficult for the outside observer to suggest a reason that begins to make sense. There was a time when it was necessary to resist attempts to push Britain into projects of European federation. But Europe's demands on Britain have radically changed in the last eighteen months. No one now asks Britain to surrender sovereignty to a federal institution, to hand over the main part of its army to the European defence community or to imperil its Commonwealth trade relations by any exclusive preoccupation in Europe. That battle was finally won at Strasbourg last summer. And since the point has been conceded, it is surely the obvious strategy to show how far Britain will go to help Europe once it is allowed to do so in its own way. Europe now asks that Britain shall name its own terms for the close co-operation and neighbourly helpfulness that it has always promised. But the Foreign Office fails to do so because it is dizzy with thinking itself the centre of "three concentric circles."

Yet if any concept is more foolish than "Britain imprisoned in Europe," it is "Britain excluded from Europe," which is likely to be the consequence of the present British tactic. Any plea for attention to the needs of Europe is, of course, likely to be misinterpreted in some quarters as a desire to turn the back on the North Atlantic conception and particularly on the Commonwealth. It is nothing of the kind. Even if the possibility of a European federation be totally excluded, even if Britain's relationships with the outer continents be given a clear priority, there still remain many topics on which it is to Britain's interest to co-operate as closely as it can with its continental neighbours. Defence is too obvious to be more than mentioned; but there are also several examples in the economic field. Recent events have shown how necessary it is to ensure that the liberalisation of European trade does not upset balances of payments; and that can only be done by the fullest readiness to discuss the impact of each country's economic policies on the others. The rationalisation of American aid to Europe is another case in point. The British pipe-dream that a special and preferential relationship can be built up between London and Washington has no reality whatever in questions of aid, where Congressional appropriations are needed, for Congress has made it clear that anything of the sort will simply be regarded as queue-jumping. For all these purposes a specifically European economic organisation is needed, and Britain should actively co-operate in it, instead of trying to kill it.

*

Nobody in this country relishes the task of criticising a department of state, as distinct from its political head. The task is doubly invidious when the object of attack is something as elusive as an attitude, a state of mind. Yet the dangers of the present position are so great that the conventions must be disregarded. The irony is that it is not only in Europe that there is distrust. If, of the three concentric circles, the European were being disregarded for the deliberate purpose of building up ever closer and more trustful relations with the United States or the Commonwealth, that would at least be a policy. But it is not so; the opinion of the conduct of British foreign affairs that is held in Washington, in Ottawa and in Canberra is no higher than in Paris, Rome or Brussels. British policy, as seen through other countries' eyes, is not extra-European or imperial or oceanic but isolationist. When the pressure of the Communist menace, which is now forcing the free nations to get along with each other, are relaxed there is a risk that Britain will fall between its concentric circles and find itself without a real ally in the world.

This is a danger to which the Foreign Secretary and the Prime Minister should direct their attention. They will find the key to the problem in Downing Street. But they may need a psychologist to help them find it.

The American Bases—I.

Training Grounds and Fighters

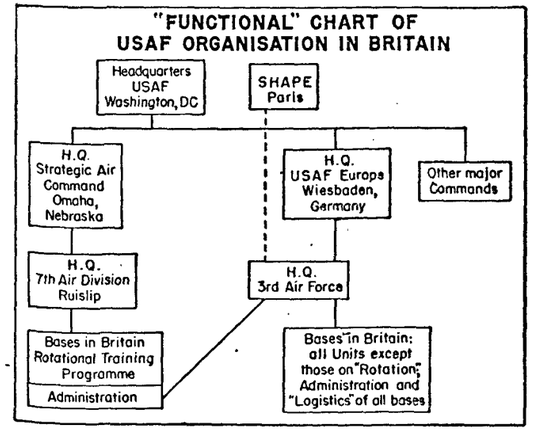
FEW things have attracted more glancing references and less serious discussion than the presence of an American air force in Britain. Mr Churchill has been franker about it than ever Mr Attlee was, and has shown a proper wish that no British susceptibilities should be offended. The communiqué issued after his Washington talks with President Truman made it explicit that operations from the American bases in Britain would be "a matter of joint decision" by the two governments. But even Mr Churchill, for all his emphasis on the essential role of the atom bomb as the present deterrent to aggression, has shrunk from directly relating this to the importance of the American bases here. It has been left to recent and authoritative American press reports to say that "the United States Air Force in Britain is in possession of atomic weapons of tremendous capability." The other aspect of the matter—the contribution of American fighters to the air defences of Britain itself—has been given even less public attention, though the Government spokesman in the air debate last month did say in general terms that the defences would be "woefully inadequate if we had not powerful allies in Nato."

This series of two articles is intended to set out such information about the American air strength in Britain as can be collected without breach of security and to consider its political and social significance. The force has grown by addition, not on a predetermined plan. Appropriately, it was the West's first effective act of determined resistance to Russian pressure—the Berlin airlift—that started it. The first American bombers to come to this country after the war arrived in July, 1948, as a result of a verbal agreement between Mr Ernest Bevin and the American Ambassador. There were 60 bombers in all. In the following August another 30 heavy bombers arrived, and the total number of servicemen, including the maintenance staff, was then estimated to be about 6,000. It became known as the 3rd Air Division and was put under the command of General Johnson, who led the air attack on the Ploesti oilfields during the late war.

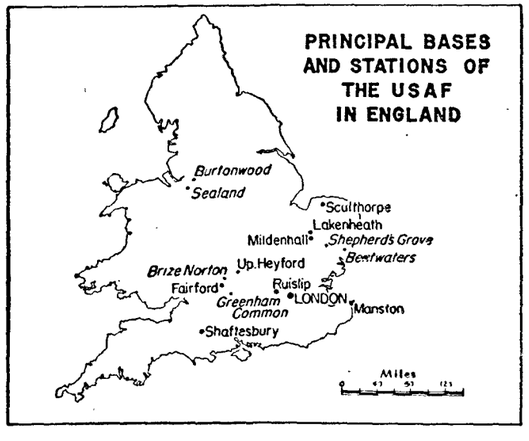
Less than a year later, on June 3, 1949, the strength of the division was officially estimated to be over 8,000 men. On July 24, 1950, Mr Attlee said in Parliament that it had about 10,000 men and 180 aircraft. On January 31, 1951, the Secretary for Air put the number at 15,000. At present it is estimated that it has risen to nearly 30,000 officers and men, stationed at 26 bases, depots and storage and supply centres.

Exact figures of the number of aircraft cannot be given. American press reports that there are "more than 200" bombers have been officially denied. It is known that, at times, as many as three bomber wings have been stationed here. Usually, however, the force does not exceed one bomber wing; an American medium bomber wing normally consists of 45 bombers and 20 "tankers" for aerial refuelling. The aircraft are both B-29s (known to the RAF as "Washingtons") and B-50s. The B-36s, the "biggest bombers in the world," are not normally stationed in England, though several of them have visited some of the bases on training flights from the United States.

The escort fighters, here for simultaneous training with the bombers, are Republic F-84 Thunderjets. Usually there is not more than one escort fighter wing in England, and the normal size of such a wing is about 75 aircraft. In addition, since August, 1951, a fighter interceptor wing has been assigned to England. It is equipped with North American F-86 Sabre jets, and would also normally consist of 75 aircraft.



It is generally believed that the USAF bases are concentrated mainly in East Anglia. Phrases like "the East Anglia American atom bases" have often been used in Parliament. In fact the force is deployed through much of England. There are three bomber bases in East Anglia, four bomber bases in Oxfordshire and Gloucestershire, two fighter stations in Suffolk (Bentwater and Shepherd's Grove), and one at Manston, Kent. In addition to these better-known bases, USAF units are stationed at several other RAF airfields. The two main supply and maintenance depots are at Burtonwood and Sealand, Liverpool. The headquarters are at Ruislip and Bushey Park. The main transit camp—the Americans call it "personnel processing"—is at Shaftesbury, Dorset. The accompanying map shows most of the principal bases, though there are several others whose location has not yet been officially revealed.



*

Since May, 1951, the American forces in Britain have been divided into two groups. The bomber force is now known as the 7th Air Division and comes under the direct operational control of the Strategic Air Command in the United States. Presumably it is this force, and this force alone, whose status was to some extent defined at the Washington conference. All the other American air forces stationed in this country are embraced in the 3rd Air Force, which developed from the 3rd Air Division, and which is controlled by the headquarters of the American air force in Europe (USAFE) at Weisbaden in Western Germany.

The relationship between Shape and USAFE (Wiesbaden) is not very clearly defined, at least so far as the 3rd Air Force in Britain is concerned. It appears that the 3rd Air Force is generally recognised as being in some sense "under Shape," but for administration purposes it is still very much under the Wiesbaden headquarters, which claims to be independent of Shape. This uncertainty may be removed in the reorganisation of all the USAF commands in Europe that is due in the near future. The 3rd Air Force in Britain is then expected to come more directly under Shape. In any event, it seems certain that Shape would be regarded as the "overall boss" in an emergency.

The bomber forces of the 7th Air Division are usually stationed in Britain for about three months, though some have stayed for as long as seven months. The main purpose is to make the crews familiar with the European area. The efficiency of an air force unit is known to be much higher if it operates in familiar conditions, and the Strategic Air Command therefore has a "rotational training programme" under which units are sent to areas where they might be expected to operate in case of

hostilities. Besides England, its training bases are known to be scattered widely over the Pacific, Alaska, the Caribbean and Labrador.

The 7th Air Division concentrates all its attention and efforts on training; administration, "logistics" and housekeeping at its bases are controlled by the 3rd Air Force. It is this force, not the bomber division which has attracted almost all the public attention, that is the steady core of American defence in Britain. All its members are stationed in England for what is called the "regular" period of overseas service—about three years. The fighter interceptor wing is here for the specific purpose of strengthening Britain's air defences —indeed, its Sabres are the only adequate aircraft at present available for action against bombers flying at the highest altitudes. It operates within the British defence system, controlled by the RAF Fighter Command. The 3rd Air Force has assigned to it some US Army groups, which include the 928th Engineer Aviation Group and the 32nd Anti-Aircraft Artillery Brigade. This brigade arrived in Britain in February, 1951, and is working in close co-operation with British AA units. There are also about 2,000 men of the American navy in Britain.

Two main conclusions stand out from this analysis. First, the American air forces in Britain are not here because they are poised to strike at an enemy in the east—as is often supposed by people who fully recognise that the motive is in any event defensive, not offensive. In fact the "atom bomb" bases have two more immediate purposes. They are training-grounds, and their fighter aircraft are an enormously valuable prop to Britain's air defences, which by any standards but those of the complete pacifist are otherwise quite inadequate.

Secondly, while the American forces in Britain are quite impressive taken by themselves, they represent only a fraction of the American military power at present deployed on this side of the Atlantic. Britain is not, to use a fashionable expression, "the American aircraft carrier in Europe." Only about 10 per cent of the American servicemen in the European area are stationed in this country. The expansion of the American military forces in Europe and in the Mediterranean is far greater than their expansion in Britain. When it reaches its intended peak—in about 1954—the forces in Britain will certainly represent much less than 10 per cent of the total. Moreover, the strategic importance of the American bases in North Africa, in Western Europe, and especially in the eastern Mediterranean outweighs considerably the importance of the bases in Britain. The notion on the Left that the Americans have "endangered" this country by making it the centre of their military effort in Europe has no relation to the facts. Britain is not quite so important as that.

(To be concluded.)

Genial Boss

IN the present month falls the thirtieth anniversary of the appointment of Joseph Djugashvili to the post of General Secretary of the Russian (later All-Union) Communist Party (Bolshevik). The duration of his power far exceeds that of any statesman of today, equals that of Nicholas I, the most despotic Czar of modern times, and approaches the periods of adult rule of the two great tyrants whom Stalin is known to admire—Ivan the Terrible and Peter the Great. Its extent dwarfs that of any who preceded him in the Moscow Kremlin or the palaces of St. Petersburg. Throughout the world today government is a more complicated task, and penetrates wider fields of human activity, than in the days of the Czars. But now, as in the past, the ruler of Russia excels all other potentates in his control over his subjects.

The dense clouds of incense that surround the "genial teacher of progressive humanity," ("genial" in its communist sense is the adjectival form of "genius"; it has nothing to do with affability) who aspires to lead the proletariat of the world, conceal the remarkable politician Stalin. From the scraps of documentary evidence and the glimpses offered by a few witnesses, it would seem that his success has been due above all to two talents: an extraordinary understanding of the machinery of government and an exceptional ability to manipulate persons.

Stalin was an important figure during the revolution and civil war, but it was when fighting ceased that he rose to eminence. He then held two major offices, the People's Commissariats of Nationalities and of Workers' and Peasants' Inspection (*Rabkrin*). Both had the advantage that no clear line could be drawn between their powers and those of other authorities. As Commissar for Nationalities, Stalin could make himself felt in the borderlands, and also in such strategically and economically vital regions as the Middle Volga and the Urals, largely populated by Tatars, the most intelligent and civilised of Russia's Moslems. His double duty—to protect the local populations from "Great Russian Great-Power chauvinism," and to defend the local proletariat (in most cases of Russian extraction) from "local petty-bourgeois nationalism"—enabled him to interfere with policy and personnel at all levels of all the various hierarchies created by the Bolshevik dictatorship. As Commissar of *Rabkrin* he was entitled to any information on the practical functioning of the administration for which he cared to ask. His officials could examine office archives, supervise public employees at work, spy on all, encourage denunciations, create or remove cliques and factions. A whole new bureaucracy was built to watch the already existing bureaucracy. Stalin's chances of patronage and intrigue were unlimited.

The key job, however, was the General Secretaryship. The Secretariat had been created by the 8th Congress of the Party in 1919, together with the Politburo and the Orgburo. While the Politburo handled political decisions, the Orgburo was responsible for the internal organisation of the Party and for personnel questions. The Secretariat was at first little more than a technical executive arm of the Orgburo. During the following three years the party's Central Committee lost power to these three executive bodies; the larger it became, the less real power it could exercise. During the same period the Orgburo lost power to the Secretariat. In April, 1922, the post of General Secretary was created, and given to Stalin. Thenceforth the General Secretary controlled appointments and internal organisation, while the Orgburo did little more than issue general directives.

The two supreme organs of the party were the Secretariat and the Politburo. Stalin dominated one and was a member of the other.

The creation of the General Secretaryship coincided with the illness of Lenin. Soon both the Bolshevik leader himself and some of his lieutenants realised how much power they had placed in Stalin's hands. Lenin himself, the ruthless bigot and master of lies and intrigue, was alarmed by the proficiency of his pupil. In his famous article "Better less, but better" of January 1923, Lenin wrote of Stalin's Commissariat of Inspection—"Everyone knows that there is no institution worse organised than our *Rabkrin*." In his "Testament" of December, 1922, and the additional note to it of January, 1923, he wrote harshly of Stalin, and recommended that he should be replaced as General Secretary by someone "more patient, more loyal, more polite, more attentive to comrades, less capricious, etc." In March, 1923, he decided to "break off all comradely relations" with Stalin. He planned to attack him at the impending 12th Congress.

★

Stalin escaped partly by luck and partly by skill. The luck was the collapse of Lenin a few weeks before the Congress met. Stalin's skill was shown in his handling of the Congress. He accepted Lenin's criticisms of *Rabkrin* and produced a plan for close co-ordination between it and the body created in 1921 to perform similar supervisory functions within the Party itself—the Control Commission. The result of the co-ordination was that Stalin manipulated both bodies. In the following years the same process took place within the hierarchy of control commissions as had previously occurred within the Central Committee of the Party. The Central Control Commission had 7 members in 1921 and 150 in 1924. With a membership of this size, it inevitably came to be controlled by its Presidium, whose leading members were Stalin's confidants. One of these, Shkiryatov, has survived to the present time. He must know more than any living man of the dark secrets of his master, and sometimes enjoys at public ceremonies in Moscow the same precedence as members of the Politburo.

At the time of Lenin's death Stalin controlled through the Secretariat all important appointments within the party, through *Rabkrin* the supervision of the state hierarchy, and through his men in the Central Control Commission Presidium the supervision of the party hierarchy. Thus he managed both the regular bureaucracy of the party and the special bureaucracy set up by the party to control itself. He was at once shepherd, sheep-dog and wolf. Even so he might have failed but for the quarrels between his rivals. In the summer of 1923 Zinoviev and Kamenev had discussed with other leading Communists, in a cave in the Caucasian holiday district of Kislovodsk, measures to diminish the powers of the General Secretary. Stalin had circumvented their manœuvres. Soon afterwards the struggle with Trotsky had forced Zinoviev and Kamenev to make Stalin their ally. In May, 1924, they persuaded the Central Committee that Lenin's request for the removal of Stalin from the General Secretaryship need not be fulfilled.

Neither they nor their enemy Trotsky realised what was happening while they wrangled. Trotsky, one of the great personalities of the twentieth or of any other century, never understood the role of personal factors in politics. Himself an outstanding administrator, he never understood the importance of the administrative machine. All he could do was to rail at the wickedness of bureaucracy. His tirades did not save him. When the turn came of his inferior in rhetoric, the demagogue Zinoviev, he, too, was crushed. By the end of 1925, when the 14th Congress met, Stalin's position was impregnable.

★

This is no place to discuss what Stalin has done with power. This is not the thirtieth anniversary of any policies, but rather of a man's rule over men; the victory to be commemorated is that of a technique. It is a technique of bossdom. Stalin is the greatest party boss of all time, greater than Crassus, Walpole or Tweed; a boss of genius, or, to use the present idiom of his compatriots, a Genial Boss.

The machinery by which he climbed, and the power that he has held and holds, are discernible at least in outline. But how he did it remains a mystery. To explain that he built a series of bureaucracies and packed them with his men is no real answer. It is not easy to pick men and bind them to one, to know whom to help and whom to discard at the right moment, whom to reward for service and whom to unmask as a counter-revolutionary diversionist. This is an art, which combines the right proportions of flattery and blackmail, remoteness and *bonhomie*, which appeals in turn to patriotism and cupidity, ambition and terror, honour and treachery. The practice of this art has put Stalin where he is, but its workings are withheld from the historian's eye.

The secret will certainly not be found in the direction in which Marxists delight to look—the "class origin." It is a curious coincidence that the three men who have plagued our generation have a similar origin. The cobbler of Gori, the blacksmith of Forli and the customs official of Braunau all belonged to that drab grey border zone between the petty bourgeoisie and the proletariat. Their sons grew up to be semi-intellectuals, with no fixed profession but with pretentions to artistic or philosophic eminence. In ability to handle men the Tiflis observatory clerk far surpassed the Vienna house-painter or the Italian schoolmaster. Hitler and Mussolini surrounded themselves with charlatans; Stalin has been well served by able men, and his Olympian ingratitude has not prevented him from replacing them by others as loyal. The other two let loose on humanity disasters which swept them away and their nations to ruin: Stalin has made monumental errors, but he has not let control over events slip for long from his hands.

General Secretary is a less resonant title than autocrat. Though his name is now surrounded with a pomp and flummery that have hardly a parallel even in the annals of Byzantium, Peking or Bagdad, Stalin himself shuns the eye of the public. But of the reality of his power there can be no doubt. What Soviet Russia is, he has made it. The immense network of the Communist Party, the myriad factory chimneys of the Urals, the bleached skeletons that pave the roads across the arctic wastes, are his work. When his time comes, his passing may have good or bad effects: it will not be unnoticed.

NOTES OF THE WEEK

Cairo and the Sudan

The past week has nearly seen the Anglo-Egyptian conversations in Cairo come to a full stop. The mood of optimism, created by the improving conditions in the Canal Zone and a feeling that the British and Egyptians were edging towards agreement in principle on defence and evacuation, was shattered by news from Khartoum before the week-end. There, a draft constitution for the Sudan had been tabled without any preparation for its effect on Egyptian opinion. It is felt in Cairo that the action of the Sudanese Administration and the nature of the new constitution challenge the whole Egyptian position—in particular King Farouk's claim to be King of the Sudan—and cast serious doubts on British good faith. Great efforts have been made to get the talks moving again. But, although both the present British and Egyptian governments give the impression that they are now committed to eventual agreement, further progress seems bound at least to be delayed. Meanwhile, anxiety about public order in Egypt and the safety of non-Muslims as well as foreigners is again beginning to grow.

The Sudan represents an even more intractable difference between the British and Egyptians than the defence of the Suez Canal. As the trend of the Cairo talks suggests, it should not be inherently impossible, given good will, to devise a military formula with the aid of other countries which would both ensure the adequate defence of the Canal and satisfy Egyptian aspirations about British withdrawal. But the future of the Sudan strikes down to the roots of both British and Egyptian sentiment. It would be almost inconceivable for British public opinion to agree to any solution that meant forcing the Sudanese to accept Egyptian sovereignty against their will. The Egyptians, all question of prestige apart, fear that a hostile government in Khartoum might interfere with the flow of the Nile.

In the Middle East as a whole, there is now a rising tide of xenophobia. By reaching what is widely regarded as a stalemate with the British over the Canal question, the Egyptians, unpopular in many other ways, have won much applause. But there still remains a hope in some quarters that the British may yet do something to regain the respect in which they were once held. The opportunity for this exists only in the Sudan. The British gained immense goodwill in Asia by leaving India and Burma when and how they did. Although it is not so easy to leave the Sudan, they must and will do so within the foreseeable future. If so, there is much to be said for the idea that the Egyptians and Sudanese should be enabled to discuss and reach agreement on their common problems—and in particular the control of the waters of the Nile—before, not after, the Sudan is committed to any new status.

* * *

Ten Out of Ten for M. Pinay

France now has a budget, and M. Pinay ten votes of confidence and a great achievement to his credit. That the economics of his budget are highly speculative is scarcely relevant to the political importance of its existence. Revenue estimates are inflated in expectation of higher prices; expenditure has been estimated in the hope that prices will in fact be kept down. There is a balance only on the assumption that the public will lend to the government, which in turn depends on the government keeping inflation at bay. But this is not the moment for economists to carp. Far more important than a good budget was to have a budget at all. For the content of this or any other budget will really be determined by the solution of France's basic economic problems, especially tax evasion and rising prices; and these in turn required a respite for M. Pinay which could only be gained when a budget had been passed.

For success in these wider fields, the Prime Minister still has much in his favour. The country as a whole is still more inclined to trust him than anyone else. There is a growing agreement with him that prices not only must but should be made to fall, and that agricultural prices particularly are unnecessarily generous. He has the Assembly's vote of confidence for the tax amnesty which was an essential preliminary to any subsequent programme of tax enforcement. And he has his own determination to get such a programme through by June.

Against him, on the other hand, he has some formidable factors. Only last week, food prices in Paris were given another vicious upward twist, and public confidence in him received its first rebuff just when he was acquiring a position of parliamentary strength. Secondly, that position itself has its own weaknesses. Like the Socialists with the previous, more moderate, coalitions, the MRP now find themselves torn between supporting a government of the Right and voting against the government which could save the Fourth Republic. This time, twenty of them voted for M. Pinay and the rest led their troubled consciences to abstain with some of the Gaullists. M. Pinay is too wise not to see that in the longer run this conflict in one of the largest parliamentary parties cannot bode well for the parliamentary republic. Then, there is always the possibility that though he may keep a majority for his own programme, he may well lose on such legacies as the sliding wages bill. Finally, there is the cost of all this to the man himself. Rumour has it that saving the franc and the Fourth Republic removed 10 lb in forty days from M. Faure and 4 lb from M. Pinay (the leaner man) in thirty. Nothing can prove more eloquently the need for a constitutional reform.

* * *

Opposition by Delay

Parliament is taking its short Easter break with the prospects of fiercer battles when it returns. The finely balanced House of Commons has become a severe testing-ground for the skill of both Government and Opposition. In the last Parliament, the problem for the Government whips was mainly the administrative one of keeping their exhausted members within the precincts for fear of a snap division. The Government had, after all, little that it wanted to do. The Conservatives have a large enough majority to be free from perpetual anxiety, but they have a legislative programme; to carry it out is proving to involve a battle of wits and procedure calling for Parliamentary leadership of the highest quality. Mr Crookshank, the Leader of the House, is facing a highly skilled, if not highly disciplined, Opposition. Its main objective is to ensure that the Steel Bill and the Transport Bill, when these are ultimately tabled, are held off the statute book as long as possible.

That is not discreditable. Delay is one of the oldest of Parliamentary weapons and much of the apparatus of modern procedure—the closure, the guillotine, the kangaroo—has been devised to cope with it. Every Opposition uses delay. The Conservatives fought, for instance, a very skilful rear-guard action on the Steel Bill and on the Gas Bill even when the majority against them was that of the 1945-50 Parliament.

The reason why delay is a more formidable weapon now—and therefore open to abuse if the Opposition is unscrupulous—is simply the composition of Parliament. The Tory majority is adequate to avoid defeat in the whole House, but it cannot ensure victory in the standing committees, on which the Government's majority is only one. This means that the committee stages of all major legislation must be taken on the floor of the House, a procedure very costly in Parliamentary time. In any ordinary session, the task of getting complicated and controversial Bills through a committee of the whole House would be considerable. In a session which has started late and which was interrupted by a lengthy Christmas recess it is formidable. Despite the advance of the Budget and the Finance Bill by a month, Captain Crookshank has perilously little time to spare for the two major denationalisation Bills dealing with steel and transport. And he is therefore highly vulnerable to delaying tactics by the Opposition.

* * *

Parliament's Timetable

With the Opposition plainly bent on delaying it as much as possible, ministers can hope to get their legislation through only by careful—and flexible—planning of the Parliamentary timetable. By curtailing the Whitsun recess, the Government whips can count on some 64 sitting days between Easter and the end of July. Much of this time is already mortgaged. Seventeen days must be used for Supply debates, ten for private members' bills and motions, and perhaps ten for the Finance Bill. There are half-a-dozen minor bills, such as the Dentists Bill and the Housing Subsidies Bill, which will occupy an average of a day apiece at the least. There is still the prospect of a Monopolies Bill; the BBC charter must be debated; the House must consider the report of the select committee that is examining the relations of Parliament with the nationalised industries; the Civil List has yet to be dealt with, and there must be days for general debates—on, for instance, Germany and the Lisbon decisions. Labour will certainly claim the right to move in committee of the whole House a number of amendments to the Steel Bill comparable to those moved by the Tories during the discussion of the original Steel Bill in standing committee in 1950. The Bill will also have to go to the Lords in reasonable time. In short, the Government will have to display more skill and have more luck than in recent weeks if it is to get the Steel Bill through by the end of the summer, let alone the Transport Bill. Already, the chances are strong that the session will run on into November or December.

Labour's appetite for this battle has been whetted by its victories in the county council elections, which have restored the party's morale after the shocks of the Bevanite dispute. The effect on the Tories at Westminster has been to increase the backbenchers' impatience for more drastic action. Though last week the 1922 Committee had agreed to support the Government timetable under which the Steel Bill will be taken before the Transport Bill, there is strong feeling about the need to liberate road transport. The backbenchers' impatience is natural, but it seems doubtful whether those who are most strongly pressing the Government to get on with denationalisation have weighed up all the political complications that might follow.

In the weeks ahead, the Labour party will fight with a massive array of amendments and new clauses, and the Government will retaliate with its weapon of closure. This is all part of the Parliamentary process, but it will certainly hold back the denationalisation statutes—and it may seriously weaken the self-confidence of one side or the other.

* * *

Defence for Textiles

Monday's debate on the second reading of the Finance Bill was mainly concentrated on the excess profits levy—the dangers and inequities of which worried chiefly the Conservatives—and on the need to help the textile industries—a cause which appealed to members on both sides of the House. The Government went a little way to meet both sets of critics. Mr Boyd Carpenter promised that the Government would consider any proposals that might be made during the debate for a third way of calculating standard profits that might make the levy less inequitable. And Mr Butler offered a little first-aid for the textile industry.

The Chancellor rightly rejected the appeals from members on both sides of the House that he should remove the purchase tax from textiles. Not only would this cost between £80 and £100 million of revenue, but it would mean that any industry in difficulties would feel that it had a right to the same treatment. It would not, in any case, solve the industry's problems, for tax-free goods have not been exempt from the slump in recent months. As for a tax-free holiday for a limited period, that would merely add to the uncertainties of the trade and invite another recession later. The aid Mr Butler did offer is small, but it is certainly better than removing purchase tax. By bringing forward some £25 million of textile orders for defence the Government will provide employment for about 25,000 or 30,000 workers, compared with about 100,000 who are now unemployed; and by the time they have finished their defence work, demand in the home market may have revived—though by promising to reconsider some of the details of the new purchase tax in the committee stage of the Bill Mr Butler has given retailers an inducement to put off new orders to the industry as long as they can.

Mr Butler was "insulted" when Mr Gaitskell asked him whether he thought the level of unemployment was high enough to secure a movement of workers to defence. In fact he certainly ought to have thought about it; the manpower for rearmament has got to come from somewhere. The case for special measures to help the textile industries is not, as even their more intelligent spokesmen have been urging, that otherwise their workers will find new jobs. The real case is that unemployment is wasteful where—but only where—the workers cannot fairly easily be absorbed into defence or export work. The Government's special orders of textiles for the Services will weaken the Budget by reducing the surplus, but they have the merit of doing that in a specific form, not by inflating demand in general, and will therefore do the minimum of harm to the economy as a whole. In a sense, unfortunately, they are too specific: they may help the Yorkshire woollen industry a lot, but the benefit to Lancashire will be small. It could certainly be made to look trifling beside the orders for British textiles that may be brewing in the East, and whose propaganda value to the Communists could be very great.

* * *

Moscow Curtain-Raiser

When the curtain rose on the Moscow economic conference last week the foreign delegates found that the stage had been prepared with meticulous care. The authorities had even thought of providing a boost for retail sales, so that foreigners would see the Russian people flocking to the shops in contrast to their own people who have recently been reducing their purchases. The technique was simple. On every March 1st since 1949 the Soviet Government had reduced prices of consumer goods, until this year, when March 1st came and went and prices remained unchanged. Even the Soviet budget gave no definite promise. The surprise came on the eve of the conference; prices, chiefly of foodstuffs, were reduced quite sharply—so sharply that according to one estimate the cost of living was cut by between 5 and 10 per cent.

The Soviet authorities have also shown their skill in other directions. They have apparently watched with interest the growing unemployment in the British textile industry, and dangled a carrot before the British delegation—that China is a large untapped market for Lancashire textiles. Lord Boyd-Orr nibbled at the carrot and hastily cabled London

to tell them what it tasted like. The Board of Trade has decided not to send out officials to inspect it. A carrot with just the same reddish tinge was displayed in the House of Commons during the recent debate on the textile industry. But Moscow went further. It showed how in 1950 nearly 80 per cent of China's imports came from, and 70 per cent of its exports went to, "capitalist states." In the first nine months of 1951 only 30 per cent of China's imports came from the "capitalist" world, and only 22 per cent of its exports went there. This decline in trade with China, the Russians pointed out, hit Britain most severely because of Britain's investments and financial interests in the Far East. They even hinted—and it was no more than a hint—that a resumption of trade on its previous scale might lead to an agreement on compensation for British investments taken over by the Chinese Government.

All this is perfectly true. An increase in trade between Britain and China could help both countries. But does China really want British textiles? If it does, why has it not bought them? There is no embargo on the shipment of textiles to Communist China, and most British exporters would be glad to experiment with a new market. For China, British textiles are merely a bargaining point. Its offer to take large supplies may be sincere, but only if certain strategic materials are sent as well. The carrot has certainly a bitter core.

* * *

Tanjong Malim

Although General Sir Gerald Templer, the new High Commissioner in Malaya, has now been widely congratulated on his quick grasp of the Malayan problem, doubts have already arisen about some of the methods he is adopting to solve it. There have been three distinct innovations under his rule. The little town of Tanjong Malim has been collectively punished for a prolonged series of Communist incidents in the neighbourhood, culminating in a particularly heavy casualty list after the ambush of a party going to mend a water pipeline. The occasion of the punishment has been used to send a thousand special questionnaires to householders, asking for information about Communist organisation which may be given anonymously. And now there comes news that equipment has been ordered in Britain for spraying the Communists' food-growing plots with hormone plant killer from aircraft; the same chemical is reported to be destined for use on roadside verges to kill vegetation from which hidden Communists launch their ambushes.

The idea of collective punishment is not new in Malaya, but this is the first time its penalties have been so severe and so strictly enforced. Its effectiveness has yet to be proved, and this may well depend on other measures taken simultaneously by the concentration of security forces in and around Tanjong Malim. Security is now the Government's prime task. Until protection can be given to people who oppose the Communists, the government cannot expect full support. It would be hard, however, to condemn the administration for also taking the action it has against the citizens of Tanjong Malim. For months, many people have been begging it to be firm and, if need be, ruthless. During the past few weeks a new spirit of determination has been felt in Malaya, and if one of the first acts of the new regime is to apply sanctions against a group of people, some of whom almost certainly deserve much greater punishment, it should certainly have the benefit of any doubt about the propriety of its decision. On purely utilitarian grounds the verdict must be postponed until clearer results can be seen. On moral grounds, the action at Tanjong Malim must rank for the moment among other police measures required to protect the community from murder and violence.

As to the probable success of the experiment, General Templer's ingenious questionnaire may yet provide one key to the riddle. If people can be induced to give information without revealing their own identities and so marking themselves down for Communist reprisal, an entirely new stage may have been reached. Already in Tanjong Malim answers to the questionnaire appear to have led to several arrests. As General Templer once said with some warmth, if he could secure the full co-operation of the Chinese, Malay and Indian communities as a whole for only three weeks, he could virtually end the emergency. If the method of punishing Tanjong Malim does not leave a lasting resentment behind it, this means of providing information may prove an acceptable compromise between opposition to the Government through fear and the voluntary public co-operation which has unfortunately proved so dangerous.

* * *

China Stiffens the Home Front

China has now been at war in Korea for a year and a half. Indeed since July, 1937, there has been less than one year during which China has neither been at war externally nor divided by civil war on the mainland. The Chinese have thus come to regard a state of war almost as the normal condition of life; and there have so far been no indications that the Communist regime is under any popular pressure to make peace or that it is itself in any hurry to end a state of affairs which does not threaten its survival, but enables it to justify everything it does on the plea of war emergency and to explain all failures and calamities as due to the malice of foreign enemies.

The use of the bacteriological warfare propaganda stunt internally in China is indeed quite typical of the current methods of the regime. An increase of disease in China (one of the last countries in the world to adopt modern institutions of medicine and hygiene) has been an inevitable consequence of the fact that the majority of foreign doctors have left China and that many of the few qualified Chinese doctors have emigrated or been arrested as counter-revolutionaries. But one of the main lines of Communist propaganda has been that the previous regime in China never did anything for public health in China and that the People's Republic is looking after it for the first time. The discrepancy between propaganda claims and the fact of large-scale epidemics could hardly be explained without the saving device of American "germ warfare," which acquits the authorities of all responsibility. Elementary instructions in hygiene are now given on the radio with the assurance that "under the leadership of the Chinese Communist party and the People's Government the Chinese people can conquer bacteriological warfare."

China today is indeed a country living on two utterly different levels of capacity. On the military plane, with armaments which have been lavishly supplied by the Soviet Union over the past year, China can now really count as a great power, but in economic and civilian life the country remains at a primitive stage from which it has no early prospect of emerging. Even with abundant economic aid from the west it would be a long and arduous task to raise the standard of living of the Chinese masses to any perceptible degree, and, having cut itself off from such sources of help, the present regime can do little to fulfil the hopes of rapid progress which it has inspired. But with Soviet military equipment and the largest manpower available to any nation in the world, it can pursue a truculent and adventurous foreign policy and counteract disillusionment over the non-arrival of its promised millenium with ever-increasing doses of chauvinism and xenophobia. The recent stepping-up of Chinese military aid to the Vietminh in Indo-China is symptomatic of the state of mind of a regime which has hitherto enjoyed military success out of all proportion to its own inherent strength.

The County Elections

It was not possible, when this issue of *The Economist* went to press, to give a full analysis of the results of the county council elections. The swing to Labour has been much greater than was expected, although only in a few significant cases has the control of a council passed into Labour hands. In many counties, especially in rural areas, party politics are still viewed as an unwelcome innovation, and on such councils the position of independents or Conservatives or (where danger seemed to threaten) of a combination of the two was too strong to be more than slightly shaken by the Labour attack.

Labour gained its main successes in Lancashire, the West Riding of Yorkshire, and in Greater London. It won back Essex, came close to recapturing Middlesex, and registered substantial gains in Surrey and Kent. Many of the suburban areas which swung to the Right at the 1950 general election appear to have renewed their faith in Labour.

The most remarkable result was the size of Labour's victory in the election for the London County Council. The mere fact that Labour has been in control of London ever since 1934 might be thought to predispose Londoners towards a change of administration. The Conservatives also had telling points to make on the losses incurred by civic restaurants, on the unpopularity of comprehensive high schools, and on the length of the waiting list for dwellings. So far as local issues were concerned, they had every reason to expect a victory. In fact, Labour increased its representation from 63 to 92 (more than it had hoped) and secured a majority of 55. It would seem that the London electorate voted almost entirely on issues of national policy and ignored the matters that their votes actually decided.

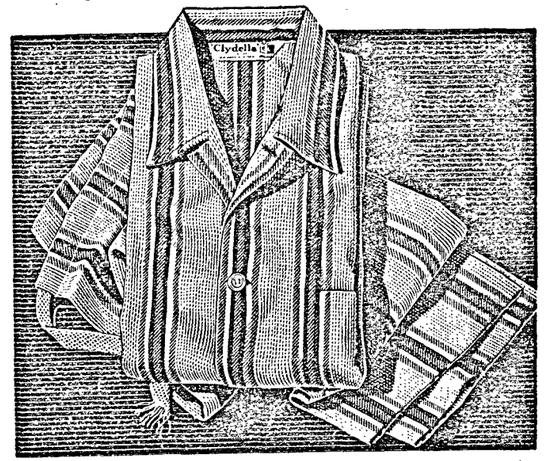
Labour Probes its Thoughts

The main struggle over the Labour party's policy and leadership has now shifted from the House of Commons to the constituency parties, and the National Executive Committee is trying to respond to this situation with an important experiment. It has published this week a discussion pamphlet on "Problems of Foreign Policy," and with this has gone out a letter from the general secretary to all the constituency parties and affiliated trade unions. According to Mr Phillips, the executive wants to have "the personal opinion of every member of the party"—on such questions as "Can Germany be permanently neutralised?"—and the executive intends to be guided by the opinions expressed.

The executive's own statement on foreign policy will be submitted to the party's annual conference at Morecambe on September 29th. In the meantime, the rank-and-file opinions on other matters will also be considered. The executive intends to publish and circulate discussion pamphlets on the social services, socially-owned industry, private industry, agriculture and the Commonwealth. Constituency parties will be asked to discuss and submit their conclusions on each of these subjects and to encourage trade unions and other affiliated bodies to do likewise. Mr Phillips hopes that they will all support "the greatest experiment in democratic expression and decision that has ever been attempted by any political party anywhere."



Such flamboyancy should not be allowed to conceal the real importance of this attempt to formulate Labour opinion. Stalwarts of the party may want to remind Mr Phillips that its constitution was designed to ensure that the wishes of its members were not only heard but carried out, but no one can pretend that this has worked well. The constituency parties have submitted their resolutions to the party's annual conference and pleaded for their acceptance. The party's policy has often been decided, or has suffered important changes, as the result of this process. But it has become increasingly unreal. The resolutions submitted to annual conferences have tended recently to fall into three distinct categories—those which favoured the policies of Mr Bevan, those which favoured the policies of the party executive as a whole, and those which advocated the impossible. To try to get down to the party's opinions and attitudes on specific matters does provide a possibility of escape from the stock and arid controversies in which the only real choice for most of the party is whether to take the side of the party leaders or the side of the perpetual rebels. But it seems too much to hope that by this experiment the leaders can, as they no doubt wish, short-circuit the Bevan controversy by transforming the party's annual conference from the battleground that it has become into the forum that it used to be and ought to be again.

Death Blow to Beveridge

The significance of the new rates of national assistance announced this week is that they have outstripped the proposed new rates of national insurance benefits, which are to be 32s. 6d. for a single person and 54s. for a married couple. In practice the insurance benefit has been below the full subsistence level ever since the social security scheme was introduced in 1948, because the Assistance Board's scale rates, shown in the accompanying table, are exclusive of rent for which an additional allowance, usually amounting to the actual rent, is made. But the problem of determining a rate of insurance benefit that would cover subsistence including rent—which differs so much from one part of the country to another—has never been satisfactorily solved. What is completely at variance with the principle of the Beveridge report, and the Government schemes based on it, is that the insurance benefit should fall below the cost of food, fuel and clothing.

F2/1

The Beveridge report did, it is true, propose that for a transitional period old age pensions should be below the subsistence level. The first break with the Beveridge principles, therefore, occurred when the Coalition Government, and later the Labour Government, put pensions on the same level as other benefits at considerable cost to the Exchequer. The second break was made a year ago when the Labour Government increased retirement pensions for the older pensioners to the new subsistence level and left other benefits at the old basic rate of 26s. a week. But this anomaly is being ended by the present Government, and it

was hoped that the new basic benefit would be high enough to cover subsistence. The Assistance Board now announces that the rise in prices since last autumn, together with the prospective rise resulting from the cut in the subsidies, justifies the proposed scales. They mean that the cost of subsistence for a married couple with three children aged, say, 12, 8 and 3, paying 12s. rent, is calculated at £5 11s. 6d. a week. Since people on assistance are allowed to earn up to a pound a week without having their assistance payments reduced, a family on assistance may receive nearly as much as the lowest paid workers in full-time employment.

Amnesty for Greek Rebels

Almost all parties in Greece have been agreed that some measure of amnesty towards those imprisoned as a result of Communist insurrection was essential for the permanent pacification of the country. The argument has been over the extent of the amnesty. The "pacification and leniency" Bill finally passed by the Greek National Assembly last Monday seems to lean as far towards a general amnesty as any Greek Government not of the extreme left could be expected to go. It commutes the death sentences passed on 2,000 rebels and will probably lead to the release of about 5,000 others.

General Plastiras, the Prime Minister and leader of the EPEK, has always been in favour of as wide an amnesty as would be consistent with national security. Many people in Greece, however, think that he has gone too far. They feel that the bitter personal enmities created during the civil war will prevent many of those released from returning to their own villages; and that if they remain in the towns they will find it hard to get employment and easy to drift back into the arms of the Communist underground. This is a genuine danger. It can only be hoped that the authorities will do what they can—which admittedly may not be much—to assist the reassimilation of these people. The Government has also been accused (not least within its own ranks) of inconsistency in pushing through the amnesty law just after it has allowed the execution of four Communist spies. Such charges of apparent inconsistency are bound to be the fate of a Government which is trying to pursue simultaneously policies of conciliation towards past enemies and of firmness towards present ones.

The Greek Government has chosen a particularly turbulent moment in its career to push through this controversial measure. The chief opposition party, the Greek Rally, has since March 27th been carrying its opposition to the length of absenting itself from Parliament in protest against references to its leader, Field-Marshal Papagos, contained in an Order of the Day issued by the Minister of Defence, Vice-Admiral Sakellariou. The resignation of the Admiral has failed to bring the Greek Rally back to its seats in Parliament. It is, in fact, clear that the present Government is being subjected to an all-out attack by Field-Marshal Papagos, who is pressing hard for new elections under the majority system. But last week's appeal by the Greek General Confederation of Labour for an all-party government to solve the country's economic, social and political problems suggests that his fanatical refusal to collaborate will do his cause no good.

Tangerine Troubles

Reports that British troops in Gibraltar were standing by last week in case they were needed in Tangier must have been for many people a startling reminder of this country's share of responsibility for the little international zone south of the Straits. The Sultan of Morocco exercises suzerainty over Tangier, and it was therefore hardly surprising that the town was affected by the demonstrations staged throughout Morocco on March 30th, the fortieth anniversary of the establishment of the French protectorate over the country. But the violence of the rioting in Tangier was clearly unexpected by its small mixed police force, which at present is commanded by a Belgian, or by the administrator of the zone, who is Portuguese. It is difficult to explain why this international community should have become the victim of what was primarily an anti-French outburst. There would seem, however, to be some significance in the fact that a number of residents who wanted to protect their property from the rioters promptly hung out Spanish flags.

Spain, which made itself virtually master of Tangier from 1940 to 1945, has never been satisfied with the agreement reached in the latter year, under which the zone was restored to the international status it had enjoyed for some fifty years in substance and since 1923 in form. It is true that the 1945 agreement was a provisional one, which was only intended to last until a full conference of the interested governments could be held. No such conference has yet been convened, and there is some reason for this week's suggestion by the Spanish Foreign Ministry that steps should be taken towards a revision of the status of Tangier. But the Spanish argument that the 1945 agreement has now lapsed can scarcely be accepted; and if the Spaniards had wanted their new approach to find a welcome on all sides, they would have done well to avoid making it at a moment when France is not only beset by a sea of troubles in North Africa, but is highly suspicious of Spanish manœuvres both in Morocco and in the Arab world generally.

Ireland's Austerity Budget

In the Irish Budget last week, expenditure was estimated at £101 million and revenue at £86 million. Mr MacEntee closed the gap by slashing the food subsidies and by higher taxation. The subsidies on sugar, butter and tea were withdrawn and the subsidies on bread and flour were reduced. Income tax was increased by a shilling to 7s. 6d. The price of petrol was increased by fourpence to 3s. 6d. a gallon, of cigarettes by sevenpence to 2s. 4d. for twenty, of stout by threepence to 1s. 3d. a pint and of whisky by sixpence to 3s. 6d. a glass. There are reliefs for smaller income-tax payers and increases in children's allowances, old age pensions and unemployment benefits. A programme of

Scene reconstructed by Ray Carnon

TO THE MECHANICALLY MINDED, 1895 was an exciting year. In spite of stringent Highways Acts, people were driving the first few horseless carriages on the public roads—frequently without the man with a red flag who should have preceded them and exceeding the speed limit of 4 m.p.h. British engineers were building their first cars; a new industry had been founded. And that same year the foundations of another great enterprise had been laid. At Tovil, Albert E. Reed had begun to make super-calendered newsprint at his first paper mill acquired the previous year. Successfully reviving other mills, he was soon to be known as "the Wizard of the South" and to build up an unrivalled reputation as a manufacturer of super-calendered printing papers, including newsprint. From this beginning, not sixty years ago, has grown the vast paper-making enterprise of the Reed Paper Group, producing today an ever-increasing tonnage of British newsprint and the largest output of Kraft paper in the whole of Europe.

The waterfront of Reed's Aylesford mills on the River Medway

capital investment totalling £35 million is dependent on the response to a new loan.

The public reaction has been sharp. It is true that the new standards of taxation are still below the British levels. But the Irish taxpayer is being introduced to austerity without any prior conditioning; and he argues that he has neither a war nor a rearmament programme to pay for. He will argue further that the limits of Irish taxable capacity are quickly reached.

It must be said that the Budget has some admirable features. The jettisoning of the subsidies and the increased consumption duties will restore a valuable flexibility. But this benefit may be expensively purchased. Rightly or wrongly, Ministers have not succeeded in convincing the public that the problems of the balance of payments and of financial equilibrium are as urgent as they claim. Their case may well be stronger than is generally admitted, but it suffers because their suggested remedy of retrenchment is not in fact being applied all round. There seems to be no prospect of any worthwhile reduction in state expenditure. Moreover, the Opposition's argument that Mr MacEntee has overestimated his needs and underestimated the yield from new taxes has not yet been satisfactorily answered; if it is not, there is little prospect that the public will respond favourably. There seems no doubt that there will be an immediate and general demand for higher wages and salaries, and the effects on trade and employment may be severe.

* * *

Army Reform by Night

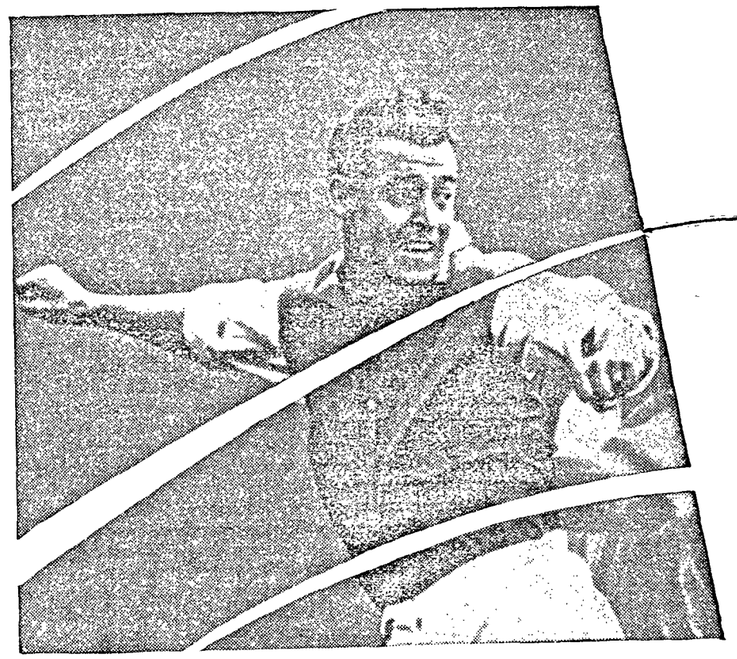
The Army and Air Force (Annual) Bill is usually passed without much controversy and without much attention to its anachronisms. This year the Opposition—still having no Steel Bill on which to exercise its ingenuity—decided that it should be brought up to date, and it arrived in committee last week with 107 amendments attached. It became the subject of fierce argument through three long committee sittings at night and the occasion of another revolt by Mr Bevan and his followers. They were less concerned, perhaps, with army reform than with delaying the Government; in particular, they wished to prolong the discussions in order to hold up the committee stage of the Health Service Bill.

At the first of the three committee sittings, the delay was largely accidental. The debate became a chaos of points of order and formal withdrawals of insults. But on the following evening the Secretary of State for War, Mr Head, announced that he had reached agreement with the Opposition that the revision of the Act should be referred to a departmental committee, whose proposals might be considered by a select committee, so that the House would be ready to make full reforms in time for next year's Bill. (In order to allow more time for this, he later agreed that the duration of this year's Act should be 15 instead of 12 months.) Meanwhile, the Government would accept some amendments to the present Bill which did not require complicated drafting. Labour backbenchers, however, were not content with this, and pressed on with their amendments as before. Mr Bevan distrusted the departmental committee. He distrusted the nominees of the Government with whom it might be packed. He distrusted the "experts"—Who would they be? An American general?

On the third evening Mr Head offered a further compromise that satisfied most of the Opposition. The select committee is to consider general questions of policy before the departmental and expert committee, which would undertake the review of the Act and then have its proposals considered in detail by the select committee. This is a cumbrous procedure, but it should at any rate produce a better Bill than the piecemeal amendment of an Act which has not been materially altered since 1881 and which is generally agreed to need thorough revision—if Parliament has time to spare from more urgent matters.

Charity Goes where it was Willed

The destination of the funds given by Lady Bland-Sutton's will for the Bland-Sutton Institute of Pathology at Middlesex Hospital has at last been settled. The impact of the National Health Service Act, 1946, on this bequest was noted earlier in these pages. The decision then reported was that of the Court of Appeal. Now the House of Lords has given its decision. Lady Bland-Sutton intended that her residuary estate should be used to support the institute associated with the name of her husband, provided that hospital and institute were not nationalised. If they were, she directed that the money should pass to the Royal College of Surgeons.



When the 1946 Act was passed, her trustees asked the Court for directions and the trial judge held that the Act did not "nationalise" the institute, and that in consequence the new administrative unit, bearing the old name "The Bland-Sutton Institute of Pathology," retained the benefit of the legacy. The Court of Appeal, which found that the institute had been nationalised but that the gift could not pass to the Royal College of Surgeons because the college was not a "charity" as the English law defines charities. The House of Lords has produced a third solution. The majority judgments agree that the institute is nationalised but declare that the Royal College of Surgeons is a legal charity and, therefore, entitled to the residue of the estate. Lady Bland-Sutton died in February, 1943. The uninstructed, reading her will, would have gathered that she had no wish to see her estate used to subsidise a state enterprise and that she believed that the Royal College of Surgeons could make better use of it. The wheel has taken just over nine years to turn its circle, but it is worth recording that its revolution has in the end been a complete one.

"Cooked Statements"

After the unscrupulous and indecent attacks in which Mr George F. Young and other Protectionists had indulged against the department of the Board of Trade, the public must have looked forward to the first monthly returns issued by the new Protectionist authorities with more than usual interest. The facts which the monthly and annual "Trade and Navigation Accounts" elicited as the results of the new commercial policy were so striking, so contrary to the predictions of the apostles of protection and restrictions, that there seemed to be no way out of their difficulty, but to accuse high and honourable public officers of a wilful perversion of the facts. "Cooked statements to serve the objects of Free Traders," and "partial and insidious statistics," were terms used in reference to the returns of the Board of Trade by the most active leaders of the party now in power. . . . Well, the new President of the Protectionist Board of Trade has laid before Parliament the first monthly return made up under his supervision. . . . What do these first returns show? Do they exhibit any corrections of the figures of last year, or any retrograde movement in the facts of the present year during the first month of the new Government when the public is no longer to be deceived by falsified accounts? Not a bit of it. On the contrary, it has seldom happened that a single month's return has exhibited a more striking proof of the rapid progress made under Free Trade. . . . What will Mr George F. Young do in this dilemma? Will he rush to public meetings and vituperate Mr Henley, the new President of the Board of Trade, as the greatest impostor, the greatest "*cooker*" of all? or will he go down to his place in Parliament, and with the meekness which becomes a convicted libeller, humbly apologise to Mr Henley's predecessors?

Letters to the Editor

Ignoble Economics

Sir,—In a Note in *The Economist* of last week you say "Only one or two peers considered seriously whether the Budget was adequate for its task and these were not among the chief spokesmen of either Government or Opposition."

I made the opening speech for the Opposition and the 8½ columns as reported in *Hansard* were divided as follows:—Introduction ¾, adequacy of the Budget 2½, Monetary policy and the restriction of capital development 2½, Redistribution of subsidies and tax relief 1¼, Lord Woolton 1½. In closing the debate I devoted a further 1½ columns to the first two subjects and expressed my regret that Lord Swinton had felt unable to supply the information which would have enabled me to judge the adequacy of the Budget.—Yours faithfully, PETHICK-LAWRENCE

House of Lords

Straining at Gatt

Sir,—Your article of April 5th seems to read as a defence of Gatt in its entirety. It assumes that those who express dissatisfaction with any part wish to "throw the whole thing overboard." Lord Balfour of Inchrye, who is chairman of this Association, in his speech in the House of Lords on April 2nd demanded nothing of the kind. He asked that the particular provisions of Gatt which deny the right of the United Kingdom to make any change in margins of preference, except in a downward direction, should be withdrawn. This involves no demand from Commonwealth countries for increased preferences on United Kingdom goods. It merely asks that the United Kingdom should have restored the right to increase margins of preference on Commonwealth and Empire goods if we decide that this is wise. Any subsequent increases in favour of United Kingdom goods would be the result of fair bargaining with other Commonwealth countries which might follow Britain's lead in regaining the same right.

The case of Pakistan quoted in your article is an apt illustration of the injustice to which the present position gives rise. Following partition of the Indian Continent, Pakistan found itself giving a great deal more in preferences to the United Kingdom than it was receiving in return. In the normal course, the United Kingdom would have been in a position to offer extended preferences in compensation for Pakistan's disadvantageous position. Gatt prevented any such action. The only course open to Pakistan in order to adjust the matter was a reduction of preferences upon United Kingdom goods.

It seems to be straining at wishful consequence for *The Economist* to attribute success to non-discrimination as represented by the ban on preferences. It is not clear that we have been brought nearer to "freer and expanding world trade" or indeed convertibility as a result of this ban. On the contrary, the independent development of trade within the Commonwealth area and other similar areas appears to offer the best hope of achieving these objects.

Any reasonably competent third-year student of economics can demonstrate with triumphant theoretical finality that any international trading system which has the peace and the welfare of mankind at heart must be based upon these principles of multilateral convertibility and non-discrimination. No sensible person would dispute that they represent polysyllabic perfection. They have only one defect: in the world as it is, they will not work.—(*The Economist*, July 15, 1950.)

Why and when did *The Economist* change its mind?—Yours faithfully,

W. A. WELLS

Empire Industries Association

[We have not changed our mind. In the world of today unmodified non-discrimination will not work. But it does not in the least follow that any piece of increased discrimination is necessarily helpful. In our view, a British denunciation of the preference clauses of Gatt would bring Gatt to an end for all practical purposes. Measuring prospective gain against prospective loss, it would be a very bad bargain.—EDITOR.]

Is the Retailer Trying?

Sir,—In the Parliamentary debate on the plight of the textile industries and in press comment, much emphasis has been laid on the need to remove the purchase tax, as if this would clear the "choked pipeline" and bring back full-time work in the factories. Singularly little has been heard of the unwillingness of the ordinary retailer to clear the pipeline himself. He wants the taxpayer to clear it for him. The wool merchants and manufacturers have done their bit and will probably have to do more whether they like it or not. The two dozen balance sheets of wool textile public companies published this year show that with about two exceptions profits are little more than one-third of those of the preceding year. They have written down their stocks, cut losses, granted quite a number of "accommodations" under the dictation of falling world prices at public auctions for wool and the need to keep machinery running. They have paid workpeople for part-time service even if it meant a loss. Unless a remarkable improvement occurs, the next balance sheets will be even worse.

What has the retailer done? The multiple tailors have slashed prices in their own branches, but they are outstandingly bold. One store still asks about 15 guineas for making up a tailored costume from the customer's own cloth. Another quoted "from 28 guineas, or from 42 guineas if you select the cloth from our stock." These quotations were made five weeks ago. One shop then had several dozen men's winter overcoats for which it asked 38 guineas each. Really superior worsted costume cloth can be bought from the mills at a cost of not more than £7 per costume. Where is the sense of quoting 15 guineas, let alone 28 guineas, for making it up, even after all allowance for purchase tax? The men's overcoats could all be made today for less than half the price asked. No wonder some of the January "sales" were failures. What inducement is there to the public in deducting 15 per cent from the regular price of wool underwear when new goods are unsaleable by the factory to the retailer at a further 25 per cent drop? The retailer has no machines to keep going and is not governed by world raw material prices as are the mills. Even if the purchase tax is a hurdle, is he doing his share to get things moving again? — Yours faithfully, WEST RIDING

Slump or Solvency?

Sir,—You ask whether the task of economic policy this year is to combat inflation or to guard against slump, and you wonder whether the Chancellor of the Exchequer knows the answer to this question. Of course the Chancellor of the Exchequer knows. If he does not, there are other ministries that do. The Board of Trade and the Ministry of Labour must have a picture of what is happening in industry today as accurate as that possessed by most bank managers, and they can have no illusions that a slump is already on its way.

Although the Government may make an important contribution in conditioning the economic climate, the economy still largely responds to the actions of individual people, business men and consumers. If profits have been expanding, business activity in general will be expansionist. When profits cease to expand, business men generally damp down their activities. If, at the same time as profits cease to expand, a banking policy which has found it almost impossible to say no to a loan is changed suddenly into one where the bank finds it almost impossible to say yes, there can be no surprise that the business man contracts his activities very sharply.

You may well ask whether the slump is limited to the textile trades or whether it is more widespread. In most industries we can now observe a number of symptoms that furnish the answer to this question.

(1) Materials which were in very short supply a few months ago are now so abundant that suppliers are almost begging their customers to place orders. Typical examples in an industry with which I am familiar are cellophane, aluminium foil, paper and board, and metal containers.

(2) Instead of quoting lengthy delivery dates, suppliers will now move heaven and earth to supply their customers at very short notice, if only the customer will undertake to place an order.

(3) Suppliers are pleading with their customers for more rapid payment because they urgently need ready money.

(4) Customers are being asked to take delivery of consignments at an earlier date so as to relieve pressure on storage space. At all points along the line of production and distribution stocks seem to be piling up, stocks which people for

a variety of reasons are anxious to liquidate.

(5) Most employers already sense a change in their relations with the employment exchange officials. When an employer informs the employment exchange officials that employees are to be laid off, he feels that they are anxious for him to spread the work as far as possible because they will find it difficult to place most of his workers in alternative employment.

(6) Published figures underestimate the true facts. Many married women who pay an insurance contribution of 3d. per week see no point in registering at the exchange. The figures for unemployed women are, therefore, much higher than the statistics of registered unemployed. Many men and women have a natural reluctance to visit the employment exchange for collecting their insurance benefits. The older workers haven't been to the exchange for this purpose for some twelve years; while, for younger people, calling at the labour exchange to draw insurance is not a pleasant prospect. Reluctance may be overcome when it becomes obvious to the worker that the interruption of work may be prolonged and savings are exhausted; then registered figures will rise suddenly and substantially. At the present moment figures of the employed population would be more relevant and more revealing than the figures of the unemployed. It is symptomatic of the situation that for the first time for almost a generation juvenile labour is being offered to the employer.

As far as the consumer is concerned, the reduction in purchasing power is already reaching such proportions that, when the multiplier effects are taken into consideration, we may well find ourselves faced with widespread trade depression. Small wonder that the Chancellor needs to re-examine his employment policy.—Yours faithfully,

JOHN R. GREYSTOKE

London, N.W.4

European Socialists and Rearmament

Sir,—May I redress the chronology of events to be found in your correspondent's comments in your issue of March 22nd regarding Belgian socialists and Mr Bevan? To judge by the debates and resolutions passed in the last three or four annual congresses of the Belgian Socialist Party, Mr Bevan's arguments were labour policy in Belgium years before anyone had heard of his theories.

For years the party had held that the only way to internal stability and external security—one and the same thing it said—was to increase the wellbeing of the masses through improved social services, to maintain economic equilibrium in the country, to balance the admittedly necessary military expenditure against the economic possibilities, to restore East-West trade and to achieve a higher degree of independence towards all great powers.

While passing no judgment here on these views, I think that they disprove what in your correspondent's comment was intended to be a charge of collective Bevanism. There is a Bevanite trend in Europe, but it did not start in Britain.—Yours faithfully, NOEL C. ANSFLOT

Books and Publications

Which is the Great Illusion?

A History of the League of Nations. By F. P. Walters. 2 Vols. *Oxford University Press* (for the *Royal Institute of International Affairs*). 833 pages. 60s.

At first sight a history of the League is an unattractive subject. The bitterness of disillusionment has been all too vividly revived by the renewed disappointment of men's hopes after the Second World War, and the current discussion of international relations is strongly influenced by the mood of down-to-earth realism to which Mr Kennan has given expression in his lectures on American diplomacy. Any reviewer may therefore be forgiven for sitting down to Mr Walters's eight hundred pages with mingled feelings of distaste and resignation. Half-way through the first volume, however, prejudice begins to yield to the conviction that Mr Walters has written an unusually interesting history of international relations between the wars, and this is amply confirmed by the rest of the book.

There are several reasons for Mr Walters's success. The first is that up to 1936 the League is the most satisfactory focus for the complicated story of international politics. It is interesting to see how much of the history of those years naturally falls into place in Mr Walters's account, and this more than compensates for the inevitable decline in interest after 1936. The second is that the author had the advantage of being at Geneva the whole time, becoming personal assistant to the Secretary-General after serving in the League of Nations section of the British delegation at the Peace Conference and finally ranking as the senior British official of the League Secretariat. He is thus able to add to an impressive knowledge of the records personal acquaintance with the figures and scenes he describes.

These advantages Mr Walters doubles by his skill as an historian. His style is lucid and, despite the length of the book, he is rarely dull and never long-winded. Few of his chapters are twenty pages long, many are not more than ten or twelve. Footnotes are rare and the note on sources commendably brief. The chapters on the Disarmament Conference might well be recommended to all writers of PhD theses who mistakenly confuse historical scholarship with the dreary accumulation of detail. The author is equally successful in keeping discussion of the organisation and procedure of the League within reasonable limits and skilfully interweaving it with the political narrative.

Mr Walters is not at all afraid to speak his mind, and some of his judgments are sharply turned. He is critical of the policy of all the great powers in turn, not least of the tepid support given to the League by the United Kingdom and the other Commonwealth countries. Few, if any, of the statesmen of the great powers measured up to the expectations of Geneva. They were too much preoccupied with what appeared to convinced supporters of the League as narrow domestic issues, selfish national advantage, or the plain avoidance of responsibility. This raises a fundamental issue and the most serious criticism of Mr Walters's book—of much greater importance than the justice or injustice of his judgments of particular issues or particular persons. For the author's view throughout is that of a man who believes unquestioningly in the principles of the League; yet nowhere are the grounds for such a view *properly set out, they are* simply taken for granted.

But what are the lessons of the League's failure? Are they, as Mr Walters appears to think, that next time the great powers ought to behave less selfishly and more resolutely in their support of international institutions like the League and the United Nations? Or are they, as a reader of Mr Kennan might be tempted to think, that the attempt to establish justice and the rule of law by international co-operation is a dangerous illusion that has served only to confuse and weaken the diplomacy of the West? Which is the Great Illusion—idealism or realism in foreign policy?

No one can read Mr Walters's admirable history without being brought up against this question time and again. It is all the more to be regretted that the historian did not feel the need to turn political philosopher at the end and put up a case for his assumptions against the advocates of the new *realpolitik*.

The Fall of France

Les Evènements survenus en France de 1933 à 1945: témoignages et documents recueillis par la Commission d'Enquête Parlementaire. Vols. 1-6. *Presses Universitaires de France.* 1,939 pages. 2,400 francs.

Au Coeur de la Mêlée. By Paul Reynaud. *Flammarion.* 1,077 pages. 1,950 francs.

When the history of the last years of the Third Republic, and that of its ephemeral successor, the Vichy regime, are written, the historian will not lack sources. In setting up a Parliamentary commission to hear witnesses and receive documents, the French National Assembly performed a service to historians, none the less valuable because men's memories are unreliable when their interests are involved.

The first six volumes contain the records of the hearings held between May 21, 1947, and June 30, 1949. Much of the testimony, particularly General Weygand's, is concerned with the military situation in 1940 or with the story of French armaments and military preparations in the preceding seven years, but there are also matters of considerable political interest. On the internal side, it is interesting to find M. Blum, in 1947, expressing his belief that the events of February 6, 1934, in Paris represented a definite and premeditated attempt at a *coup d'état* against the Republic, a sort of dress rehearsal for Vichy. The comments of M. Daladier and M. Lebrun on this episode are also of considerable interest; it is perhaps a pity that General Weygand was not asked about it as well.

On the international plane, M. Daladier's account (in Volume I), which deals in some detail with the Czechoslovak crisis of 1938 and with the Anglo-French conversations, is important for what he says about the Anglo-French negotiations with Russia in the summer of 1939 and his refutation of M. Reynaud's claim that the Western powers were offered, and refused, a Soviet alliance. Of equal interest is M. *Flandin's version* of why there was no reaction to the German reoccupation of the Rhineland and of his own conversations with Mr Baldwin and Mr Chamberlain on that occasion.

The crucial role both of British caution and of strong antipathy in France to military action on both the right and the left are brought out in even more detail in M. Sarraut's evidence in Volume III. An examination of this and other events in the light not only of the verbal evidence but also in that of the documents provided (not least the contemporary press comments) reveals the small share of individuals in the march to catastrophe. It shows how superficial are writings which seek to present contemporary history as a series of indictments against individuals.

M. Paul Reynaud, whose own evidence is given in Volume I of the report, has now revised his earlier work, "*La France a sauvé l'Europe*," under a new and less challenging title of "*Au Coeur de la Mêlée.*" This work differs from the earlier one in setting M. Reynaud's own recollections and reflections against the other evidence now available. It makes ample use not only of the work of the Commission of Inquiry, but of the records of the Pétain trial and of a variety of other sources, including Mr Churchill's *Second World War*. Unlike the latter, it is thus not simply a personal contribution to history, but a combination of this sort of contribution and an appraisal of the other materials as an historian might attempt it. For the period immediately before the war and for the war itself until the fall of France, it is indeed a work of great utility to the student, even if he may find M. Reynaud occasionally guilty of a little special pleading. This is particularly true of internal French affairs and the responsibility for certain wartime policies and for the seeking of the armistice.

M. Reynaud's fundamental point, that the false military doctrines of France's leaders, with Pétain foremost among them, were as much to blame as the alleged political vices of the Republic, can hardly be disputed. His own record of clairvoyance in this respect is not unimpressive. It is easy to see how his picture of the inadequacy of the British alliance has led him to his present campaign for a European union including Great Britain.

Overseas Law

The British Commonwealth. The Development of its Laws and Constitutions. Vol. 2: The Commonwealth of Australia. By G. W. Paton. 355 pages. 55s. **Volume 6: The Republic of India.** By Alan Gledhill. *Stevens and Sons.* 309 pages. 45s.

These are the first volumes in what may well prove to be an important and useful series. As yet no introduction by the general editor (Mr G. W. Keeton) is available to explain the scope and purpose of the whole series and the volumes under review seem to show that the various authors have been allowed fairly considerable latitude; but the publishers announce on the dust-jackets that "the main purpose of the series is to explain the development of the laws and constitutional structures of the nations of the British Commonwealth." This explains (more clearly than the sub-title) that each volume is a self-contained exposition of the legal experience of one of the entities of the Commonwealth. Very properly no attempt is made to describe the cloudy and evanescent rules governing the mutual relationship of those entities. This is no longer a topic of interest to the lawyer, who is much more interested to discover how his colleagues in other parts of the Commonwealth are tackling the legal problems of the welfare state. In short, the series attempts to do something new, and does so with a considerable degree of success.

The contrasts revealed by the two volumes are interesting. The High Court of Australia enjoys peculiar prestige in the common law world, and it is natural that Dean Paton and his rather formidable battery of specialist contributors should concentrate on the mass of robust and vigorous learning in the "Commonwealth Law Reports." This is mostly lawyers' law, and very interesting it is. The Indians, on the other hand, although rich in law reports, tend to be litigants rather than lawyers and in addition have a constitution of unparalleled complexity. Many will be thankful to Mr Gledhill, for he has provided a very readable exposition of an extremely complicated subject. After a brief review of the history and present constitution of India, he explains the main departments of its public and private law in a clear and straightforward style illuminated by many sensible reflections.

Both volumes are well produced, with indexes, bibliographies and (most usefully) chronological tables; but the prices are well up to the most punitive levels of the law publishers.

The Fanatic

The True Believer. By Eric Hoffer. *Secker and Warburg.* 192 pages. 10s. 6d.

This is a book about the place of the fanatic in the active phases of mass movements. There is much repetition, from which the following conclusions are drawn: that the active phase of mass movements is inevitably unpleasant; that the fanatic is ruthless, self-righteous, credulous, disputatious, petty and rude; that the readiness for self-sacrifice upon which mass movements depend is achieved at the expense of the full life; and that mass movements to be creative must be short-lived, as in the case of the Reformation, or the Puritan, French and American Revolutions; when the pattern of the active phase is preserved for generations, as in the militant Church of the Middle Ages or the imposed orthodoxy of Islam, periods of stagnation follow.

The fruitful attempts of small homogeneous nations to realise an ideal society are contrasted with the ugliness and violence of the vast mass movements of a heterogeneous population. Experiments in Israel and the Scandinavian socialisation programmes are cited against the "hectic coercive atmosphere" of the rise of Christianity and Islam and the Russian and Nazi revolutions. The author concludes that extreme social experiments should be left to small civilised states, on the principle of a pilot plant in large mass-producing industries, and that the West might receive from them the blueprint of a hopeful future as it received in the past its essential religion, culture and civilisation.

Mr Hoffer's generalisations are sometimes startling. Teamwork, he says, is rare among intellectuals but common among men of action. Few scientists would agree with him. He is perplexed that "people who live full, worthwhile lives are usually not ready to die for their own interests, nor for their country, nor

THE WORLD IN MARCH, 1939

Being a Prologue to the Survey of International Affairs, 1939-1946

edited by

ARNOLD TOYNBEE and FRANK ASHTON-GWATKIN

45s. net

Professor Toynbee is probably known almost as well for the series of "Survey" volumes which he edited for Chatham House between the wars, as for his great "Study of History," which is now nearing completion. The War stopped the Surveys, but they are now to be resumed. They could not be better revived than with the trumpet blast sounded in the present volume by Professor Toynbee.

The book is published under the auspices of the Royal Institute of International Affairs.

OXFORD UNIVERSITY PRESS

for a holy cause." Perhaps he has not heard of "the first hundred thousand" of 1914, or "the few" of 1940. He measures a nation's potential vitality by the intensity, but not the quality, of its longing, and says that "the gross ideal of an ever-rising standard of living has kept America fairly virile," but the "lessening drive" of the British results from "the limited ideal of the country gentleman." It will be deduced that Mr Hoffer is an American; he is. On the strength of this book some American critics have compared him with Toynbee, Koestler and La Rochefoucauld. His publishers claim that it is readable and provocative. It is.

Federal and Provincial Finance

Taxation in Canada. By J. Harvey Perry. *Toronto University Press.* (London: *Geoffrey Cumberlege.*) 409 pages. 45s.

Mr Perry's aim in writing this book at the request of the Canadian Tax Foundation was "to describe in some detail the salient features of the Canadian taxation system of today" (that is, the middle of 1951). The subject is large, covering the policies and administration of three forms of government—federal, provincial and municipal. Each of these exhibits certain characteristics in devising taxes to support the expenditures expected of it. The study therefore includes chapters on federal income taxes applicable to residents and to non-residents, succession duties, commodity taxes; provincial consumption and expenditure taxes, liquor and motor vehicle revenues, revenues from the public domain; and municipal taxes on real property. In addition to giving the basic facts about each of the principal taxes in Canada, Mr Perry has provided very useful references to the statutes under which the taxes are imposed and brief summaries of the judicial interpretation of the laws by the courts. This sort of information is of more than academic interest for individuals and business firms who have financial and commercial interests in Canada.

Quite often the author, who is a senior official in the Canadian Department of Finance, explains in some detail why a particular tax has been imposed and why it has been imposed in a particular way. In addition to providing some replies to the perpetual public complaints that taxes seem to arouse, these glimpses behind the facade of governmental pronouncements throw an interesting light on the Canadian official mind at work.

For the political scientist the book should prove stimulating as a description of a federal system of government in practice. In his admittedly sketchy chapters on the "Influences in the Evolution of the Canadian Tax Structure" and "Constitutional Limitations on Provincial Taxation," Mr Perry has given us a brief glimpse of the historical background of the present taxation system. It was originally intended that the study should include an historical survey of the development of taxation in Canada. A combination of detailed historical analysis and a full description of the present situation was, however, too big a task to be undertaken in one volume, and Mr Perry and the Tax Foundation have promised us the historical analysis in a second book.

Text and Reference Books

FBI Register of British Manufacturers, 1951-52. *Kelly's Directories Limited and Iliffe and Sons, Limited.* 882 pages. 42s.

This is the twenty-fourth edition of the authorised directory of the Federation of British Industries. It has become a standard export reference book and is classified in English, French and Spanish.

Private and Public Investment in Canada, 1926-1951. *Department of Trade and Commerce, Ottawa.* 254 pages. $2.

A very thorough investigation of investment expenditure in Canada and its importance to the economy has been made in this report. It has been prepared by Dr Firestone, Economic Adviser to the Department of Trade and Commerce. These are full tables of new investment in durable physical assets and repairs and maintenance, both by industry and by province. Details are given of how the estimates are made and their reliability.

The value and volume of investment are discussed in relation to the level of gross national product, prices, employment and other measures of economic activity. One result of this analysis is to show that, although the total volume of investment in the postwar period was the largest on record, yet in relation to either the population of the country or its total output, investment was higher in the late twenties. The results are illustrated by a number of charts and the material is very clearly presented.

City of Birmingham Annual Abstract of Statistics. No. 1, 1931-49. Edited by Richard Padley. *The City of Birmingham Central Statistical Office.* 139 pages. 15s.

This is the first of a series of statistical records for the City of Birmingham which it is intended to publish annually. A hundred and seventy-nine tables provide information on features ranging from the city's population to its weather, with special emphasis on health and housing. These tables are well set out with short notes on how to use them. Figures are mainly for 1949, but some are for 1950 and historical series are given where possible. As with national statistics, however, there are often changes in scope and definition which limit comparisons.

The usefulness of some of these detailed statistics can only be judged by those for whom they are mainly intended—the civic planners and social investigators. This first experiment in collecting standard statistics for a British city deserves careful study by local administrators.

Local Government Financial Statistics. By V. J. Oxley. *Published for the Institute of Public Administration by Allen and Unwin.* 96 pages. 7s. 6d.

This account of what statistical information is available about local government finance and where it is to be found leaves a strong impression that there is considerable overlapping between the publications of the professional societies and the various government departments. Generally there is more delay in getting out the official figures and, although this may be partly justified on the grounds of completeness, it is a severe drawback. Mr Oxley goes some way towards clearing up the difficulties which users of these statistics experience. Rather more explanation of the broad workings of local government finance would, however, have been helpful. But some useful suggestions are made about how the statistics could be improved, and the need is stressed for comparative figures over a longer length of time. Perhaps it should be added that this book does not contain any of the actual statistics.

United Nations Statistical Yearbook, 1951. *HMSO.* 616 pages. Paperbound 45s. Clothbound 55s.

The third edition of the United Nations Statistical Yearbook contains a new section on consumption of food, power, textiles and raw materials. The accuracy of the figures on food vary widely from country to country, and comparisons between countries may have only a limited usefulness. Prewar and postwar comparisons within countries, however, are said to be reasonably close.

There are also a few new tables in other sections of the yearbook, which follows the pattern of its two predecessors. Most tables give figures from 1931 to 1950.

Cassell's Dutch Dictionary. Compiled by Dr F. P. H. Prick van Welby. 1,376 pages 25s.

This is the first English edition of Kramers' English, Dutch and Dutch-English dictionary which has reached its 22nd edition in Holland. The main change is the addition of an English explanation of Dutch pronunciation. While the text is sufficiently up to date to include the Dutch equivalent of the ATS, radar or television it is pleasant to find that Little Red Riding Hood and Thomas Atkins are still there too.

You may think you are right—

but have you proved it?

If your business uses duplicating, you are probably convinced that you know which duplicator will give you the best service — but have you *proved* that your conviction is right? Roneo believe that the only way to arrive at a true answer is to have a comparative test of all duplicators—including, of course, Roneo '500.' We know that a side by side test will prove beyond doubt the great advantages of Roneo '500.'

● Considerable saving in running costs. ● Really automatic inking, giving continuously even work without stopping to re-ink. ● Interleaving, with blotting or other paper to prevent smudging, is unnecessary. ● No proofing. The very first copy is usable. ● 16,000 copies from a lb. of ink ● Quick clean colour change in 25 seconds. ● Better standard of work with greater speed.

Write for booklet "Let's take a back seat", which gives users' reports on Roneo '500' that may help you to economise.

R.S.V.P.

Our social intercourse is peppered with these little formal Gallicisms. French is, indeed, not only the language of formality—the diplomatic language—but, pre-eminently, it is the language of the table. It is the language of the *connoisseur*, the *gourmet*; it is the language of the *carte du jour*; that being so, it is the language of the *chef de cuisine* below stairs in the Connaught Rooms. Here, where no fewer than twenty of the most sumptuous banqueting halls are gathered together under one roof, London enjoys a veritable *chef d'oeuvre* every night: it is an amenity which has no equal anywhere on earth.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

AMERICAN SURVEY

Democrats Without Truman

Washington, D.C.

THE present plight of the Democratic party in the United States is curiously similar to that of the exasperated man, a familiar figure on the variety stage and in some of the earlier Hollywood comedies, who at last pulls out the pin that has been painfully sticking into his back, only to find that as soon as it is out his trousers fall down. There was never any doubt that President Truman was causing the party great pain in its southern regions. Most Democrats had come to believe that if he decided to run again for the Presidency, and if he were renominated in July, there would be a southern revolt of such scope and determination as to make the Dixiecrat effort in 1948 look like a ragged rehearsal.

Some of the more versatile visionaries in both parties were already shuddering over the possibility that at the end of a destructive three months of campaigning Mr Truman, as Democratic candidate, and Mr Taft, as Republican candidate, would have fought one another to such a standstill that neither would be able to command a clear majority of the 531 votes in the electoral college. The election would thus be thrown into the House of Representatives, and the more anybody thought of what might happen then, the colder the sweat on his forehead became.

But now Mr Truman has declared that he will not accept renomination. The notion that it might even yet be possible to "draft" him lived for only a few hours after his bold and brave declaration at the Jefferson-Jackson dinner. The Democratic party was now free to nominate somebody else. The painful pin had been pulled out, the shadow of a devastating Dixiecrat revolt receded and, in a burst of sunshine that followed, the prospect of reconciliation and unity seemed to stretch ahead like a green and fruitful valley. Nobody, however, had leisure in which to study this vista, for urgent priority had to be given to securing the party's future.

It was thus not much noticed at the time that, by the sort of irony which is so often a by-product of politics, the withdrawal of Mr Truman seemed likely to ease some of the party's other pains, as well as promising that the Solid South would now come back into the fold. Not the least of these reliefs might be that one of the issues with which the Republicans were proposing to win the election—the projection of Mr Truman's Administration as one riddled with corruption—would suddenly develop a wan and hollow aspect. Everybody, including Mr Truman's successor, would be against graft and corruption, and all could hold out the prospect of a house-cleaning.

On the other hand, the Democratic party will miss Mr Truman more than it perhaps realises yet. It can hardly hope to find another candidate with his fighting courage, his ability to attract the common voters, and his close identification in their minds with progress and prosperity at home and international co-operation abroad. Moreover, many a Democrat is filled with a sense of loneliness and insecurity as he realises that no one can now be even moderately sure who will be the party's candidate.

The conclusion hurriedly reached upon the withdrawal of Mr. Truman was in most cases that the Democratic party needed a presidential nominee who would appeal to the mass of trade union and other voters in the North without offending the South, and a vice-presidential candidate who would be able to deliver the votes from the South without offending the North. The further conclusion has been that this trick might best be performed by Governor Adlai Stevenson of Illinois as the presidential candidate with Senator Richard B. Russell of Georgia as vice-presidential candidate.

"Didn't You Know, Dearie? This Is Leap Year!"

Herblock in the *Washington Post*

The elephant traditionally represents the Republican party, the donkey the Democratic.

Governor Stevenson's record and experience as a vote-getter, a successful administrator and a liberal exponent of an enlightened foreign policy are admirable. The twin facts that he once said a good word for Mr Alger Hiss, and that he has been divorced, have been much mentioned in the course of anxious studies of the Governor which have lately appeared in print; but it seems doubtful that anybody can regard them as serious obstacles to his nomination. If this were all the Democratic party chieftains had to worry about, they would be consuming much less aspirin than at present.

One cause of the chieftains' headaches has been the preoccupation of Mr Stevenson with this week's primary election in Illinois, the first step towards his re-election as Governor. He is understandably unwilling to cast away this post as things stand now, and in consequence has refused to declare himself available for the Democratic presidential nomination. He can hardly reverse this attitude just yet and he is in fact reacting much as General Eisenhower did to the Republican wooing. Mr Stevenson has made it reasonably clear that he may be available at a later date, if the circumstances seem to warrant it, that is, if what is at present a relatively limited demand for him has been satisfactorily enlarged. What the party chieftains, Mr Truman among

them, will have to worry about here seems to amount mainly to a matter of timing. But they have another and very much bigger worry.

Senator Estes Kefauver, the man from Tennessee, wearer of the symbolical coonskin cap, gentle of voice, friendly of manner, well remembered as the television star of the Senate Crime Investigation, a sayer of popular things on virtually all issues, from Far Eastern policy to Fair Employment practices—this brash amateur who announced his candidacy while Mr Truman was still silent about his own plans—has made such good use of his early start that he now appears to be within sight of (if he has not already reached and passed) the point where he will have to be taken seriously.

As Mr Richard Strout of the *Christian Science Monitor* pointed out the other day, nobody seems to be for Senator Kefauver but the voters. They, however, have recognised in him the gallant underdog, the plucky challenger of the power of the big battalions; and in the New Hampshire, Minnesota, Wisconsin and Nebraska primary elections he has romped home.

There is no reason to suppose that he is not going to repeat the performance in the Democratic primaries in New Jersey on April 15th, Maryland on May 5th and Ohio on May 6th. And if, also on May 6th, the Democratic voters in Florida allow him to make even a respectable showing against Senator Russell, and if he then goes on to roll up a substantial vote on May 16th in the Oregon primary, in which Governor Stevenson's name has been entered without his consent, the party chieftains will certainly have to think again. "The people," said Senator Douglas of Illinois, after Mr Kefauver's triumph in Nebraska, "are beginning to speak in unmistakable terms, and it would be well for the politicians and king-makers to listen." But what the party chieftains need at the moment is succour rather than a sermon.

Banking Leviathan

[FROM A CORRESPONDENT IN CALIFORNIA]

In a country where both bigness and bankers have always been suspect, the giant Bank of America has naturally been considered a double menace. Its growth into the world's largest non-governmental financial institution has excited fear and hostility among other bankers and attempts at restraint on the part of the government. The latest took place a fortnight ago when the Federal Reserve Board, by a vote of three to two, with two members abstaining and the minority publicly protesting, decided to order the Transamerica Corporation, a holding company with an interest, now much reduced, in the Bank of America and in forty-seven other banks, to divest itself of its share holdings in the latter.

The argument was that the operations of Transamerica, which controls half the bank loans made in the five far-western states of California, Nevada, Washington, Oregon and Arizona, have tended to reduce competition in the banking field and thus violate the Clayton Anti-Trust Act. This is the first time the Act has been invoked against a bank holding company and the ruling can only be enforced by a court order, which the president of Transamerica declares will be fought right up to the Supreme Court. The Truman Administration has been far from single-minded on Transamerica and the Giannini banking empire. On at least one occasion the Treasury has opposed the Federal Reserve Board, and Mr Marriner Eccles, a former chairman

of the Reserve Board, attributed his removal to Mr Truman's desire to win support in the critical state of California for his campaign in 1948.

The Bank of America, the foundation stone of the Giannini enterprises, is not directly affected by the dispute. In itself, it is a colossus, even in a period of increasing economic concentration. Both a savings and a commercial bank, its assets of $7.5 billion are half again as large as those of its nearest rival; its savings deposits are triple those of the nation's largest savings bank, and as the pioneer of American branch banking, it has three times as many offices and deposit accounts as the second largest chain. It holds a proportion, estimated at 40 per cent, of all deposits in wealthy California and finances about a third of all new car purchases in the state. In 1947 it held, in US government securities, 1 per cent of the entire national debt.

★

Large as it is, however, it is not nearly the institution its founder, Amadeo Peter Giannini, dreamed of establishing. Giannini envisioned a nationwide and even worldwide branch banking system and doggedly pursued his goal in the face of the traditional American reliance on small unit banking. Lacking the assurance of adequate government control over large aggregations of capital, the United States has not developed the branch banking pattern almost universal in other nations, although in recent years the proportion of branch banks has been growing.

Giannini, a successful fruit pedlar in San Francisco, in 1904 raised $150,000 in capital and opened, in a former public house in the Italian quarter, the "Bank of Italy," which, naturalised and with a thousand times as much capital, is today's Bank of America. When, eighteen months later, the earthquake struck San Francisco, the new bank, by such "unethical methods" as open solicitation of deposit accounts and advertising for borrowers, had accumulated almost $2 million in resources. Giannini met the catastrophe with a celebrated manœuvre: he loaded $600,000 in gold, notes and securities into two wagons, heaped them high with oranges and vegetables and drove them through the burning city to his suburban home, where he buried them in the garden. The city's business district, its water mains broken by the tremor, was destroyed by fire, but almost before the ashes were cool, Giannini tacked a cardboard sign on a pole and started doing business in the ruins.

The following year he again capitalised on calamity when, with what his biographers call "uncanny prescience," he hoarded all the gold he could lay his hands on and greeted the panic of 1907 in fully liquid condition. These incidents not only established the young banker in the community, but suggested to him the merits of branch banking, which, he is said to have thought, saved Canadian banks from serious disruption in the panic.

When California, in 1909, approved statewide branch banking, the Bank of Italy acquired a bank in an Italian district in San Jose. By 1913 it had penetrated Los Angeles, where it began financing the infant film industry, to which it today lends $50 million a year. In 1916, acquisition of a small bank chain in the fertile Central Valley initiated

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

relations with Californian agriculture, today the nation's richest, with an annual income of $2.5 billion.

By the nineteen-twenties the bank's growth had begun to cause alarm. The California League of Independent Bankers appeared, its members pledged never to sell to Giannini, whose competition was putting many small banks out of business. State banking supervisors, alarmed over what they called Giannini's "weird mosaic" of units, refused to issue him new charters, but he evaded them with mergers, dummy corporations and interlocking directorates.

Branch banking was spreading so fast that the federal authorities, alarmed over the increasing concentration of banking assets in state banks (i.e., those organised under state laws; banks with national charters were not authorised to have branches), moved to discourage the trend. The McFadden Act, which restricted branch banking, allowed state banks converting to a national basis to retain all branches held on February 25, 1927. Three weeks before that deadline the Bank of Italy, which Giannini intended to convert into a national bank, suddenly absorbed into its 98-unit system 191 other Giannini banks. This frantic amalgamation was made possible by the election of a new Governor of California, whom 100,000 Giannini stockholders had been urged to support.

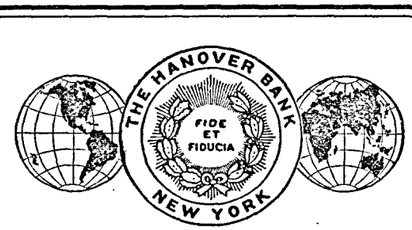
★

The Transamerica Corporation, the Giannini holding company, originated in 1919 under another name to purchase shares of other banks and prepare them for integration into the Bank of Italy. It acquired banks in four other western states, a chain in New York known as the Bank of America, and through its diverse holdings and stock manipulation became famous as "the world's largest investment trust," and a favourite of speculators. The 1929 crash ended Giannini's dreams of empire. He retired to Bad Gastein, relinquishing control of Transamerica to Wall Street bankers whom he had allowed to buy into his companies, previously owned completely by west coast stockholders. Two years later, however, he regained control by convincing stockholders that they had been cheated by slippery Eastern manipulators.

It was in the nineteen-forties that booming California became the nation's second most populous state and the Bank of America its largest bank in terms of resources, deposits, capital, profits and loans. Today it has 529 branches, 26 installations at military bases, and, through a subsidiary, 8 overseas branches with another planned for London's West End. A profitable enterprise, its shares, unlike those of other banks, sell for nearly twice their par value. It specialises in service for "the little man," refusing to follow other California banks in closing on Saturdays, and offering such innovations as "Lisa," a life insured savings account under which a depositor's savings goal is guaranteed if he should die before reaching it.

Giannini's cordial relations with the New Deal (the decision to reopen his bank after the "bank holiday" of 1933 is said to have come directly from the White House) were unique among bankers. They lasted until 1938, during which time the Bank of America added 149 branches. For the next three years no new branches were authorised, and the Securities and Exchange Commission instituted an investigation of Transamerica for alleged irregularities in its financial statement and stock manipulation.

Giannini died in 1949, and was replaced by his son, Mr Lawrence Giannini, a frailer figure, who is, however, just as closely watched by government agencies. The SEC hear-



ings were dropped in 1947, no conclusion having been reached, and the Federal Reserve Board assumed the burden of seeing that the Gianninis' attempt "to bring the resources and ability of a billion dollar bank to every American small town" does not also, as one small banker put it, "deprive citizens of their sacred American right to do banking with whom and where they choose."

American Notes

Steel Seizure

The steel industry has been snatched from the jaws of its long-anticipated strike by the President's last-minute seizure of the plants, but to the steel companies this is a fate worse than a strike. They consider it to be confiscation and are appealing to the courts. Should the companies refuse to co-operate by continuing to manage the mills under the nominal authority of the government, they could make it almost impossible for steel output to continue. The President's legal authority for seizure is certainly doubtful; he is taking his stand on his "inherent" constitutional powers to protect the country against disaster. A prolonged steel strike would indeed have been disastrous for the defence programme, although most manufacturers seem to have had sufficient stocks of steel to carry on for two weeks or more. But whether or not it is decided in the end that the President has power to seize the steel plants, the legal argument is likely to drag on so long that a settlement of the steel dispute will have been reached in the meantime.

The companies fear that the government will force them to give the full pay increase recommended by the Wage Stabilisation Board, without the accompanying price increase which they insist is essential and which Mr Arnall, the Price Stabiliser, has refused to consider. But in the final days of negotiation in New York before the strike was due to start,

genuine collective bargaining seemed at last to be beginning. The companies made their first offer, of a pay increase of over half the 26 cents recommended by the WSB, and Mr Putnam, the Economic Stabiliser, was said to be ready to over-rule Mr Arnall and grant a price rise of about $4 a ton, one-third of the amount the companies were asking. The negotiations have now moved to a higher level in Washington and, with pressure being put on the companies by the seizure, agreement should not be impossible, provided that the trade union can be persuaded to step down a little from the WSB recommendations.

The union should be in a mood to make concessions, for so far the steel dispute has gone very much its way. Not only was the WSB report much more favourable to the union as regards wages than had been expected, but it included a recommendation for a union shop, which the companies contend has nothing to do with stabilisation and therefore nothing to do with the WSB. And now the President, arguing that the union had already repeatedly postponed the strike at his request, has seized the steel plants instead of using the alternative method of an anti-strike injunction against the union under the Taft-Hartley Act. Mr Truman thus made it clear that his sympathies were with the steel-workers and that he agreed with the union leaders that this was a strike brought about by the industry, not by the union. Labour now owes him, and the Democratic party, a debt which it will be able to repay at the polls next November.

Dropping the Prober

Mr Newbold Morris has been sacked from his job of cleaning up the federal government and has gone home convinced that it was only a whitewashing the Administration wanted after all. But he has the satisfaction of taking with him Mr McGrath, the Attorney-General. It was the implication that the Department of Justice, which should be above suspicion, had been concerned in recent scandals which made the President and Mr McGrath invite Mr Morris to come to Washington. But when Mr Morris paid the Attorney-General the doubtful compliment of presenting him with the first of the financial questionnaires he had drawn up for senior government servants, Mr McGrath discharged him. Within a few hours Mr Truman had removed the Attorney-General as well.

Judge McGranery, Mr McGrath's successor, has no intention of recalling Mr Morris; he has already announced that he will turn the corruption hunt over to the Federal Bureau of Investigation. First, however, Mr McGranery must himself get a clean bill of health from the FBI. This is usual before the Senate confirms an appointment, but it is already being alleged that Judge McGranery, when Assistant Attorney-General at the end of the war, "whitewashed" government employees accused of conveying secret documents to the offices of the left-wing magazine *Amerasia*. It looks as if Mr McGranery may have some difficulty about his confirmation, even though he was once a member of the Senate himself.

Mr Morris has already given his view that the FBI is quite unsuited to the task of tracking down corruption and correcting unethical conduct in office; he is not alone in believing that the FBI should be kept outside politics and confine itself to the business of law enforcement. Mr Hoover, its head, himself seems to have felt, in the past at least, that his hands were full enough with counter-espionage and the investigation of loyalty cases for the government. It may be, however, that the Administration knew, after the Morris fiasco, that no independent investigator could be persuaded to take on the task of cleaning an establishment which soon will be turned upside down to accommodate a new tenant. The President, by trying to ride two horses at once—to keep Mr McGrath in office and to have him investigated too—has missed the opportunity of leaving his house in order, or even giving the impression that he considered it very important to do so.

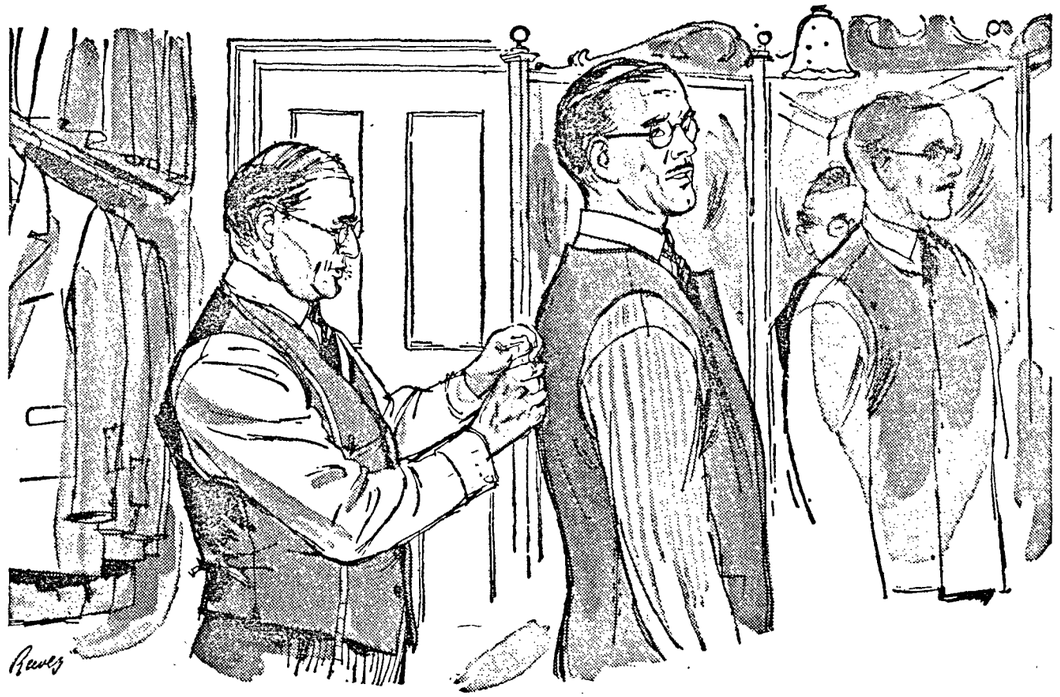
A Calculated Risk

Mr Charles Wilson's swan-song, his last report after fifteen months in charge of America's industrial mobilisation, was a rousing reply to those who have been accusing him of showing so little sense of urgency and so much concern for the civilian economy that the defence programme, in the words of the Senate preparedness subcommittee, has produced "a small number of guns and a great amount of butter, with a considerable number of lollipops thrown in." Mr Wilson also managed to get in a few digs at the Defence Department's planners, whose unattainable schedules for future armament output have provided most of the evidence for allegations that the defence programme has been lagging dangerously. Mr Wilson insisted that defence production had never been limited by shortages of materials and that he had given the services everything they wanted, even when he considered their requests irrational.



To Mr Wilson the long series of "stretch-outs" or "cutbacks" in the defence programme, which have been so much criticised, represent a calculated risk. When in 1951 the chance of full scale war breaking out seemed no greater, if as great, than in 1950, it was decided that, instead of rising sharply to a peak, military production should rise more gently to a plateau; there it would stay much longer—until at least the end of 1954, according to Mr Wilson, who put the date six months later than President Truman had in January. Defence output is already two-thirds of the way up to this plateau and in most cases climbing rapidly. When it gets to the top, at the end of this year, $4 billion worth of "hard goods" and military construction will be turned out each month. This, Mr Wilson emphasised, is the goal set by the services themselves and he reported that he was leaving the rearmament programme firmly set upon the path towards it.

The risk of this delay was obvious, and is not over yet, but the calculation was that it would in the end give America greater and more lasting strength. The new arms, when they do come off the assembly lines, will be of the latest types, a match for anything the Russians have, instead of the obsolescent weapons that are all that could have been put into large-scale production quickly. But they are armaments which take a long time to get into production, which are always being improved by research, and which involve all sorts of complicated electronic and other equipment. They will be coming, however, from factories that could double or triple output at the drop of a hat—or an outbreak of war. This is another advantage of making haste slowly; American rearmament will be on the broad base that Mr Wilson considers so important, able if necessary to rise much higher much faster than is at present contemplated. If defence industry had rushed up the peak this year, it would have been some time before it could gather enough breath to go further. It would have been ready for a war, perhaps, but not for the long pull needed to prevent war.

* * *

On the Inflation Front

Pressure is once more being put on the Federal Reserve Board by Congress to revive flagging retail sales by relaxing its curbs on consumer credit for automobiles, appliances and furniture. Consumer credit stands just about where it did a year ago, and bank loans to business, which increased little more than $100 million in the first quarter of this year, have not added to the money supply as they did a year ago, when they rose by $1.6 billion in the first three months. Indeed, at the beginning of the second quarter, there was a rapid contraction, as the season for repayment of loans began. The federal cash deficit for the year ending in

"Do you favour Colloidal Silica, Sir?"

Indeed you do — whether you realise it or not. This Monsanto chemical brings many benefits to the textile industry — greater yarn strength, fewer breakages, faster production. This, in turn, means finer quality woollens, worsteds, cottons and rayons for everyone.

Chemistry plays an important role in the textile industry by contributing substantially to better products and processes. Other Monsanto chemicals preserve yarns and fabrics from mildew and similar growths, assist in washing, scouring, sizing and dyeing.

Supplying chemicals to the textile industry is only one of many ways that Monsanto serves industry. Hundreds of similar instances are found wherever industry serves mankind.

**Chemical synonym for SYTON, registered Monsanto trade name for a textile spinning aid which increases yarn and cloth strength.*

June will be much smaller than the $4 billion the President forecast last January, and may not materialise at all, because military deliveries are lagging, and spending of the foreign aid appropriations has been slower than expected.

The monetary authorities may be forced to give way, under the threat that if they do not loosen the credit curbs, Congress will. But looking ahead, they see little cause for complacency in the fight against inflation. In the new financial year, the Treasury will probably have to borrow between $5 and $10 billion, depending, to some extent, on the amount by which Congress cuts the President's budget. No one is willing to predict that this can come entirely from non-bank sources, particularly as money will be needed to finance a record expenditure for new industrial plant and equipment. Deliveries of military "hard goods" will rise from more than $2 billion worth a month to more than $3 billion worth by December and it is hard to foresee any slackening of the economy when payments of this size are pouring into the national income stream without any compensating increase in civilian goods.

The politics of an election year have already forced the Federal Reserve Board to make a hole in one of its anti-inflationary dikes. Mr Truman has asked the voluntary restraint committees, made up of representatives of financing institutions of all kinds, to cease screening the proposed borrowings of states, municipalities and other local bodies. The reason given by the President was that it is undesirable to continue, for any longer than absolutely necessary, a federal veto on local activities. But what pushed the President momentarily into the states' rights camp was the refusal of the credit restraint authorities to approve a new bond issue by public bodies in the State of Washington to buy out a privately owned electricity company. They considered this would be inflationary, as the supply of electricity would not be increased, but in the north-west it was represented as a veto on public ownership imposed by private investment bankers. The danger is not so much that borrowings by states and cities will increase, though they certainly will, especially for such purposes as paying bonuses to ex-servicemen, but that lenders may conclude that there is no longer any need for restraint in other directions.

General Eisenhower's Coat-Tails

The hearts of Eisenhower supporters have been warmed by results in the primary elections, which suggest that, if only he can be nominated, the General will be swept into office on a flood of popular enthusiasm. These results strengthen the argument, which has force for the professional Republican politicians, that only General Eisenhower's nomination can guarantee Republican control of the Senate, where the Democrats now hold fifty seats to the Republicans' forty-six. But it is an argument which is beginning to give cold feet to some more far-sighted friends of the General. They fear that the Eisenhower flood may float back into the Senate a group of isolationist Republicans who can be counted upon to oppose General Eisenhower's international policies at every turn.

The alternative, should General Eisenhower win by something less than a landslide, is that while the Republicans would almost certainly carry the House of Representatives, the Senate might well remain under nominal Democratic control. This might be the lesser disaster, for on foreign policy General Eisenhower would command Democratic support, and the Senate committee chairmanships would be kept out of the hands of such Republicans as Senator Bridges, Senator Wiley, Senator Capehart, and Senator McCarthy.

The dilemma arises because this year, of the thirty-four Senate seats to be filled—there are in addition to the usual thirty-two contests, two special elections, one in Nebraska and one in Kentucky—only fourteen are held by Democrats, and twenty by Republicans. Their vintage is 1946, a year in which the country took revenge on the Democrats for controls, scarcities, and meat rationing by electing a Republican Congress. A number of obscure Republicans profited. The chances of the Democrats this year are further improved because at least five of their seats falling vacant lie in safe southern states.

Republicans counting their chickens concede that four other Democratic seats, in Wyoming, Kentucky, Arizona, and Rhode Island, are probably safe. If this is true, there are only five contests in which the Republicans stand a good chance of picking up the three new seats which are all they need for control of the Senate if they can hold those they now possess. The most promising are those in Connecticut, where Senator Benton was elected by a majority of just over 1,000; in Michigan, where Senator Moody was appointed to succeed Senator Vandenberg, a Republican; and in West Virginia, where Senator Kilgore squeezed in by less than 4,000 votes in 1946. But the Republicans have their own weak brethren, on whom Democratic fire will be concentrated: Senators Cain of Washington, Ecton of Montana, Kem of Missouri, Watkins of Utah, Malone of Nevada, and Williams of Delaware. With the exception of Senator Williams, who almost single-handed rang up the curtain on curruption in the Bureau of Internal Revenue, General Eisenhower would miss none of them. The irony is that if he runs he can hardly avoid giving them a free ride on his coat-tails.

Shorter Notes

The President has asked Congress to authorise a special federal ballot, similar to the one used by the armed forces in 1944, for members of the services who wish to vote while away from home. Mr Truman criticised the "complicated and conflicting" electoral laws of the various states that will make absentee voting very difficult for the 2.5 million servicemen of voting age, their wives, and 200,000 civilians living overseas. He urged that a federal ballot be provided for the coming election and that general amendment of state voting measures be undertaken to simplify the procedure for future elections.

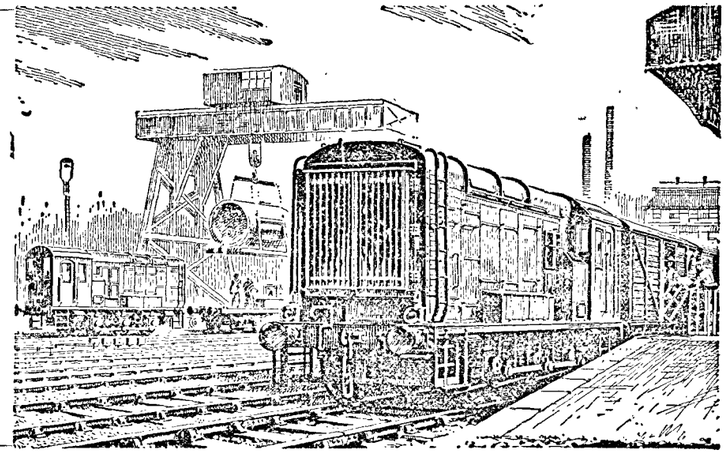
*

One face which many had hoped to see in the next Senate will not appear. The President has announced that he will not be a candidate for his old job of Senator from Missouri, and Senator Humphrey's project of making all ex-Presidents life members of the Senate is not likely to mature in time.

*

A group of more than 100 waiters have filed suit against the Waldorf-Astoria Hotel in New York City for $3 million which they allege is due to them for gratuities. The waiters argue that the hotel collects 15 per cent of banquet charges from diners as tips for the waiters, but that during the past six years they have received only 10 per cent; the remaining 5 per cent, they allege, has gone into the management's till.

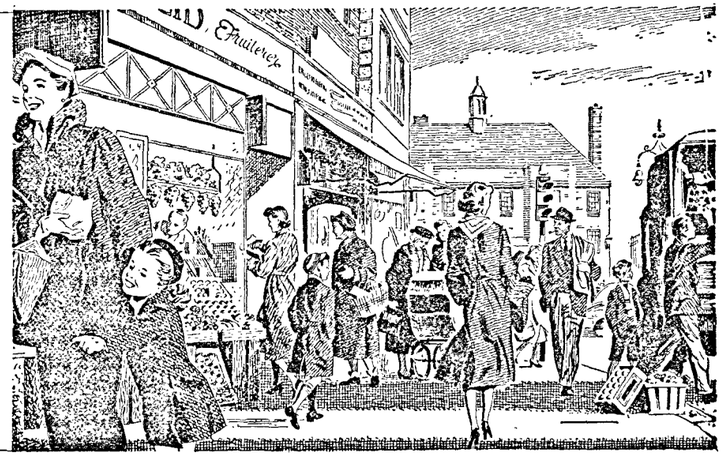
*



New York housewives will shortly be able to buy yellow margarine instead of having to buy it white and stir in a yellow dye. Thanks to Governor Dewey, the Republicans in the State Legislature, many of whom represent dairy farming districts, have at last summoned up the courage to repeal the ban on the manufacture and sale of coloured margarine which had existed for over 60 years. The federal tax on coloured margarine was repealed two years ago, but its sale is still restricted in seven other dairying states.

*

The law of supply and demand was the reason why price controls were lifted recently on sundials, bowling pins, dinosaur bones and "non-edible" foods, all of which, the price stabilisers said, "have but a trifling effect" on living costs. By non-edible foods, it was added, are meant the wax fruits and plastic turkeys often used in displaying refrigerators.



'ENGLISH ELECTRIC'

Every month Britain's railways carry more than 22 million tons of goods, and the marshalling of this enormous traffic requires powerful shunting locomotives of the utmost reliability. 'ENGLISH ELECTRIC' diesel-electric shunters, handling loads of hundreds of tons, are doing this job 24 hours a day — not only in Britain but on railways all over the world.

bringing you

In the monthly total of freight transported by Britain's railways are 4½ million tons of food and general merchandise for the shops. 'ENGLISH ELECTRIC' plays a vital part in ensuring that your meat, fish, fruit and vegetables are delivered regularly and on time — one more example of the many ways in which The ENGLISH ELECTRIC Company brings electric power to the service of millions of people.

THE WORLD OVERSEAS

Ferment in Italy

THE storm over Trieste has swept through Italy at a moment of considerable political confusion. All political parties are out with moistened fingers testing the electoral weather because the next round of municipal and regional elections is due in May; these will be followed, moreover, by a general election, which must be held either in the autumn or by this time next year. The imminence of these two important tests of public opinion greatly increases the difficulties of Signor De Gasperi, the Prime Minister, in dealing with a subject about which nearly everyone in Italy has come to have deep and often violent emotions. This feeling about Trieste has been deliberately fostered for political and personal motives by a wide variety of persons. The upshot has been to create a mood of extremism which has already shown signs of getting out of hand. As a result, the Government's efforts to adopt a rational approach, although secretly supported by considerable sections of intelligent opinion, may yet cost it dear among the masses. In some places people now run the risk of being beaten up if they are known to express the view that Italy cannot seriously expect to regain the whole of Zone B from Jugoslavia.

Complicated Manoeuvrings

It is difficult at present to assess the Government's standing in the country. On the general issues of foreign and home policy there is probably no serious disagreement between men like Signor De Gasperi, a Democratic Socialist like Signor Saragat, the Republican Signor Pacciardi, the leading Liberals, and even many of the monarchists. Yet the position of Signor De Gasperi within the Christian Democrat party is being continually undermined by his own right wing; Signor Saragat is being vigorously encouraged to enter a popular front with the Communists; the Liberals and Monarchists are increasingly subject to the pull of the neo-Fascists; and the Republicans, although they did well in the municipal elections last year, are threatened with extinction if their alliance with Signor De Gasperi is broken up. In the end the outcome of these and other complicated manœuvrings is likely to be decided by the development during the next few months of three main elements in current Italian politics—the clerical bid for power inside the Christian Democrat party, the Communist tactics of forming a popular front, and the national resurgence of the Fascists.

At the last general election in 1948, the prestige of the Church played a vital, perhaps decisive, role in winning votes for the Christian Democrat party. Since then, under Signor De Gasperi's leadership, a great deal has been done to emphasise the party's lay aspect. Although the Prime Minister is a devout Catholic—one of his daughters is a nun—he strongly believes that democrats of all kinds, Liberal and Socialist just as much as Christian Democrat, must band together if the parliamentary state and republican constitution are to be upheld. He himself has consistently tried to maintain his government as a coalition, often against the opposition of other Christian Democrats in the cabinet who could point out that the party by itself has an absolute majority in the lower house if not quite in the upper. For a long time the right-wing Socialists were in the government, but now the coalition includes only the Republicans.

Today the Vatican is profoundly worried about the prospects for both the regional and the general elections. There is accordingly a strong movement afoot in Italy to re-establish the ascendancy of clerical influence over the Christian Democrat party in order to prevent the popular front victory at the polls which many people fear. To this end, a kind of political crusade has been generated during the past few months by Catholic Action (*Azione Cattolica*) under the able and active guidance of its lively new head, Dr Luigi Gedda. Unfortunately this crusade alienates a great many people and is ruinous to Signor De Gasperi personally. It is splitting the Christian Democrat party. It has already contributed towards Democratic Socialist unwillingness to be committed to a common list with the Christian Democrats for the regional elections. It is in consequence making Signor De Gasperi increasingly dependent on right wing support, and this in turn means that he can no longer enjoy his former prestige of being virtually above party.

To these criticisms, the Church may well argue that it did, after all, make a heavy contribution to the defeat of the Communists in 1948. But the answer is that the present tactics of Catholic Action are in fact breaking up, for the first time since 1948, the political situation which has existed in Italy since those elections. What is wanted is the spread of the Church's influence outside party politics, rather than the encroachment of clericalism on the inner direction of the one mass party which is opposed to Communism. If the new political crusade were called off, the Christian Democrats would be in a stronger position to form decisive electoral alliances with other parties and Signor De Gasperi might be able to recover some of the ground he has lately lost. There can be little doubt that this would be in the interests of a democratic Italy and of its allies in the North Atlantic Pact. As things are, the leading spirits of *Azione Cattolica* frankly regard the present republican constitution as unworkable and mean to change it as soon as they can for a cross between those of Spain and the United States. Since they call Signor De Gasperi an out of date nineteenth century figure, it is not surprising that already their attitude is sometimes said to smack of *Francoismo*.

Communists Regain Lost Ground

To the left of the Christian Democrat bloc, the success of the Communists in forming a popular front depends on detaching the Democratic Socialists finally from Signor De Gasperi's side. The prospects of Communist success have improved since the recent election of Signor Romita as the Socialist Secretary and Matteo Matteotti as his Vice Secretary. Both have succumbed to the temptation of trying to filch votes from the Communists and the left wing Nenni Socialists by opposing the government; but the result of such a policy may well mean that they themselves end up again as a minor group inside the popular front. In that case the Italian Communists, who have already won back some of the voting strength they lost between 1946 and 1948, might have a larger number of fellow travellers by next year than at any previous election.

To the right of the Christian Democrats, the position is scarcely any better. Everyone expects a swing to the right in the forthcoming regional elections. If that happens and the neo-Fascist MSI (*Movimento Sociale Italiano*) gains substantially, its power of attraction over the remaining followers of the smaller and more moderate right wing parties, the Liberals and Monarchists, will increase correspondingly at the general election. Moreover, if the election is not held till next year the old guard of regular Fascists, men who followed Mussolini to the end and who are precluded by law from public life till next December, will be able to appear again openly. Already they stand in the wings, much of their prestige regained and their advice increasingly sought in private by members of the present democratic parties. How the Italian right will sort itself out eventually is still inscrutable. But already the combined strength of clericals, fascists and monarchists is enough to represent a major political force nearly comparable with the other two—the Communists and, for want of a better definition, those who are potential adherents of Signor De Gasperi.

This, then, is the scene of political confusion in which the Prime Minister is having to deal with the explosive problem of Trieste. Beneath a relatively placid exterior, Italy is today seething with a pre-electoral fever which has permeated every corner—except possibly the collected determination of the Communist camp. Sometimes it hardly seems conceivable that, beset by parliamentary difficulties even among its own followers, so friendless a government could carry on quietly for another year and then get itself re-elected to office. It is equally hard to see, nevertheless, just what the next steps even of Catholic Action are to be. And it is almost certain that President Einaudi would refuse to accept Signor De Gasperi's final resignation until somebody else, with a fully fledged programme, put himself at the head of an explicit political rebellion in the Christian Democrat ranks. The Prime Minister, therefore, is likely to carry on, living rather from hand to mouth as he has virtually done since last July. What he cannot afford is to make no progress in taking over some measure of Italian responsibility for Zone A. That is what the western alliance must always bear in mind in trying to solve the Trieste problem.

General Principles

"OUR goals are simple; they are honourable; they can be achieved. Why, therefore, should there be confusion in the minds of millions of our own peoples as to the basic aims of our defence programme?" To this question, posed by General Eisenhower in his report on his first year as Supreme Commander of the Atlantic allies' forces in Europe, there is no simple answer; but the mental confusion of which he speaks cannot be wholly attributed to the efforts of those who deliberately seek to confuse. In part, it is the result of the western leaders' failure to explain their policies in words which make a clear impression on the man in the street. The Supreme Commander's report, however, will itself help to fill this gap. Ostensibly addressed to the military Standing Group of Nato, it is nevertheless clearly directed to the general reader. It ranges far beyond the technical scope of the general's responsibilities, and in so doing provides the answers to several of the questions in the minds of the confused millions.

One of these questions asks why, if the threat of Soviet aggression is so real, the Russians have not already taken advantage of the West's weakness by sweeping through to the Channel. In simple and patient words, General Eisenhower explains that "the threat of force is no less terrifying to the weak than force itself," and that if the West had not taken both its defences and its morale in hand, nation after nation could have been "infiltrated, harassed, and browbeaten into submission" without war. Again, to the argument that rearmament means ruin he returns the firm answer that "nothing would be gained and much lost through any substantial lowering of the already low standard of living in Europe." His report, indeed, shows a sincere sympathy for European economic difficulties, and for the caution with which European governments have approached the loading of new burdens on to their peoples. To both the American and the European public he makes it clear that Atlantic defence will not call for an infinity of effort. While on the one hand America cannot be expected to arm the whole free world, and each major area must eventually be defended primarily by its own peoples, Europe will not be required to maintain permanently under arms the full regular forces necessary to meet a Soviet invasion. And for all the Atlantic peoples the goal is not too remote.

> Visible and within grasp we have the capability of building such military, economic and moral strength as the Communist world would never dare to challenge. When that point is reached, the Iron Curtain rulers may finally be willing to participate seriously in disarmament negotiations.

Yet this buoyancy is not achieved by playing down the difficulties and dangers. If General Eisenhower's forces have been doubled in numbers and successfully redeployed during his year of service, they still are not strong enough to offer "prolonged resistance east of the Rhine barrier." If morale is far better than it was a year ago, at the same time the trend towards more complex weapons is accelerating; and the resultant saving in manpower is being offset by the mounting cost of equipment, which can only be overcome by "eliminating every trace of luxury" both in the equipment itself and in military organisation. The barriers which divide the nations of Europe are still "expensive and wasteful encumbrances, pyramiding the cost of production with tariffs, overheads, taxes and middlemen." The Supreme Commander sees in the unification of Europe "the only possible way of creating reasonable security, and ensuring, at the same time, the improvement in living standards that characterises western civilisation." His hopes of seeing this unification realised are tempered by some appreciation of the difficulties involved; and if his readers on this side of the Atlantic are tempted to wish that this appreciation was stronger, they will be relieved by his verdict that, even without European union, "respectable strength can be achieved within Nato."

But the most striking thing about General Eisenhower's report is perhaps its exhortatory vein. He addresses himself in turn to political factions that consider their interests as more important than the fate of their nations; to businessmen who place "profits above patriotism"; and to workers who are still taken in by the propaganda of those who have destroyed free trade unionism east of the Iron Curtain. There are, he writes, "many steps possible in Europe which would cost little and yet bring rich returns through increased strength"; he does not specify these steps, but their nature emerges from his praise of such projects as the Schuman Plan. It is not, however, only to Europe that the general addresses himself. The whole of the West can, in his view, only be saved if its peoples "make a complete break with many things of the past, and show a willingness to do something new and challenging." This is rich fare, which neither Americans nor Europeans would find easy to stomach if it was served up by any other than General Eisenhower.

Germany Recreates Capital

SOME answers can now be given to the question—how has Germany found the capital to finance the extraordinary recovery since the currency reform of 1948? During 1951 the gross national product amounted to DM 111 billion and net investments for new plant and additional inventories amounted to DM 20.4 billion. In the previous year it was DM 15.4 billion. Large sums have, of course, also been spent on repairs to war damage. Self-financing has provided a very large proportion of investment capital. German firms and trade have been able to accumulate investment capital by charging high prices in a market which was for a long time almost insatiable and by taking advantage of a concession made in income tax and generous provisions for amortisation. Only a small proportion of investments have come from the state, though a certain amount of direction has been exercised by offering special tax concessions for investments in essential branches of industry, such as housing and shipbuilding. The Reconstruction Loan

Corporation, which was founded in 1949 to channel state funds into industry and to finance the export trade, extended total credits of DM 4 billion in the three years of its existence. Over three-quarters of its resources consisted of the counterpart funds arising from imports under ERP and relief grants from the US Government. The funds put at the Corporation's disposal by the German central bank, chiefly for financing long-term export contracts, amounted to DM 627 million.

The private banks—by tradition closely bound up with industry—helped German firms that sought credits at any cost. About one-third of the short-term credits which the banks have extended have been constantly prolonged and used for long-term investments. The banks raised the total amount of short-term credits to industry from DM 4 billion at the end of 1948 to about DM 16 billion at the end of 1951. They did so in spite of their own huge capital losses arising out of the war and inflation. In the event, the risks have been justified by the great increase in production that has followed. The banks have been able to build up more satisfactory capital reserves themselves. A very high rate of employment has been achieved, while the unemployment figure has remained fairly stable around 1.3 billion. (The number of persons who are both employable and are not earning money "on the side" is, however, certainly less than half this figure.)

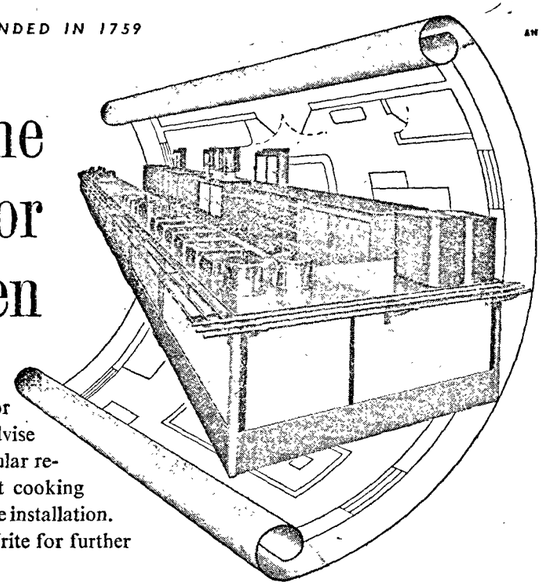
Extent of Hidden Reserves

One of the main reasons why German enterprises have been able to secure bank credits has been the extraordinary strength which they revealed when they brought out their hidden reserves after 1948. After the currency reform it was necessary to prepare new D-mark balance-sheets. The opportunity was given to revalue capital assets without becoming liable for taxation on that account. Ever since the period following the first world war German firms have conducted an excessively conservative policy of restricting dividends and writing-down assets to sums which have become increasingly disproportionate to the true value of plant. The limitation of dividends to 6 per cent became compulsory when Hitler began his rearmament campaign, and has still not been abolished. By revaluing assets to something nearer their true value, most German enterprises have been able to offset in their balance-sheets the vast losses they have incurred through the currency reform (or, more accurately, the inflation which the reform ended), the loss of property in the eastern areas of Germany, destruction through bombing, and dismantlement. The extent of this process is expressed in the single fact that the average rate of conversion of capital of industrial companies from Reichsmarks to D-marks has so far been 10:8, although the currency was cut at the rate of over 11:1. It has been expressed also in the great rise in the quotations of the leading industrial shares, which has in turn enabled an increasing number of companies to make successful issues of bonds convertible into equities.

A complaint of the iron, steel and coal companies of the Ruhr is that they have hitherto been prohibited from raising capital in the market in this way, as the regrouping of the trusts under Allied Law 27 is not completed; the assets of the companies which have been formed out of the old trusts have not yet all been valued nor has the rate at which shares will be exchanged been fixed. This handicap, together with the fact that the prices of steel and coal are limited, has placed the basic industries at a disadvantage. Nevertheless, the steel industry has helped itself to a remarkable extent out of profits and the use of short-term credits for investment. Heavy industry also received the greater part of the long-term credits given by the Reconstruction Loan Corporation. Some DM 450 million has been invested in the steel industry during the last 3 years on expansion (not including repairs), a fact reflected in the growth of steel production from some 3½ million tons to an annual rate of nearly 15 million tons. However, if output is to rise, as the Ruhr hopes, to 19 million tons, an investment of DM 3 billion is needed in the next two or three years (or double this sum according to the report of the Reconstruction Credit Corporation) and only about 40 per cent of this sum can be raised by the industry itself.

The coal industry has been neglected to an extraordinary extent despite its basic importance. This has been due to many factors, chief among them being the low price at which export coal has been fixed, and the continued uncertainty about the ownership of the mines. Some DM 1.5 billion is needed in the Ruhr coalfields for a long-term programme. About DM 600 million, part of which has already been raised, is to be invested in the short-term programme for increasing output to 450,000 tons a day. The electric power industry also calls for investment of some DM 3 billion, of which it can only raise about 20 per cent.

Needs of Basic Industries



The amount invested in the last few years in Western Germany has therefore been large proportionately to the gross national product. But the gross national product itself is comparatively low, and investment has been for the most part undirected. The coal industry in particular has been left without the funds needed to expand production. The principle followed was laid down by the Minister of Economics, Dr Erhard, when he remarked: "No one but a fool would entrust his money to the state to invest." If it had not been for Marshall aid and the device of the counterpart funds, there would have been little chance of priming the pump in the basic industries and the export trade. But counterpart funds are an uncertain factor for the future, as the amount of aid which Germany will receive from the United States will depend upon the extent to which it is ready to help in defence. With this in mind, and realising the essential importance of raising coal output if all the other expanding industries are not to be frustrated for lack of materials, German financial experts have for a long time past been working on a scheme for making all other enterprises and trade contribute towards investment in the basic industries. A complicated, and probably ineffective plan after long delays is still not in operation. Uncontrolled private capital formation is still proceeding very rapidly, helped by extremely generous taxation allowances. But for the basic industries, Germany looks to the United States to provide investment credits, once the Schuman pool's High Authority is set up and a similar body controls a common defence budget for the European Defence Community.

The Reconstruction Loan Corporation's report gives two alternatives for the future. If the rearmament drive continues, the German economy will have to exert itself to the utmost in order to increase production, maintain social welfare, and prevent inflation. On the other hand, if international tension relaxes without the markets controlled by Russia being opened there will be such extreme competition among the western exporting nations that it will be hard to prevent a dangerous fall in the standard of living.

A third alternative is proposed by Professor Fritz Baade, the head of the Kiel Economic Research Institute, whose findings are always used to support the arguments of the Social-Democrat Party. Professor Baade declares that the reunion of Germany is "much more important than our military defence contribution." If unity is achieved, Western Germany must invest in the Soviet zone some DM 3 billion, which he proposes could be saved by cutting down occupation costs. It will be seen that the question of capital investment in Germany is inextricably bound up with international politics.

CARRON THE ROYAL CHARTER COMPANY FOUNDED IN 1759

Carron will plan the complete layout for your works canteen

Carron heavy duty cooking equipment is produced to run on any type of solid fuel, steam, gas, oil or electricity. Carron experts are in a position to advise on the most suitable installation to meet your particular requirements. Not only will Carron supply the best cooking equipment for your purpose, but will plan the complete installation. Regular maintenance contracts can be arranged. Write for further details and literature to Department HC.

Carron HEAVY DUTY COOKING EQUIPMENT *Coal · Coke · Steam : Oil : Gas : Electricity*

CARRON COMPANY · CARRON · FALKIRK · STIRLINGSHIRE *and London · Manchester · Liverpool · Newcastle · Glasgow*

Increased Interest on a

SAFETY-FIRST INVESTMENT

2½% per annum

Income Tax paid by the Society

Equal to £4.15.3 per cent to investors subject to income tax at the Standard Rate

Abbey National announce that, with effect from April 1, the interest on shares will be raised from 2¼% to 2½%, and on deposit accounts from 1¾% to 2%, with income tax paid by the Society in each case. Sums up to a total holding of £5,000 are accepted for investment in Abbey National. For further particulars apply for a copy of the Society's Investment Booklet.

Total Assets £136,630,000

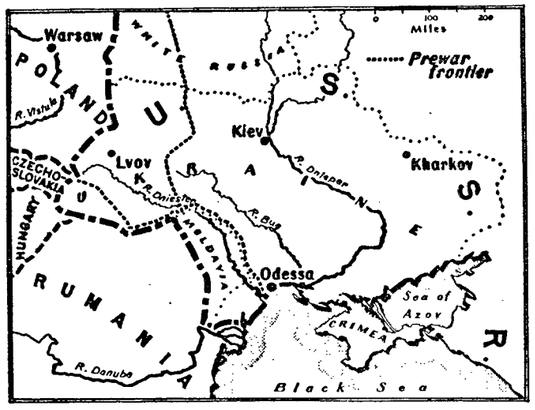
The Ukrainian Resistance

THE population of the Ukrainian SSR is now 41 million, nearly equal to that of France. With the postwar incorporation in the Soviet Union of the former Polish Ukraine, of Carpatho-Ukraine or Sub-Carpathian Ruthenia, which was formerly part of Czechoslovakia, and of parts of Bukovina and Bessarabia which belonged to Rumania between the wars, all Ukrainian-inhabited lands have been united in one state, but subject to Soviet Communist rule directed from Moscow. The movement for national independence, which was already active under the old Russian Tsardom, is still very much alive. It operates secretly within the Ukraine, but has its public political organisation and bases of action abroad.

Ukrainians outside the Ukraine belong to three categories. The first and most numerous consists of non-political emigrants and their progeny, who have settled mainly in the United States and Canada. The second group consists of anti-Bolshevik Ukrainians who went into exile after the Soviet victory in the Ukraine in 1920 and also of Ukrainians who resisted the Polish annexation of eastern Galicia. Thirdly there has been the emigration since the Second World War, consisting partly of prisoners of war and deportees in Germany who avoided repatriation to the Soviet Union and partly of refugees who came out with the retreat of the German armies; to these has been added a steady trickle of Red Army deserters and escapers over the last six years.

Politically the Ukrainians abroad are now divided into four groups, of which only one is able to function effectively beyond the Iron Curtain. In Europe the main political organisation is that of the Ukrainian National Council, associated with the so-called State Centre of the Ukrainian People's Republic, which is claimed to represent the formal continuity of the independent Ukrainian state created in 1918 and to constitute the legal basis of a government-in-exile. The State Centre has a president, Mr A. Livitzky, who has held this nominal office since 1926. The politically functioning body of the State Centre, however, is the National Council, with its executive committee, on which are represented the principal Ukrainian political parties—the Socialists, the Revolutionary Democrats (URDP), the National State Federation (UNDS), the National Democrats (UNDO) and the section of the Nationalist party (OUN) led by Colonel Melnyk.

Two important bodies stand outside the National Council. One is the Hetmanist party, a formation of the extreme Right, which has never recognised the People's Republic; they were the followers of the Hetman Skoropadsky, who held power in the Ukraine under German protection in 1918, and since his death in 1945, they have supported his son Danylo Skoropadsky. They have always had close connections with German military circles, but they are few in numbers and lost prestige when Germany failed to do anything for them in 1941.



The Banderivtsi

Much more important, especially in its hold on the younger generation, is the party led by Mr S. Bandera. The Banderivtsi broke away from the OUN after violent internal dissensions in that party in 1940. The split was not due to differences of political principle, but to a dispute over tactics. The leading group of the OUN headed at that time by Colonel Melnyk, advocated a waiting policy, with approaches to Germany in the hope that Hitler could be induced to agree to an independent Ukraine after his anticipated victory over Russia. Bandera and his followers, on the other hand, maintained that the Ukrainian nationalists must undertake immediate revolutionary action, relying on themselves alone. After the Germans captured Lvov, Bandera proclaimed the independence of the Ukraine and set up a Provisional Government without reference to the German authorities.

The Germans then arrested Bandera and his friends and sent them to concentration camps. The Nazi idea of turning the Ukraine into a colonial territory prevented the Germans from making effective use of Ukrainian nationalism during the war until it was too late; even so, there was a great deal of pro-German collaboration and a body of troops was enlisted in 1944 with the idea that they could outlive the German occupation like Pilsudski's legionaries in 1918. But this was rendered impossible by inter-Allied agreements which recognised everything east of the Curzon Line as Soviet territory.

Since 1945 the tactics of the Banderivtsi have been the maintenance at all costs of a secret political organisation within the Ukraine and the waging of perpetual guerrilla warfare against the troops and agents of the MVD, even though no immediate result is expected. Their success in harassing the Soviet regime is proved by Soviet press mention of the two names of Petlura (killed in 1926) and Bandera as synonymous with anti-Soviet Ukrainian nationalism, and recent refugees from the Soviet Union have testified to the ferment which they have caused in the Ukraine since 1945.

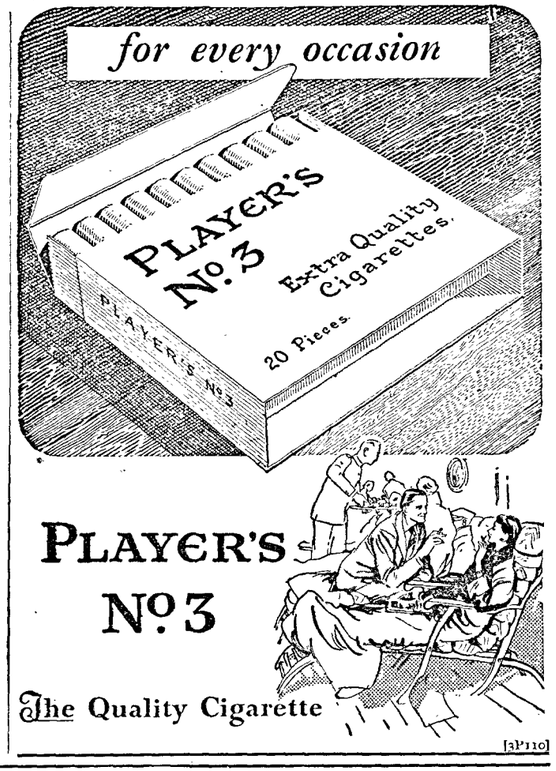
The Banderivtsi, however, claim that their services to the national cause as the one effectively fighting organisation entitled them to a position of leadership in the National Council, and this claim has been stoutly contested by the other parties, with the result that the Banderivtsi withdrew from the Council in 1950. The parties of the National

Council denounce what they call "totalitarian monoparty trends" and disapprove of terrorist methods. It is undeniable that the Banderivtsi have acquired some of the undesirable characteristics of a fanatical secret society; on the other hand, in the eyes of many Ukrainians theirs is the "heroic" party of the national movement, and the death-roll of their members is their greatest asset.

The Ukrainians of North and South America, who are mostly by origin not political emigrants, but normal settlers, have kept aloof from the dissensions of the emigration in Europe and have formed their own national organisation—the Pan-American Ukrainian Conference (PACU), the most important element in which is the Ukrainian Congress Committee of the United States. The American Ukrainians, though farther away from the homeland than those in France and Germany, are in a key position because they have direct access to American public opinion. So far the State Department has been extremely wary of giving any encouragement to Ukrainian nationalism. But certain American politicians, notably Mr Stassen, have publicly endorsed the Ukrainian cause, and President Truman himself sent greetings to the 1949 Congress of American Ukrainians. The Ukrainian vote is by no means negligible in several States, and the Ukrainian pressure group has the sympathy of many Americans who believe in fighting Moscow with its own weapons of internal disruption.

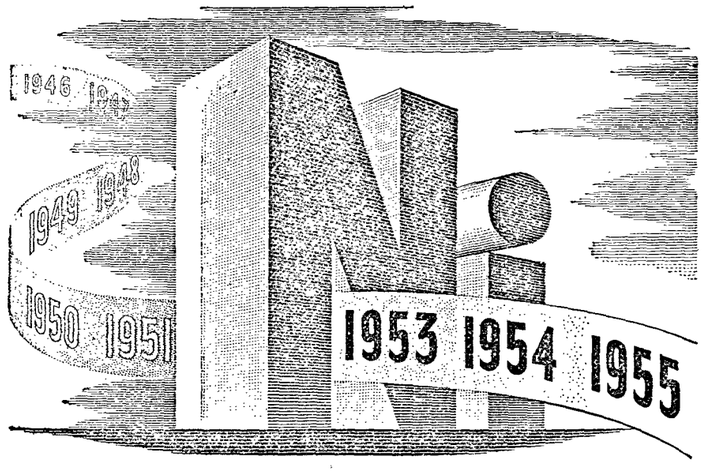
Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.



As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.



We invite your enquiries to our Linoleum Contract Division:

A Symbol of Progress

Development work by Mond Nickel looks years ahead—to the time when new engineering projects, at present only in vague outline, will need improved materials to carry them out. The metallurgist aims always to anticipate these needs so that the designer, making his first drawings, may have confidence that the better properties he seeks will be available when design gives place to construction.

MOND NICKEL

THE MOND NICKEL COMPANY LIMITED, Sunderland House, Curzon Street, London, W.1.

Any complaints, Miss Henshawe?

Making crockery and cutlery really clean is no longer the difficult problem it used to be. Efficient dishwashing methods require detergents with ingredients which soften water and prevent the deposition of film and scale. These are only some of the useful properties of Calgon - a phosphate product made by Albright & Wilson. Many proprietary dishwashing compounds now embody this practical answer to the demand for cleaner food.

THE BUSINESS WORLD

No Respite for Sterling

THE trend of the gold reserves in March was disturbingly inconclusive. Immediately after Mr Butler had announced a gold and dollar deficit of $71 million for the month, the stock exchange, remembering its worst pre-budget fears, marked gilt-edged up, but the foreign exchange market, remembering its best post-budget hopes, let sterling fall. On the next working day, each market, looking quizzically over its shoulder at the other, shuffled back towards its former level. This nervous and uncertain reaction was due to two reflections: first, that although there was some underlying recovery in the second half of March it was heavily overlain by non-recurring factors; and, secondly, that since the central reserves are now down to $1,700 million the hump of the crisis clearly cannot be said to have been passed.

Direct comparison of last month's deficit with the much larger deficits of $299 million in January and $266 million in February is vitiated by the fact that the March figures include a bewildering hotchpotch of pre- and post-budget influences. Just over $50 million of last month's net deficit of $71 million represented the transfer of gold to the European Payments Union made necessary by the sterling area's deficit with Europe in February. This, of course, was wholly a pre-budget factor, but unfortunately no great comfort can be drawn from this fact. It has been officially intimated that the sterling area's deficit with Europe in March was very little lower than that in February. The February deficit with Europe was kept down by a large British surplus with France, which has now clamped restrictions on both its imports and its rate of capital outflow; the March deficit will include a much smaller surplus with France, and this loss has offset the effects of the reduction of the sterling area's deficit with other European countries. In consequence, another $50 million odd of gold will have to be transferred to EPU within the next two weeks.

The main improvement in March occurred in the sterling area's net gold and dollar payments to non-European countries. These payments shrank to $21 million, compared with $172 million in February and $224 million in January; and in the last week of March this account was actually in surplus, so that the gold reserves increased. The month's figures included, however, about $75 million of mainly non-recurring receipts. South Africa made a special sale of $28 million of gold against sterling; the recent commodity agreement with the United States brought in $35 million from sales of rubber, tin and lead from the British stockpile; and $10 million came in from the so-called Katz-Gaitskell agreement of 1950 (under which ECA guaranteed Britain against losses of gold to EPU as a result of the use of pre-1950 sterling balances in European payments transactions). The true comparison therefore seems to be between a dollar deficit of about $96 million on non-EPU account in March and one of $172 million in February. Since there was probably some capital reflux in March—whereas in February there had certainly been some capital efflux—these figures are disappointing. They suggest that the post-budget revival of confidence in sterling has not gone much further than the covering of certain short positions in sterling that have been made unprofitable or untenable by recent interest rate changes and restrictions on the terms of acceptance credits.

In view of this, it would be optimistic to assume that the temporary swing into dollar surplus in the last week of March will necessarily be continued in the critical three months ahead. There are, however, two special factors that should lend some aid to the reserves in this period. First, unless confidence in sterling very gravely deteriorates again, the bear position against sterling should continue to be diminished, as existing credits to foreigners mature and come up for renewal on more stringent terms. Secondly, some of the promised $300 million of American economic aid should reach the reserves in the next three months. Receipts from this source have so far been negligible; about $7 million of mutual security funds were included in the figures for March, but these were mainly a backflow from previous agreements (including the agreement on purchases of machine tools in 1950-51). Unfortunately, the disappointments of this last disappointing week have included an announcement from Washington that reimbursements to Britain from its $300 million of economic aid for the current American fiscal year will be made only against imports of a very restricted list of "defence-like" commodities shipped or contracted for between November, 1951, and July, 1952. For some months the British authorities in Washington had been pressing an urgent request that the approved list of defence-like imports should be widened; many of the commodities on the present list are items that Britain added in considerable volume to its strategic reserves between June and November. The American refusal of this request in effect punishes Britain—and punishes it differentially compared with all other European countries—for pushing ahead fast with rearmament in the late summer of last year. This decision may reduce the flow of dollars in the critical three months ahead by $100 million or more below the $300 million originally hoped for.

★

There is, therefore, still perilously little room for manœuvre in the sterling area's hard and unpleasant struggle to put its external payments to right. The publication last week (as Cmd. 8505) of Britain's balance of payments statistics for the second half of 1951 has made the two main pre-requisites of such a recovery brutally clear. The first is that Britain, if necessary at

The Strain and its Sources

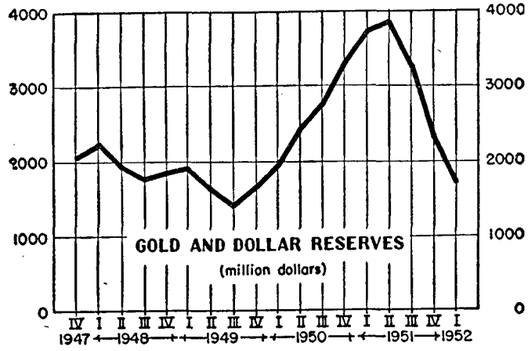

Table I and the accompanying charts show the direct causes and consequences of recent fluctuations in the sterling area's gold and dollar reserves. Tables II and III, as explained in the text of the article, sketch the course of Britain's balance of payments crisis and assess the strain that has been imposed on Britain by the overseas sterling area.

he cost of temporary unemployment, must switch esources away from the consumer goods industries that ıave been cosseted by sterling area extravagance and owards the capital goods industries that alone can make progress in overseas markets. Secondly, the overseas sterling area must cut its imports back to somewhere near the 1950 level—which means cutting them by half.

The accompanying Table II shows the vagaries of the United Kingdom's balance of payments in the last two years. In 1950 Britain ran a surplus of £234 million with the sterling area and one of £10 million with the non-sterling area; in the first half of 1951 the sterling surplus contracted moderately, to an annual rate of £136 million, while the non-sterling account deteriorated catastrophically to a deficit at an annual rate of £322 million. In both cases the trouble was the same—an alarming increase in the value of imports, especially of raw materials. Imports from the sterling area rose from £947 million to an annual rate of £1,308 million, and the rate of raw material imports rose from £415 million to £664 million. Imports from the non-sterling area rose from £1,425 million to an annual rate of £1,984 million; within these totals, raw material imports rose from £445 million to an annual rate of £824 million.

In the following six months this setback relapsed into rout. Between the first and the second half of 1951 Britain's surplus with the sterling area rose from £68 million to £171 million, but its deficit with the non-sterling area widened from £161 million to no less than £599 million. Three principal influences were at work. First, and least excusable, the whole increase in exports in this period went to the sterling area, while exports to other countries actually fell; these were six months in which the locusts of easy and unrequited exports of textiles and other consumer goods to sterling area markets ate away Britain's recovery. Secondly, imports from non-sterling area countries rose from £992 million to £1,233 million, with raw material imports rising from £412 million to £570 million; this was probably largely due to stockpiling. Thirdly, the invisible balance with non-sterling area countries deteriorated from a surplus of £100 million to an exceptional deficit of £89 million; about half of this deterioration was due to a fall in shipping earnings, and to the first interest payment on the postwar dollar loans, while most of the remainder seems to have been due to the loss of Abadan. It is a fair deduction from these statistics that Britain relapsed into a large deficit with the non-sterling area in the first half of 1951 because it failed to contain internal inflation, and that it then collapsed into a quite catastrophic deficit in the second half of the year because it was hit by certain non-recurring factors at a time when it was complacently refusing to put the previous deterioration right.

For the overseas sterling area the picture was somewhat different. It was in the second half of the year alone that the economies of these countries ran off the rails, especially in their dollar accounts. In 1950 exports from the dominions* to the dollar area were $710 million, but in the first half of 1951 they rose to an annual rate of $1,240 million—only to fall again in the second half of the year approximately to their 1950 level. Their imports from the dollar area, however, went on rising, from $590 million in 1950 to an annual rate of $900 million in the first half of 1951 and to one of no less than $1,410 million in the second half of the year. Throughout this period, the colonial empire managed to stay in surplus on its visible trade with the dollar area, at $371 million in 1950, $328 million in the first half of 1951 and $122 million in the second half. To put the matter quite bluntly, in the second half of last year Britain and the independent dominions were living partly off capital and partly off the colonies' backs.

* These statistics for the "dominions," it should be explained, exclude South Africa and Canada but they include the Irish Republic and a few other small non-dominion countries for which separate figures cannot be obtained.

The dominions went further. They tried to live off the mother country as well. Table III assesses the drain imposed on the United Kingdom by the whole overseas sterling area since 1948. This drain is estimated by subtracting sales of sterling area newly mined gold to Britain from the overseas sterling area's total current deficit (which is broadly deducible from the inter-area transfers of sterling shown in Cmd. 8505); the assessment is not ideal—for example, it excludes the £16 million gift from Australia in 1949—but it is tolerably fair. It shows, first, that the overseas sterling area's drain on Britain rose from £81 million in 1948 to £268 million in 1949; the devaluation crisis was a direct corollary. There followed, mainly as a consequence of the boom in commodities, eighteen months of sterling area lending to Britain, amounting to £230 million in 1950 and to £290 million in the first half of 1951; and then came the collapse into borrowing from Britain—to the extent of no less than £363 million, or of over a shilling from every £1 of British income, in the second half of 1951. The record of the dominions in 1951 was, of course, far worse even than this. Despite an inflow of capital, their sterling balances fell by £367 million in the second half of the year.

The lessons of this experience are clear. The normal, healthy pattern for sterling area payments should be for the overseas dominions and colonies to run a surplus with the dollar area and for Britain to run at least an equivalent surplus with the overseas sterling area as a whole. It may be that this United Kingdom surplus with the overseas sterling area should leave something to spare for investment in new primary production. And it is certainly true that, since the overseas sterling area's surplus with the dollar area is bound to wither in times of genuine American slump, the whole area must at other times run a dollar surplus sufficient to absorb the recurrent strains that are to be expected. But, in fact, the pattern that has been followed since the war is for the dominions to achieve a dollar surplus only in times of exceptional American inflation, and for them to run into uncontrolled deficit with the world as a whole whenever American economic activity has in any way receded. Britain has encouraged this process—and has usually added a deficit of its own besides—because it has found that easy sterling area markets have provided a comfortable cushion for its over-expanded textile and consumer goods trades. The whole system has been kept in being by loans from the colonies, by gifts from America and by recurrent bites into the central reserves. The last two expedients can be relied upon no longer. The first will not always endure. If the Commonwealth is to drag itself out of its third and worst postwar crisis, it is from Lancashire, Australia and the Eastern Dominions that the sharpest cries of pain must be expected. For it is they who have enjoyed the seats of most misleadingly cushioned comfort as sterling has coasted, these last seven years, intermittently but relentlessly downhill.

Radio Industry and Defence

LITTLE has been heard about the Government's decision, announced by Mr Butler on January 29th, to reduce this year's deliveries of radio and television receivers to the home market by one-third. The radio industry does not doubt that a cut—but probably of a quarter and not of a third—will be enforced, though it would prefer that this should be done without the introduction of individual production quotas. The Ministry of Supply appears to favour a quota system based on last year's output, but no decision has been taken ; perhaps there is already a sufficiently strong presumption of a fall in sales this year to match the reduction in home deliveries that the Chancellor had in mind.

Output of the radio industry, which for this purpose includes the production of radio and television receivers and transmitters, components, valves, and communications equipment increased in terms of value from £75 million to nearly £110 million. Defence orders represented £30 million of this total compared with £6 million in 1950 ; £45 million consisted of domestic radio and television receivers and their components compared with £42 million in the previous year. Exports, which included £5 million for receivers and nearly £6 million of transmission equipment, amounted to £22 million, compared with £18 million in 1950.

If a reduction of one-quarter is imposed on deliveries of domestic receivers, the radio industry does not expect to make it good by increased defence production. In the current financial year, defence orders may amount to roughly £42 million, with only a slight rise to £45 million in prospect for 1953-54. There has been genuine disappointment in the industry at the limited size and scope of defence work. The services could not work out their radio requirements until orders had been placed for the tanks, aircraft and artillery in which the equipment would be used. For some time, therefore, radio manufacturers remained in the dark about the demands that defence would make on their capacity. They knew that in value terms, defence production might quickly reach one-half of the industry's total output in 1950 and continue to run at a high level for a year or two thereafter ; but they could not foresee that equipment for defence would be so much more intricate than the normal output of the industry that its cost would be several times greater. Misconceptions thus arose about the scale on which defence equipment might be ordered. Some manufacturers who in the last war produced relatively simple receivers for tanks and aircraft in vast numbers on the same assembly lines that they had used for building domestic radio sets hoped to receive defence orders on a similar scale when the rearmament programme was announced. To their surprise, they have received small orders for highly complicated radio sets needed to work effectively in aircraft that fly at speeds of between 600 and 700 m.p.h. Less than half the defence orders consist of receiver-type equipment that can be made on assembly lines, and orders on this scale would not interfere appreciably with normal domestic receiver production.

The greater part of the radio defence programme consists of equipping the radar chain, and most of this plant is built by the big electrical engineers whose activities range beyond the radio industry as it is usually defined. In an attempt to lessen their dependence on the market for domestic sets, several of the companies that previously concentrated on making receivers are beginning to branch out into the wider fields of electronic engineering, making equipment for television transmission, cinema-television projectors, electronic calculators, high-frequency heating apparatus and portable radio transmitters. Much of this skilled engineering capacity is likely to be required for defence orders during the next year or two and although the Ministry of Supply is doing what it can to secure some expansion of capacity to avoid serious inroads into exports and essential home needs, defence orders are bound to cause some interference. As an example, exports of transmitters fell from £6.5 million in 1950 to £5.7 million last year and a sharper fall is probable in 1952. New capacity is also needed to meet the need for special components designed for defence equipment but not for standard commercial equipment.

Of these, perhaps the most important are the smallest high-duty valves designed to withstand the shock conditions under which much military radio equipment has to work. Elaborate precautions have to be taken to keep these valves dust-free during manufacture ; these entail a relatively slow rate of production, and unless further advances are made in mechanising the production processes these small valves may not be forthcoming in sufficient quantities. The Select Committee on Estimates, in a report on rearmament in May last year, expressed concern that two contracts awarded in 1946 for the development of high-speed production lines for small valves had later been cancelled. The committee was informed that although a new contract had been placed for a high-speed production line, this would not be in production for eighteen months to two years. One of the original contracts was placed with the Mullard Company, a concern associated with the Philips group in Holland. Mullard has continued independently with research and has now developed and built high-speed machinery for producing miniature valves which it claims to be equal to any similar line in the United States. It is fortunate, perhaps, that guided missiles are not an important feature of the defence programme—at least in the sense that large numbers of miniature valves are not needed for them at this stage. But recent developments hold out the hope that their production need not depend, as was at one time feared, on the recruitment and training of vast numbers of assembly workers to make the valves that control them.

★

Thus the defence programme will involve some expansion of the radio industry's capacity. But only specialised capacity is needed for defence equipment, and there is little prospect that defence orders will take up the slack in the production of receivers that has followed the fall in home sales. Last year the industry produced more

THEIR INQUIRY is interesting. What, however, is their commercial standing? You do not know—but the Westminster Bank almost certainly does. And even if it does not, the facts can quickly be obtained because the Bank has representatives in every town of importance throughout the world. This unrivalled Credit Information service is part of the much wider service which the Bank places at the disposal of all who trade abroad and which is fully described in the booklet 'The Foreign Business Service of the Westminster Bank'. A copy will be sent gladly on request.

WESTMINSTER BANK LIMITED
Foreign Branch Office: 41 Lothbury, London, E.C.2

One of our clients recently had an order from Argentina for a consignment of foodstuffs to be shipped to a port in Patagonia. He had been informed by his agent that no import permit was necessary but, being aware that such permits were normally needed for goods shipped to Argentina, he was somewhat concerned about the legality of the contract. A telephone call to us immediately set his mind at rest. We were able to tell him that certain articles including some foodstuffs could be imported into Patagonia without permits and free of customs duty.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

1 Queen Victoria Street, E.C.4.

Head Office:
Wellington, New Zealand

Branches also in
Melbourne and Sydney; Fiji and Samoa

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE PERSONAL TOUCH IN BANKING

Nearly two centuries of financial experience and personal service to each customer have helped to build up the present tradition of Glyn, Mills & Co. The banking service which is provided is completely modern in all its aspects, yet has never become impersonal in its attitude towards the large concern or the private individual.

Capital and Reserves
£1,800,000

ESTABLISHED 1867

52, CORNHILL, LONDON, E.C.3

than 2 million radio sets and 710,000 television receivers; in 1950, output reached 1,800,000 radio and 540,000 television receivers. This year, production of radio receivers is likely to fall considerably; at best it will scarcely reach 1,500,000 and at worst it may not much exceed a million. Production of television receivers may reach 800,000. Since a television receiver uses roughly three times as many components as a radio receiver and costs nearly three times as much, expansion in television ought partly offset the drop in production of radio sets. The industry would prefer to expand the production of television sets and effect the one-quarter cut in home deliveries by curtailing its output of radio sets. Last year's budget, which doubled the purchase tax on radio and television sets from 33⅓ per cent to 66⅔ per cent, was quickly followed by a sales boom that cleared dealers' and manufacturers' stocks. Production was kept at a high rate for some months after in order to rebuild the stocks but meanwhile sales fell sharply. Last summer sales of radio sets were running at an estimated rate of 1,400,000 a year; sales have now fallen to an annual rate of 800,000 sets and seem unlikely to rise much above that figure. Production has been cut back from 200,000 sets in October to 144,000 in January and, until the tax is reduced, the industry sees little prospect of recovery.

Television sales are not easy to predict. The chart shows the number of licences taken out in the three main areas covered by transmitters. Licences are not the best guide to sales, for a fair proportion of viewers find it easier to buy a set than to buy a licence and television licences never catch up with sales of television sets.

Although the average price of a television receiver is between £60 and £80, some families whose principal income is no higher than £6 a week are known to buy television sets, and some optimistic producers put the limits of the potential market as high as the number of families within the transmission area. This is an oversimplification, for there are marked differences of attitude towards television among different income and occupational groups. Transmission from Alexandra Palace which covers nearly three and a half million families was resumed in 1946. The service from Sutton Coldfield started in 1949, covering nearly one and three-quarter million families. Sales in these two areas are now approaching the limit of potential expansion and in these, but not in the other transmission areas, the doubled purchase tax last year inflicted a further check. It has been estimated that 250,000 sets were sold in the London area last year, and sales this year are not expected to exceed this figure. In Birmingham, sales reached 180,000; some manufacturers expect the same level to be reached this year, but others are less optimistic and expect a reduction. The Holm Moss transmitter, which opened last October, provides for more than three million families in an area not much smaller than that served by the London station. The licence figures show that at least 200,000 sets were sold in this area last year, some of them to families living within receiving distance of Sutton Coldfield. A cautious estimate puts sales this year at 250,000, allowing for the possible effect of continued recession in the textile industries. This figure might, indeed, prove to be 100,000 too low. The Scottish station, which opened with a low-powered transmitter at Kirk o' Shotts last month, should eventually be capable of serving about a million families. By the end of March about 12,600 licences had been taken out in this district, though by the start of regular transmission in March there may have been as many as 20,000 sets installed. Sales in the coming year may reach between 60,000 and 100,000 sets. The South Western transmitter, due to open later this year, provides for a smaller area containing less than a million families. To judge from the licence figures, 12,000 viewers are already receiving programmes from Sutton Coldfield; when local transmissions start, sales of receivers might rise by 30,000 in the first year.

Until work is resumed again on the five low-powered transmitters these figures may set the limits to the market for television receivers. They suggest sales this year of rather more than three-quarters of a million sets, as a lower limit; at the upper limit, the home market might be capable of absorbing nearer a million receivers. There are also possible developments in the export of receivers; overseas sales are not likely to be significant this year but in future years they could become important. Transmissions are about to start in Italy and in South America; there are still possibilities of services in Western Europe if the problems of meeting the costs can be solved. There is no reason why British makers should not make a bid for these markets. Perhaps £125 million is a fair estimate of the output of the radio industry this year, compared with £110 million last year. But this increase will not be evenly spread over the whole industry, and the domestic receiver market holds out rather uncertain prospects. If the sales estimates given here should prove to be optimistic, the effects would be felt not only on the receiver assembly lines, but also by component manufacturers, whose general capacity is believed to be well in excess of what is needed to meet normal demand.

FACTS, FIGURES, AND OPINIONS

Business Notes

Amendments for EPL

Both the Chancellor of the Exchequer and the Financial Secretary of the Treasury adopted a defensive posture when they explained the nature of the Excess Profits Levy on the second reading of the Finance Bill last Monday. It is evident that some major criticisms of the new tax have struck home; and the Chancellor proved to be in a placatory mood by showing that he would be prepared to think again on certain aspects of the levy. He has not closed his mind, for example, to some improvement of the standard years. It is one thing to demonstrate, as Mr Boyd-Carpenter did, that the inclusion of 1947 in the standard years is of no general disadvantage to companies, since profits in 1947 as computed for EPL were "only £110 million behind those of 1948" or to prove, as Mr Butler did, that "for about one-third of the companies we have been able to examine, 1947 was the best year of the three." The real point is that the area of disadvantage in 1947 for particular companies is still so great that in fairness they should be given an opportunity of choice in the standard years. On this, the Chancellor has promised consideration in Committee; this will do much to satisfy the developing companies that their complaints about the inadequacies of the choice of standard years have not gone unheeded.

Equally welcome is the Chancellor's promise to consider the representations put forward by the Malayan rubber and tin industries; he declared that he was "fully conscious" of their difficulties. On the substitute standard, he repeated the defence of simplicity in justification for the use of paid-up share capital instead of capital employed. "Our experience in the last war, when a substituted standard was given on the basis of capital employed, was that in over half the cases the capital employed was less than the nominal capital." This argument is a little breathtaking in view of changes in prices and the expansion of industrial investment since the war. But fortunately the Chancellor was prepared to admit the case for an improved substitute standards, subject to clear limitations:

> I am prepared to explore, between now and the Committee stage, the possibilities of providing a third alternative standard based on the net assets of the business valued, broadly speaking, on the basis that they were for EPT purposes, after deducting debts and liabilities. I must make it clear that in that event I should have to reconsider the percentage offered.

On the levy in principle, Mr Boyd-Carpenter admitted that "a tax of this sort has certain inherent and unavoidable disadvantages." The Chancellor expressed no views. And neither spokesman thought it necessary to refer to the savage treatment of investment income, which will be subject to double EPL in many cases.

* * *

Purchase Tax and Textiles

The greatest service that Mr Butler could do for the textile industry was to state firmly and finally on Monday night that the government would neither lift purchase tax from clothing nor abandon the "D" scheme. Uncertainty about the future rates of tax and the goods that would attract it had been an important factor in holding down textile orders at home to the bare minimum before the budget; and the recent campaign for lifting the purchase tax only increased the general determination to withhold orders in the hope of further concessions. Mr Butler's promise to consider amendments to the "D" scheme at the Committee stage could do the industry more harm than good if it were to encourage false hopes of widespread relief.

An appeal for the general lifting of purchase tax on textiles was from the first unrealistic. Mr Butler put the revenue cost at between £80 and £100 million; perhaps many who had supported the appeal did not realise that the figure was so high. As for the "D" scheme, it certainly has its faults—the most serious being the lack of any relief for quality goods. But its critics tend to minimise the improvement that it undoubtedly represents on the utility schemes, and it is perhaps significant that none have put forward the alternative suggestion of the Douglas Committee—namely, a flat rate tax of ten per cent on all items; such a tax would in some respects be preferable to the present system.

Considerable uncertainty prevails about the nature of the £20 to £25 million worth of defence orders that Mr Butler promised for the relief of the textile industries. The general impression is that the Government has decided to place immediately orders that were intended to be spread over a longer period. Of the 45 million square yards of serge and overcoating material needed for the three years' rearmament programme, some 20 million square yards have been ordered, and 17 million yards of the 26 million square yards of flannel shirting. Orders for £2 to £2½ million worth of blankets are also expected soon. Of the 160 million square yards of cotton goods required, 80 million were bought from abroad last year, leaving orders for a further 80 million for the home industry. But 40 to 60 million yards of this material has already been ordered. If, as seems probable, the balance of these orders are placed immediately, with perhaps the addition of further requirements that are outside the current rearmament programme, some sections of the textile industry might experience temporary support. But although Mr Butler specifically mentioned that the Government would be prepared to buy some of the lighter fabrics, such as linings, to keep in stock until uniforms were actually made, most of the goods required are heavy cloths, including canvas, drills and denims. The textile depression is felt most severely among the fashion goods sections. Mills concentrating on the heavier industrial cloths have so far escaped much of the general fall in trade, but it is here that most of the Government orders will be placed.

* * *

Textile Trade Prospects

The effectiveness of emergency measures such as the acceleration of defence orders depends on how long the present recession may continue. Many mills are likely to extend the Easter holidays to a week or more; some of Courtaulds rayon plants are to be shut for the fortnight. The Cotton Board's returns show that during the last week of February 41 weaving mills, employing 4,140 workers, were closed for the whole week. The mills that remained open were running 81 per cent of their looms compared with 85 per cent in November, before short-time working was so prevalent. By the middle of March, 43 spinning mills, employing 9,410 workers, were shut down for the week. The open mills were running to 75.5 per cent of capacity compared with between 85 and 89 per cent before Christmas. In Bradford, there was a slight increase in activity during February; the combing sections were operating to 59 per cent of capacity compared with less than 54 per cent at Christmas, but also compared with nearly 90 per cent at the beginning of 1951. The fall in wool employment has been slow and prolonged, whereas the fall in Lancashire has been more rapid in its onset and has thus attracted greater attention.

There are clear signs that, in the prevailing uncertainty about price and tax trends, retailers in the home market have talked themselves into a deeper slump than events have

justified. The King's death in February and the late spring have both affected retail sales, but the general level of consumer buying is believed to have returned to levels that might have been considered normal in 1950. There is no virtue in making matters worse by comparing the current level of sales with the inflated levels of early 1951, when buyers were in a state of panic. The difficulty of comparing figures for 1952 with those of the corresponding months of the previous year are likely to increase as the year goes on. The wholesale trade figures for textiles in February, for example, show a fall of one-third compared with February, 1951, but the sales index (1947=100) rose from 71 in January to 112. In February, 1951, the sales index reached 168, but from then until April the trade boom was at its peak, and all sections of the trade were rebuilding their stocks as fast are they could. There is also a big change in prices to allow for in comparing current trade figures with those of a year ago. A rough estimate suggests that in February wholesale prices might have been as much as 25 per cent lower than they were in February, 1951.

* * *

A Rubber Grower's Lot

In his annual address to the shareholders of United Sua Betong, Sir John Hay had every reason to complain of malignant fate and official folly. In Malaya, and particularly in Johore, Communist bandits are waging a brutal campaign of murder, arson, sabotage and theft against the company. In order to keep labourers on the estates—where their loyalty is liable to be repaid by being hacked to pieces by Communist parangs—wages have been raised to five times their prewar level. In fact, costs per unit of output actually doubled last year. Meanwhile, the price of rubber is only 113 per cent above its 1939 level; it has been kept down largely by the protectionist policy of the United States, which continues to believe that it is being gouged, although it is getting between 169 and 360 per cent more than in 1939 for its own four main agricultural products (tobacco, maize, wheat and cotton). In consequence, Sir John sees "unmistakable signs" that "prosperity, after a fleeting and fortuitous visit, is now departing" from the rubber industry. It is this moment that the British and Malayan tax authorities, who took 68 per cent of United Sua Betong's profits last year, have chosen to step up their demands—to about 75 per cent of United Sua Betong's profits unless EPL is amended.

Sir John put forward an unanswerable case not merely for amending EPL but for withdrawing it altogether from the rubber plantations. The standard EPL years of 1947-49 were a period when "the industry had scarcely emerged from the rehabilitation stage after a disastrous three-and-a-half years of enemy occupation, whilst the price of rubber was still under the influence of a blundering decision by the Government of the day by which, at a time of shortage, the price was fixed below the cost of production." Moreover the proffered alternative method of calculation of standard profit under EPL, which relates profits to "something so irrelevant as nominal capital," holds out no advantage to United Sua Betong; the company's nominal capital is £900,000, while its real capital employed is very little short of £3,000,000. It is not only in Johore that this vital dollar-earning industry is meeting murder on its way.

Fall in the Sterling Balances

Overseas holdings of sterling balances, which increased by £425 million in the first half of 1951, ran down by £361 million in the second half of the year. The whole of this fall was accounted for by repayments of £367 million to independent sterling area countries. As is explained in an article on page 115, this fall occurred despite an inflow of about £50 million of British capital to the overseas sterling area and represented a drain on Britain that was a major contributing factor to last year's crisis. Apart from a fall of £13 million in the balances of OEEC countries (which had increased their holdings by £27 million in the previous six months) the only other significant movements in the second half of the year were another increase, of £56 million, in colonial balances and a decline of £35 million in sterling held on American accounts; the fall in the latter is, of course, a sign of American and Canadian fears of sterling devaluation.

The accompanying table shows that although sterling area balances have fluctuated wildly in the last three years, in successive export booms and import sprees in the Commonwealth, non-sterling area balances have remained remarkably stable—at any rate since the Argentine railway transaction and the start of European recovery in 1948. This has an important bearing on the current controversy whether the existence of these balances represents an insurmountable barrier in the way of sterling convertibility. Convertibility would presumably mean that the unblocked portion of the balances held by OEEC countries, non-dollar western hemisphere countries and "other non-sterling countries" could be converted into dollars. Much of the

£409 million of European balances seems to be in unofficial hands so that, if these balances were made convertible, the drain could be large. But the greater part of the £57 million of balances held by non-dollar western hemisphere countries is believed to represent the blocked holdings of Brazil and Uruguay, while the mapor components of the £514 million of balances held by "other non-sterling countries" are the unblocked Japanese balance of approximately £100 million (about which an agreement might be negotiated) and the blocked Egyptian balance of about £200 million; this latter, incidentally, has been reduced by £10 million this week as Britain has—presumably for political reasons—allowed the new Egyptian Government to draw its 1952 "ration" from the blocked balance nine months before the end of the year. If, therefore, an agreement on the sterling balances is a prerequisite of sterling convertibility, it would presumably need to be chiefly an agreement with Europe and Japan.

Extra Blast Furnaces

Steel production continued to recover in March. It reached an annual rate of 16,648,000 tons, compared with rates of 15,234,000 tons in January and 16,281,000 tons in February; and was in fact higher than a year before. But not much significance can be attached to this last comparison; the annual rate of output achieved in March, 1951, 16,546,000 tons, was reduced by Easter holidays, and it was indeed from March onwards that the decline in 1951 output began to be recorded. The annual rate of output during the first quarter of this year, 15,991,000 tons, was much lower

than in the first quarter of 1951, when the rate was 16,425,000 tons, but this year's trend should continue to be more favourable.

The check in the growth of pig iron output that occurred in February appears to have been temporary. Last month the blast furnaces' output was at an annual rate of 10,478,000 tons, their highest output ever, and pig iron output in the first quarter was at the annual rate of 10,355,000 tons, compared with a rate of 9,587,000 tons in the first quarter of 1951. There is still some way to go if 16 million tons of steel is to be produced this year, though the industry's iron-making capacity is growing. In the next two months three new blast furnaces at Skinningrove, Consett and Cargo Fleet and an additional furnace at Kettering should be brought into blast; allowing for the closing down of two old furnaces, this should give a net increase in pig iron capacity of 300,000 tons a year. During 1952 this capacity may rise in all by more than a million tons a year, which would enable the production of 11 million tons of iron if supplies of raw materials were sufficient. The industry is budgeting for a rather lower output of about 10,600,000 tons; but even this will require a continued growth in current output of pig iron, and supplies of materials, particularly of coke, are still uncertain.

* * *

Bigger Demands for Coke

Because a much greater proportion of British steel is being made from pig iron this year than in previous years, and supplies of ore have improved, coke has become the steel industry's most crucial raw material. For some months the British Iron and Steel Federation has been complaining that the supplies of metallurgical coke that it purchases from the National Coal Board and from independent coke oven operators have been falling short of the amounts promised; this week it said in a public statement that

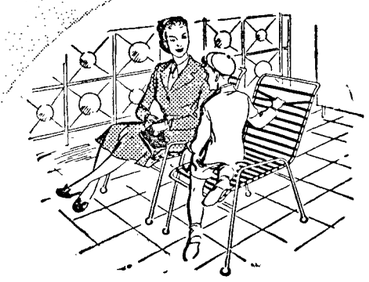
> Unless this shortfall in purchased coke supplies can be overcome, pig iron development will be held back and steel production will be below last year's level.

The additional blast furnaces now becoming available, it added, could not be brought into blast until at least 6,000 tons a week of additional coke was assured.

The country's blast furnaces are expected to require a total of about 11,700,000 tons of metallurgical coke this year, or 225,000 tons a week. Last August the Federation expected that its own coke oven capacity would be increased by about 26,000 tons a week by the end of 1952; at the time it was using about 205,000 tons of coke a week and supplying about 135,000 tons of this from its own ovens. Today it is making nearly 150,000 tons a week. By the end of the year, therefore, its own increased coking capacity might be able to make all the additional coke it requires even if its purchases from the NCB and elsewhere are not much higher than the present level of 70,000 tons a week. But in the meantime, before extra ovens are ready, consumption at the blast furnaces must grow to meet higher demand for steel-making iron, and a greater use of home ore, which requires more coke to smelt it, is accentuating the pressure on supplies; in March the blast furnaces drew on their stocks by 2,000 tons a week, and these stocks now represent only about four days' supply.

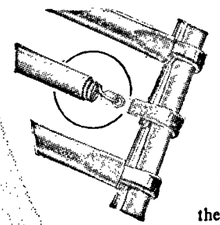
The Federation is asking for another 6,000 to 7,000 tons a week from the NCB and its other suppliers, saying that current supplies have fallen by this amount below the "supply of 76,000 to 77,000 tons on which the steel development plan was based." The National Coal Board has replied that it entered into no undertaking to supply the steel industry with given supplies of coke; that its only undertaking, to the Ministry of Fuel and Power, was to ensure that the coke oven capacity owned by it and the independent operators should not fall below 8,200,000 tons a year; and that this undertaking has been fully carried out. In any case, it adds, all coke produced in coke ovens, whether owned by the Board or not, is allocated by the National Coke Supplies Officer of the Ministry. This seems to be an effective defence. On the face of it, the steel industry has the strongest of cases for these extra supplies of coke—particularly as uncertainty about American steel is making the hopes of better supplies later this year more doubtful. But was it necessary to plead this case before the public, since only the allocating department of the Ministry can render any useful verdict upon the claims of all hard coke consumers?

* * *



Accountants and Rising Price Levels

There are few signs of an accommodation between the two sides in the accountancy profession on replacement costs versus historical costs. Not all chartered accountants would endorse without qualification the suggestions on this controversial issue recently submitted by the Institute to the Royal Commission on Taxation of Profits, which were summarised in *The Economist* of March 29th. The principal submission (in default of relief from taxation on retained profits) was a modified "renewals basis" for replacing fixed assets; the Council of the Institute was unable to make suggestions for relief for profits retained to finance stock in trade because of "practical difficulties." Some practical difficulties and limitations might indeed arise if the renewals basis that the Council suggests were itself adopted. Put shortly, the proposal is to allow as a deduction for tax purposes any excess of the cost of replacing an asset over the tax allowances that have accumulated during its life. Annual allowances on the new asset would thereafter continue at the same rate as those granted on the original asset, and would be accumulated towards the second stage of replacement, when again any deficiency of allowances compared with replacement cost would be allowed for tax purposes in the year of replacement. These principles would be relatively simple to apply in those cases where regular and rapid replacement of fixed assets takes place, and where no element of improvement in their nature occurs. Whether such conditions apply to wide sectors of British industry, where assets are replaced at comparatively long intervals, and then commonly with equipment of a technically different nature, is another question.

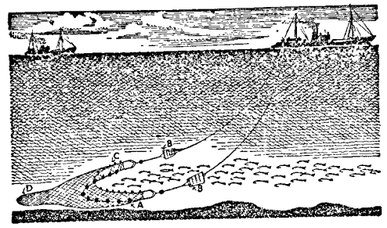


To be fair, the accounting difficulties inherent in the Institute's proposals are probably no greater than those inherent in other suggested schemes of tax relief for rising replacement costs. But they would appear to do little or nothing to remedy the understatement of the true cost of the fixed and current assets used up in current output. The Society of Incorporated Accountants, in its memorandum of evidence to the Royal Commission, emphasises "a serious danger of real capital consumption which accounting practices tend to veil"—which is to put the same point in a different way—and is pursuing its researches into problems that this raises for accountants and for industry. The Association of Certified and Corporate Accountants covered the point in its first memorandum of evidence last year, when it recommended the valorisation at current prices of annual depreciation allowances as they accrued.

A demonstration of what "replacement cost accounting" would mean in practical terms is provided in a publication of the research committee of the Institute of Cost and Works Accountants entitled "The Accountancy of Changing Price Levels" (15s.) of which an abridged version for those concerned with industrial management rather than accounting technique is available at 2s. 6d. These publications set out the principles that should apply in accounting for the effects of changing price levels and then show by a series of "models" the accountancy techniques that could be used to implement the principles. They show that comparison of "real" profits with profits computed by conventional methods, and the tracing of the fate of "real" capital against

PLASTICS
inspire new ideas

Remember the gay "Springbok" garden chairs at the South Bank last year? They were designed and made by Ernest Race Ltd., and in the construction Plastics played an essential part. The springs had to be covered, and the covering had to satisfy quite a list of "musts." It had to be soft and comfortable to sit on yet tough enough to stand a lifetime's wear in a few months. It had to be weather resistant, impervious to moisture, quick-drying after rain, colourful, fadeless and flexible. BX Plastics solved the problem with a special P.V.C. extruded tube made in five different colours.



Plastics have a way of solving problems and inspiring new ideas. They offer advantages not possessed by other materials. Have you thought how you might use them in your business? That is where the Technical Service Department can help you.

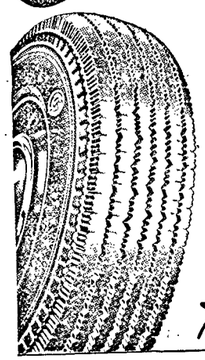
NEWS FROM THE FISHING INDUSTRY



How fish are caught

Towed about 200 yards astern, the trawl runs along the sea-bed where the fish feed. Wooden or metal "bobbins" (A) are attached to the lower part of the mouth and act as wheels, enabling the trawl to be pulled more readily and with less risk of damage over rocks and other irregularities. Even so nets have constantly to be renewed, and it is not uncommon for a complete trawl to be lost. Replacements today cost nearly treble the 1949 price!
The action of the water forces the trawl doors (B) apart and this, in conjunction with the floats (C), keeps the mouth wide open and the way clear to the cod-end (D) where the catch congregates. About every 2 hours, the trawl is winched in and — with luck! — a silvery cascade of fish pours onto the deck for instant cleaning, sorting and packing in the ship's fish-rooms.

British Trawlers know their job!

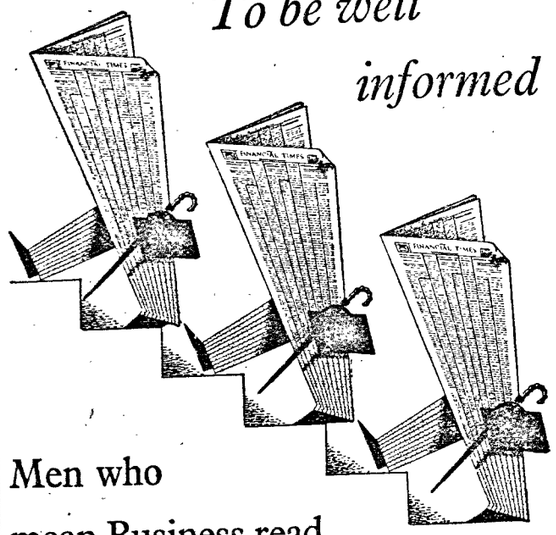
ZINC



THE element zinc occurs in "zinc blende"—a natural form of zinc sulphide—and in certain ores of lead and silver. A hard bluish-white metal, zinc was originally produced only in China and Sumatra, and substantial quantities were once mined in Britain, but most of the world's supply now comes from the Americas and Australasia. Centuries before zinc was discovered in the metallic form, the Ancient Greeks were smelting its ores with copper to make brass, an alloy that has become indispensable to modern industry. Apart from its use in alloys zinc is chiefly important today for coating or "galvanising" iron sheet and wire to give protection against rust. Zinc is also used as a roofing material and in the manufacture of casings for dry batteries, fittings for motor cars and plates for printing. Compounds of the element are well known in such diverse fields as medicine, dyeing and paint manufacture.

In addition to producing zinc wire and strip for the electrical industry I.C.I. makes zinc-chrome pigments for paints and zinc compounds for the processing of rubber.

Remedy for Tuberculosis?

A cautionary announcement issued by the Ministry of Health last week about the new anti-tuberculosis drug, isonicotinic acid hydrazide, has not dissuaded a number of companies from announcing their intention to start production as soon as possible. Reports from the United States, where the drug was developed, say that it has achieved remarkable results in serious cases which had not responded to the recognised forms of treatment; results in less critical cases were not so dramatic.

In many countries, though not in Britain, a drug manufacturer must obtain permission from a public authority before he can put a new product on the market. The medical authorities are acting properly in trying to prevent excessive expectations before the drug has undergone full clinical trials although the results of first trials are claimed to be spectacular. It is already in production in America and in this country.

Much of the development work on the new compound was carried out by the American branch of the Swiss company, Roche; the English factory put the drug in production within a short time of receiving details from the United States and is already producing it in large quantities. But the compound was first identified in 1912, and cannot be patented. The Roche company, therefore, has no claim to the exclusive production rights that are the usual reward for work and expenditure on pharmaceutical research. Indeed, the American Squibb organisation, which was conducting research into the new compound at the same time as Roche, has set up an organisation in this country with the intention of producing the drug under the trade name "Nydrazid" in competition with Roche's "Rimifon." Other companies have announced similar plans. Roche Products, which is at present the only British producer, has taken two steps to control the distribution of "Rimifon." It has informed the Ministry of Health that the compound will be sent only to tuberculosis centres and has sent samples to the Poisons Board to ascertain whether it will be classed among those drugs that are supplied only on a doctor's prescription.

If the drug only partially fulfils its initial promise, the market may prove immense. Unlike streptomycin, which is the most effective anti-tuberculosis drug now in use, isonicotinic acid hydrazide is cheap and is taken orally. Roche Products' price for 100 tablets is 22s. 6d. and treatment consists of two or three a day. It remains to be seen whether the new drug proves effective in the treatment of animal tuberculosis; if it were, it would make possible a rapid improvement in cattle herds and provide for tuberculosis a remedy as potent as penicillin has been for mastitis.

* * *

New Shapes for Ships?

In a paper on "Britain's Deep-Sea Liner Trade 1945-51," which he presented to the Institution of Naval Architects last week, Mr Basil Sanderson, chairman and managing director of Shaw Savill and Albion, dealt at length with the two main problems that have confronted the liner owner since the war: the making good of war losses, and the effects of taxation upon the replacement of obsolescent tonnage. This is a problem familiar throughout industry; Mr Sanderson was concerned to show that its effects upon shipping are peculiarly "lethal." What other industry, he asked, has such a large proportion of its capital represented by plant depreciating so quickly as within 20-25 years, and what other industry has always to scrap 100 per cent at one time when the unit of plant is becoming uneconomic? "In the case of the shipping industry the whole factory, plant, accommodation and all goes at one fell sweep into the melting-pot at scrap prices, which latter are even then subject to a balancing charge."

But to the outsider the main piquancy of Mr Sanderson's paper lay outside its weighty main theme. Venturing cautiously into the realm of the naval architects whom he was addressing, Mr Sanderson ended with three "user's questions" about ship design. Why, he asked, was cargo still handled by methods basically unchanged since the Phœnicians—lifted by derrick, swung, and then lowered to about the same level: was some approach to "horizontal loading" as opposed to vertical a possibility, even if it meant dispensing with "such anachronisms as masts and the projecting vertical funnel"? He enquired whether some improvement in the insulation of refrigerated shipping, which would allow savings in the power of refrigeration equipment, might be brought about by modification of hull design. Last, he spoke of the troubles that have come in the wake of the latest and most efficient hulls turned out by shipbuilders. These hulls, he argued, appear to suffer far more from fouling than older, less efficient hulls. There appears some need for tank tests in simulated conditions to allow for a moderate degree of fouling, instead of the ideal conditions that are usually presupposed.

* * *

Metal Fatigue in Aircraft

The Air Registration Board's recent decision to impose a limit on the life of certain aircraft structures has led to some confusion among the general public. For several years, the Aircraft Research Establishment at Farnborough has been carrying out research into metal fatigue in aircraft, with the object of defining fatigue limits for metals subjected to given combination of stresses. This research was given new significance by an accident that occurred in Australia last autumn when the onset of metal fatigue caused the wings to fall from an aircraft. This catastrophe showed that serious gaps existed in the data on which estimates of metal fatigue were being based. To fill these gaps and to eliminate any possibility of a second accident of this kind, the board started a series of practical tests on aircraft in service.

Certain combinations of stress are more likely to induce metal fatigue than others. The laboratory test programme therefore concentrated on aircraft whose design suggested the presence of these stress combinations. The first aircraft tested was the Viking, and the Air Registration Board has decided to require the replacement of the centre-section spars of the wings after 10,000 flying hours—the equivalent of three years' service. The Hermes aircraft is now undergoing the same test and other aircraft will follow.

As information is obtained the board may be able to decide, on issuing a certificate of airworthiness for a new aircraft, whether any limit must be put on the life of any part of its structure. In the past, such limitations have been imposed only when the need for them became apparent after the aircraft had been in service for some time. Service experience, for example, revealed the need for regular replacement of certain parts of the Dakota airframe. If limits can be set down before and not after an aircraft shows a tendency towards metal fatigue, the result will contribute to greater safety in the air.

* * *

Responsibility in the Mines

Early in the inquiry that followed the Knockshinnoch Castle colliery disaster in September, 1950, it became obvious

that the National Coal Board's organisation between the level of the area and the pit was in a sense on trial. This impression in the public mind has since been amply confirmed by the courts, which acquitted the manager, the former agent of the group of mines, the sub-area production manager and the sub-area production engineer of contravening mining regulations, and upheld these acquittals on appeal by the Crown. Dismissal of the appeals was in part based upon obscurities in regulations covering "moss, quicksand or liquid matter"; but perhaps mainly upon the diffusion, and indeed dissipation, of responsibility, in the area organisation. Lord Cooper, the Scottish Lord Justice General, put the gravamen of the charge in his leading opinion:

> It is impossible to lay responsibility on any individual or individuals when the hands of the manager and agent are tied and their eyes blindfolded by the hierarchy of officials responsible for planning and production. The duties were distributed among a corps of officials so that what was everybody's business was nobody's business.

This judgment is at present under discussion by the Board, and officials at Hobart House are hesitating to comment upon its consequences for their area structure of organisation. These do not arise solely from defects in that organisation. It has been increasingly obvious in recent years that the central principles of responsibility upon which mine safety regulations are based, as laid down in the Coal Mines Act of 1911, bear little relation to the organisation of modern coal mining; and though the regulations have frequently been amended, changes in the Act are overdue. Before the war a Royal Commission studied the question with a view to framing new principles, but its report appeared in 1939 and action was inevitably postponed.

Nationalisation has since complicated the chain of responsibility to a far greater extent. These are changes in organisation; but the effect of technical development has been in the same direction. Under the Act the colliery manager is responsible for direction, management and daily supervision of the pit, and takes instructions from nobody who is not technically qualified. Coal mining has gradually become a complex alliance of techniques, and specialists on particular types of engineering and equipment underground multiplied in the larger coal combines between the wars; under the National Coal Board their number has grown apace. Effective responsibility for the operations in a large-scale mine is now almost beyond one man, and in practice the colliery managers share responsibility at many points. Yet legally the main responsibility still rests upon these managers, less than a thousand in number; one result of the Coal Board's elaborate "*line and staff*" chain of command may be, it appears, to diffuse that legal responsibility beyond identification. The Board has as a member the country's foremost expert upon safety regulations, Sir Andrew Bryan, who has long recognised the need for amendment of the Act, though he has often emphasised the difficulties of framing satisfactory new principles. Amendment would be a lengthy process; but there is obviously a need for some definition of the responsibilities of specialist officials in relation to those of agents and managers.

* * *

No Change in National Savings

In the financial year 1951-52 new savings through the national savings movement amounted to £1,044 million, or £95 million more than in the previous year (when the same amount of accrued interest—£126 million—was included in the recorded total). Unfortunately, withdrawals from past savings rose in step, by £93 million to £1,037 million, so that the movement's recorded surplus of receipts over withdrawals rose only from £5 million to £7 million; in fact if the £43 million of defence bonds repaid at maturity last year are included, the movement's experience in 1951-52 was about £41 million worse than in 1950-51. The introduction of the new savings certificate in February, 1951, boosted sales of certificates by £24 million to £156 million. While encashment of existing certificates was little changed at £136 million, a great deal of the new money invested in certificates seems, however, to have come from encashment of defence bonds, withdrawals from trustee savings banks (whose "surplus" of receipts over withdrawals narrowed from £16 million to £5 million) and from the post office savings banks (whose "deficit" widened from £80 million to £96 million).

Analysis of the monthly returns shows that (even if repayments of defence bonds at maturity are excluded) small savings experience was slightly worse in the high summer of last year than in the summer of 1950; it improved slightly relative to the previous year in the last four months of 1951, deteriorated again in the first two months of 1952, but was rather better in March (thanks partly to the lateness of Easter this year). These trends accord broadly with known trends in public spending, but they suggest that national savings cannot now be regarded as much more than a neutral factor in the national economy. To have maintained neutrality is, however, no mean achievement; as Lord Mackintosh said last week "in the present economic conditions, and with many good wartime savers now reaching retirement" it is not surprising that withdrawals are so high. The movement enters the new financial year with the pattern of interest rates that it is allowed to offer on small savings much less attractive, relative to other forms of investment, than it was a year ago.

* * *

Compensation at Snail's Pace

More than five years after the vesting date for coal nationalisation, compensation of the former coalowners appears to be about half complete. So far only £40,691,998 of the £250-300 million to which it may finally amount has been paid in final settlement—for railway wagons, stocks and stores, and a few of the ancillary assets outside coal mining that were taken over. But in all, £140,148,488 has been paid out, of which about £96½ million represents payments in partial settlement of claims for collieries. Though no final settlements have been recorded by the District Valuation Boards for mines, these partial payments often represent some 90 per cent of the eventual value: they have been made to a large number of the coalowners who came to voluntary agreements to share their district's part of the £164,600,000 "global award" for collieries as a whole. Such agreements have now been made in Somerset, Cannock Chase, Kent, Northumberland, Durham, Cumberland, South Wales and Monmouthshire, Warwickshire, and North and South Derbyshire. No agreements have been reached in Yorkshire and Scotland, two big districts, and in Nottingham, Lancashire and Cheshire, North and South Staffordshire, North Wales, Forest of Dean, Shropshire and Bristol; and some disagreement appears to have arisen about the agreement reached in Leicester. Officialdom has contributed a considerable share of this delay; but some mining companies have played their part. Those still holding out against agreement must obviously protect their shareholders; but, with the aid of some of the Chancellor's periodical estimates of the fall in the purchasing value of the pound, they must be uneasily aware of how much the delay so far has lopped off the real value of the compensation they hope eventually to get.

A man of few words

Long before momentous events have become newspaper headlines, taciturn Tom Armstrong*, in charge of one of the paper-making machines at Bowaters Kemsley Mill, has run through the newsprint to carry the news.

At one end of the towering machine, a hundred yards in length, a sheet of liquid of the colour and apparent consistency of thin porridge is carried in by a moving belt. As it travels over a series of suction boxes this grey liquid quite suddenly whitens, for all the world like an egg beginning to poach. Almost instantaneously it has turned into paper, gliding on over steam-filled cylinders which carry it along to the roll.

If you can hear him above the noise, Armstrong will explain that four miles of paper are wound onto the roll every fifteen minutes throughout the twenty-four hours of every day. There are many such mammoth machines in the Bowater Organisation and this particular one happens to be the widest paper-making machine in the world. It is known, he will tell you, as "Bowaters' Number 5" — and it produces a roll 300 inches wide, which is cut into five to fit the printing presses. "Bit quicker than making papyrus," you shout. "What?" shouts Tom. "Quicker than making parchment," you bellow through your cupped hands. "No. 300 inches," Tom replies. "Widest in the world." And on a strip of newly-made paper he writes the figure down.

The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper — the 'know-how' in short — is freely at your service.

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1951.

After providing £1,153,000 for United Kingdom Income Tax and Profits Tax the profit for the year is £982,714, plus £282,327 brought forward, making a total of £1,265,041. The Directors have placed £300,000 to the credit of Exploration Reserve Account, have provided £47,000 for Staff Pension Fund contingencies and have declared a final dividend of 4s. 6d. United Kingdom currency per share free of United Kingdom Income Tax, absorbing £418,500, and making, with the interim dividend of 2s. per share, a total distribution of 6s. 6d. per share free of United Kingdom Income Tax or £604,500 for the year, leaving £313,541 to be carried forward.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under but in no case above the market value of December 31st last, or, where no market price exists, at ove the Directors' valuation. At present market prices these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price. As a result of the sale of certain shares in a subsidiary company, capital profits previously applied against the cost of the investment in that Company have been freed to the extent of £50,000, and this sum has been placed to the credit of Capital Reserve Account, which now stands at £300,000.

A copy of the Corporation's Annual Trade Cycles Chart, revised to date, is enclosed with the Report.

GOLD MINING INTERESTS

Summary of the operating results for the past year of the Companies operating in the Witwatersrand in which the Corporation is largely concerned :—

	East Geduld Mines, Ltd.	Geduld Proprietary Mines, Ltd.	The Grootvlei Proprietary Mines, Ltd.	Marievale Consolidated Mines, Ltd.	Van Dyk Consolidated Mines, Ltd.
Tons milled... ...	1,738,000	1,259,000	2,339,000	729,000	1,204,000
Yield per ton... dwt.	6.00	2.93	4.45	4.97	3.02
Working Costs per ton	25s. 5d.	27s. 10d.	25s. 0d.	37s. 2d.	35s. 1d.
Working Profit per ton	53s. 0d.	10s. 6d.	33s. 1d.	27s. 8d.	4s. 4d.
Total Working Profit	£4,604,000	£658,000	£3,872,000	£1,009,000	£263,000
Net Profit	£2,158,000	£1,154,000	£1,819,000	£512,000	£250,000
Dividends : Total...	£1,950,000	£1,077,000	£1,716,000	£450,000	—
Per cent.	108¾	73¾	60	20	—

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1951 on its shareholding in The Grootvlei Proprietary Mines was £80,640 and Geduld Proprietary Mines' dividend income in 1951 on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £770,585.

On Van Dyk, development in the No. 5 Shaft area has commenced. Payment of dividends has been suspended in order to finance this Shaft and initial development therefrom.

ST. HELENA GOLD MINES—The first ore reserve estimate as at December 31st last showed an amount of 625,000 tons, having a value of 5.9 dwt. over a stoping width of 48 inches.

After trial runs the reduction plant came into commission on 1st November and by the year end 81,000 tons of ore derived mainly from development had been milled, resulting in a working loss of £43,995. During the current financial year the mine has shown a small working profit.

The opening up of stopes has not progressed at a rate sufficient to supply the reduction plant with ore to its full capacity, but the position should improve gradually as additional stope faces become available. In order to provide funds to accelerate development work, to cover capital expenditure at the mine, and to repay the temporary loan of up to £1,000,000 granted by the Corporation last year, the Company has raised the sum of £1,700,000 by an issue of 2,125,000 shares at 16s. 0d. per share.

THE WITHOK PROPRIETARY COMPANY.—The borehole in the centre of the Company's property, which was referred to in last year's report, intersected the Main Reef at a depth of 7,034 feet. No values were disclosed.

Interests not under the administration of the Corporation :

STILFONTEIN GOLD MINING COMPANY.—This Company continues to make good progress in opening up its mine in the Klerksdorp district of the Transvaal and development work has disclosed a high percentage of payability with good values on Vaal Reef. It is expected that production will commence about the middle of 1952.

WESTERN HOLDINGS.—Both of this Company's shafts in its lease area in the Orange Free State have intersected the Basal Reef with satisfactory results. It is expected that production on a small scale with rock from development will start about the middle of 1952.

OTHER MINING INTERESTS

SAN FRANCISCO MINES OF MEXICO.—In the year to 30th September, 1951, 597,400 tons of lead-zinc-silver ore were milled compared with 623,000 tons in the previous year. Power cuts in the supply of electricity to the Mine in the later months of the year contributed to the reduction.

The Company's issued capital was doubled in May, 1951, by capitalising £1,028,406 10s. from Reserves and issuing bonus shares to members in the proportion of one 10s. bonus share for each 10s. stock unit held.

CHROME MINES OF SOUTH AFRICA.—Operations continued throughout the year but were again handicapped by the shortage of railway trucks.

Interest not under the administration of the Corporation :

TSUMEB CORPORATION.—The net profit of this Company for the year ended 30th June, 1951, was £2,966,943 compared with £1,495,572 for the previous year and dividends totalling 7s. 9d. per share were declared. During the current financial year dividends totalling 10s. 0d. per share have so far been declared. Steps are being taken to increase the capacity of the Mine and the Mill plant.

OTHER INTERESTS

BAY HALL TRUST.—The net profit for 1951 was £77,435 and a dividend of 6¼ per cent. free of tax was declared. The Trust's investments as at December 31st last showed an appreciation of £716,014 over book cost of £2,232,419.

BRITISH ENKA.—Production in 1950 was substantially increased. Net profits for the year rose to £315,241 to which was added £217,798 in respect of taxation over-provided in previous years and no longer required, making a total of £533,039. Dividend paid was increased to 10 per cent., absorbing £105,125 and £400,000 was transferred to General Reserve. During 1951 the Company further increased its output.

SOUTH AFRICAN PULP & PAPER INDUSTRIES.—During the year production and sales were again increased. The net profit for 1951, after making provision for taxation and depreciation, amounted to £274,022. Dividends totalling 2s. 0d. per share have been declared compared with 1s. 10½d. per share for previous year.

At the Enstra Mill the smaller of the two additional paper machines referred to in last year's Report was brought into production during the latter part of the year under review. Work has started on the erection of the main factory buildings for the Company's new Mill in Natal. To provide further funds for this expansion of operations, the Company last year issued 1,000,000 shares at 40s. 0d. per share.

EXPLORATION

Active exploration work was continued during the year under review by the Corporation and its subsidiary Companies, including Capital Mining Areas in the Bethal District of the Transvaal, and Central Mineral Exploration in the Miala area of Tanganyika. The Corporation continues to hold the mineral rights on certain farms in the Orange Free State.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, E.C.2.

products—compounds based on dinitro-phenol and those using organic phosphorus. The first group are weed-killers and the second, insecticides ; their use has caused increasing concern because contact with the spray of either can be fatal and the dinitro-phenol compounds have been responsible for a number of deaths.

Last year, between three and four million acres of arable land were sprayed with weedkillers, many of them being in the dinitro group. This total shows a rapid growth, for less than a million acres were sprayed in 1949. A similar growth in the use of phosphorus insecticides was checked by an interruption to supplies. Of the two most effective phosphorus insecticides, one is sprayed on to the plant and kills insects on contact ; its best known form is parathion. The other is absorbed by the plant and kills those insects that feed on the sap. An accident last year stopped production at one plant that supplied most of the parathion for insecticides, and production has not been resumed. Another company has decided not to proceed with plans for building a new parathion plant. The companies that manufacture insecticides are therefore wholly dependent on the limited supplies of parathion that they can import from the Continent. The second form of "systemic" phosphorus insecticides is still sold only by Pest Control, although the company has a close competitor in Plant Protection Limited, which has been working on the same type of product for four years and supplies more than half the market for weed killers and insecticides. Both companies are conscious of the temptation to disregard the irksome precautionary measures that they recommend to protect spray operatives. Rubber boots and gloves, hooded overalls and eyeshields are not comfortable to wear and the risk of a £50 fine under the new bill is the only legal sanction to ensure that they are in fact worn throughout the spraying operations. Both companies are working hard to discover a non-toxic phosphorus compound that could replace those now in use. Meanwhile Pest Control has developed a technique for packing the "systemic" insecticide in capsules which are placed among the plant roots and thus absorbed into the plant system. This method has been successfully used in the Gold Coast experiments to control swollen shoot disease in the cocoa plantations. It is more expensive than direct spraying, and can be used only for chemicals that can be drawn up by plant roots. But agricultural chemists are watching its development with considerable interest.

Shorter Notes

A new reference by the Board of Trade to the Monopoly Commission directs it to inquire into the supply and export of electric generators, electric motors and transformers, and steam and hydraulic turbines for driving heavy alternators. The reference sets lower limits to the capacity of the generators, motors and transformers, of which the manufacture and export are to be investigated ; but these are so low that all but a very small percentage of the value of most of this equipment produced lies above them—with the outstanding exception of fractional horse-power motors. A report upon another section of the electrical engineering industry, cable-making, should be completed this month ; and it may be noted that the recent annual report of the Commission recorded domestic electrical appliances and steam boilers as among the manufactures of which investigation has been suggested to the Board of Trade—boilers having been suggested by the London County Council.

★

Palestine currency has now ceased to circulate as legal tender and the old Palestine Currency Board is to be dissolved. Any notes still outstanding can be tendered to Barclays Bank (DC and O), which has been appointed by the Crown Agents to handle the business of redemption.

Company Notes

Ford Motor.—In spite of material shortages, Ford Motor was able to produce 171,000 vehicles and tractors last year, and to export 125,000 of them. This was less than the record output of 185,000 vehicles and tractors in 1950 ; but, despite this, total income rose by about 5 per cent, from £64,750,000 to £68,000,000. The increase in income was, however, accompanied by an increase in costs, particularly of imported materials, and group trading profits fell slightly, from £11,643,282 to £11,275,663.

Sir Rowland Smith opened his address to shareholders by averring that "in face of increasing difficulties 1951 was, nevertheless, a year of successful achievement." Unfortunately, these difficulties may become even greater this year, for costs seem certain to increase again, while the threat of a shortage of materials is by no means averted and that of a sales recession in Ford's export markets is growing. Sir Rowland explained that "the maximum effect of material shortages" was not felt until the beginning of this year and that there is still "no certainty that steel will be in sufficient supply to meet export demands."

The portents for export demands, however, are not encouraging. Last year Ford's exports to North America were smaller than in 1950, thanks to tighter credit restrictions there ; elsewhere strong competition from continental manufacturers was again encountered, particularly in Europe and South America. Moreover, in recent weeks the Australian market, the company's biggest overseas buyer last year, has been considerably restricted. Sir Rowland hopes that any disruption of foreign markets will be offset by permission from the Government to increase deliveries at home ; otherwise, he adds, "unemployment could arise." The home market would probably absorb any frustrated exports offered to it.

One symptom of last year's difficulties may be found in the steep rise in the book value of stocks and work in progress from £7,991,420 to £13,122,674 ; this increase may

Rowland of the problems that lie ahead, but they can glean some comfort from the fact that Ford intends to push ahead with capital development and expansion—about £14 million is to be spent in the next three years—and that the dividend has been raised from 12½ to 15 per cent. This increased dividend absorbed £708,750, but it was still comfortably covered by last year's distributable earnings.

★

Reyrolle.—Last year Reyrolle clipped, but did not squarely hit, the bull's eye of its target. In the year to December 31st its output, both in volume and value, was the highest in its history, but shortages of materials prevented it from producing as much as had been originally planned. The expansion of production led directly to the increase in trading profits, from £1,747,464 to £2,099,622. The chairman, Sir Claude Gibb, admitted that in view of these achievements many shareholders may believe that the company's dividend policy is "none too generous." A final dividend of 6¼ per cent has been recommended on the ordinary capital of £2,035,294, as increased by the 100 per cent scrip bonus, following an interim of 7½ per cent paid on the original capital of £1,017,647; it was upon this capital that a distribution of 15 per cent was made in 1950. Total net dividends amount to only £127,420, while £1,175,000 was provided for taxation and £628,345 appropriated to reserves. The directors justify conservatism—perhaps a little lamely—by referring to the Chancellor's plea for dividend restraint. A dividend of 15 per cent would

have been justified by the year's results, but shareholders would perhaps be unwise to look beyond a dividend of 12½ per cent this year (compared to the equivalent of 10 per cent on the new capital in 1951). The market is certainly expecting at least that distribution, for at the current price of 41s. 6d. the £1 ordinary shares yield—on the 1951 distribution—only 4.8 per cent.

A bigger order book is reflected in the rise in the book value of stocks from £2,770,954 to £3,454,388 and there are likely to be even more orders this year, for this type of capital goods industry is booming even while the prospect for consumer goods industries recedes. In the chairman's words, "higher targets have been set for 1952 and subsequent years to meet increasing demands for the company's products at home and overseas." Last year an increase in orders was apparent in all the company's foreign markets, and at home, where about 60 per cent of the group's output is sold, Reyrolle has been able to plan for about four years ahead to satisfy the British Electricity Authority's requirements for the larger types of switchgear. The biggest danger is a shortage of raw materials and Sir Claude joins other chairmen of metal-using industries in making a plea for an additional allocation of steel.

★

W. T. Henley's.—A preliminary statement by W. T. Henley's Telegraph for the year to December 31st last shows another slight fall in profits before tax, from £1,417,235 to £1,368,644. In 1950 a steep rise in production costs and fluctuations in prices of raw materials led to a similar recession in profits, and the same causes probably underlie the latest decline. As the group's manufacturing interests range from electric cables to motor tyres, its earnings are likely to be jarred—more than most—by the see-saw of metal and rubber prices. It is probably for this reason that the company has made an appropriation of £200,000 (against £105,000) to a reserve against fluctuations in prices of materials. This appropriation is made from a net profit of £646,447, compared with a net profit of £685,559 in 1950, and another £250,000 (against £200,000) has been allotted to a fixed assets replacement reserve. These appropriations have been accompanied by a draft on the carry forward, which has been reduced from £953,477 to £927,000. The fall in profits has not been sufficient to prevent the directors from recommending the customary annual distribution of 20 per cent. At the current price of 19s. the 5s. ordinary shares give the not over-generous yield of 5¼ per cent.

★

Elder Dempster.—A modest recovery in earnings has been reported by Elder Dempster. In the year to December 31st last, gross profits before tax increased from £2,486,317 to £2,826,470. Taxation absorbs £890,727 (against £834,817) and depreciation takes £582,782 (against £514,041) and net profits have risen from £1,137,459 to £1,352,961. Both gross and net profits, however, appear to be below the level of profits earned in 1948 and 1949. This modest increase in profits may disappoint some shareholders, particularly when set against the substantial advances reported by other shipping lines last year; but it does at least suggest that EPL will be less onerous for Elder Dempster. The dividend is again maintained at 15 per cent, the rate to which it was raised a year ago, and £1,072,867, against £906,385, is transferred to reserves. Like most other shipping undertakings, the company gives no indication of what proportion of its appropriations has gone to freely distributable reserves; any calculation of the earnings cover on the ordinary dividend would therefore be misleading. Since the end of the financial year ordinary stockholders have been offered 687,149 £1 shares at 30s. each in the ratio one new share for every four held. The new money will help to provide a small part of the finance needed for the recent purchase of British and Burmese Steam Navigation by Elder Dempster, an acquisition that should help to swell earnings in future years. At their current price of 44s. 6d. the ordinary shares yield 6.7 per cent.

Balance brought forward from last year less amount necessary to convert capital and reserves into pounds Egyptian	191,263 331
	2,405,402 412

Aly Shamsy Pasha, the president, in the course of his speech said:—

Generally speaking, agricultural production did not prove altogether satisfactory, while industrial production was maintained at a favourable level. In the commercial field business did not maintain a steady flow; during the first nine months of the year turnover was comparable with 1950 levels, but in the last quarter it slowed down considerably. On the other hand, our gold and dollar reserves continued to increase. However, it cannot be concealed that the improvement in certain aspects of our monetary situation was hampered by the course of prices.

BALANCE SHEET

Current, deposit, and other accounts show a reduction of about £E.22 million, due partly to a fall in certain foreign accounts owing to the opening of documentary credits and the investment of some public funds on deposit with us, and partly, but to an unimportant extent, to withdrawals of deposits since, under the Central Bank Law, we no longer pay interest on current accounts but only on notice and fixed deposit accounts, contrary to the practice of commercial banks, which allow interest on current accounts.

On the assets side, Government securities show an increase of about £E33 million, mainly due to three causes of unequal significance; the purchase of foreign Government Treasury Bills on behalf of the Central Exchange Control, the transfer to the Banking Department of British Treasury Bills against the gold withdrawn from this Department for deposit in the Note Issue cover, and finally to increased holdings of Egyptian Treasury Bills issued in connection with the Government purchases of cotton. We have taken the opportunity of switching part of the British Treasury Bills into the new One and Three-quarter per Cent Serial Funding Stock, 1952.

The total of our advances shows a reduction of about £E3 million. Advances against securities and merchandise to banks in connection with the financing of the cotton crop show an increase of about 3½ million pounds. On the other hand, advances on merchandise, mainly to cotton exporters, are down by nearly £E5 million, while other advances are down by about £E1½ million.

DIVIDEND MAINTAINED

Our profit and loss account shows gross profit at £E2,214,139, against £E1,897,536 for the previous year; this satisfactory increase of £E.316,603 in earnings is due to greater dividends on our securities and increased interest received and to a reduction in interest paid, and also to a satisfactory increase under the headings of exchange and commission, due to enhanced business, specially in documentary credits.

On the other hand, our expenses amount to £E.1,566,145, as against £E.1,277,734 in 1950. The increase in our expenses of about £E.288,000 is attributable to increased taxation, and to higher salaries, allowances, and the special bonus to our staff.

Net profits amount to £E.629,073, against £E.607,153 in 1950, which enables us to propose the distribution of a dividend similar to that of last year—namely, 20 per cent per share—which will be paid on the capital now converted into Egyptian pounds.

The report was adopted.

Copies of the President's address in full will be available at the National Bank of Egypt, 6 and 7, King William Street, London, E.C.4.

ANGLO-FRENCH EXPLORATION COMPANY

PRICE OF GOLD

The sixty-second annual general meeting of The Anglo-French Exploration Company, Limited, was held on April 2nd in London.

The chairman, Mr F. R. Cottell, ACA, in the course of his speech said:—Our investments stand in the books at £962,018 and are valued at £1,236,458, an excess of £274,440. The profit is £33,833, and we recommend the payment of a dividend of 7½ per cent on the increased capital

INTERNATIONAL MONETARY FUND

The future stability of the sterling area as a whole is in danger and further efforts are being made to achieve a balance in our trade, which it must be hoped will be more successful than the earlier attempts. However, some of the steps which are being taken are mainly with a view to correcting the short-term position and a longer-term objective in order to improve our trade is the convertibility of sterling; this is impossible of achievement until our reserves of gold have been substantially increased.

I would refer you to a recent report prepared by the United Nations entitled "Measures for International Economic Stability," which advocates changes in the structure and policies of the International Monetary Fund. The report states that the existing reserves of most countries are not in general adequate to enable them to maintain a reasonably stable flow of imports and that the International Monetary Fund provides only a comparatively trivial supplement to national reserves.

QUESTION OF RISE IN PRICE

The report acknowledges that one of the ways to raise reserves to a more adequate level would be by raising the price of gold uniformly in terms of all currencies, as provided in the articles of agreement of the International Monetary Fund.

The report also states that the official price of gold measured in dollars is no higher than before the war, while prices in international trade have doubled, and that the effectiveness of a given gold reserve as a buffer against trade fluctuations has been halved. However, the conclusion is reached by the authors of the report that, whatever the balance of the economic arguments, a change in the price of gold raises many political problems, and they have thought it appropriate to restrict their analysis to other methods of raising reserves to a more adequate level, although they acknowledge that such other methods also raise difficult questions for governments.

In my opinion, it is particularly unfortunate, and perhaps significant, that the political problems are not disclosed and explored and that the authors of the report fail altogether to examine the possibilities of increasing the price of gold in all currencies whereby reserves would be raised to a more adequate level to deal with trade fluctuations. I am far from claiming that such a world increase in the gold price would solve present-day economic problems, but I do believe it would materially assist the achievement of that desirable object, and it is to be noted that some well-known authorities are advocating an upward revision in the price of gold.

It is to be hoped that the International Monetary Fund and the United States authorities, in whose hands any decision will rest, will take steps with a view to effecting this change and that they will not delay action until they are perhaps forced to do so by a serious recession in trade.

The report was adopted.

UNITED SUA BETONG RUBBER ESTATES

FUTILITY OF COMBATING TERRORISM WITH POLITICAL WEAPONS

EPL: DESTRUCTIVE OF ENTERPRISE

SIR JOHN HAY ON USA RUBBER POLICY

The forty-third annual general meeting of the United Sua Betong Rubber Estates, Limited, will be held on May 14th at 19, Fenchurch Street, London, E.C.3.

The following is the address by the chairman, Sir John Hay, which has been circulated with the report and accounts:—

In the year 1950 two members of our staff were murdered by Communist terrorists. At the beginning of this current year another member, Mr Butler-Madden, was shot dead. He was a senior officer of great promise, serving on Tanah Merah Estate, a property situated in a district which was regarded as comparatively safe. His death is greatly deplored and we extend to his widow our very deepest sympathy. Two months later, Mr Jansen, serving on Young Peng Estate, was ambushed in company with his driver, a contractor and a special constable. All four engaged the enemy and drove them off. The driver was wounded and subsequently had to have a hand amputated. The contractor was killed. Mr Jansen was wounded, but he had the satisfaction of killing a bandit, upon which he has been congratulated by General Templer. Mr Jansen, happily, is well on the way to recovery.

It would be a mistake to suppose, however, that these are only isolated incidents. There have been many attacks both on person and property, particularly on our estates in Johore, where ten members of the security forces were killed and a greater number wounded. There have been numerous attempts at murder of selected individuals, while shooting at security forces and others is a frequent happening. Attacks on property take many varied forms—trees slashed, tapping cups broken, lorries and buses burned, telephone wires cut and poles destroyed, trains derailed, hand grenades thrown, and railway sidings raided for food. Stealing of rubber is widespread, corrupting intermediaries and serving as a source of rich income to the bandits. For nearly four years evil men have conducted a campaign of murder, violence, destruction and intimidation. Labour is the object of highly organised subversive activities: fear and apprehension are kept alive by threats and recurring acts of violence. Very recently on the estate of Oil Palms of Malaya, Limited, with which this company is associated, an Asian assistant was attacked by bandits. His hands were tied behind his back and he was literally hacked to pieces by parangs. His fault was that in the service of his company he was loyal and faithful. Those who live near such tragic realities and whose constant companion is danger do not receive well the statements too often repeated by officials to the effect that terrorism is to be fought by "political" weapons. Savagery and brutality must be suppressed by force. Political and social measures are matters to be dealt with on their merits. Progress should be neither retarded nor accelerated by the brutal acts of brutal men.

STAFF AND LABOUR

Such, in brief, is the background against which much of our company's activities are conducted. The welfare and safety of our staff and labour are our constant concern. Nothing which would contribute to their security, and which it is within our competence to provide, is denied them. During the year under review we spent over $600,000 on security measures. It was a special pleasure to me to meet members of the company's staff on the occasion of my visit to Malaya in December and January last. Such meetings are particularly valuable in present difficult circumstances in contributing to an understanding and confidence between those who direct in London and those who work in far distant Malaya. To all who continue to serve us, especially those in dangerous places, we extend our good wishes. Our thanks will find tangible expression in the payment shortly to be made by way of commission on profits. This profit-sharing scheme, together with a contributory provident fund, has long been in force in this and associated companies. It was my pleasure when in Malaya to announce the introduction of a supplementary retirement fund which offers substantial inducements and special rewards for long service. The Asian staff has its own provident fund. Another one is about to be introduced for the benefit of labour. The former also receive a share in the profits, while the latter are rewarded by bonuses on output.

Despite many difficulties, including a continuing shortage of materials, progress has been made in the improvement of housing on our estates, while additional amenities, especially for the labour force, have been provided. On our major property a cinema hall has been erected where regular film shows are given. Labourers' earnings were more than sufficient to cover the increased cost of living. It has been estimated that their earnings were about five times the rate prevailing before the war. All who are in the service of the company are, in their various ways, sharing very amply in our fortunes. There are unmistakable signs, however, that rubber is again running true to form and that prosperity, after a fleeting and fortuitous visit, is now departing, leaving in its train the difficult and painful task of adjustment to the meagre fortune which is our more usual lot.

PROFITS AND TAXATION

The tax collector again lays heavy and greedy hands on our profits, which are distributed in the following proportions:—

	%
(a) To the Malayan and United Kingdom Governments	68.0
(b) Dividends to stockholders	12.2
(c) Retained in the business	19.8

At present our total tax payments consist of four items—namely, Malayan export duty, which alone amounted to over £400,000; income-tax; profits tax; and distribution tax. One would have imagined that even the most rapacious of Governments would have recognised that the limit in taxation had already been reached, if not exceeded, but further burdens are to be laid upon us. From March 1 of this year, the Malayan Government has added to the existing duty a further 4½ cents per pound. True, this is to be returned to us—after deduction of expenses. I won't pause to explain why a supposedly hard-pressed bureaucracy should occupy itself in collecting money merely to return it—less expenses. We must extract such comfort as we can from the knowledge that in this instance they are fairly harmlessly employed. From the provisions of the United Kingdom Finance Bill, just published, it becomes evident that we do not escape from the

EXCESS PROFITS LEVY

In this context there is no exact definition of "excess." Consequently, some arbitrary standard of measurement has to be set up, Liability is not regulated according to any recognisable principle. It is determined by the haphazards of circumstance and the accident of time. The standard by which "excess" is to be measured is the average profits for the years 1947-49, plus certain allowances for increased capital, etc. It is notorious that these "standard" years were particularly unfavourable to rubber. The industry had scarcely emerged from the rehabilitation stage after a disastrous three-and-a-half years of enemy occupation, while the price of rubber was still under the influence of a blundering decision by the Government of the day by which, at a time of shortage, the price was fixed below the cost of production. The alternative method of calculating "standard profit," as defined by the Bill, offers no advantage. One of the strangest features of the provisions of this Bill is its insistence in relating profits to something so irrelevent as nominal capital instead of to real capital. Our nominal capital is £900,000. The real capital employed in the business is very little short of £3 million. The probable effect in our case of this ill-conceived tax will be to raise our total taxation to about 80 per cent of profits—and on profits so computed that out of the residue provision has still to be made for the replacement of equipment—for which this year we have had to put aside £250,000—as well as for replanting. Replanting is permitted as a charge only in so far as it is in practice undertaken. In present conditions in Malaya it can only be carried out to a limited extent and in some cases not at all. In its application to this industry the tax is harsh and inequitable. Generally, it is an incentive to waste and extravagance, it is inflationary, it impairs capital, it is destructive of enterprise, and it makes nonsense of the talk now current of "developing the empty spaces of the Commonwealth." No amendment can make this tax unobjectionable. It should be withdrawn.

ESTATE OPERATIONS

In our interim statement issued in October last we stated that the rubber crop for the year was not likely to exceed 18 million lb. It in fact fell slightly short of that figure. Significantly, the heaviest fall in crop occurred on our Johore properties. In the disturbed conditions existing there, to which I have already referred, it was no mean achievement on the part of the managers to have maintained productive operations without interruption. Despite many discouragements, we continue to persevere with replanting, although the extent of these operations has to be restricted to modest proportions and falls below our original aim. As predicted, costs were virtually double those of the preceding year. This startling increase in so short a period of time was due mainly to higher wages, lower output per unit of labour, and

a substantially increased export duty. On the whole, our rubber properties have been well maintained.

TEA

The tea industry in Malaya is young and small, and there is consequently no general pool of skilled labour upon which we can draw. Plucking entails longer hours of work than rubber tapping, and exposure to the heat of the sun is greater. To retain necessary labour we had, therefore, to conform to the higher prevailing wage standard, although against this there was no offset corresponding to the then better price of rubber. None the less, we succeeded in operating at a moderate profit. We increased the crop and maintained the quality without any neglect of the upkeep of our properties. To have achieved all this is greatly to the credit of the managers.

USA RUBBER POLICY

Deprived by governments of by far the greater part of our profits, our interest in the price of rubber becomes rather secondary. If our dividend of 50 per cent seems to belie that, it should be remembered that a dividend at that rate occurs only very rarely in our history. Moreover, if related, as it should be, to our real capital instead of the nominal capital the percentage drops to a modest figure. Our total net dividend for the year is the equivalent of less than 3d. per pound on our rubber output. On an average tyre, containing about 10 lb of rubber, that would be less than 2s. 6d. I hardly imagine that at this trifling cost the tyre user would grudge the rubber shareholder his rare dividend. Least of all would he wish to deprive the rubber worker or his manager of a fair reward for their labours.

But the importance of rubber extends beyond considerations of private profit or Government taxes. What happens to rubber may well determine the course of events in South East Asia and must certainly exert a considerable influence on the sterling area's dollar problem. One of the aims of the Communist insurrection in Malaya is the disruption of its economy. That aim has been frustrated largely by the courage and fortitude of the planter, aided by a timely, albeit fleeting, return of prosperity to Malaya's main industry. To force the price of rubber below its economic level would encourage the enemy in the pursuance of his nefarious purpose and bring dismay to those who have so long withstood his attacks.

Even if the price of rubber is maintained —an assumption which hardly seems warranted—the value of exports of rubber to dollar countries in the current year may very well decline by as much as one hundred and seventy million dollars as compared with 1951. Against this very serious loss in exports there is no offset in the form of a reduction in the price of raw materials imported from the USA. On the contrary, the prices of such imports are held fast at a high level. We are familiar with the comparison between the prices of cotton and natural rubber—a comparison which shows that in terms of American cotton rubber has declined to 55 per cent of its 1939 value. This is by no means a solitary instance of a wide disparity between the prices of what we sell and what we buy, as the following table illustrates:—

COMMODITY PRICE COMPARISON

	1939		Current price	Current price increase %
Natural rubber	17.56c	per lb	37.33c	113
Cotton	9.00c	„ „	41.40c	360
Wheat	70.00c	„ bushel	251.00c	259
Maize	48.00c	„ „	185.00c	285
Tobacco	$19.2	„ 100 lb	$51.7	169

With the terms of trading flowing so strongly and set so unfairly against the sterling area, it is hopeless to expect that the dollar problem can be solved.

In exercise of her dominant position in rubber, America pursues a course which is in strange contrast to the generous policy she otherwise follows in support of world peace and economic welfare. The main features of her present rubber policy are the enforced use of her synthetic product and the restricted use of natural rubber. This policy, originally introduced to free natural rubber for stockpiling, is now being continued and applied with accumulated momentum after that purpose has been served. The synthetic material is the product of a Government-owned industry and is at present sold at the arbitrary fixed price of 23 USA cents per lb. The market price for natural rubber, delivered to the USA, is under 38 USA cents per lb. From the fact that, despite this advantage in price, the use of synthetic has to be enforced by law, it is fair to infer that natural rubber, even at its higher price, is still the superior product. It is difficult to escape the conclusion that the policy originally introduced for defence purposes is now being used as a weapon to depress natural rubber and to protect the synthetic substitute. It would befit a great and generous creditor nation to abandon a restrictive trade practice which not only seriously disturbs the balance of trade, but also threatens to impoverish the harassed and troubled peoples of South East Asia.

LONDON & LOMOND INVESTMENT TRUST LIMITED

REVENUE EXPANSION

The twenty-first annual general meeting of London & Lomond Investment Trust Limited was held on April 9th at 116 Old Broad Street, London, E.C.2.

The following is the statement by the chairman, The Hon. W. B. L. Barrington, circulated with the report and accounts:—

The gross revenue received from investments during the year under review was £152,701, which was £26,649 more than in the previous year. This expansion of the revenue is attributable almost entirely to increases in the dividends received from investments. Expressed as a percentage, the amount earned on the ordinary stock rose to 36.38 per cent. £10,000 has again been added to general reserve. Your directors recommend that the dividend on the ordinary stock be raised to 22½ per cent by a final payment of 16½ per cent. If this recommendation is adopted, the remaining surplus revenue for the year, amounting to £10,403, will be added to the amount carried forward at the credit of profit and loss account and the net available revenue, after charging expenses and income tax, will have been disposed as follows:—

	Per cent
Debenture stock interest	17
Preference stocks dividends	12½
Ordinary stock dividends	43½
Retained by company	27
	100

At January 31, 1952, the total value of the investments as stated in the balance sheet was £2,349,237, which was £262,132 more than the aggregate amount of their book values at that date, and as usual I am giving you the following summary showing the position:—

	£
Appreciation in value of investments	262,132
Share premium account	40,000
Capital reserve	612,167
General reserve	170,000
Profit and loss account	35,180
	£1,119,479

which means that at January 31, 1952, after providing for the final dividend recommended on the ordinary stock, each £100 of ordinary stock was represented by net assets of approximately £500. This compares with £529 at the close of the previous financial year.

The chairman referred to the fact that his statement had been issued before publication of the Finance Bill and contained no reference to the position of the Company as regards the proposed Excess Profits Levy. He thought it desirable, therefore, to mention that the provisions of the Bill appeared to involve the company in a liability to pay about £800 in respect of the month of January, 1952, and about £10,000 in a full year. While reducing the earnings on the ordinary stock, payment of the levy should still permit of the dividend being maintained at the present rate with a substantial margin. The proposal to charge this levy on profits arising from dividends paid out of income already subject to the levy was greatly to be deprecated.

The report and accounts were adopted and the retiring Director, Mr W. W. Brock, was re-elected.

JOHN EMSLEY LIMITED

RESULTS AFFECTED BY STOCK REVALUATION

The fifth annual general meeting of John Emsley Limited was held on April 4th, at Bradford, Mr Harold Jaques, chairman and joint managing director, presiding.

The following is an extract from his circulated statement:—

The trading result of the group for the year has resulted in a loss, compared with the substantial profit made in the previous year. This loss is entirely due to bringing the stocks and work in progress, held by the group, down to the market replacement value on November 30, 1951.

During the year the turnover of the group has increased in comparison with the previous year, principally due to the heavy increase in the price of wool and production costs. Since March the value of wool has fallen by over 50 per cent, and it has, therefore, been deemed prudent that stocks should be valued on the market price of replacement.

With regard to future prospects, so far the operating companies in your group have maintained full-time running and have the prospect of continuing to do so for some time yet. There is, however, still no firm basis for our main raw material, wool—and this factor, coupled with the heavy stock at all stages of distribution, much of which was purchased at a higher basis than that existing today, makes the absorption of our production by those who have contracted for it, and the booking of orders for future delivery much slower and more difficult than at any time for the past 10 years. These difficulties are not confined to our home trade.

The report was adopted.

CONWAY STEWART AND COMPANY, LIMITED

(Fountain and Stylographic Pen and Gold Nib Makers)

A GOOD RESULT

MR S. W. JARVIS'S SPEECH

The seventeenth annual general meeting of Conway Stewart and Company, Limited, was held on April 9th at the Holborn Restaurant, London, W.C., Mr S. W. Jarvis, chairman and managing director, presiding.

The secretary (Mr W. G. F. Nash, ASAA) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—The accounts and directors' report for the year ended December 31, 1951, have been in your possession for some little time, and with your permission I will take them as read. (Agreed.)

You may remember that when I addressed you last year, I mentioned that your company had just moved into a new factory, and you will be pleased to know that the planning and co-operation of all concerned enabled the actual removal to be carried out most efficiently. However, the change necessitated the recruitment and training of 40 per cent of those employed. That this situation was adequately met was proved by the fact that the turnover for 1951 was greater than 1950, although the increased labour costs caused a slight reduction in profit.

PROFIT AND ALLOCATIONS

The net profit for 1951 was £25,121 after making full reservation for depreciation of plant, and taxation. This compares with a net profit for 1950 of £33,653, and in view of the circumstances I am sure you will agree this is a very good result.

You will notice that dilapidations at the old premises, and some initial expenses at the new address totalling £10,105 have been charged against the contingencies reserve. The balance, £4,895, together with a further amount of £5,105, making a total of £10,000, has been added to the general reserve. The sum of £5,380 has been allocated to capital reserve, and this is the equivalent amount of the two premiums paid against the sinking fund policy.

FACTORS IN THE OUTLOOK

While the goodwill of your company's products is higher than ever, in both the home and export markets, I feel it is necessary to say that our business, at the moment, is affected by conditions beyond our control, such as the sudden serious cut in Australian imports by 80 per cent and a further cut in South African and New Zealand imports.

Your directors trust and believe that these interruptions are temporary, and that it will not be long before we can reap the benefits of the years of work we have put into these and other markets, where our goodwill and reputation stand so high.

TRIBUTE TO STAFF

This year I wish to propose a special vote of thanks to all those members of the staff who gave us such excellent support, not only during the actual time of the move, but during those difficult months which inevitably followed such a disturbance.

The report and accounts were unanimously adopted, and a final dividend of 30 per cent (making 40 per cent for the year) was approved.

The retiring director, Mr W. D. Fry, was re-elected, and the appointment of Mr G. J. Norris as a director was confirmed. The remuneration of the auditors, Messrs. Chalmers Wade and Company, having been fixed, the proceedings terminated with a cordial vote of thanks to the chairman, directors and staff.

AERATED BREAD COMPANY

SUBSTANTIALLY INCREASED TURNOVER

MR J. G. GIRDWOOD ON BURDEN OF EVER-RISING COSTS

The annual general meeting of the Aerated Bread Company, Limited, was held on April 4 in London, Mr J. G. Girdwood, CBE, CA (chairman and joint managing director), presiding.

The following is an extract from his circulated review:

The accounts cover a period of 15 months.

The results for the trading during the period cannot be considered other than satisfactory, and particularly so in the light of the known difficulties the catering industry has had to face during these 15 months.

As against the previous 12 months' figure of £413,184, the total profits of the group for the 15 months amount to £603,318. Of this sum taxation absorbs £298,307 (against £206,129) and £81,249 (against £59,105) has been provided for depreciation. The net profit of the group amounts to £212,087 and, after deducting the profit retained in the subsidiary companies, £14,346, the net profit of Aerated Bread Company is £197,417 (against £131,281).

Obviously these results could not have been achieved without a very substantial increase in turnover. It is gratifying to your directors to have this further proof that the company is maintaining its position as "London's Popular Caterers."

We have had to provide £298,307 for Imperial taxation. As compared with this amount the ordinary shareholders receive £84,131. That is to say the Government, without any capital stake whatever in the company, take three and one half (3½) times as much out of the company as do the holders of the ordinary shares who provide the capital and take all the risks inherent in the running of the business. And further, I should point out that before arriving at our trading profits we have had to pay no less a sum than £126,759 for local rates, or almost exactly 50 per cent more than the amount received by the ordinary shareholders for the same period. These two forms of direct taxation, imperial and local, have together taken out of the business five times as much as the prudent amount available for distribution to the ordinary shareholders.

COMMODITY PRICE INCREASES

An independent calculation by a catering consultant of the increases since 1939 in the wholesale prices of the principal consumable commodities we buy, shows that these have risen approximately as follows: meat 195 per cent, fish 170 per cent, fresh vegetables 345 per cent, tea 60 per cent, and coffee 165 per cent. We estimate that the approximate overall increase to this company is over 160 per cent. Similar, and in some cases even heavier, increases have been experienced in the cost of our equipment items. Over the same period, rates of wages to our employees have increased on average by between 300 per cent to 400 per cent. In spite of these heavy increases in direct costs, the increases in the prices we charge to our customers have been only of the order of 60 per cent to 70 per cent. This is further proof of our efforts to combat the inflationary trends of the period in which we operate.

During the period, costs of every kind have been rising and they are still on the upgrade.

WAGES PROBLEMS

Two years ago, I pointed out to shareholders that we reckon profit margins in our business in fractions of a penny per item sold. Our policy always has been to give to our customers the greatest possible variety and the highest possible value at the lowest possible cost, and our prices are changed only under the stress of necessity. That still is the policy of this board. But surely it is obvious that these increased costs, mainly the result of continuous and recurring wage increases, make nonsense of our efforts to maintain steady prices and some equilibrium in the cost of living. It is equally obvious that these wage increases, unaccompanied by increased production in increased ratio, are one of the principal causes of the increased cost of living. Wage earners are pushing their claims too far.

Primarily these wages problems are political rather than industrial and will have to be faced and solved by those who, from whatever political party they may be drawn, are competent to lead and direct the fortunes of this great country.

There is one other feature to which I should draw the attention of shareholders. The issued ordinary capital of the company is £1,282,000. The reserves and surplus shown on the balance sheet total £1,092,342, all belonging to the holders of the ordinary stock whose total investment in the company therefore now is £2,374,342.

In addition to our catering interests, the position of shareholders has been protected in large measure through the valuable property interests now held by the company. Our financial position is one of great strength and we have a highly skilled and energetic technical and administrative staff. The foundations on which the company rests were never as sound as they are today.

Turnover since the beginning of 1952 is still showing a satisfactory upward trend.

The report was adopted and the dividend of 12½ per cent approved.

ZAMBESIA EXPLORING COMPANY

SIR ULICK ALEXANDER ON EXCESS PROFITS LEVY

The annual general meeting of the Zambesia Exploring Company, Limited, was held on April 2, 1952, at 20, Aldermanbury, London, E.C.2, the Rt. Hon. Sir Ulick Alexander, PC, GCVO, KCB, CMG, OBE (the chairman), presiding.

The Chairman said: "I should like to add to the remarks made in my review (circulated with the report and accounts) the statement that while the impact on the company's business of the Chancellor's Budget provisions regarding taxation cannot be accurately estimated until the passing of the Finance Act, it appears that the standard of profits for assessment to the Excess Profits levy of the company and its subsidiary will be about £125,000.

Your company will be unfairly treated if the provisions of the Ninth Schedule of the Finance Bill are not amended. This Schedule lays down the general rules for ascertaining undistributed profits since January 1, 1948. In broad terms this amounts to taking one-half of the profits and comparing that figure with the net dividends paid in the period from January 1, 1948, to December 31, 1951. In taking one-half of

the profits, the Treasury are presuming that the other half has gone, 47½ per cent in income tax, and 2½ per cent in undistributed Profits Tax, but during the period in question your company was not in fact paying Income Tax or Profits Tax, owing to the fact that taxation losses incurred during the war period were brought forward and set off against profits earned during the period January 1, 1948, to December 31, 1951.

We thus have a position whereby the accounts of the company show that since January 1, 1948, your company has under-distributed to the extent of £100,000, whereas the provisions of the Ninth Schedule result in the conclusion that during that period we over-distributed profits to the tune of £50,000. This results in our standard for Excess Profits Levy being £15,000 less than it should be by any reasonable computation, and representations will be made to the Chancellor of the Exchequer for the removal of this anomaly during the Committee Stages."

The report and accounts were adopted, and a special resolution to amend the Articles of Association governing the remuneration of the directors was also approved.

GENERAL INVESTORS AND TRUSTEES

The forty-fifth annual general meeting of General Investors and Trustees, Limited was held on April 3rd in London.

Mr Sidney S. Lamert (the chairman), in the course of his speech, said:

It is a source of considerable gratification to your directors to be able to present to you accounts and a balance sheet which certainly suggest that, as it reaches middle age, your company is thriving and prosperous. Revenue this year reaches a new high level at £181,419. More impressive still is the strength of our reserve position. With the transfer of £30,000 from current revenue, our general reserve in round figures equals the Ordinary capital of the company at the balance sheet date.

We recommend that the dividend be maintained at 10 per cent and that the bonus this year be 4 per cent, an increase of 2 per cent on last year.

Until the terms of the Finance Bill are finally settled by Parliament, it will be impossible to gauge the ultimate effect on industry of the proposed Excess Profits Levy. The grave and urgent problem which confronts industrialists today is the provision of additional capital to maintain plant and equipment and to finance stock and raw materials. Not only has Mr Butler failed to give the assistance which our national industry so badly needs, but he appears to have aggravated the difficulties of the situation.

The direct impact of the new Levy on this company is quite unpredictable, but it is reasonable to anticipate that net revenue will enable us to continue our present rate of dividend with a satisfactory margin.

The report was adopted.

THE BIRMINGHAM & DISTRICT INVESTMENT TRUST LIMITED.

In the Report of the Proceedings of the recent Annual General Meeting of the above Trust, the Final Dividend was incorrectly stated.

The correct figures are:—

Final Dividend of 11 per cent on the Ordinary Stock making 15 per cent, less tax, for the year.

THE WHITE FISH AUTHORITY invite applications for the post of AREA OFFICER.

A knowledge of the fishing industry is desirable, and a qualification in economics or business administration, with experience in investigating problems of the organisation of small-scale industry would be an advantage.

The duties of the post would include the investigation of problems at the smaller fishing ports; the supervision of the Authority's development and re-organisation policies relating particularly to production and marketing, and the encouragement of fishermen's mutual trading organisations.

The person appointed will be expected to serve in any part of England.

Age not over 35 years, salary £750—£1,000 per annum according to qualifications and experience.

Forms of application may be obtained from the Secretary, White Fish Authority, Conyngham Hall, Knaresborough, Yorkshire, to whom completed forms should be returned not later than April 30, 1952.

THE WHITE FISH AUTHORITY invite applications for the post of ADMINISTRATIVE OFFICER at Milford Haven, who will be responsible for the general supervision of the Authority's work in Wales.

A knowledge of the fishing industry is desirable, and a qualification in economics or business administration, with experience in investigating problems of the organisation of small-scale industry would be an advantage.

The duties of the post would include the setting up and administration of the Welsh office of the Authority; the investigation of problems at the fishing ports in Wales; the supervision of the Authority's development and re-organisation policies relating particularly to production and marketing, and the encouragement of fishermen's mutual trading organisations.

Age not over 35 years, salary £750-£1,000 per annum according to qualifications and experience.

Forms of application may be obtained from the Secretary, White Fish Authority, Conyngham Hall, Knaresborough, Yorkshire, to whom completed forms should be returned not later than April 30, 1952.

A QUALIFIED ACCOUNTANT OR COMPANY SECRETARY required to understudy the Director Company Secretary of a large engineering concern in S.W. London. Applications are invited from well-educated men with commercial experience in the engineering industry. Knowledge of the statutory and legal duties of a Company Secretary, together with experience in Income Tax procedure, mechanical cost accounting and budgeting, is necessary. Applicants should be between 30 and 40 years of age. Contributory superannuation scheme in operation.
