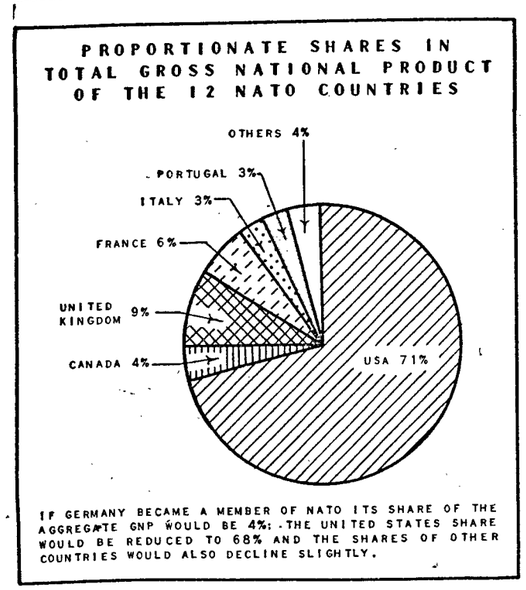
The Lisbon meeting will have to discuss two main parts of the Harriman—Monnet—Plowden report. There are the recommendations to the separate nations that they increase (or in some cases, as in the United Kingdom, merely maintain) the planned level of their defence expenditure in 1952-3, and the governments' replies to these recommendations. And there are some general suggestions about working principles for the future. It would be unrealistic to suggest that the Council will in fact be free to reach any decisions on the first part beyond what the separate governments are themselves prepared to implement. This is the nature of Nato: it is an organisation of sovereign powers which depends in the last analysis on the decisions of national governments. What it can do is to exercise the arts of persuasion and ensure that when the sovereign powers take their decisions, they do so with common needs in mind. The wise men's report has explained what these needs are more convincingly and with greater authority than it has ever been done before. At Lisbon, many of the countries of Europe whose economies are already strained will agree to increase their efforts by half the amount demanded of them by the report. Furthermore, they will all accept the principle on which these requests were based: that their limited resources will be better concentrated on finding troops in 1952 than on fulfilling grander and more perfect plans by 1954.



*

In addition to their recommendations for each country's programme, the wise men made two suggestions of a general nature on which there will be discussion, and there may be decision, at Lisbon. These were that periodic reviews of programmes and progress, on lines similar to their other report, should become a permanent and central feature of the work of Nato; and that, in the light of such an exercise, American aid should in future be divided multilaterally—that is, put into a central pool and divided by mutual agreement—and not, as at present, by bilateral agreement between the United States and each separate member. On the first point, the wise men are indisputably right. The Lisbon meeting will fail if it does not agree that the main, continuing function of the central body of Nato should be to balance each year, perhaps more often, what countries can do economically and what is militarily required of them. This is the nearest and the best that Nato can approach to a pooling of sovereignty in the economic field. The next step is to create an organisation under which it can be done regularly under normal conditions.

On the size and form of dollar aid, there are a number of things which should be said. The Council can with strict propriety discuss only the $6 billion which Congress has already appropriated for the year from mid-1951 to mid-1952. This sum is in the process of being allocated between European countries—mainly on the basis of where the need is greatest—by the Mutual Security

Agency of the United States, and the main outlines of the distribution are becoming clear. Of the total, $1 billion will, under the express provisions of the Act, be for "economic purposes," plus a further $500 million transferred from the "military" fund. As interpreted by the MSA, that means that this sum can be spent in the United States, and in some circumstances in Canada, on commodities indirectly connected with rearmament. These range from non-ferrous metals to wheat. Of the remaining $4.5 billion for "military" purposes, some will be spent in Europe, on equipment bought by the United States for the European forces of Nato, and some (in practice by far the larger part) on American equipment for the same purpose. The Americans believe that expenditure in Europe under this head may be $600 million, and even this cannot be spent at once.

The Atlantic Council will be wasting its time if it discusses whether $6 billion is enough; on that,

Congress will insist on being the sole arbiter. But Congress might well listen to the Council's view on whether this distribution represents the best way in which $6 billion can be spent in furthering European rearmament. The answer to such a question can only be in the negative—and for two reasons. In the first place, the distinction between "economic" and "military" on which Congress has insisted is utterly false. It becomes not only false but dangerous when it leads Congress into the fallacy of believing that rearmament will be less affected by cuts in economic aid than by cuts in military aid. Rearmament is not merely or even mainly a question of finding the equipment for an army. It is a question of diverting economic resources—men, materials and money—away from the civilian needs of the economy. It is in this diversion that Europe needs help from America, particularly as it directly affects its capacity to balance its trade accounts. And it is in this that it is at present receiving comparatively little aid. In the second place, even the economic aid which is available is not in fact being given in the most valuable form. After Congress had insisted on reducing the total for economic aid, it seemed that the Administration, in sympathy with Europe's needs, was going to do all in its power to meet them by a broad interpretation of the terms of the Act. The decision to use some of the "military" funds for purchases in Europe was an example. But even the Administration seems to have missed a vital point in Europe's problems. It is insisting that the "economic" funds shall be used for purchases in the United States. But Europe, though it needs to buy things in the United States, has another, equally important, need. It urgently needs reserves of gold and dollars to finance the normal fluctuations of its trade with the world as a whole, including the United States. Every country in Europe—even Belgium—has so narrow a margin of reserves that its economy is utterly vulnerable to the effect of inevitable swings in trade. Compared with the prewar level of reserves, the margin is impossibly narrow. The best thing that the Administration could have done—and the most economical from its own point of view—would have been to allow Europe to decide for itself how it would use its "economic" dollars.

*

While the Lisbon meeting should be explicit on these points, it should perhaps be less definite on the question of how American aid should be distributed in future. The wise men's suggestion of a multilateral division in the light of a reasoned survey of the situation is intellectually right. It satisfies the desire not only to be fair to everyone, but also to make the idea of equal partnership in Nato a reality. The United States can never be anything but the strongest partner; under the wise men's scheme America would at least be a partner and not, as at present, a patron. But such a scheme would be practically desirable as well as intellectually right only if it could be done without a great deal of detailed planning—planning of the kind which has wasted time and tempers for too long in the subsidiary organs of Nato.

It is right for Nato to survey; it must be wrong for it to plan. In the first place, it is in no position to plan. It is dealing not with a "still" but with a kaleidoscopic situation, continually shifting in all its parts. Even the wise men's own suggestions have been thrown out of date by the fact that France, because of the fighting in Indo-China, cannot meet its target of 15-20 divisions in Europe by the end of the year. Nato will devise its own failure if it puts itself in the position of being judged according to its fulfilment of a precise plan. In the second place, detailed planning for rearmament in twelve countries tends to obscure the reality, which is that on the rearmament of four countries—the United States, Britain, France and Canada—depends the real strength of Europe's defences. These four alone cover 90 per cent of the productive resources of the Atlantic community. This fact has been lost sight of for too long in the attempt to draw up a master plan.

*

In giving itself a new organisation, Nato will be well advised to recognise the essential difference between its functions in the economic and the military spheres. Where there is a specific job which has to be carried out internationally, then clearly there must be an international plan and an international staff to execute it. The military standing group has had to plan its strategy and the military requirements of that strategy. General Eisenhower in Shape has had to plan the disposition and supplies of his forces. All this follows from the decision, accepted by all, that there shall be only one strategic direction of the combined forces in Europe of the alliance.

But the Atlantic Council cannot plan the disposition of the economic, productive and financial resources of the twelve countries represented on it. Those matters must be decided by the national governments—at least until such time as there is a super-government able and willing to take responsibility for such things as employment, wages, taxation, imports, exports and currency deficits. The different national programmes can be "co-ordinated," in the sense of being marginally adjusted to each other—but this is very far from planning. It follows that Nato, in its general and economic as opposed to its military functions, would be wrong to have a complicated organisation or to try to tell the national governments in too much detail what they should do in matters that inevitably remain within their own jurisdiction and responsibility. Nato's task is to survey, to compare, to adjust, to propose—which suggests that the main weight of its organisation should be on the national delegations rather than on a large staff of its own, who would inevitably be divorced from the considerations on which decisions are in fact based. By the same token, it would seem wiser that the chief executive of Nato on this side of its work should be a secretary-general, a supreme liaison officer, rather than a director-general who would find that he had little to direct. The conception of an "economic Eisenhower," which has been in some minds, ignores the essential difference between the strategic and economic tasks of Nato. The governments are willing to entrust their strategy to a Supreme Commander; they are not willing to entrust the management of their economies to a Director-General—nor, in fact, could he possibly do the job if it were given to him.

To say this is not to try to set limits to the growth of Nato's functions and powers; it is only to point out the limits that are set by the nature of the case. Nato cannot be strengthened by giving its nether limbs powers which they could not carry out. Nato can be strengthened in its top organ, by making the Council itself a much more effective body, sitting in permanent session and attended by men of ministerial rank empowered to speak and decide for their governments. Proposals to this end will be before the Council; they should have first priority at Lisbon.

NOTES OF THE WEEK

Her Majesty's Government

In the past the accession of a new sovereign has at times introduced a new element into an already complex political situation and has thereby changed the course of Parliament. Queen Elizabeth ascends the throne unencumbered by hazards of this kind, but inevitably there is an interruption of Parliamentary business. The oath of allegiance must be taken; the solemnity of the occasion must be fitly observed; and, above all, Members of Parliament wish to pay especial respect to the memory of a man who worked so hard and so unostentatiously to perform his singularly exacting duties.

It seems likely that Parliament will not be fully at work until the week after next. That will bring the House of Commons within a fortnight of the budget and greatly increase the pressure on Parliament's time. Some special arrangement may be necessary to give Her Majesty's Government the time needed for legislation and for other urgent business.

The controversy on foreign affairs was broken off unfinished, and relations between Government and Opposition on this point cannot be left where they are. Either the Opposition must withdraw the motion of censure on Mr Churchill that it has tabled, or the debate must be resumed later. Mr Churchill, who was to have spoken in the debate on Wednesday, can hardly allow the motion to remain unanswered or unchanged. But time for general debate will be hard to find. Much other business is accumulating. Several Government bills have already been published, but have yet to start their Parliamentary career, and among them the National Health Service Bill is highly controversial. It seems unlikely that the Steel Bill, which has yet to be published, can now make much progress while the House is busy with estimates, the budget and the Finance Bill.

* * *

Defence Costs

The Prime Minister gave little satisfaction to Mr Bevan and others who questioned him about the defence programme on Tuesday. He confirmed that the Government does not intend to take the heroic measures that would now be necessary in order to complete the programme by March, 1954, after all. He considered it "inevitable" that rearmament should be spread over a "somewhat" longer period, but he would not be more definite.

Incidentally, however, Mr Churchill did confirm guesses about the size of the budgetary burden that defence may impose this year. He referred to an estimate that, with the rise in prices, the original programme would now cost £5,200 million instead of £4,700 million. This implies that what was originally planned for the second year would now cost over £1,800 million; if the current lag were also being made good, Mr Butler's budget would have to find nearly £2,000 million in order to bring the nation's defences to the state that was intended by March next year. That is to say, defence expenditure would rise by some £800 million compared with the year ending this March. It is too soon to guess how much less ambitious than this the Government's actual proposals will be, but they certainly must involve a sharp increase in expenditure. While the expansion in revenue from existing taxes will also be large, it can hardly be as big as the extra arms bill. That is Mr Butler's budget problem before the reduction in imports and the additional need for disinflation are taken into account.

* * *

Drugs, Wigs and Fillings

The postponement of the second reading of the National Health Service Bill may give Parliament a chance to debate it with more knowledge of the financial background of the service than it would otherwise have had. All that is at present known is that the limit of the cost to the taxpayer is to remain at £400 million a year. What is not yet known is whether all of the proceeds of the new changes are necessary to keep the cost of the health service within this limit or whether there will be a balance in hand. One detail given by Mr Crookshank in last week's debate does, however, justify, if nothing else did, the charge on prescriptions. He said that the total bill for prescriptions is now more than £50 million a year. This is well over the amount estimated

for the pharmaceutical service in the present year, which was £43.6 million, and it compares with the £39 million actually spent in 1950-51.

The new Bill enables the Government to impose charges for drugs, as well as wigs and other appliances, prescribed for hospital out-patients. But for the charge for drugs prescribed in the general medical service, the Government is using the powers granted by the National Health Service (Amendment) Act of 1949. Since the Labour Government did not make the relevant regulation, the exact form of the charge was not made known. It is understood that the present Government will impose a maximum charge, payable to the chemist, of one shilling for each prescription form, no matter how many prescriptions there are on the form. Provision will be made for people on national assistance to reclaim the charge. The Government, unlike the Labour Government, evidently does not intend to exempt old-age pensioners as a class. No doubt it will be pressed to do so, but it should resist all attempts to secure wholesale exemptions. After all, for most people the charge will be purely a token one. Even those who are dependent on a regular supply of a drug need pay no more than a shilling a month.

A stronger case for exemptions can be made in the proposed charge of a pound, or the full cost if it is less, for dental treatment. Schoolchildren and expectant and nursing mothers are already exempted. But there is an argument for extending the age limit for children from 15 to 18 or 21—if need be, by increasing the charge that adults have to pay. In the long run, free dental treatment for children and adolescents should yield economies in the dental service as a whole.

* * *

Foreign Affairs Debate

Speakers in the unfinished foreign affairs debate that began on Tuesday had no opportunity to get to grips with the problem of fitting Western Germany into Europe. It was unfortunate, because it is a fact that Franco-German relations have suddenly and seriously deteriorated, whatever assurances may be given to the contrary. At the moment of writing, the Bundestag which approved the Schuman Plan seems unlikely to approve the proposals for a European Defence Community. Indeed, the future of Dr. Adenauer and his European policy may be in jeopardy. It is possible to dislike the defiant and irritable mood that has shown itself in Bonn and yet understand that the French action in appointing an ambassador to the Saar is a clear breach of the spirit of trust in which the French Foreign Minister and the German Chancellor have been working together. Mr Eden said he believed this and other difficulties could be solved "by patient and intelligent statesmanship"; the appointment of M. Grandval was neither patient nor intelligent. It lent credibility to the malicious charges of Dr Schumacher and weakened the Chancellor's position at a crucial moment.

What is going on in Western Europe at the moment is in substance, if not in manner, revolutionary and Mr Eden's survey glossed over the difficulties, the need for speed and the contribution that Britain could make in bringing and holding the countries together. It had been hoped of him that he would give more time to an exposition of objectives—especially in his German policy—and less to a somewhat debonair survey of the facts under his eyes.

* * *

Mr Eden in Paris

British and French foreign policies are now more in line than for a long time past. This is partly due to Mr Eden's return to the Foreign Office and partly to the recent trends in those areas of the world where interests lie alongside—Western Europe, the Middle East and the Orient. The Foreign Secretary's flying visit to Paris at the end of last week was one of the most cordial and successful meetings of British and French statesmen since the war, and will help M. Faure's government over a difficult period.

In addition to discussing the progress of the European Defence Community and relations with Germany, Mr Eden gave M. Schuman an account of the talks which he and Mr Churchill had with President Truman and Mr Acheson in Washington. The most important part of their talks concerned the Far East, and Mr Eden assured the French—as he assured the House of Commons—that Britain had undertaken no new commitments. On the other hand, Mr Eden and M. Schuman are understood to have agreed on the need to back the Americans fully in warning the Chinese against the possible consequences of breaking any Korean armistice. If this attitude were to lead to the open intervention of Chinese troops in Indo-China, Britain, as well as the United States, would be under a strong obligation to drop their present hesitations and to render the Vietnamese government whatever assistance lay in their power.

When Anglo-French relations are bad, it is usual to seek the root of the trouble in the Middle East. On this occasion Mr Eden was able to bask in the new warmth that has been created during the past six months. Britain's retreat in Persia and its stand in Egypt have together allayed French distrust of Britain's previous success in trying to make terms with local nationalism. Each power now needs the support of the other. The *rapprochement* offers the opportunity to formulate a positive joint policy that takes account of the present mood of the whole Arab world.

* * *

Wider Horizons for Egypt

By issuing firm instructions on what is and what is not to be done, Aly Maher Pasha, Egypt's new prime minister, has done his country a great service. Public confidence is returning daily; Cairo shopkeepers are resuming business in their ruined premises; many of those suspected of organising the riots have been arrested, including Ahmed Hussein, the leader of Egypt's shirt movement when shirts were fashionable, and now a master of subversive patter. Road and telephone communications with the canal zone have been partially restored, and Egyptian contractors, and even Egyptian labourers, are inquiring whether their old contracts and jobs are still open there.

These signs draw attention to several important points. The authority of the Crown, which has often been underrated and called unpopular, is still an effective instrument when used as King Farouk used it last week; for example, it commanded the absolute loyalty of the army. (Would not the Shah of Persia like to be sure that he could do the same?) The pasha class is still respected and obeyed the moment it acts for the public safety or welfare. The whole of the better-to-do-class is, for the moment, showing the prudence which comes of having looked into the abyss of revolution. Lastly, though the "broad masses" possess leaders who can organise hooliganism, they possess none of the qualities that hold men together in moments of failure.

*

Aly Maher has spoken openly of the Middle East Command and the security pact between Arab states as matters for discussion with his new National Front Committee of twelve. But that body includes two of the Wafd's most intransigent members, bent on fulfilling the "national will," which is that the British should leave and recognise the Egyptian crown's title to the Sudan. The words "reopening

of negotiations" are on its lips and it is ready to talk instead of shoot, but its purpose is likely to be as inflexible as that of its predecessors.

British statesmen have, therefore, to make up their minds whether it is worth negotiating on a basis of which the difficulties are plain to see, or whether some entirely new approach would not be wiser. The British objective is something more than to make terms with Egypt; it is to organise Middle East defence. An atmosphere less poisoned by memories could be secured if it were decided to summon—perhaps in the joint names of Britain and Egypt—an area defence conference of the four western states concerned and of four states representing the Arab League. Educated Egyptians have now seen the danger threatening at home; such a conference might direct their attention to external dangers that may be less pressing but are no less great.

* * *

Retirement without Rule

A longer working life for civil servants has been under discussion for several months, and last week the Chancellor of the Exchequer wound up the negotiations with a decision that sixty will in future be regarded as the "minimum age of retirement," and not as the "normal age of retirement." The departments will be able to retain the services of efficient civil servants up to the age of 65, and the general aim will be to keep them as long as possible. In practice they were able to do this already; a number of civil servants are over sixty. But the new statement of principles may have an important psychological effect in three ways. The departments will be less apt to let a good man go without trying to stop him; the civil servant will no longer expect to go at sixty—and he will be more ready to stay because his subordinates will no longer expect him to go; and, finally, the civil service thus gives a lead to industry in a policy that is clearly in the national interest.

While the ever-increasing proportion of pensioners in the population makes it desirable that people should work longer, the decision about civil servants' retirement involved serious controversy. The fact that postponement blocks the promotion of younger men raises particular difficulties in the civil service, where salaries are rigidly fixed according to grade. The staff side of the National Whitley Council was naturally concerned about this, and made two counter-proposals: that members of junior grades who worked after sixty should do so in a lower rank; and that senior members should be retired at fixed ages, the higher the grade the lower the specified age. The Treasury rejected these proposals because they would have reintroduced the rigidity it sought to avoid.

Indeed, the success of the new system will depend on its flexibility. Financial pressure may make an increasing number of people willing to stay on, and it is important that the departments should not accept them automatically but apply firmly their criteria of efficiency and the best interests of the service. This will not be easy; but clearly the service will not be efficient if able men are fuming in subordination to men who have passed their prime.

* * *

Packing the Secondary Schools

The cuts in the school building programme, and the makeshifts that will be necessary in consequence, are tolerable only because the present overcrowding of the schools will not last long. It will last until the exceptionally large crop of children born just after the war has left school—in other words until about 1961. Those children are now crowding into the primary schools, and the peak number of entries will be reached this year. After 1956 the "bulge" in the school population will move into the secondary schools, and in 1961 numbers will begin to fall.

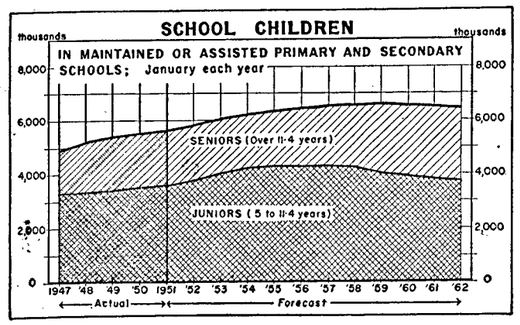
It is against this background that the Minister of Education announced this week that expenditure on school building in 1952-53 is to be held at its current level. Building for further education, except industrial training, is being stopped, and the school programmes are being slowed down. The effects on the schools will not be felt immediately, since projects already started will provide 400,000 new places, three-quarters of them in primary schools. As it takes three or four years to plan and build a school, the places that have not been provided will be missed in 1955 and 1956, when the bulge will reach the secondary schools. School building will not be held up on the new housing estates, but elsewhere the existing schools will be put to strange shifts. They are asked to increase the number of classes by making fuller use of practical rooms, such as laboratories and art rooms; when the bell rings, presumably, the classes will rush in search of an empty room. The secondary schools must also house their pupils temporarily in primary schools, which by that time will have places to spare. In rare cases it may be possible to move a primary school's pupils elsewhere and to convert it into a secondary school; and where the primary school is next to the secondary, it will be possible to use it as an annexe. But more often pupils will have to be left in the primary schools for anything up to a year extra.

The Minister could do no more than hope that the children thus left in the primary schools would not be late in starting their secondary curriculum. Miss Horsbrugh said that the practical details had still to be worked out with the local authorities; but her inability to give a more positive assurance is disturbing. By considerable ingenuity in staffing and transport arrangements it may be possible to bring secondary education to the primary schools in the towns; but how is this to be done in the rural schools,

'Clydella' lasts longer

Sizes 38 to 44 inches chest. Price 69/11d. (Includes Purchase Tax)

'Clydella' pyjamas, famous for long service, never lose their softness, warmth or colour. We shall be happy to send you a selection of patterns of men's Shirt and Pyjama fabrics, upon request to Dept. Er/S, William Hollins & Company Limited, Viyella House, Nottingham. If necessary, we will give you the name of your nearest shop.



There's nothing to equal 'Clydella'

MADE BY THE MAKERS OF 'VIYELLA' AND 'DAYELLA'

F2/1

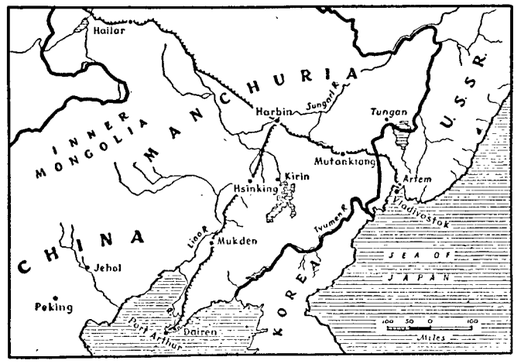
where there may be only two or three teachers? Admittedly it would be foolish, among all the other claims on the nation's resources, to double all through the system the places that have already been provided at the primary stage, and for which the worst of the need will have passed in ten years'

time. But while the Government insists on believing that the country can afford a bigger housing programme, it would be entirely wrong to push the economies in school building to extremes.

* * *

Spreading the Towns

The general purpose of the Town Development Bill, published this week, is to help relieve congestion and overcrowding in the large cities and industrial areas of Britain. Not only the large cities, such as London, Manchester, and Liverpool, but a surprising number of other towns have "surplus" populations which cannot be accommodated (on the basis of good planning standards) within their own areas. The problem is increased—in some cases it is produced—by the artificiality of many urban boundaries. Planning schemes thus require that a large part of the housing needs of county boroughs and of the LCC should be met outside their own areas.



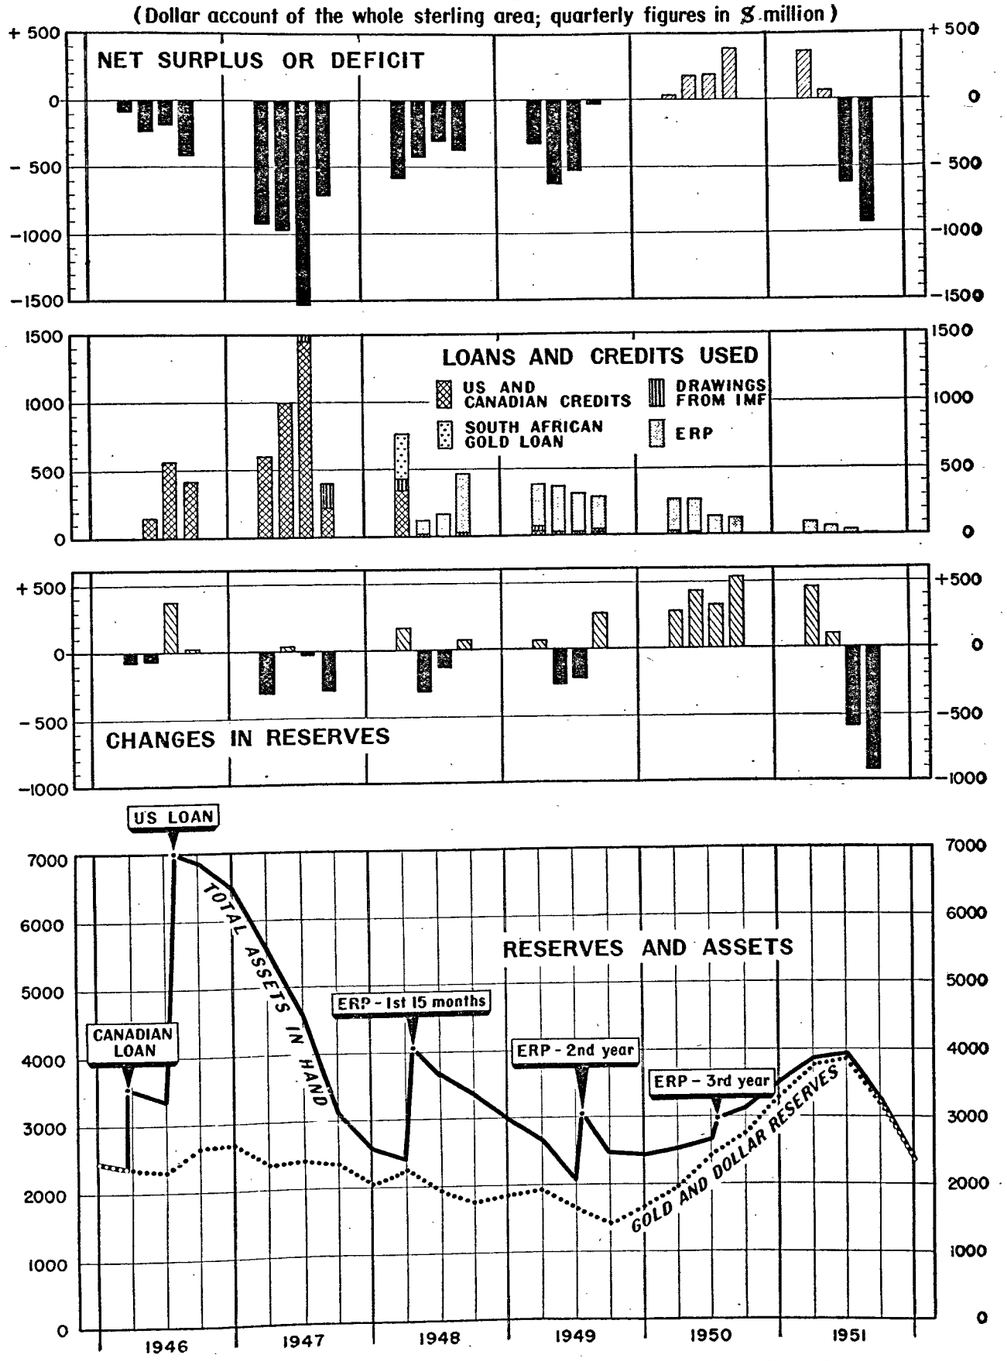
The Bill proposes to meet this problem by providing financial assistance for those county district councils which can act as reception areas for surplus population from the large towns. It also enables county councils as well as the "exporting" county boroughs to participate in the scheme either by undertaking part of the work or by providing financial assistance. This is an essay in local government co-operation, and the modest success which is already being achieved by overspill schemes of this sort in Lancashire and Staffordshire suggests that its methods are perfectly feasible. The Bill provides for an Exchequer-contribution which may be used for a variety of purposes, including the acquisition and development of land, the provision of water supplies and sewage disposal, and that part of the housing subsidies which would otherwise fall on the rates. This aid is necessary because it is unfair and unpractical to expect small councils to meet the requirements of their big neighbours out of their own resources. But could not the big neighbours be made, instead of being allowed, to contribute? The Bill leaves the amount of the Exchequer subsidy to be settled on the merits of each case.

The Bill is a commendable effort to bring housing into line with the requirements of good planning, which is all the more necessary after Mr Macmillan's recent pronouncements. But it avoids the difficulties of allocating financial burdens among numerous local authorities by the simple device of throwing on the Exchequer costs that should properly fall on the rates. In so far, however, as the Treasury takes a niggardly view of its liabilities (as it is perfectly entitled to do), the scheme may not work at all—for there are obvious difficulties in compelling local authorities to participate. But it deserves a fair trial, and the Bill is certainly preferable to continued inaction, provided that its adoption does not delay the search for a formula which will adapt the local government system to the requirements of good urban planning.

* * *

Sino-Soviet Treaty Anniversary

On February 14th China is to celebrate the second anniversary of its treaty of "friendship, alliance and mutual assistance" with the Soviet Union. Two sections of that treaty are today of great significance. The first is the actual alliance agreement, which binds each partner to render military assistance to the other in the event of attack by Japan or "any State uniting with Japan, directly or indirectly, in acts of aggression." Since Japan was completely disarmed and under Allied military occupation at the time the treaty was concluded, it must be inferred that its authors regarded the United States and other western powers, rather than Japan itself, as the foe against which the alliance was to be directed. Moreover, since the United Nations forces have been carrying on the war in Korea from bases in Japan with the non-belligerent co-operation of its government, they can be represented as "uniting" with Japan. If, therefore, the war which the Chinese Communists have been waging in Korea were to be extended by operations against Chinese territory, Peking would have grounds for claiming that the *casus foederis* had arisen. Whether the Russians would agree or not would depend entirely on their will, or lack of will,



to enter on a major war; if war were desired, the obligations of a treaty of defensive alliance could be invoked, but if it were wished to avoid war, they could escape responsibility on the ground that Japan was not involved in the "aggression." In any case, the western powers, in considering what action to take if the Chinese either continue to agree to reasonable truce terms in Korea or violate a truce after it is made, must take full account of the risk of open Soviet intervention on China's side.

The other provision of the treaty which is now of outstanding importance is the Soviet undertaking to restore to China control of the Port Arthur naval base and the Manchurian trunk railways "immediately upon the conclusion of a peace treaty with Japan, and in any case not later than the end of 1952." These Soviet rights on Chinese soil were generously granted by the British and American Governments at Yalta, and subsequently confirmed under *force majeure* by the Chinese Nationalist regime; Stalin's agreement to relinquish them by the end of 1952 was regarded as a diplomatic triumph for Mao Tse-tung in his negotiations in Moscow. The present year is the last in which it can hold these key positions by legal right, and it will be interesting to see whether there is a complete withdrawal of the Soviet garrison and air force now stationed at Port Arthur, or

STERLING AND THE DOLLAR, 1946-1951

(Dollar account of the whole sterling area; quarterly figures in $ million)

The three top charts show the sterling area's dollar deficit or surplus in each quarter and how it was financed. In the graph, the resulting movement of the dollar reserve is shown in the lower (dotted) line. The black line above attempts to represent the varying size of total dollar resources by adding to the reserve the unused portions of the dollar aid received from North America. In the case of ERP (Marshall Aid), the actual allotments were not known at the beginning of each period, and there was a time-lag in the drawing of the funds; but the sums eventually received were known at the beginning of each period accurately enough to be relied on as an asset in hand.

whether some Soviet forces will continue to be kept in Chinese territory as part of a scheme of military co-ordination within the framework of the alliance. It is no light matter for the Soviet Union to abandon altogether such a strong forward position as it now holds, even though Mao Tse-tung's Government may be regarded for the time being as a reliable ally protecting the Soviet eastern front. Moscow may be expected to press for some informal arrangement which will publicly save Mao's face but still keep a Soviet foot inside China's door.

* * *

Japan and China

In spite of fears expressed in this country, nothing has happened to show that the Americans were wrong to suggest to Mr Yoshida, the Japanese Prime Minister, that he should come to terms with Chiang Kai-shek. In his now famous letter to Mr Dulles of December 24th, Mr Yoshida made it clear that "the terms shall be in respect of . . . all territories which are now or which may hereafter be under the control of the National Government of the Republic of China"—no more and no less. Mr Yoshida's Liberal Party forecast last summer that he would have to make this move sooner or later. It has been bitterly attacked both by business men and by Mr Suzuki, the right wing Socialist leader; but neither onslaught seems to have seriously weakened the government's position. Mr Yoshida, by taking this step at this stage, is helping to secure ratification of the Japanese peace treaty in the American Senate, without blocking the way to any separate commercial or political agreement with Communist China.

Where the Americans were unwise was in their suggestion to Mr Yoshida that he should, as an alternative to what has actually happened, recognise Chiang Kai-shek as the ruler of all China. In rejecting it the Japanese have shown their independence of view and have set a precedent that it might pay others to follow. The British feared that too much pressure on the Japanese would encourage hostility to the West in Tokyo and that recognition of the Nationalists would make trade with the mainland of China impossible for Japan, thus increasing its trade rivalry with Britain in South and South East Asia. In neither respect is there likely to be any special cause for worry. Now that the Japanese are shortly to resume sovereignty, their present leaders look like fostering their own interests very skilfully, whatever the West may do. Their interests hardly coincide with those of the Communist powers, although the latter will certainly woo them with the lure of trade and by other methods. The process began with Stalin's unusual New Year message to the Japanese people. It must seem to their leaders that, if they play their cards carefully, they may yet get the best of both worlds.

* * *

World Bank and Persian Oil

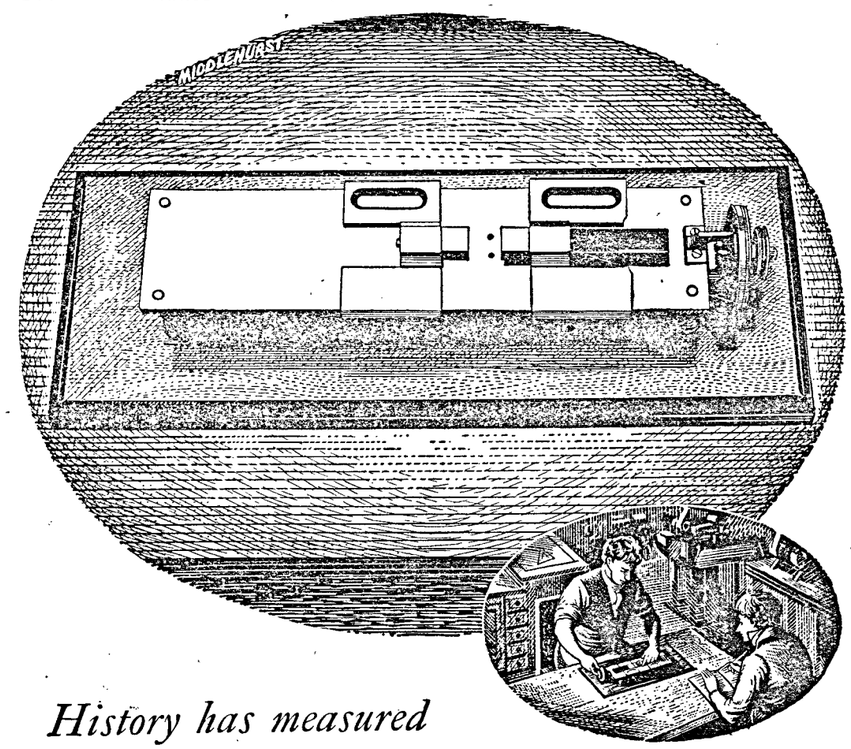
The World Bank is likely once more to try to get Persia to help itself. It may send a new mission to Teheran to discuss Dr Mossadegh's objections to its scheme for restoring the flow of Persian oil. The offer which the mission would explain and, perhaps, amend was a new departure for the Bank, which has so far not gone beyond financing long-term productive credit and giving advice. This proposal is that the Bank, in order to get the oil moving into world markets, should become the trustee of the nationalised Iranian Oil Company's properties; that it should select a "neutral top executive group," responsible to itself, to operate extraction and refining; and that it have the right to hire and fire staff and otherwise secure efficient management. It was to supply the funds needed to resume operations inside Persia, and it proposed to sell all exported oil to a bulk purchaser for distribution. After deduction of costs, profits were to be turned over, in proportions to be agreed, to three parties—the Persian Government, the wholesale buyer (the only one with the necessary facilities being the marketing organisation of the Anglo-Iranian Oil Company), and the Bank itself, which would retain its share on trust pending settlement of Persia's dispute with Britain.

Dr Mossadegh rejected this scheme on a number of grounds. He insists that the Persian Government retains "full authority"; and he refuses to admit that the British company is entitled to any share of profits as a return for the money, brains and enterprise that it has put into the industry. ("Who," he says, "has ever heard of a customer sharing in profits?") If the Bank were to proffer help without insisting on some rights for the oil company, it would be showing the world that it pays to expropriate; but Persians do not see this point.

*

The Bank has had ample evidence of the drawbacks of Persian management. Since 1948 it has sent mission after mission to study loans for specific projects; but no loans have materialised, chiefly because poor government or unsound finance at the Persian end offered no prospect of a genuine and efficient productive effort. If Dr Mossadegh insists on full Persian control, the prospects of compromise with the Bank are dim. Yet his price can scarcely be less. For it is he who in 1944 introduced the Bill which made it an indictable offence to grant new oil concessions to foreigners without the approval of the Majlis. He has never yet swerved from that policy, and he is unlikely to do so now when Persia is in slow process of holding a general election. The Bank would be wise to wait until this is over.

* * *



Ireland and the Crisis

The Irish Republic was not represented at the Commonwealth finance conference last month, but it caused no surprise in London or Dublin when Mr Butler announced that he has invited the Irish Minister for Finance, Mr MacEntee, to come to London to discuss the problems of the sterling area. Our correspondent in Dublin reports that the Commonwealth Ministers' statement of policy had been read with attention there. Few countries have a greater interest than Ireland in the stability of sterling and in any policy that will lead to its convertibility. The Irish sterling balances were estimated at over £400 million gross a few years ago, and even after heavy drawings they must still be substantial. These holdings are the result of commercial transactions. They take the form of British Government securities or of shares in British companies bought in the market; in a true sense, they represent the savings of the Irish people.

It also goes without saying that convertibility is a major Irish interest. In 1950 Ireland had a surplus in transactions with the United Kingdom of £17.4 million, only in part offset by a deficit with the rest of the sterling area of £6.8 million. But in overseas payments as a whole Ireland's deficit was £30 million, of which £15.5 million was with the United States and Canada. The deficit in 1950 was thought then to be heavy but it was almost doubled last year. It seems probable that when detailed figures are published, Ireland will be found to have been in deficit with the United Kingdom in 1951. However that may be, the traditional pattern of Irish trade and payments was that shipments from outside the sterling area were met by earnings within it, and it is this that chiefly governs the Irish attitude.

There are some wider aspects of the problem that Mr MacEntee will want to emphasise in London. It has

Proud Inheritance

History has measured his genius with accuracy....

Of the private life of Henry Maudslay only a little is known, but of his engineering genius historians can tell us much—since his passion for accuracy and perfection of finish led him to introduce many developments in manufacturing technique which have since become common-places of precision engineering. The first slide-rest and the screw-cutting lathe were his inventions, as were the punching and shearing machines and the table type of steam engine, and in 1805 his constant search for accuracy led him to produce the earliest micrometer, nicknamed by him "the Lord Chancellor". Now preserved in the Science Museum, South Kensington, it was officially tested in 1918 and found to possess a quite extraordinary degree of accuracy considering the date of its construction. Maudslay knew that without the machine real accuracy was impossible . . . but he also knew that fine machines were useless without fine craftsmanship. Were he alive today he would have thrilled to see the combination of both in the modern Maudslay plant in Warwickshire which bears his name: and the engineering precision and finish of the heavy commercial vehicles produced there would satisfy even his meticulous standards.

6 SCIENCE AND EVERYDAY THINGS

You go to work

to earn the money to buy the food to give you the strength to go to work to earn the money . . . and so on and so on. Some people would call that a *Cycle of Energy.*

There's another Cycle of Energy in the various forms of transport that take people to work. Think of it this way. Coal is set on fire to raise the steam to drive the turbines that make the electricity that works the motors that make the train go—all *energy* in one form or another. The energy of heat, the energy of movement, the energy of electricity . . .

But where do A.E.I. come in? They come in everywhere.

A.E.I. make mining equipment and turbo-generators; the transformers and cables that carry the current; the electric locomotives that use it up . . .

AEI Associated Electrical Industries

You have met the family:—The British Thomson-Houston Co. Ltd. Metropolitan-Vickers Electrical Co. Ltd. The Edison Swan Electric Co. Ltd. Ferguson Pailin Ltd. International Refrigerator Co. Ltd. Sunvic Controls Ltd. The Hotpoint Electric Appliance Co. Ltd. Newton Victor Ltd. Premier Electric Heaters Ltd.

been the complaint of Irish economists that the Irish farmer in the past did not take full advantage of his proximity to the British market; the farmer now replies that he has been discouraged by the unattractive prices offered by the Ministry of Food. The American investigation before the passage of the Marshall Aid Bill suggested that the best contribution that Ireland could make to European recovery would be increased food shipments to Britain. This advice was followed; a high proportion of Ireland's ECA dollars went in purchases of wheat and maize, designed to increase the traditional exports of livestock products. In the last eighteen months, British prices for bacon, eggs and poultry are said to have been pitched lower than the cost of feeding-stuffs and to have checked the export revival. Anglo-Irish trade is further complicated by the fact that a dollar-earning trade in Irish meat has sprung up. And, our correspondent concludes, failure to deliver all the promised British coal has led Ireland to spend more dollars in the United States. Recriminations need not, however, obscure the common interest in the future of sterling.

Federation Timetable

The Government's statement this week about its talks with Sir Godfrey Huggins, on the federation of the Rhodesias and Nyasaland, was noncommittal. So far, almost all discussion on the subject has centred on the Africans' attitude to the idea. Their rooted objection to any form of closer association has tended to overshadow criticisms of the form of closer association proposed by the London conference of officials last March. In the recent talks, in which the Governors of Northern Rhodesia and Nyasaland also took part, these criticisms were voiced, and as a result the governments of the three territories have been asked to inform the United Kingdom Government and each other of any changes they consider desirable in the officials' scheme.

These proposed changes have to be put forward by March 1st. The next step will then be the holding in London of the full conference that was adjourned at Victoria Falls last September. It was originally intended that this full conference should be resumed in July, but it is now proposed to hold it towards the end of April—a sign perhaps of the Government's wish to obtain an early decision. The April conference will consider the changes proposed in the original scheme and formulate what is called a final draft scheme of federation. This will then be published as a White Paper, and the four governments will afterwards decide whether or not to accept it.

The statement does not say whether the Secretaries of State for the Colonies and Commonwealth Relations agreed in principle to Sir Godfrey Huggins's objection to the proposed Minister for Native Affairs in the federal cabinet, nor whether they insisted that an equivalent safeguard of African interests should be substituted. Nor does it say who will attend the London conference or how the Africans will be represented. Nor does it give any indication of what will happen if, say, the Southern Rhodesian Government agrees to the final draft scheme and the protectorate governments object to it. It is equally silent on what will happen if all the governments agree to the scheme in the face of continued African hostility to it. It is to be hoped that before April the whole affair will be debated in Parliament and the Government asked to make its attitude clearer.

Church and State

The report of a commission of the Church Assembly* tackles anew the thorny question of the right relationship between the Church of England and the State. The extreme remedy of disestablishment, as a means of freeing the practices and worship of the Church from lay control, is firmly rejected. It would be a grave injury to each partner; it would be taken as an overt sign that the nation had cut adrift from the Christian faith, and it might not (probably in practice it would not) result in greater freedom of worship. Resentment in the Church at Parliament's brusque rejection of the revised prayerbook in 1927 and 1928 does not prevent the commission from recognising the important role of Parliament in maintaining the Church on a broad basis of worship; and it points out that

> However anomalous it may be, parliamentary control has in fact operated to prevent each successive school of thought in the Church first from being itself extinguished and later from dominating others.

Establishment has indeed given to the Church some of its distinctive qualities and has kept it from the narrowness as well as perhaps from the fervour of sectarianism. Disestablishment might well destroy its essential character.

Nevertheless, majority opinion in the Church, mindful of the humiliations suffered over the revision of the prayerbook, is anxious to secure for it a greater autonomy in spiritual matters. The commission's proposals for achieving this are more modest than many that have been made. It has three main suggestions. The most important is that a two-thirds majority of each house of the Church Assembly should be sufficient sanction for experimental deviations from the authorised form of worship. It is assumed—probably rightly—that Parliament, which would still retain ultimate control, would not withhold its approval from innovations which won general approval in the Church over a period of years.

It is also suggested that the Crown's appointment of bishops should be hedged with various new safeguards, although it is admitted that the present system works excellently in practice and produces men quite as pious and able as could any alternative devices. Finally, it is proposed that the judicial committee of the Privy Council should be replaced as the highest court for ecclesiastical causes by a new body comprising the two Archbishops and two nominees of the Lord Chancellor who are communicants of the Church. These modest and cautious proposals deserve early consideration as a way of meeting the Church's legitimate requirements.

Inflation in Eastern Europe

The annual report of the Economic Commission for Europe includes an attempt to assess, with the scanty information available, the extent to which the Communist satellites in Eastern Europe have become the victims of inflation. For some time Communist officials have plainly been as worried about inflation as their opposite numbers in the west. The extremely rigid and comprehensive controls that they are able to operate should to some extent put them in a better position to deal with it; but their freedom of manœuvre in the field of national policy is very limited. Their first duty is to carry out the ambitious plans of industrial expansion and rearmament imposed on them by the Russians, and by their imitation of Soviet methods. However carefully distributed and organised, too-rapid industrialisation is almost bound to have temporary inflationary consequences, if only because of the difficulty of providing sufficient foodstuffs and consumer goods to meet the needs of the rapidly increasing industrial workers.

The aid from the Soviet Union—"Molotov aid"—which might have helped to overcome this difficulty has not been forthcoming. And things have been made worse by the failure of the regimes to win the confidence of the peasants and get more food supplies from them. The scale of rearmament is shown in two instances: Hungary's budget for 1951

called for an increase in defence expenditure equivalent to 3 per cent of the national output in 1950; and in Poland there has been an increase which is "probably comparable" to that in Hungary.

The conclusions reached in the Commission's report confirm that the Communist leaders are not able to control the inflationary pressures for which their own policies are largely responsible. Both wages and prices have been steadily rising throughout the area and the former have not kept pace with the latter. The average real earnings of industrial workers have certainly fallen. In Hungary, for example, between the spring of 1950 and the end of 1951 average wages increased by 28 per cent; but prices of sugar, vegetable oil, pork lard and milk almost doubled, and those of bread, butter and beef almost tripled. Food consumption, which absorbs at least one-half of personal expenditure, has been kept down by inadequate supplies. Judging from the production figures, there seems to have been in most countries increased supplies of some types of consumer goods, particularly textiles and shoes; and the report estimates that the total volume of personal consumption in eastern Europe in 1951 increased by up to five per cent. But because of the migration to industrial areas of country people, whose standard of living is well below the average, the average standard of living of industrial workers has declined.

* * *

Perón's Promises and Problems

In a speech last week General Perón declared that Argentina's internal position had never been better. This claim is likely to obtain no more credence abroad than his assertion some months ago that the country possessed sixty million cattle. Two years of drought and eight years of misdirected effort have reduced Argentina, once a major participant in world trade, to the painful position of a country which must export or die but which has very little to export. The virtual disappearance of the country's formerly huge surpluses of wheat, maize and beef is largely due to the government's ruthless exploitation of the farmer for the benefit of its grandiose plans for industrialisation and of the industrial worker, the pampered child of *Peronismo*. Until recent months the rapid deterioration of Argentine agriculture has been hidden from the mass of the urban population by the holding down of food prices and the forcing up of wages. Both these policies have now, however, reached their inevitable conclusion. The hard-pressed farmer has cut his losses by raising less cattle and less grain, and the inflationary spiral encouraged by swollen pay-rolls is threatening to get out of control altogether.

The President, fresh from his successful disciplining of a restive army, thus confronts a new and more serious problem. The workers themselves, his main source of political strength, are unlikely to accept austerity quietly. Accustomed to plentiful food and even more plentiful promises of greater things to come, their reaction to meatless days, shortages of other foods, and the scarcity of imported goods which must inevitably follow the collapse of Argentine exports, is only too easily predictable. General Perón's action in releasing from prison the Socialist leaders whom he so recently jailed, and in holding conferences with the leaders of other opposition parties—a striking departure from his usual practice—suggests that he himself is beginning to doubt the loyalty of his "shirtless" supporters. He can hardly expect the men whom he has imprisoned and harried to join with him in appealing to the urban masses for forbearance; but he may regard them as a counterweight to the leaders of his own state-controlled labour federation, who are no longer as pliable as they were. However, no such manoeuvres can avert an explosion if the President keeps up the pretence that all is well much longer.

Shorter Notes

During the year ended September 30, 1951, 28 per cent of the first feature films shown in British cinemas were British, compared with 30.4 per cent in 1949-50. Since the "quota" exhibitors were required to show 30 per cent last year, against 40 per cent the year before, this smaller percentage of British films nevertheless resulted in only 18 per cent of exhibitors failing to fulfil their quota, compared with 55 per cent in 1949-50. The quota for supporting features was not reduced from the 1949-50 level of 25 per cent; in fact, 22 per cent of the supporting films shown were British, and 48 per cent of exhibitors failed to fulfil their quota. The general improvement, therefore, does not reflect any increase in the number of acceptable British films available; it merely means that the quota set was more realistic.

*

Price control on cakes and buns, soap, semolina, cocoa and drinking chocolate ended this week; and control over the prices of unsweetened biscuits is to go shortly. In making this announcement, the Minister of Food said that these changes were in line with the policy of removing price control where it was no longer necessary. Prices of sweetened biscuits, however, remain under control.

Pretty Songs

The Young Singer's Book of Songs. By the Rev. H. Formby. *Longmans, Paternoster Row.*

To Mr Formby are owing the thanks of all juvenile songsters and songstresses, for his little book of pretty songs, which are adapted to the voices and the comprehension of the youngest child. We remember the sad want of some such happily-carried-out idea which existed in our own childhood, when—because no kind Mr Formby, or other equally philanthropic individual, had arrived at the conviction that children might and should learn to sing—the little creatures were condemned to use only the poor fingers to make music, by thumping on mamma's piano, or to exert their poor little voices to a lamentable pitch in endeavouring to imitate mamma or sister in singing Italian bravuras or English songs, equally unfit for the voices of childhood. Mr Formby has set an example; he has catered wisely and well for the taste of his little friends; at least, those must indeed be more difficult to please than children usually are who do not find amongst the sixty songs we have in this little volume many with which to be pleased and amused. We have old tunes of various countries in their simplest forms, and to these are adapted words by many composers, some new, or nearly so, others older and well known. Amongst the latter we have Goldsmith's "Elegy on the Death of a Mad Dog" to the favourite old air of "Barbara Allen," Campbell's "Irish Harper and His Dog" set to an Irish tune, Burnes' "John Barleycorn" to an old ballad air, and several very pretty poems by Mary Howitt and Mr Formby all set to melodies chosen from amongst the simplest of various countries. The old English song, "The Beggar Girl," is preserved—and could either music or word, be prettier?—in its original shape; and, for the conclusion, we have appropriately enough, "God Save the Queen." We much admire Mr Formby's attempt to make *Young England* more musical than it has hitherto been; we wish him success in his first effort, which we hope he will speedily follow up by others of a similar nature, and, by his energy, inspire others to follow in his footsteps.

Letters to the Editor

The Price of Labour

Sir,—I entirely agree with the principle of the payroll tax, and, in view of your anticipated "rows with the shop stewards," let me hasten to add that I have had five years' experience as a shop steward in the motor industry.

However, I must disagree with your method of application. The object of the tax, as I see it, is to effect the transfer of labour from an overmanned to an undermanned industry. But the point you have apparently missed is what kind of labour is to be transferred. In my opinion, the labour to be transferred should (1) have an expectation of working life long enough to justify the expense involved in retraining in another industry; (2) be sufficiently free from domestic responsibilities for the transfer, not only to another plant but to another district, to be effected without incurring the expense of lodging allowance or furniture removal.

Now if the tax is levied indiscriminately on every employee every week, it would only produce the opposite effect. The management would only "cull the old birds" and retain the young. Even worse, if the choice were between a local worker and another lodging in the district, in their own interest the management would tend to dismiss the local man—knowing he would still be available if and when required. If the lodger were laid off he would most likely move out of the district. Consequently the employer would have one string less to his bow—or would it be more appropriate to say that his supply of labour was diminishing? The result would be a difficult problem for the local labour exchange.

Suppose the workers were divided into two classes—mobile and immobile. The tax could then be applied more heavily on the former than on the latter. This would tend to counteract the natural desire to pass the buck and would produce a more suitable transfer list.

In conclusion I would like to draw your attention to the "rows with the shop stewards." If I have interpreted your remark correctly, it appears that you are incapable of distinguishing between a shop steward and a trouble maker. The shop steward has an unpleasant, thankless and unpaid job. In the event of a strike he is the "Billy Muggins what holds the baby" and no one realises that better than the shop steward himself.—Yours faithfully,

Oxford W. H. Lowe

The Sterling Crisis

Sir,—I wonder if Mr R. G. Hawtrey is not being too pessimistic in your issue of January 26th in fearing that the rise in Bank rate two months ago was only a gesture and that the restriction of advances promised by the bankers will amount to no more. I cannot help drawing attention to Mr Hawtrey's own comment (in his book "Currency and Credit") regarding the rise in Bank rate in April, 1920, which brought the last postwar boom to an end.

> The effect of a movement of the Bank Rate is largely psychological. It is required to offset, not the profits that traders have been making but the profits that they expect to make in the future. If they can be brought to moderate their expectations, a comparatively low rate will be a deterrent.

Even under a system of planning and controls, there must be a very large volume of private business which is undertaken because market conditions make it profitable. During a prolonged process of inflation, this must include a considerable amount of marginal enterprise which would not pay its way if selling prices were not constantly increasing. Provided, therefore, a serious belief were to be developed that the action of the Government and banks would stop the flow of excess purchasing power, even if only for a few months, there might be some hesitation on the part of business men to continue the less efficient part of their operations. Accordingly, a reduction in bank loans might take place, not so much because the banks were refusing credit for less essential purposes, as because of a reluctance on the part of some of their customers to undertake further business on borrowed money until they were more sure of market conditions. This might well lead to a genuine reduction in the volume of bank deposits and the deflationary effect would be reinforced by a decline in the velocity of circulation of the remaining supply of money.—Yours faithfully, H. Houston

Sutton Coldfield

Ceylon and Britain

Sir,—In your issue of January 19th your special correspondent says that "great though Ceylonese goodwill to Britain is, it is not always helped by the behaviour of the British on the spot" who "have trodden upon every Ceylonese corn." This has aroused considerable resentment among the "local mercantile community," whose task in maintaining United Kingdom business and looking after its capital assets in this country is by no means an easy one: it is largely a matter of goodwill, of which there is plenty on both sides. This task, however, is liable to be rendered more difficult by remarks like those made by your correspondent, based apparently on casual gossip of an ill-natured type heard during a flying visit. It could be readily understood if it appeared in one of the daily papers which wanted a news item, but when it is found in a journal like yours, it is apt to cause ill will.

There are many of the mercantile community who do their very best to avoid treading on *any* Ceylonese corns, and it is an interesting fact that the majority of Ceylonese who seek mercantile employment greatly prefer it to be with a "European firm," or, in the case of planting, employment on a European-owned estate. I may remark that the Ceylonese are a sensitive race—I myself have lived here for thirty years and am well aware that they respond quickly and generously to polite treatment; this, I may add, they usually get. I am sure that many of them would resent the article in your paper just as keenly as do the Europeans.

It is naturally difficult for a community which has inevitably regarded itself as part of the "ruling race" for a century and a half to accustom itself to new conditions. But its members have on the whole done it with success, and I can state confidently that the relations subsisting between the Europeans in Ceylon and the Ceylonese have markedly improved in the four years since the grant of independence. The tendency in this country is and always has been towards segregation into racial communities, and long standing habits are by no means easy to break. But many of us, both Ceylonese and Europeans, have for a long time been striving our utmost to break down these barriers.—Yours faithfully,

S. A. Pakeman

House of Representatives, Colombo

Castings or Sheet Steel?

Sir,—In your issue of February 2nd, a question is raised whether sufficient enamelling capacity exists to treat steel replacing cast iron. As one example, and there must be many, more than 50,000 tons of iron castings are used yearly in gas and electric cookers. These castings are vitreous enamelled. The same enamelling furnaces would use less fuel in enamelling sheet steel because only a quarter of the weight of metal would have to be raised to enamelling temperature. To replace 50,000 tons of castings in cookers would need about 12,500 tons of sheet and tube—setting free some 112,500 tons of materials and 75,000 tons of coal for use in steelworks idle for lack of them, to make available some 35,000 tons or more of extra steel additional to that used in replacement. This multiplies resources.

Technical difficulties can be overcome—given a lead. Thousands of cookers without any cast iron already give satisfaction both to testing authorities and housewives. These cookers weigh 100 lb. each, against 180 lb. to 260 lb. each for comparable ones using varying amounts of iron castings. They are considered sufficiently durable.

There are two million out of date "black" (not enamelled) gas cookers now burning gas equivalent to 700,000 tons a year of coal more than modern cookers would use, and representing more than 200,000 tons of ferrous scrap.—Yours faithfully, T. B. V. Hirst.

London, W.1

Books and Publications

Belief and Fact in Foreign Policy

American Diplomacy, 1900-1950. By George F. Kennan. *Secker and Warburg.* 146 pages. 12s. 6d.

Since this book was published in the United States its author, the most scholarly and perceptive product of the American Foreign Service for many years, has been appointed Ambassador to the Soviet Union, in which, or around whose walls, he has spent most of his professional life. He is accepted as his country's greatest expert on modern Russia, and the two essays on which his public reputation rests (which first appeared in *Foreign Affairs*) are reprinted here after the six lectures, delivered at the University of Chicago last spring, from which the book gets its misleadingly inclusive title.

Although it is a short book, "American Diplomacy 1900-1950" constitutes the collected public writings of Mr Kennan, most of whose life has naturally been spent producing confidential reports. But it would be a mistake to accept it, as so many American reviewers did, as his collected thinking. The lectures were clearly designed to provoke thought and to encourage the young to question all lazy beliefs about the immaculate purity of the motives behind American foreign policy. In doing this, Mr Kennan did not, as his title suggests, make a thorough survey; he only took a few of the more persistent myths, like that of the "Open Door" policy in China, and devastated them with a salvo of facts.

Mr Kennan begins by asking the questions how a country which in 1900 had a sense of security "such as no people had ever had since the days of the Roman Empire" and which "had no thought that its prosperity and way of life could be in any way threatened by the outside world" had arrived by 1950 at a point "where it seemed to be able to think of little else but danger" and to be dominated by a "sense of insecurity greater than that of many of the peoples of Western Europe," who are so much closer to the source of the danger. He concludes that

> there has been in the past a very significant gap between challenge and response in our conduct of foreign policy; that this gap still exists; and that, whereas fifty years ago it was not very dangerous to us, today it puts us in grave peril.

The most serious fault he finds in the formulation of American foreign policy is what he calls "the legalistic-moralistic approach to international problems." The American mind, he thinks, finds it "implausible that people should have positive aspirations, and ones that they regard as legitimate, more important to them than the peacefulness and orderliness of international life." It assumes that "the things for which other peoples in this world are apt to contend are for the most part neither creditable nor important" and that the behaviour of nations could, therefore, be regulated if only "some formal criteria of a juridical nature" could be discovered. As he asserts that these beliefs ignore most of the facts of international life, he has been denounced by some indignant reviewers in his own country as an advocate of such un-American devices as "balance of power" and "power politics."

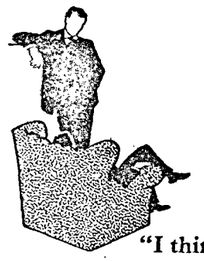
These brilliant lectures are the first fruit of Mr Kennan's sabbatical leave at the Princeton Institute for Advanced Study. They prove the wisdom of planting him in New Jersey with time to think; they also suggest that it was not advisable to dig him up again so soon to waste his time delivering notes to the Kremlin. The intellectual scars which any disinterested public servant who tries to make policy in the State Department inevitably collects may have not yet had time to heal. He still seems to take too gloomy a view of the possibility of conducting a reasonable foreign policy in a democracy of the American variety—though it must be admitted that the evidence at the moment is preponderantly on his side. He finds it "hard to see how we can live up to responsibility as a great power" unless there is some constitutional reform "which would give us a parliamentary system more nearly like that which exists in England." Admitting the impossibility of such a reform, he is driven back on his mistrust of the legalistic-moralistic approach.

What no American reviewer seems to have noticed is that, in exaggerating this part of his argument, Mr Kennan may have been unconsciously explaining, and excusing, his own decision to take the unusual course of asking for a long holiday from his official career. He was Director of the Planning Staff of the State Department when a lawyer and moralist became Secretary of State; eighteen months later he had left the Department. There could hardly be much agreement between a man who can write that the United States should "have the modesty to admit that our own national interest is all that we are really capable of knowing and understanding" and one who can tell the Senate Foreign Relations Committee that "as early as 1943, in the midst of war, the United States Government began its planning for the occupation of Japan, an occupation based not on retribution, but on altruistic principles. . . ." Mr Acheson's words undoubtedly describe what the American people believe about their motives; Mr Kennan's have, perhaps, a greater ring of truth. His book is an important contribution to the education of future American diplomats.

Garden Suburb in Downing Street

The Prime Minister's Secretariat, 1916-1920. By Sir Joseph Davies. *R. H. Johns, Newport, Mon.* 199 pages. 12s. 6d.

Lloyd George's "garden suburb," the collection of unofficial (and unpaid) expert advisers established in hutments in the garden of 10 Downing Street, is constantly mentioned in books dealing with the period and generally with disapproval. The garden suburb was a device whereby L.G. made his own short cuts to information and action, often leaving the ministers constitutionally responsible for the problems in question uninformed, resentful or even aghast. It was the rivalry between the Foreign Office and L.G.'s own little foreign office in the garden which led directly to the downfall of the Coalition Government in 1922. Yet the experts in the garden suburb were admirable men, with a Warden of All Souls as their chief, and an account from the inside of what the garden suburb actually was and did would be a useful addition to historical knowledge.



In spite of its title and the fact that its author was in a sense the original member round whom the suburb grew up, this little book makes no attempt to supply such a record. Sir Joseph Davies is now a man of eighty-six, and he has had the happy idea of publishing items from a diary which he kept at the time, supplemented by letters written to his wife and memoranda relevant to his official duties. Sir Joseph was by training a statistician, and an expert on the coal and transport industries. As a Welshman he had contacts with other Welshmen who had contacts with Lloyd George, and it was natural that he should be roped in as a collector of current information required on shipping and shipbuilding problems. In spite of the dates on the title page the book is confined to the two years from December, 1916, to December, 1918, when Sir Joseph was elected Coalition Liberal MP for Crewe.

It is a somewhat scrappy book, but of that it would be churlish to complain. Sir Joseph joins the short list of those who, like Bernard Shaw and the sixth century monk Cassiodorus, have produced books within fifteen years of their centenary.

The Opening of China

British Trade and the Opening of China, 1800-42. By Michael Greenberg. Cambridge Studies in Economic History. *Cambridge University Press.* 238 pages. 21s.

The period in Britain's relations with China covered by this book has hitherto been treated almost wholly from the standpoint of the diplomatic historian, despite the fact that, three abortive

AMERICAN SURVEY

Saving Spree

Washington, D.C.

"A VERY critical part of our defence job this year," the President said in his message to Congress on the State of the Union "is to keep down inflation" and, a week later, in his Economic Report, he called the economic situation "precarious." His warnings have been echoed up and down the Administration. Mr Charles Wilson, who is in no danger of being called a New Dealer, a Fair Dealer or any other kind of believer in government for government's sake, has said that he is more worried about inflation than he is about meeting any production goals; and Mr Lovett, the Secretary of Defence, who is equally uncontaminated in Republican minds, has more than once expressed apprehension about what may happen in the spring.

None of this is likely to have any effect on Congress in an election year. That body may have, as Mr Truman said, "a tremendous responsibility" because the stabilisation law was "shot full of holes at the last session" and probably it should be one of its main tasks in this session "to repair the damage and enact a strong anti-inflation law." But, in the view of most members of Congress, the main task this year is to get themselves re-elected and the men whose tangible help is needed between now and polling-day are, in most cases, those who dislike controls. While consumers' prices continue to be relatively stable there is little chance of serious pressure for further controls from the consumer, who is the voter, to offset the pressure of the producer, who is the provider of campaign funds.

The Administration's case has not been made any easier by the failure of prices to start moving up again as quickly as its prophets had predicted. The result has been that the Congress has been able, with statistical evidence to support its contention, to assert that the President has been crying "Wolf! Wolf!" And some more objective observers who thought, as long ago as last summer, that the wolf was just around the corner, are now beginning to wonder whether, like Mr Hoover's prosperity, he may not stay there.

The imponderable in this situation has been the consumer himself and what Mr Truman called his "extraordinarily high level of personal saving." It is a long time since economists have had to take personal saving into serious account. Institutional saving has become such a large, and predictable, proportion of the whole that it has been possible to ignore the individual's whims when estimating the future. Now, however, the mood of the public has become all-important. There was an increase in the rate of saving from an average of 5 per cent or less of disposable personal incomes to around 10 per cent in the last three quarters of 1951. And nobody can foresee how long this will go on. This increase, according to the Annual Economic Review of the Council of Economic Advisers, reflected some temporary factors—among them "a reaction to previous buying sprees, to higher prices and to credit tightening."

The chief buying spree was that which took place between the outbreak of the Korean war and February, 1951, but it was the culmination of a long period during which the savings accumulated between 1941 and 1945 by those with no previous habit of saving had been steadily drained away. The Council of Economic Advisers suggest that

> it is not unlikely that many American families, who during the war had their first opportunity to build up some reserves, have become more "saving conscious." Having satisfied urgent demands for many consumer durables by 1951, they may now be ready to replenish their liquid asset reserves, and to attain a higher level of family and personal security.

One question which must be answered, but which only time can answer, is, therefore, whether the present saving spree will go on until the level of pre-Korean reserves has been reached—and this should have happened by March—or until reserves are back at the 1945 level, or whether saving has become a habit which is only abandoned temporarily at moments when there is a prospective shortage of goods.

Higher prices certainly contributed to the sudden end of the buying spree a year ago. The retail price index rose from 170.2 to 183.8 between June 15, 1950, and February, 1951, and the wholesale index rose even more sharply, from 157.3 to 183.6. But, since then, the rise in consumers' prices has been little more than five points and wholesale prices have even fallen to 177.2. But the very stability of prices at the moment carries its own dangers. Most wage agreements are now tied, either tightly or loosely, to the cost of living and most wages have had time, in the last year, to catch up with increased prices. The public has, therefore, more money in its pockets than it did then and the level of prices, which seemed so staggering when it was first reached, has now become, if not contemptible, at least familiar, and therefore less of a deterrent to spending.

The present stability will, for these reasons, be maintained only as long as the consumer goes on saving. Certainly there is nothing in the movement of wholesale prices to suggest that retail prices ought to start going up in the near future. But, though there is no shortage of goods at the moment, and, indeed, many manufacturers are probably happy to be able to put the blame for their reduced sales on the difficulty of getting raw materials, rather than on the fall in demand, the position could change overnight. The allocation of many important materials—copper and aluminium, in particular—to non-essential uses is now, by pre-Korean standards, very small and shortages would appear very quickly after another spell of buying began. The real gap which already exists between supply and potential demand would become apparent and prices, with more than the hysteria of the public to impel them upwards this time, could easily get out of hand.

★

The third of the temporary factors mentioned by the CEA—credit tightening—was probably the most effective of all last spring. But the council has its doubts whether such measures as the unpegging of government bond prices and controls on housing and consumer credit (which were later weakened by Congressional action) will continue to be of much use, unless they are adjusted to differences between the situation in 1951 and that likely in the future.

One of the Economic Advisers, Mr John D. Clark, wrote a separate note in the Economic Review, pointing out that

> the advance in short-term rates in August, 1950, was followed by the greatest expansion of business loans in our history [while] the increase in long-term rates in March, 1951, coming after the price freeze in January had taken the steam out of boiling markets and when a seasonal contraction of business borrowing was due, had no effect on new business investment. . . . To complete the topsy-turvy picture, the more rapid the growth in money supply creating "more dollars chasing more goods," the quieter became the consumers' markets.

Mr Clark concludes that, in the kind of economy and institutions, the country now has, monetary policy cannot be used successfully to stabilise the economy. The only effect of increases in the basic commercial interest rate, which were "hailed as a valuable contribution to economic stability," was to enable the banks to increase their earnings by one-third while "all other business men are criticised when they exploit a situation by raising their prices by a smaller percentage."

All three of the Economic Advisers agree, however, that there are two ways in which monetary policy can help—the Treasury must borrow new funds so far as possible from non-bank sources and the Board of Governors of the Federal Reserve System must be given additional authority over reserve requirements. "Higher reserve requirements," they consider, "may be a suitable means of curbing bank lending." But, because nobody expects any action from Congress which will give additional powers to anybody, some consolation is taken from the fact that "there are grounds for anticipating a continued high saving rate." "It would be unwarranted," the council hastens to explain, however, "to base economic policy on the expectancy that so high a rate as the recent rate or an even higher rate can be maintained." However unwarranted it may be, the Administration will probably have to base, if not its policy, at least its hopes, on the unpredictable consumer and pray that his present preference for saving will continue.

Eyes on Illinois

[FROM A CORRESPONDENT IN THE MIDDLE WEST]

OFFICIALLY, Mr Adlai Stevenson, the Democratic Governor of Illinois, is a candidate for nothing except another term at Springfield, the state capital. But his recent cordial reception at the White House, and the mystery about Mr Truman's own intentions, have made him widely discussed as a possible Democratic candidate. Mr Stevenson has been a first-rate governor and he possesses solid qualities that might make him a first-rate President. How strong he would be as a candidate, especially if General Eisenhower were the Republican nominee, is more doubtful. Unlike Senator Kefauver, who is already running hard for the nomination, he has not enjoyed the advantages of a nation-wide television audience. Two aspects of his personal background will be regarded by some politicians as positive handicaps—the deposition which he filed testifying to the good character, as he knew it, of Mr Alger Hiss; and the fact that his wife divorced him after he became governor.

On the other hand, there is some evidence that Governor Stevenson possesses a new sort of political strength which defies the orthodox rules of the game. As they look for a vote-getter, the Democrats cannot forget that Governor Stevenson was elected in 1948 by 564,000 votes—the largest margin ever given a governor in Illinois—while Mr Truman was carrying the state by only 33,000. It seems probable that, without Mr Stevenson's great personal strength, Mr Truman would have lost Illinois and with it, perhaps, the election.

Governor Stevenson, unlike Senator Kefauver, wears no coonskin cap and makes no other concession to the presumed prejudices of the masses. Mature and urbane himself, he insists on treating the voters as adults. He speaks with a cultivated Princeton-State Department accent, dresses like a conservative city lawyer, and declines to indulge in the political "corn" which is supposed to get votes. He first came into prominence for taking an internationalist stand before the war in Chicago, the capital of the America Firsters. Following his war service as special assistant to Mr Frank Knox, the Secretary of the Navy, Mr Stevenson enriched his administrative experience by heading the first economic mission to Italy, and worked with Mr Archibald McLeish and Mr Alger Hiss on preparations for the United Nations conference. At San Francisco he acted as the American delegation's adviser and press officer, and served as delegate or alternate at later United Nations sessions.

★

Three years as governor have sharpened Mr Stevenson's administrative talents and given him experience in political leadership. He has had to manage a Republican or half-Republican legislature during two rough and tumble sessions. He has not secured his whole programme, but he has obtained a surprisingly large part of it. He knows when to compromise, and when to stand fast. Early in his administration a group of Chicago legislators who had connections with organised crime presented him with a difficult choice. He had campaigned vigorously for a constitutional convention to modernise the Illinois constitution, in which no significant reforms had been made since 1870; it still prevents a state income tax from being adopted. The Chicago group undertook to defeat another of his measures, a Bill to strengthen the powers of grand juries in Chicago.

At the crucial moment, they offered to pass his resolution for a constitutional convention if he would quietly forget about the grand juries. The deal could have been made without much public notice being taken, and many governors would have made it. Mr Stevenson refused, and suffered defeat both on the grand jury Bill and on the constitutional convention.

Essentially a financial conservative who thinks that all government costs too much, the governor showed his mettle in a brush with the Republican Senate on his first budget. He had called for increased expenditures on schools, state aid to local governments, and assistance to the aged. To find the additional money, he needed legislation to tighten sales tax collections. The Senate, following a classic if cynical rule of politics, defeated his revenue Bill and then proceeded to support his appropriations. Shocked and disillusioned, Mr Stevenson found himself waging a fight to trim his own budget in order to keep within the revenue provided. He succeeded by the margin of a single vote.

*

Governor Stevenson has gathered about him a much better than average staff, some of them Republicans. He has eliminated more than 1,300 superfluous state employees, put the state police under civil service, reformed the regulation of public utilities and taken it out of politics, and improved the state welfare services. Having succeeded an unusually negligent Republican administration, he found the introduction of simple honesty and efficiency in state government a formidable task. He has not succeeded in sweeping out every corner, but by comparison with preceding administrations Mr Stevenson's record shines indeed. His intelligence and devotion to the public interest have gone far to rekindle faith in the state government.

Nothing has tested the governor so severely as his effort to eliminate politically protected gambling. Not by any means a fanatical reformer, he nevertheless recognised that one reason for his large majority at the polls was the voters' disgust with the corruption of local and state officials by organised gambling interests operating for many years in violation of the law. After patiently seeking to persuade local officials to deal with the problem, he used the state police in several of the most badly infested communities. Governor Stevenson would much prefer that local governments cope with what is essentially a local problem. But instead of taking refuge behind this preference, as so many state executives do, he acknowledged a state duty to act where the local government did not. There were 8,400 federally registered gambling machines in the state in 1948; last year they numbered 1,783, most of them in private clubs. Only the state police raids, the constant pressure from the governor, accounted for the decline of gambling and with it the decline in corruption of local officials.

When the time came for the Democratic organisation to pick its local candidates for this year's election, Mr Stevenson used his influence as a party leader to prevent the renomination of two prosecutors—in Chicago and the East St Louis area—whose law enforcement records had been most dubious. He did not attempt to dictate who should be chosen, but he made it clear that he would not accept the nomination of officials with proved bad records. By firmness and tact he compelled the machine to throw its two prosecutors overboard. That is a rare achievement in American politics, denoting both courage and political skill.

This record explains why Democratic politicians are looking over Governor Stevenson with more than ordinary interest. His friends believe that he is just what the party needs, if President Truman decides to retire: a man of high principle with the proved ability to win votes in large numbers in a crucial state; a man of broad administrative experience, who has been associated with the Administration's basic foreign policy and yet has stood outside the acrimonious disputes of recent months; and a governor with a notable record in cleaning up scandals similar to those which currently plague the Democrats in Washington. Whatever liabilities the politicians may assess against him, these are certainly assets which cannot be overlooked.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

American Notes

New Hampshire's All-Star Cast

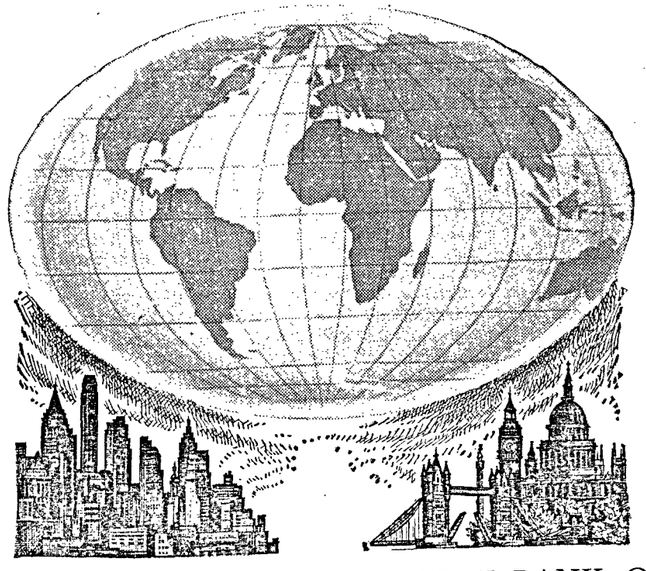
A battle of the giants is to take place in New Hampshire, where a fortnight ago it seemed that General Eisenhower, to all intents and purposes, would have the ring to himself. The top performers of both parties are now entered in the primaries, the preliminary elections on March 11th, in which members of each party show which candidate they prefer. So small a state—it is 44th in population—cannot hope to affect the final choice of a President; that is the prerogative of such heavyweights as New York, California and Pennsylvania. But this first popularity contest may decide who is to receive top billing in each party.

New Hampshire Republicans will be able to choose between General Eisenhower, Senator Taft and Mr Stassen; Senator Taft, at the last moment, decided that he had little to lose by invading a state where the Republican organisation is publicly pledged to the General. On the other hand, should he do well against such heavy odds—admittedly an outside chance—this might deal a mortal blow to the Eisenhower boom. It also gives Senator Taft an excuse for challenging Eisenhower supporters to enter their candidate in states such as Illinois where the Senator is on safe ground. The results in the preference primary bind no one, but they may set the tide flowing for the victor and sweep the waverers along.

New Hampshire moves in a Republican orbit, and the chance to show off his tricks in the primary ring is not needed by the President, who can secure his re-nomination from the convention by other means if he wants it. New Hampshire's submerged Democrats, therefore, hardly expected to be invited to judge between the President and Senator Kefauver, who has hardily challenged Mr Truman. Senator Kefauver's anxiety to exhibit his prowess is natural enough; his zeal for taking the lid off Democratic corruption has made him more popular with the people than with the bosses of his own party, and his only chance of running off with the nomination is by an impressive show of popular support. Until this week it seemed that in New Hampshire, as in Illinois, he would be unopposed in the Democratic primary, and have to content himself with shadow-boxing, for the President announced that he would withdraw his name, entered without his consent. But a few days later Mr Truman changed his mind. One factor was the threat of Truman delegates to withdraw if he did not run. Another may have been the fear that to withdraw would strengthen the assumption, so dangerous to his political influence, that he means to retire. Or it may simply have been the tempting prospect of himself deflating Senator Kefauver, who in recent weeks has begun to look a trifle formidable.

Tariffs on the Table

In the latest budget the work of the Tariff Commission is classified as part of the conduct of foreign affairs, instead of being included with the promotion of trade and industry, but the Senate lost no time in demonstrating that the change was wishful thinking on the part of the Administration. Ignoring the country's declared foreign policy of lowering tariff barriers and interested only in promoting the trade of the twenty American manufacturers of blue cheese, the Senate sent back to committee the Bill repealing the so-called fats and oils amendment. This amendment, improperly introduced into the Defence Production Act last year, sets quota restrictions on imports of dairy products and has drawn protests from ten countries, many of which had stepped up their exports of cheese to the United States on the urging of the Economic Co-operation Administration. The amendment may still be repealed in June, when the Defence Production Act must be renewed, if not before, but it survived last week because it had the united support of the usually divided Republicans, an ominous sign for the future of freer trade should they win the next election. The decisive seven votes were cast by a group of Democrats with dairying interests.



Next day, however, national interests triumphed over sectional when the Senate approved the lifting of import duties on lead and zinc, badly needed for the rearmament programme. If the Senate had then proceeded to consider the Customs Simplification Bill, already passed by the House, it might have wiped out a little of the distrust created abroad by the cheese quotas. But instead the fish lobby is being given a chance to repeat the success of the dairy lobby and to send up the price of America's tuna salads and sandwiches as well as of its cheese ones. The fishing industry of the west coast is asking the Senate to follow the House's example and impose a tariff on fresh and frozen tuna fish coming duty-free from Latin America and Japan. These countries are underselling the American product on a market from which imports of tuna tinned in oil were almost eliminated last year, when the tariff on them went up to 45 per cent, as a result of the cancellation of the Mexican trade agreement.

This did not, however, affect imports of tuna tinned in brine or bonita, a similar fish, tinned in oil and the Tariff Commission is now considering whether duties on these inferior, but competitive, products should be raised. This is one of a series of about ten investigations which are overburdening the commission as a result of last year's amendment to the Trade Agreements Act; this made it obligatory to hold hearings whenever a domestic producer claims that he is being injured by foreign competitors who benefit from lowered tariffs. Other investigations now proceeding are into imports of garlic, briar pipe bowls, bicycles and motorbicycles and watches and watch parts. The last is the most important, for if higher tariffs are recommended in this case a flood of applications for increases in the duty on similar products is expected.

* * *

Three Ring Investigation

A bad taste was left in many mouths by Mr Truman's mysterious decision to entrust the inquiry into corruption in the federal government to the Attorney-General, Mr McGrath, whose own department is under fire, and whose services Mr Truman had, at one point, been ready to dispense with. Mr McGrath has now delegated the job to Mr Newbold Morris, a highly respected independent Republican, who began his political career under Mr La Guardia and has been President of the New York City Council. Neither his independence nor his Republicanism, however, have protected him against charges which he hotly denies that he is a "soft-headed idealist" who has been used by Communist-controlled organisations. Republicans in Congress profess to be less confident than Mr Morris that, even without powers of subpoena, all the locked cupboards of the Administration will fly open at his touch. And, however great the personal integrity of Mr Morris, his inquiry is

World-wide Banking

Businessmen with international interests rely on a bank whose services are world wide.

The National City Bank of New York provides a global network of 54 branches, as well as banking correspondents in every important centre of the world. The staff of the London branches are experienced not only in British banking, but also in the financing of overseas trade, and are uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, a world-wide organization stands at your service.

THE NATIONAL CITY BANK OF NEW YORK
(ESTABLISHED 1812)
Incorporated with limited liability under the National Bank Act of the U.S.A.
HEAD OFFICE: 55 WALL STREET, NEW YORK
LONDON OFFICES—CITY: 117 OLD BROAD STREET, E.C.2. WEST END: 11 WATERLOO PLACE, S.W.1

bound to suffer from the fact that he has been made Special Assistant to the Attorney-General, for his first task will be to consider allegations that the Department of Justice has been lax in prosecuting tax frauds.

Mr Morris hopes to have ready by the middle of July his estimate of how far the rot has gone, and how it can be stopped. If Mr Truman hoped, by this belated appointment, to appease Congress and bury the corruption issue before the election, he is going to be disappointed. Congress has already set aside $500,000 to dig it up again this session. A full-scale investigation of the Department of Justice has been authorised in the House, and the Senate is to scrutinise the Alien Property Office, a division of the department, whose administration of $500 million of enemy assets is questioned. When he comes to the Bureau of Internal Revenue, the heart of the scandals, Mr Morris will have to compete with the King subcommittee. The President's proposals for reforming and modernising the bureau have already been approved by the House, but the Senate, which enjoys patronage privileges under the present system, may prove more awkward.

Other inquiries are expected to delve into irregularities in the sale of surplus war goods, particularly tankers, to keep hammering at the Reconstruction Finance Corporation, and to see what can be turned up at the Securities and Exchange Commission. This last is one of the few the Democrats relish, for the chairman of the SEC has been a Republican whom the President has, with no regard for party feeling, appointed to head the RFC. In most cases the Democrats, who nominally control Congress, would not be so eager, in an election year, to hold up the mirror to their own faults, if they did not know that any hesitation would be exploited by the Republicans. The most they have been able to secure is a promise that the inquiry into the Department of Justice will consider only specific allegations, based on adequate evidence, rather than mere rumour.

* * *

Canada's Challenge

President Truman's regular appeal to Congress to carry out the 1941 agreement with Canada on joint construction of the St Lawrence Seaway and Power Project has additional backing this year in the Canadian announcement that it will go ahead alone on the seaway if the United States does not act soon, presumably in this legislative session. In spite of opposition to the "socialised ditch" from railway, port and electricity interests, the Administration is strongly in favour of United States participation in the project, for several excellent reasons: its importance to national security; the safe and cheap transport for iron ore from Labrador to the hard-pressed steel mills of the Middle West; the fact that otherwise Canada will decide the toll rates for a route that will be chiefly used by American commerce; industrial need for the power the hydro-electric plant would generate; and the effect that failure to co-operate would have on American relations with Canada.

This last is not the least of the reasons for the United States to shoulder part of the cost, estimated at $818 million, of the project, which will make the St Lawrence navigable for ocean vessels headed 2,347 miles westward from the Atlantic to Duluth, Minnesota, and will provide a 2,200,000 horsepower hydro-electric plant. Canadian plans for carrying out the scheme split the work into two parts, the seaway and the hydro-electric plant, assuming that the latter could be built jointly by the Province of Ontario and New York State. But critics of the Canadian proposals say that this is entirely too big an assumption to make in view of the failure of past efforts by the province and the state to start the power project separately from the seaway, even though it does not require Congressional sanction. And the seaway locks will depend on the dams for their power.

The ambitious Canadian plan for the seaway is only one of the many ways in which the northern Cinderella is now rivalling the fairy godmother below the border. Another challenge is being offered by the Canadian dollar, which, only five weeks after all controls were lifted from Canadian currency, reached parity with the US dollar. It is even suggested that the continuance of the heavy American investment in Canadian oil, mines and manufacturing may before long bring the Canadian above the US dollar on international exchanges. Locally it is in some respects already in that enviable position; for the first time in years Canada is importing cattle from the United States, instead of exporting them to it, because prices received in the Canadian market are now higher and Canadian dollars buy more at home.

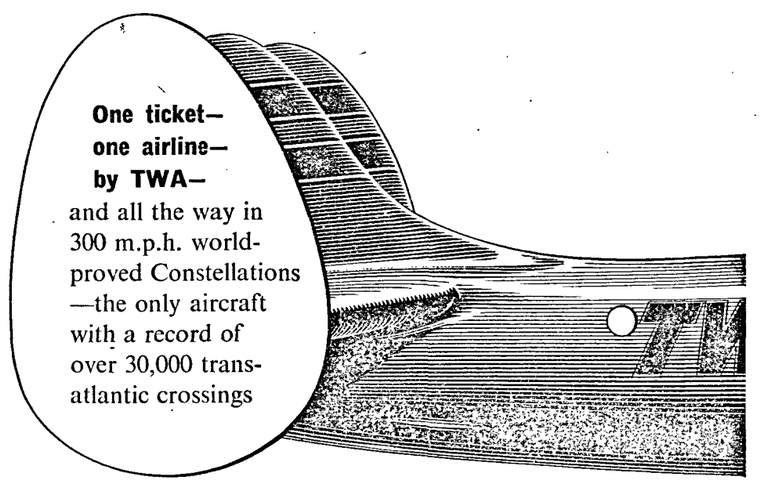
* * *

Senator Capehart's Silver Lining

Thanks to his courage and cheerful common sense, Mr DiSalle has survived as price administrator to celebrate the first anniversary of controls. But he is to leave this month, with the gratitude of the Administration for his past services and its best wishes for his hopes of defeating Senator Bricker of Ohio in the autumn. Despite an ineffective stabilisation law, increases in the cost of living have been held to less than 3 per cent, compared with a 10 per cent increase in 1950. One of the features of the law to which the Administration has taken, vainly, the strongest objection, is the Capehart amendment, adopted last June, which permitted businessmen to raise prices to compensate them for virtually all increases in costs incurred between the first half of 1950 and July 26th last year. Because of the fall in consumer demand, not all businessmen allowed to increase their prices have done so; the automobile companies, for example, have not as yet raised prices as much as they might, though they may swallow the whole cherry in time.

It now appears, however, that, for the authorities trying to stave off a steel strike, the Capehart amendment may have a positive silver lining. It offers the only available excuse for allowing the steel companies, who, before taxes at any rate, made very large profits, to raise their prices. Unless the industry receives some price relief it is determined not to consider the union's claim for higher wages.

Senator Capehart regards this as a scandalous misuse of his amendment; he believes that the steel companies are really being compensated for increases which took place later than July. His threat to repeal the amendment is not taken very seriously, however. The stabilisation authorities are resigned to the fact that it would be difficult to revoke concessions already made; what they want to stave off is, on the one hand, any extension of the amendment to a later date, and, on the other, the decontrol of industries such as shoes, apparel, and textiles, which are suffering from a slump. Wool prices have fallen so far that the ceiling has been reduced 20 per cent, yet is still 40 per cent above the market price; the same thing has happened in the soap and detergent field. Mr DiSalle actually has set up a committee on decontrol, but the purpose seems to be to reassure Congress that the problem is not being overlooked, rather than to take immediate action.



Mr DiSalle's parting view is that it would be dangerous to move too fast, and that the weakness of prices is much exaggerated. The prices of goods used by defence industries are all pressing against their ceilings, while "startling rises" in fruit and vegetable prices have helped to raise the December cost of living index to a new high. Fresh fruit and vegetables, indeed, are so costly that, like the humble potato, they may soon qualify for control. With the life of the defence programme being stretched out to 1954, the danger of inflation will not soon be routed.

PLASTICS
inspire new ideas

Plastics, because they offer advantages not to be found in other materials, are continually inspiring better ways of doing things. An oil company sought a method of filling tractor grease guns that would save time and waste. The answer came only through knowing what can be done with plastics — a pliable pack from which grease can be squeezed cleanly into the gun. The pack had to be more flexible than metal, yet tough and durable to withstand storage until required, and it had to be of a material which could be readily joined to give grease-tight seams. BX plastics solved the problem. How many problems in your own business can they solve? That's worth considering. The BX Technical Service Department will give you all the information and advice you may need.

With acknowledgments to Messrs. John Tye & Sons Ltd. 457 Caledonian Rd., London, N.7, and The Vacuum Oil Company Ltd.

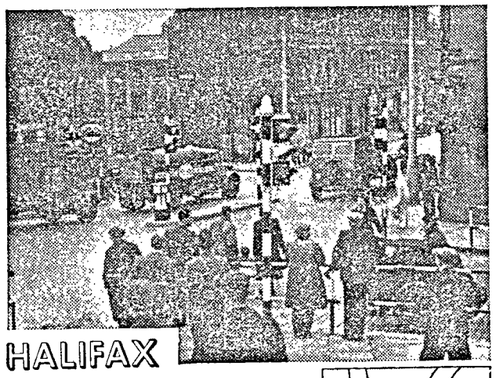
NEWS FROM THE FISHING INDUSTRY

A first-class passage for first-class fish

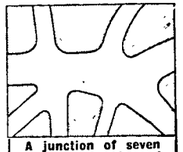


Since British Trawlers were freed from wartime restrictions, a number of measures have been taken by the Fishing Industry to raise the food-value of the fish you buy.

One of these relates to the storing of the catch in ships' fishrooms. More and more, the method of packing the fish in layers of ice is being improved by 'shelving'— that is to say the fish are carefully laid out on ice-lined shelves fixed in tiers so that no weight presses upon them from above. Thus risk of damage to the fish is greatly reduced — important because a damaged fish tends to deteriorate more quickly.

Indeed it might be said that more and more of the fish you eat these days, instead of travelling steerage from the fishing grounds, has a first-class passage home — as befits such first-class food.

British trawlers know their job!



Issued by the British Trawlers' Federation Ltd.

HALIFAX

chooses "ELECTRO-MATIC" for the most intricate traffic control system in the North

At a complicated seven-road junction in Halifax, the "Electro-matic" system of traffic control is seen at its best. Congestion and delay are virtually eliminated for road users and pedestrians proceed safely. "Electro-matic" signals are in use all over the world. Being vehicle actuated, they enable traffic to control itself. No matter how dense the traffic or how complicated the junction, "Electro-matic" will keep all streams of vehicles moving smoothly and rapidly. Let us send you information and literature.

A junction of seven roads all safely and efficiently controlled without the aid of the police.

One of the greatest advantages afforded by "Electro-matic" is the saving in police personnel. When "Electro-matic" controls the traffic the police are released to do their rightful job—the prevention and detection of crime.

THE WORLD OVERSEAS

The War of the Wavelengths

LAST week's announcement that the Treasury grant-in-aid on which the BBC's foreign broadcasts depend would not be affected by the cut made on other information services may by some have been taken to mean that Britain would continue to speak with the same strength on the wavelengths of the world. It was at once clear, however, that this was not possible. In the first place, the BBC's external services are as much a victim of the inflation as any other non-profit-making institution; they cannot raise their prices to cover mounting costs, for they have nothing to sell. But a more important adverse factor is the present intensification of the radio "war." The rapid expansion of rival broadcasting systems is threatening not merely to overshadow the BBC's external services, but even to crowd them off the air altogether in certain areas.

Broadcasting's most important battlefront is, of course, Europe; and here the picture has changed dramatically in the last few years. From 1946 to 1948 the BBC was the most powerful voice on the Continent. Since that time it has slightly increased its service, and today it is broadcasting to Europe at the rate of over 260 programme hours a week; but it has been far outstripped by its rivals. Moscow radio now devotes over 400 hours a week to Europe, and the external broadcasts of the satellite Communist countries contribute another 400. The Voice of America's European services are also running at over 400 hours a week, and Radio Free Europe, an unofficial network financed by American citizens, is concentrating on the satellite countries a volume of broadcasts which may soon surpass that which the BBC provides for the whole of Europe. Among the "middle powers" of European radio, Italy has in the past year increased its external output to a figure not far below the British, and Jugoslavia is now directing to its Communist neighbours more broadcasts than they receive from London.

Soviet Jamming Activities

In Eastern Europe the BBC's difficulties have been further increased during recent weeks by the extension of Soviet jamming to broadcasts in Polish and Finnish. Since 1949 the Russians have tried to jam all broadcasts in Russian by both the BBC and the Voice of America, and this particular sector of the radio battlefront has assumed the appearance of a massed artillery duel, hundreds of jamming stations on the one side being engaged by simultaneous transmissions on over a hundred short wavelengths on the other. Five western nations—Britain, America, Canada, Italy and Greece—are now co-operating in an effort to get at least a fraction of their output through by beaming their programmes to Russia at the same time each day, and the Voice of America is about to begin broadcasting in Russian from six transmitters mounted on ships, whose mobility, it is hoped, will baffle the jammers. Similar barrage methods are already being used by the BBC to counter the jamming of its broadcasts to Poland and Finland. This is an expensive operation, and a great strain on the limited number of transmitters available; and the strain will be intensified if the Russians now proceed to jam broadcasts in Bulgarian and Rumanian, a possibility indicated by their recent jamming tests on these programmes. Another source of apprehension lies in Communist broadcasting and jamming activities in Eastern Germany.

There is, however, ample evidence that the Soviet jamming is far from complete. The BBC's Russian service, formerly carried on only three short wavelengths, now goes out on up to 28, at least three of which escape jamming during the average transmission. Moreover, the Russians appear to rely largely on weak local jammers, the greatest concentration of these being in the area of Moscow, and comparatively good reception of western broadcasts can be obtained not only in the more distant parts of the Soviet Union, but even at a short distance from the capital. The Soviet jamming of broadcasts in Finnish is at present even less effective.

But although recent developments have focussed attention on broadcasts to Eastern Europe, it must be realised that these represent only a fraction of the output of the BBC's external services. Their total of programme hours is only half that of the General Overseas Service in English, which alone accounts for nearly one quarter of all BBC external broadcasting. Until last May this service was on the air throughout every twenty-four hours, its short-wave beams following those of the sun westwards around the world. Three hours a day were then sacrificed to the need for economy, leaving little more to be cut from a service whose audience is dispersed in over twenty time zones, if it is to continue to provide entertainment, cricket commentaries, and news bulletins at hours convenient alike to the British businessman in Buenos Aires, the tobacco planter in Rhodesia and the soldier in Korea, Malaya or the Middle East. Nor can much saving be effected by dovetailing the General Overseas Service more closely in with the short wave programmes directed to specific parts of the Commonwealth and to the United States; for while the former is based on items of interest to the whole English-speaking world, the latter are designed for particular communities, and include broadcasts in Afrikaans, Maltese, and French (for Canada). In particular, the BBC's services to the colonies are gaining importance in proportion to the mounting number of wireless sets used in those territories.

Outside the borders of the Commonwealth it cannot be expected that so high a proportion of listeners will tune in to London; nor is short-wave listening within the means of more than a fraction of the populations of Middle and Far Eastern countries. Nevertheless the BBC can cite as evidence of its audience such facts as the receipt of over 6,000 letters a year from listeners to its Arabic programmes; the frequent quotation of London broadcasts, with due acknowledgment, in the Japanese press of the next day; and the continued receipt of letters from listeners in Communist China. Last May the BBC's access to Far Eastern listeners was greatly increased by the opening of its powerful relay station at Tebrau, in Johore. For the past year Hongkong radio has also relayed BBC transmissions in Chinese.

The last field of British broadcasting outside Europe, the service to Latin America in Spanish and Portuguese, is today something of a Cinderella among the external services. The weakening of the British connection with Latin America, combined with the widespread assumption that the United States can, unaided, ensure the solidarity of this area with the rest of the western world, has led some people to see here the possibility of saving money without any political loss; but last May the Latin American service, then broadcasting for over nine hours a day, was cut by half, and thereby reduced nearly to the minimum for the effective coverage of a bilingual area extending over four time zones.

A similar attitude is often adopted towards the BBC's broadcasts to Western Europe. What need, it may be asked, is there for Britain to broadcast to countries whose own stations present the western point of view? Here, however,

hard facts provide a convincing answer to theoretical questions. In France, for example, eleven public opinion polls taken since the war under very various auspices have indicated that the BBC's regular audience increased from 870,000 to nearly 1,500,000, and its occasional listeners from 4,500,000 to 7,500,000, between 1946 and 1950. This is not an audience to be lightly thrown away. Medium wave broadcasts from Britain are receivable in the nearer continental countries, ranging from France to Sweden; and the problem of reaching more distant listeners has been partly solved by the relaying of BBC transmissions by the main networks in Italy, Austria and Greece. But several of the European services are already operating at or near minimum levels—Sweden now receives only half an hour, Portugal three-quarters, and Flemish Belgium a quarter of an hour a day—and further reductions must mean virtual extinction.

Soviet Balance Sheet for 1951

THE authorities in Moscow have now drawn the official balance sheet of Soviet economic development during 1951. This should have been, and probably was, the first year of a new five-year plan. The Soviet planners, however, still judge it inopportune to reveal what their targets are, and thus make it difficult for outsiders to relate the fulfilment of the annual plan with long-term objectives. On the other hand annual reports, however summary, when supplemented by the statements of various ministers, allow an insight into the rhythm of Soviet economic development and hence make it possible to make certain estimates of long-term trends.

The evidence available is mainly on the expansion of basic materials and fuel, and it is on these as well as on engineering that the main emphasis continues to be laid. When in February, 1946, Stalin spoke of a future level of production "providing a guarantee (for Russia) against all possible accidents" it was in terms of these basic commodities that he traced the path to be followed. The goals to be reached in two or three five-year plans—60 million tons of steel and oil, 50 million tons of pig iron and 500 million tons of coal—may no longer be considered "a sufficient guarantee." In any case, how distant is the Soviet economy still from these objectives?

Two assumptions can be made when projecting present Soviet production into the near future. Either the recent increases in absolute terms or the current rate of development can be taken as yardsticks of future progress. If the first method is adopted—taking 20 to 25 million tons of coal, over 4 million tons of oil, about 4 million tons of steel and somewhat less than 3 million tons of pig iron as the average annual rise—Stalin's targets should be reached at the beginning of the next decade, probably even somewhat earlier for steel and oil (for which, however, predictions are particularly risky). Should it be assumed, on the other hand, that the annual rate of increase—varying from less than 10 per cent for coal to about 15 per cent for steel—is the appropriate measuring rod Stalin's "guarantee" should be honoured around 1957.

The report on 1951 would at first seem to indicate a substantial fall in the rate of growth. Measured in roubles gross industrial output failed to rise on a scale comparable with the previous quinquennium, though this may be partly explained by the changed method of computation. Yet, even in volume the output of basic materials did not increase as much as in previous years. Has the Soviet economy reached a stage of "diminishing returns"? It seems rather that a decline in the rate of growth—already noticeable in the previous year—was bound to happen once the ravages of war were repaired and further progress depended exclusively on new construction. New investments must probably take some time to mature. On the other hand it is unlikely that the expanding output will always increase by the same proportion. It is safer to assume that the rise will be usually somewhere between last year's actual rise in absolute figures and last year's percentage increase. On this basis Soviet production should reach Stalin's targets before the close of the decade, and by 1955—which should be the last year of a second postwar plan—the Soviet Union should produce some 400 million tons of coal, over 50 million tons of crude steel, nearly 40 million tons of rolled steel, over 35 million tons of pig iron and about 60 million tons of oil.

Obviously such an expansion would require the concentration of all efforts on industrial output, a further growth of manpower, improved technique and a substantial flow of resources into investment. In 1951 the total labour force —both workers and employees—rose by an additional 1,600,000 to 40.8 million, i.e. over a million more than in 1940. Yet, even this is considered insufficient, particularly as in many branches increased output is due more to the increased number of workers than to increased productivity.

Coal seems to be a case in point and therefore the responsible minister spoke recently of the need both for more workers and more skilled labour. Incidentally, he claimed that some 300,000 miners attended special technical courses during the year. Thus it is hoped that it will soon be possible to reap the real advantage of mechanisation. As regards the oil industry, the main progress during the year was apparently achieved in the Bashkir and Tartar republics and around Kuibyshev, i.e., in the so-called "second Baku." While in this sphere the Russians speak of the "growing importance of the more eastern regions," in the iron and steel industry progress is apparently equal both in the western and more eastern regions. Thus Krivoi Rog (Ukraine) has fully recovered and is working at full steam, while Magnitogorsk—now celebrating its 20th birthday—exceeded its targets very substantially. Little information is available about the engineering industries. The Minister of Machine Tool Industry claimed last week that 82,500 metal-cutting tools were produced in 1951, 8,500 more than the planned target for 1950. Judging from volume indices it is in engineering that expansion has been the greatest since the end of the war.

SOVIET PRODUCTION

	Output in Million Tons			Indices Previous Year=100		
	1940	1950	1951	1949	1950	1951
Pig iron	15·0	19·4	22·1	119	117	114
Crude steel	18·3	27·3	31·3	125	117	115
Rolled steel	13·1	20·8	23·9	127	116	115
Coal	160	264	285	113	111	108
Oil	31·0	37·8	42·3	114	113	112

Cement	5·8	10·2	12·1	126	126	119

* '000 million kWh.

The gap between the output of producer and consumer goods has remained since the war as wide as it was before. While basic materials and engineering products exceeded quite stiff production targets and left the 1940 level far behind, the output of many consumer goods just reached the prewar level and often failed to fulfil their very modest targets. Thus cotton fabrics, with 4,650 million metres, and shoes, with 240 million pairs, have only just reached the level planned for 1950. The position seems somewhat better for fats and sugar, but generally the levels of consumption are still very low. Obviously the Russians must have felt quite an improvement after the appalling standards during and immediately after the war. Yet even the sons of patient *muzhiks* must wonder when they will finally reap the fruits of years of abnegation and effort. Once again, however, they are likely to be robbed of their well-merited reward by the vagaries of the international situation. In the present situation the Soviet planners will not be able to shift the emphasis on to consumer goods. The USSR has no idle resources

or unemployed manpower to harness into the defence effort. The planners will have the alternative of cutting consumption or investment, and when faced with such a choice they have consistently and understandably put a premium on investment. The failure of agriculture to keep up with industrial development also makes a major contribution to the relatively low level of consumption. The Soviet citizen will probably have to wait for quieter times to get a larger slice of his national income.

China and Britain—A New Phase

MR CHURCHILL'S references to the Korean war and Formosa in his address to Congress have been prominently featured in Chinese Communist radio and press publicity and interpreted as a British surrender to an American policy of "expanding the war." At the same time alleged "unfriendly acts" of the British authorities in Hongkong against "Chinese citizens" are being played up in a manner which is both new and ominous. There are signs that the heat is to be turned on seriously against Britain for the first time since the *Amethyst* affair. All expression of opinion in China is today integrated under a fully totalitarian central control, so that the new tone about Britain appears to indicate that the Chinese Communist leadership is reconsidering its hope of a decisive separation between British and American policies in the Far East. Whether the new agitation on Hongkong will develop into real menaces against the British position there remains to be seen, but the period of virtual immunity from officially sponsored hostile agitation in China that Hongkong has so far enjoyed now appears to be over.

In reporting Mr Churchill's speech to Congress a Chinese radio commentator declared that he had come to America "wagging his tail and seeking pity", and had

> profusely lauded the bloody aggression of the United States in Korea and expressed hearty approval of the American stalling tactics in the armistice negotiations. He even went so far as to urge his American masters to conquer the peoples of China and Korea. . . . Churchill stated that he fully supported the shameless action of the United States in occupying Taiwan, a part of Chinese territory. This fully reveals the ugly mien of Churchill towards the Chinese people.

Chinese press editorials declared that Mr Churchill's speech had shown him both as the representative of British imperialism, "the enemy of the Chinese and Asian peoples," and as the subservient auxiliary of American imperialism striving to "curry favour with his American bosses." He had "viciously slandered" the Chinese People's Republic and had "openly declared in Washington his friendship for the Kuomintang bandit remnants in Taiwan." He had explained to Congress that "Britain could not carry out American policy if American aid were not forthcoming," but that America could not carry out its aggressive imperialist plans without Britain. He had "tightened Britain's subservience to America and begged for sympathy before the mouthpiece of Wall Street, the United States Congress." The *Kwangming Jih Pao*, however, warned the British imperialists that they would suffer "crushing defeat if they try any tricks against the Chinese People's Republic at the bidding of their American masters."

Chinese Communist comment sought to emphasise that British opinion was not united in support of the attitude expressed by Mr Churchill, who had spoken "in utter defiance of the British people's desire for friendship with the Chinese people." Prominence was given to expressions of British "irritation" at American pressure on Japan to conclude a treaty with the Chinese Nationalists, and it was

declared that neither America nor "the British reactionary clique led by Churchill" could shake the Chinese people's determination to "liberate" Formosa.

On January 25th a manifesto against "illegal" arrests and expulsions of "Chinese citizens residing in Hongkong" was issued over the signatures of a number of prominent personalities, including Kuo Mo-jo, Liu Ning-yi and Liao Cheng-chih. The manifesto declared that the "shameless persecution of Chinese residents" in Hongkong was due to the British Government's subservience to American policy. The Hongkong authorities were accused of "obstructing the patriotic activities" of Chinese in the territory, of preparing to "transform Hongkong into an outpost for the invasion of China," and of "instigating Kuomintang brigands to raid China's borders." The British were warned that they must "bear full responsibility for their provocative actions." This manifesto was followed up by a similar blast at British "hostile acts" against Chinese in Hongkong signed by representatives of the Shanghai branches of the China Peace Committee, Democratic Youth Federation, Democratic Women's Federation and other organisations which usually provide the Communist party's chorus on such occasions.

Ninety Days in Paris

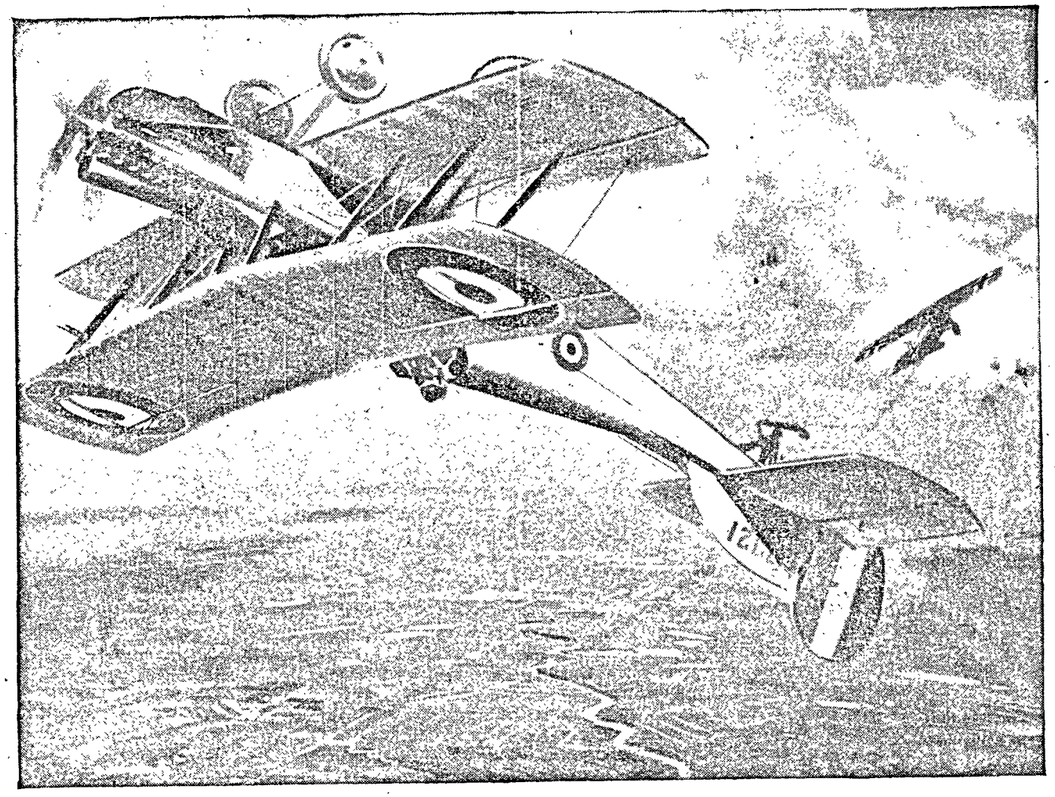
Two remarkable paradoxes characterised the sixth United Nations Assembly, which ended on Tuesday just three months after its opening session. In the first place, this was (*pace* Mr Eden) perhaps the most vituperative Assembly yet held; each Soviet speech seemed to contain more invective and abuse than the last, and the United States delegates were not slow to answer in kind. Yet, despite this mounting conflict of words, and despite the open conflicts in both the Far and the Middle East which accompanied the session, at no time was there any serious suggestion, such as has been heard at almost every previous Assembly, that the United Nations was in danger of breaking up. Even Mr Malik's assertion that the third world war had already begun stirred no more than a ripple of comment.

That in itself might pass merely as an illustration of mankind's habit of taking institutions for granted, whatever their difficulties, if they can only survive for a certain length of time. But the second paradox is less easily explained. From the beginning of the Assembly it was clear that it would be distinguished from its predecessors mainly by the heightened tension between the countries of the Middle East and those of the west. Morocco, Libya and Palestine were on the formal agenda, Egypt and Persia were already at loggerheads with Britain when the session opened, and before it closed matters came to a head over Tunisia, which is now being brought before the Security Council by fifteen Asian governments. The logical consequence seemed to be the forging of a new "anti-colonial" front, with the Soviet Union, as the professed champion of the Asiatic and African peoples, gaining a new following among their delegations.

The surprising thing is that this did not happen. Of the whole long series of resolutions and amendments tabled by the Soviet representatives, only a handful secured the support of any nation outside the iron curtain. Last week's vote on the western proposal to defer discussion on Korea until a more suitable moment was typical; the proposal was supported by 51 out of the 58 delegations present, the five contrary votes were those of the Soviet bloc, and the only sign of any disunity in the non-Communist world was the abstention of Chile and the Yemen. The Russians fared no better in the debates on collective measures and the Balkans, and although there were more abstentions in the votes on the creation of the Disarmament Commission and on the Soviet complaint against the US Mutual Security Act, the number of hands raised in support of the Soviet motions could still be counted on the fingers of one of them. Mr Vyshinsky, who left Paris a fortnight before the end of the Assembly, will no doubt have to answer some awkward questions in Moscow about this failure to exploit the inherent contradictions in the non-Communist world on which Soviet spokesmen lay so much stress.

Part of the explanation lies in the divided counsels of the Asians themselves. From the very beginning of the session Egypt's evident intention of launching an all-out attack on the west was viewed with disquiet even by some of its partners in the Arab League. As the weeks passed, the Wafdist delegates, who dragged their quarrel with Britain into wholly irrelevant debates and supplemented this almost daily with inflammatory press conferences, acquired a reputation akin to that of the Irish spokesmen at Strasbourg, who cannot approach any European issue except by way of "partition." Iraq and the Lebanon were quick to dissociate themselves from these tactics, and when the Wafdists went so far as to denounce the new Libyan government as a tool of imperialism they found themselves completely isolated.

Anti-western feeling was, however, widely manifested in debates on both political and economic issues, and particularly in the fourth committee, whose approach to colonial questions led to the temporary withdrawal of France as well as South Africa. That this feeling was not carried to the point of opposition to the major western initiatives was due largely to the good sense of the western delegates themselves. The anger with which American spokesmen answered Soviet attacks in debate did not prevent their agreeing, often on British and European advice, to modify the wording of several resolutions so as to make them acceptable to Asian opinion. And the west's success in weaning Asia away from the attractions of Communism was perhaps seen most clearly in the unopposed adoption of the American resolution on land reform and the crushing defeat of a rival Polish proposal, despite the latter's seductive appeal to nationalism.



Mr Vyshinsky's Poor Form

The Soviet delegation's failure to capture any significant support must nevertheless be largely ascribed to its own ineptitude. Except on disarmament and the admission of new members, the Russians showed themselves unwilling or unable to modify their own proposals in such a way as to broaden their appeal; and their endless repetition of old charges against the west fell on increasingly weary ears as the session progressed. Mr Vyshinsky's notorious "dead mouse" speech, and his equally maladroit revelation of the extent of Soviet control over Hungary when discussing the case of the American airmen forced down in that country, did much to alienate even those delegates who prefer to think well of the Russians as long as they can; and Mr Sobolev pained many of his hearers by his personal attack on the Secretary-General, whose assistant he had so recently been. The British delegation under Mr Selwyn Lloyd fully deserves to be congratulated on having emerged so well from an Assembly whose beginnings were dark with storm warnings; but its members would probably be the first to agree that their success was at least partly due to the clumsiness of their chief antagonists.

Elections in Burma

[FROM A SPECIAL CORRESPONDENT]

LIKE India, Burma is now nearing the end of a general election spread over a considerable period of time and the new Chamber of Deputies is expected to assemble for the first time about the beginning of March. As with the Congress Party, the government party in Burma, the AFPFL (Anti-Fascist People's Freedom League) is certain of being returned to power under the present Prime Minister, Thakin Nu. It has not, however, been possible to carry on the Burmese elections according to a fixed plan established beforehand because of the disturbed and in many respects still disintegrating state of the country. While, therefore, it

We've solved some problems in our time!

WANTED—*an unspillable aircraft battery*. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manœuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

¶ Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

¶ For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.

¶ Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

SIMON ENGINEERING GROUP

Behind the scenes the Simon companies are often concerned in well-known industrial ventures of great national importance. One example is the immense Margam steelworks, for which Simon-Carves built the new boilers, coke ovens and by-product plant. Another is the United Sulphuric Acid Corporation's project to produce sulphuric acid from anhydrite as a long-term measure to meet the sulphur shortage; Simon-Carves are the main contractors for the construction of the plant, and Simon Handling Engineers are responsible for all materials handling and preparation.

These facts are published to show what British workers can achieve in spite of difficulties, given opportunity and backed by enterprise.

It can be done

At one of the biscuit factories of Messrs. Carr and Company Limited of Carlisle, a building was demolished and a new two-storey bakehouse erected in its place in 10½ days.

Starting on a Friday evening in August 1951, two teams of 35 men worked twelve-hour shifts—the night shift under floodlights. Construction was carried out over machinery which could not be moved and all materials had to be hoisted across existing buildings. The programme—worked out in advance to the last detail —was fulfilled in spite of bad weather.

At 7.30 a.m. on the following Monday week the new bakehouse —a steel framed building with pre-cast concrete floor and roof and brick walls—was completed and in production. It was the spirit of those men who worked all hours and in all weathers that saw the job through

is something of a triumph to have carried them out at all, some of the results may be open to question. Moreover, as foreseen, it proved impossible to complete the whole operation by January 4th. Elections of a sort have been held in 233 constituencies out of 250, but some results are not yet complete and others are still under scrutiny by the Elections Supervision Commission. The score board as at January 20th read as follows:

CHAMBER OF DEPUTIES

	Total No. of Seats	Election Held in No. of Seats	Left to be Held	AFPFL	Opposition
Burmans (incl. Arakanese)	190	176	14	135	41
Karen Nationals	20	18	2	15	3
Karenni State	2	2	...	2	...
Chin Sp. Division	6	6	...	2	4
Kachin State	7	7	...	2	5
Shan States	25	24	1	24	...
Total	**250**	**233**	**17**	**180**	**53**

The unco-ordinated opposition elements are made up as follows:

Opposition Group	Chamber of Deputies
BWPP (Burma Workers and Peasants Party)	6
PPF and PDF (People's Peace Front, People's Democratic Front)	14
Arakanese Parlt. groups	9
,, Indep. (Muslim)	4
Karen Congress	3
Chins	4
Kachin	5
Other Independents	8
Total	**53**

On the whole, the elections that have been held passed off with remarkably little rioting and bloodshed, although voters were not entirely free from outside influences. On the government side these included the intimidatory use of "peace guerrillas" in some district constituencies. There is also strong suspicion amounting to virtual certainty that in a few cases electoral rolls were falsified and ballot boxes tampered with or conveniently lost. On the other side attempts were made to break up the elections altogether by threats of reprisals and attacks on the polling booth areas. Some of the voting has therefore been half-hearted to say the least of it, and in some constituencies absurdly small percentages of the electorate cast votes. Some Karen constituencies were noticeably bad in this respect, the record being a total poll of 0.7 per cent. There were many of 5 per cent and under.

Of the 135 shown in the table as belonging to the AFPFL, it seems that 80, or perhaps one or two more, are members of the Burma Socialist Party (BSP)—which is a constituent of the AFPFL grouping. Ba Swe's particular dream is said to have been to organise an absolute Socialist majority, throw off the mantle of the AFPFL, form a purely BSP Cabinet and oust Thakin Nu, who would either have to become President or retire from public life. This has now failed, since about 80 seats out of 233 is not nearly enough.

The Burma Workers' and Peasants' Party (BWPP)—a fellow-travelling organisation—contested the earlier batches but then announced that the elections were not "free and fair," and that they would boycott the remainder. They actually withdrew two candidates who would have been returned unopposed, although they did contest a few more seats where they had not much hope of success. In areas where they were stronger they did not put up candidates but tried to disrupt the polling and to get the local people to boycott and ridicule the whole affair. This action is very puzzling, since they could certainly have got a few more seats had they tried, and it merely handed the extra seats on a plate to the AFPFL.

Ever since its foundation last year the BWPP has appeared to be an instrument used by the Communists—who have themselves gone into open rebellion. Its members, therefore, probably have no intention of being banned as a party. They appear to intend to exploit their constitutional position, although this does not preclude a great deal of covert trouble making both in the districts and in Rangoon. On the other hand, not one of the front line leaders is now in Parliament —Thakin Lwin, Hla Kywe, Chit Maung or Ba Nyein. The six who did get elected all represent constituencies in the Tharrawaddy district and are comparatively unknown second-rank men. Since, barring accidents, the present Government is now due to have four years in power, one is forced to wonder whether the BWPP is not considering purely subversive action in due course, along with its Communist masters.

Until about this time last year there was no organised parliamentary opposition in Burma. Then the newly formed BWPP tried to attract all those with extreme leftist ideas by forming the People's Democratic Front. This consisted of the BWPP, some white PVOs (People's Volunteer Organisation) and any odds and ends with extremist views who cared to join. It did not immediately have much success. So the People's Peace Front (PPF) was formed before the elections, under the leadership of U Aung Than, Aung San's less able brother. It was not so far to the left and included the Dobama Asiayone Party, the so-called "Repentent" White PVOs and a number of anti-Socialist Independents. This provided the best, or least poorly organised parliamentary opposition last year.

Recently there has been a movement actively encouraged by the Russians to co-ordinate all the opposition parties. Furthermore, Dr Ba Maw, although not himself interested in Opposition affairs, and his Mahabama Party have been resuscitated and revitalised, and put up a few candidates in the elections. The result is "the triple alliance," namely, the BWPP (or PDF), the PPF and the Mahabama. This is a comparatively new development, and it is impossible to say at this stage how it will shake down into a parliamentary opposition, particularly as none of the recognised leaders is in at present. Each party has been careful to stress its own entity and freedom of action, and, judging by previous alliances in Burmese politics, it is unlikely to show a continuously united front in the Chamber of Deputies. But for harassing purposes it represents a more formidable combination than any the Government has so far had to deal with. Moreover, the triple alliance as such is contesting the forthcoming municipal elections.

Black Sea Colonies for Russians

[BY A CORRESPONDENT]

THE Soviet Union's policy towards its satellites has employed a technique of ruthless "colonial imperialism" in more than one field. But the Russian "enclaves" in the maritime provinces of Bulgaria and Rumania are more than ordinary examples of the practical application of this colonising policy. They show a definite tendency on the part of the Russians to expand along the coastlines of the countries under their control. The same policy has been followed with great determination in the Baltic area, where, in the past few years, compact groups of Russian settlers have been firmly established all along the coast, as far west as Stettin. The "traditional" conception of the Russian bear as a "land animal" will have to be corrected. The bear has now taken a strong liking to sea-water.

In the last two years the two Soviet Balkan satellites, Bulgaria and Rumania, have concentrated their main construction projects in the Black Sea coastal districts. The Rumanian effort is almost totally absorbed in the formidable enterprise of building the Danube-Black Sea canal, while the Bulgarian government has decreed that the "transformation of nature on a gigantic scale" is to take place in the Dobrudja province, south of the Rumanian canal. Before embarking on these projects, the two governments organised

acquired a year ago on terms that would attract private purchasers and cover the price that the state paid. The notion that 3½ per cent Steel Stock could be tendered in exchange for the underlying securities for which it was issued also fails, for Steel Stock is in totally different hands and is now impossible to identify with individual holders of steel securities before nationalisation was imposed. No doubt, if offers of steel securities were made to the public, those investors who held them on February 15, 1951, might well be allowed to apply for them on "pink forms" and, indeed, to tender Steel Stock for them on the same terms that were offered in compensation. But the fact is that Steel Stock is now largely in institutional hands, and institutional investors would be failing in their duty if they did not give full weight to the political and economic risks that "free enterprise" in steel might imply.

* * *

It is not surprising, therefore, that public discussion has turned towards the possibility of leasing the physical assets of the old companies to successor companies. Several stages would be involved. First, the Iron and Steel Corporation would transfer its steel securities to a new holding authority, which would assume its obligations for the service of Steel Stock. The holding company could then act as a landlord owner of steel properties which it would be prepared to lease to new operating companies. For example, the present board and staffs of, say, Dorman Long and Company Limited would no longer serve that company, but instead serve Dorman Long and Company (Successors) Limited. The successor companies would lease the steel plants for an annual rental, and furnish working capital and management—the latter being independent of the holding company. That company would secure that the rentals that it received from the new operating companies were sufficient to service Steel Stock, which would become quite literally a rent charge on the industry. Each operating company would then be left to make its own arrangements for new finance to provide working capital.

Such a scheme would present plenty of difficulties. The relations of landlord and tenants would not be simple. The extension or alteration of existing plants would raise thorny problems. But in terms of finance it would be a far easier operation than attempting to resell the steel securities now held by the Iron and Steel Corporation. In round figures, these securities were acquired for £250 million. Some, like English Steel, that were acquired from holding companies, might conceivably be bought back by them, but £50 million is probably the outside figure for re-transfers of this kind. That would leave £200 million worth of securities (at 1945 and 1948 prices) to be placed. By contrast, the amount of working capital that would be required would be much lower—how much lower could only be a matter of guesswork. But if it amounted to £50 million, it would not impose any great strain on the market mechanism. And the new operating companies would then have the manifestly great advantage of starting with a clean financial slate, their capital overheads represented by a relatively cheap rent charge, and their newly subscribed capital in equities with every prospect of satisfactory earnings and dividends. On this basis, a sensible and attractive prospectus for new steel capital could be contrived; but no other solution seems to present itself.

So far as finance is concerned, the criterion of "free enterprise" in steel is the test of the market and of the willingness of investors once again to provide the risk capital. There is no half way house in this matter. No mixture of public and private interests in the industry is likely to work; there must be no repetition of the absurdity, for an industry such as steel, of relying on public finance at fixed rates of interest. That is not to say that the properties to be let out on lease must be coterminous with the properties owned by the former steel companies. There will be opportunities for regrouping and integration that should not be missed. But the determining factor, in the end, must be the willingness of the private investor to finance the remodelled companies, to take risks in their expansion and to accept the principle that an effective measure of public control must be secured over it. It would be better not to rush this process, for more is involved in "free enterprise" in steel than the wide distribution of its equity. Before the investor is asked once again to participate in the industry he will want to be certain what he is buying. It was commonly said before 1949 that to buy one steel share was to buy the lot. The truth of this exaggeration is important. One plant may have an intrinsic value because it can make steel cheaply; another may make good profits given a certain price structure and a certain degree of shelter from the full burden of its real costs. It is to these questions that the second article in this series will turn.

Profits before the Pressure

THE announcement of a fortuitous rise in profits in a period of inflation arouses two sorts of exasperation—the economic, which is directed mainly against the Government that allowed the inflation to grow and to benefit all industries indiscriminately, and the malicious, which is directed wholly against industry for having allowed higher profits to be foisted upon it. Failure to distinguish between these two reactions has led to a consistent stream of errors in public policy. In the first and lush phase of each inflationary crisis, industry shows an increase in profits, enjoyed indiscriminately by the essential enterprises that ought to be attracting more resources and the marginal ones that ought to be releasing them; even in this phase, however, the depredations of the tax collector leave companies with barely sufficient profits to keep the real value of their assets intact. In the second, or corrective, phase—which usually comes when overseas markets are drying up and profits are declining anyway—the Government steps in with new profits taxes and other measures that make the raising of risk capital impossible; the result is that businesses are driven to various sorts of fixed interest borrowing (the burden of which may cause a crop of bankruptcies if ever real recession returns) in order to maintain whatever level of replacement of real assets the system of physical controls allows to them. In the first phase profits are rather too low but much too easy; in the second phase they are still rather too easy but much too low.

The 567 profits statements published in the last quarter of 1951 still mirror a phase of incipient

inflationary crisis, a phase when profits were much too easy. They relate, for the most part, to a trading year that ended last spring, and thus cover the giddiest twelve months of excess domestic buying and of easy markets abroad. The total income of these 567 companies, at £435.4 million, was some 55 per cent higher than in the previous year; if the exceptional experience of three oil companies is excluded, the increase for 564 companies was 32 per cent (to a total of £278 million). This latter increase was spread right across the board, thwarting any incentive to move resources into rearmament or exports or any other discernible or desirable pattern. The full figures (published on January 26th in the *Records and Statistics* supplement) show a rise in the total income of 25 textile companies by 56 per cent, of 101 companies in other consumption trades by 18 per cent, and of 80 companies in capital goods industries by 21 per cent. Even shops and stores, which so soon after this trading period ended were to feel the first lick of the flame of falling consumer demand, experienced a rise in income by nearly 24 per cent on the year.

For the consumption trades, at any rate, all this is a story of profits past. Even while the buying spree lasted they were not very real profits, in any sense of the word except that interpreted by the tax collector. Of the £154 million increase in income earned by these companies, £68 million went in taxes, £53 million into reserves against future tax liabilities and less than £1,300,000 to ordinary shareholders; indeed, the shareholders actually received a smaller percentage return on the net worth of their companies (6.6 per cent against 6.9 per cent) than they did in the preceding year. The importance of this familiar story lies not simply in the fact that it makes the social malevolents (and all pandering to them by a new Excess Profits Tax) look silly, but also in its significance for the future. Are some of these industries, which were stripped of potential reserves by the tax collector as they swept up to the top of the inflationary wave, now going to find themselves in a defenceless state if and when the wave dashes them down again? Have the depredations of the past few years made the financial structure of British industry intolerably rickety?

The best that can be said is that the balance sheets published last quarter do not show any further deterioration in this regard; if they had done so, in such a time of super-boom, the position would indeed have been serious. An unnerving unknown, however, is the extent to which the published rise in profits last quarter was due to a rise in the book value of stocks, a rise that the wool industry for one has already found can be dramatically reversible. The value of stocks held by these 567 companies rose by £74½ million, or just over 20 per cent in the year. It is impossible to say how much of this was due to a rise in volume, but it should be noted that the Board of Trade's index of wholesale prices rose by 28 per cent in the year to March, 1951: it has continued to rise since then, but at a much slower rate. This rise in stock holdings, however, was financed without any further weakening of liquidity. Cash holdings rose by £73 million (though £45 million of this was accounted for by the three oil companies); moreover, there does not seem to have been any substantial sale of gilt-edged or other marketable investments, and bank borrowing rose by only £7 million on the year (though this represented a rise of nearly one-fifth). Sharp increases in sums due

to and from other current creditors and debtors indicated once again the inflated volume of trade credit that is still being handed from one company to another, but there was a welcome lessening of the build-up of the burden of prior charges at longer term; debenture capital rose by less than £7 million, and ordinary capital by twice as much. Thanks to a substantial ploughing-back of profits, the net worth (that is, the book assets minus liabilities and prior charges) of these 567 companies rose from £697 million to £799 million during the year.

The broad impression therefore is that, in this period of inflationary boom, net profits rose just about enough to finance the replacement of stocks and fixed assets at the concurrent rate of rise in prices; they probably did not, however, increase sufficiently to finance any expansion of real capital (and thus of real productive power), while they certainly did not increase enough to drive dividends up to a level where much new equity capital would be attracted for that purpose. The process of borrowing short and on fixed-interest terms, of throwing away the cushion that equity capital provides against bankruptcies and unemployment when demand runs down, has been a characteristic of other booms in world history—the sort of booms that the history books sagely declare, on looking back, to have "clearly carried the seeds of the subsequent financial crisis." But to run into this noose in order to keep capital equipment intact, instead of to increase its efficiency, is a new phenomenon.

★

As it happens, two statistical series illustrating these disturbing trends towards euthanasia of the risk bearer have been published this week by the Commissioners of Inland Revenue in their report for 1950-51. The first of these, summarised in Table IV, shows the ratios between profits and turnover in a wide range of industries. For various reasons these statistics do not cover the operations of all the public and private companies with which the Commissioners had dealings; in fact, the net trading profits assessed for these sample companies in 1949-50 (which, the Inland Revenue states, broadly cover trading operations in the calendar year 1948) amounted to £736 million, while *The Economist's* figures for public companies that published balance sheets in 1950 and 1951 show net trading profits of £925 million and £1,258 million respectively. Nevertheless, the Inland Revenue has access to much fuller accounts (including, of course, statistics on turnover and costs) than the private investigator can have.

The conclusions to be drawn from the Inland Revenue's figures are startling. It will be seen that the weighted average ratio of total income (before allowing for depreciation allowances) to turnover was the same in 1948 as in 1937. This was in spite of a sizeable growth of profits in the textile trade—mostly, no doubt, as a result of profits from exports. Industries serving the home market have kept down their profit margins as turnover has risen; in a time of inflationary pressure and sellers' markets this has been a "triumph" for moral suasion, price control and purchase tax. The result of this "triumph," however, has been that the increased share of total revenue going to profits and income tax has been at the expense of the shareholder. Retained earnings have also risen relatively to turnover but (outside the textile trade) the rise has been a sorry one when measured against the rise in the costs and needs of capital replacement.

These figures, it must be emphasised, relate to trading experience more than three years ago. Since then the situation as regards capital provision has certainly grown worse. The disease, of course, is a hidden and unevenly malevolent one, not always obvious to the industries themselves. The expansion of turnover since the war has enabled many capital using industries to spread their overhead costs by flogging their capital equipment more intensively, and has thus made total profits look comfortable, even when profit margins have been declining. This is merely another example of the distorting mirror of an economy living on capital; under the influence of this mirror many industries—and incidentally many stock market prices—may have been thrust dangerously far out on to a tight rope.

* Total income is inclusive of depreciation. † Profits assessed in 1938-39 and 1949-50 respectively, which relate, broadly speaking, to trading operations in the calendar years 1937 and 1948. ‡ Weighted average on basis of 1948 turnover.

TABLE V.—DISTRIBUTION OF INDUSTRIAL STOCKS AND SHARES IN ESTATES ASSESSED TO DEATH DUTIES, 1950-51

	£000's	% of Total
Net Capital Value of Estate :—		
£2,000—£20,000	68,599	*27·5*
£20,000—£50,000	58,999	*23·5*
£50,000—£100,000	40,162	*16·1*
Over £100,000	82,131	*32·9*
Total	249,891	*100·0*

A second startling series of figures emerging from the Inland Revenue's report is that showing the holdings of "stocks, shares, etc., of joint stock, etc., companies" in estates assessed to death duties in 1950-51. These figures, summarised in Table V, show that very nearly half of these shares were held in fortunes of over £50,000; probably the proportion of privately held ordinary shares in such large portfolios is even greater.

Ascot produce first BALANCED FLUE GAS WATER HEATER

ASCOT 715 Balanced Flue Multipoint Gas Water Heater

This is a significant achievement, for the difficulties of applying the "balanced flue" principle to instantaneous gas water heaters had hitherto defied solution.

The important advantage of the new Ascot 715 is that the air intake and flue circuit are sealed off from the room in which the heater is installed, thereby eliminating downdraughts and vitiation of the indoor atmosphere. There are no visible flue-pipes either inside or outside the building.

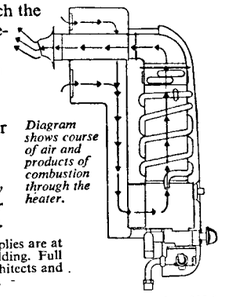

Diagram shows course of air and products of combustion through the heater.

Ten local authorities have already specified the Ascot 715 for their housing schemes.

As production is limited, supplies are at present restricted to new building. Full co-operation is offered to architects and all interested in new housing.

ASCOT GAS WATER HEATERS LTD., 43 Park Street, London, W.1

Business Car Hire LOWERS your costs

Many famous British companies are using our special Business Car Hire Service—*to their profit.*

They have discovered, as you will, that this individually planned service often reduces travelling costs to a considerable degree.

For meeting clients at airports or docks, for making sales calls or for entertaining—in fact, for all your journeys a fine new chauffeur-driven car is always at your service... bringing your company added prestige and efficiency. Only the large resources of Daimler Hire Ltd. can offer such facilities—and *guarantee* absolute reliability.

CARS INCLUDE *latest model* 1951 *Daimler limousines, Humber Pullman limousines, Humber Super Snipe saloons.* DRIVE YOURSELF SERVICE *provides Humber Super Snipe, Standard Vanguard, Humber Hawk, and Hillman Minx saloons.*

By Appointment Motor Car Hirers to H.M. The King

'BARCLAY'S NEW CLERK, 1786'

History records that even in 1786 this "new clerk" appeared a little overdressed in his "embroidered waistcoat reaching nearly down to his knees." It is pleasant to be able to add, however, that he "remained in the house many years, and died at a very advanced age, much respected by his employers." Much has changed since 1786, but it is still the aim of our staff to provide the same high standard of personal service which the old private bankers offered in the days of "Barclay's New Clerk."

After a watercolour now in the Institute of Bankers

BARCLAYS BANK LIMITED

One of our clients recently had an order from Argentina for a consignment of foodstuffs to be shipped to a port in Patagonia. He had been informed by his agent that no import permit was necessary but, being aware that such permits were normally needed for goods shipped to Argentina, he was somewhat concerned about the legality of the contract. A telephone call to us immediately set his mind at rest. We were able to tell him that certain articles including some foodstuffs could be imported into Patagonia without permits and free of customs duty.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

This does not mean, be it noted, that all shareholders are therefore plutocrats; another series of figures in the Inland Revenue's report, which shows that over £71 million of the £685 million of interest and dividend payments made in 1949-50 went to people with a gross income of less than £300 a year, is sufficient proof of the real distress that vendettas against capital can cause. But fortunes of over £50,000 are liable to estate duty of over 35 per cent, and the annual sale of ordinary shares on this account must now reach substantial proportions—while, with only 60 people in the whole United Kingdom making more than £6,000 after tax last year, the amount of new fortunes of over £50,000 now being built up from scratch must be strictly limited. The supply of private risk bearers for industry is being destroyed, at the very moment when all incentives to risk bearing have become politically out of fashion.

It would be wrong to conclude from all this that a serious shake-out of industry's finances is imminent, or even inevitable. Profits in many industries will certainly be lower this year, but not catastrophically so. Mr Butler's technique—which was inevitable in the circumstances—of first banning £500 million worth of imports, and then trying to think of a method of mopping up the internal purchasing power thus released to the home market, may even result in an upsurge of demand for some domestic consumer goods; this might help precisely those industries that are now suffering from moderate recession. The danger is indeed that this process may go so far as to claw back resources that should be diverted to exports or rearmament. It is true that the Government now has a potent weapon to set these resources free—the weapon of dearer and scarcer credit; it is also true, however, that the financial mismanagement of the past few years, and the excessive reliance on short-term borrowing that has resulted from it, mean that the wielding of this weapon may be less smooth and more painful than it once need have been, with the result that the Government may grow frightened of using it. To dodge the issue in this way, however, would merely be to make it certain that redistribution of resources will be even more painful when it can no longer be avoided—for example, in any inflationary crisis during which Britain could not mobilise aid from abroad, and in any deflationary crisis caused by a real recession of external demand.

The implications of these figures for the coming budget are plain. That budget should strive after two objectives. First, it should seek ruthlessly to cut demand to the level the country can afford. Secondly, it should seek equally ruthlessly to set afoot the long-term correctives that are needed to make a smooth transition of resources possible; so long as industry's finances remain clogged by present inconsistencies and past political malevolence, there is a real danger that any transition that may be forced suddenly upon this country will take place against a clatter of bankruptcies and needless social distress. One day the great white light may shine through, and statesmen on both sides of the House may realise that dividend freezes, excess profits taxes and other vendettas against the risk capital market are the antitheses of any long-term policy for the maintenance of full employment. But, on present evidence, both parties have a long way to go.

Business Notes

Trustee Borrowing at 4½ per cent

The shock of the death of the King was nowhere felt more acutely than in the City. On Wednesday morning, the Stock Exchange and provincial exchanges, the commodity markets and Lloyd's, all ceased dealings—or decided not to start them—immediately the news became known. The Stock Exchange formally closed at noon, but business had stopped some time before that. In consequence, the price lists for the day showed hardly any changes—none at all in gilt-edged, a few minor declines in industrials, and some more considerable fluctuations in foreign bonds.

Earlier in the week, the gilt-edged market had been rather shaken by the announcement of a trustee issue on a full 4½ per cent yield basis—the dearest trustee borrowing since the cheap money era was opened by the War Loan conversion of nearly twenty years ago. The issue took the form of a Government of Southern Rhodesia loan for £7½ million in 4½ per cent stock, 1977-82, at 99, thus offering a redemption yield of rather over 4½ per cent. When Southern Rhodesia last entered the market, roughly twelve months ago, it borrowed at par on 3½ per cent stock, 1980-85, and 43 per cent of the issue was left with underwriters. The contrast between these terms underlines the violence of the change that has occurred in the structure of interest rates—especially, of course, since the launching of the new monetary policy. In the market the first reaction to the issue was based partly upon this contrast and partly upon a supposition that the terms of the issue implied a significant change in the official attitude towards "second line" trustee issues, involving a deliberate widening of the margin between the yield basis for them and for the first line stocks. On closer examination, however, this reduction looked less justifiable. Although there has been some widening of the margin, it was clearly necessary—in the present delicate state of the gilt-edged market—to offer a sufficient turn to give reasonable assurance that the issue would not be heavily left with underwriters. In the event, the margin seems to have been adequate without being needlessly generous. The British government stock with the most nearly comparable life, 3½ per cent Treasury Stock, 1977-80 ("Coal" stock), was offering a redemption yield of nearly 4¼ per cent for its slightly shorter maximum life when the terms were announced. At the same time, the much shorter existing 4½ per cent Southern Rhodesia stock, 1956-68, was standing 2 points above the issue price of the new stock.

The lists were closed promptly on Thursday morning, and if the issue proves to have been oversubscribed the authorities will be entitled to feel that just the right degree of reassurance has been given to a market that would have been seriously strained by another failure and yet needed some encouragement if it is to cope with the pressure of borrowings that lies ahead. There have been some heartening signs lately that investors, as well as borrowers, are likely to be more responsive to the rate of interest than many people nowadays suppose; but it is much too soon to assume, either from this evidence or from the recent stability of the market, that any durable resistance point has been reached. The queue of waiting borrowers of all kinds is both long and clamant; and, if orthodox discipline of the credit structure is to do the large task that now seems likely to be left to it after the budget and other measures have taken a share of the whole burden, the British Government itself will have to join the capital market queue.

Cracks in EPU

Another ominous crack appeared in the structure of the European Payments Union this week with the announcement that France has suspended trade liberalisation. Since Monday all French imports from OEEC countries, except essential raw materials and foodstuffs, have again been subject to licence. The intention seems to be to fix quotas for imports from other countries in a series of bilateral negotiations—and it is still not clear how far contracts already entered into will be allowed in under the wire. The announcement of the new restrictions, however, has been greeted with a whoop of delight by France's largely uneconomic—and traditionally protectionist—textile industry; the indications are that exporters of manufactured goods to France may be very seriously hit. The new French Government is apparently working up another of the grandiose "European initiatives" for which its predecessors have been famous; it is soon to submit a memorandum to the OEEC suggesting that the road back to trade liberalisation should be marked by a "harmonisation of the economic, social and fiscal legislations" of West European countries and by the creation of a "supra-national investment bank." M. Faure has also been echoing with fervour Mr Butler's recent encouraging noises about the need for pressing forward towards restoration of convertibility of non-dollar currencies. This has led some speculators to suppose that the new government may be less firmly opposed than its predecessor to devaluation of the franc. French wages and prices rose out of line with those in other European countries last year—although it is worth noting that the rise in industrial production, reported to be 12 per cent on the year, was also substantial. There would, therefore, be some economic case for devaluation of the franc at this time—if, and it is a big if—speculators could be persuaded that it was once for all.

The background to the new French restrictions may become clearer when the results of the E.P.U. settlement for February are announced; the Bank for International Settlements is due to publish these by the tenth working day of February, which means before the end of next week. The usual—and in the past fairly reliable—leaks from Paris suggest that the overall picture will be as bleak as in December. France's monthly deficit is almost certainly up, perhaps by as much as $22 million to $90 million; Britain's deficit and Belgium's surplus may be little changed from their December rates of £53 million and $57 million respectively. Belgium's surplus may, however, be brought under firmer control in February, for the efforts to limit exports to EPU countries are only now beginning to plough out of the impediment of outstanding licences; against this, there may be some difficulty in bringing Luxemburg steel exports (which count towards the Belgian surplus) down into line. Meanwhile the Belgian National Bank's refusal to grant extra credits to E.P.U. unless they are covered by deposits by the Belgian Government is, rather absurdly, causing stringency in the Brussels money market. It seems clear that the present pattern of intra-European surpluses and deficits will have to be violently altered before the summer if the whole mechanism of EPU is not to collapse under the strain.

* * *

Dismissals in Coventry

Mr Sandys was entirely right this week in declining to take special action to ensure that motor companies that have been giving their workers notice should be ensured enough steel to keep them on. As he said, there has been considerable under-employment in the motor industry—as in many other sections of engineering—since the steel shortage became acute last year; while on the other hand industries seriously in need of labour for the defence programme have been unable to get the men they need. This is particularly true of Coventry, where the dismissals of about a thousand men from the Humber factory and from the Morris engines branch aroused the demand for "emergency measures." Here machine tool factories and the production lines being established for aero engines need considerably more workers than as yet appear likely to become unemployed in the motor works.

This does not mean that what Mr Sandys euphemistically termed "releases" do not cause hardship, particularly to a labour force that has become accustomed to assuming a right not only to a job but to a particular job in a particular place. Not all the tradesmen dismissed can immediately find employment in the same kind of work, though Coventry machine tool companies have often argued that many among the assembly line workers in motor factories were highly skilled engineers who preferred a less exacting, repetitive task at wages that were often higher than in other branches of engineering. Nevertheless, there are 17,000 vacancies for workers in the Midlands "metals, engineering and vehicles" trades, and it is difficult to believe that the men now dismissed will not be able to find work in them. If any of the objects of the drive for metal exports and defence production this year are to be achieved, a large number of engineering workers will have to change jobs; and though many of them may be able to do so within factories, this must mean some increase in transitional unemployment. It is no doubt particularly hard that workers in an industry from which exceptional efforts are expected in exporting should be laid off through a steel shortage that may prove only temporary. But Rootes have informed the Minister of Supply that they would have had to give this number of men notice even if their steel allocation could be increased in the second quarter of the year. In 1952 under-employment is a luxury that the country simply cannot afford.

* * *

Tussle for Meat

Both Britain and Argentina are preparing for the annual negotiations on the meat contract. Argentina has the advantage of a flying start, for while the Ministry of Food officials are still immersed in the annual review of British farm prices, Señor Perón has declared to the world that Argentina will not accept less than £250 a ton this year. Last April the deal was concluded at £146 a ton for prime chilled beef and £118-£126 a ton for frozen beef. In addition Britain agreed to pay a lump sum of £6,250,000 in final settlement of the Argentine claim for a higher sterling price following devaluation. In the result, the average price was about £160 a ton if the lump sum payment is included, or £128 12s. without it.

Last year's negotiations were bitter and protracted. Argentina stopped all meat shipments from August, 1950, and in the early months of 1951 the weekly meat ration was consequently reduced to 8d. at prices then current. This year's negotiations will hardly be more pleasant. In 1951 British consumption of carcase meat amounted to only 1,360,000 tons compared with 1,850,000 tons in 1950—a decline of 26 per cent. But supplies fell less sharply from 1,755,000 tons to 1,460,000 tons representing a decline of 17 per cent. Home production increased from 946,000 tons to 980,000 tons, whereas imports fell from 810,000 tons to 480,000 tons. Supplies from Australia fell by 50 per cent to 65,000 tons, from New Zealand by 24 per cent to 265,000 tons and from Argentina by 63 per cent to 86,000 tons.

The prospects for this year are far from bright. Numbers of beef cattle are still increasing (though the number of calves being reared has begun to decline) and domestic production this year might well reach the million ton mark. It will be possible to draw on the 100,000 tons that may have gone into stocks last year. If Australia and New Zealand together supply 350,000 tons, consumption can be kept at last year's level without supplies from Argentina. This implies that if supplies from home killings cannot be spread over the year, the ration in the lean season may have to be cut to less than 1s. 2d. a week.

Even if this country were to agree to pay Argentina the rapacious price of £250 a ton, there would still be no guarantee that Britain would get the meat. Last year's agreement satisfied practically all of Argentina's demands, but instead of producing the promised 200,000 tons of beef, it is likely to provide only 150,000 tons. Britain's overseas suppliers can make a plausible but specious case for pushing up prices, on the ground that the Ministry of Food continues to make a profit from imported meat to help pay the subsidy on home-produced meat. If retail prices were adjusted so that imported supplies were sold at cost and the whole of the subsidy put on home-killed meat, the force of this argument would disappear. The problem would then remain of disposing of high-priced British meat in the summer months, or to spread these supplies more evenly over the year.

Production in 1951

Judged by the criterion of the official interim index of industrial production, output last year appears to have averaged no more than 3 per cent more than in 1950—which implies a level lower than was attained at the end of 1950. The index gives a figure for all industries of 153 in November last, compared with 151 in October, and with 152 and 153 in October and November, 1950, respectively. The provisional figure for December is expected to be 137-138, the same as in December, 1950. This means that during the last quarter of last year production showed no increase at all compared with the same period of 1950. Manufacturing industry, indeed, appears to have been running at a lower rate of output; this component of the official index gives figures of 156 and 158 for October and November last year, compared with 158 and 159 for October and November, 1950.

A rise of only 3 per cent in annual output, compared with the average rise of 7 per cent achieved in 1949 and 1950, seriously weakens the assumptions upon which official planners have worked, not only for 1951 (when the "Economic Survey" hoped for a rise of 4 per cent), but for longer periods. It will presumably have followed largely upon the developing scarcities of metals and some other materials that hampered industry, particularly in the second half of 1951. What assumptions are being made about output during this year are not yet known. Last autumn there were indications that about the same rise in output was hoped for in 1952 as in 1951, and the estimates of steel shortage made at the beginning of this year were calculated on a greater consumption of steel for 1952 than at any time since the war. The promise of American steel suggests that this total amount may indeed be forthcoming during this year, though for the first half of the year the shortage may remain acute. It would hardly be safe, however, to draw any conclusions from this about output even of the main industries using steel. The official allocations, and the cuts in supplies for the home market that these are expected to reinforce, must make estimates of total output for these industries as thankless as the task of industrial managers planning the output of individual factories.

INDEX NUMBERS OF INDUSTRIAL OUTPUT, EMPLOYMENT, "PRODUCTIVITY," WAGE RATES AND EARNINGS, 1949-51

Year	July to December, 1948=100				October, 1948=100
	Industrial Production	Employment	"Crude Productivity"	Weekly Wage Rates	Weekly Earnings
1949	106·9	101·1	105·7	102·3	103·0*
1950	116·0	103·3	112·3	104·2	107·5*
1951	119·3	105·0	113·6	112·7	116·4†

* October. † April.

It may be worth noting the implications of these production figures so far as productivity and costs are concerned. In the accompanying table—based upon the second half of 1948, or in the case of earnings, upon October, 1948—necessarily crude estimates of changes in productivity are set beside the indices of production and employment upon which they are based, and also beside indices of wage rates and earnings. Little significance can be attached to the absolute index numbers shown: but the trends they suggest are disquieting. "Crude productivity," which in 1949 and 1950 might have risen by about 6 per cent per year, hardly appears to have shown any significant change last year. But wage rates rose last year by roughly 10 per cent, compared with an average rise of about 2 per cent in the two previous years; and it may be that earnings, when the figures for October, 1951, are published (perhaps next month), will be seen to have risen even more steeply. This implies quite simply that the labour costs of a unit of British industrial output, which had been decreasing in 1949 and 1950, increased during 1951.

* * *

Waiting for the Spring

The New Year has not brought with it anything to revive Lancashire's dormant markets. There is a certain amount of replacement buying of cotton goods, and a steady trade in industrial cloths, but no sign of any buying on a scale that would put an end to short time in the mills and to the insidious wastage of labour from the industry. It is still possible that customers' persistent lack of interest is a sign that trade in textiles is returning to its prewar seasonal character; if this is so, orders will not be taken until the early spring. But the depression is remarkably widespread. American mills are said to be down from three shifts to one shift a day and if this is typical of trade in the United States, then Lancashire is not doing too badly.

The output of cloth, it must be noted, rose steadily during 1951. The total for the year, which includes rayon and mixture cloths, is estimated at 2,960.10 million linear yards, between 4 and 5 per cent higher than in 1950. The weekly output of cotton cloth rose from an average of 39.6 million yards in January to 47.4 million in November, while production of rayon and mixtures rose from 14.1 million to 15.9 million during the same period. In December, however, the widespread closing of the mills during Christmas led to a big drop in output. Weekly average output of all kinds of cloth fell from 62.80 million in the four weeks ending December 1st, to 49.63 million in the month ending on December 29th. In spite of this, the figures do not compare too unfavourably with the weekly average of 52.05 million yards in December, 1950. With a number of mills on short time, cloth production is not likely to show much improvement in January.

The most conspicuous feature about the present recession is that it does not appear to be a "buyers' strike" in the sense that prices are too high. By now individual British, American and Japanese manufacturers have each tried offering cloth at greatly reduced prices, but they have done no more business at these low levels than they did before. This suggests that trade buyers and final consumers have overordered and overstocked on an even bigger scale than was first believed, and a general fall in prices will therefore involve the trade in quite considerable losses on these stocks. At home, uncertainty about the future of utility textiles is a contributory factor to the general reluctance to buy. There may be some confusion among wholesalers and retailers about the Douglas committee's exact terms of reference—at least, there is no sign of precautionary buying of utility goods as a hedge against the introduction of some form of sales tax.

* * *

Japan's Price for Steel

Hopes that the British steel delegation now in Japan had succeeded in avoiding difficulties about foreign exchange seem to have been shortlived. The delegation, which repre-

sents the central purchasing authority of the industry, managed to place a contract for the supply of 109,000 tons of finished and semi-finished steel—and was then told that it would have to arrange the terms and conditions of payment with the Ministry of International Trade and Industry. The Ministry has already announced that it needed dollars for the steel (possibly by way of a re-export deal through the United States) or, failing that, the equivalent in scarce raw materials—among which it mentioned wheat, wool, raw cotton, rubber and tin. It also spoke of an alternative condition—access by Japan to iron-ore deposits under British control in Asia. This last suggestion is hard to understand. South-East Asian resources of iron ore, according to the most recent surveys, exist in India, China, Indonesia and Australia—and barring Japan, nowhere else.

This is an attempt to drive a hard bargain. The quantities of steel at stake are not large, though they may meet needs for particular types of steel, and also have a special importance in that they could be obtained quickly—supplies could begin next month, and be completed by May. The prices—billets at £40 a ton, soft wire rods at £49 a ton, hard wire rods at £70 a ton, tube strip at £52 a ton, bars at £46, reinforcing bars at £46 a ton, and slabs at £40 a ton—are high. It is surely doubtful whether the Treasury would welcome the use of dollars for a marginal purchase of a scarce material in this one case, since that would be an open invitation to other suppliers. The Japanese request for access to iron ore seems incomprehensible. And while it may be that some reciprocal supplies of raw materials from the sterling area might be possible, such negotiations would appear beyond the scope or powers of a British steel delegation.

* * *

Controlling the Fiduciary Issue

The government has introduced a Bill designed to give permanent statutory form to the powers for regulating the note issue that it at present exercises by virtue of Defence (Finance) Regulations. Under the Currency and Bank Notes Act of February, 1939, the basic level of the fiduciary note issue was fixed at £300 million, and it was provided that any increase above that level made by Treasury sanction could not remain in force for more than two years without Parliamentary authority. The issue has, of course, long been maintained far above that level: the successive increases in 1939-46 raised it to a peak of £1,450 million, from which the postwar reflux of hoarded notes reduced it to £1,300 million by early 1948; it then climbed back to £1,400 million by June of last year, and has since remained at that level, apart from two seasonal increases and reductions. These increases, being made under the emergency powers, have not been subject to the need to seek Parliamentary authority; under Defence (Finance) Regulation 7AA (SR and O 1941, No. 1199 as amended by SR and O 1945, No. 1001) the original two-year limit was extended indefinitely.

The new Bill will restore the prewar principle of control by Parliament. No increase above the present level of £1,400 million—which becomes the "basic" figure in place of the £300 million fixed in 1939—may remain outstanding for more than two years unless ordered by the Treasury by statutory instrument, which will be subject to annulment in pursuance of a resolution of either House of Parliament. Apart from this, any changes in the basic issue, whether upwards or downwards, will be made (as in the past) by Treasury direction at the request of the Bank of England; any such direction must expire within six months, but is renewable (also at the request of the Bank) for successive periods of six months or less, subject to the need for a statutory order to extend the total period beyond two years. The Bill also empowers the Bank to call in and to demonetise any denominations of its notes—a power that at present extends (under Defence Regulations) only to notes of £5 or over. Smaller notes can at present be called in, but cannot be demonetised.

Reports from the Tax Collectors

Both the main bodies of British tax collectors have now delivered an account of their stewardships in 1950-51—and of the odd sidelights on the economy thrown up by their work. The Customs and Excise Commissioners collected £1,628 million in the last fiscal year, against £1,520 million the year before. The tobacco tax accounted for the huge amount of £604 million, little has changed from the year before; the Commissioners report a "continued steady demand for cigarettes," but note that nearly 40 per cent of the tobacco smoked in this country now comes from the Commonwealth, compared with 20 to 25 per cent in the prewar and early postwar years. Beer consumption, which brought in £262 million in taxes, against £277 million in 1949-50, went down again. The drop here, and in receipts from entertainments duty, came mainly in the autumn of 1950, when the Commissioners report that "increased expenditure in certain directions, mainly on durable goods and motoring, resulted in rather less money being available for . . . other forms of expenditure." The rise in import prices after Korea led to higher yields from protective duties, which are mostly *ad valorem*, but there was also an increase in attempted smuggling. Smugglers are turning away from their traditional lines of tobacco and spirits to such goods as nylons and watches, which the Commissioners believe are "increasingly the subject of organised 'commercial' conspiracies to evade duty and purchase tax." Some of the 60,000 watches seized last fiscal year (against 40,000 in 1949-50) were detected while being smuggled in yachts or specially constructed motor cars.

The Inland Revenue Commissioners collected £2,049 million from various forms of direct taxes in 1950-51 (against £2,108 million in 1949-50). The main interest in their report centres on the light it throws on the financial operations of industry, on the distribution of incomes (only 60 people made more than £6,000 after tax during the year), and on the distribution of assets in estates assessed to death duties; these points are discussed in an article on page 354. But the Inland Revenue, too, is meeting trouble in collecting all the tax that is due. The number of married women paying tax is 1 million less than the number known to be employed; rather oddly, the number of children claimed in taxpayers' returns (for purposes of securing allowances) is 500,000 less than the Registrar General believes to exist. The commissioners are now in full cry in their pursuit of those who have managed to evade part or all of their taxes in recent years; they ferreted out 2,838 cases last year, and secured nearly £7½ million from them, while they believe that "steps already taken" will ferret out 40,000 more, mostly small traders.

* * *

Dealings in "Non-Reich" Loans

After a lapse of three months, dealings in Potash bonds and in the loans of German municipalities and provinces were resumed on the Stock Exchange this week. On January 31st the President of the Board of Trade told Parliament that the Government is to introduce amending legislation to allow holders of these non-Reich German sterling bonds to lay claim to their share of the £15 million to be distributed under the German Enemy Property Act, without fulfilling the impossible condition of proving that their bonds were in British ownership at the outbreak of war. While the exact form of the legislation is being worked out, holders of these bonds need not submit claims, and the time limit for submission has accordingly been extended. At the opening of dealings on Monday the prices of these bonds shot up to mirror the rise in Reich bonds that had occurred since November 7th; Munich 6 per cents, which carry a gold clause like that on the Young loan, were naturally especially strong. A heavy speculative demand drove prices up further on Monday morning, but very little of it seemed to come

from switching out of Reich loans, which generally held Friday's levels. By Monday afternoon, however, a reaction was setting in, and this was interrupted on Tuesday after rumours—at first exaggerated rumours—of rumblings of

PRICES OF REICH AND "NON-REICH" BONDS

	1951				1952		
	Jan. 1	Mar. 30	June 29	Nov. 6	Feb. 4	Feb. 5	Feb. 6
Reich Loans							
Dawes 7% (5%)	19	20½	25	54½	64½	62	62
Young 5½% (4½%)	15	15½	19½	47	70½	68	68
Konversionskasse 4%	14	15	19½	38½	48	47	46½
Non-Reich Loans							
Potash 7%	64½	33½	33½	103	117	113	113
Potash 6½%	62½	29½	31½	96½	108	105	105
Berlin 6%	6½	8½	9½	27½	33½	29	29
Cologne 6%	17½	18½	18½	43	47½	45½	45½
Dresden 5½%	7½	5½	6½	17	21½	20	20
Munich 6%	20½	21	21	57½	78½	76	76

Westphalia 7%	21½	21½	21	52½	58½	56½	56½

German discontent about the Saar. At the close of Wednesday's short session, therefore, prices were considerably below their peak on Monday, but, even so, many of the municipal bonds show a three to fourfold capital appreciation over their level at the beginning of last year.

* * *

British Railways' Second Gas Turbine

When the Metropolitan-Vickers gas turbine locomotive arrived at Paddington last week it attracted less attention than the Brown Boveri gas turbine that arrived there from Switzerland two years earlier. Yet it is the first gas turbine locomotive to be built in this country; and its delivery means that British Railways can start a series of trials to compare the performance of gas turbines in locomotives with that of other forms of motive power. For comprehensive tests, two locomotives are necessary; they are to be used on the London to Plymouth route, doing one round trip a day each. This line has been chosen because it includes a number of steep gradients. The Swiss locomotive has already been putting in about 2,700 miles a week on it, and has proved that the powerful acceleration of a gas turbine means that such trains lose much less time on the gradients than those drawn by steam locomotives; this feature alone might justify the use of gas turbines on special routes. A case for their general use on economic grounds is usually argued on the grounds that their low maintenance and lubrication costs in comparison with steam or diesel engines offset higher fuel costs, and that the locomotive itself is lighter. The Brown-Boveri locomotive, which develops 2,500 horse power, weighs 118 tons. Diesel traction of the same power is generally supplied by two locomotives, together weighing perhaps 230 tons.

The Metropolitan-Vickers turbine is more powerful than the Swiss. It weighs 129½ tons, giving 3,000 horse-power; and will eventually be raised to 3,500 h.p. This is more power than British Railways need; but the locomotive has been designed with the export markets in mind, and powers of this order would be needed in tropical countries to offset the effect of high temperatures on the efficiency of the turbine.

There are a number of interesting differences in the design of the two locomotives reflecting the different approach of British and Swiss engineers to the design of gas turbines. The Swiss locomotive employs a heat exchanger to save fuel and in consequence to improve the thermal efficiency of the gas turbine. The British locomotive does not. Metropolitan-Vickers have attempted to obtain the same thermal efficiency by improving the performance of the compressor—a difficult task—without the added complication of a heat exchanger. Another vital difference is in the operating temperatures of the locomotives. The Swiss locomotive operates at 600 degrees C., which makes it possible to burn a heavy fuel oil without damage to the turbine. But this comparatively low temperature does involve a sacrifice of efficiency in that the power output of a gas turbine rises with its operating temperatures. The British turbine operates on more expensive diesel oil, but does so at a temperature of 700 degrees C. A difference of 100 degrees C. at this range of temperature is critical. Swiss engineers, with their long experience of turbines, believe that it is asking too much of an industrial turbine to run for long periods under such conditions. British engineers, whose principles in this connection, like the materials they employ, have been developed with aero-engines, think otherwise. They are also attempting to combine the use of high operating temperatures with that of heavy fuels. In many countries there is a far bigger difference than there is in Britain between the price of diesel oil and of the many types of oil covered by the umbrella term "bunker C," and it is therefore important not to restrict gas turbines to the more expensive fuels. Even though for convenience, British Railways may run both on the same fuel, trials of the two types of locomotive side by side should provide some extremely interesting comparisons.

Concrete and Steel

According to the Minister of Works, Mr Eccles, it is hoped that deliveries of steel reinforcing rods to the country's building and civil engineering industries may be increased to 350,000 tons this year. If that happens, one of the most acute scarcities that have arisen for any type of steel product will be relieved, and these industries will be enabled to make considerable savings in their use of steel. The use of reinforced concrete instead of structural steel may cut the tonnage of steel needed in a building by a half or even more, though the practicability and economy of substitution will vary from case to case.

The shortage that has undoubtedly been experienced by contractors using concrete during the past six to nine months does not appear to be justified by the statistics of deliveries. These suggest that during 1951 some 235,000 tons came on to the home market, compared with about 199,000 tons during 1950—an increase of 20 per cent. It is true that output of these rods from British steelworks fell compared with the year before—over the first nine months of the year, perhaps to a greater extent than output of most other steel products; but this decrease was more than offset by an increase in imports of these rods. The degree of shortage of these rods, therefore, may partly have arisen from heavy purchasing for stock; but the difficulties it has imposed upon many contractors in recent months suggest that large stocks were not held by the main consumers, at any rate. The reinforced concrete companies have asked whether in the general shortage of steel-making materials the output of these rods—a cheap and perhaps relatively less profitable steel product—was particularly reduced, while output of structural steel, in which some of the companies supplying rods are directly interested as civil engineers, was maintained at a higher level. This would have been in no sense unreasonable. The pattern of demand—which has been high for all products in recent months—and the profitability with which that demand can be fulfilled are the obvious factors upon which a steel producer must plan his output. The allocation scheme that came into force this week seeks to ensure that the right amount and type of steel is produced to meet essential requirements by vetting individual demands rather than by instructing particular producers how much of each type they should make. But it is not clear that any such diversion of steel between products was in fact a major cause of the

shortage of reinforcing rods last year. The main producers of these rods, it has been suggested, depended for billets upon one of the largest cold metal shops in the industry, where output was affected to an exceptional extent by the shortage of scrap.

The Ministry of Works, which has now set up a Steel Economy Committee, will presumably this year take account of the economies in steel that reinforced concrete affords when parcelling out its block of steel allocations. In very rough terms, it may be said that the 5,000 tons of reinforcing rods a week that contractors have recently been using might correspond to some 12,500 tons of cement a week in reinforced concrete construction. The 350,000 tons a year promised for 1952, therefore, may mean the use in building of some 1,200,000 tons of reinforced concrete this year, compared with about 850,000 tons last year.

Indonesia Shuffles the Pack

Theoretically, Indonesia simplified its exchange rate structure and devalued the rupiah last weekend ; in practice, it seems to have made confusion only slightly less confounded. The rupiah—originally the East Indies guilder—stood at par with the Dutch guilder up to March, 1950. In that month the authorities of the new Republic carried out a currency reform, under which exporters received "exchange certificates" equal to 50 per cent of their export earnings and could sell these on the free market, where importers and those with permission to remit foreign exchange had to finance all of their exchange needs. The effective exchange value of the rupiah thereby went down to between a half and a third of its old value ; the effective average exchange rate for exports came out at 21.17 rupiahs to the £ and that for imports at 32.10 rupiahs to the £. Last weekend the exchange certificate system was abolished (except apparently for dollar exports and imports) and the rate for both exports and imports was set at 31.72 rupiahs to the £. Simultaneously, however, extra export duties of 25 per cent were imposed on rubber and copra, and of 15 per cent on palm oil, tin, oil, pepper and coffee ; exporters of tea and tobacco escaped from these new imposts. The new exchange rate, which is pitched between the previous two effective rates (though much nearer to the old import rate), suggests that both those who sell and those who buy foreign exchange should secure some slight gain. But how much foreign enterprises operating there will be allowed to remit remains a question as inscrutable as the local Government's whim.

Tight Fit for Aluminium

Under the metals deal made in Washington last month, Britain will divert to the United States 15,000 tons of aluminium from Canada in the first half of 1952. This is the second time in recent months that this country has assisted the United States to get more aluminium. In November Britain agreed to divert 10,000 tons and the bulk of this tonnage will also come out of this country's 1952 supplies. The total 25,000 tons is a loan to the United States and will be returned in 1953 and used to rebuild stocks.

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

The Economist Intelligence Unit

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

Last year users of aluminium just managed to make ends meet. Consumption at the beginning of the year was running at 15,000 tons per month, but it rose to about 18,000 tons in December. The year's total was 202,900 tons ; supplies amounted to 203,000 tons, of which 172,000 tons came from Canada, just under 30,000 tons from home production and the remainder from Norway and France. This close balance between supplies and consumption arose mainly from delays in Canadian shipments and by the end of the year Canada still owed Britain about 20-25,000 tons from the 1951 contract. In 1952, defence demands are likely to increase aluminium consumption still further. Prospective consumption for the first half of the year is estimated at 123,000 tons and in the second half additional quantities will be needed to supplement supplies of secondary aluminium, which are being rapidly exhausted. Altogether Britain may use about 250-260,000 tons this year and several thousand tons will also be needed to maintain stocks to keep pace with the higher rate of consumption.

Supplies may in fact be a little above 260,000 tons —after allowing for the amount diverted to the United States—and more may be available if Canada makes up the leeway on last year's contract. But they will not be ample. Stocks in Britain are low ; on January 1st they were around 38,000 tons, virtually unchanged from their level twelve months earlier. They are indeed higher than the minimum of six weeks' consumption, but at this time of the year with the St. Lawrence closed to shipping, stocks have to be used to maintain consumption. Supplies are, therefore, likely to be tight until late April when shipments from Canada are again flowing freely. On a longer prospect, stocks can hardly be built up until the United States repays its loan of 25,000 tons.

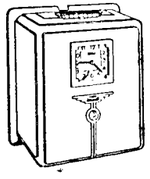
Copper Companies' Domicile



The question of a change in domicile to Northern Rhodesia, bringing with it a saving in tax, has now been revived, in discussion though not in decision, by the directors of the Selection Trust group. This may be a matter of significance, since a large-scale development programme has to be financed. The Rhodesian copper companies in the group last year decided against a change in domicile on the general grounds that "taxes alone should not be allowed to determine so important a question as the seat of control of the company," but they believe that political and administrative considerations still outweigh the element of taxes. But the centre of political gravity for Northern Rhodesian affairs seems to be shifting from Britain to Rhodesia, and the chairman of Roan Antelope and Mufulira, Mr R. L. Prain, suggests, in his statements with the annual reports (reviewed on a later page) that such a change might create conditions under which it would be the directors' duty to seek to transfer control to Central Africa. This possibility leads Mr Prain to condemn roundly Section 36 of the 1951 Finance Act, which stipulated that Treasury consent must be obtained before a change in domicile can take place. Last week, Wankie Colliery, whose interests are closely bound up with those of the copperbelt, obtained Treasury permission to transfer its seat of control to Rhodesia. This decision suggests that the Selection Trust group might not be refused consent if it were sought ; but the objections to Section 36 would still stand in all their force irrespective of the Treasury's yea or nay.

A proposed revision of the Northern Rhodesian taxation laws may tilt the balance more in favour of a change in domicile. Under these proposals, new mines will in effect be allowed to write off their initial capital expenditure out of profits before taxes are assessed ; thereafter all capital expenditure in any year will be allowed as an operating cost. The group's three new subsidiaries have been registered in Northern Rhodesia so as to secure the important benefits of

Hold on to SCRAP and you hold up STEEL PRODUCTION

Search out every ton of scrap in your works and turn it in. Old plant, redundant buildings, machines and spares—it's all wanted back in the steelworks to keep up steel production. Round it up and put it in the hands of your local scrap merchant. It will go to make the new steel that you and every other steel user need so urgently.

Scrap merchants are glad to help with dismantling and collection.

WHEREVER YOUR NEW STEEL comes from, please return your scrap to merchants in your own locality. That will save unnecessary transport, and time, before the old scrap is turned into the new steel all steel users want.

Easier Metals

The non-ferrous metal market is showing some weakness. Last week the Ministry of Materials reduced the price of lead from £175 to £170 a ton. The official American quotation has remained unchanged at 19 cents a lb (£152 a ton) but the free market which reached a peak of nearly 30 cents a lb last June has fallen steadily in recent months and is now the same as the official quotation or even slightly below it. At the moment lead supplies are more than adequate, and Continental refiners are experiencing difficulty in finding sufficient buyers. The bulk of British supplies comes from Australia and the Ministry raised its selling price above the American level to allow for purchases of additional quantities from the Continent. On present standards the new price of £170 is still too high, for prices on the Continent are down to £160-£165 a ton. Perhaps the Ministry is trying to recoup some of its past losses.

The free market price for zinc has also weakened, although supplies of the metal are hardly ample. Zinc has fallen from a peak of 33 cents a lb last summer to 23 cents and before long it may reach the official New York quotation of 19½ cents a lb (£156 a ton). The British price has remained at £190 a ton for the past six months, although three weeks ago the so-called American export price fell from 26-26½ cents a lb to 23-24 cents. Copper is still the firmest of the three metals, despite a fall in the free market price from a peak of 55 cents a lb to its current level of 40 cents. The official price is still 27½ cents a lb (£220 a ton) and the selling price of the Ministry of Materials is still £227 a ton.

The decline in the free market price for both copper and zinc can be traced to the introduction of allocation by the International Materials Conference in the second half of last year. In the first place the quotas to countries were not so small as was expected, and, although not all allocations have as yet been met in full, no country has experienced a severe shortage. Secondly, most countries are controlling the civilian use of these metals, and this has also restricted the demand on the free market. At first sight it would seem that the IMC has done what it intended, namely, curb the rise in prices, and if the allocations to the different countries increase as the year goes on, the pressure on the free market will be reduced still more. The steel shortage is another factor, for many of these metals are used in conjunction with it at one stage or another. As soon as the supply of steel improves both in Britain and in the United States, the demand for non-ferrous metals may well expand.

* * *

The Paradox of Wool

The wool market has become much steadier in the past two weeks. The price of merino 64's fell from 131d. a lb in the first week of January to 122d. in the third week. Last week it rose to 124d. and this week to 126d. a lb. Twelve months ago the price stood at 280d. a lb. Demand in the current London sales has come mainly from Britain and Europe. The firmness of the market is somewhat surprising when judged purely by reference to supply and demand. World production this season is estimated by the Commonwealth Economic Committee at 2,315 million lb (clean) which with the 150 million lb carried over from last season (because of the New Zealand waterfront strike and the difficulty of getting export licences in Argentina) makes a total supply of 2,465 million lb. Consumption in 1951 was probably less than 2,200 million lb, a decline of some 17-18 per cent on 1950. Unless consumption rises once more, the wool market will experience a surplus for the first time since the war. But allowance must be made for stockpiling. Britain announced last week that it will now buy 48 million lb this season instead of the original 40 million lb. The United States and European countries may also buy for stock though no official pronouncements on this have been made. Retail sales of textiles are still in the doldrums, though activity in the textile industry this year might be sustained by government orders for military cloth.

On January 22nd the United Kingdom-Dominion Wool Disposals Limited, better known as the Joint Organisation, went into liquidation. New Zealand is the only one of the three dominions that will continue the price reserve scheme —and then only for this season unless the New Zealand woolgrowers wish it to continue. A referendum will be held later. A similar referendum was held last summer in Australia and there the woolgrowers voted against such a scheme. The Joint Organisation disposed of the wartime stock of 10¼ million bales as well as the current clips in six years. Throughout this period world consumption of wool rose almost continuously and demand seemed insatiable. It is ironical that just when the scheme is being wound up, the possibility of a surplus should emerge. In point of fact a surplus of 265 million lb would constitute no serious threat to the market, for the British stockpile will take almost 50 million lb and commercial stocks in most consuming countries are still low.

Shorter Notes

William Jessop and Sons of Sheffield, makers of special steels, in association with the British Iron and Steel Research Association, have developed a method of economising in the pouring of ingots of high-speed steel that affords 10 to 20 per cent more sound steel from a given ingot. This is based upon the insertion of a tile of heat-resisting material into the "feeder head" from which an ingot, in cooling, draws molten steel to avoid "piping," or the formation of cavities within it. Allowing for a difference of £20 a ton in the prices of sound tungsten steel and of the faulty steel that has to be cut off and charged back into the furnace, it is estimated that 4s. a ton is saved for every additional one per cent of steel that can be saved in the ingot. The improvement in the ratio of finished steel to ingot steel is perhaps even more important at the present time: demand for tool steel has greatly increased since the inception of the rearmament programme last year. Trials now in progress suggest that it may be possible to apply this technique in pouring larger ingots than those used for special steels.

*

A Bill to put the law relating to Customs and Excise into a modern and simplified form will shortly be presented to Parliament. At one stroke, the new Bill will consolidate all existing legislation, including some 200 Acts of Parliament. During the last six months it has been under consideration by a committee which has made various amendments to the draft. The report of the committee (Cmd. 8453), published this week, states that its members are satisfied that the Bill in its present form will remove obsolete provisions and make other minor improvements without introducing any "debatable reforms or innovations."

Company Notes

Roan Antelope and Mufulira.—Mr R. L. Prain, chairman of the Selection Trust group, aptly describes the present condition of the Rhodesian Copper-belt as being one of "prosperity, expansion and new development." One measure of the recent prosperity of the copper producers is to be found in the bound of Roan Antelope's profits before tax from £2.4 to £5.9 million and of Mufulira's gross profits from £4.2 to £7.9 million. Nor is the end of the boom yet in sight, for the estimates of gross profits in the first six months of the current financial year amount to £4.2 million for Roan Antelope, and £4.3 million for Mufulira. These striking advances can largely be attributed to the rise in copper prices during a period in which the increase in costs has lagged far behind; the average price of copper sold by Mufulira, for example, rose in 1950-51 by £48 10s. to £174 18s. a long ton (f.o.b. Beira), but average costs only rose by about £16 to £70 18s. a long ton. An appreciable increase in copper production has also made an important contribution to profits. The formidable problem of fuel supplies is brought into prominence by Mr Prain's statement that not much more than half of the Copperbelt's fuel requirements was met last year by coal deliveries from the Wankie colliery. Production has only been maintained by the "mediæval expedient" of burning wood and slurry, and by sending some part of the Copperbelt's own much-needed labour force to work at the colliery. An eventual solution of the fuel problem may follow the loan of £5 million by ECA to the Rhodesia Railways and the plans to harness hydro-electric power, but in recent months the slight improvement in fuel supplies that became apparent in 1951 has been lost—at least temporarily. Short run difficulties have not been allowed to impede the group's plans for expansion. Three subsidiary companies, domiciled in Rhodesia, have been formed to direct the exploration of new areas. The Chibuluma Mines, development of which is to be mainly financed by ECA, should come into production by 1956; about 16,000 long tons of copper and 500,000 lb. of cobalt should then be produced annually. Meanwhile the refining and milling capacity at the Mufulira mines is to be expanded. By 1954, the annual capacity of the electrolytic refinery should have been enlarged to 72,000 tons, and by 1956 the monthly milling capacity to 340,000 tons. Both these developments will be financed from the company's own reserves. If the demand for cobalt is maintained, the date of the development of the Baluba area may be brought forward. Indeed, if the results of drilling, to establish further ore reserves and to check the continuity of cobalt values, prove to be satisfactory, a new company, Baluba Mines Ltd., will be formed this year. Capital cost at Baluba would be even greater than at the Chibuluma mine; on the basis of an annual production of 24,000 tons of copper and 1,100,000 lb. of cobalt, it might be of the order of £9 or £10 million. Ways and means of finding this finance are under consideration and "an announcement will be made in due course if it is decided to proceed with this mine."

★

Petrochemicals.—Sir Robert Renwick, the chairman of Petrochemicals, reveals in his annual statement that all the company's plants are now in operation, most of them at or above their rated capacity and the remainder approaching this level. The period of running in is in fact practically over, and the company is settling down to routine operations. Clearly, however, a good deal has still to be done in improving yields and qualities, in reducing operational losses and in achieving the most economical operation of plant. In recent months, the Gas Separation Plant, upon the smooth running of which much of the company's revenue depends, has been "performing very satisfactorily" but it has been operating with one "cold box" out of action, which means without any "standby capacity." If a more plentiful supply of chlorine had been available the company would have been able to take fuller advantage of the improved performance of the plant at Partington and consequently "more favourable results" would have been obtained. Fortunately additional chlorine supplies are being obtained from abroad, and it is hoped that in the first quarter of this year deliveries will match requirements. An expanding market for the company's products, greater efficiency in operating the plant, and the promised improvement in chlorine supplies may help to reconcile stockholders to the borrowing of another £1 million from the Finance Corporation for Industry and to a prolongation of the moratorium on the interest payable on the company's funded debt. The present moratorium will end on March 31st, but as "payment of the interest accumulated on that date in one lump sum will not prove possible" negotiations for its extension will be necessary. On June 30, 1951, the accumulated debit on the profit and loss acount was £2,025,296. Since that date current revenue expenditure, excluding interest, has been covered by current income, but there will inevitably be a further loss this year once provision has been made for depreciation and loan interest. Last year's progress in modifying the plant at Partington has been heartening, but it has added heavily to capital costs. So far £700,000 of the FCI loan has been spent—and the remainder will be spent by the end of June—in meeting the costs of the modification and improvements programme, in providing working capital, and in financing increased stocks. Petrochemicals may be a little nearer the edge of the wood, but it is not yet out of it.

COMPANY MEETINGS

WEST RIDING WORSTED AND WOOLLEN MILLS, LIMITED

EFFECT OF WIDE FLUCTUATIONS IN WOOL VALUES

MR J. H. KEELING ON THE OUTLOOK

The twenty-third annual general meeting of West Riding Worsted and Woollen Mills, Ltd., was held on February 5th, at the Midland Hotel, Bradford, Mr J. H. Keeling (the chairman) presiding.

The secretary, Mr E. Matthews, read the notice convening the meeting, and Mr D. E. Batchelor, of Messrs Peat, Marwick, Mitchell & Co., the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended August 31, 1951, and was taken as read:—

Ladies and Gentlemen,—The profits of the group for the year under review, though satisfactory, were considerably below the peak figure reached last year. These results, however, must be considered in the light of the unusually difficult trading conditions which confronted—and still confront—our industry.

The money value of the turnover was considerably in excess of that for the previous year, the reduced profits being occasioned by writing down the value of the stocks and providing for contingencies resulting from the steep fall in the price of wool from the peak reached at the end of March to the level ruling at the end of August. As this was done out of the earnings for the year, the substantial specific reserves created in previous years to provide against these very eventualities have been left intact.

It will give our shareholders some idea of the wide fluctuations in the value of wool during the year under review if I quote the price of 64's B tops at the beginning and end of our year and the peak figure reached during this period:—

September 1, 1950	235d. per lb.
March 31, 1951	348d. per lb.
August 31, 1951	152d. per lb.

These difficult trading conditions placed upon the managements of our operating subsidiaries a heavy burden of responsibility, which was shouldered with courage and ability.

THE YEAR'S RESULTS

The profit of the group before taxation amounted to £693,173, which compares with £1,729,204 for the previous year. Of this profit it was necessary to provide for taxation £376,195, namely, 54.3 per cent.—an onerous charge. Of the balance, Preference and Ordinary shareholders receive by way of dividends £110,257, equivalent to 15.9 per cent. of the profits earned, while £206,721, or 29.8 per cent., has been retained in the business.

The amount required to pay the Ordinary dividend, which it is recommended should be maintained at 22½ per cent., requires slightly more than for the previous year, as reserves to the extent of £47,644 were capitalised on January 30, 1951, by the issue of one new Ordinary share for every 16 Ordinary shares then held.

During the past four years the earnings of your group have been dealt with as under:—

Taxation	£2,680,326	52.2%
Retained in the business	2,058,494	40.2%
Distributed to shareholders	391,445	7.6%
	£5,130,265	100 %

These figures indicate beyond any measure of doubt the policy of "moderation and restraint" exercised by your company in relation to distributions by way of dividends, a policy lately recommended by the president of the Federation of British Industries, following upon similar exhortations in recent years from other quarters. I only wish that I could feel equally sure that this policy of "moderation and restraint," so consistently pressed upon industry, had been followed to anything like the same extent by His Majesty's Government in its expenditure of the moneys which industry has provided by way of taxation.

CONSOLIDATED BALANCE SHEET

There are several items in the consolidated balance sheet, to which I would like to refer.

The increase in the share capital reflects the capitalisation of reserves which I have previously mentioned, and the issue for cash of 175,000 Five-and-a-Half per Cent. Cumulative Preference shares of £1 each, being the balance of the preference capital which we were authorised to issue. The cash proceeds of this issue were utilised in the main to provide further finance for one of our most recently acquired operating subsidiaries, Thomas Hey and Shaw, Ltd., which I am pleased to say made a most useful contribution this year to the profit of the group.

The fixed assets after allowing for depreciation show an increase of £204,570, mainly due to the cost of completing the new factory at Wombwell for Priestleys, Ltd., to which I referred last year, the acquisition by Thomas Burnley & Sons, Ltd., of Nellroyd Mills, complete with modern machinery, so as to increase that company's spinning capacity; and the provision of additional storage accommodation for J., J. L., & C. Peate (Guiseley), Ltd.

It is in regard to the current assets and liabilities where the figures show the greatest changes as compared with the previous year.

Stock on hand and work in progress, in spite of the writing down to which I have already made reference, are £923,086 higher at £5,505,069, while debtors have increased by £801,819 to £1,636,809.

Last year cash and marketable securities exceeded advances from our bankers by £272,844. On August 31st last, the date of the balance sheet which we are now considering, the net amount due to our bankers was £2,738,731. Against this, secured trade creditors, representing wool purchases, were down by £1,189,060 to £104,284, which shows how we were trimming our sails to meet the storm.

The figures which I have given to you are very large, particularly as the physical turnover was less and not greater than for the previous year. They have been the cause of no little anxiety to those responsible for the direction and management of your company, as, I am sure, our shareholders will readily appreciate.

I am glad, however, to say that these figures are now mainly of historical interest. For example, the group's net indebtedness to its bankers on December 31st last was only £45,540.

THE PRESENT

During the past nine months the wool textile industry has been passing through a storm at least comparable in magnitude to that which was encountered after the first world war. But on this occasion there is a very real difference—the lessons learned thirty years ago were not forgotten, and were, in fact, in the forefront of the minds of the many able men who are responsible for the management of the industry.

No one trusted the rise in the price of wool, difficult though it was to know when it would stop, commitments were kept to the minimum consistent with full employment, and as large reserves built up as taxation permitted.

As a result the industry has so far weathered this storm of gale force remarkably well, but it will be some months before we shall have seen the last of its effect.

A storm of this character naturally starts by affecting those engaged in the raw material section of the industry—in which our group is largely interested—and finishes in the shops where the made-up goods are sold. The pipeline is gradually being cleared, although I fancy that those engaged in all branches of our industry heave a sigh of relief as each month goes by without undue troubles being encountered.

It is unfortunate that in the midst of these difficulties a well-known politician advised the public not to buy, thereby not only adding to the difficulties already facing the trade, but even endangering employment. In this connection I am glad to be able to say that we have kept our labour force for all practical purposes intact, though overtime has had to be cut and in some cases the working week shortened.

During the four months since the date of the balance sheet trade has been quiet and wool prices have continued to fluctuate considerably. In recent weeks, however, these fluctuations have narrowed, and there have been signs of some new business.

Taking stock of our position as it exists today, I am personally satisfied that we have come through a most difficult period with all our reserves intact, including those specific reserves which were created to provide against just those adverse conditions which have prevailed.

THE FUTURE

It is difficult indeed to forecast the future. There are too many incalculable factors—world politics, currency problems, and now the declared disinflationary policy of the present Government. I incline to the view

that trading in our industry for the next few months will continue to be difficult, and that thereafter we should return to more normal, though more competitive, conditions than we have experienced for some time.

A year ago at our annual general meeting I warned you against the dangers inherent in the great rise which had taken place in the price of wool. Since then this position has been largely readjusted and today the price of wool is in more general alignment with that of other raw materials. At the moment we need more than anything a steady price and less of the violent fluctuations that we have witnessed over the past two years.

A steadying influence on the price of wool over the years will come, I think, from man-made fibres, the development of which we continue to watch closely. These new fibres will not replace wool, but in my opinion as they become perfected—and subject to price—they will be used increasingly in conjunction with wool. I would not like you to draw the inference from this that I am suggesting that there will not continue to be a world demand for all-wool goods of high quality such as are made in Yorkshire. This is not the case, but if fibres with some of the characteristics of wool can be produced at a cheaper price the wool textile industry in this country will be able to take full advantage of them for the further expansion of its trade.

Looking to the future generally, your group is engaged in a basic industry, and if as I have foreshadowed we return to more normal and competitive conditions, our earnings will depend upon the ability of our management and employees, and upon the excellence of our plant. In these matters I consider that we have nothing to fear.

GROUP'S EARNING CAPACITY

What the earnings of the group may be in more normal and competitive times I do not know. I do not think that they will reach the peak figures of the year before last—in fact, I hope not, unless this is occasioned by the continued development and extension of our business and not by any further abnormal advance in the price of wool.

I can, however, say this. The earning capacity of your group has been proved by past results, and I believe that good profits can be earned in future years.

In conclusion, may I once again thank all the directors, managers, executives and employees. The more difficult times through which we have passed have stimulated them to ever-increasing efforts. I am also especially grateful to my colleagues on this Board who have unstintingly given me their fullest support.

The report and accounts were adopted and the final dividend of 12½ per cent., making 22½ per cent. for the year, was approved.

The retiring directors, Mr J. H. Keeling and Mr M. W. Shelton, were re-elected, and the other formal business having been duly transacted the proceedings terminated.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1

ROAN ANTELOPE COPPER MINES LIMITED

The following is an abridgement of the statement of the Chairman, Mr R. L. Prain, O.B.E., dated January 8, 1952, circulated to the members:—

RESULTS FOR THE YEAR

The output of 74,520 long tons blister copper was produced at a cost of £78 7s. 11d. and sold at an average price of £176 3s. 7d. per ton, both f.o.b. Beira. The gross profit was £7,287,000. Copper stocks remained static in volume, but increased in book value by £115,000. Other expenses amounted to a net figure of £234,000, leaving a profit of £7,168,000.

Appropriations were made of £1,250,000 to Replacements Reserve, £150,000 to General Reserve and £51,000 to Loan Stock Redemption Fund.

The Final Dividend now recommended amounts to 3d. per new share, making a total distribution for the year of 1s. 7½d. per new share.

On this basis taxation would amount to £4,169,000 and the carry-forward £195,000.

The Company has capitalised certain reserves in order to bring the issued capital more into line with the actual capital invested, and the issued capital has been increased to £8,987,688 by the issue of four new shares for every five held.

MINING TAXATION

Mr Prain referred to certain new changes which are proposed in the Northern Rhodesian tax laws as affecting new mines, and continued: Representations have been made through the British Overseas Mining Association to the Millard-Tucker Committee and to the Royal Commission on Taxation with a view to presenting the case of the industry and of trying to impress on these bodies the points on which the mining industry differs from most other industries. While it is too early to say what effect these representations may have, it is a matter for regret that one has to record that, after several years of such representations to various Government Departments, the overseas mining industry here has yet to obtain from the British Government any real recognition of its case. Unless this case is recognised, it is beyond question that the overseas mining industry, which for so many generations has been centred in London, will wither and fade away altogether. The high rates of capital expenditure which mining requires today, the lower grade ores which it will be increasingly necessary to mine, and the high rates of taxation, make mining altogether too hazardous an undertaking to organise except in countries where the position of the mining industry is specially recognised.

After referring to the position at the mine and to the problems arising from the shortage of fuel in the Copperbelt, Mr Prain stated:

DOMICILE

The problem of the domicile of the Company has continued to engage the attention of the Board during the year.

Briefly, it may be said that there are two factors which influence a decision on domicile. The first may be called economic and the second political. From the economic angle it is possible to save taxes by controlling companies such as ours from abroad. Until the Finance Act of 1951, we, in common with other companies, had been free to move control in this way ever since the incorporation of the Company some 25 years ago. It is true to say, I think, that a move at any time during these 25 years would have resulted in some saving of taxes paid by the Company. That we did not choose to change the control of the Company was due to a number of factors, which I need not go into here but, generally speaking, to the overriding feeling that taxes alone should not be allowed to determine so important a question as the seat of control of the Company.

This outlook had, of course, to be critically examined when the disparity in taxes became as wide as it has in the last two or three years. A change of domicile would now effect impressively large savings in taxes for the Company and hence indirectly for all its stockholders. Nevertheless, your Board still feels that political and administrative considerations outweigh the element of taxes.

You will agree, I am sure, that a Company such as ours cannot act exclusively from motives of commercial self-interest; it is bound also to take into account national and imperial requirements. In the light of this principle your Board intends to keep the question under continuing examination. Events appears to be moving rapidly toward a shift in the centre of political gravity for Northern Rhodesian affairs from the United Kingdom to Rhodesia. Such a change in the political picture may well create conditions under which we should consider it our duty both to our stockholders and to our country of production, and indirectly to the Commonwealth, to seek to locate our seat of control in Central Africa.

FINANCE ACT, 1951

Since the passing of the Finance Act, 1951, it is no longer permissible to transfer the control of a company abroad without prior permission from the Treasury. It is impossible in passing not to protest against the provisions of Section 36 of this Act. It has been described as making a concentration camp of the City of London. While the need to maintain revenue in this country is admitted, and while the possibility that consent may be forthcoming is recognised, it seems singularly ungracious to seek to retain compulsorily in this country companies which have voluntarily stayed here over many years in spite of ever-increasing taxation. It would not only be more in keeping with the traditions of this country if this Section of the Act were to be repealed but it would also be far sounder. This Section attempts to make permanent a pattern of business organisation which events demand should essentially remain flexible. It may become vital to a mining company to move its control to the territory in which it operates if new political movements are developing there. In this context the interests of such a company and of this country are parallel, since it is surely far more important for this country to retain influence over sources of raw materials than it is for it to cling to a relatively small fraction of revenue, which may anyway disappear if a semi-feudal attempt is made to cling at any cost to the patterns of yesterday.

High taxation in recent years and a tax code generally unsuited to mining have deterred new mining company formation in this country, but Section 36 of the Finance Act is an even greater deterrent for, even with the provisions whereby consent to move abroad may under certain circumstances be obtained, the fact that permisison has to be sought for such a move is sufficient to deter new companies from putting themselves in a position where they risk being refused permission.

MUFULIRA COPPER MINES, LIMITED

The following is an abridgment of the statement of the Chairman, Mr R. L. Prain, O.B.E., dated January 8, 1952, circulated to the members:—

RESULTS FOR THE YEAR

The year to June 30, 1951, was a record one for the production of ore from the mine and of copper from the smelter.

Of the 86,681 tons of copper produced, 83,681 tons were sold at an average price of £174 18s. 1d. per ton f.o.b. Beira. Costs averaged £68 8s. 10d. per ton f.o.b. Beira and the gross profit was £8,704,000.

Stocks of copper increased by 2,987 tons in volume and by £381,000 in book value. Other expenses amounted to a net figure of £208,000, leaving a profit of £8,877,000.

Appropriations of £1 million to Replacement Reserve, £1,050,000 to General Reserve and £36,000 to Loan Stock Redemption Fund, have been made. The Final Dividend now recommended amounts to one shilling per new share, making a total distribution for the year of 8s. 3d. per new share.

On this basis taxation would amount to £5,122,000, and the carry-forward £87,000.

The Company has capitalised certain reserves and the issued capital has been increased to £8,148,123 by the issue of two new shares for every three held.

REFINERY

The Board agreed to increase the capacity of the Electrolytic Refinery from 36,000 tons to 72,000 tons per annum. The increase is expected to bring the total cost of the Refinery to £3 million.

The first section of the Refienery, of 36,000 tons capacity, is expected to come into production in 1952, and the second half in 1954.

CHIBULUMA

Chibuluma Mines Limited has been formed as a subsidiary of Mufulira for the purpose of developing and working the Chibuluma copper-cobalt orebody with indicated reserves of 7.3 million tons of ore, running 5.23 per cent. copper and 0.25 per cent. cobalt. Arrangements were entered into with the Economic Co-operation Administration whereby Mufulira would subscribe £600,000, in order to take up the ordinary share capital of Chibuluma Mines Limited and the E.C.A. would provide up to £3 million in the form of an unsecured loan, repayable in metals in due course.

Development is now proceeding at the Chibuluma Mine with a view to getting into production by 1956. It is expected that it will produce copper at the rate of about 16,000 long tons per annum, and cobalt at a rate estimated at about 500,000 lbs. per annum.

BALUBA

Mufulira includes amongst its Special Grants one called Baluba. This copper-cobalt orebody is estimated to contain between 19 million and 37 million tons of ore, depending on the point at which the cut-off grade is determined.

Drilling is still proceeding to establish further ore reserves and to check the continuity of the cobalt values and, depending on the result of this drilling, consideration will be given later this year to the formation of a company to be known as Baluba Mines Limited for the exploitation of this mine as soon as possible. It is anticipated that in this event, on the basis of a mine production of 1.3 million tons per annum giving a copper production of about 24,000 tons and a cobalt production of about 1,100,000 lbs. per annum, the capital required might be of the order of £9 or £10 million. Ways and means of finding this finance are under consideration.

PROSPECTING

Prospecting continued throughout the year on the Special Grants of the Company.

It was decided, in conjunction with Roan Antelope Copper Mines Limited and The British South Africa Company, to take up exclusive prospecting licences over three large areas in Northern Rhodesia, and accordingly three new companies were formed, namely, Mwinilunga Mines Limited, Kadola Mines Limited and Luapula Mines Limited. These Companies are owned as to 45 per cent. each by this Company and Roan Antelope and as to 10 per cent. by The British South Africa Company. The companies are Northern Rhodesian Companies and controlled by local Boards.

Mwinilunga Mines Limited has granted exploration rights over some of its area surrounding the Kansanshi mine to the Company to be formed to explore that mine, Kansanshi Copper Mining Company Limited, in return for a 10 per cent. free participation. Mufulira also has a direct 5 per cent. interest in that Company.

MINING TAXATION

Discussions have been held with the Northern Rhodesian Government which have led to the tabling of legislation which will provide for a change in those sections of the law which deal with the treatment of capital expenditure on mines. Briefly, new mines will normally be allowed in effect to write off their initial capital expenditure out of profits before taxes become payable. Thereafter, all capital expenditure in any year will be allowed as an operating cost. This brief statement somewhat over-simplifies the actual procedure but the net effect is that these laws, which follow somewhat the laws of the Union of South Africa, will create a new incentive to the developing of mines in the territory, and especially of low-grade propositions or those which involve a high degree of capital expenditure.

GENERAL

Mr Prain then referred to the position at the mine and the problems arising from the shortage of fuel on the Copperbelt. After stating that the question of the Company's domicile had continued to engage the attention of the Board during the year, he concluded: At present the atmosphere on the Copperbelt is one of prosperity, expansion and new development. A dynamic spirit infuses this remote corner of the Empire, combined with a consciousness of the key role which the Copperbelt has come to play in Imperial affairs. This is not to deny that there are clouds on the horizon. The gravity of the fuel problem and the uncertainty of the political future are factors which give cause for concern and are largely beyond the power of your Board to influence. I cannot believe, however, that human ingenuity will fail to find an early solution to the fuel problem or to devise a formula which will satisfactorily ease the growing interracial tension and lay a foundation for Northern Rhodesia's future relations with other African territories. If this view is justified, I can see no reason why your Company's fortune should undergo any major change over the coming months.

THE NATIONAL BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and seventeenth annual general meeting of the proprietors of The National Bank Limited was held on February 7, 1952, at 13 Old Broad Street, London, E.C.2.

Mr Michael J. Cooke, the chairman, presided.

The acting secretary read the formal notice convening the meeting and the report of the auditors.

The directors' report for the year, which had been previously circulated, was taken as read, and the chairman reviewed the principal movements in the balance sheet figures as compared with those of a year ago. Reference was made to the transfer from profit and loss account of £25,000 to the reserve fund, contributions of £106,199 to the staff pensions and provident funds and the provision for a final dividend of 5 per cent., making a total of 10 per cent. for the year, which left the sum of £52,128 to be carried forward.

The chairman moved: "That the profit and loss account for the year ended December 31, 1951, the balance sheet as at that date and the directors' report be adopted by the meeting and entered on the minutes."

Sir Cornelius J. Gregg, K.C.B., K.B.E., LL.D., seconded the motion, which was carried unanimously.

The retiring directors, Sir Cornelius J. Gregg, K.C.B., K.B.E., LL.D., Mr Thomas Geoghegan, F.C.A., Mr Richard J. Maume, and Mr Arthur J. Jenkins, were re-elected, and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Bros. and Pim, was fixed.

KILLINGHALL (RUBBER)

DIVIDEND RAISED TO 50 PER CENT.

The annual general meeting of this company was held in London on February 5th, Mr Jack Addinsell, the chairman, presiding.

The following are extracts from his circulated statement:

Security conditions on and in the vicinity of the estate during the year under review have continued to be very precarious, and unfortunately there has lately been some further deterioration in the general situation. This has had an adverse effect upon the labour force who are suffering continued intimidation by threats of violence.

Net profit for the year is nearly double that of the previous financial year at £61,254, and this has enabled your directors to recommend a final dividend of 35 per cent., making, with the interim of 15 per cent. declared in August last, a total of 50 per cent., as against 40 per cent. paid last year. It has been decided to transfer a further £5,000 to general reserve and £10,000 to replanting reserve, leaving £15,970 to carry forward as against £16,765 brought in.

The higher profits for the year were derived from increased proceeds from the sale of our rubber and a larger income from tin tribute as a result of the then existing high prices. There has, however, been a sharp fall in the price of rubber since the close of our financial year, and costs have continued to rise.

During the year the company has continued to deliver its rubber in field latex form and to have its lower grades milled by a neighbouring estate. Arrangements were, however, made to put our sheeting equipment in order to allow of a reversion to sheet manufacture if this should be necessary.

The report was adopted.

F. W. WOOLWORTH AND COMPANY

SUCCESSFUL TRADING

MR S. V. SWASH'S STATEMENT

The forty-third annual general meeting of F. W. Woolworth and Company, Limited, will be held in London on February 29.

The following is an extract from the statement by the chairman, Mr S. V. Swash, circulated with the report and accounts for the year 1951:

It is my privilege to place before you the directors' report and accounts resulting from a very successful year's trading. The past year carried its own crop of troubles, notably in the matter of stock control, and there has been much publicity concerning excessive inventories, customer resistance and the general difficulties of retail trading.

When conditions are difficult we get further evidence of the broad-based nature of your business, and certainly the figures shown in the report would never have been possible without a very satisfactory increase in sales. Your board is highly gratified by this proof of public approval of the variety, quality and price of the merchandise offered and the service given by the Woolworth stores.

VALUE OF COMPETITION

In the competitive field of retail trading, where the customer's right of choice is an integral factor of social freedom, success can only be achieved by giving satisfaction to the public. One hears a great deal about the "costs of distribution," and it is vital to the national economy that they should be kept as low as possible, but costs there must be. Food on the farms is no use to the people of great cities until it is brought to them, and small wares in Midland factories are no use to the housewife until they are placed within her reach.

Your board endeavours to keep these distribution costs down to the minimum, and this is the prime object of your Company's operations. A competitive system, while never perfect, does eliminate untold abuses and inefficiencies that breed, thrive and multiply in the dark undergrowth of controls. An adult civilisation should endeavour to work with the minimum of controls and the minimum of taxation.

THE YEAR'S FIGURES

Turning to the figures in the balance sheet and profit and loss account, I would refer to development and general reserve funds. The proposed appropriations here are £500,000 and £750,000 respectively. Your board has now had some experience of building costs at present-day prices from the few new stores which have been erected to replace bombed properties. Roughly, it costs the company three times as much as before the war to build a comparable store, and to equip it with counters, fixtures, stock and staff accommodation. So it is prudent to have good reserves available for developing and extending existing stores and opening new ones as opportunity offers.

The dividend is unchanged from last year's, and whilst there might be some ground for considering there was scope for an increase, the main reasons leading your board to maintain the figure are these: (1) Some uncertainty in the supply position of merchandise for 1952 in view of the rearmament programme, the metal shortage, the cut in supplies of confectionery and biscuits owing to the shortage of sugar. As you will know, the sweets ration has already been cut. (2) The penal rates of taxation, particularly the distributed profits tax. (3) The announced definite imposition of an Excess Profits Tax for 1952 as yet unknown in scope, amount and incidence.

The trading profit figure at £15,114,662 shows a healthy increase, but unfortunately it is inflated money that is circulating to-day. It will be much better for commerce, for workers, for pensioners—and, indeed, for the whole community when we can hold our own or make small increases in hard stable currency rather than show big gains in money that slides downwards in real value compared with other currencies, with raw materials and with living costs.

It is to be hoped that the dangers of inflation are increasingly becoming clear to the whole population; also the causes, of which taxation and State spending are by no means the least; and that the pound can be given increasing value in the housewife's purse. In the great battle for restoring the country's economy, I think this is the crucial engagement at the present time. "Hard work and a hard pound sterling" would make a good battle-cry for the fight.

COMPANY'S SUPPLIERS OF MERCHANDISE

I wish to pay the repeated, but all the more sincere, compliments to our manufacturers and suppliers of merchandise. Very many of them have been selling us goods for decades—quite a number since the very earliest days of the stores, and our association with them is one of our most treasured assets. Confidence and good relationships between our suppliers and the company are the firm foundations on which continued success for both parties may be built. Our team of skilled and experienced buyers spares no efforts to cultivate this confidence and relationship.

THE COMPANY'S STAFF

Given a steady flow of merchandise I think you can rely on the company's staff in stores and offices to maintain their skilled and loyal standards of work and service, and I want to pay high tribute on behalf of your board and stockholders to the good work done in such full measure during 1951. There has always been a tradition of hard work from top to bottom in the Woolworth Company, and in view of the very much shortened shopping hours of today it can be realised that a high standard of skill, co-operation and organisation is attained in the stores to keep them stocked and serviced.

Morale is of the very first importance, not only in war and in the Fighting Services, but in peace and in business, too, and a Woolworth employee can—and does—feel a "sense of mission" in providing for the needs of the public, and fulfilling a job that is exciting and interesting at all levels in the company. Your board is grateful that it is served by such a splendid staff, and will continue to give much care and attention to all matters affecting staff welfare and morale. Every individual, right through to the newest counter girl, is of vital importance in a retail selling organisation, and training and interesting these girls in their work are tasks that test the leadership of store managers to the highest degree.

Since our last annual general meeting, Mr. C. S. Watt has resigned his directorship after a lifetime of service to the company, and we express the very strongest appreciation of all his work. We shall miss him greatly, and wish him long and happy years of retirement. Mr W. Wainwright joined the board on March 21, 1951, and since the accounts were approved by the board we have co-opted Mr R. J. Berridge in accordance with the articles of association and he will also offer himself for re-election at the annual general meeting. I welcome these gentlemen as colleagues, and look forward to a valuable contribution from them to the work of the company.

ASSOCIATED MOTOR CYCLES LIMITED

HIGH REPUTATION MAINTAINED

EXPORT FIGURES WARRANT FAVOURABLE SUPPLY TREATMENT

The twenty-third annual general meeting of Associated Motor Cycles Limited was held on February 5th, in London.

Mr S. R. Hogg, D.S.O., M.C., F.C.A., (the chairman), in the course of his speech, said:

The accounts show, as regarding liquidity, the immense strength of your company's position. Out of the group's profit on the year's working of £402,776, the Government takes in the form of taxation no less than £221,468.

I need hardly remind you that the year under review was a difficult one by reason of the substantial increases in costs of raw materials and services. It is common knowledge that the upward trend of all costs still continues, but I think we may express the hope that the active steps which the present Government are taking to combat the inflationary phase will, in due course, have a noticeable effect.

The high reputation of our Matchless, A.J.S. and Francis-Barnett motor-cycles maintained, throughout the year under review, a demand substantially in excess of the maximum numbers which we could manufacture. We were, moreover, glad to be able to add to the products of the A.M.C. group, motor-cycles and bicycles made by our new subsidiary, The James Cycle Company Limited, which bears a name which is amongst the oldest and most respected in our industry.

SUBSTANTIAL EXPORT CONTRIBUTION

Once again I can report that we have made a substantial contribution to the export drive, since the percentage of our products which we have exported has been maintained and has been substantially higher than the average achieved in our industry. It is a matter of great regret to us that this has resulted in a continued shortage of our motor cycles in the home market.

I find it more than usually difficult today to say anything useful to you about future prospects. Up to date I am able to report an improved turnover in all sections. Unfortunately, as you all know, our prospects in the future are entirely controlled by the availability of steel and other raw materials and components. Such matters are now under Government control, in the national interest, and we are not yet in a position to make any accurate assessment of the possibility of future supplies.

The recent statement by the Chancellor of the Exchequer that supplies of motor cycles to the home market will be reduced by one-third may mean that we shall have to make a further increase in the already high proportion of our products which we export if we are to justify an adequate allocation of raw materials and of manpower to maintain our full output. With conditions as they are today that would not cause us any serious difficulty, but I would not like to say how long our export markets will continue to take all we can ship to them, in view of the rapid economic changes which are taking place throughout the world. I feel, however, that it is unlikely that we shall be seriously affected before the end of the current financial year, and I am very hopeful that we shall receive favourable treatment from the authorities in view of the known importance of maintaining high exports of engineering goods which, like our motor cycles, have a very high conversion value.

In spite of all difficulties, therefore, I hope to be able to present to you another satisfactory report at this time next year.

The report was adopted and the total dividend of 20 per cent. approved.

CAMBRIDGE UNIVERSITY SCHOOL OF AGRICULTURE

Applications are invited for a post as Assistant Agricultural Economist in the Provincial Agricultural Economics Service. Starting salary between £360 and £450 per annum according to age and experience. Applicants should possess a degree in Economics and/or Agriculture and should be under 25 years of age. The duties of the post are concerned with the collection and interpretation of data for farm management and enterprise costing schemes.—Applications in writing, stating age and experience, to the Secretary, School of Agriculture, Cambridge, with names of two referees, not later than February 28, 1952.

UNIVERSITY OF LONDON

A lecture on "Economic Factors in the Making of Canadian Federation" will be given by Professor D. G. Creighton (Toronto) at 5 p.m. on February 14th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2.
ADMISSION FREE, WITHOUT TICKET.
JAMES HENDERSON,
Academic Registrar.

ENTERPRISING M.A. (Cantab Maths.), nearly five years' experience Market Research (including management responsibility) with world-famous manufacturer; young; seeks better prospects.—Box 870.

WORKS MANAGER required for Company specialising in the manufacture of electric welding equipment. Appointment calls for first-class engineering and technical background; experience in development and production aspects of special purpose machinery essential.—Apply, giving full details of experience, qualifications, etc., to Box M4390, A.K. Advg., 212a, Shaftesbury Avenue, W.C.2.

CONSTRUCTIVE CO-OPERATION with those directing business growth—that is our business as one of the most experienced of advertising organisations. Our practical guidance and technical assistance can lighten your load—and prove an economy—in creating demand for the new product or reviving the sales of an established one. Consultation with us costs you nothing. It is confidential—and it will be constructive in a way which will be of great value to you in your future plans.—Townend-Smith Limited, Registered Practitioners in Advertising, 40-41 Conduit Street, London, W.1. Telephone: Regent 2600.

FOR SALE.—*The Economist*, 1947/1951.—Offers to Box 875.

PERSONAL ASSISTANT. Well-known industrial organisation with world-wide interests manufacturing electric welding equipment has vacancy for a Personal Assistant to Managing Director. University degree, engineering and technical background with administrative ability essential.—Apply, giving details of age, qualifications and experience, etc., to Box M4382, A.K. Advg., 212a, Shaftesbury Avenue, W.C.2.

JOHN SUMMERS AND SONS, LIMITED, are anxious to set up an organisation to further the education of the junior staff employed at their large Steelworks near Chester. Applications are invited for the full-time position of organising and conducting this development. Personality and enthusiasm are considered the essential qualifications with a background of business experience and interest in education in the broadest sense.—Box 853.

WELL-qualified and experienced Consultant in accounting, costing and general administration seeks further assignments to introduce or reorganise financial and administrative methods. Fees by negotiation, references can be supplied.—Box 855.

BLOCK DISCOUNTING FACILITIES are required by a Hire Purchase Finance Company for an additional £17,000 worth of business per month in minimum units of £1,000 per month. Blocks of individual Agreements and Promissory Notes are lodged and repayment is by monthly Bills of Exchange secured by a collateral guarantee from a well-known firm of retailers. Attractive terms. Of particular interest to institutional investors or companies with large liquid resources. Particulars from the Company's Accountants.—Box 858.

CONSULTANT EDITOR AND DESIGNER undertaking sub-editing and preparation of MSS. for Press, invites inquiries for planning, layout and execution of publicity literature and non-fiction publications.—Box 851.

BRAZIL.—A Joint Managing Director is required for the Associated Company in Sao Paulo of British engineering firm. The appointment offers great scope for a man with high level experience of management, including commercial and financial matters, and, if possible, with an engineering background. The successful applicant will be around 40 years of age, having had a first-class education preferably with a university degree; breadth of vision, wide interests and congenial personality are all necessary qualities. Aptitude for language is indispensable, and knowledge of Portuguese a great advantage. Consideration can be given only to those who conform to these requirements and can qualify for the high level of remuneration and other privileges which the position commands. Before proceeding to Brazil this man will have a course of intensive training in London.—Apply in writing, with full particulars, to Box 863.

ESSENTIAL TO ALL BUSINESS MEN!—"Advantages of trading as a limited Co.," by T. A. Herbert, LL.B., Barrister-at-Law (post 1s. 8d.), from "EC," Anglo-French Press Agency, Ltd., 128, Albany Street, London, N.W.1 (EUS. 8308/8178), who have TRUST INVESTMENT C. REGN. for sale. Ready for use, complete, £30.

WIDELY EXPERIENCED British Agent residing in Hongkong, seeks resident or travelling representation for British Manufacturer or Shipper, in the Far East or Japan, on commission basis.—Box 84.

FOR SALE.—*The Economist*, 1945-1950 inclusive.—Box 873.

CROWN AGENTS FOR THE COLONIES

ECONOMIC AND MARKETING OFFICER required by the Government of Uganda for the Department of Commerce for one tour of 2½ to 3 years with prospect of permanency. Salary according to age and experience in the scale £660 rising to £1,340 a year (including allowances). Outfit allowance £30. Free passages for the officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary. Candidates under 30 years of age should be of good education and preferably have a knowledge of commercial practice or agricultural marketing. A University degree would be an advantage.—Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting on letter M.29085.C. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

IMPORTANT public Corporation with widespread activities invites applications (to be submitted by March 31st) for post in London of Controller of Finance, who will be responsible for financial control and preparation of accounts throughout the Corporation and will act as its financial adviser. Knowledge of the international money market and up-to-date experience in tax matters desirable. The post is pensionable; salary will be in accordance with qualifications and requirements.
Applications will be treated as strictly confidential and should give full personal particulars and details of qualifications, experience and previous appointments. Please write to Box 867 quoting Serial No. 93 B.

TIME, GENTLEMEN, PLEASE! But what does it matter if you've got a bottle of J.V.R. Three Star at home. J.V.R. Three Star, 37s. 6d. per bottle; 19s. 3d. per half-bottle.

SIMENON IN FRENCH. List of his novels free on request.—Anglo-French, 72, Charlotte Street, W.1.

APPLICATIONS are invited for the post of General Manager of a large manufacturing, processing and sales concern in Jamaica B.W.I., with an annual turnover of approximately £1,000,000. Applicants must have had wide administrative experience which will be regarded as of greater importance than a knowledge of the manufacturing side of the business in question.
Salary between £3,000 to £5,000 per annum according to experience and qualifications.
Applicants should state their age and give details of their experience and should state how soon they would be available to assume the post. Applicants should submit a small recent photograph as well as the names of two referees.
All applications will be treated in the strictest confidence.—Box 860.

Elizabethan Age

QUEEN ELIZABETH THE SECOND has come to the British throne when the future is full of uncertainties. Therein lies the challenge to her people. To an unusual degree, what is done now can shape the history of these islands for forty or fifty years. If there is the will, the long reign now beginning can be made a new period in the affairs of this country and of the Commonwealth. The reality of the British peoples' attachment to their constitutional monarchy, which has been brought so strikingly to the surface by the death of King George VI, makes it more than a convenient historian's label to speak of what is now beginning as the Elizabethan Age. There is an opportunity for the accession of a sovereign to coincide with a genuine turning-point in public affairs.

If the reign of the late King is to be characterised, it must surely be as the Age of Conflict. He came to the throne when Nazi power was beginning to rise to the point at which it could challenge and almost overthrow the West. In the last years of his reign the West has been organising itself to withstand Communist aggression. But if during these troubled fifteen years the event has more often than not been worse than the expectation, yet disappointment is not despair. Indeed, the last reign provided far more reason for hope than for despair. The Great Depression had shaken the self-confidence of the Western world; the bitterness bred in the sufferings of the thirties had broken the faith and confused the will of free men. But the will stiffened when the need pressed. So far the West has triumphantly withstood the threat from without. The disappointment of the last fifteen years, indeed of the last forty years, has come from the stop to progress, the failure further to expand the area of Western civilisation. But at least where freedom and democracy were well established, they have been preserved.

When so much has been saved at such peril, the Elizabethan Age can and should begin confidently. It is not necessarily a loss that hopes are set less high than they were under Britain's last queen or even in 1945. People and parties now have a clearer conception of what they want to achieve, and a more realistic idea of what it is possible to achieve, than at any time for at least twenty years. That is a solid gain.

But if these aims are to be sufficiently ambitious, they must be set in terms of the West as a whole, not of Britain or even Western Europe alone. By its example, this country can contribute freedom and justice in full measure to the world. But the survival and expansion of Western civilisation depend also on its wealth, on a productive capacity and economic inventiveness that no other organisation of society can equal. The path of failure for the free society was marked by the economic restrictionism of the thirties. Hope for the Elizabethan Age turns on its ability to create and maintain an expanding economy. And the leadership in this task has inevitably passed from Europe to North America. It is American capital, if any,

that will play the main part in irrigating and invigorating the backward areas and may help them to combine higher living standards with a freer and juster society.

Britain can play a useful secondary part in this process, but its task is less to help to bring about world expansion than to adjust the British economy to it. The development of the backward countries, with what seems an inevitable bias towards industrialisation, will for a time at least inhibit increases, if it does not actually cause reductions, in the exportable surpluses of food and raw materials that Britain must buy. The terms of trade must be expected to remain unfavourable for this country. It may be that this pattern will be broken, in the future as in the past, by a slump in primary prices. But that would raise too many other difficulties to be welcomed. If the West succeeds in maintaining its expanding economy, then British imports will be dear. That is the price of prosperity in at least the early years of the Elizabethan Age.

★

The task that high import prices impose is in no way formidable. The way to succeed as a trading nation is now, in all essentials, the same as it was when trade was easier. It is to act as a trading nation. It is to provide scope and incentive for the inventiveness and flexibility that push traders and manufacturers into a constant search for new products and new export markets. The resources of the British people and British industry are fully adequate for the task if they are used. They are adequate to combine a reasonably flexible economy with the high productivity which all the politicians now preach. That combination means economic efficiency.

The tragedy of the postwar years has been that just when life as a trading nation had become harder for Britain, faith in the virtues required for trading was lost. The British people and their leaders thought they had learned from the thirties that efficiency did not matter, that the problems of production had been solved and only those of distribution remained. Security was put before flexibility, egalitarianism before productivity, not so much because social values had changed as because the depression had suggested that there was really no conflict. That illusion has been largely, if not yet sufficiently, broken. The country will now face its economic problems in a more realistic spirit provided only that the politicians have courage to lead it.

If war is avoided, Britain's most pressing concern in the Elizabethan Age is to earn its living in a new world; but though the need is economic, the problem is primarily political. It is a matter less of means than of will. As yet, there is still a political vacuum. Labour has run out of the ideas it learned in the thirties; the Conservatives have caught up with the ideas of the thirties, but they have failed to distinguish the sound ideas from the illusions and to fit them into a wider political and economic philosophy. The political heritage of the Age of Conflict is a full range of unsolved questions, questions that the two parties have been united in avoiding. In the Elizabethan Age answers of some kind will have to be found, and while in some important respects the two parties will no doubt differ, in others their answers are likely to be similar enough.

The direct political question is the power of the modern state: how wide do the British people wish its activities to extend? The associated economic question is how to reconcile such state activity with the need for enterprise and initiative. The direct social question is how much equality of income and property do the British people want? The associated economic question is how to combine redistributive taxation with adequate incentives to high productivity and to saving. The direct economic question is how to secure full employment without continuous inflation. And all the answers have to be related to the needs of a trading nation whose position in the world economy has permanently shifted for the worse.

The way in which the British people settle these issues will determine, in the first place, the nature of the Elizabethan Age; it will determine whether or not this country can remain a first-class power. The difficulties are less than many that have been overcome before. If only they could be faced with the spirit that this people showed under their great queens of the past, hopefulness would be sobriety and optimism would be wisdom.

A Pause in Germany

SOMETHING much bigger than a crisis in Franco-German relations faces Mr Eden this week-end as he consults in London with Mr Acheson, M. Schuman and—perhaps—Dr Adenauer. There is a clear prospect of a complete breakdown of three-power policy towards Western Germany, with an end to all talk of German rearmament and integrated European defence. To put the matter briefly and bluntly, the occupying powers were proposing to give the Germans something just short of sovereign independence in return for a contribution of men and money to a European defence community and equal status with its other members. That was the policy Dr Adenauer defended without success before the Bundestag in heated debates at the end of last week. Now the Chancellor is empowered, indeed forced, to say that there will be no German defence contribution save on conditions that include the grant of complete sovereignty. The negotiations and the assumptions of many months have been shattered, and those who spoke on these matters this week in the French Assembly have been merely trampling in the wreckage left by the German party politicians. The warning symptom of the feelings that have been roused is the fact that M. Schuman, who has come to London for the King's funeral, may refuse to talk business with Dr Adenauer, who has also come to pay his respects.

There has been some demagogy and some dishonesty on both sides of the Rhine; but whatever might have been better said and done, the fact has now been established that a majority of Germans are against a policy of concessions to France and a majority of Frenchmen are against a policy of concessions to Germany. In such a situation the Americans and British cannot maintain the role of mere mediators. For it is they who have been pressing the reluctant French to accept limited German rearmament—on conditions; and it is they who have been pressing the reluctant Dr Adenauer to accept limited German sovereignty—on conditions. Now it is plain that they can accept neither the limits nor the conditions demanded of each party statesman by his parliament. A chain of events which British policy, at any rate, made no serious attempt to control, a series of linked explosions of political exasperation, have driven the French and German parliaments into diametrically opposed positions.

In the few days that are left before the Atlantic Council meets in Lisbon strenuous efforts will be made to pretend that the situation is difficult but not grave. They should be treated with scepticism. In France, as in Germany, a coalition government commanding only a small majority has been—or is being—manœuvred into virtual agreement with the Opposition. This is not to say that the idea of the European Defence Community is dead, that the effort for European integration stops, that the scaffolding of the Adenauer-Schuman policy has already collapsed. But it does mean that German rearmament and the removal of the Occupation Statute cannot, for the moment, go on; that firm foundations for the scaffolding have still to be prepared; that the attempt to achieve a quick revolution in Franco-German relationships has failed and must give way to a slower and more subtle process. It means, too, that both Mr Acheson and Mr Eden have to re-examine their German policies.

★

Mr Eden should ask himself, and Mr Acheson, two searching questions. Is it possible or desirable to go on with the policy of freeing and rearming the Germans? If not, what is the alternative? Clearly, if the policy is not possible, then there is no point in arguing about whether it is desirable; and the evidence now is that it is impossible. What is written elsewhere in this issue by an eye-witness of the Bundestag debates last weekend makes it clear that Dr Adenauer's apparent success was in fact a decisive defeat. To carry a motion in favour of helping in the defence of Western Europe, he had to accept conditions that every Frenchman will instantly reject and few Englishmen would accept. And those conditions were meant to satisfy, not the Opposition of the Left, but his partners of the Right. If that Opposition came into power tomorrow it would refuse to provide a German army even if the Republic were given complete sovereignty. Suppose, therefore, that Dr Adenauer went on with the present negotiations for a European defence community and treaty; suppose that he could take them the few steps further that were necessary before the present crisis occurred; suppose that he presented a treaty to the Bundestag for ratification—what would then happen? Either it would be such an emasculated version of the original Pleven Plan that the Bundestag would accept it by a comfortable majority—and the French Assembly would not. Or it would be a serious plan and barely scrape through the Bundestag against the opposition of three-quarters of the people of Western Germany. If recruiting then began in such a situation, what would be the morale of the German units in the European army? They would come from a country where few people have the courage to be anything but nationalist, and where a conscientious objector would be called a good patriot.

Here is one point for careful consideration this week-end: the majority of Germans do not want to rearm. There is the further point that a minority of Germans are ready to try to raise an army and to pay for it—on conditions. Are those conditions acceptable? Two of them are concerned with the Saar and the release of war criminals, and it is possible that there might be negotiation and compromise on these points. Another is concerned with the share of defence burdens that Germans should pay and their refusal to pay higher taxes. Here again there might be room for manœuvre. But the limit of bargaining is reached when it is proposed that Western Germany should be given complete sovereignty, which would include, for example, the right to revoke measures against trusts and cartels in the Ruhr and safeguards against the breakdown of parliamentary government. It is on these terms that the Bundestag authorised Dr Adenauer, by a majority of only 48 votes, to offer "a due share in defending European democracy and freedom and in securing the unification of Europe"; but it is not on these terms that Britain and France accepted the American proposal for German rearmament in September, 1950. They are plainly unacceptable.

If, then, the policy of arming and integrating Germans is not for the time being practicable, and if it could be made practicable only on conditions that are unacceptable, what is the alternative? Some voices in the United States may say that the Germans should be rearmed by simple arrangement between the Pentagon and Bonn; from a place at the bottom of the list for arms deliveries to America's allies, Western Germany would move to the top. Dollars would be frankly swapped for infantry. It is quite clear that the Germans would accept no such plan without the assurance of sovereignty, and if that assurance were given, the beginning of a new national army in Germany would be the end of all the plans for European integration that American policy has encouraged. In this direction no alternative lies. Where then does it lie?

★

It lies, perhaps, in doing nothing, in saying quietly but firmly to Dr Adenauer and M. Schuman that there will now be an interval in Allied policy, a pause for reflection—what Germans might call a "creative pause." The Occupation Statute would continue for the time being. Negotiations for a substitute would be taken at a more leisurely pace. The technical and political talks about the European Defence Community would be suspended. The Atlantic Council in Lisbon would quietly register the fact that there is no integrated European army in the offing, and would instruct its military advisers to reconsider their strategic advice in the light of that fact. It would not be the first time that they had examined the problem of defending Europe without German troops. In short, things would go on much as they did up till two or three months ago. Passions in France and Germany would have time to cool and, above all, it would have been made clear to the Germans that they are not indispensable. The only effective answer to the cry of "Count us out" is "We do count you out."

Obviously there are difficulties and dangers in such a policy. It would mean, for the time being, the frustration of Dr Adenauer's European policy; but has that not already come to a dead end? It would exasperate some sections of American opinion and expose Mr Acheson and General Eisenhower to charges of having misled their countrymen; but the speeches and voting of the Bundestag and the French Assembly have aroused that criticism anyhow. It would cause elation among those in Moscow who saw in it a sign of western weakness; but those who thought a stage further would see that an Atlantic alliance which can think of dispensing with German rearmament must be remarkably self-confident, and potentially very strong. It will, of course, be the duty and the inclination of the Foreign Ministers to

try to save all they can from the present confusion and deadlock. Neither American nor British policy could or should take sides in a deadlock for which the French, as well as the Germans, have a full share of responsibility. But it must be made clear to the nationalists both in France and Germany that there is an alternative policy if they persist in their mutually exasperating attitudes. In the short term it can be a policy of pausing for thought. In the long term it must be an Anglo-American policy to convince them that the Americans will not leave Europe and that the British will make a reality of the Atlantic community.

How to Grow More Food—II

The Price of Land

THE first article in this series argued that, contrary to general belief, there is ample scope for growing additional food without any increase in the average costs of production. Most farms have not yet reached the point of diminishing returns ; and most farmers would find it profitable, at the prices now prevailing, to expand their output. That they do not do so must be attributed to conditions which often make the financial reward not worth the effort and risk involved in getting it.

The object of agricultural policy should therefore be to spur farmers on to greater productive efforts. An effective system of incentives must operate in two ways ; it should increase the penalties for those farmers who fail to use their land to full effect and it should smooth the path of those farmers who try to improve their land and grow more. The two methods are equally necessary ; indeed, they are complementary. This article will consider the prods and pushes which might be applied to the farmer, while a subsequent article will consider ways of giving him positive assistance.

Rent is, in economic theory, the barometer of farming prosperity. If a farm is capable of growing more food economically, this fact ought to be reflected in the rent paid for it ; an economic rent would force the occupier who is not prepared to use his opportunities to make way for a farmer who is. Unfortunately, agricultural rents today quite fail to perform this function. Whereas farming profits (in money terms) have increased since 1938 by about 400 per cent, rents have gone up by a mere 25 per cent or so. In fact, farm rents have not yet climbed back to the level of 1872—despite the staggering change in the value of money since that date.

The main reason for this amazing stickiness of agricultural rents is the reluctance of landowners to raise the rent to a sitting tenant. This reluctance is deeply rooted in the best of rural traditions. When the farm changes hands the rent is raised, but even then by much less than would often be appropriate. Good relations with his tenants matter more to many a landlord than a higher income, much of which would be absorbed in tax. These habits add to rural tranquillity ; they could not in any event be changed quickly. But the fact should be recognised that they are inimical to the interests of food production. Low rents help many farmers to jog along in their accustomed grooves without responding to the changing needs and opportunities of British agriculture.

If landowners will not—for the best of reasons—raise rents to their economic level, is there any alternative device which would achieve the same effect ? The obvious answer is the introduction of an agricultural land tax. That would be highly unpopular ; it would be difficult both to devise and to administer. But before dismissing the idea out of hand, it would be well to ask some pertinent questions. Recent articles in *The Economist* have put the general case for levying a tax on scarce commodities in order to make people use them more efficiently. Should agricultural land be placed in the same category ? The farmers' unions, at least, seem to think that it should be. They fight the taking of land for housing and other purposes by stressing the vital importance of food production. But if agricultural land has become so precious, is it not essential to ensure that none of it is wasted by being farmed below its economic intensity ? This is not, it should be emphasised, a vague counsel of perfection. It means farming up to the intensity that is made profitable by the prices that farmers receive for their products. It means simply giving the consumer—and, under the present subsidy system, the taxpayer—value for money.

The county agricultural executive committees have, it is true, the power to place inefficient farmers under supervision and, as a last resort, to take steps to dispossess them. But in practice there are few dispossessions ; it is generally only the really bad farmers who attract the committees' attention. Even in these cases, the time and labour involved in the work of supervision was commented on unfavourably by the Ryan committee. The working of the agricultural committees is essentially democratic ; the arraigned farmer receives " trial by his peers " and may appeal to an independent tribunal whose decision is final. It would be unthinkable to use this machinery to turn out those farmers who are producing less than they reasonably could. The most that might be done would be to reintroduce compulsory cropping orders on the wartime scale, and even that would encounter strong opposition—from, among others, the members of committees who must administer the orders.

To dragoon farmers into growing more food through the use of compulsion is in any case a repugnant idea. There is no justification for singling out agriculture for such treatment. Indeed, even the present activities of the local agricultural committees deserve to be viewed with some distaste. By all standards, it would be preferable to rely on economic devices to get the food which the nation needs.

A land tax could not indeed be levied at a uniform rate per acre, for that would be impossibly unfair to the occupiers of inferior land. Nor should it be based on present rents, which are generally distorted as well as low. It would need to be related in some way to the natural advantages of each unit of land ; the official classification of soil fertility might serve as a basis for this purpose. But if a satisfactory basis could be found, a land tax would have the advantage over higher rents in that it would bring the need for more production home to the large number of owner occupiers.

The notion of a land tax is suggested not in a spirit of advocacy—for the difficulties are many and obvious—but as a way of showing the direction which agricultural policy must follow if it is to be effective. Somehow, farmers must be prodded into growing more food, but at present there is no effective penalty for those who fail to respond. The effect of the Agriculture Act is to give the ordinary run of farmers not less but more security of tenure. Landowners have lost their right to terminate a tenancy unless they can prove the tenant's " inefficiency " to the local agricultural committee and the agricultural land tribunal. This procedure is unlikely to be adopted or to be successful save in exceptional cases. The fact that some other occupier might farm the land more productively cannot be held against a sitting tenant so long as he is doing no worse than the bulk of his neighbours.

*

It is an exaggeration to say that the ordinary farmer is " feather-bedded "; but prices have been high enough since the war to enable him (except in one or two bad seasons) to make an adequate living out of a moderate turnover. Each rise in prices, while it offers bigger rewards to the efficient farmer, also makes it easier for the unambitious farmer to earn a living without changing his methods. The combination of low rents, high prices, and security of tenure makes it possible for many unenterprising farmers to grow less food than they might and should do. It also retards the flow of new entrants into agriculture who would substitute ideas and methods appropriate to the fifties for those of the thirties. Some agricultural scientists argue that the narrow horizons and outworn methods of many farmers are the main barriers to enlarged output. Certainly agriculture today is in need, as never before, of new men and enlarged ideas. Some farmers and landowners have responded to the challenge, but economic conditions throw a protecting shield around those who do not, while newcomers have difficulty in finding a farm at all.

Under the new order introduced by the Agriculture Act, compulsion cannot be wholly avoided. There must be some method of ensuring that indifferent tenants do not get greater protection than in prewar days. But the main emphasis should be on changing the economic climate under which farmers operate. The aim should be to ensure that only those farmers who make reasonably intensive use of their land get a satisfactory living. This should be the yardstick of rent policy and of any devices which can be thought out to compensate its inadequacies. It should also be the guiding idea behind price policy, and it carries the clear implication that prices should not be fixed so high as to smooth the path of the unproductive farmer.

This is not to say that no increase of prices should be conceded if costs rise. But the general logic of present conditions is that prices should be kept down and rents pushed up. Since, however, this policy would bear hardly on all farmers operating in conditions less favourable than the average, it must be supplemented by various forms of special assistance to those farmers who need it. What should be done in this direction will be considered in a final article.

Those who resist the attitude expressed in this article should take a good look at the alternatives. On the one hand, there is the degrading possibility of the widespread use of direct compulsion—which ministers threaten even if they do not mean it. On the other hand, there is the possibility of reinvoking the final expedient of nationalising the land, an old political dogma that could be revived to serve a new economic purpose. Land nationalisation would perhaps be the easiest way of establishing a differential system of rents which would force farmers to produce to the economic level or quit their holdings ; and it would save for the taxpayer, through the same device, part of the cost of the windfall profits that the more fortunate farmers at present accumulate. Its drawbacks would doubtless be greater than its advantages. The mere fact of its universal unpopularity in the countryside is reason enough for any democrat to dismiss the proposal. Nevertheless, the existence on the horizon of these two extreme expedients adds emphasis to the need for choosing milder measures and making them effective.

Voice of Britain

ON January 25th it was announced that the Chancellor of the Exchequer, the Foreign Secretary and the Secretary of State for Commonwealth Relations were shortly to explain Britain's problems and policies in a series of broadcasts over the BBC's external services. This week it has been revealed that those services are to be cut by six and a half hours a day, in order to save the sum of £140,000 a year. The arguments for such cuts are obvious at a time when the Government is forced to economise on all sides ; but the juxtaposition of the two announcements suggests that the three Ministers—who, despite the nominal authority of the Postmaster-General, have the closest interest in the BBC's foreign broadcasts—have as yet no very precise idea of the function and value of those broadcasts.

In this they are not alone. Before the average Englishman can gauge the usefulness of broadcasting to other countries, he has to realise that his own easy-going approach to radio, which usually consists of moving his pointer round the medium wave dial between two or three stations, is by no means universal. The habit of tuning in to foreign stations is widespread not only in totalitarian countries but also in areas where local programmes and newspapers are gimcrack, dull or inhibited, or where enemy occupation during the war led listeners to seek news from abroad. The BBC, thanks to its unique services in wartime and to its reputation for objectivity, has benefited from this habit more than any of its rivals. Even the men who direct the now more powerful " Voice of America " have found that in many countries where their broadcasts are classed as propaganda the BBC is still regarded as the voice of truth.

This is not to suggest that the comparison between British and American foreign broadcasting is one of white and black. The BBC's reputation is based on its carefully edited news bulletins and the high quality of its comment ; but it does not hesitate to use ridicule or emotional appeal in its broadcasts to totalitarian countries. Its programmes for Soviet Germany, for example, include satirical features so bitingly destructive of Communist myths that they are widely appreciated as entertainment in Western Germany too. Again, the

"Voice of America" is sometimes criticised in the United States for not carrying political warfare to its logical extremes; and this criticism has led to the development over the past two years of Radio Free Europe, a system financed by voluntary American contributions and now broadcasting for thirty programme hours a day to the six satellite countries from transmitters in southern Germany. One of this network's specialities is the denunciation of individual Communists, whose names listeners are urged to note for future use; the use of this technique, and the irresponsible zeal with which some of Radio Free Europe's broadcasters carry out their declared function of kindling "an active spirit of liberation" in eastern Europe, are somewhat disquieting phenomena, which strengthen the case for maintaining the BBC's services to that area.

*

That case, however, rests principally on two other arguments. The first is that Soviet jamming, as an article in *The Economist* last week noted, has failed to prevent British broadcasts getting through. The second is the known existence of a large audience for London both in the satellite countries and in the Soviet Union itself. The size of this audience has been indicated not only by the statements of escaping Red Army men and other refugees, but also by the violent rebuttals of BBC reports that regularly appear in the newspapers and radio programmes of eastern Europe. From Czechoslovakia the evidence is precise and conclusive; for a few months before the Communist *putsch* of 1948 a poll taken by the Czechoslovak Government showed that twenty per cent of all listeners were getting better reception from the BBC than from any other foreign station, with Moscow a poor second. And an American research worker who spent ten months in the country after the *putsch* and interviewed 5,000 people found that one out of every two listeners tuned in to London daily, and three out of four weekly.

The BBC has wisely decided that broadcasts to eastern Europe, whatever else has to be cut, must go on as long as possible; for these broadcasts are now the only means of bringing truth and uncensored comment to the subjects of the Communist empire. On this side of the iron curtain, people are not entirely dependent on foreign broadcasts for objective information. Yet it is regrettable that British broadcasts to the free world, already drastically cut by previous reduction, should have to be reduced again. Understanding of British policies and sympathy for Britain's difficulties are not so widespread, even among near neighbours, that the intimate relationship that the BBC has established with so many of them can be endangered without real loss. No bond is more tenuous than that which links a listener with his accustomed station, and an audience once lost is not easily recovered. Even a slight alteration in schedules is liable to affect the number of listeners. Norway's outstanding loyalty to BBC programmes is in part due to the fact that for twelve years news in Norwegian has gone out from London at the same hour every evening. There is the additional factor of prestige: it is of little use to tell the German, Greek or Danish listener that his familiar programmes from London are being reduced precisely because Britain is devoting her resources to building up her military and economic strength. The broadcasts impinge on him far more directly than those things; and he cannot be blamed if he interprets the weakening of the voice of London as a sign of weakness in Britain itself.

These considerations have clearly influenced the BBC's decision to reduce its actual output as little as possible, and to effect the greater part of the saving which is now called for by deferring certain capital expenditure. But this can only be a short-term policy, and it may have economic disadvantages; for much of the new capital expenditure was meant to achieve an eventual lowering of running costs. The BBC itself is not to blame in the matter. Its hands are tied by the present unsatisfactory system under which the Treasury grant-in-aid, on which its external services depend, is arbitrarily determined every year. Such hand-to-mouth budgeting makes it impossible to draw up a long-term plan for foreign broadcasting based on an objective evaluation of the various tasks to be performed. It places the external services at the mercy not only of indiscriminate economies—which are usually inflicted in the form of a simple percentage cut, the most wasteful of all methods of saving—but also of intervention from outside. The plain fact is that the Russians, though their jamming is only partly effective in the east, are now forcing the BBC to reduce its services in the west. That is to say, if Soviet jamming is extended throughout eastern Europe, even more drastic cuts will have to be made in broadcasts to the free world if the BBC is to penetrate Soviet interference and at the same time keep within a static budget.

There is, moreover, a minimum level of effective operation below which the overseas activities of the BBC cannot fall except by ceasing to be a major force in world broadcasting. This fact alone would surely justify an early review of the whole function and responsibilities of external broadcasting by an outside body armed with enough authority to command the respectful attention of Parliament and the Ministers concerned. The recent Beveridge inquiry into the BBC scarcely concerned itself with the external services; indeed, no comprehensive survey of their work appears to have been made by a disinterested party. The BBC external services have been left, quite unfairly, to be sole advocates of their own cause before the public.

The tasks of foreign broadcasting must, however, change as the political situation changes; and no once-for-all examination could produce a set of recommendations which would be valid for all time. This is a matter that calls for continuous attention, just as, say, the Chiefs of Staff give continuous attention to changes in the cold war. The BBC's home services are already operating under the eyes of seven Governors and a host of specialist committees; and the external services, while they would not lend themselves to precisely similar treatment, might benefit greatly from the creation of a small permanent committee empowered to keep under review the whole field of broadcasting to the Commonwealth and other countries. At the very least, such a committee might help the external services to convince the Treasury and other departments that their work is of the highest importance to British foreign and defence policy. The weakening of this effort may be a heavy price to pay for relatively minor economies in expenditure. At all events, if the cuts in services are now quite inescapable—as unhappily they may be—they should be high on the list for restoration at the earliest moment.

NOTES OF THE WEEK

The Queen and the Commonwealth

Her Majesty's accession to the throne has been the occasion for registering some important developments which took place in King George VI's reign. In the proclamation of Queen Elizabeth II in London, two special phrases were used for the first time: "Queen of this Realm and of Her other Realms and Territories," and "Head of the Commonwealth." Gone was any reference to "Dominions beyond the Seas," and, of course, gone too was the title "Empress of India," which her great-great-grandmother assumed. And it was Mr Nehru, speaking on behalf of that new Republic of India—which has set the constitutionalists an intractable problem by its loyalty to the Commonwealth—who first adopted the other new usage when he said in his message of condolence "May I also welcome your Majesty as the new head of the Commonwealth."

Three patterns have emerged in the proclamations of certain other members of the Commonwealth. In Canada, where the use of the world "Dominion" is being gradually dropped, Her Majesty has been declared Queen of Canada, a kingdom in its own right. In Australia, where for the first time the accession proclamation was read ceremonially, the Queen was described as "supreme liege lady in and over the Commonwealth of Australia." In South Africa, the Governor-General's proclamation used the phrase "Queen, Defender of the Faith, Sovereign in and over the Union of South Africa." In spite of the strong republican sentiments of many South Africans, there was no reference, as there was by Mr Nehru and in London, to a title such as "Head of the Commonwealth."

Yet that is what her Majesty now is, and there is a case to be made for emphasising this as one of her formal titles. During the last reign there was a change in the real nature of the Commonwealth, from a group of states bound together by allegiance to the Crown in London to a body of which the Crown alone is the formal head. This implies, as Dr Malan claimed two years ago, the equal right of every member, not Britain alone, to decide on the admission of new members. And it also implies that Queen Elizabeth is equally at home in all her Realms. It may be that by the end of her reign it will be normal practice for Her Majesty to reside at various times in each of her Realms and from time to time to open their parliaments. There is much to be said for encouraging it.

A Home for Nato

When the North Atlantic Council meets in Lisbon, it will have to decide not only how but where it is going to lay its head. For two years arguments have gone on about what sort of organisation Nato should be, what it could do and how it should organise itself to do it. For two years, also, it has been trying to decide on a permanent home, having temporarily settled in London. Where is that home to be?

Those unfamiliar with the intricacies of this complicated organisation may ask what there is in an address. What sort of collective effort is it that boggles at deciding whether it shall concentrate itself in Paris or in London? The answer is that where Nato is based has a major bearing on what Nato is to become. The British have always believed that the civilian headquarters of the Atlantic community should stay in London. Others have argued against London with varying intensity and for a variety of reasons. They have argued, first, that since the military headquarters of Nato are and must remain in France, the civilian headquarters must be there too. Then, the nucleus of an economic general staff for Nato already exists in Paris in the Organisation for European Economic Co-operation. Thirdly it is hinted that Paris is gay and comfortable, and that the French are lavish with the privileges accorded to resident organisations. London is dull and the British have been slightly stingy.

Most of these arguments are misconceived. If Nato is to grow and flourish in the future, it must resist the temptation to become a purely military body. To put the English Channel between Shape and the civilian centre of Nato is to help preserve the balance between military strategy and politico-economic co-operation on which Nato must rest—and the communications are excellent. Again, if Nato is to succeed and create the Atlantic community, it must realise its inherently Atlantic characteristics, which are missing in the OEEC. This is a body for European co-operation which must go on. Nato is a body in which North America and Europe must develop their mutual interests and resolve their conflicts. Versailles is the centre of Nato's army; Paris is the centre of Europe's attempt to make itself strong; London is the obvious centre of Nato's attempt to combine the moral and material resources of North America with the moral and material resources of Europe. The balance might yet be tilted by Europeans in favour of London if the British offered Nato a worthy meeting place—say on the South Bank—and stopped suggesting that their relationship to the Americans is in some sense exclusive.

Chequered Scene in Egypt

Amr Pasha, Egypt's Ambassador to Britain, who is at present based on Cairo as King Farouk's personal adviser on foreign affairs, is now in London and has had one long and "useful" talk with Mr Eden. Any assumption that this is the easy prelude to negotiations would be quite out of place. Success in any Anglo-Egyptian negotiations depends on two basic conditions. One is greater flexibility on the part of the British negotiators than they have shown in the past; the other, equally important, is some measure of harmony between the views of the parties inside Egypt. There are not yet signs that this exists.

By comparison with the strident last days of the Wafd the atmosphere in Cairo is serene; but it could be judged so by no other standard. Aly Maher, the Prime Minister, has failed to form the all-party national front committee for which he had hoped; the Wafd will not join it. He is by temperament a negotiator, not a dictator, and has stated that he intends to work through and with parliament. Yet in parliament there is a big Wafd majority, which has told him that it will support him, but not "blindly." Meanwhile, there is increasing evidence of some Wafd connivance at the outset of the riots on Black Saturday. Some of its leaders seem to have thought, erroneously, that these would be purely anti-British. Therefore Aly Maher is in the unhappy position of having to request the appearance before the public prosecutor of certain leaders of a party on whose support he depends in parliament. Neither of the other major parties, the Saadists and the Liberals, is represented in his cabinet, and his political position is not strong. Only on the strength of winning resounding concessions from Britain can he go on holding it for long.

Outside Parliament a clash threatens between the high command of the army and the Wafd, each of which is charging the other with failure to act in time to stop destruction of the heart of Cairo. On the grounds that polemics between Egyptians benefit nobody, Aly Maher has temporarily muffled the clash by confiscating the newspaper in which the Wafd made its charges, and by ordering the army not to publish its reply. Both cases are being turned over to the Public

Prosecutor. If the legal findings go against the one, it is difficult to see how Aly Maher can go on governing except in complete dependence upon the other. Even such a skilled navigator will find it difficult to steer between these two obstacles. For satisfactory negotiations with Britain, complete dependence on the Wafd would be a black prospect.

* * *

A Tight Programme

The loss of a fortnight from the Government's timetable will put a heavy load on Parliament in the next weeks and months. The timetable at this time of the year is built round three pillars of the state: the Budget (on March 4th), the Finance Bill, and the supply debates, for which twenty-six days must be allotted before August 5th. Supply in fact overflows this measure, for the committee stage (unlike the report stage) of the service estimates does not fall within the "allotted days."

A study of the prospects up to the end of next month alone shows how much hard work lies before the House of Commons. If private members are allowed to keep their Fridays—and the last thing that Mr Crookshank said on this subject confirmed to them the use of next Friday at least—and if the Budget debate takes up five days, as it did last year, there will be fifteen days between now and the end of March for which no business had been announced. Some of these days will no doubt be taken up with supply, but there are already seven Government Bills waiting to start or make progress through the House of Commons. Three of them, which have had no more than a first reading yet, may take a good deal of time in committee: the National Health Service Bill, the Town Development Bill (which Mr Macmillan must certainly regard as playing a major part in the housing programme), and the Licensing in New Towns Bill. The rest are smaller measures: the Agriculture (Fertiliser) Bill and the Export Guarantees Bill both of which are up for second reading next week, the Empire Settlement Bill and the Currency and Bank Note Bill.

Before long the Finance Bill will descend upon the House, and perhaps more quickly than Mr Gaitskell's Bill did last year. Then Budget day was April 11th, the second reading of the Finance Bill was on May 8th, and the committee stage began on June 5th. Mr Butler may feel compelled by the economic situation to work more speedily this year. This is the assessment of the work ahead without taking into account the Bills to denationalise iron and steel and to widen the powers of the Monopolies Commission, neither of which has yet been presented to Parliament.

* * *

No Pointers

Polling was light at all three by-elections last week; at Leeds (South-east) the percentage of electors who voted was reduced by as much as 29 per cent compared with the general election last October. In these circumstances the number of votes cast for each party and the size of the majorities tend to be even more misleading than usual. Changes in the percentage of the poll obtained by each party are therefore shown in the accompanying table, but even from this the one safe conclusion to be drawn is that the Liberals definitely lost favour, relatively to the other parties, at Southport, which used to be one of their better constituencies. On the other hand, at Bournemouth (East and Christchurch) the Liberals almost held their own.

At Bournemouth, also, the Conservatives did well; their share of the votes cast for the two main parties increased very slightly. In the other two contests they lost a little ground compared with Labour, but not enough to be significant when the poll was so sharply reduced. This evidence, such as it is, suggests that the Government has not yet forfeited much, if any, support since October; the alleged bribes of red meat and the rest were probably never taken seriously by many marginal voters, and the country's introduction to a Tory austerity is therefore not the electoral blow to the Government that Labour likes to believe. But there will have to be more by-elections, and in more marginal constituencies, before either side can draw confident conclusions.

Training in Drilling

The second reading in the House of Lords of the Dentists Bill, which took place on February 5th, gave ample warning of the opposition it is going to meet in its passage through Parliament. The opposition is provoked by the clause obliging the new General Dental Council to arrange for the training and employment of a number of special dental ancillaries whose work will include filling and pulling out teeth. The British Dental Association is, not unnaturally, objecting to this apparent dilution of dentists, and its objections were reflected in the House of Lords debate. Lord Woolton, in fact, when opening the debate, announced in advance that, because of the doubts expressed to him privately about the proposal, consultations will take place before the committee stage of the Bill.

The proposal for these specially trained dental workers is based on New Zealand's service of school dental nurses, which is now thirty years old. Two reports, one to the World Health Organisation and another by a dental mission from this country, have spoken favourably of this scheme, and it is in the light of them that first the Labour Government and now the Conservative Government have decided to experiment with a similar scheme here because of the serious shortage of dentists in the school dental service.

It is true that there have also been criticisms of the New Zealand scheme. These were summarised in an article in the *British Dental Journal* of January 1st, which attempted to prove that if the New Zealand Government had concentrated on expanding the training facilities for dentists instead of starting the training school for dental nurses, there would have been less wastage and better treatment. For the layman, however, disagreement on the value of the New Zealand scheme is beside the point. What is certain is that the expansion of the dental profession necessary to ensure an adequate service for adults and children simply could not be carried out for many years—at least not without seriously lowering the quality of the training or the standard of dental students. Everyone would prefer that there should be enough trained dentists for all purposes. But since this ideal cannot be fulfilled, the second best alternative is surely not to let children's teeth rot, as is happening at present, but to have them treated by specially trained persons working only in public clinics and only under the supervision of a qualified dentist. Such persons would not undermine the standard and prestige of the profession nearly so much as would an influx of poor dentists.

The Persian Elections

Persia's elections, which began a month ago, cannot end before the end of March, but it is already plain that Dr Mossadegh's party will win them easily. He has secured all 22 of the seats for which a result has been declared (one of them after a recount where the first count had gone the other way). In Teheran, which is one of the few areas in which most voters understand what is at stake, and which returned his party in strength last time, nine out of twelve seats have gone to active members of his National Front party and the other three to supporters. Elections in nine constituencies have been postponed owing to disturbances in which over fifty people have been killed, but the most serious of these provincial commotions was a personal contest between rivals who were unconcerned with national issues. In countries where the count can always be influenced by pressure, the party already in the saddle is at an advantage; but even without these extraneous aids Dr Mossadegh would win. So few Persians have as yet been rendered any poorer than they were before by his planless economic policy, that he is still, for most people, the national hero.

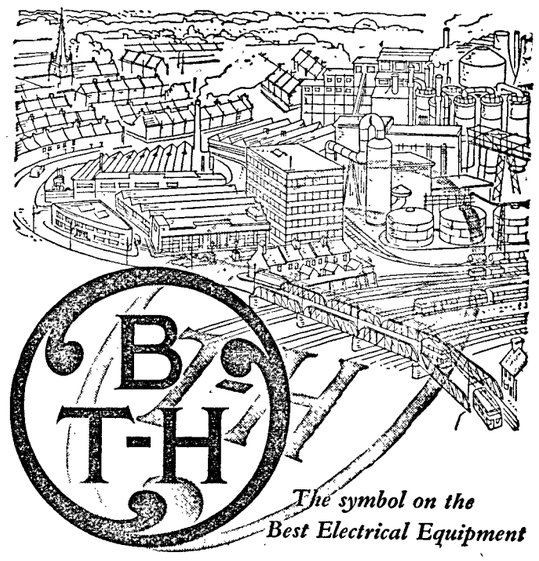
Will success render him more or less ready to listen to foreign plans for the sale of Persia's oil? With most statesmen, a guess could be hazarded. A new and firm mandate from an electorate can endow a prime minister with the strength to be flexible; knowledge that a term in office is assured is likely to create a desire for financial stability. But with a man of Dr Mossadegh's limited mind, no predictions are possible. At the moment he is reinforced in his belief that Persian oil is vital to the western world by the arrival of a weighty mission from the World Bank. Negotiating with him is an operation at cross purposes so long as he starts from this assumption; whereas the purpose of the westerners who want to help him is less to get his oil than to save Persia from the bankruptcy and muddle that suits no one but the Soviet Union.

* * *

Omission by Moscow

In *The Economist* of November 17th an appraisal of average Soviet living standards was attempted and a broad comparison made with the levels prevailing in this country, the United States and France. The purpose was not to jeer at Soviet deficiencies, but to refute irresponsible talk about starvation and declining standards in the West and luxury and rising standards in the East. It was argued that such comparisons with the old industrialised states, provoked by Soviet claims, are unfair to the USSR, which only recently emerged from a semi-feudal stage, concentrated all its forces on the development of heavy industry and in addition was ravaged by two wars and a civil war.

Lack of statistical data makes the appraisal of Soviet living standards difficult; it requires much guesswork and introduces a wide margin of error. An appeal was therefore made to Soviet economists, who should have the necessary information, to correct these estimates or offer alternative calculations. The first answer comes after three months interval, in this month's issue of *News*, the Soviet English-language monthly, which devotes four pages to an article by A. Vikentyev on "*The Economist's* Omission." The article is polemical but not vituperative. It is, therefore, the more unfortunate that it fails to provide additional or alternative data on Soviet levels of consumption.



The main weaknesses of *The Economist's* article, according to Mr. Vikentyev, were the failure to show trends, i.e. the relative rise in Soviet standards; the inclusion of too few items in the comparison of consumption per head; and the underestimation of social services. The remarkable postwar improvement in Soviet consumption was in fact mentioned: but it was pointed out—as the author of this article does not—that it was a rise from appallingly low wartime levels not comparable with western standards. In the original table of consumption per head wool and cotton fabrics, shoes, butter and vegetable fats were included. Estimates could be added of sugar, soap and meat consumption, in which the Soviet figures vary from ¼ to ½ of the American and British levels. The best answer from the Russians would be to supply actual data on these and other commodities.

It is not maintained that comparisons per head are the ideal method. The Russians used to quote the total wage fund, from which average money wages could be worked out. Then, by deducting taxes and adding on the benefits of social services real average wages could be calculated. It was then possible to compare the results with the prevailing prices and draw conclusions on the worker's purchasing power. These figures are no longer given, and Mr Vikentyev only rehashes the official "percentage increases in real wages," which are meaningless without details of the method of computation.

*

If the Russians admitted that their living standards lag behind those of the west and stressed the odds against which they have had to struggle their case would be strong. This, however, would go against the Stalinist dogma of Soviet superiority, though there may be what amounts to a tacit admission in the reluctance of Mr Vikentyev and other Soviet economists to question the estimates published in *The Economist*. As long as no better ones are put forward, they must be considered as rough but fairly accurate approximations.

The points raised in *News* will be dealt with when a final balance sheet of the discussion on this topic can be drawn up. It still rests with Soviet economists to give—either directly or in their own journals—the only possible answer: detailed facts and figures on Soviet wages, prices and consumption levels. "Facts," said Lenin, "are stubborn." That is perhaps the cause of Mr Vikentyev's reticence.

The symbol on the Best Electrical Equipment

Industry in all its branches is well served by BTH electrical equipment—be it a motor driving a machine-tool or a turbo-alternator providing power for the whole plant. Over a period exceeding fifty-four years BTH has gained an enviable reputation for the quality of its products, which include:—Generators; motors; rheostatic and electronic control gear; turbine plant, including gas turbines; switchgear; transformers; rectifiers; high-precision helical gearing; 16mm and 35mm sound-film projectors; a wide range of electronic devices; ignition equipment; resistance, high-frequency, and induction heating; Mazda lamps and lighting equipment.

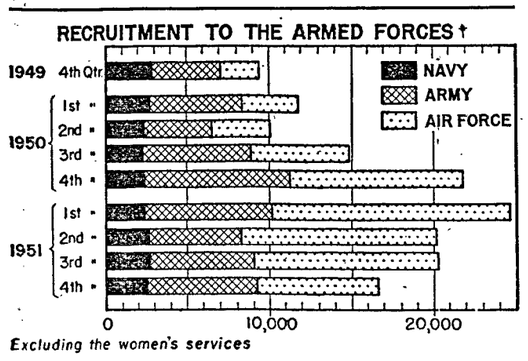
Voices Off

Two events this week make one wonder whether British counsels have the effect they should have on those who frame the United States' foreign policy. On Monday Mr John Foster Dulles is reported to have said, during a broadcast, that America must not rest while any country remains under Communist rule. Mr Dulles apparently wants the United States to harass Communist China by all possible means, including the use of the Nationalist forces in Formosa. The night before his broadcast, Admiral Kirk, whose resignation from the post of American ambassador in Moscow was announced only last week, accepted the chairmanship of the American Committee for the Liberation of the Peoples of Russia. This is an unofficial organisation which helps Russian refugees to wage propaganda campaigns against the Soviet Government.



Admiral Kirk's action is ill-advised. He will associate American official policy with an organisation that is responsible to none but its own patrons. Even Soviet ambassadors, however active they may be in clandestine propaganda, do not publicise the fact, and take pains to be strictly "correct" in matters of diplomatic etiquette. Mr Dulles's statements were even more unfortunate, coming as they did from a man still in an official relationship to Mr Truman's government, and who might occupy a high position in a Republican administration. They will gravely embarrass the Prime Minister when the interrupted foreign affairs debate is resumed, and provide the Opposition with better ammunition than it had last week. If Mr Dulles was misreported, or if he was led to use thees words in the heat of wireless debate, it is important that a speedy correction should be issued.

* * *

Manpower for the Forces

It is not at first sight encouraging that as rearmament gets into its stride recruitment to the armed forces should fall. The higher rates of pay introduced after the outbreak of war in Korea were very effective in stimulating recruitment, which reached a peak in the first quarter of 1951; but since then there has been a fall, which became most marked in the fourth quarter of 1951.

The exception to this trend is the army. The possibility of serving three years with the colours and four in the reserve has proved an attractive alternative to national service; the pay is higher, there are greater opportunities of being taught a trade, and the first eighteen months of training can bear

Excluding the women's services

fruit in the form of promotion. The navy does not offer short service, on the theory that naval training takes several years and that it would therefore be wasteful to allow men to leave the service after three years or so. Although naval recruitment fell in the last quarter of 1951, this is not necessarily serious. The navy recruits to a programme, which was somewhat lower in the last quarter of 1951 than in earlier quarters; and on the whole the programme is proceeding fairly satisfactorily. The RAF, too, is not overanxious about recruitment. There was a sharp fall in the final quarter of 1951, but this was principally due to the fact that the trades most popular with applicants were full. The present strength of the RAF, at roughly 261,600, is above the estimate made last March of 250,000 for the year.

On closer inspection, therefore, it does not seem that the services are yet losing ground to industry in competing for manpower. The effect of a rising cost of living is little felt, at least by the single serviceman, for living expenses are largely met. But the relative attractions of the services as compared with industry certainly become less with every rise in wages, and new pay increases may soon be needed if the armed forces are to continue holding their own.

* * *

Cut!

A case can always be made out for exempting each individual victim of general retrenchment. The protests against the disbanding of the Crown Film Unit perhaps carry more weight than most, but they still need careful scrutiny. The flimsiest arguments are those based on its artistic achievements. It has indeed set a high standard in documentary film making; but while the state may sometimes legitimately be a patron of the arts, it should not be producing art for art's sake. The proper test of the wisdom of closing down the unit concerns its effectiveness as a means of information.

Crown films had a more obvious value in wartime than they have today. Sober reporting of subjects like British road transport seems pointless compared with morale-raising epics of the war like "Target for Tonight." Since the war some useful films have been made—some valuable in a general way, like the series for vocational guidance sponsored by the Ministry of Labour, and some having a particular purpose such as recruiting for civil defence. Many Crown films have been "dubbed" for showing in the Commonwealth and a few have been made expressly for overseas audiences. But the Unit has also made some films for which it is hard to see the need.

The Crown Film Unit, in fact, made too many films, partly to justify the heavy overheads. These include expensive studios at Beaconsfield which were quite unnecessary—documentary films are made almost entirely on location, and when studio space is needed it can be hired. Another overhead was administrative costs at the Central Office of Information, the intermediary between the sponsors and the film unit.

It will no doubt be cheaper to have an occasional film made by a private company—for presumably the Government will not altogether abandon this medium of propaganda—than to keep the Crown Film Unit in being; and that, in present circumstances, is enough to justify the step. But has the Government considered whether it might not salvage the best of the Crown Film Unit while still making a very substantial economy, by keeping in being a small nucleus, stripped of the heavy overheads? A drastic pruning was certainly needed, but it might have been better to make more drastic cuts in other parts of the information services—or even in the considerable support given to the private film industry.

Investment by Deficit

The sterling crisis and its possible consequences for the Irish Republic has helped to revive the long drawn-out debate on the principles and practice of Irish investment policy. The statistical basis of the discussion is, as usual, inadequate. Official returns put the gross total available for domestic investment at £48 million in 1949 and £59 million in 1950,

while the figure for 1951 is thought to have risen to about £70 million. National income was estimated at £352 million in 1949 and £363 million in 1950. It is clear that the increase in investment is largely the fruit of higher prices.

The sources of the resources available for investment are hard to distinguish. Personal savings are put at £17 million in 1949 and at £7 million in 1950, while it seems certain that there was net dissaving in 1951. Foreign disinvestment ran at £10 million in 1949 and £30 million in 1950, and is put at approaching £70 million in 1951. The best that can be said about these figures is that they are possibly not so bad in reality as they look. There is no firm figure for personal savings; and in a country of farmers and family businesses it is possible that the amount of saving is greater than the usual indications would suggest. Stock-piling played some part, though its extent is open to much debate. But the broad conclusion is inescapable; investment at home has been financed mainly by disinvestment abroad.

The type of investment leaves much to be desired. Imports of productive capital goods averaged £18 million in the three years 1949-51. "Social" building—of houses, hospitals, schools and so on—seems to have accounted for rather more than one-third of the total investment in each year. The amount going to agriculture has so far been comparatively small, though it is here that the need is certainly greatest. The Irish Central Bank has justifiably commented that an unduly high proportion of investment has been in directions from which no help to the balance of payments will be forthcoming. The bias of investment has been towards urban rather than rural needs, towards social rather than economic purposes, and towards long-term rather than short-term returns. Balance might have been restored by the progress of the Land Rehabilitation Project, which now seems to have been affected by the change of government. Whatever might have been said in justification of this bias in the conditions of 1949 or early 1950, investment should now surely be directed towards helping the Irish Republic to pay its way in overseas trade. Unfortunately the Land Rehabilitation Project, which might, as it progressed, have restored some balance to the investment programme, seems to have been slowed down since the change of government.

Less Rice for Asians

The shortage of available food for the rice-consuming regions of Asia becomes more and more serious as the population increases without any corresponding increase of rice production or export surpluses. India, Japan, Ceylon and Malaya are all affected as importers; China is approximately self-sufficient, and Indonesia and the Philippines nearly so. Of the three countries which were formerly the main suppliers of the international trade in rice—Burma, Indo-China and Siam—the first two have never recovered from the effects of war and civil war sufficiently to regain prewar levels of production and export. Only Siam, which has so far led a kind of charmed life amid the catastrophes of South East Asia, has increased its output. Thus it has acquired a unique importance for Asia's precarious food supply, and the Siamese Government's decision to cut by nearly half the quantity of rice exported last year could have serious consequences.

Siam has concluded an agreement with British South East Asian territories for 295,000 tons to be supplied by the middle of September; the British originally requested 470,000 tons. The Siamese state that they will not export this year more than a total of 800,000 tons as compared with 1,500,000 tons last year and 1,700,000 which trade circles estimate will be available this year. The question arises: why does Siam wish to withhold such a large quantity of rice from the international market? The official explanation is that stocks are being conserved because of the tense international situation, and this explanation may be the true one. The possibility of a collapse in Indo-China is taken very seriously in Bangkok, and if the Siamese had to defend themselves against aggression, the existence of a large food reserve would be a great asset for national resistance.

There are, however, other possible reasons. One is that the Siamese Government may believe that by holding stocks off the market they may create such a scarcity that they will be able to get famine prices. It is only fair to say that Siam has not hitherto shown any signs of a disposition to exploit its economic position so brutally. The other, and perhaps the most likely, explanation is that the balance of the rice surplus will in fact be exported, but through private channels. The Siamese rice trade was formerly in the hands of expert Chinese merchants who would probably get higher prices than can the Siamese Government. Siam probably does not wish openly to abandon inter-government dealing, which is favoured by both Britain and India; but, by letting part of the trade flow back into private channels, it may hope both to get more foreign exchange and also to conciliate the Chinese merchant class, at present a matter of great political importance.

Criticism from Malaya

General Sir Gerald Templer, who arrived in Malaya at the end of last week as High Commissioner, has already run into strong criticism of Mr Lyttelton's appointment of Mr Donald McGillivray as his Deputy. This official has been seconded from Jamaica for duty in Malaya to relieve the High Commissioner of detailed administrative work. Although this has happened in the normal course of Colonial Office postings, the move has been called by a leading Malay a "slap in the face for Malaya," and it is widely resented among civil servants there. These reactions are an unfortunate reflection of the bitter disillusionment in which the

country not unnaturally finds itself, as a result of the downward trend in the struggle to bring the emergency under control. And while General Templer has, of course, to secure from officials the co-operation vitally necessary to his task, he would be wrong to accept too much of the criticism and advice that will be offered to him on the spot.

It is true that there has been a procession of newcomers and "outsiders" moving through the Malayan administration, many of them with experiences in Palestine which were not always helpful. They have not all been a success in Malaya, though Sir Henry Gurney was an outstanding exception. But several facts have to be recognised. One is that there is no evidence to prove that, if those with long experience of the country had been left to deal with the emergency, they would have handled it any better than it has in fact been handled. They failed, for instance, to read the warning signs beforehand as clearly as they were read in Singapore. Another fact is that the struggle in Malaya is not just a domestic concern. It is part of a world-wide Communist offensive, success against which is of profound concern to the Commonwealth and to the rest of the free world.

General Templer can certainly afford no mistakes. Apart from giving to his own administration the kind of leadership its members will respect, he has to get on terms with several different racial communities which lack responsible leaders with any real following. There is a danger of Malaya becoming another Burma. The new High Commissioner can save the situation only with a determined, brisk and many-sided policy. He must get the co-operation of the Chinese by showing them he can win. He must restore the efficiency of the administration, by stopping incessant departmental expansion and cutting out dead wood. He must infuse new energy into the housing, educational and hospital programmes, and press on with the elections. And he must win a personal position for himself through contacts with individuals and groups.

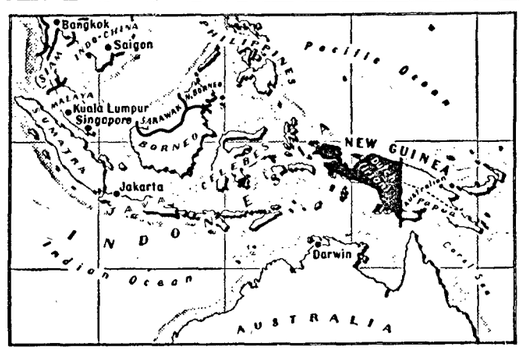
"Not Very Fond of Spain"?

Mr Stanton Griffis, the former American ambassador in Madrid, certainly did his best to bounce Washington into an agreement with Spain. To his great disappointment, however, he has not been able to clinch the deal; he had worked hard on it during his time in Madrid, which lasted rather more than a year and ended a fortnight ago. Instead, President Truman recently let it be known that he "never had been very fond of Spain" and to this General Franco replied with a Note of protest at the end of last week. In Madrid itself there has been bewilderment at the fresh evidence of American hesitation and, by way of reaction, a distinctly more favourable attitude to Britain than for many months past.

In spite of these minor fireworks and the protracted negotiations a new American-Spanish agreement is likely before very long. This would take the form of a bilateral defence pact outside, but worked in conjunction with, American commitments under the North Atlantic Treaty. If the decision were left to Washington alone, the Americans would possibly end by having Spain in Nato; although General Eisenhower, like President Truman, has lately expressed his lack of sympathy with the nature of the Franco government. But as things are, the Americans are fully aware of the many reasons why the admission of Spain remains politically impossible.



The basis of a deal between Washington and Madrid would be the supply of American economic aid—largely, if not exclusively, directed to military ends—in return for special rights for American forces in naval and air bases. Two American missions have already reported during the past few months on the economic and military possibilities; and Congress has put down stake money as an earnest of good intentions by writing $100 million for Spain into the Mutual Assistance Act.

If the Americans are satisfied that an arrangement with Spain offers sufficient strategic advantages to outweigh its political drawbacks, other members of Nato can hardly oppose them. Portugal, about to play host in Lisbon to the Atlantic Council, will actively welcome this alternative to having its neighbour and ally as a full member. American association with Spain in this form does not prejudice the democratic ideals and practices of Nato. Even the idea that the Spaniards have a military contribution to make to Western Europe's defence does not conjure up, as it used to, the alarming belief that American strategists expect to hold nothing more than a last ditch defence line on the Pyrenees. The progress of General Eisenhower's command is rapidly making these fears out of date.

* * *

New Guinea—Boon or Burden?

Those who believe that any international problem can be judged in terms of black and white would do well to look at the case of western New Guinea, which has now been in dispute between Holland and Indonesia for the last two years. Although this remote and under-developed area would be even more of a liability to the Indonesians than it is now to the Dutch, neither government is in a position to modify its claims now that the issue has become one of prestige. Whichever was first to give way would almost certainly be overthrown and replaced by a less reasonable group, with serious consequences not only for their own

countries but also for the free world as a whole. A parliamentary crisis in Holland would deal a new blow to the cause of European integration; and in Jakarta the fall of Dr Sukiman and his moderate colleagues would open the door wide for ultra-nationalist or Communist influences.

Little has so far emerged from the latest negotiations in The Hague; and the fact that the Dutch now enjoy the express support of Australia, while Indonesia's case is being increasingly favoured in the United States, amounts to no more than a scoring of debating points. Meanwhile the inflammatory propaganda in Indonesia for the "liberation" of Irian—as the disputed territory is now termed—is helping to perpetuate disorder; and the Indonesian government has been forced by nationalist pressures to resort to such threats as the liquidation of the union with Holland and the expropriation of Dutch interests. Relations between the two countries can never become really harmonious while the New Guinea dispute drags on. But it must not be forgotten that a great deal of cordial co-operation between Dutchmen and Indonesians is continuing in spite of the dispute; and, since no practicable solution appears to be in sight, it would seem that both nations must resign themselves to agreeing to differ for the time being.

Unticketed Cornporter

From time to time the courts throw a sharp light on the current scene, all the more valuable when it comes from an unexpected angle. Such a case is that of Abbott *v.* Sullivan, which came before the Court of Appeal a few weeks ago. Mr Abbott was a foreman cornporter in the Port of London, one of the group of two hundred men who have by custom the exclusive right to handle grain overside from the ships using the port. He was also a member of the group's executive committee. In September, 1947, the committee imposed a cash fine on Mr Abbott. Immediately after that committee meeting, in the street outside, Mr Abbott assaulted the trade union organiser who acted as convener for the meeting. The assaulted man at once called another meeting of the committee, which decided to remove Mr Abbott's name from the register of cornporters ; thereafter, Mr Abbott could no longer work at his trade in the Port of London.

The majority of the Court of Appeal has now held that the committee acted beyond its powers in removing Mr Abbott's name from the register, but that, since there was no basis of contract between Mr Abbott and the committee, or the group, their action did not give rise to any claim for damages, and the Court had no power to put him back on the register. Lord Justice Denning dissented from the decision. His argument was that, just as a member of a company or a proprietary club has an implied contract that the governing body will not expel him except in accordance with the rules, so each member of a group such as the cornporters of London has an implied contract that his executive committee will not expel him unjustifiably. But Lord Justice Denning did not carry his colleagues with him in this attempt to keep the common law in step with changing social conditions.

The decision has a wider aspect. It illustrates again the power which unions have come to have over their members. There must now be many millions of men whose jobs depend more on holding a union ticket (or the right union ticket) than on any skill or experience they possess. There may be hundreds of men who have been thrown out not only of their jobs but also of their trades on grounds which a court of law would not support. Evidence of the need for an inquiry into trade union rights and duties by something like a Royal Commission is continually mounting. The Labour Government found time for Parliament to overhaul the tribunal which removes the names of doctors from their register. It is a pity that it did not tell the trade unions that they would be strengthened, not weakened, by a public overhaul of their machinery.

* * *

Hospital Volunteers

There has already been plenty of evidence of the survival of the voluntary principle in the welfare state, and much talk about how it can be used to best advantage. The report* written for the National Council of Social Service and King Edward's Hospital Fund not only shows, with the help of quotations from John Stuart Mill, how important it is that the principle should survive ; it also discusses in detail the application of the principle to the nationalised hospital service.

Hospitals have always been noted for the depth of local loyalty they inspire and the amount of voluntary service they bring forth, and it was feared that both would be destroyed by nationalisation. The report shows that this has not happened. The many voluntary societies that work inside the hospitals and on their fringe are constantly finding their scope increasing and are still in need of both funds and volunteers. It is true that, as the report points out, not all voluntary service is efficient or undertaken for the right motives. Overlapping can lead to waste and imitation, and to some people voluntary service is merely a means of enhancing their own importance and giving them personal power. But to recognise this is not to deny that the wish to do true voluntary service should have its outlet.

Perhaps the most striking example of the perpetuation of the voluntary principle in the new hospital service lies in its organisation and administration. Both regional authorities and hospital authorities have their paid staffs of administrators. But they themselves, on whom statutory responsibilities have been laid, are composed of men and women who give their services voluntarily. As the report puts it, the freehold of the hospitals is vested in Parliament, and the leasehold is entrusted to volunteers. The result is an experiment in partnership between the state and voluntary service which is of great importance. But the report expresses some fears that the experiment is not working out as it should. Regional boards cannot be expected to have loyalties to their regions. They therefore lack the cohesive force of the governing bodies of the former voluntary hospitals or municipal hospitals, and at the same time their independence, which might have provided cohesion, has been steadily undermined by a Ministry anxious to curb hospital costs. All roads lead to Rome ; it is not therefore, surprising to find the report coming to the conclusion that more financial autonomy, through a block grant system, is the way to preserve the independence and liveliness of mind that ought to characterise the voluntary side of the hospital partnership.

* Voluntary Service and the State. George Barber & Son. 2s. 6d.

Progress and Reform

It has often been remarked by intelligent foreigners who have examined our constitution, that the franchise upon which the representation of the people is based, excludes from its exercise very large numbers of persons who, according to its theory, should be entrusted with the exercise of that privilege. In almost every other country than England, whatever has been the test of the right of voting . . . it has been so contrived that every person answering the description of that test, has had a voice in the election of some one member of the legislative body. But in England, where it has been recognised that a £10 occupation in a town should give a right of voting, hundreds of thousands of persons, in some counties even amounting to a majority of the whole, answering that description, have been entirely excluded from the franchise. Again, in country districts it is notorious that while thousands of persons possess the right of voting in virtue of a *forty-shilling* freehold, who have no interest in the county beyond that, and no residence in the neighbourhood, large numbers of the most intelligent resident persons . . . are excluded from any participation in the choice of those who represent them in Parliament. Again, if it be admitted, as we believe it will be by all classes of politicians, that a Government based upon a representative system is only the safer and firmer by embracing within it the greatest number of persons and classes that can with safety be included, we think it will not be denied that the great change in the condition of the masses of the people, both morally and intellectually, which has taken place during the last twenty years, will fully justify the Legislature to embrace, as its constituents, an extensive class, with regard to whom there may have been grounds for apprehension in 1832. Moreover, our experience at home, and our observation of what has occurred abroad, has deeply impressed all parties in this country that the true conservative policy is to persevere in that course of patient progress and steady reform by which our institutions have gradually acquired that security and solidity of which Englishmen now so justly boast.

The Economist
February 14, 1852

Letters to the Editor

Mr Churchill and China

Sir,—The article in your issue of February 9th unrealistically overlooks the fundamental factor responsible for the tortuously long drawn out truce negotiations in Korea and the bitter antipathy which has grown up between the new China on the one hand and the United States and ourselves on the other. It is a mutual mistrust and suspicion, genuine and deep-rooted, and instead of all-out attempts being made to remove it, or at least to alleviate it, provocative actions and pronouncements on both sides have been best calculated to increase it.

You ask specifically whether soothing or minatory noises should be heard from us? I would have thought that recent events, not only in the Far East, would have taught us that minatory noises in themselves, far from leading to a solution of disputes between nations, merely exacerbate them. Moreover, even if, for argument's sake, it be conceded that it is necessary to inform China in advance of the penalties of breaking a truce agreement, in the name of objectivity, surely such warnings should have been accompanied by incentives for good behaviour?

Incongruous to relate, however, while attempting to convince China's rulers of our good faith at Panmunjom in the hope that this would lead to a similar demonstration on their part, American and British statesmen have, in effect, publicly questioned the integrity of the Peking Government. Such statements have inevitably been interpreted as a gratuitous insult to the people of China. Worse still, they have been seized upon as further evidence to support the sense of injustice at the hands of the western powers under which the Peking Government has been labouring since its inauguration—a feeling that has gone a long way to inspire the present aggressive policies, which I in no way seek to justify.

Only when agreement has been reached in Korea, and China is no longer able to parade itself before the peoples of Asia as being unjustly treated by the United Nations or by individual major western powers, shall we, the freedom-loving nations, begin to win the full confidence and abiding good will of those who live in that part of the world.—Yours faithfully,

London, W.2 GERALD SAMSON

The Price of Labour

Sir,—In the article in your issue of February 2nd you discuss a tax on labour as a possible inducement to the employer to dismiss redundant workers. This system has its disadvantages, as you point out, and in view of the labour shortage the incentive to the employer is unlikely to be sufficient.

A more logical approach would seem to be to offer the incentive to the worker, who will find less difficulty in finding alternative employment than would his employer in finding replacement labour. Further, if the worker can be induced to move of his own free will the question of dismissal does not arise.

The approach I suggest is that industry, in its widest sense, should be graded into two or three categories according to their value to the nation. In assessing income-tax liability the "earned income" allowance would vary according to the nature of the employment. Work in "luxury" occupations would carry no relief for earned income while the present allowance would remain untouched in the majority of cases. A special incentive could be applied for particular items, such as coal mining, by raising the earned income allowance from one-fifth to one-half, but preferably leaving the upper limit of allowance at its present level of £400.—Yours faithfully, C. I. RUTHERFORD

Potters Bar

*

Sir,—With reference to your article on a payroll tax, may I suggest that a scheme could be started by which any dismissed employee could apply to be retrained for some more essential job. The firm which would train him would, of course, only pay him part of his wage during his training; the rest would be paid by the Government out of the money collected by the payroll tax. In this way a large number of people could be switched to essential jobs without loss of pay during training and without cost to the Exchequer.

As a long term policy also the tax could have great value, as it would be a very strong weapon against unemployment. The moment unemployment threatens, the Government would simply remove the tax. This would lower all firms' wage bills and so halt dismissals without reducing the general purchasing power of the public; it might in fact lower prices in addition. As soon as full employment is again secure the tax could be reimposed to act as a safety valve at the next emergency. Finally, if the Government wants to influence industrial policy in favour of, say, co-partnership, piece rates, or anything else it can do so very simply by applying the tax in differential rates.—Yours faithfully, E. R. REIFENBERG

Trinity College, Cambridge

*

Sir,—Why call your excellent suggestion a payroll tax? Could not the same result be obtained by increasing the employers' contribution to the national insurance stamps by 5s. or 10s. per week? In administration this would cost no extra, and politically it could be represented as the employers' contribution towards the solvency of the social services.—Yours faithfully,

W. E. HAMILTON

Ceylon and Britain

Sir,—Mr Pakeman is undoubtedly expressing the traditional angle of a good British "diplomat." The younger generation of Ceylonese want practical results, not mere platitudes. Perhaps Mr Pakeman and the European associations could provide us with the answers to a few questions which may shed some light on the policies of British companies in Ceylon. How many European and Ceylonese executive officers employed by British mercantile interests were there on Independence Day? How many of each today? How many of these European executives speak Sinhalese or Tamil fluently? But perhaps more important, as a measure of deliberate British policy to overcome the ruling race complex, is this question: how many mercantile Europeans could say that they have a single Ceylonese friend whom they have invited to their homes to dinner?—Yours faithfully,

London, W.8 AGAMSIRI DE SOYSA

Colonial Development

Sir,—Britain is pledged to develop the colonies to the full with the object of raising the standard of living of colonial peoples, and also in order to contribute to the solution of the world's deficiencies, to earn dollars and to assist the United Kingdom. Those of us who are responsible for the execution of that policy are doing our utmost, but development requires money and the translating of that money into real goods, mainly capital goods.

Because of the economic difficulties of the sterling area, a restriction has had to be imposed on all borrowings, including the raising of colonial loans. That presents us with the first difficulty, but even more serious is the problem of translating such funds as we have got, or can raise, into real goods. To develop the colonies the first requirement is transport facilities, but the capital goods required for that purpose are made of the raw materials, mainly steel, which are required for the rearmament programme; also the skilled workers required to manufacture those raw materials into transport equipment and other requirements for development are the very men required to make tanks and guns.

There are, therefore, very sound economic reasons why there must be some restrictions in the supply of both finance and capital goods to the colonies. Yet we are still encouraging the colonial peoples and private enterprise to think a full colonial development programme can be maintained and colonial development is out-running the basic requirements such as transport, water and power supplies.

Ought not British economists to examine the position and see, in the face of the demands for rearmament, what allotment of raw materials and manpower could be set aside for colonial development, and how that allotment could be controlled to secure the best economic result? Ought we not to tell the colonial peoples that if rearmament is to be secured in the next three years, some curtailment of colonial development is inevitable? Something of the sort is essential if we are to avoid serious difficulties in the colonies.—Yours faithfully, COLONIST

Books and Publications

Liberalism in Revival

Le Néo-Libéralisme: Etude Positive et Critique. By Jacques Cros. *Librairie de Medicis, Paris.* 413 pages.

The title of Dr Cros's massive, ambitious and widely ranging book may prove misleading to his readers. It suggests an evaluation of that revival in liberal thought and particularly in liberal economics which has characterised, especially on the continent of Europe, the postwar years, and of which the Mont Paleria conferences appear, in English eyes, as the visible symbol. In fact, the foundations of "Le Néo-Libéralisme" appear to have been laid down in the nineteen-thirties, under the stimulus of the gathering to which Mr Walter Lippmann gave his name. Any report on the current content and fortunes of the liberal idea must necessarily be an interim report—the necessity is implicit, as Dr Cros himself makes clear, in the very nature of the essentially "open" liberal doctrine; this particular interim report, though it contains some references to postwar events and publications, is essentially dated 1938 and will consequently disappoint any reader anxious to be put squarely in the contemporary picture.

Given this warning, any sufficiently determined student of political and economic ideas should find it richly rewarding. Dr Cros has erected an impressive edifice—the architectural simile is particularly apposite to a work at once so shapely, so logically balanced, and so overpoweringly solid. Liberalism has declined because, false to its own soul, it has itself become dogmatic; in revival, it hesitates between reliance on a first principle and criterion, that of the free market, and reliance on method and attitude alone. Elaborating these initial distinctions, Dr Cros is led to analyse, and subsequently synthesise, all the forms of collectivism; to sum up the debate on the economic calculus; and to trace the development of political ideas relating to individualism from the Middle Ages to the present day—a feat of compression which results in an almost unassimilable sequence of epigrams.

Studying in more detail the different strands of thought to be distinguished in the neo-liberal revival, he discloses a degree of conflict to which it is hard to see any harmonious resolution; a conflict, in fact, corresponding rather to the difference subsisting between serious Conservative and Liberal thought in this country than to any mere difference of emphasis among doctrinally united thinkers. Between the essentially conservative "Civitas Humana" of Röpke, whose spiritual kinsman is Burke, and the essentially liberal "Open City" of Walter Lippmann, there is in common one great positive belief—belief in the primacy of the individual—and one great negative or defensive aim—to counter the totalitarian pressure on men's minds. Both alike are, in face of the mechanistic and collectivist threat, liberal by contrast; but the opposition between them is real. Dr Cros sees a possibility of synthesis in an increasingly realistic economic theory, made possible by the contribution of Keynes, and in a recognition of the relative, incomplete and necessarily "open" nature of political thought. Such a synthesis would have nothing in common with a simple reaction towards an idealised nineteenth-century competitive order.

By its breadth of vision, its closely wrought intellectual texture, its historical perspective, and its power of relating widely divergent ideas, "Le Néo-Libéralisme" takes rank as a work not to be missed by the serious student of contemporary thought. Even the most conscientious, however, may well wish that Dr Cros had taken to heart that saying of Pascal—one of the few philosophers whom he does not cite—to the effect that so-and-so "has written a long book because he had not the leisure to write a short one."

Fantasia on the Police

The Blind Eye of History. By Charles Reith. *Faber and Faber.* 257 pages. 18s.

Mr Reith has changed his publisher but not his thesis. In this, as in his earlier books, he argues that only by a police system as developed in nineteenth century England can law and order be maintained on acceptable terms. Mr Reith's tribute to and analysis of the functions and methods of the police in this country contain much that is just and sensible. He is undoubtedly right in holding that the problem of enforcing law should receive from historians and lawyers "the scholarly and unsensational treatment which it deserves." But in the present book Mr Reith, apparently goaded on by his sense of the importance and originality of his thesis, has inflated his claims and enlarged his subject matter.

"It is a strange fact," he tells us, "that the history of the British police has been almost entirely ignored by historians"; but there is no lack of strange facts and sensational treatment in his attempt to set historians right. His interpretation of history is a curious compound of the tenets of Marx and Carlyle, and his invocation of sinister moneyed interests and master minds enables him to take a short way with the Gordian knots of history. The growth of organised gangster crime, not only in America but also as developed by Fascists, Nazis and Communists, is attributed to the master mind of that overlooked figure, Jonathan Wild, the Professor Moriarty of eighteenth-century London. On the other hand, Wilkes, here endowed with a single genius which enabled him to exploit mob violence as a political weapon, was yet dependent on the City merchants who financed him. It is not, therefore, surprising to learn that Federal and State authorities in America have been "the victims and instruments of the capitalist and moneyed interests in the Union"; but behind these there stood another diabolical figure, Alexander Hamilton, who achieved the remarkable feat of deliberately creating the American moneyed class and establishing "a standard of financial immorality which was accepted as being a moral standard for more than a century." It is difficult to reconcile this with the statement that "the existing facts of the history of the United States all originate in the breakdown of the parish constable system," though this is in harmony with Mr Reith's determination to make the presence or absence of a true police force the sole causal factor in events so complex as the American Revolution, the passage of the Reform Bill and the American Civil War.

It is regrettable that Mr Reith, instead of completing his investigation of the history of the British police in the nineteenth century, should have spoilt his case by such an extreme exaggeration of the causal importance of a single factor and by making rash raids into historical territory ranging from the age of Hammurabi to Soviet Russia. And to attribute contemporary predicaments, as he does, solely to the clash between what he calls the Kin-Police and the Despotic Police systems shows that he is ready to generalise as rashly about the present as about the past.

Peacock *Redivivus*

Headlong Down the Years. By Amabel and Clough Williams-Ellis. *University Press of Liverpool.* 118 pages. 10s. 6d.

"This eloquent, absurd little tale," as Mr Richard Hughes describes it in his preface, is an eminently serious work. Its subject matter has been treated in ponderous tomes, blue books, white papers, learned articles, and repulsive official minutes; by economists, political theorists, philosophers, technical experts, divines and administrators. Writ large, that subject matter is the relation, physical and spiritual, of Man to Nature; writ small, it is the Snowdonia electrification scheme. On any scale, it has importance; but it has not as a rule been seen to offer opportunities for wit and literary virtuosity, nor a framework for polite comedy. Mr and Mrs Williams-Ellis, bringing two remote scions of the Headlong family back from

the Antipodes to the ancestral hall where Thomas Love Peacock installed their ancestors, makes them participants in a lively conversation piece wherein there figure such characters as Mr Galvanic (whose precise connection with the Electricity Authority it would be unfair to disclose), Professor Cosmic the astrophysicist, Lord Pythagoras the mathematician, Mr Margin the economist, Mr Cincinnatus the scientific smallholder, and, of course, the reigning Squire Headlong, who "appeared to owe his inclusion [in "Who's Who"] to his past or present activities as a designer of buildings."

The story begins with the two young Antipodeans—one a Perfectibilian, the other a Deteriorationist—conversing in the down train from Paddington; it ends with a double betrothal and the promise of a fireworks party. On the way it takes in such themes as racial relations in Africa, the impact of great painting, the rewards of political office, primitive culture patterns, and Feng Shui; and such incidents as the encounter of a helicopter with a swarm of bees and of Mr Galvanic with a Bard. It passes from philosophy to slapstick, from poetry to pun, with entrancing dexterity; it is as light as a soufflé and as polished as a cameo. Its underlying motive, however, is a passionate indignation against *Ansyberwyd* or "gross behaviour" in all its forms, and a corresponding conviction of the need for "a respect for nature, a respect for man as part of nature." Squire Headlong suggests to his impatient guest, inclined to brush aside the threat to Snowdonia as a trifle, that he try to "see this Hydro-Electrics business as a sort of geographical section of good manners."

Conceiving that good manners begin at home, and that these enjoin on writers the duty of entertaining rather than boring their public, Mr and Mrs Williams-Ellis have produced a book which can be read at one greedy sitting, with quiet chuckles and sharp yelps of joy, by unregenerate citizens who do not give a fig for Snowdonia. It will be surprising, however, if their readers are still indifferent to Snowdonia when they finally put the book down.

Life Among the Basuto

The Basuto. By Hugh Ashton. *Oxford University Press.* 355 pages. 35s.

The Basuto gained brief notoriety in 1948 because of a series of brutal murders carried out in secret by some of their leading chiefs for the sake of obtaining parts of human bodies to make "medicine." Experienced officials, though powerless to prevent the murders, recognised them as symptoms of the economic deterioration, the political insecurity and the decay of moral standards characteristic of native life throughout Southern Africa. Mr Ashton's book gives the background to this sombre state of affairs. Compared with many recent historical and anthropological books about Africa, it is flat in tone and covers too wide a range of topics. But Mr Ashton has a very thorough knowledge of the Basuto, based on long residence among them and careful study of all the existing historical material. He is accurate, honest and impartial without disguising the affection and admiration he feels for the Basuto.

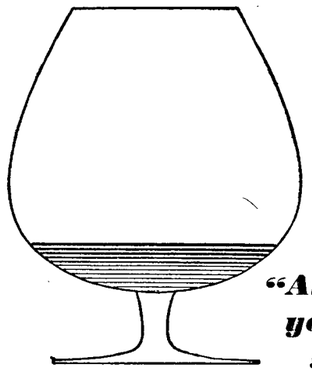
The Basuto now number over half a million. Eighty years ago they were placed under the reluctant protection of the British by Moshesh, the military and political genius who made a nation of them. Mr Ashton's aim is to describe Basuto life as it is today after eighty years of British rule, economic intercourse with the Union and missionary activity. His framework is the fast disappearing traditional way of life. He first describes the general body of native custom as seen in the life history of the individual from birth to old age and death. A thorough discussion of the economy follows. Then comes a carefully balanced account, packed with detail, of the political and judicial organisation; and a final chapter explains the persistent addiction of the majority of the Basuto to those magical beliefs that underlie such outrages as the ritual murders. Overcrowded among their mountains, indifferent farmers and poor pastoralists, the Basuto could not maintain themselves without large scale labour migration to the Union; but this merely increases the instability of a social life no longer protected by traditional sanctions. Belief in Hell fire and rudimentary literacy are no substitutes for the former right of a subject to desert a bad chief. Mr Ashton conveys an overwhelming impression of the major problem of the country, the huge gap between the wealth of the covetous aristocracy of chiefs, whose powers now have the backing of the colonial government, and the poverty and political helplessness of the mass of the people. He makes no judgment and offers no advice; but it is clear that no measures of democratisation can succeed in such a land without the abolition of hereditary chieftainship.

The reader will put this book down with a feeling of despondency. It gives a picture of a likable, intelligent and vigorous race whose economic and political future is at the mercy of forces they cannot control and do not understand and whose moral bearings have been partly destroyed by the education and religion which they themselves regard as the best things they have gained from white civilisation.

Washington Observer

America the Sun is High. By Robert Waithman. *Heinemann.* 264 pages. 16s.

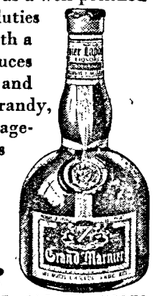
One hopes that this quiet, perceptive, and at bottom affectionate book about the United States may be widely read on both sides of the Atlantic. Because it is quiet, it may not be; because it is perceptive, its effect may outrun its readership; because it is affectionate, it can only make a net addition to amity. Except for three years, Mr Waithman has been looking at Americans since 1937, as the correspondent of the *News Chronicle*, and there is no evidence that he has ever permitted clichés to distort his observations.



The contents of the book are varied: some parts show moods; others are descriptive; some are conventional feature articles; others are more detailed studies of the morals, political procedures, and intellectual habits of American life. These include a rather lengthy section on politics, which is probably the most valuable part of Mr Waithman's book because it takes up several practices Americans are more or less openly ashamed of and shows them to be almost virtues. In his defence of the spoils system in American politics, he argues that, because reward for competitive endeavour is an essential and distinguishing quality of life in the United States, American politics could not, and should not be expected to, exist without it, and might be much worse if what seems superficially to be only the crassest form of incentive were removed.

In his chapters on the conventions, in which the major parties choose their candidates for the Presidency, Mr Waithman offers much readable information and an equal amount of enlightened judgment. His thesis is that the Republicans and the Democrats cannot really be at odds on fundamentals because within themselves they have first of all to reconcile the most divergent interests a complex nation can generate.

> So long as each party holds its umbrella over comparable numbers of similar Americans with similar ideas, there can be no big Party of the Left and no big Party of the Right: there can be only two Middle-of-the-Road Parties.



From that, he proceeds to argue that if there were no need to achieve a united front in the nominating convention of each major party, "the chances are that there would have arisen in America a spate of splinter parties." This argument can be challenged by the academician, but it is supported by certain facts: the loud outcry of frustrated Republicans against the me-tooism of Mr Dewey's campaign, after the unexpected defeat of 1948; the circumstance that for as far back as 1936, at least, the Republican party, being out of power, has always nominated a candidate somewhat to the Left of its real centre of gravity; and the apparent truth that, in 1952, the party would prefer to nominate General Eisenhower, as more middle-of-the-road, although Senator Taft's more expert grasp of the party machinery may frustrate that desire.

Mr Waithman is precise in examining the reasons why the country has for the most part supported Mr Truman, even when the political experts in Washington could show innumerable reasons why the President must be losing popular favour. He conducts a good defence of Mr Acheson. He comes closest to being devastating (but actually is only being fair and helpful) in an essay on the American talent for the Educated Defiance of Facts, a phrase he credits to Sir Norman Angell. There are other examples to show that Mr Waithman has done more than observe; he has also studied what he has seen.

"And with your coffee, sir. . . ?"

To the expert diner the answer is as clear as a well-polished glass. When a good meal ends, the special duties of Grand Marnier begin. In close alliance with a cup of black coffee, this famous liqueur induces an altogether old-fashioned sense of luxury and well-being. Made exclusively with Cognac brandy, matured for years in cellars hewn from the age-old rocks of the Charente, Grand Marnier is a tradition in itself. Uphold it—in your favourite glass.

Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

7.30 for 8.0

THIS IS THE HALF-HOUR when the day ends and the evening begins. It is a time for adjustment—for changing gear, as it were. The hustle and bustle of a business day give place to the more leisured, measured pace of evening. One becomes pleasurably aware of the good fellowship about one, the excellent dinner not far off, the fine wine and the impeccable attention . . . On most evenings at the Connaught Rooms, these are the feelings of as many as 2,500 people. For, at the Connaught Rooms, no fewer than twenty of the most sumptuous banqueting halls are gathered together under one roof. In this, London has an amenity without equal anywhere on earth.

CONNAUGHT ROOMS

The economics of advertising are analysed in 'Advertising Expenditure in 1948' by Rodney Silverman. Containing: comparison of pre-war and post-war expenditure; analysis of post-war trend of expenditure and of the contribution of advertising to business revenue; comparison of expenditure in this and other countries. Foreword by Sir Miles Thomas. To be published on 22nd February for The Advertising Association by Newman Neame Ltd, 21s. net. Distributed by James Barrie Publishers Ltd., 3-4 Clement's Inn, W.C.2

You may think you are right—

but have you proved it?

If your business uses duplicating, you are probably convinced that you know which duplicator will give you the best service — but have you *proved* that your conviction is right? Roneo believe that the only way to arrive at a true answer is to have a comparative test of all duplicators—including, of course, Roneo '500.' We know that a side by side test will prove beyond doubt the great advantages of Roneo '500.'

● Considerable saving in running costs. ● Really automatic inking, giving continuously even work without stopping to re-ink. ● Interleaving, with blotting or other paper to prevent smudging, is unnecessary. ● No proofing. The very first copy is usable. ● 16,000 copies from a lb. of ink ● Quick clean colour change in 25 seconds. ● Better standard of work with greater speed.

Write for booklet "Let's take a back seat", which gives users' reports on Roneo '500' that may help you to economise.

AMERICAN SURVEY

Presidential Question-marks

Washington, D.C.

SENATOR TAFT is the only one of the three favourites for the Presidency who leaves nobody in any doubt about his intentions. Whether President Truman is working towards the Democratic nomination, and whether General Eisenhower can get the Republican nomination without working for it, are questions to which no final answers have yet been returned. The uncertainty on the electoral heights, meanwhile, is encouraging a brisk activity in the foothills. Lesser figures are now moving, openly or furtively, to the higher ground where the lightning might strike if by some chance it should miss the peaks.

On the Democratic side, Senator Kefauver of Tennessee has climbed to a bold eminence from which, having announced himself without equivocation to be a candidate for the Presidential nomination, he has made one or two observations mildly critical of Mr Truman and his Administration. This has caused gritting of teeth within the White House and has led some gratified observers, who had been rather impatiently waiting for fireworks, to conclude that a determination to "Stop Kefauver" explained the sudden decision of the President to allow his name to remain on the ballot in next month's New Hampshire primary contest. Democratic voters in that state will thus be able to show whom they prefer as their candidate. The evidence, however, is that while Mr Truman certainly cannot have overlooked the fact that the brash young Senator from Tennessee was also entered in this primary, the President was mainly concerned not to undermine the influence of the Democratic party organisation in New Hampshire, as he might if he adhered to his original decision to withdraw his name.

"Sorry, Bud — I'm A Reporter Myself"

Herblock in the *Washington Post*

Senator Kefauver's national fame dates only from his appearance on some millions of television screens last year as chairman of the Senate Crime Investigating Committee. One of the mounting number of public opinion polls which Dr Gallup and his competitors have lately taken has shown that 59 per cent of the voters now know who Senator Kefauver is (a very respectable proportion) and that, of this segment, 47 per cent hold a favourable opinion of him. But some of the powerful bosses of big city Democratic machines are among the dissenting 12 per cent. The Kefauver committee's revelations of who was mixed up in what rackets is considered by them to have contributed to the defeat of many machine candidates in the 1950 elections. Mr Kefauver is much too liberal, moreover, for many of his fellow Southern Democrats. With the President now on the ballot in New Hampshire, Mr Kefauver's prospects of making a favourable show there are felt to be cloudy.

Senator McMahon of Connecticut, whose chairmanship of the Atomic Energy Committee has invested him with a modest reputation for statesmanship, has withdrawn from the race for the Democratic nomination with protestations of loyalty to Mr. Truman; but Senator Kerr of Oklahoma, who hesitated at first, has now, it is reported, secured the President's blessing for his entry as a candidate in the Nebraska presidental preference primary.

The record of Governor Stevenson of Illinois, first as a government official and a United Nations delegate, then as a surprising vote-getter, then as a calm, liberal minded and successful governor of a difficult state, is also being talked about with a good deal of warmth since the governor's visit to Blair House for a political discussion with Mr Truman. The belief that the President is considering him for the post of heir apparent is quite widely held. For his part Mr Stevenson is lying low for the time being.

On the Republican side Mr Harold Stassen, who has long wanted, but has repeatedly fallen short of, the Presidential nomination, seems now to have made up his mind that General Eisenhower, to whom he almost but not quite committed himself, is likely to be lost overboard. Mr Stassen's conclusion appears to be that, if the General cannot or will not divest himself of his uniform and return to the United States to campaign like any other candidate, he will not get the nomination. So the hustling Mr Stassen has announced his own intention of entering nine state primaries, and has begun to lay about him with speeches on such diverse subjects as the need for an American return to the gold standard and the sins of the British Labour Party.

Governor Warren of California, whose chances in the event of an Eisenhower-Taft impasse at the Republican National Convention are often rated highly, had appeared to be proceeding at half-speed until this week, when he flew across the country to speak up for himself in New England. General MacArthur, though he had ordered his followers to halt or

withdraw, saying he was not a candidate for public office, seems to have been looking the other way long enough to enable the Republican delegates pledged to him to enter the New Hampshire primary at the eleventh hour. General MacArthur's supporters do not consider it unlikely that events in the Far East between now and July, when the conventions will be held in Chicago, will show that he has been right all the time, so that a new wave of public enthusiasm for him may rise to engulf all lesser men.

That possibility apart, however, the less favoured candidates know their road is barred unless, on the Democratic side, Mr Truman decides not to run and unless, on the Republican side, there is a draw between General Eisenhower and Senator Taft, which forces the convention to turn to a compromise candidate.

★

There does not seem to be much doubt that, for the moment, the Taft forces, by virtue of an early start, a fanatical devotion to their cause and a relentless application to duty on the part of the candidate himself, have established a considerable technical lead over the Eisenhower forces. The Senator's supporters talk in concrete terms of convention votes already sewn up. According to a recent count by the Associated Press, Senator Taft has been promised in twelve states a total of 312 votes—just over half the number that will be needed to secure the nomination—while only 210 votes in six states have been promised to General Eisenhower.

In the Eisenhower camp the reply is that this is going to count for nothing when it dawns on the Republicans that what they need is not a candidate who can collect votes within his own party (which is, in truth, numerically smaller than is the Democratic party) but one who can collect votes from Democrats and independents—one who, in short, can win the election. Both Taft and Eisenhower supporters are now anxiously aware of the importance to them of the outcome of the Republican balloting in New Hampshire. If General Eisenhower overwhelms Senator Taft, the theory that he is the candidate to deliver the victory will be the more firmly established. But if Senator Taft succeeds or loses only narrowly, the "Taft-can't-win" theory will be in serious jeopardy and, failing an active campaign by the General himself, the Eisenhower boom might fade away into an echo.

And Mr Truman? There are many people in Washington who think that up to last autumn he intended not to run again. They think he believed that General Eisenhower could be persuaded to run as the Democratic candidate—in which case he could expect to be elected over Senator Taft. But General Eisenhower declared himself to be a Republican, and the plan (if such it was) collapsed. Whether, after this disappointment, the President will decide to run again is something nobody knows—apparently not even Mr Truman himself. Representative Sabath of Illinois, after a talk with the President, told reporters that Mr Truman felt that conditions might develop in which another Democratic candidate would do just as well, but that he himself would run if it seemed necessary—"would sacrifice his health, shorten his life and run again"—if he believed that to do so would "help to bring about peace and benefit the nation."

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Education—Higher and Wider

[FROM A CORRESPONDENT IN NEW YORK]

In New York, at least, Americans can now wander in the academic grove from pre-school age to the grave. Columbia University has put its School of General Studies, where adults can learn in their off-hours, on the same level as that of other colleges within the Columbia fold, in which over 27,000 students are collected. With Columbia College for young men and Barnard College for young women, it becomes the third of Columbia's undergraduate schools. Studying in the new school is admitted to be a part-time occupation; students whose ages range from twenty to eighty are offered a great variety of subjects, but they need not finish their courses in four years nor aim at a degree, although they will be encouraged to do so. They must, however, take their studies seriously and attend classes at the university regularly; this is not a scheme for correspondence or extension courses. The Dean, Mr Louis Hacker, who was responsible for the change, served a year at Oxford as Harmsworth professor of American history, and is convinced that he has improved on that university's extra-mural programme.

Whether or not the move symbolises a return to the mediæval university at which all students were welcome, it certainly emphasises the importance which Americans attach to the bachelor's degree. This is becoming not so much a passport to the company of educated men as a certificate required for white collar employment. The same forces which insisted on the importance of free public education for all children are now pushing toward academic degrees for all citizens. Whether given in liberal arts, in engineering, in music or in animal husbandry, they are coming to constitute one of the basic American rights.

★

There are 1,858 institutions listed as giving higher education to over 2 million students in the United States. Of these at least 1,300 offer four-year courses and confer bachelor or first professional degrees. Some call themselves colleges, some universities, but the distinction between them is not always clear. Of the 165 which list themselves as universities only a few follow a pattern which in Britain would give them university standing. The rest offer varying conglomerations of instruction. Sometimes they have a liberal arts college at the core, sometimes not, almost always they include trade schools, a professional school or two, a library and scientific laboratories. Their professional and scientific schools are more or less related to the needs and aims of the region which gives the university shelter.

Thus the University of Washington, in the Pacific northwest, includes an important college of forestry; the University of Nevada is justly proud of its mining school; the University of California, through its school of agriculture, contributes to farming skill. That the University of Houston in Texas should carry an airlines stewardess course in its School of Business Administration is no more surprising to a Texan than that it teaches costume design, diesel engine maintenance, woodworking and the harp. Those are the things that people in Houston want to learn.

This diversity springs in part from the Morrill Act of 1862 which granted federal land for colleges, and in part from President Eliot of Harvard University who, about that same time, began to break through the hard crust of classical education on the British model which had hitherto prevailed, and to replace it with an elective system of choosing courses and specialising in the German manner. He could hardly have foreseen that his reform would lead to classes in chicken raising, television and the fundamentals of gemology.

The land grant colleges were created in the process of settling a new country. In 1862 Congress, considering the needs of a population moving westward, provided grants of federal land to the states

> for the endowment, support and maintenance of at least one college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life.

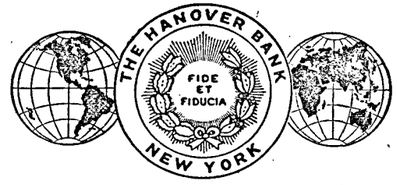
Out of this came 69 land grant colleges, of which each state has at least one. Some of them are free; all of them, supported at least in part by public funds, offer less expensive education than can privately endowed institutions, as do the state universities, with which, in 26 states, the land grant colleges have been merged.

★

The Eliot reforms have in their turn been superseded, first by the Hutchins reform of the University of Chicago in the nineteen-thirties, and second by related reforms in such older universities as Harvard, Yale and Columbia. The changes made by Dr Robert Hutchins, after he became president of the University of Chicago at the age of thirty, included combing out the listed courses and reorganising them into an undergraduate college, four divisions (biological science, the humanities, the physical sciences and the social sciences), six professional schools (Business, Divinity, Law, the Graduate Library School, Medicine and the School of Social Service Administration) and a University College for adults, including those who wish to study at home.

The undergraduate college was made over. Not only were its courses opened to students who had finished only the first two years of high school (most colleges require four years of high school preparation), but they were also grouped into a logical and coherent pattern for the purpose of providing students with a general education. "The welfare of a democratic community depends in no small measure upon the general possession of a common body of knowledge," says the catalogue. Therefore, the college will provide "a general education, that is, the kind of education which is desirable for everyone, whatever occupation or profession he expects to enter." This includes history, science, languages and mathematics, but wastes no time on frills.

The Hutchins reforms have aroused wide discussion. The term "general education" caught at imaginations grown wary of too many specialists who seemed to know nothing outside their own field. How it differed from the old ideal of a liberal education was not clear, but it quickly took on the sanctity of a slogan and a movement. A journal dealing with phases of "general education" is now six or seven years old and there is talk of projects and surveys, of inter-departmental courses to break down walls between divisions, of cross-fertilisation and synthesis.



The land grant college, the Harvard elective system, the revolt against it known as the general education movement, the growth of graduate and professional schools and lately, at the other end of the scale, of junior or community colleges—these are landmarks. To them might be added the efforts at standardisation designed to handle such a lively development. The College Entrance Board, for example, holds entrance examinations simultaneously in various centres throughout the country; these are tests not so much of what the student knows, as of how well he is prepared to go on learning; the results are used by most of the major colleges, although state universities take students from within the state on their high school records. And the Carnegie Foundation and other groups try hard to protect the good name of higher education by setting standards for the granting of degrees.

Not all of this energy and diversity upholds the dignity of the university as such, nor contributes to the contentment of the educated man. Some of it merely panders to the American belief that education is everybody's right by lowering the content to bring it within everybody's reach. Much of American higher education lacks useful direction and worthy purpose but it is not lacking in either strength or flexibility, or in the capacity to criticise and reform itself.

American Notes

Mobilisation Takes More Time

The Secretary of Defence, when he went before Congress to defend the reduced $52 billion military budget for the year beginning next July, found he had to defend it not only against those who thought it still too large, but also against those who feared that the slowing down of the aircraft programme would give the Russians an even longer lead in the air than they already possess. The decision to mobilise at a slower pace, but over four, rather than three, years was taken last autumn, over service objections, when it was realised that the higher military goals the Chiefs of Staff felt were necessary could be met, on the old time-table, only by the most drastic dislocation of the economy. These goals include a 21 rather than an 18 division army, an Air Force

NEW YORK . . . 70 Broadway

of 143 instead of 95 groups, new building for the Navy, and 3.7 million instead of 3.5 million men in uniform. They will be met, but by an 18-month effort running through 1953 and the first half of 1954, rather than a sharp, six-month peak in production in 1953. The aircraft programme, however, will not be complete until 1955, perhaps even 1956.

Giving the arms programme more time means assuming that no major war will break out for two years. But the cuts in the budget may not do a great deal more than make a virtue of necessity. The arms programme is already behind schedule. A cut in the aircraft target from 1,850 a month in September, 1953, to 1,250 will not mean any reduction in the number to come off the production lines for at least a year. Now only 600 a month are being produced. Mr Wilson, the defence mobiliser, would argue, indeed, that there has been no cutback, but simply a facing of the facts of production. Under the new schedules, the expansion of basic industries, such as steel and aluminium, will be nearing completion before the arms factories reach their peak demand for metals, and civilian industries need not be crushed between the two. A more moderate pace, moreover, will lessen inflationary pressures in the year ahead. Even the military, though they are uneasy, can find some compensations. Costly contracts, signed when speed was all that mattered, are being reviewed; the door need not be slammed so hastily on changes in design. There is less risk of building up vast stocks of arms, only to see them become obsolete. The aircraft industry, guaranteed three or four years at least of work, will find it easier to attract the workers it needs.

For the civilian economy, the dividends are already beginning to come in. The Air Force has turned back 20 million pounds of aluminium which it is not now justified in keeping, and a million have been promised to Detroit, where further cuts in automobile production in the second quarter threatened to swell unemployment dangerously. Real relief from the materials pinch is not expected until the autumn, when the new steel and aluminium supplies will begin to come in, but at least the pinch is not likely to grow worse just before the election.

McCarthy's New Lease of Life

Senator Welker, one of Senator McCarthy's admirers, has replaced Senator Margaret Chase Smith, Mr McCarthy's most outspoken Republican critic, on the committee which is investigating his fitness for membership of the Senate. With Mrs Smith went the possibility that the committee might censure Mr McCarthy—there was never any real hope of his expulsion—and that the Republicans of Wisconsin might thus be encouraged to send a less shameful representative to Washington next November. The governor of the state, Mr Kohler, who, it had been hoped, would oppose Mr McCarthy in public as he has in private, has now decided to play for safety and to run again for governor hand-in-hand with Senator McCarthy, instead of trying to wrest the Republican Senatorial nomination from him. No one but Mr Kohler is considered to have a chance of defeating Mr McCarthy.

Even the national leaders of the Republican party are now reaching out for Senator McCarthy's coat-tails. Senator Taft has for the first time declared that his attack on Communists in the State Department was fully justified. And Senator Styles Bridges inaugurated his leadership of the Republicans in the Senate by introducing a resolution declaring that one of Mr McCarthy's standing targets, Dr Philip Jessup, US delegate to the UN Assembly, does not command the confidence of the American people. Not to be outdone, Senator McCarran, a Democrat, has been subjecting Mr John Carter Vincent, another of Mr McCarthy's victims, to a "brutal badgering," to which Mr Vincent laid himself open by insisting on presenting his case publicly, and by making it clear that there was no foundation for the charges of Communism levelled against him.

President Truman is another who has no intention of letting Senator McCarthy enjoy his new lease of life unchallenged. Incensed by accusations against two of his personal aides (one of whom has relatives in Wisconsin who oppose Mr McCarthy publicly), Mr Truman declared at a press conference that the Senator was a pathological case, a liar and a character assassin. He might have added that Mr McCarthy apparently has no objection to profiting from disloyalty, for his recent allegations have been based on secret government files that he could only have obtained through the services of a spy. Mr McCarthy says he has no time to sue the President for calling him "dirty names." He is, however, brave enough to take indirect action against his press critics—*Time* magazine and a Milwaukee newspaper—by urging advertisers to boycott these publications. But in striking at the freedom of the American press, even Senator McCarthy may have bitten off more than he can chew.

Railways' Heavy Load

The multitude of problems besetting the country's 130 railway lines has made Senator Bricker, right-wing Republican from Ohio, suggest that they might have to be nationalised—a tongue-in-cheek proposal designed to stir Congress into aiding the carriers rather than to force them into the fate Senator Bricker regards as worse than death. As a public service the railways have already been subject to public regulation for 75 years. Their labour relations come under the Railway Labour Act; their freight and passenger tariffs and routes are subject to the Interstate Commerce Commission as well as, for interstate traffic, to the public utilities commissions of the states, and the mobilisation programme places their expansion under the control of the Defence Transport Authority. The railways complain that they are bound with far more of the red tape of regulation than are their competitors—lorries, inland ships, airlines and buses.

At the moment the ICC, which can put both floor and ceiling on railway charges, is considering a request by the carriers for the full 15 per cent increase in freight rates that they have been campaigning for since early in 1951. Last August they were given a temporary rise of 9 per cent for the eastern lines and 6 per cent for all others; it was temporary because the ICC was not sure that the additional revenue needed should come from higher freight rates. In presenting their claims the railways have marshalled a variety of arguments and grievances. Rising costs and taxes have meant that, even though gross operating revenue reached more than $10 billion last year, net operating income dropped as well as the rate of return on investment. This turns up another facet of the question, the need to attract capital for expansion. Since 1945 an average of over $1 billion a year has been spent on equipment and facilities; last year the figure was $1.4 billion and, in spite of claims of poverty, even greater expansion is planned for 1952.

Indirectly, railway firemen have also been stoking the blaze under the ICC, with their pressure on the roads for wage increases. Since a strike threat in August, 1950, the railways have technically been under Army control and, of the four chief operating unions, only the trainmen have reached a settlement with the companies. A Presidential board, whose hearings were boycotted by the unions, recommended two weeks ago that the remaining three—the firemen, engineers and conductors—accept a similar settlement, which would provide substantial wage raises, an additional increase when the work week drops from 48 to 40 hours, and modifications in working rules desired by the companies. The unions have, for the moment, spurned the board's proposals, objecting to the rules changes but not to the wage increases.

"There's a whole morning's mail answered!"

Perfectly recorded by the Dictaphone Time-Master on a single Dictabelt

On to one little Dictabelt, you can often dictate the replies to a whole morning's mail! There they are, perfectly, clearly recorded and ready for your secretary to transcribe at the most convenient moment.

For the amazing little Dictabelts—small pliable plastic belts—give *more* recording as well as *better* recording. In fact it was the invention of the Dictabelt that led to the development of the Time-Master—a smaller, simpler, more efficient dictating machine than was ever thought possible!

SIMPLER, CLEARER DICTATION

Dictation with a Time-Master is remarkably simple. Controls are reduced to a minimum and are wherever possible, fully automatic. The tap of a finger is all you need to put a new Dictabelt in or get a completed Dictabelt out; flick a switch and you're all set for 15 minutes of crystal-clear recording.

And Time-Master recording is *clear*—the sensitive microphone picks up every word, even a whisper—making transcription easier for your secretary.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Dictabelts, low-cost plastic medium. 6. Service facilities in principal cities, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co., Ltd., Dept. O, 107 Kingsway, London, W.C.2.

Senator McCarran's Beat

The Attorney General has at last rescued the State Department from the embarrassment of having to refuse a visa to Mr Graham Greene, the British author and prominent Roman Catholic layman, on the ground that he would endanger American security. The Attorney General has the power, which under the Internal Security Act the visa department has not, to overlook Mr Greene's too-candid admission that when he was a student he had, for two months, joined the Communist party. Other eminent applicants, such as Dr Ernest Chain, one of the developers of penicillin, have not been so lucky. Under pressure from the State Department, which knows how much these senseless exclusions blacken America's name abroad, Senator McCarran has agreed to shorten his watch-dog's chain a trifle ; former Communists will be admitted if they have recanted and demonstrated their redemption for five years. There is no thought, however, in an election year, of repealing or substantially modifying the Internal Security Act.

Instead, the Act seems likely to be embedded permanently in the 300-page revision of the immigration and naturalisation laws which the Senate Judiciary Committee has been preparing. That Senator McCarran should preside over the codification of the basic law is unfortunate and a guarantee that the emphasis will be on restriction, rather than freedom. Nevertheless, even his draft has some good points: it ends the offensive policy of Oriental exclusion by assigning token immigration quotas to the Japanese, Burmese, Siamese, and so on, and permits them to become citizens. (The Chinese received their reward during the war.) The Bill fails, however, to open the door to immigration any further ; it does not even allow unused portions of one country's quota to be transferred to another, whose nationals may have to wait from ten to forty years for admission. Nor does it modernise the basis on which national quotas are calculated.

Other members are sponsoring Bills which include these reforms, and hope that the need for labour and the happy experience with the Displaced Persons programme may persuade Congress to liberalise the law. So far, Americans have not regretted their generosity in providing a haven for 336,000 DPs in the past two years—a third of the million or more resettled by the International Refugee Organisation. Senator McCarran, however, has made objections to the appointment of Mr Donald Kingsley, former head of the IRO, to run the provisional organisation which has succeeded it and is to experiment with moving some of Europe's surplus population. He has gone on to submit a resolution that the United States should withdraw its support from the new committee, and set up an independent agency in Washington to supervise this new migration. Presumably he wants to lock the United States back door in South America as tightly as he has locked its front one on Ellis Island.

Fair Trade or Price Fixing?

The forces fighting for what they call fair trade, and their opponents call price fixing, have manœuvred themselves into a favourable position for the start of their war to end price wars. It was made necessary by the Supreme Court decision last May that a manufacturer outside a state cannot make retailers in that state observe minimum resale prices on his products unless he has signed individual agreements with them ; previously it had been thought that the Miller-Tydings Act of 1937, which applied state fair trade laws (45 states have them) to interstate commerce, enabled a manufacturer to hold all retailers to an agreement signed with only one of them. This decision made a mockery of fair trade, in the opinion of its advocates, and they immediately mobilised to force Congress to make resale price maintenance binding on non-signers.

One Bill, an amendment to the Miller-Tydings Act, has been languishing in the House Judiciary Committee, since its chairman, Mr Celler, is strongly opposed to price fixing. But another Bill has now been introduced by Mr McGuire, in the form of an amendment to the Federal Trade Commission Act, which puts it under the wing of the Commerce Committee. Here the chairman, Mr Crossor, fights under the fair trade flag, and he beat Mr Celler to the draw by unexpectedly opening hearings at which the case for fair trade is being put in a very favourable atmosphere, with much emotion and publicity, by spokesmen for retail chemists and other little businessmen.

Nowadays it is the small retailers who cling to the fair trade laws, which protect them from price cutting by department and chain stores, much more than the manufacturers, who originally proposed fair trade as a protection for their brand names. Only about one-sixth of the trade in branded goods is actually under fair trade agreements ; other forms of protection, such as the licensing of dealers, have frequently been found more satisfactory. Many manufacturers must in their hearts have been relieved when last summer's price war, set off by the Supreme Court decision, cleared retailers' shelves of accumulated stocks of fair traded goods, and produced a substantial number of new orders. Full scale hostilities lasted only about a month, but sporadic breaches of resale price agreements have been reported since then, and a new outbreak of fighting is likely this summer if retail trade continues to be disappointing. Meanwhile a continuous underground operation is being conducted by a rapidly growing number of discount houses, which sell branded goods at one-fifth or more below listed prices ; they can afford to do this because they can save on advertising and showroom space, since their customers take advantage of the manufacturers' national advertising and displays in local stores.

Shorter Notes

President Truman some time ago withdrew his nomination of General Mark Clark as US Ambassador to the Vatican but he has not given up hope of diplomatic representation there. However, the Senate, which must confirm such appointments, is most unlikely to approve the creation of such a post in view of the strong Protestant opposition to what is regarded as a violation of the separation of church and state.

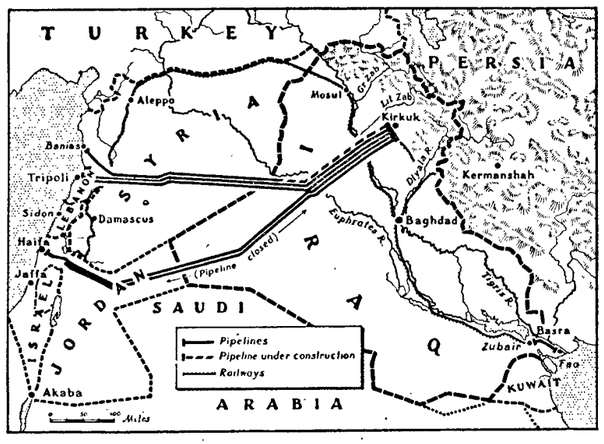
*

At last one of the strongholds of discrimination against Negroes in sports, the Professional Golfers Association, has had to give way before a vigorous attack by Mr Joe Louis, former boxing champion. Largely as a result of his fight over the issue, Mr Louis was allowed to play in the recent PGA tournament at San Diego, California, and the association voted to change its rules to allow one Negro professional and one Negro amateur to play in each PGA event. This is but a partial victory, since participation in tournaments depends on invitations from the local PGA group, and the South therefore will still be able to discriminate against Negroes.

*

Enterprise that is a little too "free" is plaguing two American companies. In one case a television servicing firm in New York was forced into bankruptcy because some of its employees had taken over $400,000 worth of TV parts since 1947 to set themselves up in smaller television repair shops. And from Wisconsin, the Parker Pen Company has asked the State Department to act against widespread counterfeiting of its pens, including even the brand name, in Italy and Japan. The head of the firm said that it should be made clear that "Americans mean something quite different than imitation when they speak of free enterprise."

THE WORLD OVERSEAS



Iraq—Land of Promise—I

THIS week the Iraqi Chamber of Deputies ratified by 89 votes to 7 the oil agreement which the Cabinet negotiated late last summer with the Iraq Petroleum Company—the international body which, with associates at Mosul and Basra, operates the extraction and export of all Iraq's great oil resources. The agreement, which is the fashionable fifty-fifty profit sharing arrangement now enjoyed by all other Middle Eastern producers except Persia, was formally signed last week by the Iraqi Minister of Economics, and has since been unanimously approved by the parliamentary economic committee. Some opposition parties have condemned its "injustice"; party politics demand that they should do so. But ever since the bulk of them resigned their seats in dudgeon over a year ago, they have not been strongly represented in a parliament which consists largely of independents. Many of these last sit, almost hereditarily, for the districts with which their families are linked, and, by custom, they tend to support whatever government is in power. Opposition to ratification is, therefore, to be found outside rather than inside parliament.

The relative sobriety of this scene has surprised those who have watched nationalist passion defeat economic self-interest in Persia. Undoubtedly, Iraq is capable of sudden, passionate outbursts of nationalist temper. It demonstrated this fact in January, 1948, when, for a mixture of reasons, the Opposition called the crowd into the street to defeat the Portsmouth Treaty which the then Prime Minister had signed with Great Britain. Yet Iraq has not so far followed Persia's example over oil.

The Iraqi character is deeply different from the Persian, with a difference as great as that which distinguishes the English character from the French. Iraqis are the more realistic of the two peoples; they have perceived (as Persians have, even now, not done) that Persia's oil policy is a grave economic failure. They are also less conceited than the Persians and, therefore, less sure that they can at their present stage of development run complicated industrial and marketing operations entirely singlehanded. For instance, they employ on short-term contracts foreign directors for their irrigation and their railways. They realise that technical training takes time, and do not all feel that interim employment of foreigners is beneath their dignity. They have also, thanks to their management of their national finances—immensely superior to Persia's—reason to know that their oil wealth will not disappear into the maw of daily expenditure, or into private pockets. Again, the average Iraqi knows, from personal experience, and therefore much more surely than does his Persian counterpart, that costly effort made on a national scale is almost essential to improvement of his lot as a farmer. Persian provinces are isolated and unrelated. Iraqi districts, strung together by their great rivers, all share, collectively and perennially, in the national disaster caused by flood, and know from personal experience that only vast sums of money can control this scourge. A conception of the nation-wide benefits to be derived from oil revenue is, therefore, relatively easier to grasp, even for the uneducated, than it is for a Persian.

Lastly, nationalist yearnings to operate a national oil industry will in part be met. The domestic refining and marketing of oil will henceforth be in Iraqi hands. The Iraqi government lately reached, with the subsidiaries of the Anglo-Iranian Oil Company that used to run refining and marketing in Iraq, an agreement whereby both these operations are now to be taken over. It will build a new refinery outside Baghdad (for which a £9 million contract has been awarded to the American firm of Kelloggs). A second refinery will be built near Basra. For the Baghdad plant, the government will purchase oil from Kirkuk which will be piped to it by IPC at a cost of only 5s. 6d. per ton—the price of the transport. Both these state concerns, together with domestic marketing are, until 1961, to be run by a British firm acting as the government's managing agent.

Some idea of the wealth that the agreement, if ratified, will bring into Iraq's national coffers can be gleaned from the following figures. In 1951 Iraq produced 8 million tons of oil, virtually all from Kirkuk, and earned an income of about £15 million therefrom. By the end of 1952, Kirkuk will be pumping at part capacity through its new 30-inch pipe, and this yield, together with 2 million tons from Zubair (Basra) field which was opened in January, should bring Iraq's total output for the current year to 16 million tons. The anticipated output for 1953 is 24 million tons and, for 1955, 30 million tons. The resultant revenue is expected to be £200 million for the five years 1951-5 and, it is estimated, will touch £300 million for the years 1953-7. A clause in the agreement now before Parliament adds that in the event of another state securing a higher rate per ton, Iraq can ask for most-favoured-nation treatment. In fact, subject only to the hazards of war and revolt which today face any country in the world, Iraq is amply justified in making ambitious plans for the future.

A second article will describe some of the natural advantages which it enjoys, the plans made by its own Development Board, those suggested in a report issued this week by the World Bank at its request, and the arrangements which it is making for spending money that is at its disposal, if it so wishes.

(To be continued)

Germans Name Their Price

[FROM OUR SPECIAL CORRESPONDENT IN BONN]

FOR two days last week the wireless stations of Western Germany broadcast uninterruptedly the first great debate on foreign affairs ever held in the Bundestag. Hitherto, Dr Adenauer had conducted vital negotiations on the various agreements determining Germany's future—the treaties replacing the occupation statute, the Schuman Plan, and the European Defence Community—without parliament having a chance to express its views. Even last week it was without many of the relevant facts. The public had become more and more suspicious that the Chancellor was preparing to sign away German rights and manpower, and had demanded information with increasing annoyance. It was the last straw when Herr Blank, the Bonn commissioner for defence, announced a few weeks ago that the parliament would be required to ratify or reject the coming defence treaty *in toto*, and that it would involve conscription.

At this point Dr Adenauer was forced to agree to a debate on the whole complex of treaties in preparation. Then came the eposide of the Saar. France's sudden and, it seemed, deliberately provocative action in appointing an Ambassador in Saarbrücken was unforeseen, and ensured that the Bundestag met in a mood of angry resentment and overwhelming resolve to make an end to Germany's inferior status. The Chancellor had hoped for a gesture that would have encouraged the Germans to accept further burdens and continued restraints in the interests of European defence; instead he received a blow from which he and the idea of the defence community are both unlikely to recover. Throughout last Thursday's debate the Chancellor was not only on the defensive, but so conscious of the weakness of his own case that he failed to impress the audience. Last year he had excused France to the Bundestag by explaining that the Saar and negotiations for European unity were separate issues, and that German wishes would be met. He could not do the same again. This time he joined the Opposition and condemned France's action as a breach of the assurance that M. Schuman had given him when he signed the draft Schuman plan.

Dr. Adenauer's Weak Defence

The outstanding fact about the debate was, indeed, not only the strength of the opposition but the weakness of the coalition government's defence. The outcome was, in essentials, defeat through surrender. The coalition proved that it agreed on many essential points with the Opposition. During the debate on the Schuman Plan it had been clear that Dr Adenauer's main partners, the Free Democrats, held very much the same views as the Social Democrats. In this debate the whole-hearted supporters of the Chancellor were even more plainly isolated. One deputy from Berlin flatly declared that Germany is faced with a simple choice between Russia and America, and that there could be no middle way; the air-lift had saved Berlin because the people of the city had shown their readiness to fight, and Berlin was the model for Western Germany. This was, however, a very solitary voice in two days of argument during which German terms for helping the west were stated with little or no consideration of the alternative to be faced if the west should find it impossible to accept them.

In the end, it is true, the Bundestag voted by a majority of 48 in favour of a European federation and German participation in its defence. The Social-Democrat leader, Herr Ollenhauer, had declared that the deputies were not there to debate "how" but "whether" a defence contribution should be made; this much has now been decided, "in principle" (sacred words, which accompany most declarations of faith in western defence). But the resolutions which followed laid down the terms on which the principle should become practice. They were drawn up, it should be remembered, by the coalition parties alone, during the course of the debate, and reflected a slide towards the Opposition's standpoint.

The opening resolution, which stated Germany's readiness in principle to take part in western defence as an equal partner, rejected the idea of neutrality and affirmed the aim of re-uniting Germany in peace. The Christian Democrat leader in the Bundestag, Dr von Brentano, specifically asserted that by reunion the government meant the re-establishment of Germany's 1937 frontiers. The four resolutions which laid down the terms on which the German government must stand in negotiations with the Allies demanded in essence: the release of all "war criminals," except those found personally guilty of crimes in the customary sense; political freedom in the Saar; and recognition that Germany is already contributing almost its maximum to defence, and that social welfare is the best form of defence. A final comprehensive resolution dealt with the contracts which are to end the occupation regime. It laid down that the troops stationed in Germany must have no special rights; the sovereignty of the Federal Republic must be complete, except in matters such as Berlin where it is in the German interest to restrict it for the time being. There must be no "petrification" of the occupation regime in the new treaties, and Germany must be free to decide what allied measures it wants to retain; nothing must be done to prejudice a future peace treaty; all discriminatory organs, such as the Military Security Board, must disappear, and all controls on industry must be lifted. Germany must make only one financial defence contribution, covering relief to refugees as well as the cost of allied troops in Germany; the German labour and guard units in Allied service must be dissolved; disputes must be referred to neutral arbitration; and Berlin must be more closely linked with the Federal Republic.

A Frank Challenge

Each phrase of these resolutions is heavily weighted with consequences. In essence they frankly challenge the occupying powers to give up any further attempt to restrict German sovereignty. For example, the government could, if it chose, re-establish the Ruhr trusts and cartels. In all probability, the industry itself would not wish to set up precisely the old structure; but enough would be done to strengthen Germany's position inside the coal-steel union of the Schuman Plan. The French, on the other hand, will hardly agree to setting the machinery of the Schuman union in motion if the Ruhr trusts are not first broken up.

A completely new situation must be faced by Dr Adenauer and the Allies with whom he has been working out the new

JAPANESE COMPETITION

The Economist Intelligence Unit now provides a service of quarterly reports on economic and business conditions in Japan and in about thirty other countries. These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from:

THE ECONOMIST INTELLIGENCE UNIT

22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1

status of Germany and the European Defence Community. Presumably, negotiations will now be continued; but it will be in the knowledge that the German parliament will reject any treaty that departs from the terms laid down last week.

Last Friday's debate left the opposition in a very strong position for an appeal to the electorate next year, even if Dr Adenauer goes on rejecting the widespread demand for general elections now. The Social Democrats added more provisos to the list made by the government, and in the end voted against even the qualified resolution in favour of taking part in defence on a footing of equality. Four main points were made by them. They demanded that the United States shall defend Germany with the same effective strength as "any other point on its own frontier." The German army must not be set up in order that the Americans can "call the boys back." Full sovereignty and social welfare must precede a contribution to defence. And nothing must be done to prevent a four power agreement on German unity.

How Spaniards Live

[FROM A CORRESPONDENT]

THE special tourist exchange rate enjoyed by British visitors to Spain (of whom there will no doubt be fewer this year) is apt to give much too favourable an impression of the cost of living in that country. Nor is it always easy for the casual visitor to appreciate the very wide gap that exists between wages and prices. Take, for example, a young couple in Madrid, where conditions compare favourably with most other parts of the country, particularly the south. The husband works in a clerical job on the railways from 7 a.m. to 3 p.m. daily, earning 1,000 pesetas a month. This sum includes a bonus distributed on a points system—five for a wife and one for each child—and is about double the earnings of a manual worker. Even so, with such staple items of Spanish diet as bread (black market) and beans at between 10 and 12 ptas. a kilo, lentils at 8.50, vegetables between 8 and 10, and chickpeas between 7 and 9 ptas. a kilo, his salary is barely sufficient to feed his wife and young child, let alone to clothe them and pay the rent. He has therefore to supplement his income by doing another job in his spare time, and rarely gets to bed before midnight. His wife also earns money by sewing.

The young couple live with their in-laws in a working-class district. Their tiny bedroom has no windows and little space for more than the bed, while the child sleeps in an equally windowless alcove. This is the only place that this young married couple have to themselves. To get a flat in a working-class district, they would have to pay between 8,000 and 15,000 ptas. key money and then about 500 ptas. a month rent for a new flat or 150 ptas. for an old one (three rooms and a kitchen, two of the rooms without windows). It is hardly surprising that husband, wife and child have all been unwell. Their experience of the medical attention provided by the theoretically excellent State social services was thoroughly unsatisfactory. But it must be remembered that this family is fortunate by comparison with many, particularly with those agricultural workers who are also casual labourers, and who constitute about a quarter of the total population of the country.

Spanish attention has recently been focused on working-class conditions by an article in *Ecclesia*, the organ of Acción Catolica. This article is the record of a talk given by the Archbishop of Valencia on the findings of a sort of "Gallup poll" taken among workers. It is the first of its kind to have been made public in Franco Spain, and it is doubtful whether such outspoken comment would have been allowed except in a religious journal with a limited circulation. The following are some of the findings of the inquiry.

The worker believes his legal wages to be at starvation level, and unjust; without making allowances for either the civil war or the world war, he attributes his plight to the anxiety of his employers to enrich themselves and to the extravagance of the wealthy. He does not appreciate the social services, although he makes use of them; he believes that if the amount now deducted for contributions to the social services were added to his present earnings, they might add up to a living wage. At the bottom of his heart he believes that he is entitled to a rent-free dwelling. The worker hates to be bossed by his employer even more than he hates injustice. He is not interested in politics; he would prefer to have a government in which he had some say, but does not want to be worried by responsibilities. He has no faith in his trade union, which he regards as mixed up in politics and on the side of the bosses. He hates his employers and the rich; he also hates the Army and the Church, which he regards as their supporters, but while he fears the Army he is not afraid of the Church.

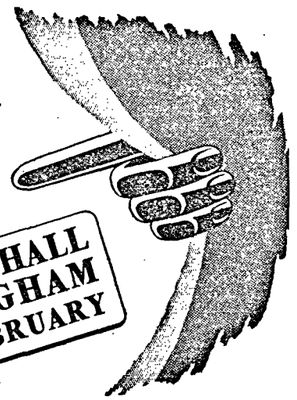
Six in a Room

The Archbishop goes on to tell of what is being done to house the poor, but illustrates the need for further effort by a case known to him. A doctor had been called to visit an old woman, and in a room nine square metres in area he found six people sleeping on maize leaves, the old woman in the farthest corner. The Archbishop points out that this is only one case among hundreds. He then comes to the support of the worker by giving it as his opinion that the legal wage is indeed unjust and cannot meet the worker's bare requirements of food, clothing, housing and education for his children. An employer paying only the legal wage might not be brought to justice by his fellow men, but would nevertheless be subject to God's justice unless there were some adequate reason for his action.

The Archbishop then suggests ways in which the employer could enable the worker to earn a living wage: by allowing him to work longer hours, if this was no detriment to health (there being nothing sacred about the statutory eight hour day); by bonuses for higher production; by special payments; and by measures for his welfare such as the subsidised sale of food at low prices. It might be said that if the worker spent less on tobacco, alcohol, cinemas, amusements and women, he would be better fed, clothed, and housed, and his children better educated. This might be true, but the amount saved would be negligible, since there was concrete evidence that the worker paid very little for his pleasures. He believed himself to be a slave, and sought such pleasures as a relief from his chains.

This extremely frank analysis by the Archbishop of Valencia is yet another example of one of the most interesting features of Spain today: the growing and justifiable concern of the Church with the economic and social conditions of the working class.

The Malays Look at Malaya



[FROM A CORRESPONDENT]

THE great volume of public discussion in British circles which has followed Mr Lyttelton's tour in Malaya and the appointment of the new High Commissioner has not passed without contributions from leading Malays. The following represents a fair account of some of them.

The British, they remark for a start, did not conquer Malaya but made treaties with Malay rulers and became no more than the protecting power. Under British protection, however, the country at first prospered amazingly. Good luck in tin and rubber accumulated a wealth that gave Malaya the highest standard of living in Asia, and surpluses were so wisely invested in roads and railways, schools, hospitals and other fixed capital that the plural community was happy and richly productive.

Nevertheless, the protecting power could not protect the

country against the Japanese, since the important centre was Europe. Moreover, during the war the Colonial Office planned the ill-starred Malayan Union which in effect made Malaya a Crown Colony. The scheme could have been adopted, but the Colonial Office presented it so badly that opposition was stirred up and the cumbrous Federation is the result. The warm welcome to the delivering troops was dissipated by the British Military Authority, of which the morals were so bad that it was called the Black Market Association.

After the war, the Colonial Office sent one of its members as High Commissioner, Sir Edward Gent. He brought in a vast apparatus of new departments—social welfare, economic advisers, import and export, war damage, currency controllers and others—to such an extent that under-secretaries were multiplied by ten. The clerical staff had suffered severely in the occupation, and newcomers to the service had only had Japanese education; since there was no post-entry service training, the administration was almost crushed under the burden.

Since then, things have gone from bad to worse. The emergency started in June, 1948. This brought a flood of experts from home, who were recently described by a cynical Indian in the Federal Council as "all men of proved ability and wide administrative experience." The first GOC promised to end the war by Christmas. General Briggs had a plan which cost millions, but has not ended the war. Colonel Gray, the Commissioner of Police, was full of the offensive spirit and for long denied his men armour for their cars or barbed wire for their stations. Sir William Jenkin, the Criminal Intelligence Chief, came; he resigned and has left. The two ablest Malayan police officers, Dalley and O'Connell, resigned, as their advice was never taken and they were never allowed a free hand. Other policemen who did well before the war were deliberately side-tracked and the promotion they felt to be their due was given to Palestinians.

In addition, economic advisers have been thrust on Malaya. The head of the Agricultural Department is from Africa. The head of the Medical Department—and Malaya is immensely proud of its medical services—is to come from Africa. Law officers from elsewhere come in, and one, a Judge of the Supreme Court, becomes Officer Administering the Government—no doubt making Dicey spin in his grave.

Even Sir Henry Gurney came from Palestine and brought in more Palestinians who know none of the languages or customs or prejudices of the country and give much offence. The prewar administration and its survivors are given to understand that they are fossils, out of date, and unwelcome. It is scarcely surprising that they are mentally as well as operationally depressed—and that morale throughout Malaya is as low as it is.

"Parliament of Asia"

[FROM OUR SPECIAL CORRESPONDENT]

MUCH useful work has been done by the Economic Commission for Asia and the Far East (ECAFE), which was set up by the United Nations in 1947, and which has just held its eighth meeting in Rangoon. When the Commission began its work, the vast triangular region which it has to cover, stretching from Afghanistan to Korea and New Zealand, was not only an inchoate grouping of countries unaccustomed to mutual co-operation, but an area in which reliable statistics and data were few and far between. Some of its publications and documents are now beginning to stand comparison with those of the Economic Commission for Europe. Moreover the Commission, with its specialist committees and working parties, has provided a meeting-place for practical co-operation among countries that share a very definite common denominator, the desire for economic development. The delegate of Pakistan was undoubtedly sincere when he said at the closing session on February 8th that the commission had become "the parliament of Asia."

Like other United Nations bodies concerned with a multiplicity of economic and social tasks, ECAFE has not been slow to learn how easily it could be swamped in a mass of impracticable projects. It has therefore adopted a commonsense method of giving priority to the more valuable proposals, eliminating those which can be better handled by other organisations, and judging the others by their urgency, feasibility, degree of preparation, and prospect of concrete results. The benefits of this system were shown at the Rangoon meeting, which for the most part eschewed cloud-castle debates in favour of such practical decisions as the sending of a group of experts to study the Japanese iron and steel industry, and the convening of a regional conference on mineral resources. Much of the ten-day session was devoted to the review of reports from technical committees, whose recent work in fields ranging from flood control to trade between Asia and Europe was in general found highly satisfactory. One study which may prove of particular importance in the long run is that concerned with the mobilising of domestic capital in Asian countries.

Soviet Advertising

Against this background of friendly teamwork, the actions of the Soviet delegates stood out in sharp relief; indeed, by their behaviour at Rangoon, the Russians may well have lost significant ground on the wider political front of their campaign to turn the independent states of Asia against the free world. Both in the plenary sessions and in the committee meetings which preceded them, the Russians were alone in tabling blatantly propagandist motions and refusing to seek common ground. They secured little support. India, Burma and Indonesia inclined towards the Soviet view on the question of Chinese representation, but when the Soviet delegate in the committee on industry and trade denounced the sins of foreign capital, almost every Asian representative rose to confute him. The Indian delegate declared frankly that India had found that it could not do without foreign capital, and that the latter was in no way responsible for Asian poverty. An equally cool reception was given to attempts to use the meeting to advertise Soviet trading offers; and a Soviet demand that these offers should be recorded in the text of the commission's report was rejected by thirteen votes to one, with no abstentions.

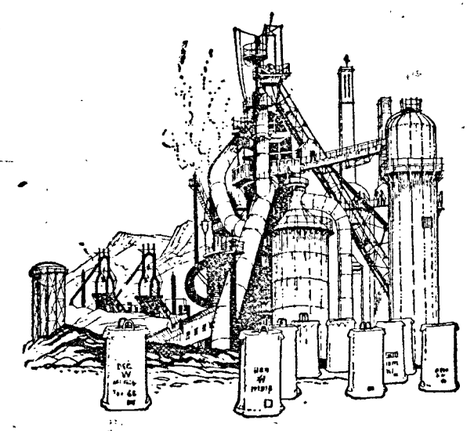
Japan, not yet a member of the Commission, was represented in Rangoon by observers. There was some debate as to the propriety of admitting the Japanese to membership before the peace treaty had been ratified by an adequate number of nations; but agreement was eventually reached on a Pakistani proposal requesting the Economic and Social Council to extend ECAFE's geographical scope to include Japan, with the proviso that if the Council so decides, Japan will be admitted to associate membership. It is therefore probable that, by the time the commission reassembles for its next meeting, which will be held in Java, Japanese delegates will be able to take their seats, although, like the eight other associate members, they will have no right to vote.

* * *

Correction

In the article on page 346 of the last issue of *The Economist* it was stated that "in 1951 the total labour force (in the Soviet Union) rose by an additional 1,600,000 to 40.8 million—i.e., over a million more than in 1940." This should read "over nine million more than in 1940."

Has nobody told you, Mr. Grigson?



Most drivers take the underneath of a car for granted, but industry cannot leave protection from rust to chance. Among the most effective methods of rust removal and rust prevention are those calling for phosphoric acid. Albright and Wilson's phosphate products in many different ways, often anonymously, are giving manufacturers what they want—to provide the better goods which the public needs.

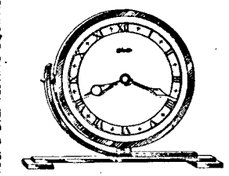
IRON

THE element iron is the most important of all metals and, next to aluminium, the most widely distributed. It has been estimated that there is an average of one cwt. of iron for every ton of the earth's crust. There are many different forms of iron ore, but only four — hæmatite, magnetite, limonite and siderite — are of industrial value. Most of the iron ore mined in England comes from the siderite deposits at Corby in Northamptonshire and the Scunthorpe district of Lincolnshire. Iron ore smelted in a blast furnace with coke and limestone becomes pig iron, the raw material from which cast iron, wrought iron and steel are made. Steel, the strongest metal in common use, is iron containing about 1% of carbon. Though iron is a newcomer compared with copper and bronze, more than 3,000 years ago it was used to make implements and weapons. Today it is an essential in the structure of civilization. Without it, there would be no railways, steamships, skyscrapers or machinery. Apart from its use in the construction of chemical plant, iron and some of its compounds are vital in certain chemical processes.



I.C.I. uses iron as a catalyst in the production of synthetic ammonia, and iron pyrites — a sulphide of iron — in sulphuric acid manufacture. It also uses some of the oxides of iron to make pigments for the paint and rubber industries.

Czechoslovakia's New Model Army

[FROM OUR VIENNA CORRESPONDENT]

RECENT news from Czechoslovakia suggests that the efforts of Dr Cepička, the Minister of Defence, to build a New Model army with which to crush imperialism have not so far been crowned with the triumphant success that attended his better known predecessor in this field, Oliver Cromwell. Dr Cepička, it will be recalled, took over the task of russianising the Czechoslovak army in April, 1950, from General Svoboda who had been in command of the Czechoslovak forces on the Russian front during the war and who, perhaps for that reason, had not pushed on with the re-modelling of the Czechoslovak army as fast as the Kremlin wished.

Fresh from his successes in sovietising the Czechoslovak penal code and in bringing the Roman Catholic Church in Czechoslovakia under close Communist control, Dr Cepička brandished his unaccustomed military broom with considerable energy. He gave the army a new uniform, introduced political commissars into every unit and instructed all ranks to report upon any neglect of duty by their superiors with the not unnatural result that he soon had to admonish the commissars to help the military officers maintain discipline. Accompanying these measures was a drastic purge of officers and NCOs, whether serving or on the reserve, as the first step towards turning the whole army into a reliable instrument for the building of socialism. Dr Cepička also tried to popularise the period of army training by raising the pay of conscripts, improving their amenities and urging local communities to "adopt" units. The effect of the adoption, however, was to provide extra "brigades" to do farm and factory work when the young soldiers were not actually engaged in military duties.

The first to feel the full impact of Dr Cepička's broom were the recruits called up for their two years' term in September, 1950. Since that date, not only the organisation but the whole system of field and barrack square training has been on Russian lines in spite of the fact that the comparative disregard of the Russians for human life means that, if there were a war, the Czechoslovak army would in all probability suffer casualties which would cripple the country for generations. In order to integrate the older classes into the New Model army, a number of people, especially the wartime partisan groups, have been called up from time to time to take part in manœuvres with the conscripts. There is reason to believe that this necessary step has sometimes had unfortunate results. Most of the so-called partisans, in particular, have no military training or discipline worth speaking of, having carefully abstained from any form of military activity during the war. On one occasion, during manœuvres at Kynsvart, near Marianské Lázne, they gaily started firing one night simply to amuse themselves. They were using blank but some conscripts nearby, thinking that war had started, replied with ball and several of the partisans were killed.

Meanwhile, the industrial manpower situation in Czechoslovakia has made it impossible for Dr Cepička's New Model to be much more than dressed by the Left. Industry has claimed every recruit it can, including the conscripts, with the result that many of those called up for training have not even received their uniforms. In particular, all the known unreliables are immediately sent into the mines. Of the forty-odd lads called up for "military" service last October from one small community between Brno and Zlin, seventeen were in the Ostrava-Karvinna coal mines before they had been with the colours a month.

According to the reports reaching Vienna, there is an officer of the Soviet army attached, allegedly for instructional purposes, to each unit of the Czechoslovak army. Liaison is also maintained through the Soviet Embassy in Prague, the military department of which has been, and still is, in the hands of a colonel-general. But there is a growing impression in Czechoslovakia that this system is about to be changed and that the Czechoslovak army, like the Polish, is to have a Soviet commander-in-chief who would acquire, or resume, local nationality in order to preserve the outward appearance of independence. Marshal Koniev, whose forces are officially supposed to have "saved" Prague at the end of the war, is a natural candidate for such a post if it is created.

Meanwhile there is still no evidence to support the theory that the Soviet Government has large forces in Czechoslovakia. It does appear, however, that the Czechoslovak Government has handed over the barracks at Matliary in the Tatra Mountains to the Soviet army, though whether for recreational or training purposes is not certain. This camp is near the Polish frontier, and the Soviet Government is entitled to keep troops in Poland until the peace treaty with Germany comes into force.

So far as the Czechoslovak army is concerned, there is reason to believe that many of the formations supposed to be doing garrison duty in the towns are actually in camps some distance away. This is certainly true, for example, of the Zvolen garrison in Slovakia. Zvolen is some twenty miles south of Banska Bystrica where anti-Government partisans are said to be active. The other chief centres for training seem to be Prostejov, Olomouc, Pilsen, Brno and Kosice. There are also garrisons based on such places as Leopoldov, Piestany, where there is considerable air activity, Pardubice, Domazlice, and Presov, and of course Prague. Very few recruits are trained near their homes and every training unit appears to include people from all parts of the country. Very few Slovaks, in particular, are allowed to stay in Slovakia during their period of training.

How Red is the Army?

Reports about the extent to which Cepička's New Model army is being permeated with the communistic spirit poured down its throats vary widely. It is worth mentioning, however, that when there were demonstrations by factory workers in Brno on May 1st against the reductions in wages, the army and the police both excused themselves from dispersing the demonstrators on the grounds that they had been taught by their political instructors that only capitalists used the army against the workers. The authorities took the hint and called in the factory guards to whom no such restrictions applied. When further demonstrations took place—in connection with the abolition of the customary Christmas bonus—the factory guards were at once brought into action and the army and police were not asked to act.

It may be assumed that an army composed mainly of young men of the worker and peasant classes would share the bitter discontent of those classes regardless of the propaganda poured into it. One of the Czech refugees to whom your correspondent spoke recently insisted that if any well-known general paraded the troops under his command and ordered them to follow him to Prague they would do so with enthusiasm and would be joined there by the rank and file of all the other garrisons, though not necessarily by all the officers and NCOs. Only the emergence of a suitable contemporary General Monk can prove or disprove this assertion. Meanwhile, it is perhaps significant that the Government still keeps its most up-to-date weapons in the hands of the STB, or political police, who even possess tanks and light artillery. The army's own equipment is also being gradually renewed, but the information available suggests that it will be a long while before the miscellaneous collection of weapons and transport (much of it German) which the Czechoslovak army acquired at the end of the war has been entirely replaced.

THE BUSINESS WORLD

Steel and Enterprise—II

Steel Prices and Competition

EVEN after the prospective increase—still further delayed this week—of £4-£5 a ton, the home price of British steel will remain among the cheapest in the world. This favourable comparison has been a legitimate source of pride to the industry ever since the war and has offered a stock answer to any questioning of its price policy. As such, it has effectively rebutted the cruder criticisms levelled against steel profits; but it may be beside the point in calmer enquiries. Steel, as has often been suggested in these columns, can be too cheap. The present excess of indiscriminate demand that has made necessary a cumbersome allocation system and the import of much foreign steel at up to twice the British home price would indeed suggest that it is too cheap now. So, for that matter, may the estimates of retained company earnings for the iron and steel group quoted in *The Economist* last week from the recent report of the Commissioners of Inland Revenue; these estimates suggested that in 1948, at an early stage of its vast re-equipment scheme, the iron and steel industry was ploughing back a smaller proportion of its turnover than in 1937. Although the profits of most steel companies have risen since 1948, in real terms the heavy section of the steel industry may still, at current prices, be "giving its capital away." If so, it would mean distortion not only for the steel industry but also for other industries using steel in preference to other materials. It is not enough, therefore, to repeat that steel is cheap. What matters is how its price is related to costs. That question always closely involves the public interest, but doubly so when the return of the core of the industry from public to private ownership is to be undertaken. It is equally important to the private investor who may be invited to take an interest, not in the steel industry as a whole, but in the fortunes of particular steel companies.

Steel prices, it should be said at the outset, are still under Government control. Moreover, the form that official price control now takes has altered considerably from the wartime "prices fund" system that was designed to encourage maximum output and took special care of high-cost companies unable to make standard prewar profits at the controlled prices. A succession of public bodies have been charged with the supervision of steel prices since control began informally in the mid-thirties—the Import Duties Advisory Committee, the Iron and Steel Control, the Iron and Steel Board, and the Ministry of Supply's Iron and Steel Division. The experience gained has been cumulative, and the methods now used display some sophistication in avoiding the technical weaknesses to which some official price controls are prone. Periodic statistics of the production costs of steel are supplied by the British Iron and Steel Federation to the Ministry, and prices are fixed on the basis of the average costs for each product at all the works making it, excluding interest and depreciation charges (and in some cases from the calculation excluding works with abnormal costs). To this average is added a standard margin for fixed charges and for profit — having regard also to hypothetical costings, calculated independently for the Ministry, of a new works making such products. This standard margin was kept unchanged at its prewar level until early in 1949, when the Ministry reviewed it and allowed some increases in favour of the producers of heavy steel products, partly at the expense of the finishing trades. The average costs of making each product obviously conceal a fairly wide spread between the high and low cost producers, and standard prices calculated from the average therefore afford widely differing returns to different producers. The British Iron and Steel Federation on several occasions since the war has demonstrated that a significant fraction of the output of major steel products was being turned out at a loss, and that the margins earned varied widely. That is no doubt true today. It does not necessarily imply that any producer is incurring a loss over all the products he sells.

*

This method of price control, therefore, broadly justifies the industry's assertion that under it

> the least efficient producers pay the normal penalty and have every incentive for striving to reduce their costs and so convert their losses into profits.

But this controlled competition is controlled in more ways than one. The federation is not allowed to fix prices to cover the highest costs of its least efficient members, nor does it directly subsidise them (except one or two small "uneconomic" works of which the products are still particularly useful). But it does at present very considerably moderate the severity of short-term competition between its members by a system of equalisation levies and subsidies that has the broad result of bringing towards balance the costs of the different raw materials used by different types of steel works. The federation's commercial subsidiary, the British Iron and Steel Corporation, Limited, administers an "Industry Fund" largely financed by levies on the tonnage of ingots and castings and semi-finished products produced by each steel works. The fund is used primarily to cover the losses incurred in importing steel-making materials—iron ore, scrap, and semis—at world prices and selling them at the lower home prices; by this means the steelworks that primarily depend on imported materials for making pig iron and steel are brought on more level terms with those making pig iron from the leaner but at present far cheaper home iron ores. Steel companies with works situated on home orefields have, therefore, to make payments to assist their competitors using imported ores.

The fund also covers a number of other minor purposes, such as the expenses of the federation and its subsidiary central organisations for the industry, assistance to the small works already mentioned, and certain payments to moderate the cost of transporting semi-finished steel abnormally long distances within Britain, particularly during periods of dislocation such as the present. But its other major purpose, also in the direction of equalising material costs, is to charge a levy upon the tonnage of scrap used by works making steel from it, and to pay a rebate to steelworks that make steel from pig iron. This process is intended to compensate in part for the fact that scrap bought in Britain—apart from the "circulating scrap" that arises within the steelworks themselves—has since 1937 been supplied to the industry by scrap merchants at a much lower price than the cost of pig iron, originally under a contract between buyer and seller and since 1939 at a statutorily fixed price supported by the prohibition of the export of scrap. Under normal competition, the prices of these alternative steelmaking materials would presumably be closely related; since bought scrap makes up about a fifth of the tonnage of raw materials that steelmakers buy, the low fixed price must obviously have a considerable effect on the cost of all steel made partly from scrap. The federation's fund is here, therefore, used to correct a distortion in costs that in part came about originally from its own bargaining. Since August last year, in addition, the "Imported Materials" side of the account has been swollen by the loss on expensive imported finished steel sold at the lower home price: this component of the fund has recently aroused the particular criticism of Mr Steven Hardie, whose nationalised corporation during its year of steel ownership has played only the part of an observer in the fixing of steel prices.

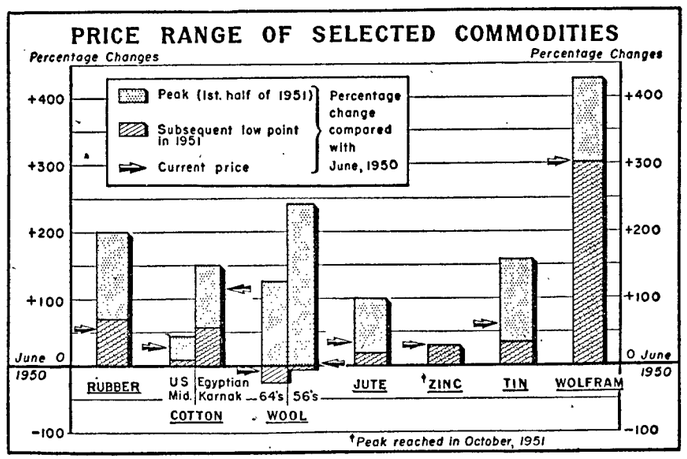
Such, in silhouette rather than in detail, are the purposes of the steel industry's cost equalisation arrangements. Few details are ordinarily published by the federation; the Ministry of Supply has access to the accounts, but a Ministry spokesman described them to the Committee of Public Accounts last year as "a purely private transaction between the steel industry and its constituent members." One scrap of evidence before the Public Accounts Committee last year suggested that the levy paid in the production of billets last year was some £4 to £5 a ton, equivalent to perhaps just over £3 an ingot ton on steel output; in terms of annual steel output, that would suggest that the total equalisation fund might have been credited with some £50 million last year. With the swift rise of prices of iron ore and imported scrap, the industry fund may nevertheless have paid out more than it received during 1951; the cost of redressing its balance, and of covering losses on well over a million tons of expensive imported steel, suggests that 1952 may require a much increased total levy on steel output—perhaps of the order of £5 an ingot ton.

These are formidable slices of cost to transfer between different sections of the industry, and their effect must blur to a considerable extent the comparative costs of steelmaking. The resultant financial influences upon particular steelworks have never, it appears, been examined publicly, and without full details of the constituent levies and rebates of the funds such an exercise cannot be attempted with any accuracy. It may be questioned, moreover, whether even the controllers of the fund can predict with any real certainty the ultimate economic effects of all its levies and rebates. But evidently an integrated steelworks situated on a home orefield with an output of, say, a million ingot tons a year, using little scrap except that arising in its own works, might find that the difference between the total levy it pays on ingot steel and the total rebate it receives on the pig iron it uses, could affect its own financial results by several millions of pounds a year. Any investor invited to purchase shares in such a company would surely be entitled to know in advance the effect upon its prospective future earnings of such net payments as it makes to assist the industry as a whole—and any contractual arrangements under which a company may be bound in the future to accept such obligations.

*

To question the usefulness of such arrangements is not to support exaggerated charges of combination against the public interest. The pooling of so appreciable a part of the industry's basic costs was not in the industry's mind during the prewar days of supervision by the Import Duties Advisory Committee; but the first steps in this direction before the war provided the basic principles on which the wartime price control arrangements were framed, and this pattern of levy and subsidy, though shorn of its grosser features, has remained. The war period was abnormal; and it is in the belief that postwar conditions too have been abnormal that the system has been continued, first under partial Government subsidy and since 1949 by the federation. In 1949, when the federation took fuller responsibility for these arrangements, it commented

> At some later stage it may be practicable to charge the actual prices paid for imported materials to the using firms without the levy system but, in view of the abnormal levels at which import prices now stand, it is considered that such a course would not, in the meantime, be practicable.



It did, in fact, steer towards that course in 1950; but since the Korean emergency the equalisation system has returned on a larger scale than before. How long, it may be asked, will the meantime remain abnormal? The federation's desire for price stability in steel is understandable; and in the next decade there may be every likelihood that the price of foreign ore, for example, may decline, while the cost of winning home ore will go up. The levies and subsidies probably do not wholly obscure the real comparative advantages and disadvantages of steelmaking at particular works (though the artificially low price of bulk-purchased scrap might in certain cases have a great influence upon the financial results of certain technically "obsolescent" cold metal shops). Nor need one accept the more theoretical condemnations of the distortions in location of new plant that may flow from this blurring of cost advantage; decisions about location ought to give full weight to calculations of economic cost, but they are never wholly determined by them. In the same way, the uniform delivered pricing system under which British steel is sold has had in practice probably less effect in distorting the economic location of consuming industries than it would seem able to have in theory.

It remains true that these departures from competition have not recently been publicly examined, let alone publicly justified. The last full-scale examination of the steel industry was published in July, 1937, by the Import Duties Advisory Committee, a body imbued with the desire for security of British industry in the thirties,

and not ill-disposed towards the curtailment of competition that might bring that security about. At that time the price system of the industry was barely being worked out; and in any case what was appropriate to that period has little relevance to the nineteen-fifties. The steel industry must plan for the long term, and it cannot assume that the present boom in the demand for steel will be necessarily more lasting than a slump in days gone by; therefore security can fairly be its legitimate concern. But whether security is best sought in a partial withdrawal from the rigours of free competition is debatable. Perhaps the greatest need for the British steel industry today is an impartial—and public—re-examination of its price and development policies, proceeding from the principle that each and every departure from competition needs to be justified publicly and periodically. That might well be the first task of the Iron and Steel Board that appears to be the chosen instrument of the Conservative Government for supervising a denationalised steel industry. A further article will examine the powers that such a board might require.

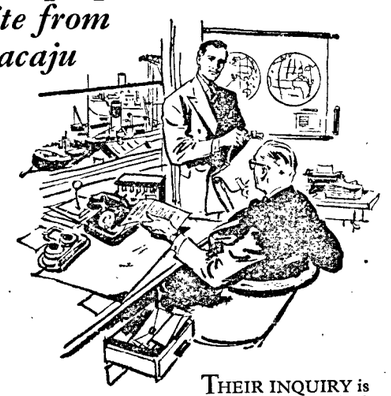
Commodities Now

THE general tenor of the commodity markets is still one of uncertain stability. Prices in recent months have displayed no marked swings in either direction; but there is little confidence in the permanence of existing levels. Last autumn it was quite widely believed that a renewed but moderate upward movement was about to follow the violent relapse of the previous six months or so; but this expectation proved ill-founded. The firmer tone that developed in most markets last October later gave place to uncertainty, with the general tendency slightly downwards; Moody's index of commodity prices, for example, has fallen by 2½ per cent in the past four months and most of this fall was concentrated in the opening weeks of this year. To get perspective in any attempt to guess the future trend, it is necessary to glance first at the spectacular movements of the past eighteen months.

Since the invasion of Korea, commodity prices have passed through three distinct phases. The first was the notorious scramble for supplies, with its associated dramatic rise in prices, that occurred mainly in the last quarter of 1950 and the first quarter of 1951. Prices had, of course, tended to rise shortly after the actual commencement of fighting in Korea, but this initial movement was quite moderate; the real pressure of demand did not come until after September, 1950, when it first became clear that the Korean campaign was not just another "incident." Different commodities reached their peaks at different points of time, but all, or nearly all, reached them in the first quarter of 1951. Goods of which the United States is a large importer rose much more sharply than those that America exports. At the peak, for example, the price of tungsten was 428 per cent above its pre-Korea level, crossbred wool 240 per cent, rubber 200 per cent and tin 160 per cent. In contrast, American cotton at its peak had risen by only 44 per cent, copper by 22 per cent, zinc by 30 per cent and lead by 55 per cent; the last two of these commodities did not reach their peaks until October, 1951. Moody's index at its peak showed a rise of 36 per cent.

This first phase, in which the markets greatly overreached themselves, gave place to a period of readjustment extending roughly from March to September of last year. During this second phase some prices fell almost as dramatically as they had previously risen. Generally, those that had risen most fell most; the chief exception was wolfram. Wool fell to below its pre-Korean level; the only other major commodities to do so were the shorter-stapled Egyptian cotton (Ashmouni and Zagora) and tea. Rubber and tin each lost well over half their previous gain, and at their low points were 70 per cent and 40 per cent respectively above their pre-Korean levels. Wolfram, which fell only moderately, has remained 300 per cent dearer than in June, 1950. The price of American cotton also declined only moderately; at its low point it was 10 per cent above its pre-Korean level. In contrast, the official prices of copper, lead and zinc in New York rose in 1951, but the free market prices of these metals have fallen from the peaks reached last summer, and those of lead and zinc now roughly approximate to the official quotations. Moody's index, at its low point in September, was still 15 per cent higher than in June, 1950.

The third phase—that of uncertain stability—began last October. Since then prices have fluctuated frequently though not violently, and with no consistent tendency. There has been a firmer tone in most of the staple foodstuffs, wheat, maize, cocoa and coffee, and in a number of raw materials, cotton, flax, jute, sisal, tin. But there has been a further fall in wool, sugar, rubber and vegetable oils—the last three are now below the low points reached last year. Copper, lead, zinc and wolfram have shown no change in New York. Wool remains the only commodity whose current price is below its pre-Korean level. These trends, by themselves, do not suggest any fundamental weakness in the commodity markets.



On the other hand, there is no evidence, from the supply side, to warrant fears of another dramatic rise in prices. World output of most commodities increased in 1951. Coal production was 5 per cent larger than in 1950, crude steel 10 per cent larger, crude petroleum 15 per cent, electricity 12½ per cent, copper and zinc each 5 per cent; output of natural rubber was also 5 per cent larger, but that of synthetic rubber leapt by 75 per cent. The two main exceptions among the strategic materials were tin and lead; tin production fell by 3 per cent and lead by 2 per cent. The world cotton crop for 1951-52 is estimated at nearly 20 per cent above that for 1950-51, wool is up by 2 per cent, while larger crops are also forecast for jute and sisal. Among the staple foods, the current season's crops of wheat, maize, sugar and coffee are all larger than last season's, but the cocoa crop has declined by 10 per cent. Only a hazardous guess can yet be made of 1952 supplies, but, on present trends, output of coal, steel, copper and zinc may continue to increase, while tin and rubber production may decline slightly.

This year's uncertainties arise rather from the side of demand than from that of supply. Defence will continue to absorb an increasing share of world supplies of raw materials, and the crucial consideration is whether the resultant pressure will be reinforced or eased by the behaviour of civilian demand. This declined sharply in the second half of 1951, after the buying spree that followed the launching of arms programmes. But there is no certainty that it will now begin to expand again; on the contrary, if governments introduce more drastic measures to curb their domestic inflations, it may decline further. Four particular factors deserve careful scrutiny. First, the operation of the International Material Conference in Washington; secondly, internal conditions in the United States; thirdly, the balance of payments difficulties in Britain, the sterling area and Europe; fourthly, the economy in the use of scarce materials.

The IMC has introduced allocation schemes for seven materials—copper, zinc, tungsten, molybdenum, cobalt, nickel and sulphur. It is also keeping under review lead, manganese, cotton, wool, paper and pulp, and intends to introduce allocation if these materials become scarce. Although only one scheme, that for tungsten, lays down any specific conditions about price, the allocation systems have curtailed the pressure of demand on the materials concerned and have prevented any further rise in price. This can be seen from the behaviour of the free market prices for non-ferrous metals. "Free" copper is now less than 50 per cent above the official New York price, whereas before allocation it was 100 per cent above; "free" zinc is almost down to the official level. The existence of the IMC, therefore, should prevent a repetition of the spectacular price rises of twelve months ago.

During the past nine months the United States has experienced another of its postwar "prosperous recessions." The imposition of price control, the restriction on use of certain materials for civilian purposes, the curtailment of instalment credit, and the excessive building up of stocks both by consumers and by manu-

facturers in the winter of 1950/51 all played their part in restricting purchases after the first quarter of 1951. Manufacturers lived on stocks; the American public saved its extra income. In fact, net saving as a proportion of disposable personal income rose from 4 per cent in the first quarter of 1951 to 9 per cent in the second and to 10 per cent in each of the last two quarters. It may well be that such a high rate of saving cannot be continued indefinitely, but, even if consumer demand does increase, American manufacturers may be inhibited —in fact prevented—from bidding up world commodity prices by the existence of domestic price controls. There is also the risk that stockpiling may slow down this year; the programme for stocking rubber, for example, is expected to be completed shortly. If this does occur, however, some of the slack in demand may be taken up by the relaxation of existing American restrictions on civilian use of these materials.

The defence programmes in Europe are barely under weigh; but steps have already been taken in most countries to limit civilian use of a number of materials. The main problem confronting Britain, the sterling area and Europe is to restrict imports to the level that can be paid for by overseas earnings. The burden of restraint will be eased to some extent by American grants under the mutual aid programme, and no country is likely to abstain from taking up the quota of any materials allotted to it by the IMC—and most of the materials at present allocated come from the dollar area. Nor is Britain or Europe likely to restrict further its imports of other raw materials, which come mainly from the sterling area. Britain, admittedly, has already announced a cut in its stockpiling programme, but the quantities involved are small by comparison with total world demand; moreover, the largest cuts have been made in defence materials that are subject to allocation, so that the British decision is unlikely to have perceptible effects on world prices. The only commodities for which the demand from the sterling area and Europe may decline are those used mainly for consumer goods—notably wool, cotton and rubber.

The campaign to economise in scarce materials may not have any immediate impact on consumption, but it is likely to have far-reaching long-term effects. The rayon industry, for example, has apparently found that it can make do with less sulphur; engineering firms have adopted scrap salvage as part of their normal routine; improved methods of stock control have enabled factories to carry a smaller working stock. These developments should in time reduce the amount of raw material required for each unit of end-product; and, once economy of materials has become part of the normal procedure of efficient management, it is likely to continue.

These four considerations relate mainly to industrial raw materials. Among the foodstuffs, there is no prospect of any large surplus of either wheat or maize. In sugar, the bumper crop ought to imply a phase of lower prices; but Cuba, the largest exporter, is unwilling to accept much less than 4¾ cents a lb for its exports, and if prices fell below this level, it would ask for the international sugar agreement to come into operation once more. The larger coffee crop may involve some decline in coffee prices, but cocoa prices have already risen quite sharply, under the influence of the continuing prosperity in the United States and of the smaller crop.

The conclusion to be drawn from these conflicting trends cannot be precise. The existing national and international controls on prices and consumption should prevent another dramatic rise in prices such as occurred in the nine months following the invasion of Korea, even if the American public spends a larger proportion of its expanding income. On the other hand, so long as defence programmes are maintained, the chance of any further substantial fall will be remote. During the first quarter or even the first half of this year, the present uncertain trend seems likely to continue, probably with a downward tendency. But as soon as the public has consumed part of the stocks it accumulated twelve months ago, and as soon as it is convinced that prices will not fall sharply, the tendency will be for prices to rise—unless disinflationary policies are unexpectedly tough.

Business Notes

Dearer Money for Local Authorities

Mr Butler evidently intends to stick closely to the sound rule that he laid down in November, that interest rates charged to local authorities by the Public Works Loan Board should not contain any "element of concealed subsidy." The increased rates announced with effect from February 9th conform even more closely to the current pattern of yields on British Government securities than did those announced three months ago. The rate for loans up to five years, which was then left at the 2 per cent to which Sir Stafford Cripps raised it in 1948, goes up to 2½ per cent; the rate for five to fifteen years, previously raised by ½ per cent to 3 per cent, now becomes 3¼ per cent; while the rate for longer loans, previously raised by ¼ per cent, is now raised by ½ per cent, to 4¼ per cent.

This prompt second adjustment, to take account of the big effect that the new monetary policy has had upon the gilt-edged market, makes it plain that the authorities intend to keep the PWLB charges even more closely in line with what the Treasury now describes as the "true current cost of money" than had been expected. Practice will not be allowed to lag behind precept as it has done in these past four years. The Labour Government professed to follow the same principle of relating charges to market rates. Thus in January, 1948, Sir Stafford Cripps declared that

> the rates of interest charged to local authorities are fixed from time to time to correspond broadly with Government borrowing rates for comparable periods.

But in fact the Labour Government made only one increase —when Sir Stafford Cripps was obliged to acknowledge the radical change caused in the interest structure by the collapse of the Daltonian experiment. He then reversed Dr Dalton's reduction in the PWLB rates, raising the longest rate from 2½ to 3 per cent, but even then did not come fully into line with the market.

* * *

Effect on Housing Subsidies

Much more important than the actual increases in rates over the past three months is the effect they will have upon local government finances; and this is still uncertain. Mr Butler said in November that long-term capital investment should be financed at the true current rate of interest, but added that "in the case of housing, if no other adjustments were made" the effect would be to raise either local rates or rents. Accordingly, the Minister for Housing and the Secretary of State for Scotland were to advance the date of the annual review of the housing subsidy and were to hold with the local authorities discussions in which the increase in interest charges would be "one factor"; changes in the structure of the subsidies were not to be ruled out. At the time, this phrasing gave the impression that the Government intended to amend the subsidies in such a way as to relieve the local housing accounts (but not other accounts) of at least the greater part of the additional interest charge; but this impression was greatly weakened a fortnight later by the dogged refusal of Sir Arthur Salter, despite repeated pressure in debate, to give even the most general promise to that effect—or, indeed, to clarify the Chancellor's statement in any way.

Since then the promised discussions have been opened with the associations of the local authorities, and it has been rumoured that any change in the subsidies is now unlikely to cover more than a part of the additional charge that might be expected to fall upon the housing accounts. Yet the Treasury's announcement of the latest increase in interest charges states that the Government's proposals "for the new housing subsidies" take "full account of this rise in rates" in addition to "other adjustments." This is no less bewildering than Sir Arthur Salter was in the debate of last November.

The explanation, perhaps, is that the ramifications of local finance on these issues are themselves bewildering. Even if a substantial part of the additional interest charge for housing is left uncovered by subsidy, it still will not follow that rents or rates will be raised correspondingly. Much will depend upon the practice of the individual authorities, who will presumably remain free, as in the past, to decide for themselves such questions as whether to spread increased interest payments over the whole range of their expenditures, how to apportion the burden between rates and specific charges, and whether to finance the amount remaining to be borne on the housing account by raising rents for all their housing or only for new housing. It is to be hoped, however, that this opportunity will not be missed for taking a first step, in this relatively limited field, towards a more realistic pattern of rents.

Rights Issues and the Market

Industrial share prices have been slipping for most of this week. By Thursday morning, indeed, the slip had almost become a slide. The *Financial Times* index of industrial ordinary shares still stood at 114.2 by Wednesday's close compared with 114.8 before the week-end, but the extent of recent general falls was somewhat masked by speculative interest in certain shipping shares and by the strength imparted to tobacco shares by the maintenance of the Imperial Tobacco dividend and the announcement of the Carreras share bonus. The dominant influence of the week has been the announcement of two new "rights" issues to ordinary shareholders. Boots is raising just over £4 million by the issue of 5,120,000 5s. shares at 16s. each on a one for three basis, and GEC is raising just under £6 million by the issue of 1,679,348 £1 shares at 72s. 6d. each on a two for five basis. As has now become usual, the existing shares of these companies were promptly marked down. Immediately after the respective announcements Boots lost 1s. 3d. to 20s., to make the "rights" worth about 1s. a share, and GEC lost 2s. to 77s. 6d., to make the "rights" worth about 1s. 5d. a share. In the last three months British companies have raised over £57 million from their existing shareholders by rights issues of this sort; when the terms of the coming British Insulated and Callender Cables issue are announced, the total is likely to go well above £60 million. It is perhaps a blessing in disguise that the failure of certain big industrial debenture issues at the end of last year has put a temporary stop to the orgy of borrowing on fixed interest terms, which was building up a heavy burden of prior charges that could have grim consequences if and when the world boom fades. But it is not a happy implication that the main pre-requisite for raising capital in Britain today is not that that capital can itself be profitably used, but that the company making the issue has a sufficiently good and lengthy record behind it to be able to pitch an issue at ordinary shareholders at some price between par and current market values.

Gilt edged have also been inclined to sag this week, despite the fact that last week's Southern Rhodesia 4½ per cent loan was oversubscribed (with applications over £500 receiving only about 59 per cent of the amounts applied for). At the end of the first day's dealings on Friday of last week the new loan had gone out to a 9/16 premium, but by the close of business on Wednesday of this week the premium was down to ¼.

* * *

Trade Troubles Continue

British exports last month again broke through to a new record. Their total value (including re-exports) was £264 million, or £51 million greater than in December, and £10 million greater than in the previous peak month of November; their daily rate was thus 6 per cent higher than in the second half of 1951. Unfortunately, British imports also rose sharply; their total of £357 million was £43 million greater than in December, though £11 million below the peak of last August. It seems clear that importers are using their licences straight away, and not spreading them over their allotted six-month period; the recent import cuts may, however, begin to show up sharply in a few months' time.

In all, the excess of imports (valued c.i.f.) over exports (valued f.o.b.) fell slightly from £101 million in December to £93 million in January. The improvement, however, does not seem to be reflected in the hardest pressed sectors of Britain's trading accounts. Exports to North America, at £19½ million last month, were only slightly above their depressed average rate in the last quarter of 1951—and exports to Canada were actually below it. It is significant that America's gold reserves — when struck net of foreign deposits—are continuing to rise at a rapid rate. In the last quarter of 1951 the reserves were rising at an average weekly rate of $66 million; in four successive weeks from January 9th they rose by $44 million, $90 million, $97 million and $54 million respectively. Britain is also still losing gold hand over fist to the European Payments Union. The sterling area's net deficit with EPU countries amounted to £54 million in January, compared with £53 million in December. Britain is now in the fifth tranche of its quota, where 80 per cent of all future payments must be met in gold; last month's gold drain to EPU amounted to £33½ million. The deficits and surpluses of other EPU countries in January also conformed to the disturbing pattern forecast in *The Economist* last week. France showed a deficit of $103 million on the month, Belgium a surplus of $49 million, and Holland, exceptionally, a surplus of $99 million.

* * *

The Tottering Franc

France has now followed up its suspension of trade liberalisation by extending its complicated system of export subsidies. M. Buron's present hope seems to be to reap some of the advantages that would undoubtedly accrue from a devaluation of the franc while avoiding the setback to confidence that orthodox depreciation would incur. An indignant official communique this week declared that recent rumours of devaluation were "entirely without foundation and circulated exclusively for speculative purposes." The new

export subsidies, which the communiqué cites as symptoms of the government's intention to défend the currency, take the form (previously tried out for dollar exports only) of refunds to certain exporters of part of their taxes and social security payments ; the remissions announced last week-end will benefit only about one-third of France's exports, but they should reduce the costs of production of these by between 10 and 12 per cent. French export interests have immediately hurled their shoulder against this half-open door and proposed that the refunds should be increased and granted to all exporters without discrimination, and that they should also apply to commission agent exporters, French firms representing international brokers, and manufacturers making goods with an export content. The French Foreign Trade Counsellors have also proposed that credit ceilings and company taxes should be eased to help the export drive ; in mooting this last proposal they may be somewhat over-optimistic, since the new government is reported to be courageously sticking by its predecessor's plan to counter inflation by increasing most direct taxes and all indirect taxes (except those on essential foodstuffs) by 100 per cent.

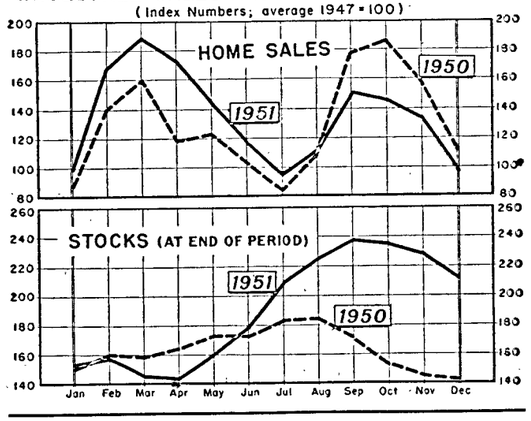
Meanwhile, the flight from the franc goes on ; it has indeed been given a new impetus by the news that France ran a $103 million deficit with EPU countries in January. An interesting feature of the latest crisis of confidence, however, is that much of the flight seems to have been into Stock Exchange securities that would gain by devaluation rather than into the traditional hedge of gold. In the first six weeks of 1952 the price of gold bars on the Paris free market rose by 7 per cent, while the index of French industrial securities rose by 11 per cent (to 73 per cent above end-1950 levels). Foreign securities quoted in Paris rose by 13 per cent in these six weeks, and the premium on most sterling securities has recently fluctuated at between 20 and 30 per cent above London Stock Exchange prices ; the French Government has now had to reimpose a virtual ban on French subscription to new capital issues by foreign companies. On past experience, this more sophisticated "investment approach" to crisis seems overdue. Although successive devaluations have driven the cross-rate with the dollar down from 38.01 francs in 1938 to 350 francs (official rate) or about 468 francs (free rate) now, it is too often forgotten that French industrial securities have increased in capital value by 16½ times since 1938. The Frenchman who bought ordinary shares just before the war has still done much better, in capital and income considerations combined, than the Frenchman who bought a gold bar.

* * *

Coal Prospects Improve

Measured by a variety of yardsticks—the level of stocks, the number of miners, and the rate of consumption—coal prospects since the middle of December have been growing steadily healthier. With distributed stocks at the beginning of this month amounting to 14,243,000—four million tons more than at this time last year and more than at the beginning of February in any postwar year except 1948—it is becoming obvious that the decision taken in November by the new Minister of Fuel to import American coal this winter, understandable at the time, will probably have been an unnecessary reinsurance. The total number of men on colliery books, 705,300, is almost back to the level of the beginning of 1950, and about 12,000 above the average for last year. Inland consumption during the first five weeks of 1952, 22,515,000 tons, was higher than in the same period of 1951, but by no more than 67,000 tons ; for a short period at least, the steep rate of increase in consumption seems to have been checked. In the last two weeks recorded production has been about level with that of the same period of 1951, while attendance has recorded more than five shifts a week for each wage-earner. This means, firstly, that the Saturday working is the equivalent of a five-day week for everybody in the industry with no absenteeism whatever ; without some national increase in general working hours this seems the utmost that can be asked of the mining community. But it also shows that the effect of that Saturday working, in tons of coal, has been reaped once and for all. No considerable further increase in output from this source can be hoped for in 1952.

None of these encouraging trends has been evident long enough to justify over-optimism. The stabilising of inland consumption that has left much more coal in stock has come about during a period of fairly cold but dry and almost windless weather that has favoured economy in domestic and industrial heating. There is still some reason to fear a loss of older men from the industry under the new pension scheme ; but enrolments in the scheme have been disappointingly low, perhaps because young miners doubt whether 30s. a week in twenty years time will be worth much, and wastage of miners on account of this may be less than was expected. Nevertheless, the safer balance should relieve the Board from quite that degree of preoccupation with day-to-day supplies that has often diverted its energies from seeking higher output. To achieve that increase quickly most certainly deserves the greater part of their attention.



* * *

Spring Trade Doubts

The size of stocks was the most important single factor in the wholesale textile trade during 1951. At the beginning of the year, continued buying by retailers during a normally slack period ran down the wholesale stocks to well below safety level. In March the Wholesale Textile Association reported that, although selling prices were rising, stocks were 8 per cent below their level of the previous year and sales were nearly 19 per cent higher. By December the positions were reversed, with sales 14 per cent lower than those in December, 1950, and stocks nearly 50 per cent higher. Wholesale trade in December showed nothing to compensate for the disappointing sales of the previous months. The index of sales fell from 134 (1947=100) in November to 96 ; and was 13.6 per cent lower than in December, 1950. Only the sales of typical Christmas goods such as hardware, sports goods and fancy goods showed any improvement on the year before. The index of stocks has been brought down point by point from 237 in September to 211 in December compared with 141 in December, 1950.

WHOLESALE SALES AND STOCKS OF TEXTILES

(Index Numbers; average 1947=100)

Neither retailers nor wholesalers are particularly anxious to order spring goods before they see clear signs of a trade revival. With so much capital tied up in stock, they are short of cash and are no longer able to get, or indeed to give,

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE PERSONAL TOUCH IN BANKING

Nearly two centuries of financial experience and personal service to each customer have helped to build up the present tradition of Glyn, Mills & Co. The banking service which is provided is completely modern in all its aspects, yet has never become impersonal in its attitude towards the large concern or the private individual.

much credit. This argument, however, applies with more force to the wholesalers than to retailers. By the end of December, retail stocks were considerably lower than they had been at the beginning of the month. The retail sales index (1947=100) had jumped between November and December from 157 to 201. This compares with a rise of 147 to 182 between November and December, 1950, and by this standard the rise in Christmas sales, big though it was, cannot have been sufficient to offset the slack trade of earlier months. Its most satisfactory feature was that sales of clothing, and especially of men's and boys' clothes, showed the biggest rise. The whole clothing sales index rose from 176 to 252 and in consequence, clothing stocks showed their first fall in six months, dropping from 223 to 190. But this is 30 points higher than the level at the end of 1950 and stocks may still be substantial enough to have an inhibiting effect on retailers. The announcement of an early Budget, the promised changes in the utility scheme and now the sad events of the past two weeks, all encourage them, and through them the wholesalers, to hold their hand a little longer. But clothing manufacturers have retained many of their staff on short time in the hope that orders for spring stocks would provide them with employment. If the orders are delayed much longer these workers will have to be dismissed and there may then not be the labour to meet normal retail requirements.

* * *

Courtaulds Cut Output

The decision of Courtaulds Limited to reduce the rate of output at three of the company's rayon factories is a sign that no early revival in the market for rayon textiles is now expected. These are three fair-sized yarn factories, between them employing 3,750 men, and they specialise in yarns for clothing fabrics. The two Welsh factories at Aber and Castle produce continuous filament yarn and the Deeside factory operates a crèpeing plant. Rayon production in the country as a whole showed a sharp drop in December, from 36 million pounds in November to 28.5 million pounds, but the need to make cuts on this scale, which will presumably involve standing off a number of men, has to a large extent been avoided by increasing the output of industrial-type yarns. This expedient was not possible at these three factories, and the stocks of domestic yarns have reached a point where the rate of production had to be reduced.

The switch from domestic to industrial textiles is likely to become more marked. The recession in rayon sales started many months before the general slump in textiles and, since the fall in raw wool prices, Bradford's customers, too, have become less prepared to accept rayon-wool mixtures. Many orders are being changed back to all-wool cloth. This lack of interest in all but industrial high-tenacity yarns is surprising because rayon is still the cheapest textile fibre and its possible uses have in recent years been greatly widened. Where it is being used for fabrics of intricate construction, as it is to an increasing extent in certain furnishing and dress materials, British weavers cannot compete in price with continental producers. Cloth importers estimate that the price of some of the French furnishing damask now on show in London is less than half that of its British equivalent. That is, however, a specialised market. In mass-produced fabrics British prices, are, in general, still competitive.

* * *

Thinly Spread Butter

This year Britain will have to spread its butter more thinly for, according to estimates made by Lovell and Christmas Ltd., available supplies are likely to fall from 314,000 tons in 1951 to 272,000 tons. About half the total supplies come from New Zealand, and although production is expected to remain high, exports to this country are unlikely to be much above 135,000 tons; the shipment of 153,000 tons last year was achieved at the cost of running down stocks in New Zealand. Foot and mouth disease in Denmark is not expected to reduce its butter output over the season and supplies for this country should be about the same as last year. Other continental countries are now buying less in Denmark, though bad weather in Europe during the next few months might lead to renewed buying.

UNITED KINGDOM BUTTER SUPPLIES
(Thousand Tons)

Country	1938	1950	1951	1952 (Estimate)
Australia	90	66	33	10
New Zealand	130	128	153	135
Denmark	118	126	101	100
Netherlands	36	15	18	} 20
Poland	10	(a)	2	
Other imports	92	(a)	1	
Total Imports	**476**	**335**	**308**	**265**
Home production*	21	17	6	7
Total Supply	**497**	**352**	**314**	**272**

* Excluding farm butter. (a) Under 500 tons.
Source: Lovell & Christmas, Ltd.

Australian exports to this country have been dropping sharply since 1950 and this year production is likely to be curtailed by the serious drought. Britain may, in fact, receive less than a third of the quantity of 1951—say, no more than 10,000 tons. In all, British supplies of butter from all sources (including home production) will total some 272,000 tons in 1952. Since 265,000 tons will be needed to maintain the 3-oz ration there will be little to spare. Last year, the ration was kept at 4 oz for two-thirds of the year, but total supplies amounted to 314,000 tons, leaving a small deficit which was made good from stocks.

Prospects for cheese supplies are hardly more reassuring; Lovell and Christmas suggest, indeed, that the ration may have to be reduced to 1 oz a week for short periods. New Zealand and Australia are expected to send 110,000 tons to this country—about the same amount as last year—and home production will probably remain steady at 45,000 tons. But the present ration of 1½ oz a week absorbs nearly 180,000 tons in the year. To make up this amount nearly 25,000 tons would be required from Canada and the United States. Last year exports of Canadian cheese to this country were only about 12,000 tons, and even if dollars could be found for more cheese, it is doubtful whether shipments could be doubled this year. In 1951 supplies of ration cheese from all sources came to 206,000 tons; these included heavy purchases from United States stocks, which allowed an increase in the ration to 3 oz during the worst period of the meat shortage. Such a rescue operation this year seems improbable.

Commercial History and Review of 1951

This week's issue of the *Records and Statistics* Supplement to *The Economist* includes the first part of the Commercial History and Review of 1951—the 89th of the series which began in 1863.

Part I provides a general review of British economic developments last year, and special articles on finance, investment, overseas trade and agriculture. Part II, to be published on March 15th, will contain articles on all important British industries, and Part III, consisting of overseas economic reports, will appear in April.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

Attack on Pulp Prices

This week the Ministry of Materials advised paper manufacturers that ceiling prices would be imposed on all import licences for woodpulp ; pulp bought at higher prices will not get a licence. No price ceiling has been fixed for imported woodpulp used by the rayon industry. Evidently the British civil service is taking a leaf out of the American book ; what has been done to rubber and tin during the past twelve months may be attempted for wood pulp and perhaps for other commodities that are subject to import licensing. Pulp escaped fairly lightly from the Chancellor's import cuts of last November. Supplies were to be reduced by 9 per cent on then existing prices. If the imposition of ceiling prices succeeds in bringing prices down, imports of pulp this year could be maintained at the same quantity as in 1951. Import licensing was re-imposed for pulp last November, and since then importers have been refused licences from time to time if the prices they agreed to pay seemed too high. Now they are being told to what limits they can go. The ceiling price for chemical pulp is £88 a ton, compared with current spot prices of between £105 and £120 a ton ; the limit for a mechanical pulp is £39 2s. a ton against current quotations of £42-£45 a ton.

Officially this ceiling price technique is a purely British policy. In fact, it results from discussions with other European importers who themselves have been anxious about the persistent rise in the price of pulp from Norway, Sweden and Finland. Caustic criticisms from these exporting countries are only to be expected. Norway has described it as "a serious blow" for it means a reduction of 20 per cent on current prices and Britain takes between a third and a half of Norway's exports. But since Norway and Sweden levy an export tax on pulp, the remedy for any hardship that the new ceiling prices might impose on the pulp producers would seem to rest in their own hands.

Furniture Looks Up

The furniture industry was probably hit earlier and harder by the retail sales recession than any other consumer goods industry. But a slump of this kind is nothing new in its history, and its apparent vulnerability to any fall in consumer spending conceals a remarkable resilience. The first part of the industry's annual trade exhibition is being held in London now, and the second part will open in Blackpool towards the end of the month. In the opening days exhibitors have been doing quite good business and the furniture industry has hopes of more active trade during the next few months than, for example, the clothing industry. One reason for the modest revival is that manufacturers have had the good sense to meet the buyers' market more than half way in their prices. Another is that the retailers have disposed of much of their big stock of furniture. In August retail furniture stocks by value were 47 per cent higher than twelve months earlier. By December they were only seven per cent higher. This reduction did not come about by an increase in the rate of sales in the intervening months ; retailers ran down their stocks simply by placing no orders with the industry. This industry has already borne the impact of this: some 20 per cent of the union members, and probably even more of the non-union workers, are either out of work or on part time.

By cutting prices the furniture manufacturers have now made it easier for retailers to contemplate re-stocking. Costs have risen by about 25 per cent during the past year, but manufacturers whose three-piece suites cost £70 last year are showing suites this year at £40. It would be foolish to pretend that reductions of this order have been made possible by production economies that offset rising production costs. For the greater part the reductions have been achieved by cutting quality to the bone of the utility standards.

Many manufacturers have also combined reductions in price with a noticable change in style. The furniture shown falls into three distinct styles: reproduction, conventional designs, and "contemporary" furniture. The characteristic failings of each class are less conspicuous than in previous years, although the quality of much of the timber makes it necessary to persist with lavish use of varnish, and the limitations of machine methods of production make it difficult to introduce much real variety. Some of the most outstanding exhibits were those made by pupils from technical schools, but few of these pieces seem adaptable to machine production. This is an aspect of furniture design that might with profit be given more attention than it at present receives. The second limitation on the industry, the utility specifications, may soon be removed. These will be remembered for having introduced a good average standard of quality into an industry where quality used to vary widely. But they also tended to repress the natural resourcefulness of the industry and made it difficult for manufacturers to make more than superficial changes in a standardised range of furniture.

* * *

Less Canned Food

Optimistic forecasts about tinplate supplies last year, this year, and next that were made by the Ministry of Supply twelve months ago have been drastically amended by the current steel shortage. In February, 1951, the Ministry was confident that about 760,000 tons could be produced—200,000 tons from Ebbw Vale, 520,000 tons from the handmills, and 40,000 tons during the later part of the year from the new electrolytic mill at Trostre. Production in 1952 was expected to be 950,000 tons, and in 1953 "substantially over a million tons." In fact about 750,000 tons was produced last year and production may not be greatly increased this year. The mill at Trostre was brought into operation somewhat later last year than was expected, and is at present running on a one-shift basis, while its electrolytic tinning line is not yet working. Ebbw Vale and the handmills alike were affected by the general steel shortage, and the handmills lost some labour to Trostre, causing a decline in their output without an immediately corresponding gain at the new mill.

Deliveries of tinplate last year were 724,000 tons, about 60,000 tons more than in 1950, and exports were maintained at roughly the 1950 level of 250,000 tons, so that home consumers of tinplate received rather larger supplies than in 1950. But a considerably larger tonnage of tinplate appears to have gone into defence supplies, leaving probably about the same for domestic food canning. Exports will be maintained this year, and may in fact be increased by large allocations to British oil companies overseas, so that domestic prospects for tinned food are once again not very bright, The allocation of tinplate to the British food canners for the first half of this year is the same as in 1951, but this is not being applied equally to all canners. The fruit canners, and some others, have been notified of a fairly large cut in their supplies for the first period of this year ; the canners of milk, who have rather less milk to put into tins, should fare rather better. The Tin Producers' Association, considering the prospects of home supplies and reduced preserved foods from abroad, suggests that the housewife may receive two cans this year for every three she could obtain in 1951.

CARRON THE ROYAL CHARTER COMPANY FOUNDED IN 1759

Would a better Canteen help production in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

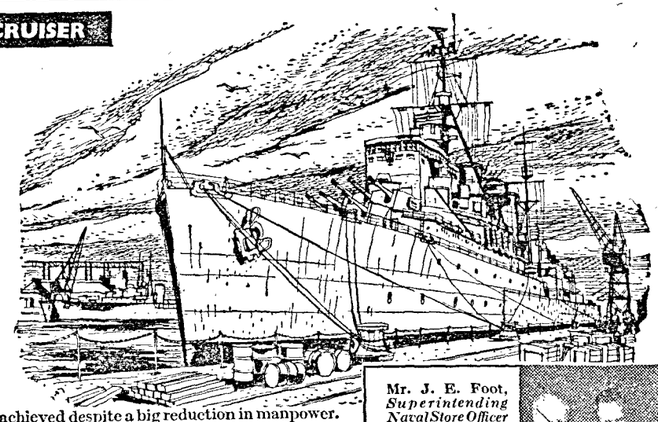
THE CASE OF THE CAPTIVE CRUISER

Was there a "secret weapon" to set her free?

H.M. Dockyards, serving one of the largest naval forces in the world, were faced with a serious problem.



World War II had suddenly increased their inventory of ships' supplies to almost 300,000 items. Handling this increase with hand accounting methods had become almost impossible despite extra manpower and overtime.

As a result, the movement of stock to keep ships supplied was held up by paperwork.

To free these ships, a new accounting system was needed at once. The Admiralty directed an immediate investigation of all methods and systems. Machine accounting specialists of Burroughs Adding Machine Ltd. were called in.

After investigation, Burroughs specialists suggested a simplified system for handling stock cards and ledgers. They specified Burroughs High Speed Accounting Machines, Duplex Adding Machines and Adding-Subtracting Machines for the job. The authorities acted on these recommendations.

Today, the issue of supplies in the Royal Dockyards is never held up by paperwork. Increased speed of inventory accounting has been achieved despite a big reduction in manpower.

Mr. J. E. Foot, *Superintending Naval Store Officer of one of H.M. Dockyards, examines one of his Burroughs High Speed Accounting Machines.*

With him on the right is Mr. S. F. Harmer-Elliott, *one of the Burroughs men who helped solve the Case of the Captive Cruiser.*

WHAT ABOUT YOU? If you think your business could benefit from faster figuring, call in Burroughs. They can advise you on all the latest machines and systems, for Burroughs make the world's broadest line of modern record-keeping machines; Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm equipment.

Call in Burroughs today. Sales and service offices in principal cities around the world.

Incomes—Real, Apparent and Approximate

In the current issue of *The Manchester School* Mr J. Mars attempts to translate recent national income estimates into an index of real national product. He has done this by computing price indices for different sections of the economy and applying these to the official national income figures. The best known previous attempts to translate national income estimates into real terms, those made by the Department of Applied Economics at Cambridge, adopted the opposite technique of comparing estimates of real output with expenditure aggregates, and then computing a price index from them. The Cambridge approach seems to be preferable, but Mr Mars's method provides a useful, if rough, cross-check. It will be seen that he estimates that real national product (inclusive of depreciation) in 1950 was nearly 8 per cent higher than in 1948 and nearly 40 per cent higher than in the relatively depressed prewar year of 1938.

ESTIMATED INDICES OF REAL NATIONAL PRODUCT, 1937-1950

	1937	1938	1947	1948	1949	1950
Manchester School ...	...	77·3	94·7	100	103·3	107·7
Cambridge School* ..	85·90	...	94·0	100	105·0	109·0

* See *Bulletin* of London and Cambridge Economic Service, August, 1951.

The Cambridge economists estimated real product in 1950 to be about 9 per cent higher than in 1948 and between 21 and 28 per cent higher than in 1938; they pointed out, however, that the growth in population, the adverse turns in the terms of trade, and the need to concentrate more resources on defence meant that real income per head (in welfare terms) probably rose by only some 7 to 12½ per cent between 1937 and 1950.

These estimates are obviously only very approximate—but then so are the official national income figures themselves. In the opening passages of his article Mr Mars compares the variations, as between successive White Papers, of official estimates for the same factors. These revisions have necessarily been most marked for those items that are indirectly calculated as residuals—that is, for personal, corporate and public savings, and, up to April, 1950, for gross investment; for example, the official estimate of personal net savings in 1948 was first published as £6 million and then revised to £195 million. There have also, however, been wide fluctuations in those entities that are calculated directly; profits for 1948 were first estimated at £3,134 million, and then revised to £2,960 million. It is clear that national income estimation is still only an experimental science and that the next step should be to secure some cross-check on the estimates of savings. Beyond that lies the need to compile input-output estimates of the sort now produced in the United States; Mr Mars considers this latter advance to be most necessary for this country since such estimates enable economists to "calculate the component parts of the industrial circulation and watch the cumulative propagation of inflationary pressures more accurately."

* * *

More Rhodesian Tobacco?

The five-year agreement between the Tobacco Advisory Committee to the Board of Trade and the Southern Rhodesian Tobacco Marketing Board has recently been revised. The serious drought last year not only reduced the crop but also retarded the expansion in Rhodesian output. Britain has therefore reduced the amounts it will take in each of the next five years to 75 million lb for this year; 80 million lb for 1953; 85 million lb for 1954 and 1955; and 80 million lb for 1956. If Rhodesia provides 75 million lb this year it will be half as much again as last year's shipments. Present estimates suggest that this year's crop might achieve a record of 120 million lb, but the weather in the next month or two will determine the size of the harvest. Production in 1951 totalled only 90 million lb.

The revised agreement also provides for the suspension of export control for a trial period of one year, so that British buyers will have to compete with buyers from other countries. Export control was imposed in 1947 after British traders had complained that foreign competition forced up prices against them. Its removal is not likely to affect British supplies greatly—these depend more on the size and quality of the crop. If the crop is poor there will not be sufficient of the good quality leaf that Britain buys; if the crop is good there should be enough to cover all needs at reasonable prices.

Total imports of tobacco into Britain last year reached 355 million lb, including 212 million lb from the United States and nearly 22 million lb from Canada. The £22 million cut in the dollar allocation recently announced by Mr Butler will reduce dollar imports of tobacco by two-fifths this year—that is, by about 95 million lb—but the cut will not take effect until the autumn when buying from the new season's crop begins. If in fact Rhodesia is able to provide 25 million lb more than last year, total imports in 1952 should only be about 70 million lb below last year's level of 355 million lb; this should be enough to cover consumption, which in 1951 was around 225 million lb.

Stocks of tobacco at the end of 1951 were probably over 500 million lb. Tobacco takes a year or so to mature but with stocks at a record level of nearly 2½ years' consumption, there seems little likelihood of a cut in consumption. Sir Edward Baron in his statement as chairman of Carreras Ltd., has commented this week on the sharp increase in the company's stock last year and says that the quality was good and the price reasonable. He concludes that no serious fall in supplies to the public will occur this year because of the high stocks and the need for the Government to maintain revenue.

* * *

Development by Corporation

The second annual report of the National Research Development Corporation gives more information about the corporation's activities than did the first; but still without enough detail to make clear the value of the work. The NRDC was formed with two purposes. The first was to see that development work done in this country is properly covered by patents. This applies particularly to research done in government establishments, in the universities and medical research centres. An immense revenue in royalties has been lost to this country because developments originating in establishments like these have not been patented at an early stage. The NRDC report gives evidence of considerable activity in this field: on June 30, 1951, at the end of its financial year, the Corporation held 409 patents and had applications pending for another 488.

The second purpose for which the Corporation was set up was to see that inventions of value to the country are properly exploited; if necessary, by providing finance for their development. It appears that 104 licensing and other agreements covering single patents or blocks of patents, entered into by the Ministry of Supply and the Department of Scientific and Industrial Research, have been assigned to the Corporation. It has entered into 20 similar agreements on its own behalf and is negotiating another 74. These are clearly revenue-earning projects, but the report then continues:

> In addition to the routine exploitation of large number of inventions we have a smaller number of individual inven-

tions upon which continuous supervision requires to be exercised at high level.

Besides needing special supervision, some of these cases "have other characteristics such as the need for the provision of substantial development expenditure." Two examples are given. The first concerns electronic computors, in particular the one built at Manchester University. These computors are of great value to the country, for pure research, for defence, and eventually for industry, and although one has already been built at public expense by the National Physical Laboratory, any advances made by the NRDC out of its £5 million fund to Professor Williams at Manchester are probably more than justified by the value of the work.

It is not possible to feel the same confidence about the Corporation's participation in the development of a combine potato harvester, despite its statement that "the importance of potatoes in the national food supply has been strongly impressed upon us." Having been approached by a company of engineers, NRDC has invested to date £21,459 in a development company working on the engineers' design of a potato harvester. This compares with a figure of £29,628 shown in the accounts for all other development expenditure. The report gives no indication of the eventual sum needed to develop this harvester: on the information given it is difficult not to ask whether this is a risk more suitable for private than for public capital.

* * *

Credit Insurance

Trade debts have increased substantially in recent months; debtors rose by £110 million to £563.8 million out of total assets of £3,892 million in the balance sheets of 1,082 companies whose accounts were published between July and December, 1951. (These accounts were analysed in *Records and Statistics* of October 20, 1951, and January 26, 1952.) Buyers are also taking longer to pay their accounts. It is not surprising, therefore, that credit insurance, which is a relatively little known service provided by the insurance industry and the state, expanded considerably in 1951. Credit insurance is likely to grow further this year, when the risk of bad debts will be greater than for many years. An additional incentive to insure is that banks, accepting houses and discount houses may feel disposed to grant larger credit lines to an insured trader than might be obtainable otherwise.

Because of the highly specialised nature of the business, and the importance to the insurer of accurate and up-to-date information about the credit-worthiness of trade debtors over a wide range of industry and commerce, a number of the leading insurance companies formed the Trade Indemnity Company in 1918 to underwrite credit insurance exclusively; they participate only by way of reinsurance received from the specialist office. The company underwrites credit insurance in the United Kingdom and also covers overseas risks, particularly in the Commonwealth. The credit risks of the export trade are, however, mainly insured by the Export Credits Guarantee Department, which was set up under the Overseas Trade (Credits and Insurance) Act, 1920. The cover given by the Department extends far beyond that which can be offered by the insurance market and includes, in addition to the risk of insolvency, insurance against loss to the exporter through war, the cancellation of export licences and exchange restrictions in the buyer's country. It is estimated that last year about £1,000 million trade debts were insured, £600 million with the Trade Indemnity Company and £400 million with the Export Credits Guarantee Department, compared with £349 million and £362 million respectively in 1950. The Exports Credits Guarantee Department is at present empowered under the Export Guarantees Act, 1949, to undertake commercial guarantees of up to £500 million (previously £300 million). A Bill brought in recently by the President of the Board of Trade increases the limit to £750 million. The Department also grants certain special guarantees, the limit for which is now to be £150 million compared with £100 million at present and £60 million before 1949. The Department operates on proper insurance lines and has never imposed any charge on the Exchequer.

The whole of a debt is never insured, the usual proportion covered being from 75 to 90 per cent, although as little as 50 per cent may be accepted by the insurer if the transaction is speculative. Rates of premium range from about ¼ to ½ per cent of the insured turnover, and thus represent only a small addition to costs. In this, as in other classes of insurance, not the least of the services rendered by the insurer is expert advice to the insured aimed at minimising losses. Information is available to insured traders regarding the credit-worthiness of debtors and the maximum amount of credit considered appropriate; help is also given in recovering outstanding debts. Apart from insolvency, claims are paid if an account is not settled within 90 days of the due date by a buyer who has accepted delivery of goods without disputing liability.

Shorter Note

Output of steel in January was at the annual rate of 15,234,000 ingot tons, compared with a rate of 14,953,000 tons in December and of 15,907,000 tons in January, 1951. This was achieved at the same time as an annual rate of pig iron output higher than at the end of last year—10,319,000 tons compared with the rate of 10,281,000 tons in December—reflecting the industry's greater dependence on pig iron as the stock of steel scrap has declined.

Would they give your wife your job?

Could she earn what you are earning now, or will earn in the future? Could she maintain the same standards, and perhaps bring up a family, single-handed? If not—what happens in the event of your premature death?

The right sort of life policy will save you all this anxiety—and some income tax as well. Should you die before retirement age, your wife would receive a series of capital payments. The same policy will provide you with a Personal Pension when you are ready to retire. For details post this coupon to:

Company Notes

Imperial Tobacco. — The fear that Imperial Tobacco would be forced to cut its ordinary dividend was only finally dispelled by the directors' announcement last Tuesday that the year's total distribution was to be maintained at 32 per cent for the fourth successive year. Immediately after this announcement the stock units were marked up $\frac{7}{32}$ to 4$\frac{1}{4}$, but they slipped back to 4$\frac{1}{32}$ before closing at 4$\frac{5}{8}$. To a certain extent these erratic movements—unusual in a "blue chip"—were due to the terseness of the preliminary statement, which makes comparison with the 1949-50 results difficult. It seems clear, however, that the company fared better on its trading account in the year to October 31st last than it did in 1949-50. Group net profits are shown to have fallen from £11,325,487 to £10,092,605, but the 1949-50 total included a special surplus (after tax) of £3,073,455, whereas in the latest year only £1,344,262 of net profits represented a special surplus. This surplus was an adventitious "profit" that arose once stocks of leaf tobacco, purchased before devaluation, were cleared from bond and converted into their sterling value at post devaluation rates of exchange. The British tax collector, in assessing the group's liability for tax at £16,166,873 (against £13,201,806), makes no distinction between these inventory gains and true profits; he ignores the fact that these stocks have to be replaced at post devaluation rates of exchange and thus, in effect, levies a tax on capital. Once the stocks have been fully replaced the group will have had to find about as much again as the net surplus from its own resources. All the directors can do is to draw shareholders' attention to this erosion of the company's substance, by transferring the net amount to a leaf replacement reserve.

The broad inference that may be gleaned from the recovery in gross profits in 1951 is that Imperial Tobacco has been able to maintain a high level of sales and to reap further benefits from economies in manufacturing costs. In the last months of the financial year the company will also have benefited from the increase in the selling price of cigarettes; the full benefit from this increase will be felt this year. At the current "middle" price of 92s. 6d., the £1 ordinary stock units yield as much as £6 18s. per cent; high indirect taxation—and recurrent fears of more to come—have plainly helped to make "Imps" much more of a risk investment than they used to be in the days when they were recommended to so many small investors as the paragon of "safe equities."

★

F. W. Woolworth.—The sharp increase in Woolworth's profits last year from £12,259,819 to £15,114,662, seems to have been due to what the chairman, Mr S. V. Swash, calls "a very satisfactory increase in sales," combined with strict control of stocks. In spite of price inflation, last year's expansion in sales was achieved with only a very small increase in the book value of stocks, from £10,015,166 to £10,340,304. Although stocks are admittedly always at their lowest level at the end of the financial year, it seems apparent that the company must have been content, at the very most, to keep the physical volume of stocks intact. This tight rein on stock expenditure has led to a further improvement in liquid resources; these resources represent a reserve that can be drawn upon immediately the company decides to improve or extend its stores or to build new ones. To build and equip a new store costs about three times as much as it did before the war and the directors, therefore, believe "it is prudent to have good reserves available" for this purpose. Shareholders, who have had to be content with a maintained Ordinary dividend of 42½ per cent., may feel that this policy is excessively cautious—especially as the chairman admits that at the moment opportunities for new development are very limited. Mr Swash, however, gives warning in his address of "some uncertainty in the supply position of merchandise for 1952 in view of the rearmament programme, the metal shortage, and the cut in supplies of confectionery and biscuits owing to the shortage of sugar"; moreover, the company will soon have to bear the burden of an excess profits tax "as yet unknown in scope, amount and incidence." The year ahead may not be an easy one, but Mr Swash believes that "the broad based nature of the business" should help the company to overcome many of the difficulties that may arise.

5s. ordinary stock at 42s. 9d. yields £4 19s. per cent.

★

Bowater Paper.—Although the directors report that "a not unimportant part of the improvement in earnings is attributable to increased production," the main reason for the increase in group trading profits of the Bowater Paper Corporation, from £5,395,488 to £10,275,537, must lie in last year's increases in pulp and paper prices. Even after £5,045,317, against £1,890,688, has been provided for taxation, group net profits are £1,733,327 higher at £3,361,355. The greater part of these net earnings, however, has been ploughed back in the accounts of subsidiary companies, so that the parent company's net profits have only increased by £146,805 to £690,189. The Ordinary dividend rate has been maintained at 15 per cent, but equity capital, on which it is to be paid, has been doubled from £1,800,000 to £3,600,000 by a capitalisation of reserves, of which all but £450,000 has been issued to ordinary shareholders. Clearly ordinary dividends are being kept in step with the advance in profits.

	Years to Sept. 30, 1950	1951
Consolidated Earnings :—	£	£
Group profit	5,395,488	10,275,537
Depreciation	1,444,888	1,450,813
Taxation	1,890,688	5,045,317
Retained by subsidiaries	1,084,644	2,671,166
Parent company's net profit	543,384	690,189
Subsidiary Co's. Trading Profit:—		
Lloyd Pulp and Paper Mills	1,103,074	2,815,034
Mersey Paper Mills	548,673	1,058,794
Bowater's Sales	377,414	796,169
Newfoundland Pulp and Paper Mills	$7,916,972	$11,304,119

£1 ordinary stock at 43s. 9d. yields £6 17s. per cent.

The directors have recognised the true nature of profits earned in an inflationary period. Subsidiaries in the United Kingdom have provided just over £1,500,000 against possible fluctuations in stock values; the directors report that stocks "equivalent to several months' requirements" are being maintained at a high level in order to ensure the smooth flow of production and delivery. The corporation and its shareholders have fared well in the period of newsprint shortages; but probably it is on the success of the corporation's policy of diversifying its products that shareholders should pin their hopes of satisfactory dividends in the years to come.

Statistical Summary

EXCHEQUER RETURNS

For the week ended February 9, 1952, total ordinary revenue was £181,948,000 against ordinary expenditure of £77,381,000 and issues to sinking funds £1,080,000. Thus, including sinking fund allocations of £20,453,000, the surplus accrued since April 1, 1951, is £341,286,000 compared with a surplus of £628,972,000 for the corresponding period of the previous year.

COMPANY MEETINGS

RICHARD HAWORTH AND COMPANY, LIMITED

SATISFACTORY RESULTS—RECORD TRADING PROFIT

EFFECTS OF PENAL TAXATION

THE CHAIRMAN'S REVIEW

The annual general meeting of Richard Haworth and Company, Limited, was held on February 14th at the Lesser Free Trade Hall, Manchester, Mr Stanley Beddow, F.C.I.S. (chairman and managing director), presiding.

The Chairman, in the course of his speech, said:—

CAPITAL STRUCTURE

Having increased our issued capital in March last from £400,000 to £1,300,000, strict comparison with previous year's accounts is difficult. At the time we capitalised £400,000 of the general reserve account, issued £200,000 of new ordinary shares and £300,000 of 5½ per cent. preference shares. All the ordinary shares rank for a full year's dividend. Of the £500,000 5½ per cent. preference shares, the new 300,000 only ranked for dividend for a period of nine months. The cost of dividend on the new capital structure is increased approximately four times. You will notice that since March last we have repaid the loan accounts of £148,955.

RESULTS

The trading profit for the year at £775,464 is the highest in the history of your company. From this figure we have provided for depreciation £40,446, directors' fees £3,500, and then taxation claims no less than £415,052, equal to approximately 57 per cent. of the profits—what a heavy penalty making it extremely difficult for industry to build new premises or fully modernise its plant and machinery. To the resultant profit of £317,977 we add the balance brought forward from 1950 of £115,582, a taxation provision of £14,879, no longer required, and deduct £11,391 due to increase in standard rate of tax last year, thus leaving a balance available of £437,047.

From this amount dividend on preference shares and an interim dividend of 6 per cent. on ordinary shares, which you will be asked to confirm, absorbed £37,472, and your directors recommend transfers to reserves totalling £225,000, and a final dividend on the ordinary shares of 10 per cent., making 16 per cent. for the year, thus leaving a balance to carry forward to next accounts of £132,575.

At this point an analysis of our turnover may prove of interest to you. For every £1 of sales during the year:

	s.	d.
Raw materials, stores, finishing, etc., absorbed	15	8
Salaries, wages, national insurance	1	11¼
Administration, overheads, discounts, etc.		9
Depreciation		1
Taxation		10½
Dividends		2
Reserves and increase in carry forward		6¼
	20	0

MACHINERY AND PLANT

Buildings, plant and machinery have been maintained at our customary high standard. During the year new machinery and equipment totalling £99,453 have been installed, and a final payment of £11,967 for war damage received. You will notice from the balance sheet that our outstanding capital commitments amount to £197,500. At our mills in Salford and in Padiham we are constantly modernising machinery, layouts and improving amenities. To mention a few of the items we have added during the past year—complete modern line blowing room plant, high speed winding and warping machinery, ring doubling frames, improved size preparation machinery. In addition we have converted more looms and machinery to individual electric drive, gradually eliminating all overhead drive, and altered entirely the layout in some departments. Our new mill at Hindley Green is maintained at a high standard of efficiency. It may be of interest to mention that the replacement value for insurance purposes of the buildings, plant and machinery is five times the amount stated in the balance sheet.

PROPOSED EXTENSIONS

For some considerable time it has been our desire to extend our activities by building a spinning mill, with modern layout, etc., modern machinery and also to extend our weaving plant. Part of the proceeds of our offer for sale in March last was intended for this purpose. Many plans have been produced and carefully studied, and finally, in September last, we applied for the necessary building licence.

While our application was under consideration new regulations were issued restricting capital expenditure and thereby imposing a ban on the issue of building licences.

During the last six months the pattern of trade has changed considerably, also the threat of Japanese competition, plus Indian and West German exports will have their effect on future trade in textiles in our traditional markets. At the moment, therefore, it would appear that our building plans will have to be shelved and the new spinning machinery, new looms and preparation machinery may have to be applied to further modernisation of our existing mills.

BURDEN OF TAXATION

At this point I would like to revert to the effect of the present penal taxation. Briefly, profits are struck on highly inflated values, and are immediately required to finance the business; depreciation allowance is on historical cost which bears no relation to cost of replacement; profits tax at 10 per cent. (plus 40 per cent. on amounts distributed) is a charge to the company, and then income tax on the balance at standard rate. Provision must be made for future contingencies. To take 50 per cent. or more of profits (which are not true profits) leaves no incentive, only a pioneering spirit, to build new up-to-date works, and equip them with modern machinery and amenities.

COTTON

The present exchange position governing the method of securing our supplies of raw cotton makes it extremely difficult to secure the quality and quantity of cotton required for specific purposes. If we are to compete successfully with world productions we must be able to purchase our raw material in a parity with the rest of the world and select the quality of cotton we desire to allow us more scope in the production of quality goods.

It is to be hoped that the Cotton Import Committee set up by the Government to inquire how in the current foreign exchange position cotton can best be supplied to the U.K. cotton industry on the most advantageous terms as to quality and price, will quickly find a solution that will prove beneficial to the industry until such time that a free market will again be open.

GENERAL

Present world economic conditions make it particularly difficult and dangerous to forecast trading results for the current year. A marked change in trading conditions both at home and in overseas markets developed in the autumn of 1951. Although we commenced the current year with a good order position, it may prove difficult, particularly if the present consumer resistance continues, to execute all orders as they are ready for delivery.

For the past five months now business has been scarce, in some cases delivery of orders deferred at customers' request, consequently stocks have increased considerably.

At the same time, costs outside our control are still rising as, for example, the further rise in coal and transport charges, and the latest award to operatives.

In the middle of last month (January) in order to reduce production a little more in line with demand, we reluctantly decided to discontinue the 1¼ hours overtime that has been loyally adhered to by all operatives continuously since Sir Stafford Cripps, then Chancellor of the Exchequer, appealed to the Textile Trade in 1947. That small adjustment not having proved sufficient to check the rise in stocks, we have reluctantly decided as from next week to place two-thirds of our Weaving Section on to four days per week for a short period.

Fortunately, we have made and are continuing to make, considerable progress in the modernisation of our plant, and as I indicated earlier, new machinery is expected during the year. Scientific work measurement has now been applied to two-thirds of our production unit, and with the aid of our Research Department, technical development of our fabrics and our production methods, progress is continuous. We have a sound, modern organisation, and enjoy the services of a very loyal, competent staff. I therefore feel that given any reasonable volume of trade, I can look forward with confidence to presenting a report in 12 months that will be satisfactory.

I express my warm appreciation to my colleagues, every member of the staff and to all operatives for their excellent efforts and the record achieved during the year under review.

The report and accounts were adopted.

CLYDESDALE & NORTH OF SCOTLAND BANK, LIMITED

EFFECT OF NEW ANTI-INFLATIONARY MEASURES

INCREASED PRODUCTION FINAL SOLUTION OF ECONOMIC PROBLEM

SIR HAROLD E. YARROW'S ADDRESS

The 114th general meeting of shareholders of Clydesdale & North of Scotland Bank, Limited, was held in the head office, St. Vincent Place, Glasgow, on February 13th, Sir Harold E. Yarrow, Bt., C.B.E. the chairman, presiding.

At the outset the Chairman made sympathetic reference to the great national loss suffered by the death of our beloved Monarch, King George the Sixth.

The Chairman continued: Our profit at £395,256 is £8,061 lower, which may be considered satisfactory in these times. The directors recommend a dividend of 16 per cent.

Let me now turn to matters of national importance. In the postwar period our efforts to achieve economic stability have been marred by a series of rapidly accumulating deficits in our overseas balance of payments. Although the contributory causes are many, domestic inflation has been the major element, and it has long since been apparent that the steps taken to deal with this problem have been quite inadequate. Instead of facing up to the unpleasant facts and adopting a resolute policy which admittedly would have necessitated unpopular measures, the late Government seemed content with palliatives. Thus over the past few years the position steadily deteriorated and at the same time an illusion of prosperity was created largely as a result of inflation. More realistic measures were adopted by the new Government in November, and among these was the introduction of a monetary policy designed to tighten credit and impart greater flexibility to the national economy. A further instalment of the measures to be taken to restore the country's solvency was announced by the Chancellor of the Exchequer at the end of last month. No one can foresee how far, or how vigorously, the policy will be pressed; but the nature, if not the degree, of its effects upon the banks is already sufficiently clear.

As you know, the banks have for some time past closely observed Treasury requests to restrict the provision of credit facilities to the essential minimum, and the fact that advances have none the less shown substantial increases has been largely due to the prevailing inflationary conditions. The most recent monetary changes, however, have resulted in a tighter official control of the volume of bank cash. For the banks this means a curtailment in the amount available for lending and this is superimposed on the new request by the Chancellor of the Exchequer that they should be even more sparing and discriminating in the granting of credit facilities to customers.

BANKS AND CLEAR DUTY

As a result, it has become increasingly necessary for the banks, in complying with official policy, to perform the disagreeable task of declining proposals for advances which conform in every way to normal banking requirements and which under different circumstances would have been readily granted. Moreover, in recent years many sections of industry have been obliged to rely on the banks for finance which but for the crushing burden of taxation would have been provided from their own resources. The influence of the restrictions of credit, although beneficial to the country as a whole, may seem severe and even discriminating to a particular individual who has all the attributes of a sound borrower. But in the national interest the duty of the banks is clear, and if the new policy is to succeed it is the responsibility of everyone to play his full part in the strenuous attempt now being made to save our national economy from disaster. The task ahead will not be easy, but I am sure the banks, while respecting the wishes of the Government, will do their utmost to minimise any inconvenience to their customers and to ensure that business is carried on in an orderly manner wherever the national interest requires. Nor will the banks find the altered conditions to the benefit of their profit and loss accounts since the new pattern will result in restricting the enhanced income which might otherwise have come from advances. Any net accrual from higher rates of interest will be but trifling compensation for the capital losses sustained by reason of the long-continued and latterly accelerated decline in values of gilt-edged securities.

Although the banks have thus no reason in their own immediate interests for welcoming the change in monetary conditions, they readily concur in them so far as they may prove in practice to contribute to the establishment of a sound basis for the conduct of the nation's business at home and abroad.

NEED FOR GREATER OUTPUT

The monetary changes are only part of the necessary remedies, however, and the final solution of our present problem is increased production. The need for greater output is widely recognised, but the personal responsibility for achieving it is less readily acknowledged. We now have a shorter working week and longer holidays—both, no doubt, very desirable, but justifiable only if the hours now worked are more productive. To achieve the greater output so vitally needed at present, restrictive practices, whether on the part of the employer or employee, must be removed. Exhortation to increase production will, of itself, achieve little, and effective Government action is called for to provide both sides of industry with the necessary incentives. Not least amongst these measures should be a reorganisation of the fiscal system so that the incidence of taxation no longer jeopardises the re-equipment of industry nor discourages the worker from all-out effort. The taxpayer's gain need not be the Exchequer's loss.

Failure on the part of each individual to make a supreme effort to increase production can only lead to considerable unemployment at no distant date. If our goods cannot compete in the world markets, our exports will fall and in turn we must suffer a reduction in the import of materials on which our manufacturers so largely depend. Let no one be under any delusion of the dire consequences which will follow from such failure. Our standard of living will be permanently lowered, and all our social gains lost.

The report and accounts were adopted.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The annual general meeting for the year 1952 of the stockholders of Barclays Bank Limited was held on February 8th at the head office of the bank, 54, Lombard Street, London, E.C.3.

Mr A. W. Tuke, the chairman, who presided, paid tribute to the memory of His late Majesty, King George the Sixth; and the meeting stood in silence before proceeding to formal business.

Mr H. G. Tickle (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts were taken as read.

The chairman moved:

"That the report of the directors of the company now produced, together with the accounts annexed as at December 31, 1951, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the 'A' stock, and a final dividend of 7 per cent., making 14 per cent. for the year, on the 'B' and 'C' stock, respectively, less income tax at the standard rate in each case, be declared, payable on the 22nd instant to the stockholders registered in the books of the company on January 14th last."

Mr F. C. Ellerton (deputy chairman) seconded the motion, which was carried.

Lieut.-Colonel Edward Hoblyn Warren Bolitho, C.B., D.S.O., Sir John Donald Horsfall, Bart., Commander Sir Robert Micklem, C.B.E., R.N., Sir Ernest Henry Murrant, K.C.M.G., M.B.E., Mr Frederic Seebohm and Mr John Thomson, directors retiring at the meeting, were re-elected directors of the company, and other ordinary business was transacted.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and twenty-first annual general meeting of Martins Bank Limited, was held on February 12th at the head office, Liverpool. Mr A. Harold Bibby, D.S.O., D.L., chairman, presided.

Before commencing the business of the meeting the shareholders stood as a mark of deep respect to the memory of His Majesty King George VI.

The notice convening the meeting and the auditors' report were read.

Mr Bibby said that, along with others, the bank had suffered depreciation in gilt edged values but was well able to protect the position with the help of inner reserves, as the investment portfolio was in predominantly short-dated Government stocks, if held to maturity, these would show a useful recovery.

The report and accounts for 1951 were adopted and resolutions were passed re-electing the retiring directors and fixing the auditors' remuneration.

A vote of thanks was unanimously accorded to Mr Bibby for presiding.

The chief general manager, Mr C. J. Verity, acknowledged the tribute to the general management and staff.

JONAS WOODHEAD AND SONS

(Manufacturers of Road and Rail Vehicle Suspension Systems)

RECORD OUTPUT

CAPTAIN ALLAN KYLE'S REVIEW

The thirty-second annual general meeting of Jonas Woodhead and Sons, Limited, was held on February 11th at 177 Kirkstall Road, Leeds.

The deputy chairman, Mr Michael Moore, F.C.A., who presided in the absence abroad of the chairman, Captain Allan G. Kyle, said: Before dealing with any formal business, I am sure that it is the wish of all to stand in silence for a few moments in memory of our late King George VI; in regret at the loss to this world of a good man; in sympathy with his family and, because the future is ever ahead of the past, to ponder the burden which at so early an age has fallen upon the shoulders of Her Majesty Queen Elizabeth II. May we all, in our various ways, do our best to lighten that burden.

The secretary (Mr James Templeton, C.A.) having read the notice convening the meeting and the report of the auditors, Mr Moore then read Captain Kyle's review as follows:—

For some years now I have had to explain to you that we have had to deal with trading losses sustained by some of the younger members of our group in bringing them to a state of fruition. But I always felt confident that the day would come when each in turn would pull their weight and together we would do well. That day has now come. Not a single subsidiary company (with the exception of a new acquisition of a few months ago) has failed to earn a profit and your parent company has once again eclipsed all previous records of output. It is indeed a heartening performance. The periods of growing pains in these new ventures have been a severe test, but by vigour and enthusiasm and by magnificent teamwork, they have come through in good heart and in fine fettle. It is certainly with some pride that I say to all concerned, "Thank you for the great efforts you have made, for your loyalty and for the fine work that you have put behind this great achievement."

STEEL SUPPLIES

As you know the healthy existence of your group of companies mainly depends upon receiving the necessary deliveries of certain grades of steel. Owing to our modern and continuous processes of fabrication, we are ravenous consumers, and as our organisation expands, which it is doing both at home and abroad, it is absolutely necessary for our requirements to be met continuously and smoothly. Our suppliers have seen to this over many years and, now that the likelihood of interference by those who are more politically minded than industrially experienced is on the ebb, we feel confident that their ability to help us efficiently will not be impaired. While on the question of steel supplies, I would like to explain that our customers look to us, as a natural service, to hold large stocks of steel with which to meet their scheduled forward requirements. Our inability to do this in present circumstances is a continuous source of anxiety to your management.

THE PROFIT MOTIVE

There has been much misguided and irresponsible talk on the subject of profit, as if it were something to be shrouded, something to one's discredit. Well, to those who think in this manner, let me say at once that here it is our aim to make a profit and when we do so we are proud of it. So are our staff, and so are our workpeople. Let me go a step further. Do you think our customers would continue to give us their confidence and their orders if our level of efficiency was such that a profit could not be earned? This dangerous and infectious criticism of the profit-motive has gone far enough and must be energetically attacked and destroyed.

REVALUATION OF ASSETS

There has been a move in several quarters to get Boards of Directors to revalue their assets at today's figures so that proper allowances for depreciation may be provided and so that reserves can be judged in their true relation to the cost of asset replacement. It is a sensible suggestion in itself but, in my opinion, it is fallacious when linked up with the business as a whole. If we were to propound such an idea in the throes of a slump it would surely be treated with contemptuous criticism—then why do it at the height of an industrial boom which has been going on for 16 years? The true value of buildings, plant and equipment is related to their long-term profit-earning power, and once you get away from this dictum you are heading for an unhappy future.

ACCOUNTS

While the accounts for the year ended September 30, 1951, have been before you for some weeks, there are a few points to which I would like to draw your special attention.

Our group's net profit (before taxation) has increased by £79,025 from £88,753 to £167,778. This is in part due to increased production and in part, as already mentioned, to our young subsidiaries having got through the teething stage. Taxation takes £87,221, against £35,581, and after a minor adjustment for interests of outside shareholders we are left with a net profit of £80,296, against £52,898, an increase of £27,398.

I want you to weigh these figures very carefully: by sheer toil we have been able to win £79,000 extra net profit, but of this nearly £52,000 has gone in taxation, leaving the company only some £27,000 net. The chairman of one of the Big Five banks recently used words far more apt to describe this process than any I can express: "The plain fact is that the present level of national and local taxation is causing a steady erosion of personal, industrial and national assets." And again, "If, therefore, this country is to regain its economic health and increase its productivity, there must be a drastic reduction of taxation and a reform of its incidence."

CONSOLIDATED BALANCE SHEET

Looking now at the consolidated balance sheet at September 30, 1951, the main features are the new item of £200,000 four and three-quarters per cent. Unsecured Loan stock, 1956-61, coupled with a marked improvement in our current liquid position. For years past, this company has financed itself out of ploughed-back profits or cut of new risk-bearing capital. The amount of the former has been grievously and progressively reduced by excessive taxation: the latter course has been rendered practically impossible by the incidence of profits tax. During the year, in view of continued increases in the cost of everything, your board came to the conclusion that we must have more cash and decided to raise it in a semi-permanent form the service of which is an allowable charge for taxation.

A casual observer looking at the balance sheet at September 30, 1951, may be inclined to think, in view of our holdings of tax reserve certificates and cash amounting to some £312,000, that it was not necessary to raise this money. My answer to this is really given in my earlier remarks as regards steel supplies: as soon as we can again hold adequate and balanced stocks we shall need every penny unless there is a sharp drop in prices.

DIVIDEND

The true capital employed in this business is over £1,200,000 and therefore the recommendation of your board to pay a 15 per cent. dividend is in reality the equivalent of less than 6 per cent. of the capital employed. In this light it was felt that the merging of the bonus paid last year in the basic dividend was fully justified. On the other hand, your directors did not feel justified in recommending an increased total distribution as we must conserve our resources.

EXPORTS

Our direct export trade of locomotive and carriage suspensions was well maintained throughout the year, but the present-day tendency in foreign countries to transfer the private ownership of railways to state ownership is inclined to disorganise the normal flow of supplies and replacements. The demand for the Woodhead-Monroe shock absorber is increasing rapidly both at home and abroad and, provided that we are not subjected to a raw material shortage, the future is bright. The great bulk of our export consists, of course, of suspensions fitted to motor vehicles whose manufacturers have done such a magnificent job in breaking into world markets as never before.

REARMAMENT AND PROSPECTS

It is indeed sad that once again we have to turn our minds to rearmament but no one would deny the wisdom of preparedness in these times. Your group of companies will have an important part to play and their experience, resources and manufacturing capacity are unreservedly available to the Government for this purpose. Whatever is required of us will have its influence on our normal productions. This unknown factor, together with the international problems of today, makes it difficult to discuss future prospects. Current prospects are certainly good and I think it would be wise to leave it at that.

The report and accounts were unanimously adopted and the proceedings closed with a vote of thanks to the directors, staff and employees.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1

LIEBIG'S EXTRACT OF MEAT COMPANY

INCREASED DEMAND FOR OXO

The eighty-seventh annual general meeting of Liebig's Extract of Meat Company, Limited, will be held on March 6th at Thames House, Queen Street Place, London.

The following are extracts from the statement of the chairman and managing director, Mr Kenneth M. Carlisle, which has been circulated with the report and accounts:—

Profits less losses on trading, etc., at £2,100,000, show an improvement over the previous year of £435,000. Most of the companies within the group participated in this better overall result, but the greatest single factor is a very welcome recovery in the profits of Oxo Limited.

Results of our Continental European subsidiaries again improved and played their part in swelling the profits of the group as a whole.

We had last year to face a net exchange loss of £208,000 as a result of devaluations of the Argentine and Paraguayan currencies. This year we are confronted with the really formidable figure of £408,000 arising almost entirely from the devaluation of the Guarani, the Paraguayan currency. Inflation has been rampant in the River Plate countries during the last few years and unfortunately, shows no signs of abating. Even so, it must be admitted that a fall in the value of the Guarani to the extent realised was something of a shock for companies operating in that country It is a considerable disappointment to find our profits whittled away by factors over which we can exercise no control.

The profit brought into the accounts of the parent company amounts to £259,000, an increase of £9,000 as compared with the previous year. Your directors recommend an allocation of £33,440 to reserve for contingencies which will bring this reserve to a round figure of £450,000. The proposed final ordinary dividend of 7s. per £5 unit, tax free, makes a total for the year of 9s. per £5 unit, tax free, representing a gross payment of 17.14 per cent.

OXO LIMITED

In my statement last year, I referred to the general restriction of trade in the spring and summer of 1950, due to the desire of all traders to reduce stocks. At the same time I mentioned that, during the latter part of 1950, sales to the trade had greatly improved. This tendency was maintained throughout the balance of the financial year, with the result that the sales of Oxo Cubes during the whole year now under review largely exceeded the sales for the previous year. Still more encouraging is the fact that purchases by consumers over the counter show increased consumption per head of the population.

Fray Bentos Soups and Meat and Fish Pastes continue to find favour with the public; but the volume of trade is severely restricted owing to unavoidable shortage of tins for soups and of meat and fish for pastes. Meanwhile, quality is maintained at the highest possible level, with a view to eventual expansion of business when supplies of first-class materials become adequate to meet all demands.

Large quantities of Fray Bentos corned beef from our factories in Paraguay and Africa have been supplied through Oxo Limited to many export markets, notably in the Mediterranean area and to the United States and Canada. The greater part of the output of corned beef from our Argentine factory continues to be purchased by the Ministry of Food, the balance being distributed by Oxo Limited in overseas markets.

CARRERAS, LIMITED

A SATISFACTORY ACHIEVEMENT

PROPOSED CAPITALISATION OF RESERVES

The 48th annual general meeting of Carreras, Ltd., was held on February 11th in London.

Sir Edward Baron (chairman and managing director), in the course of his speech, said: The twelve months to October 31st last developed rather in the way we anticipated, with costs and expenses continuing their upward trend. At one time we thought that the results would not make such a good showing but two factors helped to improve the position. In the first place our export trade was larger in volume and this naturally gave us some advantage. Secondly, for the last two months increased selling prices were in operation, from which we derived a corresponding benefit. This was long overdue, but the full advantage should of course be felt in the current year.

While the view expressed by your board a year ago that they could not be confident that profits would be maintained at the same high level was thus borne out, the results might well have been worse. I hope, therefore, you will regard our achievement as satisfactory in the circumstances.

With the existing stock position and the need for the Government to maintain the revenue from tobacco duty, I cannot see that any serious diminution in supplies of tobacco and cigarettes to the public will occur this year.

The period covered by the accounts was more competitive than for some long time, but our relative position in the trade remained unimpaired. All our products continue to enjoy widespread popularity.

CAPITAL PROPOSALS

A study of our balance sheets over the past few years must have impressed upon you the fact that the capital actually employed in this business far exceeds the issued share capital. Your board has decided that the time has now come to bring these two more into line so that some of the large amount of our earnings which we have ploughed back over many years and invested in the acquisition of buildings, plant and machinery, stocks and other assets, and upon which current profits are earned, may be shown in the accounts under their true description.

Application was recently made to the Capital Issues Committee for consent to capitalise £3,720,300 of the reserves and carry forward and to apply that sum in paying up 29,762,400 "B" ordinary shares of 2s. 6d. each for distribution among the ordinary shareholders on the basis of eight new "B" ordinary shares for each existing ordinary or "A" ordinary share, and one new "B" ordinary share for each existing "B" ordinary share held. You will, I am sure, be pleased to learn that the necessary consent has been received and we hope to be able to issue allotment letters early in May. Our dividend policy in the future, as in the past, will be governed by considerations affecting the best interests of the business.

We also contemplate taking steps at a later date to convert each of the existing £1 "A" ordinary shares to eight "B" ordinary shares of 2s. 6d. each. This will, I know, be welcomed by shareholders generally.

So far as the current year is concerned, all I can say is that we have made an encouraging start and if this continues we should have a reasonably good result to report in twelve months' time.

The report was adopted.

MILLS AND ROCKLEYS LIMITED

MR GEORGE MILLS' STATEMENT

The accounts for the year ended October 31, 1951, show that the consolidated profit of Mills and Rockleys Limited and its subsidiaries is £133,618 compared with £134,054 last year. The available net profit is £42,205 compared with £55,857 in the previous year. This decrease of £13,652 in the available net profit is due largely to the heavy increase in taxation which amounts to £87,306 compared with £78,197 last year. Taxation this year absorbs 13s. 1d. out of every £1 of profit earned by the company, an increase of 1s. 5d. in the £1.

The directors recommend an ordinary dividend of 10% (1s. per share) less Income Tax, absorbing £27,830, being the same rate of dividend as has been paid last year.

RISE IN COSTS

The rise in costs to which I referred a year ago progressed even more rapidly during the first half year of 1951 than it had done in the latter half of 1950, with the result that by the middle of 1951 an increase in our charges for space and service became imperative.

On the other hand the volume of our turnover has been more satisfactory. The shortage of civilian supplies in the shops, which a year ago was generally expected as a result of the diversion of resources to rearmament, did not materialise. Indeed, as the year progressed the retail home market has turned to a growing extent towards a buyers' market, and our turnover was buoyant during the latter half of our financial year.

The results shown in the accounts have scarcely benefited at all from the increase in our charges. This increase will gradually become effective during the present year, but costs of every character are still rising.

Though at the moment there are not the immediate signs of a recession in our trading, which were apparent a year ago, I must utter much the same word of warning that I did then. The Government are now again having to take drastic steps to make the country pay its way and, sooner or later, some shortage of civilian supplies is likely to appear which may bring about a reduction in the total amount of advertising.

NEW POSTER PRESENTATION

During the year, with the assistance of Mr Rolf Hellberg, F.R.I.B.A., of Coventry, we have devised a new form of poster panel which has been the subject of much favourable comment from advertisers, their agents and town planning authorities. Your board are proud to be the sponsors of the most marked improvement in poster presentation that has been achieved for a quarter of a century.

ADVERTISEMENT REGULATIONS

I referred in my last statement to the difficulties arising as a consequence of the advertisement regulations. Those difficulties continue, but I am happy to report that a better understanding between the industry and the public authorities is arising. Many authorities are now realising the important economic necessity for outdoor advertising and, on the suggestion of the Ministry concerned, are co-operating to ensure that there are proper provisions to meet the demands of national and local advertisers while still preserving amenities. There is no doubt that the pleasing characteristics of our new Hellberg panel and our patented design of public information panels are helping materially.

NEWCASTLE BREWERIES LIMITED

RECORD OUTPUT

The sixty-third annual general meeting of the Newcastle Breweries Limited was held on February 14th, at Newcastle-upon-Tyne. Mr Alex. McConnell, chairman of directors, presiding.

The output at the Brewery was again a record, the increase in barrelage being of the order of 10 per cent. The Exhibition Pale Ale once more shows a gratifying rise, and the IPA, our standard ale, has more than held its own. The bottling factory has had a good year against increasing competition and the sales were higher than any previously recorded. There is a definite trend all over the country towards beer in bottle, but I am glad to say, as far as this company is concerned, our draught beers maintain their popularity. The wines and spirits department have also had a busy time. The mineral water factory has more than maintained its turnover.

The trading figures, I think, may be considered under all the circumstances satisfactory; gross profits being higher by slightly over £10,000, but the cost of materials and charges of every kind increased to such an extent that the trading profit shows a small decline.

PROFIT AND DIVIDEND

The profit for the year after providing for income tax and profits tax on the profits to date, debenture interest, and directors' fees amounts to £145,290.

It is proposed:

1. To pay a final dividend of 3 per cent. less tax on the preference stock.

2. To pay a final dividend of 10 per cent. and bonus of 3 per cent. on the ordinary stock.

An analysis of the disposal of the total revenue of the company works out as follows:—

Duties, taxes, and licences	60.6 per cent.
Materials and services ...	24.9 per cent.
Wages, salaries and pensions	10.3 per cent.
Reserves	1.9 per cent.
Debenture holders and shareholders	2.3 per cent.
	100 per cent.

Stocks are much higher owing to enhanced prices, particularly of barley and malt. The barley harvest was difficult and prolonged following a cold spring and unsettled summer. The figure for good malting barley has risen to fantastic heights and the average cost per quarter is anything from 40s. to 60s. above that of last season, when it was considered inordinately high. All this is bound to affect brewing costs and may mean an increase in outlay of 8s. to 10s. per barrel. In addition to which wages and other materials will take their toll.

In the summer of last year the question of price adjustments of beers was discussed at meetings of the local associations and it was decided at that time to leave the prices of draught beers as they were but to increase those of bottled beers in which the elements of labour and transport enter to a greater degree. It was also agreed to make an allowance off the cost of draught beer to the retailer to go some way to compensate him for increased charges of many kinds. Since then, owing to the soaring price of barley, and malt and hops, the situation has completely altered and after consultations between the local brewers and retailers it has been resolved to raise the price of draught beers by one penny per pint, with an additional allowance to the retailer.

The report was adopted.

LUMUT RUBBER ESTATES, LIMITED

The annual general meeting of Lumut Rubber Estates, Limited, will be held on March 5th in London.

The following is an abstract of the address of the chairman, Sir Eric Macfadyen, circulated with the report and accounts:—

The marked recovery in the rubber market coincided largely with the company's financial year under review. It is a source of great satisfaction to my colleagues and myself to present accounts which disclose the most successful trading operations enjoyed by the company during the 42 years of its existence.

The net selling price of our crop (3,528,550 lb. of rubber) worked out at just over 42d. per lb., almost double the previous year's average. On the other hand costs also nearly doubled but, on balance, we were better off by fully 11d. per lb.

Before taxation our profit was £322,963. An interim dividend of 10 per cent. has been paid and we recommend a final of 15 per cent., making 25 per cent. for the year, and if this is approved the rate of dividend will be the highest since 1926-27 when 30 per cent. on the then capital was paid.

I visited several of our estates again during the year and found conditions most satisfactory. Good progress has been made at Dusun Durian in replacing obsolescent rubber with oil palms and we now have 588 acres under palms.

For the current year, we estimate production at some 3,400,000 lb. of rubber, allowing for some reduction in crop for the time being from areas in course of replanting. We have sold forward 27 per cent. of this estimated crop at prices which average approximately 37d. per lb. London landed equivalent.

THE TRAINING OF TECHNICAL TEACHERS

Applications are invited from men and women of approximately 25 years of age and over, for admission to a ONE-YEAR COURSE OF TRAINING as full-time TEACHERS OF GENERAL COMMERCIAL AND PROFESSIONAL SUBJECTS, AND/OR OFFICE ARTS (SHORTHAND, TYPEWRITING AND OTHER SECRETARIAL WORK) in Technical Colleges and similar institutions.

Applicants who wish to teach general commercial and professional subjects, should have a University Degree, or professional qualification, or a Higher National Certificate in Commerce.

Applicants who wish to teach Office Arts should possess higher certificates of some recognised examining body in shorthand and typewriting, and should show evidence of a good general education.

In all cases applicants will be expected to show evidence of good business and other clerical experience.

The courses will begin in September, 1952. Recognised students will pay no fees and they will be eligible for maintenance grants for the period of the course.

Further particulars and application forms may be obtained from the following Colleges on receipt of a stamped addressed foolscap envelope.

Enquiries for forms should be endorsed "S/1/22."

CROWN AGENTS FOR THE COLONIES

PRODUCE OFFICER required by the Government of Nigeria for the Department of Marketing and Exports for one tour of 18 to 24 months with prospect of permanency. Commencing salary according to qualifications and experience in scale £711 rising to £1,290 a year, including allowances. Outfit allowance £60. Free passages for Officer and wife and assistance towards the cost of children's passages or their maintenance in this country. Liberal leave on full salary. Candidates, under 40, should have had a good education and preferably hold a University Degree in Commerce, Economics, or Agriculture, or a Diploma of an approved Agricultural College. Experience in the inspection and grading of agricultural products an advantage.

Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting on letter M.25572.C. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

A YOUNG director of old-established City import and export company interested in joining firm of foreign exchange brokers. —Write Box Z.O.203, Deacon's Advertising, 36, Leadenhall Street, E.C.3.

UNIVERSITY OF BIRMINGHAM

BARBER CHAIR OF FINE ART AND DIRECTORSHIP OF THE BARBER INSTITUTE

Applications are invited for the above post to be rendered vacant by the retirement of Professor Thomas Bodkin on September 30, 1952. The salary will be not less than £1,850 p.a. Applications should be lodged with the undersigned (from whom particulars should previously have been obtained) before March 8, 1952.

C. G. BURTON, Secretary.

The University, Edmund Street, Birmingham, 3.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER IN SOCIAL ANTHROPOLOGY from candidates with research qualifications in the field either of primitive society or of modern community studies. Salary scale of Lecturer £500 to £1,100 per annum, membership of F.S.S.U., and children's allowance scheme. Applications should be sent not later than March 17, 1952, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

NATIONAL BANK OF PAKISTAN

(Incorporated in Pakistan under Ordinance No. XIX of 1949 of the Government of Pakistan.)

HEAD OFFICE. Post Box 519, Karachi.

Applications are invited from retired men or men with a minimum of 20 years' banking experience obtained in a first-class commercial bank for employment in responsible positions in the National Bank of Pakistan. Experience in banks in the Indo-Pak Sub-continent will be an advantage. Contracts will be for three to five years. Those selected will be stationed in Karachi, Dacca and Lahore.

Applications, stating details of qualifications, experience and minimum emoluments acceptable, should be sent to he undersigned within thirty days of the publication of this notice.

S. K. ABDULAZIZ, Chief Establishment Officer.

LADY PRIVATE SECRETARY required by Chairman and Managing Director of leading organisation managing large group of Companies with interests abroad. The post is a senior one involving both business and social responsibilities and calls for a lady between the ages of 25 and 35 who has already had a first-class secretarial training and experience at a high level in her profession and will be remunerated accordingly.—Full particulars to Box No. 462, Dorland Advertising, 18/20, Regent Street, S.W.1.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar ($1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable March 15, 1952, to shareholders of record at the close of business February 15, 1952.

By Order of the Board,
Toronto, February 12, 1952. C. H. WINDELER, Secretary.

GOOD FOOD

We specialise in catering for industrial canteens, offices, and luncheon clubs. Our organisation is not too large or unwieldy and we can give personal supervision to all our contracts. Write for testimonials from our clients; addresses given on application to:-

Harold Jayes & Son, Ltd.,
29, West Heath Court,
LONDON, N.W.11.

Postal Tuition for B.Sc. ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 760 Successes at Lond. B.Sc. Econ. Final Examinations, 1925-51.

Prospectus from the Director of Studies, Department P17 — WOLSEY HALL, OXFORD

In Defence of the Realm

NUMBER 1 IN A SERIES

There's no question about it. Tomorrow's aircraft will be Deltas. And it's not a revolution. It's an evolution in design. The normal, orderly process of development which strides from today into tomorrow. Given immense jet power — the design, the shape, the planform of future aircraft naturally becomes a Delta. Here is the answer for long range, high altitude, high speed aircraft with a heavy payload. Pioneer in Deltas is A. V. Roe of Manchester. Their successful research and flight testing programmes with the 707 A and B have captured the imagination of the world. They have proved, among other things which unfortunately must be secret, that the Delta handles like any other good aeroplane, easy to fly, easy to land. A. V. Roe is a member company of the Hawker Siddeley Group, that industrial commonwealth of companies, largest of its kind, whose resources are pledged to building the prosperity and defensive strength of the Free World.

A Bargain for Lisbon

DEMOCRACY was at work with a vengeance last weekend when the four Foreign Ministers began their consultations about the defence of Europe and Germany's contribution to it. The Bundestag had hoped to tie Dr Adenauer's hands with limiting resolutions; and these had excited the French Assembly, which, very naturally, proceeded to attach conditions to its approval of M. Schuman's policy in the hope that he, too, would have to negotiate under restraint. Mr Acheson, though less directly under pressure than his European colleagues, knew that what was decided in London and Lisbon this week would deeply affect the attitude of Congress towards the Mutual Security Bill that comes before it shortly. If he had not heard he could at least imagine the charges and arguments that would greet any breakdown of western defence policy and the fate that would befall the appropriations he would request for Europe. Only Mr Eden can have felt any real freedom of gesture, thanks to the vagueness that has marked British policy in Europe; yet even he faces next week a debate in the House of Commons that might switch quickly from alarm about China to misgivings about Germany. In the circumstances the Ministers' task was to work for compromise, to persuade the Atlantic Council in Lisbon to say that there is still hope for the European Defence Community, and to keep details from the legislatures until that has been done. In the event, neither the French nor the German Foreign Minister took his legislature too seriously; concessions were made, especially by M. Schuman. Hence the anodyne communiqués and the rapid departures to Lisbon of almost everyone who knows what was actually said and done.

Clearly, the deadlock and breakdown that threatened last week have been averted by compromise. It looks as if a triangular understanding has been reached, so that negotiations for the defence community can go on. M. Schuman appears to have agreed to drop his proposal that the new contractual arrangements with Western Germany should include restrictions on its right to produce arms; so moving a little way towards the Bundestag's claim for equality and sovereignty. Dr Adenauer appears to have modified that claim and agreed that the commissioners—that is to say, the executive officials—of the European Defence Community will decide where and how arms are to be produced. (The Ruhr, being highly vulnerable to attack, could be denied on strategic grounds some of the most important production tasks.) In short, some of the restraints on what future German governments might do will be in the hands of the defence community, in which Germany can vote as an equal with France. And, as the third side of the triangle, in order to save the French from feeling that they are left alone with Germany, which will one day inevitably again be stronger than France, the Americans and British are considering ways of bringing their influence to bear on the disputes that will certainly arise within the community. On the other major difference—the clash between Germany's insistence

upon equality, including the right to join Nato, and France's refusal to consider German membership—a similar compromise appears to have been reached. Germany will not actually join Nato, but there will be the closest relationship, on relevant matters, between the EDC and Nato.

By these means, an open breakdown has been averted and the work of constructing the European Defence Community can continue. But it has been made very clear how fragile is the paper structure that M. Schuman and Dr Adenauer are building. It requires, after the last few weeks, a very hardy degree of optimism to believe that a trustful comradeship in arms can be built between France and Germany if they are left to confront each other without the active participation of stronger powers.

Something else has been made clear—the prospect that will open up if a European Defence Community is not created. France and Britain would have to face the choice between assuming burdens of rearmament even heavier than those under which they are already staggering and losing even such prospect of security as they now have. The Americans might think that they had to choose between the French and the Germans as allies. Or, worst of all, they might, in this Presidential year, decide that any allies are more trouble than they are worth. As was argued in these columns last week, these are the very unpleasant alternatives that would have had to be faced if M. Schuman and Dr Adenauer had felt bound by the demands of their legislatures.

★

The inference to be drawn from all this is almost too obvious to require stating. If a European Defence Community is necessary, but a satisfactory community is not to be expected by leaving the Continental countries alone to set it up, then it follows inevitably that America and Britain must lend a hand. That is what Mr Acheson and Mr Eden have been doing, and it was entirely proper that the work should have been done in London, since Mr Eden, of the four, has probably the most to contribute and is the most free to contribute it. It is, of course, no new discovery that the key to the European Defence Community lies in London. It has been said, with tiresome iteration from the start, particularly in France. But the difficulty about the point, as it has hitherto been made, is that it has usually taken the form of insisting that Britain must come into the Community as a full member like any other. That is simply not on the cards; no British government would agree to it, and would not be supported by public opinion if it did. One of the gains of the last few weeks has appeared to be the acceptance by all concerned of the fact that Britain is no longer regarded as a prospective candidate for membership. The talk, during the past week, of guarantees of the community to be given, from outside, by the United States and the United Kingdom has been a tacit concession of the point. It puts matters into the right light, for it is based on the proposition—which seems almost obvious to British minds—that militarily and strategically Britain's position is far more akin to that of the United States than to that of any country on the Continent of Europe.

If this essential principle is now accepted, however, it clears the way to positive action by Her Majesty's Government; there is no longer need for the British reaction to French appeals for help to be negative and defensive. If it is clear that the plan is for Britain to be a flying buttress, supporting from outside, not a pillar within, the construction can start. It is to this that Mr Eden should now address himself. First of all, there should be an emphatic—indeed, a ringing—declaration from the British Government that it will give to the European Defence Community any help or support (other, alas, than financial) that the United States will give. It should be made clear once and for all that, wherever feet are being dragged, it is not in London.

Beyond that, however, there should be an attempt to specify what help Britain can give. The talk has hitherto been of "guarantees," and if there are practical guarantees they should be given. What the French have in mind is a guarantee that the Germans will not use the EDC as a means of regaining troops and armaments and then at a later stage denounce the agreement and convert the German contingents into a national *Wehrmacht*. The contingency is clear enough, and conceivably the Germans might not be the only denouncers—General de Gaulle must be borne in mind as well as Dr Schumacher. But how does one "guarantee" such an agreement save by promising to use force, and are America and Britain ready to use force in such a contingency?

★

Indeed, a "guarantee," though it might have some value, would be a very remote and lifeless means of achieving its end. What would allay the French fears far more completely than the existence of a legal document, which could hardly be other than vague, would be the presence of the Americans and the British actually in the councils of the community. Is it impossible for the British Government to declare that the forces it in fact maintains on the Continent of Europe shall be treated as an integral part of the European army, just like the other national contingents? Could it go further and promise that, for a stated period, these forces would never be less (though they might be more) than, say, two divisions of ground troops and an appropriate number of tactical aircraft? If this could be done, then Britain could take its seat in the Community as, so to speak, a non-resident member paying a reduced subscription.

An offer of this kind would also help in securing the other major condition of Western European security, the most indispensable of all—that the Americans should stay in Europe. It would be disastrous if greater British support for the EDC were anywhere interpreted as reducing the need for American support. People on the Continent have not forgotten something that General Eisenhower was reported last year to have said, that when a powerful European army existed the withdrawal of American divisions could begin. That prospect has been used in successive weeks by speakers in the French and German parliaments to arouse suspicion and fear. American policy can perhaps hardly be expected to go quite as far as the suggestions made above for the British. For all the support of federal principles and of world government, no country is in fact as jealous of its sovereignty as the United States. But it would be a very healthy change in the international atmosphere if it were for once the British who were issuing a friendly challenge to the Americans to match their own practical contribution to European integration.

The Case for Severity

IN ten days' time the Government's economic policy will be complete. The budget on March 4th will be the third and final instalment of the measures that should save this country from economic disaster. The threat of disaster is drearily familiar, and for many people familiarity has already bred contempt. Yet that in itself makes the third crisis since the war different from the others. A country that has scraped through so many perils has become harder to convince that it cannot rely on scraping, and that heavy sacrifices are the necessary price of future safety. Mr Butler's task requires, therefore, more political courage than was needed for Sir Stafford Cripps's first budget in 1948.

But if the difficulties are greater, the spirit in which they are faced should be stronger. The task now falls to a new administration, to men who for six years have enjoyed the comparative leisure of opposition in which to clear their minds on the familiar issues of economic policy. It is, indeed, thirteen years since a Conservative government presented a peacetime budget. Keynesian thought had then barely begun to influence Whitehall and Westminster. It falls, appropriately, to Mr Butler to give the first practical demonstration of his party's response to this great intellectual change and to all that has happened, by development and by reaction, since the modern concepts of the budget and of economic planning were worked out in wartime.

Mr Butler must be tempted to wish that his budget could be restricted to prewar aims. If it were no more than the conventional accounting of government revenue and expenditure, without any conscious attempt to steer the whole economy by the influence of public finance, the coming budget might give Mr Butler no harder task than many Chancellors have fulfilled before. It is, admittedly, difficult to make the usual forecasts, even about the state's own finances, a month before the end of the old financial year. Such figures, and guesses at figures, as can be given will be found in an article on a later page. The decisions the Government has already taken will keep expenditure to this year's amount—for purposes other than defence—in spite of higher prices. But those higher prices, and the inflation which they express, will be reflected on the other side of the account. Mr Butler can expect a large expansion in the revenue from existing taxes: how large is, at present, the most important unknown. But it may well balance, in the conventional accounts, a large part of the increase in defence expenditure.

If the defence programme were being carried out on the intended scale for the second year, it would cost nearly £600 million more than has been spent in the first year. In fact, the increase is to be little more than £300 million. It is possible, therefore, that if he were to look strictly at the Budget problem alone, Mr Butler might feel himself excused from the necessity of making any sharp changes. Although some modifications in the structure of taxation and subsidies have already been promised—there is, for example, the Excess Profits Tax to come—the changes might roughly balance out and leave the public at large feeling pleasantly relieved. The Budget would still show a bigger surplus than is being achieved this year.

The temptation for any government to do this if it possibly can must be very strong, and for a Conservative Government with a narrow majority it is almost irresistible. The test of Mr Butler's statesmanship and of his courage will lie in the extent to which he insists that the Conservatives must have a larger surplus in 1952 than the Socialists secured in 1951. The temptation to be resisted is all the stronger because it is just possible, with some optimism, to make out a tolerably respectable argument for the thesis that a severe budget is not absolutely necessary for the next twelve months—provided that no attention whatever is paid to what would happen after that.

★

The argument would run something like this. Budgetary action, whether it consists of higher taxes or reduced expenditure, inevitably affects consumption—that is, the standard of living of the people. Granted that some form of civil expenditure must be reduced to make room for higher defence expenditure, there still are some things, other than the people's consumption, that can be cut. Indeed, some of them are going to be called upon for a contribution in any case. Some of the import cuts are to be softened by drawing on the strategic stockpile. Since the only extra exports that can certainly be sold quickly are various engineering products, investment in British industry is in any case to be cut and new plant and machinery are to be exported. In these ways, by drafts on existing capital and by reduced provision for the creation of new capital—even without any contributions from the most conspicuous such source, the housing programme—it is possible that enough resources might be scraped together to increase exports and to keep the defence programme going on reduced scale for twelve more months.

But after that would come the deluge. One may leave aside, in this mainly domestic analysis, the effect of such a renewed display of improvidence on the world's confidence in sterling—the factor which, though it escapes from the planners' calculations, dominates their results. Next year, defence expenditure will rise once more; the stockpile cannot be raided again; the revenue may not be—if inflation is stopped, should not be—so buoyant as it is now. As for exports, nothing could be clearer than that it would be madness for an industrial exporter to go on starving himself of new equipment in order to export. That is the procedure of the bankrupt sale, and it can be the cause as well as the consequence of insolvency.

Some drafts on capital or capital formation are technically necessary in the immediate emergency. But it is the obvious aim of economic policy to make them as small, and bring them to an end as quickly, as possible. Britain cannot be secure unless it carries out the defence programme. It cannot be prosperous unless it can trade freely without continually cutting imports to the danger level. It cannot be solvent unless it exports enough to pay for an adequate volume of imports. It cannot be progressive, or hope to lift the standard of living to a new and higher plateau, unless capital investment, so far from being throttled, is stimulated. There is really no possibility of denying any one of these propositions. Yet the inevitable consequence of them is that, in the immediate

future, it is the consumption of the people—all but the very poorest of them—that should take the necessary cut. And for the purposes of the next few weeks, the sign and symbol of that is a large surplus in the budget. A courageous Chancellor of the Exchequer, so far from trying to postpone the inevitable and stretch out his expedients as long as they will last, should aim to push them aside as soon as possible and save the country from insolvency by methods that can be permanently sustained.

*

These are not ideals ; they are what solvency means. If it is content with lesser objectives, the Government may scrape through this crisis, but it will not restore the British economy to strength. Once again, in Sir Stafford Cripps's phraseology, a fresh crisis will follow when one series of expedients is exhausted. And this is not an unending progression ; sooner or later, the expedients will fail to stave off even the immediate peril.

When they were in opposition, ministers saw these things plainly enough. They cannot now be blind to the implication for this year's budget. Mr Butler may be able to scrape along without harsh measures forcing the British people to consume less. It may be—though it is highly doubtful—that with such a budget the country could survive the present strain on sterling. But it is quite certain that the recovery would be temporary, that a relatively mild Budget will not transform this economy and enable it to meet all the commitments—for exports, for investment and for arms—on which the security and solvency of the British people depend.

The only method of meeting these commitments is to reduce the other demands on the economy ; and that is to cut consumption. If the purchasing power of the home market is not cut down, manufacturers in most consumer trades will remain able to get along comfortably without looking for new export markets ; it will then be true, in 1953 as in 1952, that the only way to increase exports quickly is again to cut investment. In twelve months' time it will still be true that the industries which could export more are short of manpower and materials. But these are not facts of nature. They can be altered by the Government provided that the Government acts in time. The export trade can next year be freed from its dependence on temporary expedients provided that disinflation at home starts this year. That is why the Conservatives were right to blame Labour for short-sightedness in the other crises.

It will be said, of course, that times have changed, that unemployment is increasing and therefore inflation is over ; that there cannot be any need to reduce purchasing-power when textile mills are already short of orders. In fact the latest figures, for January, still show the proportion of unemployed as only one-fifth of one per cent bigger than it was at the same time a year ago—1.8 against 1.6 per cent. No doubt the number is still rising, but employment is still overfull. Some of the increase in unemployment is caused by shortages of raw materials ; it reflects the dislocations of inflation, not deflation. Other people, mainly in the textile trades, are out of work because the demand for their products has fallen. In the same way, some people were out of work in the development areas even at the height of the Daltonian inflation. The troubles of Lancashire and Yorkshire do no more to remove the need for disinflation now. In both cases the unemployment is structural ; it springs from particular circumstances and has little to do with the state of inflation, except that the distortions which inflation perpetuates often make necessary structural changes more difficult. The Chancellor must know perfectly well and should insist whatever the political difficulties, that the weak point in the British economy is the gold reserve, not the structure of full employment. The danger of mass unemployment still lies not in a slump but in the possibility that more and more factories will run short of materials because the country cannot earn its imports. It is inflation, not disinflation, that carries the greater risk of serious unemployment. Disinflation will clear the way for greater exports, and therefore for every man it puts out of work, it saves ten from unemployment.

This is the basic need that the Budget must serve. And to do so, it must be a severe Budget. It must be directed openly and firmly to reducing the consumption of all but the very poorest sections of the community. There is little point in trying to guess at this stage, before Mr Butler has set out the official forecasts of production and income for the current year, how large the cut ought to be. But to make it effective will certainly require further cuts in the Government's own expenditure ; and whatever else escapes, the food subsidies, which are the least efficient and most inflationary part of that expenditure, are the obvious target.

Talking with Egypt

ONLY three weeks ago, a pitched battle between British and Egyptians had just taken place at Ismailia and an Egyptian mob was sacking central Cairo. Today, the din is hushed. Diplomatic contacts with British representatives have been resumed. Ministers of the Egyptian Crown are making serious statements about austerity, about taxing luxuries and about "acquiring essential supplies for the majority of the people"; and are proclaiming that the cotton market must no longer be a "club for gambling." Part of the hush is due to the incredulous awe with which a public that is starving for signs of decency is watching a cabinet of new brooms tackle its work. In London the Egyptian diplomatic envoy to King George VI's funeral has twice talked with Mr Eden. The contrast with the turmoil of the last days of Wafd rule is astounding and does great credit to the Egyptian Prime Minister, Aly Maher Pasha. By a remarkable exercise of personality he has brought about a lull that is affording a useful pause for thought both in Cairo and in London.

There is a considerable division of responsible opinion in both capitals. In Britain, the principal cleavage runs between those who have lately been in Egypt and those who have not. Those without experience of Egypt in the past year—during which some profound changes in the climate of opinion have taken place—cannot understand how it is that men living in so central, so covetable and so vulnerable a country can be impervious to the logic of geography, to the existence of the cold war and to considerations of world strategy. There must, they

say, be some way of putting emotion and logic into a reasonable perspective—that is, of convincing Egyptians that a foreign base is in their national interests. Those who have recently watched the Egyptian scene at first hand know that to expect this is to expect too much. They know that the Wafd's anti-British propaganda fell on fertile soil ; they know also that left-wing doctrines have lately made huge strides. The British troops are a symbol of former bondage and are hated, while a great mass of Egyptians do not think that their present way of life is worth defending. In a word, as was argued in *The Economist* two weeks ago, Britain is trying to establish with Egypt two relationships—one, that of a friend, the other that of defender of Egyptian soil—and the two are in local eyes no longer compatible.

Opinion in Egypt, too, is divided but along different lines. The cleavage there lies between those who, like the principal Wafd leaders, want the evacuation of British forces as an end in itself, and those who, while realising that dangers to Egypt exist, want the British to go because they are confident that given an adequate supply of arms, the Egyptian army could hold its own until allies tumbled in out of gliders and transports from bases not too far away. Both groups want the British to go at least some distance away.

Between the extreme views on either side, there is clearly an unbridgeable chasm. The rift which lies between even the more moderate thinkers is considerable. Anyone who sets out to bridge it must be prepared to resolve many practical points that are no less important than the diplomatic question of rights. For instance, what is to happen to the phenomenally large stores and repair shops which the British have since the last war stored in Egypt ; these goods belong to the hard pressed British taxpayer. Who can guarantee that, once shifted, they could ever be moved back again if Egypt were attacked ? Or again, how can sufficient Egyptians be quickly trained for the immense mass of highly technical jobs that are essential to adequate air defence of their vulnerable canal ? In common with the Arab states, Egyptians believe this complicated operation is easy, whereas their own inquiry into their army's recent management of a small campaign—the Palestine war—suggests that its administration was so faulty as to be unable to rise to much simpler tasks. The forms of integration that are necessary in modern warfare, difficult enough to arrange even among European states who feel the sharp prick of danger, are still unknown among Arab commanders who, however brotherly their theories, still hesitate in practice to co-ordinate their battle tactics. These searching, practical questions are unpalatable in the Middle East. But they are better asked now than under the shadow—or worse still, the strain—of an aggression.

If Egyptians can be brought to face them, it may prove possible to find some compromise on the defence of the canal. But that would solve only half of the Anglo-Egyptian question. There would remain a problem that bulks even larger in some Egyptian minds, notably in King Farouk's—the problem of the Sudan, which has more than once been the sole cause of breakdown in Anglo-Egyptian negotiations. Egypt wants international recognition of King Farouk as King of the Sudan also, and, therefore, as sovereign in the whole Nile valley. By picking the centuries that illustrate their point, Egyptians lay claim to "5,000 years of unity." They quote from Kitchener and Cromer to show that the Sudan was re-conquered in their name and administered with their money. They contend, with some justice, that, when the Sudan was threatened from without, the British took their stand upon guardianship of Egyptian rights but that since these threats lapsed they have switched to championship of Sudanese rights to self-determination. The Egyptians regard this switch as a piece of sharp practice, not as a sign of British capacity to keep pace with the birth of public opinion in Africa. They fail themselves to move with the times when, in tones of singularly old-fashioned imperialism, they concede the Sudan's right to "autonomy," but only subject to immense reservations of power to Cairo. The three "reserved points"—defence, finance and foreign policy—which they seek to impose set far tighter limits upon Sudanese autonomy than those to which they have so often objected as impositions by Britain. The British have so repeatedly and clearly promised the Sudanese the right freely to decide their own future that all Asia and Africa would be shocked were they to break this promise. The British, therefore, can concede kingship to Egypt only if it is clear that everyone's conception thereof is the modern one—that is, a conception which recognises that kingship would have to bow to the superior right of self-determination if the Sudan were—as Burma and Eire have done—to decide against affiliation to a crown.

When the viewpoints of the parties are so far apart, it is obvious that somebody will have to make concessions. But Egyptians—and some people in other countries, notably in the United States—will have to rid themselves of the inclination to assume that all such concessions must come from the British side. In the

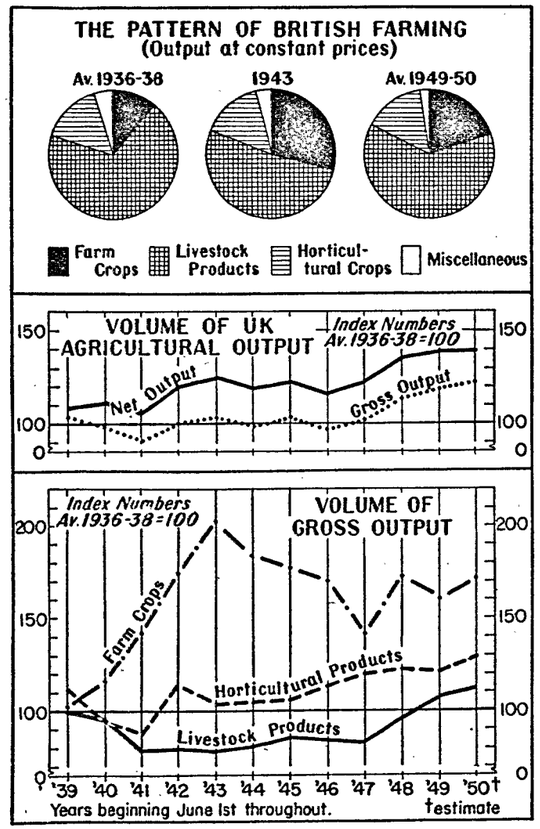
first place, where would the world be if every unilateral denunciation of a valid agreement, and every manifestation of violence, were to produce nothing but rewards for the pledge breaker and the noisy demonstrator? Already, Persia would be a living example of the reward of bad faith were Dr Mossadegh cleverer than he is at seizing upon advantageous economic offers; Senator Wiley—the senior Republican on the Senate Foreign Relations Committee—was right to point out—as he did this week in a letter to the President of the International Bank, whose colleagues are now negotiating in Persia—that offers of help and concessions to people with a blemished record will "encourage governments everywhere to embark on a policy in violence of their contractual obligations." Secondly, both on the canal and in the Sudan, there is more substance of logic and reason, though perhaps less of emotion, in the British case than in the Egyptian. In politics, human passions must be taken into account; but if they alone sway policy the result will rarely be a good one. Concessions, therefore, must come from both sides. If the British are to concede the Egyptian royal title, the Egyptians must repeal the law whereby they arrogated to themselves rights in the Sudan that are the prerogative of any autonomous people. If the British concede evacuation of the Canal Zone, by stages that are thought safe in relation to the world situation, the Egyptians must concede that the gravity of that situation is great—so great as to call for some foreign participation in canal defence arrangements. Neither they nor Britain are the sole parties interested in security at this crossroads. The Arab states may feel that they alone can manage its defence, but if they want the assignment they must convince not only Britain but a large number of canal-users living on the Mediterranean and the Indian Ocean that they can do the job without calling upon help in a field in which their own experience is still scanty.

Neither Britain nor Egypt can be asked for unconditional surrender. Neither country would accept it, for each contains groups that object strongly to the other's conditions. These include, in Britain, the soldiers who foresee that diplomatic solutions are bound to impair the technical efficiency of the present arrangements for defending the canal; in the Sudan, men who prophesy uprisings if points are conceded to Egypt's vanity, and, in Egypt, a Wafdist majority in Parliament that is preaching "no retreat." In face of such obstacles, compromise is not easy. But it must be attempted. Given the statesmen at present in charge in both countries, it is not impossible.

How to Grow More Food—III



A Helping Hand

THE preceding article dealt with the ways in which farmers might be pushed into growing more food. Clearly, however, a policy of negative inducements, increasing the penalties on farmers who fail to use their land to good effect, is not of itself sufficient. It is equally essential to give farmers practical help and encouragement in overcoming the undoubted obstacles to higher production. This final article will consider what forms the helping hand may take.

It may seem strange to start by suggesting that the farmer's first need is confidence in the future. Nevertheless, the long period of agricultural depression has left a strong mark on farmers' memories and many of them still half expect a sudden reversal of Government policy. To add to liabilities by carrying a greater volume of livestock and machinery or by undertaking farm improvements is often viewed as an unwarrantable risk. The guarantee of "stability" for agriculture, given in the Agriculture Act and endorsed by all political parties, has not overcome this attitude. For one thing, the minimum prices for livestock products, which are fixed for up to four years ahead, have had to be fixed so low (because of the possibility of falling prices in the outside world) as to alarm rather than reassure farmers. It would be unwise and impractical for the Government to enter into closer commitments about prices; already it has bound itself far too rigidly. But it could give farmers a more effective and more reassuring picture of their general prospects.

Ministers have frequently emphasised the need for higher agricultural production, but their pronouncements have usually been couched in terms of some immediate crisis. Rightly or wrongly, many farmers get the idea that they are needed to pull the chestnuts out of the fire when dollars are scarce but that they will not be wanted when times improve. In fact, there are two ways in which the situation is likely to remain permanently different from prewar days. British consumers will want more food, and the volume of food imports which the nation can consistently afford will be smaller. Together these changes indicate a permanently enlarged market for the products of British agriculture. They do not alter the fact that the precise size of the market for most products—especially for the important group of protective foods—will in the long run be closely related to the prices at which they can be produced. But it is unlikely in the highest degree that the general policy of expansion will ever be put into reverse or that agriculture will sink back into its earlier doldrums; and Ministers should go out of their way to make this point abundantly clear. They should not, however, think that the way to ensure confidence is to suggest that present policies for agriculture will never be changed. Many farmers can see quite clearly the two defects of the methods that have so far been used to expand agricultural output. Those defects are, first, that some farmers are able to grow rich too easily on the consumers' and taxpayers' money; and, secondly, that if there is a world slump the prices paid to British farmers may seem unnecessarily too high by comparison with the cost of foreign food. A policy that is costly in the aggregate and unfair as between individuals is not a policy the permanence of which can, in a democracy, be guaranteed. Policy should be permanent; but to persuade people, including the farmers, that it will be permanent, it will have to be less crude than it is at present.

In detail, agriculture has so far suffered unnecessarily from the twists of Government policy. For instance, the change of emphasis last year from milk to meat production was certainly desirable, but it was taken several years too late and without adequate warning. The decision came after many farmers in remote areas had already, mistakenly, switched over to milk production, and it left the unfortunate impression that the production of any commodity which reached its "target" would promptly be discouraged. The point which should have been made clear was that the further demand for milk depended, not on some purely quantitative "target," but on a combination of the amount produced and the price at which it could be offered. Generally, the Government has done little, either by education or by direct action, to bring home to farmers the realities of consumer demand—to point out the large unsatisfied needs which remain as well as those cases where price may become all-important.

To breathe an air of confidence about the future of agriculture is not, of course, enough. More concrete forms of aid are needed. There is already a medley of direct subsidies of various sorts available to farmers and landowners, but they do not add up to an integrated policy. They are chopped and changed from year to year, according to financial or administrative expediency. For example, Sir Stafford Cripps wished to eliminate producer subsidies, and grants for ploughing up grassland and crop acreage payments were discontinued; the present Government has already reversed this policy. Some flexibility is essential, but governments should keep their eyes firmly fixed on the long-term needs of agriculture. This means refraining as far as possible from stopgap measures aimed at getting a little more food this year or next or at reconciling farmers to some increase in their costs. The petrol subsidy to farmers is a good example of what should not be done. Subsidies and grants should be aimed at enabling farmers to produce more food permanently and to produce it more economically. This is the only solid basis for expansion.

There are two main ways of increasing output: by improving yields of crops per acre or of milk per cow; and by intensifying the farming system. Both methods would give good results on the majority of farms. The fertiliser subsidy has proved of great value in increasing yields, and its temporary withdrawal was a mistake. The danger is that it makes cash cropping too profitable in certain areas, such as the Eastern Counties, and so exhausts the soil. There is also the point, which applies to some dairy herds, that an increase in quantity may be obtained through deterioration of quality. Government price and subsidy policy must take forms which promote good farming practice.

The accompanying charts show that the net output of agriculture has increased considerably more than its gross output. But, though farmers have become less dependent on imported feedingstuffs, the supplies available permit a volume of livestock production only a little greater than before the war. There is general agreement that future improvement lies in a great extension of ley farming, which would enable a much larger head of stock to be carried per acre of grass while setting land free for growing additional food. A policy of this sort would go a long way towards remedying the present national deficiency in all types of meat, and judiciously devised subsidies or loans for grassland improvement could do much to make the prospect a reality.

Farmers pursuing this policy must somehow secure adequate working capital and manpower. Farmers' credit with the banks and with suppliers is, however, already strained and there have been fears that the restriction of bank credit might limit agricultural developments. In fact, the banks will no doubt recognise that agriculture is uniquely dependent on them for working capital and, if more food is to be procured, must be made an exception to any really tight general rules for the quantitative control of credit. Labour supply is a more difficult problem, since in the last year alone 22,000 regular workers have left the land. This renewed drift to the towns, if it continues, will make nonsense of the idea of agricultural expansion. The fault lies partly with those farmers whose response to the increase in farm wages has been to get rid of workers instead of aiming at higher productivity per head.

Finally, there is the basic need to improve the fixed capital of the land—drainage, water supply, farm buildings, and so on. The legacy of a long period of neglect of agriculture's real estate cannot be overcome quickly; but, for example, the drainage of many thousands of acres of land must be put right before there can be any hope of making them productive. It is not just a question of dealing with marginal land but of improving fields dotted up and down the country. Clearly the amount of Government aid that can be given for this

purpose is strictly limited. Moreover, state aid to private landowners on a very large scale would be an obvious injustice to taxpayers who would get no financial return from the assets they would largely create. This is the rock on which many schemes of agricultural rehabilitation have foundered.

The appropriate remedies are twofold. Where land can be made productive only if the state bears the major part of the cost, public ownership is the only fair solution. The work, if it is worth undertaking at all, should be done under the aegis of the Agricultural Land Commission which was originally set up for that purpose. In the majority of cases, however, public subsidies or, preferably, public loans at a preferential rate of interest should stimulate private owners to effective action. The work must, necessarily, be slow, but it may be doubted whether enough is being done at present; apart from hill farming, state aid for capital purposes runs into only a few millions a year, which is little enough to set beside the long-term requirements of food production.

One point in conclusion should be made clear. If there is to be more direct and specific aid to food producers, there should be no question of again using price incentives in an effort to stimulate production. This has shown itself to be impossibly costly and wasteful. It is not even necessarily effective, as previous articles have shown. The temptation to resort to it again must be resisted. And though, so long as inflation continues, prices must from time to time be raised in line with costs, they should not be raised to the same extent.

Direct aids to producers are advocated on the grounds that the nation needs to grow more food and can profitably do so. The precise nature of such aids—their form and extent, and the relative advantages of grants and loans—needs a far more thorough examination than it has yet received. Throughout, the motto of *festina lente* should be kept in mind. It is often wasteful—and fruitless—to use public money to get quick returns out of British agriculture; but a long-term policy of gradual and economic expansion is another matter.

NOTES OF THE WEEK

Nato and Necessities

The North Atlantic Council opened its Lisbon session on Wednesday with a short formal meeting in the Palace of Necessities, and then transferred itself briskly to the Technical Institute. The nature of the session could hardly have been symbolised more accurately. No resounding or spectacular achievement can be looked for at a gathering so overshadowed by last week's developments in Paris and Bonn. But, while the earlier hope that the Lisbon meeting would see the conclusion of a firm agreement on the relationship between Nato and the European Defence Community has been sharply disappointed, this does not automatically make the meeting into a fiasco. Much urgent and important work faces the representatives of the Atlantic partners, and the fact that most of it is technical and unspectacular in no way detracts from the critical nature of the Lisbon session.

The closed meetings in which the Council has immured itself are expected to last for a full week, and indeed the work to be done can hardly take less time even if the question of the European Defence Community is set aside for more leisurely consideration. The appearance for the first time of delegates from Greece and Turkey calls for more than the usual speeches of welcome and appreciation. The resources of the two new members, and the strategic problems which their inclusion in Nato involves, have got to be dovetailed into the original plans of the twelve founder nations. The proposed reorganisation of Nato's administrative structure raises a number of complex issues, among them being the choice of a permanent political headquarters and of a secretary-general. Paris and Mr Pearson seem now to have a lead over all other contestants for these two vacancies, but in the case of the former it will be surprising if the rival claims of London are not supported by a strong minority. Mr Pearson, however, ought to enjoy the backing of most of the smaller member countries, whose interests he has ably championed as chairman of the five-member committee on the development of an Atlantic community. This committee's new report provides a further item on the Lisbon agenda.

The weightiest problem on that agenda, and the most technically complicated, remains that of the sharing of the common burden. The gap between the demands of the three wise men and the actual defence efforts made by member countries has already been reduced to smaller proportions by concessions on both sides. Consultations held in Lisbon before the Council meeting by Nato's standing military group, the wise men, and representatives of Shape have produced a further narrowing of the gap. Much remains to be done; but at Lisbon the Atlantic Council has before it, for the first time, an objective picture of all Nato's necessities and potentialities. It has also a good deal of encouraging, if not sensational, evidence of its members' will to succeed. Military service, for example, is now being raised to at least eighteen months in all Nato countries except Iceland. If realistic but vigorous decisions on the final closing of gaps in Nato's defences emerge from the Lisbon meeting, it will have marked another essential step along the road to security in the west.

* * *

The Politicians Protest

Parliament resumed its ordinary work this week in a mood of relaxed tension, as was expected. But it certainly gave no guarantee of calm ahead. Labour members from industrial constituencies claim to have been made sharply aware during the past fortnight of strong resentment at the Government's proposal to impose new health service charges. Some of this resentment has already been made public; but some is being stored up and threatens to spill over in strange ways. For example, the health service proposals, represented as an attack on the poor, may well be contrasted with the denationalisation of steel, represented as a benefit to investors.

The political entanglements that could develop from a double attack of this kind are endless. All considerations of economic policy apart, it would be a misfortune if party warfare prevented Parliament from looking calmly at the social services. There can be no doubt that a thorough examination of the relative value of the benefits offered in the many different schemes, and of the sources of income that are redistributed in the process of paying for the social services, is an urgent political need. It might produce strange results, disarming the criticism of those who believe they are bearing most of the cost of services they do not themselves require, and convincing some of those who believe they are beneficiaries that they are in fact benefactors. If the politicians would look for facts of these kinds, there might be fewer protests, and it would be easier to settle the social services on a firmer base.

The Workers Protest

When Labour is in power old gentlemen in clubs write letters to the press denouncing its reckless extravagance and its policies of robbery and confiscation; there are even some who suggest that violent things should be done in protest. When the Tories are in power trade unions and branches of trade unions pass resolutions denouncing the Government's reactionary policies and talk about strikes. It is not an indication of what most trade unions and their members will do.

The Welsh miners were the first to make a strong protest against the health charges. One lodge of the National Union of Mineworkers declined to work on Saturdays and 41 other lodges, representing 40 per cent of all the miners in South Wales, have since decided to join it. Their objection is partly to the health charges but partly, and more practically, to the abolition of workmen's bus fares. Miss Horsbrugh's attempt to reduce the amount of money spent on education has also provoked one practical protest. The London Society of Compositors is telling apprentices not to join the composing departments of Government printing establishments. It says that if the Government wants to reduce the facilities for technical education, then the Government must be the first to suffer. Mr George Tomlinson, the last Minister of Education, appears to think that vigorous protest is right. He has written an article predicting that, whatever the Government may say, it will soon have to curtail the period of compulsory education if it "carries out the policy announced." And he thinks that the only reason why the Government has not done this already is because the public made such a fuss. "The storm that arose over the announced five per cent cut seems to have frightened the Tory reactionaries off the raising of the age of entry or the lowering of the school-leaving age, for the time being."

While the threats of strikes and the rest are not, in general, to be taken seriously, it does seem that Labour leaders will do their best to encourage widespread and strong protests against the health service charges and every other economy in public expenditure that hurts "the workers." In a Labour meeting it is even easier than in Parliament to make capital out of grievances without saying what Labour if it had responsibility would do instead.

* * *

Sabotage by Subsidy

The Minister of Housing and Local Government has announced that the Government subsidy for housing will be adjusted to cover the whole increase in the rate of interest for local authority borrowing. Local councils will share Mr Macmillan's evident pleasure at this decision; yet the real effect is to create a gross and unwarrantable inconsistency in Government policy. Why was the interest rate raised to local authorities at all if its impact on their main form of investment is promptly to be nullified? Why except the tenants of council housing from the general effects of dearer money? This is just the sort of favouritism, of pandering to the convenience of some pet service, that will wreck any attempt to instil realism into the national economy.

Probably the Minister, if he dared, would justify himself by his eventual intentions. It is the policy of his party gradually to increase the volume of private building, and at some point the activities of local authorities will be expected to diminish. The long-term effect would be to lower the cost of housing subsidies through a reduction in the volume of public building. But aspirations for the future, even if they materialise, can be no excuse for muddle-headedness in the present. The whole structure of housing rents and subsidies needs drastic reform; to ride off this need by blandly doling out another instalment of public money is, from the point of view of housing policy alone, ostrich-like; from the point of view of general economic policy, it is sabotage.

Germany's Defence Bill

The three Solomons of the North Atlantic Treaty Organisation have cut roughly in half the difference between the German government's estimate of what its people could afford to pay for defence, and that of the occupation powers' experts. They name a figure of DM11,250 million (nearly £1,000 million) for the Nato financial year 1952-53 as the global expenditure which Germany can afford for all kinds of defence (including presumably the cost of maintaining Allied troops). The German figure of DM10,800 million included about DM1,200 million for economic aid to Berlin and some smaller items which the wise men could not accept as defence expenditure. Some of the money spent in Berlin has been allowed because it is legitimate according to the criteria applied to all Nato countries. And the remainder of the cost of Berlin has been taken into account when assessing the country's capacity to pay; it would simply have been reckoned twice over if the sum had also been included in the actual assessment of Germany's potential defence expenditure. If the same items are included in both figures, the actual difference between the three wise men's estimate and Bonn's is of the order of DM1,600 million.

Bonn has no cause for consternation or indignation at this finding. Germany's potentialities have been judged by the same men and the same standards as were those of Britain, France and other members of Nato. Drastic new taxes for defence will probably not be needed, for the federal revenue will increase as production grows under the impetus of defence expenditure. The three wise men agree with the Allied experts in thinking that the German government is underestimating the gross national product. Even if its figure for 1952-53 is taken (at factor cost in order to enable a fair comparison to be made), the contribution now proposed amounts to no more than 10.5 per cent of the national product. This compares with 12.8 per cent for the United Kingdom, 11 per cent for France and 17.6 per cent for the United States. The German government's contention that its percentage must be lower than that of richer countries has been accepted.

The Nato report stresses that defence expenditure is to be met in every country as far as possible by increased production; and it very justly points out that Germany is in a better position to expand than countries where there is no surplus capacity or labour. Exports in the year 1952-53 will not be hindered by the defence effort. The main conflict of opinion will now come over two points—the extent of investment needed, and German claims for increased social welfare. Despite its fairness, the judgment of the Paris committee is likely to meet bitter opposition in Bonn.

Battle against Time

Europe is in the throes of another payments crisis, probably the most serious yet. It is no longer simply a matter of balancing dollar expenditure against dollar income. All currencies are hard; for under the rules of the European Payments Union a total deficit, once it has exceeded a certain level, has to be met partly in gold, and all European transactions of the sterling area are brought within the union's scope. Now the gold and dollar reserves of most member countries and of the union itself are declining fast. Even Belgium, hitherto a constant gold creditor of EPU, has seen its reserves decline from $913 million at the end of 1949 to $840 million at the end of 1950, and to $769 million by the end of September 1951. The greatest loss was suffered

by Britain (whose reserves fell from $3,300 million to $2,335 million) and France, where reserves declined by $214 million to $620 million.

Britain and France are feeling the malady in its most acute form. Unless the drain on British gold is checked, the sterling area reserves could fail by July. To this end imports have already been cut, credit curtailed and a tough Budget is expected. In addition, Britain has sold to the United States $90 million worth of raw materials, and in an emergency it could borrow gold from South Africa.

France is less well placed, with its current gold loss of about $75 million a month. The bank rate was raised last autumn and imports were cut drastically last month; but these measures will take time to become effective and already confidence in the franc has ebbed. The flight of capital and the hoarding of gold are increasing alarmingly. Like Britain, France is waging a battle against time: to stop the gold drain before reserves are exhausted. It is hampered not only by its small reserves but also by the impotence of its Government to administer the necessary dose of disinflation. If it fails, then the whole of Western Europe will suffer, for it is the second largest trader in Europe and the second largest contributor to rearmament.

*

Help can only come from across the Atlantic. The United States has already allotted $1,500 million of economic aid and $4,300 million of military aid to be spent in Europe by the end of next June. France has been granted $270 million from the economic aid, but the whole sum is tied to purchases of goods not already under contract. The American method of setting out purchases in a programme before authorising expenditure means that none of these dollars will be available in the critical period of the next two or three months. Of the military aid $620 million will be spent in Europe on off-shore purchases, and France could hope to get between $200 and $250 million. But again time is the difficulty: the arms must first be produced, and even the Americans estimate that actual payments by the end of next June will not exceed $20 million.

There is one other channel through which dollars can reach Europe: the so-called "infrastructure" payments for military installations used by American forces. From these France might get at most $200 million, which would be insufficient to stave off the crisis unless the money were provided immediately. France and Europe need dollars to pay their way through the spring. To know that the appropriations already made will provide help next autumn gives little comfort.

* * *

"Persecutions" in Hongkong

In the interrupted foreign affairs debate in the House of Commons a fortnight ago neither Government nor Opposition speakers showed concern about the press and radio campaign against Hongkong which has been going on in China since the end of January. This has been conducted with a virulence of language which could hardly be exceeded if the Chinese Communists were preparing some kind of *coup* against the colony, and even if it is regarded as mere barking with no bite to follow (though in Korea a very hard bite followed the barking), it is at least a reminder that British possession of Hongkong is an issue between Britain and China. Eleven national organisations in China have issued a manifesto warning the British authorities to "stop the persecution of Chinese residents in Hongkong," and this has been taken up by the press, one organ of which describes Hongkong as Chinese territory "forcibly occupied by British imperialists for over a hundred years" and now "a base for economic aggression and the headquarters of imperialist conspiracy and criminal activities against the Chinese mainland."

The "persecution," of which the Chinese Communist-controlled press complains, consists of the expulsion from Hongkong of certain persons who have been fomenting trouble there during the past few months. Without such powers of expulsion, it would be impossible for the Hongkong authorities to maintain order in the colony; if subversive elements were to be imprisoned instead of being expelled, the outcry would only be greater. The Communist claim, as stated, is that "the people of China have the right to reside in Hongkong and to engage in patriotic activities; they can tolerate no violation of these rights." But since "patriotic activities" signify primarily preparations for driving the British out, the toleration of them by the authorities would be equivalent to a decision to abandon the colony. No such decision has been taken either by the present or the last British government; on the contrary, additional troops have been sent to Hongkong for its defence during the past three years. It must be assumed, therefore, that there is an intention of holding Hongkong against any attack which may be made upon it.

There is less ground for assuming that all the implications of defending Hongkong in a possible emergency have been seriously studied in official quarters. It is difficult to see how it could be effectively defended without the use of naval and air power; but how would American opinion react to the argument that operations which Britain condemns when proposed as counter-moves to Chinese intervention against the United Nations in Korea might be right and proper for the preservation of a British colony? It is to be hoped that no such contingency will actually arise; but if there is indeed a threat to Hongkong, it will not be averted by totally ignoring the danger.

* * *

Labour's Lordly Economics

The House of Lords conducted on Tuesday and Wednesday its postponed debate on the economic situation, and their lordships spent a good deal of time explaining to each other that the crisis was grave. For Labour, Lord Pakenham echoed the arguments used three weeks ago in the House of Commons. They reflected, that is to say, more concern about party unity than about economic realities. The party as a whole has plainly moved into a position midway between the realism that once was Mr Gaitskell's and the exclusive concern for welfare shown by Mr Bevan and his friends.

Lord Pakenham had nothing against import restrictions—though, with some reason, he had misgivings about the policy of raiding stocks. He had nothing against an attempt to switch goods from the home to export markets, but his party would have achieved this by physical controls only. Monetary measures were, by comparison, clumsy and indiscriminate, he said; Lord Balfour of Burleigh effectively pointed out that in fact the advantage of monetary restraints is that the "decisions are taken by the person who in each case is most closely affected and has most knowledge of the relevant facts."

Lord Pakenham pointed to unemployment in Lancashire as evidence that disinflation has gone far enough, but the other new Labour dogma that expenditure at home has no effect on the balance of payments appeared to stick in his throat. He seemed to convince himself only by confining his remarks strictly to the charges for dental treatment and prescriptions. These, he said, could increase exports and lessen the demand for imports only if they prevented people from getting the treatment that they needed; they amounted to a redistribution of wealth in favour of the healthy at the expense of the sick. But if Labour in the Lords avoided the extremes of nonsense that were[illegible] in the House of Commons, it did nothing to quieten there might be fewer in a time of crisis is bringing out the w[illegible] the social services [illegible]'s leaders. They are determined to [illegible]

therefore they are opposing neither coherently nor reasonably; they are content blankly to deny the very economic facts on which their own policies rested for four years.

* * *

Where Ignorance is Thrift

The British public is to be less well informed this year to the extent of £700,000 of government spending. What gaps in its knowledge will be represented by this sum? More than half is accounted for by the £160,000 to be saved on the Crown Film Unit and the £200,000 to be found by disbanding the mobile projector service, whose purpose has been to show films to specialist audiences—for example, to hospital staffs; its abolition leaves many current Crown films without a medium of exhibition. Another £70,000 will be saved by winding up the lecture service of the Central Office of Information. These lectures have been given mainly to voluntary organisations and most of them have dealt with the Commonwealth, about which the public was shown by the Social Survey to be abysmally ignorant. Another £70,000 will come from halving the exhibition service, which has attempted to publicise such subjects as civil defence, clean food, Parliament, and, again, the Commonwealth.

All this must be sacrificed with regret. There are plenty of other media of information for which the taxpayer does not have to pay, and the state has lately been all too prone to duplicate the functions of the press and the BBC. It should be primarily a wholesaler rather than a retailer of information; its main role is to provide through the departmental information officers the material on which public comment depends. These information offices are now being contracted as part of the reduction of 10,000 in civil service staffs. The considerable variation in their size would appear to justify some pruning. The Ministry of Food, for example, has a particularly big office, partly because it has always tended to add to its information functions—telling people how to get their new ration books—a consumer service telling them, for instance, how to cook cabbage without destroying the vitamins. The Ministry of Materials, on the other hand, has no press office at all, as the number of inquiries does not justify one. The Treasury, even after dismissing four officers, has one of the largest information units, and is almost a publishing house. It has undertaken a mission to raise productivity, and it appears that none of its several monthly periodicals will be affected by the cuts. Since they are distributed free their circulation is no guide to their value; but when so much that has a proved value has to be sacrificed it seems that the information services are escaping lightly.

* * *

Freedom of Propaganda

At the Old Bailey this week Mr Justice McNair ruled that there was no case to go to the jury on the prosecution of Tronoh Mines, Ltd., its secretary, and *The Times* for alleged offences at last year's General Election. The charge against the defendants was that they had unlawfully incurred expense in promoting the election of the anti-socialist candidate in the constituency of London and Westminster, by preparing and publishing a strongly worded attack on dividend limitation in particular and other aspects of socialism in general. The facts were not in dispute. The Representation of the People Act, 1949, requires that all election expenses, to be legal, must be authorised by the candidate, or his agent (and, of course, be kept within certain limits). The cost of advertising the Tronoh Mines statement was not authorised by any candidate or his agent. It was, the case for the prosecution went on, a statement directed to promote the return of an anti-socialist candidate and therefore became an unlawful expense.

The arguments of the three defendants in substance concentrated on one point. This statement, they said, was not intended to promote the election of any particular candidate. It was general propaganda and it was still open to any individual or association to buy space in a newspaper for the purpose of stating its belief that it was better to have a government from one party rather than one from the other. For the prosecution to succeed, they said, it must show that the statement was focused on a particular election contest and intended to promote the prospects of a particular candidate. Mr Justice McNair accepted this argument. General political propaganda was not, he thought, prohibited by this section of the Act. He directed the jury to return verdicts of not guilty.

The result is a commonsense one. The machinery by which candidates declare their election expenses makes no provision for this kind of generalised expense, and had the verdict been otherwise every elected anti-socialist candidate in every constituency in which *The Times* circulates might well have felt a sudden unease over the legality of his election. The case was brought, presumably, at the wish of the Labour party, and if so it indicates a disquieting attitude of mind in the politicians or party officials who wanted it. The general rule at election times plainly should be freedom to argue. And there cannot be effective freedom if individuals and organisations who wish to spend their money on propaganda are prevented from doing so. That principle, not the attempt to secure some rigid and impossible "fair shares" in propaganda, should inspire the rules that are necessary to save freedom from abuse. After all, as counsel said, the Tronoh Mines statement may well have done the anti-socialist cause in, say, Durham, more harm than such backing as it won for the Conservative candidate in the Cities of London and Westminster.

From REYKJAVIK to RANGOON

History TODAY

has enthusiastic readers

Read in every continent, and in cities as far apart as Reykjavik, Teheran, Hongkong and Rangoon, HISTORY TODAY is a magazine designed for the intelligent man or woman, planned upon entirely new lines. The basic idea is very simple—that, to understand *today* and forecast *tomorrow*, one must have studied *yesterday*, and that the key to present problems often lies in the remote past.

But readers of HISTORY TODAY are not merely specialists. They are students of the modern world, whose interests extend to every field of human activity—industry, economics, the history of science, as well as political thought, art and literature. Among them are many people to whom *your* advertisements will make a strong appeal.

A New Chance in Kashmir

The end of the Indian elections has created a new chance to reach a settlement of the Kashmir dispute. No government in Delhi could have been expected to yield even on its more extreme claims while the election campaign was at its height. Indeed, by claiming Kashmir with its predominantly Muslim population as part of the secular state of India, Mr Nehru probably benefited positively from the dispute, for he was able to rout the extreme Hindus and squash the communal parties in the elections. But now that Congress has been returned to power with a strong majority, its leaders can afford to make a bold move to settle this wearisome and dangerous dispute.

From both Delhi and Karachi the news is good. Those who feared that mishandling of the Devers Plan might have poisoned the atmosphere irretrievably look like being proved wrong. Following the discussions in the Security Council on January 30th and 31st the United Nations mediator, Dr Graham, is now trying to complete his task by bringing the Indian and Pakistani Prime Ministers together in his presence ; hitherto he has only dealt with them separately. Furthermore, the plan drawn up by General Devers for the demilitarisation of Kashmir, in order to prepare for a plebiscite, is still open to discussion and acceptance. Although nettled by premature announcements of their supposed views, the Indians have since made a helpful contribution by agreeing, after all, to consider the whole Devers Plan with Dr Graham. When the Security Council last met he had certainly not had time to receive official reactions from both capitals. Now he is to report back by March 31st.

If the Russians hoped to postpone a settlement by their recent intervention on India's behalf, they may well find that their action has had the reverse effect. Following the Indian Communists' electoral success, *the active* Russian interest in Kashmir may prove a clearer embarrassment than ever in Delhi and provide a warning that the dispute has become something more than a problem of relations with Pakistan. In Karachi the Russian intervention has had the effect of a bombshell. Many Pakistanis had always hoped that help from this quarter could be kept up their sleeve as a final trump card if all else failed. They were aghast when Mr Malik removed this trump by declaring for India.

* * *

A Lean Time for De Gasperi

Signor De Gasperi's standing in Italy is now less good than at any time since the Christian Democrat victory of 1948. With the next Italian general elections due at the latest within about a year from now, and possibly this autumn, the growing political embarrassment of the Italian government is an unhealthy sign. One of the most important reasons for it is the change in the international situation. The Prime Minister is not only committed in the public mind to the foreign policy of closer association with a western organisation that is now in great difficulties ; he has also been, in home affairs, essentially the man who held the country together, politically and economically, while international events worked to Italy's advantage.

The main events were progressive unification of Europe and continued American aid. European unity promised greater scope for trade and the emigration of Italy's surplus workers ; this helped to discredit the misery propaganda of the Communists. Now the setbacks to the idea of unity and the severe French import restrictions, so closely following the British, make the conception of a consolidated Europe look, for *the moment*, rather deflated. The Italians, moreover, are becoming bitterly disappointed at the extent of the American aid to be derived from Nato orders to industry. So little has materialised that it does not look like counteracting the economic recession ; this in turn has partly been induced by the government's determination to go on with its strictly deflationary policy because it is afraid to stop.

Apart from his parliamentary difficulties, which are now *considerable*, Signor De Gasperi is under severe pressure of work. Since Count Sforza's retirement from the cabinet last summer, he has chosen to be Foreign Minister as well as Prime Minister. This is a dual role which cannot be played successfully for long. Already the handling of routine business by the Palazzo Chigi has suffered, and on matters of policy Signor De Gasperi has made several quite unnecessary tactical errors. Some people are even regretting their old enemy, Count Sforza ; *si stava meglio quando si stava peggio.* Italy badly needs a full-time Foreign Minister.

Celestial Displeasure

The German Supreme Court at Karlsruhe now has before it an application for the Communist and Neo-Nazi parties to be declared illegal under the West German constitution. They have a difficult decision to make, but the judges have received assistance for their deliberations from an unexpected quarter. Mr Shen Chun-ju, as President of the Association of Judicial Workers in the Chinese People's Republic, has addressed a letter to the court warning it against giving a wrong decision by declaring the Communist party illegal. It is common knowledge, declares Mr Shen, that the German Communist party represents

> the aspirations of the German people by fighting for Germany's unity and democratisation and for safeguarding peace in Europe.

Instructions from China to European courts of law are a new phenomenon in international relations, but now that the practice has begun we must expect it to continue. Soon the Lord Chief Justice of England, or the Court of Appeal, or even the " judicial workers " of the House of Lords may be receiving communications from Mr Shen in the cause of peace and democracy. There do not appear, however, to be any precedents in English law for the guidance of the courts from Peking, and Her Majesty's Judges would probably deem Mr Shen's interventions *ultra vires ;* they might even consider him guilty of contempt of court if seeking to direct them on cases *sub judice.*

If some Europeans may consider that the Chinese Association of Judicial Workers is straying outside its proper sphere in these messages to western colleagues, they should reflect on their own historic responsibility for enlarging the Chinese horizon. In 1834 the Canton Viceroy declared to Lord Napier, in explaining that the extension of trade desired by the British was contrary to Chinese law:

> Even England has its laws ; how much more the Celestial Empire ! Bright as flame are those laws, more to be dreaded than the awful thunderbolt.

The Chinese did not then wish to interfere in the laws of western lands ; they aspired only to enforce their own. How much better if they could have been left in seclusion Because they were not, the thunderbolt of celestial displeasure is poised over Karlsruhe and nobody knows where it will strike next.

Prescription for the Pound

In 1947 Mr Roy Harrod's pungent little book, " Are These Hardships Really Necessary ? " offered as a cure for Britain's economic ailments a slash in capital outlay and a surgical operation on the sterling balances. In his latest pamphlet* he remains of the same mind and urges, in addition, a drastic revaluation of the pound. The case for capital cuts is the stronger of the two. Few measures could

THE Eagle BY GOODYEAR

Proved the highest mileage tyre ever built; combining immense strength and road gripping ability with handsome appearance

DISTINGUISHED BY THE SILVER RING

The tread rubber is tougher, more shock-resisting than ever before.

*

Wider, flatter tread area grips *more* road for *more* traction, and wears more slowly.

*

The improved All-Weather Tread—with its new Stop-Notches for quicker, safer stops—resists every direction of skid throughout the tyre's longer life.

*

Handsome buttressed side-walls provide protection from kerb damage, and make cornering steadier than you've ever known.

You can trust GOODYEAR

FOR LONG LIFE AND LASTING WEAR

WHAT DISAPPOINTMENTS dogged the early aviators in their first experiments in flying. Many worked in secret; few were so ambitious as Sir Hiram Maxim who in 1894, testing his machine at Baldwyns Park in Kent, coaxed sufficient power from a light marine steam engine to lift the whole contraption off the rails. There his endeavours ceased and who would have thought that in less than 60 years men would be flying at speeds faster than sound? Who, indeed, could have foreseen the great industries which would arise from the inventive genius of the 1890's? In that same year, 1894, Albert Edwin Reed acquired his first paper-mill at Tovil near Maidstone, to lay the foundation of what is today one of the largest organisations of its kind in the world. He was outstanding among the pioneers of modern paper-making methods and from his vision and enterprise have grown the great Aylesford mills of the Reed Paper Group, where giant high-speed machines turn out mile after mile of newsprint and the tough Kraft paper which has entirely revolutionised this country's packaging methods.

DOLLAR EARNERS WHO FLY TCA

MR. R. C. LINTON CRONBACH, Export Director for Joseph Cheaney & Sons Ltd., the footwear manufacturers, has travelled 166,000 miles across Canada and the U.S. — and thanks TCA for having made every mile of his complex route easy and enjoyable. What has always impressed him is the personal touch in the TCA service, the friendly advice and expert help the staff are so ready to give at every stage. Mr. Cronbach leaves London confident that he will be able to keep his appointments "on time" in Canada and the U.S.A. He arrives fresh and ready for work, thanks to the relaxed comfort and the excellent hot meals on board TCA's pressurised "North Star" skyliners, which leave daily from London via Prestwick or Shannon.

bring more immediate and general relief to the present economic strain, both internal and external, than a general diversion of resources from the pursuit of pie in the sky to the production, or indirect earning, of today's bread and butter. Indeed, since this pamphlet was written government policy has shifted strongly in the direction it urges.

Mr Harrod, however, goes much further. He regards present consumption levels as sacrosanct. The consumer has suffered enough and will endure no more, and, moreover, his claims on manufacturing output—the crucial shortage—are so small already by comparison with those of defence and investment that even a savage cut in his standards would be inadequate. Let the cuts, therefore, fall entirely on capital outlay. Consumption must be exempt.

This view is surprising, not to say perverse. For one thing, austerity or no austerity, real personal consumption has not, as Mr Harrod implies, been stationary since 1948; it has risen by an amount that must be nearly equivalent to the present external deficit. For another, Mr Harrod makes no distinction between investments destined to bring a net increase in standards and that far larger class of investments needed, in any modern economy, merely to maintain them—between, as it were, extending the building and keeping the fabric in repair. Cutting the one may be a regrettable necessity; cutting the other is the way to an economic collapse far more disastrous to consumption than any temporary return to the standards of 1948. At a time when no very perceptive ear is needed to detect, on the Left, the reviving strains of that regrettable song which used to sound in Dr Dalton's heart, the case for disinflation and its link with Britain's standing abroad needs to be put with the vigour Mr Harrod commands. It is a pity, however, to raise expectations of an almost painless return to solvency.

The Miners' Pension

The brief, sad history of the miners' pension scheme shows once again how out of touch the workers' leaders often are with the workers themselves. The National Union of Mineworkers had demanded a pension scheme for the coal-mining industry for many years, and it secured one virtually by striking a bargain—as the price of a higher output of coal. When the scheme was launched it was proclaimed as "a reform which the industry had long desired." Yet three months after it had been introduced, only half the country's mineworkers had joined it.

This poor result for the country as a whole conceals wide differences between regions. In Cumberland and Northumberland, for instance, 85 per cent of those eligible had joined the scheme by the end of January. In Yorkshire, on the other hand, only 38 per cent had joined. It is impossible to say whether the scheme varies in popularity according to local industrial conditions—the chances of alternative employment, for instance, or of part-time work for retired miners—or according to the attitude of local miners' lodges; but the low percentage for Yorkshire does suggest that the miners think they have genuine grievances against the scheme.

Undoubtedly the most serious of these is that younger miners who leave the industry within ten years of joining it cannot hope to recover all the contributions they have paid towards their pension. This provision was introduced, against the wishes of the Coal Board and the Mineworkers' Union, to encourage miners to stay in the pits. So far, its effect has been to discourage them from joining a scheme which, they think, will deprive them of their savings if they exercise their acknowledged right to get another job. Another grievance is that the maximum pension a young miner can hope for if he starts contributing at the age of 18 is 30s. a week. This sum, the miners point out, compares unfavourably with pensions obtained by clerical workers in the Coal Board's employment—for whom the Board pays a bigger proportion of the total contribution. Another reason for the scheme's unpopularity with the younger miners is that credits for past service in the pits are only granted to the older miners who would otherwise receive no pension. The grant of extra credits for good attendance, moreover, has been misinterpreted as making unjust discriminations.

Of all these grievances the most justifiable seems to be the use of the pension scheme as a device for keeping miners in the pits. But on the amount of the pension it ought to be made clear to the miners that the scheme is contributory, which means that a bigger future pension would involve a bigger contribution from present earnings. What should be resisted is any attempt to increase the pension by raising solely the contribution paid by the Coal Board—that is, by the consumer of coal.

African Prime Minister?

If the rumours are to be believed—they have been so numerous that they must soon be either confirmed or denied—Mr Kwame Nkrumah is soon to become Prime Minister of the Gold Coast, and the three *ex officio* British ministers are to be replaced in the colony's Executive Council by elected ministers. Undoubtedly, amendments to the constitution are being considered, and it can be assumed that they are on the lines rumoured, particularly as regards the position of Mr Nkrumah. Since his year of office has been freely criticised by some people, it is important to understand why constitutional promotion is being granted.

Mr Nkrumah and his Convention People's Party were elected to power a year ago largely as a result of their slogan "Self-government Now." On being elected, however, he and his fellow ministers showed themselves willing to drop, for the time being, the demand for self-government in favour of learning how to govern. Unfortunately, in the peculiar conditions of a colony where parties rival each other in the loudness of their cries for self-government, this abdication from his programme has considerably weakened Mr Nkrumah's position both within his own party and *vis-à-vis* his opponents, the United Gold Coast Convention led by Dr Danquah. Hence the move to strengthen Mr Nkrumah's prestige by giving him the status of Prime Minister instead of merely Leader of Government Business.

It should be realised that even if the constitution is amended on the lines reported, full self-government will not have been achieved, since the Governor's reserve powers will remain. But the amendments will mean that the room for manœuvre is becoming restricted. The Gold Coast is approaching very near to the point where any further advance will mean crossing the border from colony to dominion. The time for Mr Nkrumah and his supporters—and his opponents—to prove themselves fully equal to their responsibilities is getting short.

Impartiality at Suez

Now that strident Wafd charges of British inhumanity have ceased to appear daily in Egyptian newspapers, the outcome of an international inquiry into such allegations is less important than it was. But the International Labour Office report on the subject, issued this week, is a good example of the sobering role that United Nations bodies can play in times of frenzy. At the request of London and Cairo, Mr Raghunath Rao of the ILO, assisted by a Swiss professor, conducted a five week inquiry into the Egyptian allegation that the British authorities were "savagely violating the basic human rights" by their treatment of Egyptian workers in the Suez Canal Zone. His report clears the British: there was

no forced labour, no internment and no abduction. Possibly the spark that the Wafd fanned into flame was the tale that suspects under preventive detention by the British forces were made to sweep out their cells. The item of most permanent interest in the Rao report is the statement that many Egyptians left the Zone because they thought they would not be able to remit money home to families in the delta. Future arrangements for engaging labour on the Canal, whoever makes them, could be adjusted to meet this cause of unrest.

Twice recently Middle Eastern governments, the Persian and the Egyptian, have permitted the ILO to inquire dispassionately into allegations against British behaviour. First the Anglo Iranian Oil Company, and now the British authorities in the Canal Zone, have come well out of the respective investigations. In Persia, the government said nothing about this verdict, which no Persian expected. Unfortunately it is the accusation that hits the headlines ; the acquittal deserves equal publicity.

* * *

Israel's Leap in the Dark

This week the Knesset endorsed the Israeli government's attempt to bring order out of economic chaos. It has introduced differential exchange rates for imports, exports and investments and it has decided to cut the public works programme. The Israeli pound has not been devalued, but the effect will be much the same: a steep rise in prices for many things which are by no means luxuries. Only for iron rations—flour, oils and fats, sugar and the like—will the old rate of $2.80 to the £1 prevail. For all the rest, including raw materials, fuel and kerosene, and near-basic foods like fish, there will be rates of $1.40 and $1.00. The general level of prices, including those for basic commodities which are controlled, must rise immediately by at least 25 per cent and in some cases by 100 per cent. Taxi fares are already doubled. All this is to happen in a country where violent inflation is working in the same direction, and which depends greatly on imported goods.

The logic of this painful action is clear. To house and employ the immigrants, and to grant the new state the period of economic expansion that any new state must have, Israel has been spending far more money than it had. The result has been to create purchasing power out of all proportion to the goods which were, or could possibly be, available and to divert over half the country's resources to non-productive work. This came on top of an irreducible deficit in visible trade of more than 80 per cent of the total. Hitherto, the Socialist government has tried to make things go round in a socially equitable way, through physical controls. But now the inflation and the black market are too powerful to be restrained in this way. It now has to use the monetary weapon, which operates against rich and poor alike.

Mr Ben Gurion hopes that the new measures will mop up the excess consuming power and drive out of business the speculative builders, the cosmetic manufacturers and the black marketeers who have done well out of the inflation. At the same time, the cost of the 100 per cent subsidy for Israel's main export, citrus fruit, will be borne on the exchanges and not, as at present, on the revenue. He also hopes that "the cost of living will not rise very sharply." That clearly depends on whether production can increase before higher prices force wages to follow them up, and before there is bad unemployment in the non-productive sectors. The Histraduth, the socialist trade union organisation, has said that it will do its best to hold wages if everyone else will do the same. But the Mapam, the more extreme party of the left, has already complained violently. In any other country the outlook would be hopeless, but in Israel people will suffer a great deal for the state.

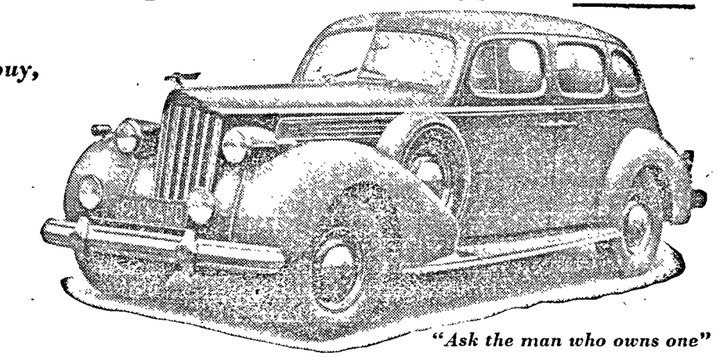
Shorter Notes

The first report of the Committee of Public Accounts for the present session consists almost entirely of a Treasury minute on the reports of the previous session. Commenting on dentists' earnings, the Treasury says that their future level cannot be assessed until the demand for treatment has been stabilised after the introduction of a charge for dentures last May. The minute is dated November 29, 1951, and the subsequent proposals to impose a charge of up to £1 on all forms of dental treatment for adults must have made the future demand for treatment and therefore the cost of the dental service even more problematical. It is worth noting that in a subsequent paragraph the Treasury says that the charge for spectacles has resulted in a very heavy drop in demand.

*

The figures of road casualties in December are anything but reassuring. It was the worst December for ten years, and the total number of casualties was 18,187, of whom 521 were killed and 4,578 seriously injured. The total for the whole of last year, the first complete year since the end of petrol rationing, was 216,493, including 5,250 killed and 52,369 seriously injured. In 1950, when there were seven months without rationing, there were 201,325 casualties, of whom 5,012 were killed and 48,652 seriously injured. The 1951 figures were, however, still not so high as those of the last prewar year. In 1938, of the 233,359 casualties 6,648 were killed.

Defeat of the Government



Lord John Russell's Ministry is at an end. The Government was defeated last night by a majority of *eleven* on the introduction of the Militia Bill. . . . The motion before the House was for the introduction of a bill to establish a *local militia*, and to amend the existing laws relating thereto. To this motion Lord Palmerston had given notice of two amendments, one to omit the word *local* from the title, the other to substitute the word *consolidate* for the word *amend*. In introducing the motion Lord John Russell explained that he did not object to the substitution of the word *consolidate* . . . the word expressed his meaning quite as well, or even more particularly than the other. But he objected to leaving out the word *local*, because that involved a difference of principle to which he was not prepared to assent. But he claimed to introduce his bill, to have it printed in order that members might see its provisions; and he expressed himself not only willing to consider any amendments which might be proposed in the progress of the bill, but even, if desired, to refer it to a select committee of the House. . . . But no—Lord Palmerston, acting with the Tories, whose benches were well packed apparently for the purpose, insisted upon the alteration of the title, and, contrary to all precedent, persisted in discussing and dividing upon this important principle of the bill on its introduction. Now we believe this is the first time in Parliamentary history, that the House of Commons ever refused to a Government leave to lay a bill on the table in the shape and form they thought best . . . and doing so can only be interpreted into such a withdrawal of confidence, and . . . of ordinary courtesy, that it would be in the highest degree inconsistent for a minister to consent to hold office for an hour longer. With that regard for high constitutional and Parliamentary principle, Lord John Russell immediately declared that he could regard the division only in the light of a withdrawal of confidence, and intimated that he could no longer be responsible for the government of the country. And thus has ended, by the most factious and unwarrantable proceeding that can be found in the records of Parliament, the Government of 1846.

own a PACKARD now

Here is an opportunity to buy,
for business or pleasure,
a superb car,
in first-rate condition,
that will give you
new-car-service

"Ask the man who owns one"

The range of Packard pre-war models, thoroughly rebuilt by us, offers you pre-war craftsmanship for about £1250; and offers it *now*. And you have the assurance that the correct spares are available, because we import them directly from the Packard factory in America.

VIRTUALLY NEW CARS

'Rebuilt' is the word. This is no case of merely reboring or resleeving or changing the engine. The whole car, if necessary, is stripped — engine, gearbox, back axle, steering and suspension. Wear is taken up by refitting or replacing, recellulosing or reupholstering. Carburettor, oil, fuel and water pumps, dynamos and starter are reconditioned. The electric system is overhauled.

These 1938/39 Packards look like new cars, perform like new cars. If you would like to see or drive one, or if you want further details, please write or telephone us.

A MARKET for progressive people

There is no doubt at all that The Listener readership offers a first-class market for a wide range of goods and services. Here you have a market of educated men and women from trade, industry and commerce, from the professions and the arts, from public services and private life. They include some of the most influential people in almost every sphere of activity. Listener readers are, naturally, people of more than average discrimination and taste, and their confidence in the journal extends to the very sound advertisements it carries and the products they offer.

If you have a first-class product or service appealing to substantial people, you will do well to consider advertising in The Listener.

UNITED NATIONS

NEW BOOKS AND REPORTS

Land Reform
100 pp. 5s. (5s. 3d. incl. postage)

An analysis of the impediments to economic development arising from defects in the agrarian structure in many areas of the world. The book describes the types of land reform already undertaken in certain countries and suggests the direction of future reforms.

Report of the United Nations Mission of Technical Assistance to Bolivia
128 pp. 11s. (11s. 5d. incl. postage)

This study was prepared by an expert mission of technical assistance which visited Bolivia in 1950. In addition to a discussion of the economic, social and administrative problems which exist, the report includes specific proposals for a comprehensive economic development programme.

Political Education of Women
43 pp. 1s. 9d. (1s. 11d. incl. postage)

This booklet, which was prepared at the request of the United Nations Commission on the Status of Women, discusses certain of the broad problems which all women face when confronted with the rights and opportunities of the franchise for the first time and makes a number of suggestions regarding the political education of women.

Labour Productivity of the Cotton Textile Industry in Five Latin-American Countries
293 pp. 22s. 6d. (23s. 2d. incl. postage)

This report examines the labour productivity of the cotton textile industries of Brazil, Chile, Ecuador, Mexico and Peru. It is the first attempt which has been made in Latin America to assess industrial productivity, to compare it with the standards based on the experience of highly industrialised countries and to analyse the factors which bear upon it.

Balance of Payments Trends and Policies, 1950-1951
50 pp. 3s. (3s. 2d. incl. postage)

Based on replies to a questionnaire submitted to a number of governments, this report discusses the general status of exchange and trade restrictions in recent years as well as current trends in balances of payments and related policies.

World Cartography, Volume 1
107 pp. 9s. (9s. 4d. incl. postage)

The first of a series of annual volumes, *World Cartography* is designed as a clearing-house for current information on new developments in cartography and map-making. Special articles in Volume I include a study on "Cartography as Related to Resource Development."

Letters to the Editor

A Pause in Germany

Sir,—In your analysis of the causes and consequences of the trouble between France and Germany you write:

> An Atlantic alliance which can think of dispensing with German rearmament must be remarkably confident and potentially very strong.

It would indeed have all these qualities, and others besides, including a magician who could conjure up the manpower for the minimum number of divisions required to deter possible Russian aggression.

Elsewhere in your pages you quote Lenin as saying that facts are stubborn. The stubborn fact about West European defence is that it will be a façade if it does not include all the resources of Western Germany. We must choose between the risks of giving Bonn full sovereignty (which they will take anyhow by 1955) and the risk of having no defence. If you are going to count the Germans out you are laying the foundation for Dunkirk II. We should immediately bring the Germans into Nato, and at the same time Great Britain should participate in the European Army in order to reassure the French. Your article suggests that time is on our side. If that be true, let us cut our rearmament programme by 50 per cent; but I fear time is not our ally today.—Yours faithfully,

STEPHEN KING-HALL
Headley, Hants

★

Sir,—Impatient good intention in the German problem seems to me to have put the cart before the horse. Germany should first obtain a peace treaty, with full sovereignty, and then be invited to join the European or Atlantic community.

Any international commitment that a German Government might undertake while subject to foreign control would be denounced by the majority of people as "extracted under duress." Although West Germany today enjoys a far wider political freedom than under Hitler, the Bonn Administration is generally regarded there as a sort of "Vichy Government." Dr Schumacher probably expressed public feeling on both Right and Left when he called Dr Adenauer "the Chancellor of the Allies," and the Schuman Plan "just another name for reparations."

At the same time, current German anti-militarism is not merely a pose adopted to blackmail the Western Powers; it is a genuine feeling. In the perspective of history, the German character seems to have two traditional forms of expression: the *Landsknecht* and the *Spiessbürger*—the mercenary and the comfortable bourgeois. In 1945 the *Landsknecht* had failed them; thus, the Germans subsequently reverted to the ideals of *Spiessbürgertum*.

The best that the Western Powers can do now is to proceed with the establishment of the Atlantic Community as well as the preparations for a German peace treaty. Once stabilised, the Atlantic Community will be attractive enough to cause a sovereign German—or West German—Government to merge its fate with the West, and will offer sufficient safeguards to make France accept a gradual German rearmament.—Yours faithfully,

GEORGE A. FLORIS
Edenbridge, Kent

The Ethics of Fixed Prices

Sir,—Your Note in your issue of February 2nd contains a questionable conclusion which you do not justify. I refer to the distinction between collective and individual resale price maintenance which you describe as "superficial."

While joining with you in condemning collective price rings which hold the consumer to ransom, I cannot agree that individual resale price maintenance has this effect. Any price individually fixed is subject to the stimulation of competition, and such price fixing is most prominent in branded consumer goods where competition is particularly severe. Also, the distributive margins on fixed price branded goods are invariably smaller than that of comparable unbranded products, and this is justified by the higher demand and increased stock-turn.—Yours faithfully,

E. A. WINTER
Bristol

The Lisbon Meeting

Sir,—If the ideal of equal partnership in Nato is to become a reality, the strictures, in your issue of February 9th, on the Three Wise Men's recommendation that American aid be put into a central pool, are open to challenge. In the first place, your article surely thrashes too hard the distinction between strategic and economic planning in the particular context of Nato. You, yourself, say "General Eisenhower in Shape has had to plan the disposition and supplies of his forces." But how shall we define supplies in a modern defence community? According to a recent broadcast statement by General Gruenther, General Eisenhower regards the economic stability of Nato countries as of equal if not of even greater importance than the military side. Even so, Nato's task is not to manage the entire economies of its members—which you rightly regard as impossible—but rather to secure progressive adjustments in the military and economic content of each member's dues to the central pool. One should surely, therefore, welcome the decision of the Temporary Council Committee to recommend that member countries' efforts be closely co-ordinated to make the most effective contribution to the common defence, as opposed to the existing procedure where each did more or less what it pleased.

If the American role is to be, to borrow your description, that of "partner, not patron," and the obsolete concept of American "aid" swept away, three further steps in the newer direction are needed: (*a*) The fixing of a global Nato financial budget. (This is reportedly in train.) (*b*) The allocation to each member of a percentage quota within this total. (From the standpoint of economic stability there are reasons for thinking that many European quotas, including the British, have been pitched too high.) (*c*) Authority for Nato to *decide*, or at least, strongly to recommend, the most effective expression in military and economic terms of each member's contribution. Decisions on these lines would enable Nato to recommend that certain European members make physical contributions in excess of their allotted financial quotas, balancing finance stemming from corresponding gearing in the case, mainly, of America and Canada, but also, perhaps, of Belgium.—Yours faithfully,

Caterham, Surrey J. L. GIBSON

Castings or Sheet Steel?

Sir,—In your issue of January 9th, Mr T. B. V. Hirst states that "the 50,000 tons of iron castings used yearly" for the manufacture of gas and electric cookers could be replaced by 12,500 tons of steel sheet and tube. An inquiry of one of the largest manufacturers of these appliances from both materials, but with a preponderance in steel, shows that a cast-iron cooker weighing approximately 224 lb of cast-iron is replaceable by a similar article in steel weighing 148 lb. These figures drawn from actual experience show a ratio of 3 of iron to 2 of steel, whereas Mr Hirst's figures show a ratio of 4 to 1. This discrepancy would appear to reduce to a large extent the saving in raw materials which Mr Hirst has portrayed.

The inference to be drawn from the letter is that we should begin at once to withdraw the old cast-iron cookers, substitute steel cookers and stop manufacturing cast-iron ones. This is not a practicable proposition. The firm mentioned above considers that it would take at least three years to retool and re-equip plant to produce all-steel cookers to the exclusion of any others. During this period, extensive dislocation would be caused and at the end of it all there would be no certainty of the increased amount of steel being made available. Obviously a trend towards lighter cookers has set in; why not let this take its natural course, leaving the consumer to decide the rate at which the transition takes place?—Yours faithfully,

Books and Publications

Exponent of Neutralism

Réflexions Politiques 1932-1952. By Hubert Beuve-Méry. *Paris, Editions du Seuil.* 255 pages. 400 fr.

It is generally unwise for a journalist to republish in one volume pieces written over a long period. Contemporary journalism tends to ignore the long-term nature of present problems and to concentrate on the all-absorbing task of current analysis. Looking back, the journalist finds that he has judged different events by different and even incompatible standards, that he has let himself drift with the changing currents of the time. M. Beuve-Méry's book shows that fluidity in general principles is not a necessary condition of the journalist's art; that it is possible even in the most vexed of all fields, that of foreign policy, to hold over a long period and in changing circumstances a point of view at once consistent and intelligible.

The book does not, and could not, do justice to M. Beuve-Méry's major role in recent French affairs as editor of *Le Monde*, which under him has been a great and representative newspaper. But it does show his own approach to the issues that France has faced in the four periods when the writings from which these extracts are made appeared: the period of uncertainty when the unreality of the Versailles world was becoming manifest—his account of a short visit to Russia in 1933 and of his reflections thereon is a notable and rare piece of lucidity; the period of collapse before the pressure of Nazi Germany—and again M. Beuve-Méry's understanding of the essential appeal of Nazism made him unaffected by many well-intentioned efforts to blur reality; the period of occupation in France when only the exceptionally lucid could measure the real dangers inherent both in collaboration and in resistance; and lastly our own tormented world.

Because M. Beuve-Méry is best known as an exponent of what is or was called "neutralism," it is to be feared that most readers will tend to look at the last part of the book first, and perhaps to look there only. Yet to do so would be unfair. M. Beuve-Méry's refusal to allow his hatred of Soviet tyranny to make him blindly accept all the present panaceas for dealing with it follows naturally from his rejection of a purely mechanistic interpretation of foreign policy, from his general understanding that it is not arms alone that are essential, but the convictions according to which they are used or not. It is still ideas that rule the world.

He has, of course, his prejudices, and it is salutary to see what they are. He appears to be no friend of this country; there are the familiar French charges of insular egoism and (here not ill-founded) of unnecessary hostility to France in the Middle East, although he is now prepared to give Britain reluctant admiration for having more than any other beneficiary of America's learned how to maintain independence of policy. Still less does he rank as a friend of America's though recognising that in the last resort the protection of Western Europe is America's strength. But he is concerned, as a Frenchman is and an Englishman is not, about the increasing Americanisation of his country, and was so in prospect, it appears, even before the liberation. Nor is he happy about the sudden reversals in policy, from appeasement as at Yalta to defiance as in the projected rearmament and hence rehabilitation of Germany and Japan. Finally the brutality of the Korean war redoubles his conviction that whereas the "Anglo-Saxons" can legitimately hope for victory, if they fail to secure peace continental Europe is doomed once it is lost. He perceives, too, that no war in which France took part could now fail to be a civil war—perhaps the most telling fact of all.

One may feel that the suspicion and intransigence of Moscow made a "third force" impossible from the start, that even a France freed from the burden of the Indo-China war could not have become strong enough to count as a factor in the balance. One may indeed decide to reject point by point M. Beuve-Méry's running commentary on the last few packed years of history. But to follow it is at least a good mental exercise; and at a time when all sensible men of goodwill seem to have the same foreign policy it is salutary to have to reckon with someone who disagrees.

Malthus Through the Looking Glass

Geography of Hunger. By Josué de Castro. *Gollancz.* 288 pages. 18s.

The chairman of the executive of the Food and Agriculture Organisation has built his book around a paradox—a paradox being, as G. K. Chesterton remarked, a platitude stood on its head. He takes the Malthusian platitude that overpopulation and hunger go together, and demonstrates to his own satisfaction that it is hunger which causes overpopulation and not, as one might think, *vice versa*. Hunger, particularly the "partial hunger" of chronic malnutrition with its train of deficiency diseases, has a double effect on its victims; it reduces their power and their will to produce and at the same time, except when it reaches the intensity of actual starvation, increases sexual appetite and fertility itself by a demonstrable physiological mechanism—the decrease in the power of an under-nourished liver to inactivate oestrogens. The primary impetus in the vicious spiral of hunger, ill health, low production, squalor, blind breeding and hunger again comes from hunger itself; and hunger initially results from social and cultural, not from natural, causes. Tackle these social and cultural causes, and the vicious spiral will reverse itself into virtue. The change required, says Dr de Castro, is from commercialism and colonialism, with the vicious land tenure and monoculture which they foster, to co-operation on—one is left to infer—the "people's democracy" model. Seconded by a wholehearted but discriminating application of scientific techniques, this reform would make any artificial limitation of births unnecessary; the oestrogen-neutralising activities of mankind's well-nourished livers would, presumably, do the trick. (When one thinks of the meals, and the fertility, of the Victorian bourgeoisie one feels a little doubtful about this.)

The thesis is interesting and in some particular instances convincingly supported; indeed, "The Geography of Hunger" offers some promising avenues of investigation and some unequivocal warnings against wrong roads. Unfortunately it is riddled with bad logic and historical dishonesty, reeking with malice and self-righteousness, and bulging with the kind of rhetoric which is generally the sure sign of a weak case. Lord Boyd Orr does not enhance his reputation by lending his authority, even if rather evasively, in a foreword.

Drama in Africa

Venture to the Interior. By Laurens van der Post. *Hogarth Press.* 241 pages. 12s. 6d.

This is a perfect travel book, so gripping in action and pace that it must be read at a sitting, so rich in human understanding that it must be savoured in the re-reading.

It is divided into three distinct parts, each complete in itself: the flight from Heathrow to Blantyre, which is a drama of contrasts; the expedition to Mlanje, which is a drama of presentiment and disaster; and the discovery of the "contented, serene and deeply fulfilled" plateau of Nyika, which is a drama of achievement.

Two themes underlie the action. The first is the schism between "the starved rationalism of our twentieth century minds" and the inherent urge towards the realisation of our own inner possibilities. This is equated with the tension between the European and the African, or the collective and the personal in our make-up, and it is the deep conviction of the author that until this gap is bridged it is useless to offer religious, political or scientific soporifics, or "better houses and finer gadgets which are more and more ingenious in order to disguise the triviality of the service they render." He also believes that if we could close our own split natures, no task would be too difficult or dangerous for a human being, so long as it was sufficient for his full self. The second theme is the intrusion of the physical enormity of Africa on the

pathetic endeavours of its human occupants, and here Colonel van der Post enriches his profound knowledge of the continent and its peoples with contrasts and analogies drawn from other lands, giving to his visual and mental experiences a universal validity.

From the brilliant and tender vignettes of his parents with which he introduces the book one would expect the author to be sensitive and courageous. In addition, his descriptive power is such that the reader shares the journey as if it had been shown in a Technicolor film. He has the gift of transmuting experience, so that a flight through a storm, or an exhausting struggle in mist and torrential rain on an impassable escarpment, becomes a part of his own development and he pursues a parallel exploration into himself and through himself into his contemporaries. All who are exiled or bereaved or disoriented will recognise here a friend who has shared their "mental load" and augmented and repacked it for the equipment of his next venture, and they will close his book invigorated and comforted.

Anti-Intellectualism

George Sorel, Prophet without Honour. By Richard Humphrey. *Harvard University Press. (London: Geoffrey Cumberlege).* 246 pages. 25s.

Sorel is remembered today mainly as the author of "Reflections on Violence" and as an apostle of revolutionary syndicalism. It is usually forgotten that he was a thinker of considerable power and acuity, whose social analysis often reveals the autodidact's ability to illuminate much that remains hidden from the academic mind. For his comparative neglect Sorel is himself much to blame. He always insisted that he was no system-builder and that his writings were mere notes, not treatises; his thought is usually diffuse and often obscure. It is not surprising that only his more spectacular—and less valuable—ideas should have survived.

The great merit of Mr Humphrey's penetrating study is that he succeeds in presenting for the first time an integrated analysis of Sorel's contribution to political sociology. He shows with admirable skill that the underlying purpose of Sorel's work was the constant search for a new moral basis to the social edifice; a profound pessimist about human affairs, Sorel bitterly rejected the postulates and methods of eighteenth-century rationalism and its doctrine of progress. Bourgeois society was a decaying corpse; not only had it failed to fulfil its promise, the promise itself was a hollow abstraction. This view partly explains Sorel's intellectual and political vagaries. He was a pragmatist before James, a pluralist and a syndicalist who also flirted with the monarchists of the *Action Française* as well as with the Socialist movement. Ultimately, he decided, only the proletariat could provide the *élan vital* for the new society. It must be equipped, not so much with a political ideal, as with a dynamic that rationalist methods of analysis could not erode or destroy; hence the "myth" of the general strike, an unattainable aim whose vision would yet foster the revolutionary apprenticeship of the masses.

Sorel, as Mr Humphrey clearly shows, belongs to the line of rebels against the categories of rationalist thought; like other nineteenth-century romantics he was a restless prisoner of a *fin de siècle* nausea neither confined to France nor peculiar to his age; that anti-intellectualism also formed part of the armoury of Fascism and Nazism is not without its importance in the assessment of Sorel's place in European thought.

Life of the Federal Reserve

American Monetary Policy. By E. A. Goldenweiser. *McGraw-Hill.* 391 pages. 25s. 6d.

Conscious monetary policy began in the United States only with the creation of the Federal Reserve system in 1913, and the Committee for Economic Development could have found no one better qualified to write a historical and analytical survey of its successes and failures than Mr Goldenweiser, who for many years was director of research and statistics for the Federal Reserve Board. His study traces, in non-technical language, the gradually widening understanding of the goals of monetary policy, from elasticity of the currency, which seemed of overriding importance in 1913, to the maintenance of a stable and growing economy, which is the aim today.

possessed by the system come all at once; there is an interesting chapter on bank reserves, the chief instrument of quantitative control, and four proposals for altering the reserve rules. Two of these proposals—the 100 per cent reserve plan and another, which would require a certain proportion of bank reserves to be carried in government securities—the author dismisses. He finds merit, however, in the suggestion, first officially advanced in 1931, that reserve requirements should be based on velocity of turnover, and in another which, in inflationary emergencies, would apply higher requirements to any increase in deposits after a given date. In his view, this would permit war needs to be financed directly by the Federal Reserve Banks, without interest and without leaving a legacy of swollen credit.

Mr Goldenweiser deals in detail with the mountainous problems the new central bank had to meet: the financing of two world wars, the stock market boom in the twenties and the depression of the thirties. The greatest interest, however, attaches to his conclusion that after the war the Federal Reserve system allowed the desirable aim of supporting government bond prices to take priority over the fundamental aim of damping down inflation. He believes this was not the result of Treasury dictation, though the Federal Reserve Board was reluctant to seek a quarrel, but of an honest, though mistaken, conviction that it would be catastrophic to allow government bond prices to fall. The agreement last March, which permitted the board to withdraw from the market, was reached too late for inclusion in the book, but events since then bear out Mr Goldenweiser's views.

His chief criticism of the central bank, with the exception of this policy, is that too often it acted too late. To remedy this, and to give the system greater prestige, he would like to see the board of governors replaced by a single governor, perhaps of Cabinet rank, with effective control of all monetary policy, including control of open market operations which is now shared with the Reserve Banks. Better men would be attracted, decisions would be reached more rapidly—and if it made the link between politics and monetary policy plainer, is the link not there already?

Reparations Failure

Am Abend der Demontage. By G. W. Harmssen. *Friedrich Trüjen, Bremen.* 196 pages. DM 10.

When the *Bremer Ausschuss für Wirtschaftsforschung* published in 1947 a study on reparations under the Potsdam agreement, the volume of removals was not yet known, and before currency reform valuations were often mere guess work. "Am Abend der Demontage" stands on much firmer ground. The Inter-Allied Reparations Agency had valued removals, in 1938 prices, at $146.8 million. These values, this study rightly points out, are unreal. Prices have at least doubled since 1938; amortisation rates were too high (only residual values were recognised); dismantling costs were ignored. The reparations agency admitted that the replacement costs of the assets would amount to $400 million. The study claims an actual loss through removals of over $300 million, 8 per cent of the $4,000 million of capital assets available in 1951.

The discrepancy between these estimates is due much more to a different approach than to different methods. The agency was mainly interested in the cash value of assets acquired through removals, the study in losses suffered by the German economy. Each selected a method appropriate for its purpose. Disagreement was inevitable under a system of reparation payments in kind, which was considered better than one of cash payments. The system failed completely. Instead of the $10,000 million President Truman expected for the Western Allies, a little over $517 million was collected by removals and confiscations, and over $4,000 million had to be pumped into Germany to prevent its complete collapse. Even if Germany can pay back over a lengthy period the $1,600 million, to which the Allies have reduced their $4,000 million claim, they will be still badly out of pocket. After having tried to reduce Germany to a kind of penurious self-sufficiency, they now have to pin their hopes of Europe's economic recovery on the coal output of the Ruhr mines, which Mr Morgenthau planned to wreck. One need not agree with all the calculations of this study. But it presents the material necessary for further research, and it is indispensable to every serious student of a badly conceived, ill-fated experiment.

Analysis of Revolution

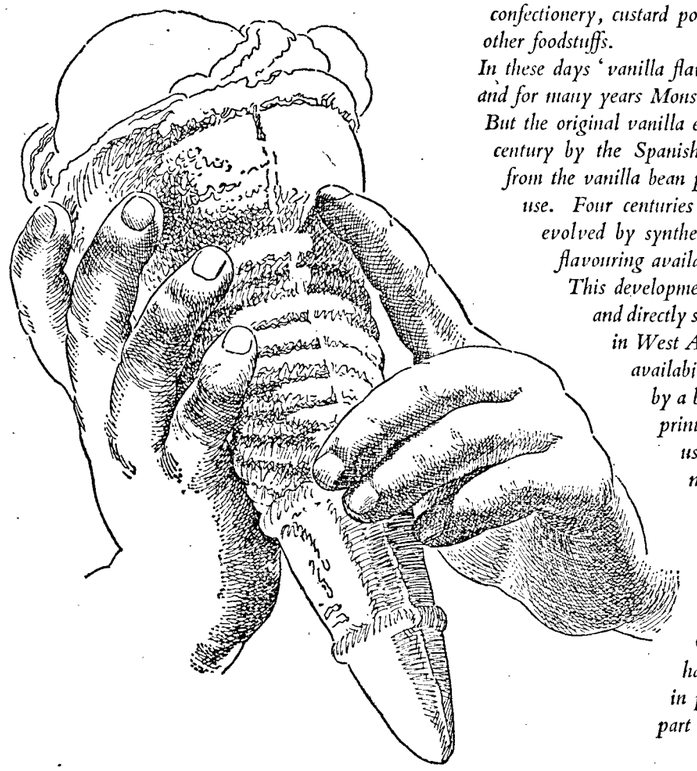
Les Deux Revolutions Francaises, 1789-1796. By Guglielmo Ferrero. *Editions de la Baconniere.* 220 pages.

Guglielmo Ferrero, an eminent Italian liberal historian, died in 1942. This book, based on lectures M. Ferrero gave at the University of Geneva, has been edited posthumously by M. Morriner. As usual in such cases one does not know what final form the book would have taken in the hands of its original author. As it stands, it is not convincing. In scarcely 200 small pages, many of which are quotations, it rushes through the French Revolution from the summoning of the States General to the advent of Napoleon. On the way it disagrees with both the right and left wing explanations, which, it is argued, fail to distinguish between revolution as "a new direction of human mind" and as "the breakdown of an established legal system."

It is through the fear of its leaders that M. Ferrero explains the descent of the Revolution from lofty principles to the reign of terror. Yet this emphasis on psychological factors vitiates the analysis. The conflict of the growing middle classes and the upholders of the feudal system is left unexplored. But the continuation of this antagonism well into the nineteenth century seems to indicate that any solution *à l'anglaise* was impossible, and once the middle classes were on the march the movement could not be limited to the higher bourgeoisie. As now published, M. Ferrero's notes—with their short-cuts, controversial statements and unwarranted assumptions—do little to dispel the prevailing view that the French Revolution must be taken as a whole, that in the given circumstances, the pains and the pangs were inherent in the birth of the new regime. The "new direction of mind" and the break-down of the established legal system" were inseparable parts of the same process.

Shorter Notices

Collected Economic Papers. By Joan Robinson. *Basil Blackwell.* 236 pages. 21s.



This economic miscellany ranges over a period of thirty years and over subject matter as diverse as Euler's theorem, the obstacles to full employment, the role of the United States in the world economy, and (an undergraduate *jeu d'esprit*) the economic inwardness of "Beauty and the Beast." It has all the Robinson hall marks; the zestful virtuosity in the handling of abstract ideas, the lively style, the flashes of irreverence, the erudition—and the social myopia and inveterate class hostility which make this brilliant writer so interesting.

In the papers dealing with pure theory these latter characteristics find little scope, manifesting themselves only occasionally in a brisk rap over the knuckles for the Hidden Hand. They appear most strikingly in the paper on "Obstacles to Full Employment," where all the disadvantages of a roaring seller's market, from take-it-or-leave-it shopkeepers to a shortage of coalminers, are enumerated, dismissed as "drawbacks" (Mrs Robinson's quotation marks) only to "those whose incomes are secure anyway" and described as "the reverse side of the advantage of full employment for the mass of the people." This is said as though the "mass of the people" were entirely unconcerned with the buying power, either in actual goods, convenience, or freedom of choice, of the incomes they earn, and the shopkeeper's boorishness or the worker's slackness an actual benefit to everyone in the community but the unspeakable rich. It is noteworthy, however, that in this same paper, written in 1946, Mrs Robinson puts on record her conviction that the difference between 95 per cent. and 98 per cent. employment—that is, the difference between that level assumed by most liberal economists to be practicable and that actually ruling during the last six years—is the difference between a tolerable and a "great" sacrifice of liberty. This is a distinction on which she has not, since that date, seen fit to lay stress.

You and the Law. By A. J. F. Wrottesley. *Williams and Norgate.* 208 pages. 9s. 6d.

This is rather a disappointing book, mainly because it seems to fall between all available stools. It is simply and clearly written, but for whom is it intended? It is not sufficiently detailed, nor referenced, to be of real value to either lawyer or student. It is too full of detail, and too superficial, to make the layman interested in the structure of the law. It is not a practical handbook, such as the individual books in the "This is the Law" series are. It is deficient in the one practical section which might be of the greatest help to the ordinary citizen, on exactly how to go about getting legal aid under the Legal Aid and Advice Act, 1949. It really belongs to the "Every Man His Own Doctor" class of book, which leave many people with many more symptoms, but less certainty, than they had when they first opened the pages.

Cornet solo ...

Cornets, wafers, tubs, bars or bricks . . . nine times in ten the flavour is 'vanilla'. And not in ice-cream only; but in chocolate, confectionery, custard powder, biscuits, mineral waters and many other foodstuffs.

In these days 'vanilla flavour' comes almost entirely from vanillin, and for many years Monsanto have been one of its chief producers. But the original vanilla essence—introduced to Europe in the 16th century by the Spanish conquerors of Mexico—was extracted from the vanilla bean pod. It was scarce, costly and restricted in use. Four centuries later vanillin, the active principle, was evolved by synthesis from clove oil making this delightful flavouring available in quantity and at a fair price.

This development helped to reduce the price of chocolate and directly stimulated the growth of the cocoa plantations in West Africa. And in many other trades the ready availability of Vanillin-Monsanto has been followed by a broadening of demand . . . such as for soap, printing ink, and rubber, where vanillin is used as a masking agent to obscure the natural odour of the product.

Vanillin-Monsanto has a long-established standard of purity. It has exerted an immense influence in relation to the minute quantities in which it is mixed with numerous basic products.

Over the years Vanillin's delicate bouquet has crept steadily and surely into first place in popular preference throughout the greater part of the world.

AMERICAN SURVEY

Allies in Spite of Themselves

Washington, D.C.

THE President's remark, at a recent press conference, that he was not very fond of the Franco government was a simple and poignant expression of his bewilderment at the direction of his own foreign policy. Mr Truman, whose pugnacious liberalism lost him four southern states in the election of 1948, has never displayed any great enthusiasm for the present Spanish regime, and he can hardly have enjoyed reading that his Ambassador in Madrid, Mr Stanton Griffis, had, before sailing from Gibraltar, called Spain "the best bet in Europe" and, on landing in New York, suggested that General Franco was the ideal mediator in the Middle East. But, with the General's friend, Senator McCarran, riding high and the Department of Defence collecting naval and air bases like an industrious squirrel, all he could allow himself were a few words of irritation at the behaviour of the Spanish government during the course of the present negotiations between the two countries.

The incident, however, was too much for the Spanish Ambassador and, within forty-eight hours, he had delivered a note, described as something less than a protest, to the State Department. Sr de Lequerica became Ambassador to the United States when full diplomatic relations were re-established last year, but he had been a "roving Ambassador" for some time before—and one whose roving, oddly enough, was confined to the United States and, indeed, largely to the halls of Congress and those places where certain members of Congress like to be entertained. So he must have been quietly confident that the immunity from criticism, which his country has shared for so long with Nationalist China and the ex-enemy countries, was assured for the future; he must have been shocked by the dash of cold water from the highest quarters.

Those in Congress who have been most receptive to the idea that Spain is the only trustworthy anti-Communist country in Europe are precisely those who most dislike the necessity for having close relationships with any foreign countries. They regularly express their dismay at the present impossibility of isolationism by insulting their allies whenever an opportunity occurs. On the very day that Mr Truman made his incautious remark about Spain, Senators belonging to this group were celebrating the seventh anniversary of Yalta, a word which always gives them a chance to display their talents. On this occasion Senator Knowland used it as a terrible example of the dangers of secret agreements, this one having been made, as he pointed out, by Mr Roosevelt, Mr Stalin, Mr Churchill and Mr Alger Hiss without benefit of Senatorial advice.

The Senate was officially debating a public agreement—the North Atlantic Treaty—and the question of whether Greece and Turkey should be included in it. And Senator Watkins of Utah was trying to get approval for a reservation by which the President would be forbidden to use American forces abroad "in a manner which would necessarily involve the United States in war." As Mr Watkins is not very good at explaining anything, Senator Taft undertook the job of making a case for this proposal and failed so dismally that he was deserted even by most of those of his colleagues who support him for the Republican nomination.

Greece and Turkey, he pointed out, had been at war frequently in the last hundred years and, according to his interpretation of the treaty, if Turkey were to attack Greece five years from now, the United States would have to go to the defence of Greece. The obligation assumed by the United States, he said, was too broad and he had always "favoured a narrower obligation in some respects, but a direct statement that if Russia attacked any of these nations, Russia would find herself at war with us." Being at war with the United States, in Mr Taft's definition, however, would hardly give an aggressor much reason for pause. It would not necessarily involve the use of American troops in defence of the country attacked. According to the Senator,

> all we are obliged to do is to assist the nation attacked . . . a wide discretion is left open to us to use economic measures or any other kind of measure.

Senator McMahon then led an expedition into the dark forest of Mr Taft's mind and brought out that Mr Taft did not object to sending troops to a friendly nation if it happened to be a convenient place to station them; he gave as an example the stationing of aircraft in Britain. That would not necessarily involve the United States in war because "the British are perfectly able to defend themselves." Mr McMahon saw daylight at last. According to Mr Taft's interpretation of the Constitution, he suggested, the President's right to station troops abroad depended on "their ability to run away if aggression occurs." Mr Taft agreed, saying,

> that is substantially the doctrine I have advanced . . . It rests upon the nation's ability to decide whether we will later be involved in war.

*

The Watkins reservation got nowhere, largely because, as Senator Millikin pointed out, it injected an impracticable formula into a field which was already badly confused, and it was finally withdrawn. But earlier in the day the isolationists had scored a victory that some people find rather a disturbing one. Senator Bricker got the support of quite a number of Democrats and such men in his own party as Senators Lodge, Saltonstall and Ives for a resolution proposing an amendment to the Constitution. Its purpose was to ensure that treaties do not

> vest in any international organisation or in any foreign power any of the legislative, executive or judicial powers vested in the Congress, the President, and in the courts of the United States or . . . alter or abridge the laws of the United States or the Constitution or laws of the several states.

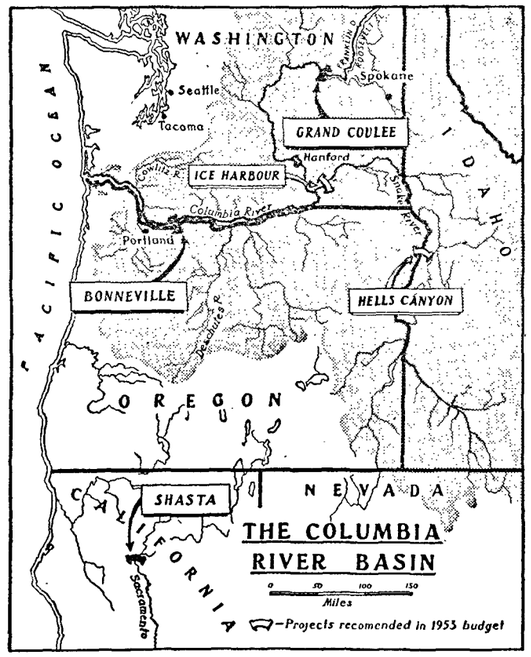
As treaties must be ratified by a two-thirds vote in the Senate, it seemed odd that Mr Bricker should be able to find nearly sixty of his colleagues willing to tie their own hands in this way. Mr Bricker made it plain, however, that Senators must be protected from their own weakness. It was his contention that

> by a ruthless exercise of the treaty-making power a President, with the support of two-thirds of the Senators present and voting, could revolutionise the relationship between the American people and their government as prescribed by the Constitution.

The Seventy-ninth Congress, he said, had not understood that "the Charter of the United Nations would supersede a large body of federal or state legislation" when it ratified the Charter. Some state laws have, it is true, been automatically repealed by the Charter, but they are laws, such as those prohibiting the ownership of land by aliens, which are peculiar to the land of the free. Mr Bricker obviously feels, however, that once the gates are open, anything might come in. Specifically, he did not want, he said,

> any of the international groups, and especially the group headed by Mrs Eleanor Roosevelt, which has drafted the covenant of human rights, to betray the fundamental, inalienable and God-given rights of American citizens.

He added that he was unalterably opposed both to world government and to the so-called Atlantic Union.



Among his supporters were the three Republican Senators who went to Strasbourg in the autumn and expressed their "deep regret that more realistic progress has not been made toward European union, economic and political." There is, therefore, every excuse for people in Europe, and even in the United States, to be confused about American policy. On the same day the President says that he is not very fond of the Franco government, but recognises the wisdom and necessity of an alliance with it; the Senate, while maintaining that Europe should forget about sovereignty, tries to defend the sovereignty of each and every state of the Union; and some Senators want to be able to use the territory of their allies for offensive operations against Russia without the obligation to defend those allies. The Spanish Ambassador might be well advised to explain some of the vagaries of American procedure to his government, now that the relations of the two countries are going to be closer. It would save them from the tedious necessity, in the future, of sending notes of complaint on matters which other countries have learned to take in their stride.

Where Power Transcends Party

[FROM A WEST COAST CORRESPONDENT]

PRESIDENT Truman, in his 1953 Budget message last month, recommended three controversial electric power projects for Oregon and Washington and thus gave new life to the Northwest's perennial dispute over whether its water resources should be regulated by federal or state authorities. The basic questions are how the Columbia River basin is to be developed and who is to control the hydro-electricity generated by the giant dams and power plants at Bonneville, Oregon, and Grand Coulee, Washington. Together, these two federally built projects now produce 17,685 million kilowatt hours of electricity a year. It is this power pool, most of it developed to meet wartime needs, which enables these two states to maintain the low electricity prices which attract a continuing stream of new industries. Nearly half of the country's pig aluminium production, for example, now comes from plants powered by water from the Columbia river; and at Hanford, Washington, electricity from Grand Coulee produces the plutonium on which the American atomic energy programme depends.

While hydro-electric power has brought growth and prosperity to the Pacific Northwest, and made it possible for the area to absorb comfortably the million new residents who have moved there since 1940, it has also brought deep political cleavages. The self-reliant sons of the pioneers, who made these states out of a wilderness, find little satisfaction in improvements designed in, and imposed from Washington, DC, nearly 3,000 miles away. The idea of a Columbia Valley Authority, modelled on that for the Tennessee Valley, fills most native Oregonians and Washingtonians with alarm and anger. So does the idea of linking the federally controlled

electricity distributing system of Bonneville with that of California's Shasta Dam, an idea twice rejected by Congress but endorsed again by the President. To the Northwest's Congressional representatives, whether Republican or Democrat, this looks like one more step towards complete control of the western electricity grid by the federal Department of the Interior. Equally objectionable from this point of view is the President's request for authorisations and appropriations for new federal dams in the area.

A plot to hand over to the Department of the Interior both private power companies and the Public Utility Districts, the special local government units for power distribution, is also seen by private electricity interests in the President's third recommendation. It calls for fuel-fired electricity generating plants in Oregon and Washington, in order to increase the Northwest's power capacity to meet defence needs. Under this plan, which was submitted to Congress last summer by Representative Henry Jackson, a Democrat from Washington, eight new fuel plants would be built on the periphery of the Bonneville transmission system,

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

and would burn local wood waste, coal and oil. It would mean that for the first time the Bonneville Administration would be responsible for the generation of electricity; now it only distributes the power from government-operated hydro-electric plants. Washington's coal producers favour this development as a step towards better utilisation of the state's abundant coal resources, and it also has some support from commercial fishing and sporting interests who object to any more of the Columbia's tributary streams being dammed.

This "fish versus dams" controversy complicates the situation in other ways. In Oregon the Portland General Electric Company wants to build a dam on the Deschutes River to bring increased power over its lines, and in Washington the Tacoma City Light and Power Company wants to build two dams on the Cowlitz River to meet a local electricity shortage. In their efforts to prevail over their local opponents, both these private companies have appealed to the Federal Power Commission and obtained favourable decisions. In return the opposition now threatens to challenge the Federal Power Commission's jurisdiction over these non-navigable streams and thus raise the whole burning question of states' rights in the courts. The dispute is further enlivened by the claims of the Confederated Tribes of Warm Springs Indians in Oregon to undisturbed fishing rights in the Deschutes River, which is their Reservation's eastern boundary.

*

Since the states' rights argument is a very lively one in the Northwest, the President's latest challenge to local authority may make them nearly as important an issue in next November's elections there as in the south. At the recent conference of Republicans from the western states, which preceded the Republican National Committee meetings in San Francisco, one of the planks proposed for this year's party platform dealt specifically with the question of electric power. Under strong pressure from the Northwest, this plank was drafted to read:

> We recognise the practicality of the participation of the federal government in planning and developing multi-purpose programmes . . . for our great river basins; but we affirm that such programmes must be based upon the desires and with the consent of a majority of the citizens affected in the areas being developed. We favour the principle of interstate regional co-operation and compacts. . . . We express our opposition to the Valley Authority method of river basin development . . . because such proposed Authorities would put vast and unlimited powers in the hands of appointive rather than elective public officials.

Western Republicans are not alone in their stand against extension of federal control over northwestern power development. Washington's Democratic Senator Magnuson, a close friend of the President's, differs sharply with him on this question, and in this he is joined by such staunch fellow Democrats as Representative Jackson. Needless to say, Oregon's entirely Republican delegation to Congress opposes all expansion of federal management and keeps the Bonneville Administration under close scrutiny. So does the coast's leading Democratic daily paper, the *Oregon Journal*, in Portland.

This solidarity on the states' rights issue in the Northwest illustrates the transcendence of regional over party interests and the fluidity of party lines in this area. In Washington, D.C., Senator Magnuson finds himself strangely aligned on the power problem with the Republican Mr Cain, the other Senator from the state of Washington, though otherwise the two men always pull in opposite directions. Senator Cain represents that extreme right wing in the western hinterland which is still trying to return to what it regards as the security of the gold standard, of higher tariffs, of withdrawal from the United Nations, of McCarthyism at home and MacArthurism abroad.

But next door, in Oregon, one of the Republican Senators, and a most distinguished one, is Senator Wayne Morse, a "constitutional liberal" who believes that it is the job of a Senator to lead as well as follow public opinion. Mr Morse consistently demands that the Republican party carry out "the tenet of Lincoln when he said, in effect, that the government should do for the people what they cannot do for themselves . . . but what in the interest of the general welfare needs to be done." This terrifies Oregon's constitutional conservatives, but even Senator Morse calls the proposed Columbia Valley Authority "bureaucratic paternalism."

American Notes

Fact-finding in Steel

The fact-finding panel appointed after the steelworkers agreed to postpone their strike has concluded its hearings, and is now drawing up a report on which the Wage Stabilisation Board can base recommendations for a settlement. The truce runs out this week, but the union is virtually certain to extend it, in the well-founded belief that an elastic wage policy can be stretched to cover one more increase, particularly in an industry vital to the defence programme. Neither side, however, is bound to accept the government's recommendations.

On their day in court, the steel companies, who insist they cannot afford higher wages without higher prices, echoed with embarrassing fervour all the anti-inflationary doctrine the Administration preaches. They contend that this time, as so often in the past, steel will set a new national wage and price pattern, and that increases in steel prices will set the inflationary ball rolling once more, robbing even the steelworker of his paper gains. Should they be forced to raise wages without raising prices, they submitted that it would be the consumer and the Treasury which would suffer: the consumer because the companies could no longer build new steel capacity to ease the shortage, the Treasury because the bulk of the wage claim would be paid out of profits otherwise destined for the tax collector.

In the view of the union, the increase of 18½ cents an hour it asks, coupled with other improvements, would set no other wage demands in motion and need not result in higher prices. The steelworkers won an increase of 16 cents an hour in December, 1950, and have had nothing since; they consider they are merely trying to overtake the automobile workers, who now lead the parade with $1.95 cents an hour to their $1.88, and who, in addition, are protected against further increases in the cost of living and guaranteed an annual productivity bonus as well. Steel profits, before taxes, are more than four times as great as in 1946; trade union economists feel the industry can well afford higher wages without dipping into its expansion fund, starving its stockholders or raising prices. But it is profits after taxes which interest stockholders and finance expansion, and these fell by a quarter in the first nine months of last year.

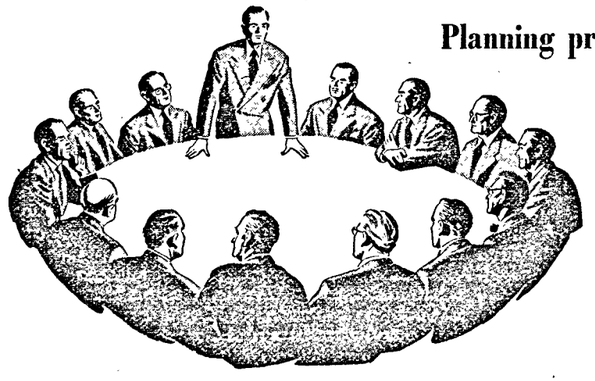
Behind this year's miles of statistics, arguments and charts there has been relatively little passion. Everyone knows the Administration is determined to avoid a strike, which would cripple the armament drive, and is prepared to pay the price. Even while the panel was sitting stories from Washington were already naming it—15 cents an hour for the workers and a sweetener of $2.50 to $3 a ton for the companies. The only question is whether the steel industry, swallowing hard to get rid of its anti-inflationary sentiments, would regard this sum —a third of what it asks—as adequate compensation.

Taft on Tour

Senator Taft celebrated Lincoln's Birthday in Seattle last week by repudiating the Joint Chiefs of Staff and, in effect, offering General Chiang Kai-shek as an alternative. The Senator declared that deliveries of American arms to the Nationalists on Formosa should be speeded up so that they might invade the Chinese mainland—"the only way of stopping the Communists from over-running Asia." Mr Taft had made it clear a few weeks earlier that he did not think that Americans were capable of stopping them. The unnecessary Truman, or Korean, war, he said then, had proved that the United States could not prevent aggression and that it had lost control of the air. But if the Nationalist troops failed to conquer China, and there is every reason to suppose that they would fail, then the logical result of Mr Taft's proposal, whether he realises it or not, is that American troops would have to try to finish what is already being called the Taft war.

This was at once pointed out by Governor Warren of California, one of Mr Taft's opponents in the only war in which he is really interested, that for the Republican presidential nomination. When Mr Taft spoke in Seattle he was carrying war not into the Chinese Communists' camp but into Mr Warren's—and General Eisenhower's—in order to bring back as his prisoners a batch of west coast delegates to the Republican nominating convention next July. He needs them badly, for General Eisenhower, his only dangerous rival, has been doing well since he announced his willingness to be drafted for President.

Senator Taft is supposed to be strong in the south and in the local party machines, but in Oklahoma and Louisiana, two southern states, Eisenhower supporters have revolted with some success against machines pledged to Mr Taft. Amongst members of Congress, however, a recent poll showed Senator Taft to be more popular than he was last November and much more popular than General Eisenhower. The Senator has also caught up with the General amongst Republican voters in the country, according to the latest Gallup poll, but the General continues to gain on the Senator amongst independent voters, 42 per cent of whom now prefer General Eisenhower to any other Republican.



This preference is, of course, the General's greatest asset, but it is doubtful how long it can hold the balance against Senator Taft's personal campaign. His trip to the west coast was the last of a series of hard-working tours, in which he has covered thousands of miles since the autumn, giving the whole country the individual treatment which acted so successfully on the voters of Ohio in 1950. At Madison Square Garden two weeks ago a clamorous gathering of 15,000 people, led by film and stage stars, sang a "Serenade to Ike" which the General heard by short-wave radio. But he was not lured into dropping even a hint that he was thinking of coming home in the spring to fight for himself.

Death at the Airports

Had Newark Airport not been hastily closed last week after the third air disaster in two months, citizens of the nearby city of Elizabeth, New Jersey, would probably have taken the law into their own hands. Two Congressional groups were already hearing demands for its removal from the angry and frightened residents when the third crash brought the death roll to 118. Eleven were killed in their homes, some in their sleep. The fear proved infectious. When Newark's air traffic—normally a third of that for the whole New York area—was transferred to La Guardia and Idlewild, protests began to pour in from residents of Queens County about the danger and the noise. The airlines, soberly aware that another tragedy might shut them out of New York altogether, hastily agreed that the number of daily flights at La Guardia, which had risen to 680 from 520, should be cut to 454. All foreign flights were transferred, and aircraft diverted as far north as Bridgeport and as far south as Philadelphia. Pilots were instructed to use routes over the least populated areas, as far as possible.

Newark did not deserve its ill-fortune. Until last December it had not had a fatal commercial crash in all its twenty-four years; experts consider it one of the safest airports in the country. So far, investigation has shown no negligence or violation of safety regulations. What happened at Newark might happen anywhere—and sixty-two of the country's hundred major airports are as near people's homes and businesses as Newark's. (There the nearest houses are just over a mile from the end of one runway.) Improved safety regulations can lessen the hazards: re-wiring has been ordered in two types of aircraft, and the Senate Interstate Commerce Committee has recommended tighter controls on bad-weather flying. In some cases runways can be adjusted to eliminate flying over congested areas. The Port of New York Authority, which operates Newark as well as La Guardia and Idlewild, is building a new runway at Newark which will permit most take-offs and landings to be over water.

With the increasing speed and density of air travel, however, some accidents will remain the price of the air age. Many towns and cities which once sought the economic benefits and convenience of an airport will want to keep it at arm's length. Relocation of existing airfields would be exceedingly costly. Over $50 million has been invested in the Newark Airport, and twice that at Idlewild. Nor, in such heavily populated areas, is it easy to find new sites which do not endanger third parties. After the tragedies at Elizabeth, however, new airports will be placed farther from built-up areas—passengers eventually may be taken to and fro by helicopter—and homes and shops will not be allowed to crowd in on the runways. The President, concerned at the number of accidents that have occurred recently when aircraft have been taking off and landing, has now set up a special commission to study safety conditions at airports throughout the country and report within 90 days.

Bases Around the Atlas

In its latest attempt to prove that the armed forces are unnecessarily extravagant and that military spending can therefore be cut, Congress is turning its attention to the five air bases being built in French Morocco, between the Atlas mountains and the Atlantic. These, like the American bases in Britain and Greenland, and the one to be built in Cyprus, are for the use of the huge B-36s, the aircraft which are able to carry bombs to the heart of the Soviet Union and which are under the operational direction not of local US Air Force officers but of the Strategic Air Command in Nebraska. Also like the bases in Britain, the Moroccan bases can be reached without flying over hostile territory, can be supplied and defended by sea, and are conveniently situated between the B-36s' home airfields in Texas and their probable targets.

The building of these bases in Morocco, at an estimated cost of about $500 million, is the largest undertaking ever supervised by the Army Corps of Engineers, yet two of the airfields were already in use last July, only seven months after the scheme had been agreed in principle with the French government, and less than three months after the first ground had been broken. In view of the threatening international situation, speed was the main consideration and it had to be paid for; by starting to build while the project was still being planned, the engineers saved as much as two years, but they do not pretend that this was either economical or efficient. Criticism so far has centred on two allegations: that three airfields were started and then abandoned when it was found that they would be under water at certain times, and that American labour was brought at great expense from the Middle West and even Alaska when there were construction workers unemployed just across the ocean in New York. To this the military authorities reply that they consider it inadvisable, for political and social reasons, to employ American Jews in Arab countries; in New York it is forbidden by law to discriminate against workers because of their race or religion. The contractors responsible for building the bases were therefore obliged to engage their labour in states where they could refuse to hire Jews—and where there were not so many to hire.

About 4,000 of these skilled American workers, being paid altogether about $2 million a month, are employed on the five bases, with another 20,000 unskilled Moroccan workers who, under the agreement with France, are paid at local rates in order to prevent inflation; this differential is one of the things about the scheme which the Moroccan nationalists resent. Using machines, such as the 200-ton Supercompactor, which make giant bulldozers look like pigmies, these men are clearing and laying 200-feet-wide, 2-mile-long airstrips, able to bear the weight of the B-36s, at a rate of over 150 feet a day. They are also building houses, storage depots and other facilities, and rail and pipeline connections between the airfields and the ports of Casablanca and Safi.

Oil Shortages

The shortage on the east coast of residual fuel oil for ships' bunkers, which has been holding up coal and other cargoes for Europe during recent weeks, is basically the result of increases in the number of ships in active operation. Since the Korean outbreak the Maritime Administration has taken 512 vessels out of reserve, each of which needs an average of 60,000 barrels of bunker oil a year. The main reason why additional supplies are not available to meet this new demand is that the oil must come from Gulf ports; charter rates on tankers have gone up 200 per cent in the last year, while price controls prevent any increase in the amounts charged to shipping companies for their bunker oil. It sells in Houston, Texas, for around $1.85 a barrel and it costs $1.30 to send it to New York, where the ceiling price is only $2.45.

A similar price squeeze explains the shortage of home heating oil on the east coast, which has reached serious proportions at the coldest time of the year. The Petroleum Administration for Defence proposed a price increase of ½ cent a gallon, but the price stabiliser turned this down on the grounds that it would push up the cost of at least 60 million barrels of heating oil for the sake of bringing in only an extra 6 million barrels. The next suggestion was a subsidy to cover the loss of transporting the extra supplies, but this was rejected by the mobilisation authorities. Now the petroleum companies themselves have agreed to carry the loss, put at $7 or $8 million, of bringing in five per cent more heating oil over the next two months, on condition that price ceilings are reviewed in the meantime.

These sudden shortages, even though only temporary and local, dramatise the change in the oil situation since the autumn, when the talk was all of surplus supplies and the oil companies were by no means as enthusiastic as the government about plans for expanding their output. Now they are concerned because their expansion is being delayed by lack of steel and other materials. In 1952 45,000 new wells are supposed to be drilled, but at the moment certain existing wells could produce more if new pipelines were available to take the extra output to the refineries. The refineries, however, are working to practical capacity and their expansion is falling behind schedule because of shortages of construction material and components. Nevertheless the PAD has now stepped up its proposed increase in refining capacity this year from an extra 330,000 barrels a day to 475,000.

A proportion of the scarce petroleum equipment—steel pipe and so on—is being sent abroad, to the annoyance of the independent American oil companies, who have no interests overseas. Their annoyance will be increased if, as is expected, the United States increases its imports and reduces its exports of oil this year. PAD estimates that imports of petroleum during 1952 will average about 900,000 barrels a day. This may seem very little compared with an estimated daily domestic demand of 7,800,000 barrels a day, but it is quite enough to send the independent oil producers crying to Congress for help.

Shorter Notes

Democracy lost, 174-28, in San Francisco, California, when house owners in a small suburb voted their objections to having a Chinese family move in, for fear it would lower property values. A former Chinese Nationalist officer and his wife had agreed to abide by a community vote on the issue when they learned there was opposition to their entry. Their faith in America has been revived, however, by general indignation at the vote as well as by offers of homes or property in other sections of the area.

*

High beef prices and low horse prices make a combination some meat packers have been unable to resist; a midwestern grand jury has discovered that in Chicago many hamburgers are really horseburgers. Millions of pounds of horse flesh—wholesale cost, 5 cents a pound—has apparently been sold as beef—wholesale cost, 37½ cents a pound. Eleven food inspectors in Illinois have been discharged for accepting bribes to pass mixtures of beef and horse meat as beef, and the equine exposé has cut sales of chopped beef drastically in restaurants and shops.

*

Britons already dismayed by the American custom of using tea bags to make that comforting drink will have further cause for exclamation: now, for $4.50 a hundred, Americans can have "personalized" tea bags with their name or initials printed on the tab.

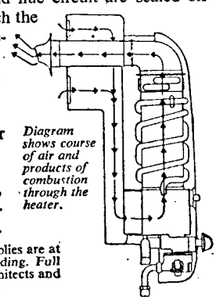
Ascot produce first BALANCED FLUE GAS WATER HEATER

ASCOT 715
Balanced Flue
Multipoint
Gas Water Heater

This is a significant achievement, for the difficulties of applying the "balanced flue" principle to instantaneous gas water heaters had hitherto defied solution.

The important advantage of the new Ascot 715 is that the air intake and flue circuit are sealed off from the room in which the heater is installed, thereby eliminating down-draughts and vitiation of the indoor atmosphere. There are no visible flue-pipes either inside or outside the building.



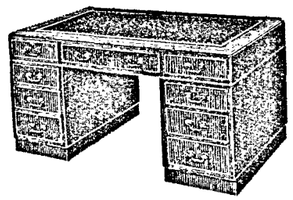


Diagram shows course of air and products of combustion through the heater.

Ten local authorities have already specified the Ascot 715 for their housing schemes.

As production is limited, supplies are at present restricted to new building. Full co-operation is offered to architects and all interested in new housing.

THE WORLD OVERSEAS

Fears and Factions in France

(From a Paris Correspondent)

THE French National Assembly has at last ended its debate on the European Army. It has set limits to M. Schuman's policy towards Germany in a series of resolutions. These laid down, among other things, that there shall be no German recruitment until the European army treaty is ratified by all the parliaments concerned; that no state may join Nato without the approval of the parliaments of all member states; that renewed efforts to bring Britain into the army should be made, and other recommendations should be adjusted to meet Britain's requirements; that the United States and Britain should guarantee the Defence Committee against disruption by any member; and that the army shall only be established at the same pace as the military organisation is created to direct it.

The debate itself, however, has been rightly described as "distinguished." A high proportion of the speeches are worth reading. The occasional shouting of insults by M. Duclos on behalf of the Communists, or by individual deputies of the right on their own behalf, could not destroy this impression. It was also an instructive debate in that it exhibited most usefully two deep currents of French opinion: the one profound repugnance for any form of German rearmament, the other a great anxiety lest the Channel be widened while the Atlantic is contracted, till France finds itself keeping house with Germany, while Britain and America look on from a distance. But it was none the less a discouraging debate, marked by all the tendencies which make French parliamentarianism alternately anarchic and academic. It also illustrated how little dynamic support French governments can expect at present from the nation.

The repugnance for German rearmament was universal and almost physical. It tended to cast into the shade the less traditional and geographically remoter Soviet danger; M. Paul Reynaud cut an eccentric figure when he insisted on the latter. The government spokesmen themselves only presented the European army as a lesser risk than that of isolation with Germany rearmed under her national flag and practically uncontrolled. The opposition to German rearmament was most vividly and painfully expressed by a former inmate of a concentration camp. He came as the spokesman of comrades who had died in the camp before liberation and who had sworn to each other that whoever survived would always oppose the rearmament of Germany. The sentiment was strong enough to bring together Socialists and Gaullists. It was not surprising that Gaullists should be delighted at the opportunity of showing that their movement was not exclusively one of the right and that they were able to speak even of General de Gaulle's bugbear, M. Moch, with sympathy. But it was a little odd that the Socialists did not show more resentment of the arm flung affectionately round their waist on this occasion.

What was noticeably absent from the opposition speeches, however, was any real reply to the government's proposition that there was only a choice between German non-participation in western defence, a German national army and a European army. Equally striking was the failure of those who most earnestly desired British membership of the European Defence Community to examine the reasons that kept Britain outside it. Thus Socialist speakers implied that M. Schuman had done less than he should to draw Britain into the European army, while themselves advocating what British opinion had unanimously rejected—namely, European integration below the level of a small division.

The gravest weakness exhibited by the debate is the absence from most deputies' minds of the elementary political principle expressed in the British saying "the King's government must be carried on." It might have been thought that three days would have been enough in which both to express views of principle and to find the practical application of principle to the particular situation. Did the Socialists really want to bring the government down and deprive France of representation at London or Lisbon? Since the executive committee of the party has the right to overrule the Socialist parliamentary group in certain important circumstances such as votes of confidence, was it really impossible for both party organs to agree in advance on the course to be pursued and then to negotiate with the government betimes, so as to avoid the indignity of keeping everybody waiting and the grave inconvenience of delaying until after Lisbon parliamentary consideration of France's urgent financial problems?

Socialists Out of Hand

The failure to consider the convenience or dignity of the French government is indeed a widespread malady in the French Assembly, as the behaviour of the Finance Commission illustrates; it has just thrown out for the second time the entire tax proposals of the government, nibbling instead at the deficit with a proposed mechanical 2 per cent cut on all the expenditure which the commission itself had recommended only two months ago. But the Socialist party is a special case at present. The party is internally out of hand. Gone are the days when one addressed its leaders in the hope of swaying it. To have been a minister today almost excludes a man from having a say in party affairs. The essential disease is the consciousness that the party has tumbled from a vote of five million in 1945 to one of 2,760,000 in 1951. There is a group of "young Turk" deputies which subordinates every other question to that of demagogic appeal to the voter, and is prepared to leave France ungoverned provided that every suitable question—schools, railway reform, wage sliding-scale or German rearmament—is exploited ruthlessly on the party's behalf in the constituencies. Bevan and Schumacher have their pupils, pupils who unfortunately bear responsibilities not borne by Bevan and Schumacher. The wonder is that the party has been persuaded to vote for a resolution acceptable to the government on this occasion—perhaps only because the resolution was so far from the government's original ideas.

A further depressing habit of mind illustrated on this occasion is that of attempting to solve problems by erecting a series of inconvenient little fences, closely resembling those in the new constitution and the standing rules of the Assembly which have done so much to make the Fourth Republic ungovernable. Even the Prime Minister has accepted the extraordinary principle that, in order to maintain the balance of forces in the European army, German forces must be reduced if French responsibilities overseas should in some emergency reduce the French contingent actually serving in the European army below the level of the German. Are German units then to be disbanded and the drain on European strength to be multiplied by two?

Two general impressions emerge from the debate. The first is the sharp contrast between the boldness and self-confidence of some leaders and groups of opinion in France and the (comprehensible) traditionalism and timidity of thought of a very large part of opinion. The events of the years 1939-45 have put bold minds at the head of that part of the electorate which is "republican" (in the French restrictive sense) chiefly because it wants a strictly limited amount of change. The second is that the decision to make Germany a participant in western defence has imposed on the still youthful movement for European unity a problem heavier than anyone had the right to expect its adolescent shoulders to bear. It may yet succeed in shouldering it, but at what cost in deformation remains to be seen. It was as civilians that Frenchmen and Germans would have best learned how later to wear a common uniform.

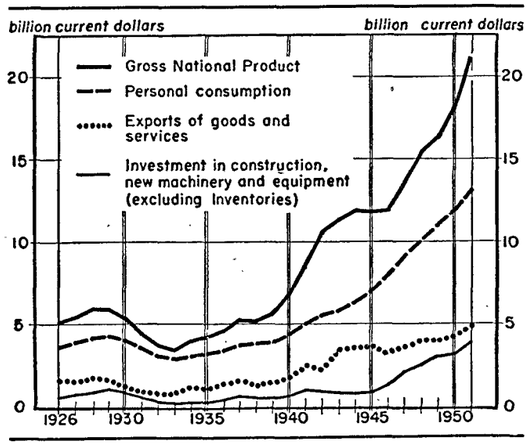
Canada's Doubled Output

[FROM OUR OTTAWA CORRESPONDENT]

THE rapid growth of the Canadian national economy has been brought into clearer focus by the publication here of a detailed review of the last quarter century, showing fluctuations in terms of a constant (1935-39) dollar as well as in current values. The period 1926-51 brought Canada from one peak of activity to another higher peak, but it bridged the depression of the thirties and the artificial and distorted activity of the war years. From 1926-29 Canada was expanding fast. In 1928 the gross national product was put at $6,100 million. In 1951 it is estimated at $21,200 million. But in terms of constant dollars, the increase between the two years was from $5,330 million to $10,700 million. The physical output of the Canadian economy was, therefore, almost exactly doubled in just under a quarter of a century.

During the same period the population grew from less than 10 million to 14 million. The productivity of workers must have increased at a cumulative rate of about 1.3 per cent per year, which is the more striking because working hours (averaging 50 hours a week in 1929) dropped substantially (to 43 hours a week in 1950). The improvement of the physical standard of living can be judged from the figures for expenditure per head on consumers' goods and services. It increased by 38 per cent, from $360 to $495 in terms of 1935-39 dollars.

It would, of course, be expected that this period of growth should show a substantial increase in industrialisation. Manufacturing, which accounted for only 23 per cent of the national income in 1928, accounted for 30 per cent in 1950. In spite of the increase of population agriculture now employs 4 per cent less people than it did after the First World War: manufacturing employs 134 per cent more people.



One effect of the increase in domestic consumption and manufacturing is to reduce the relative importance of foreign trade to the economy. Although Canada's export and import trade increased by 45 per cent between 1928 and 1950, in the same period the gross national product nearly doubled, government expenditure more than doubled, personal expenditure nearly doubled, and domestic investment increased by 65 per cent. By a coincidence of figures the adverse trade balance in 1950 (at $300 million) was almost exactly the same as in 1929. But in 1929 it represented more than 5 per cent of gross national product. In 1950 it was only 1.7 per cent.

Canadian exports of goods and services were valued last year at over $5 billion, equivalent to a quarter of the gross national product. But looking at the period as a whole, it is apparent that price changes have had more effect than volume changes on the foreign trade account. The depression drop from 1929 to 1933 reduced exports by 54 per cent in value, but in volume the reduction was only half as great. The recovery of export trade from 1939 to the present time was an increase of 273 per cent by value; but by volume the increase was only 40 per cent.

Capital investment has never been equal in value to Canada's export trade, but it has been even more volatile. The years 1926-29 marked the previous peak of capital expansion, and considering the smaller base on which it then rested, it was perhaps an even greater feat than the present investment boom. (The volume of new investment increased by 60 per cent between 1926 and 1929.) But in absolute terms the investment boom that has been going on since 1946 has never been equalled. In 1946 private and public investment in Canada absorbed more than 14 per cent of the gross national product. In 1947 it was 18 per cent; in 1948, 1949 and 1950 it was over 21 per cent; and in 1951 it exceeded 22 per cent. The indications for 1952 are that it will be at least as high this year. (These figures include government construction but no other defence spending by government.) This rate of expansion coupled with a considerable defence programme obviously presents some pressing problems. The promise for the future may arouse envy, but the present is not altogether enviable.

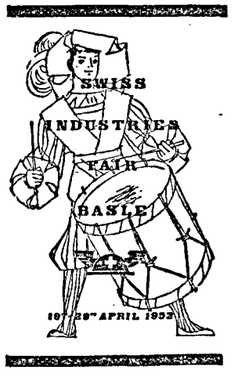
Will Consumers Hold Back?

Last year private investment of $3,880 million coincided with government expenditures of $3,110 million (including defence) to account for one third of the gross national

expenditure. Personal expenditure rose by 11 per cent over the previous year, but this was entirely due to price increases. There was no increase in physical consumption by persons. The restraint in personal consumption was accompanied by a doubling of personal savings. It made a great contribution towards stabilising the economy last year; but one wonders whether it can last even for another year. In the existing situation any decrease in saving or increase in personal expenditure, coupled with the inevitable increase in the defence programme and the continued high rate of private investment, could quickly revive inflationary pressures which have been relatively dormant in the last nine months.

Another sobering thought is that most of the big development projects now being undertaken require some years for completion. Iron ore will not be coming out of Labrador until 1954, nor aluminium from the huge new project in northern British Columbia, nor nickel and copper from the big Lynn Lake deposit in northern Manitoba. Nor will Alberta oil find its second outlet—the pipeline to the Pacific Coast—until almost the same time. It is not, therefore, until 1954 or 1955 that Canada may expect to reap the rewards of the strain it is now undergoing for the sake of big development programmes. And 1954 or 1955 is, according to present plans, the time when the rearmament drive should be getting on to a care and maintenance basis.

China's "Tested Tiger-Catchers"



THE Chinese Communists' campaign "against corruption, waste and bureaucracy" has now been carried on in the grand manner for several weeks. It is rated by the government as being of such transcendent importance that the Chinese-Soviet friendship week, which was to have been held in celebration of the second anniversary of the treaty of alliance with the Soviet Union, was cancelled in order not to interfere with it. The methods of denunciation, mass rallies, public confessions and "trials" used last year for the rounding-up and liquidation of "counter-revolutionaries" have now been directed against "corrupt elements." These include both businessmen, who try to evade economic controls or taxes by bribing officials, and the officials who either take the bribes or harm the state by extravagance, laziness or embezzlement of funds.

The most trusted cadres of the Communist party have been mobilised for the task of rooting out the corrupt elements; in the words of the chairman of the North China austerity inspection committee, Liu Lan-tao, the need is to set up in each area "a strong, pure and clean commanding headquarters with a tested tiger-catching backbone corps." The tiger-catchers, however, require the co-operation of the general public in order to achieve results, and in accordance with the standard Communist practice denunciation is encouraged—indeed demanded—as a proof of loyalty to the regime. Workers and clerks in private business concerns are required to investigate and denounce their employers, and staffs in government offices to expose their superiors. The democratic women's federation has been pressed into service and has exhorted its members to denounce not only their husbands but even their sons.

The public response has been almost embarrassingly voluminous; according to Liu, 160,000 letters of accusation had been received in Tientsin alone and 150,000 in Peking. While it is good to accuse someone else, it is even better to accuse oneself; leniency is promised to those who "repent of their crimes and come over to the side of the people," and, as "refusal to confess" is in itself a crime and entails being sent for trial with virtually no hope of acquittal, there has been a rush to confess. In some districts this seems to have taken the form of mass demonstrations. Railway workers in the Hangchow area held "confess and report" rallies at which over 1,500 corrupt elements are said to have confessed; in Chungking there are reported to have been 20,000 self-accusations.

If the accusations and confessions which have been published are to be believed, evasion of controls and of taxes appears to have been almost universal in Chinese private industry, and embezzlement very widespread in official institutions. In heavy industry, the manager and two deputy managers of the Anshan Trust Company, and the managers of the Hunghsin, Kueihsin and Hsinho iron works, have been implicated. Waste and corruption on a large scale are alleged in the Dairen and Port Arthur communications company. When such things occur in the most thoroughly "liberated" parts of China, it is not surprising to find an even worse state of affairs in provinces such as Chekiang. There one official has been charged with embezzling over 200 million yuan of public funds, another with corrupt deals involving 248 million yuan, and a third, the director of the public health laboratory, with receiving 170 million yuan for conniving at the theft of drugs. Offenders are classified into "big tigers," whose corruption involves sums of more than 100 million yuan, and small ones who do not come up to this standard; up to the beginning of February, 48 "big tigers" had been brought to confession in Hangchow.

Although the main drive has been directed against private

A warm welcome awaits all the trade buyers to this comprehensive survey of Swiss production and progress made within the year.

Full information from the Swiss Legation, 18 Montagu Place, London, W.1, or the Swiss Consulate, 53 Spring Gardens, Manchester 2. Details of travel arrangements and currency allowance from any leading Travel Agency or the Swiss State Travel Bureau, 458/9 Strand, Trafalgar Square, London, W.C.2.

ALMINAL

"Five Hundred"

ALUMINIUM - COPPER - CADMIUM ALLOYS*

In the new aluminium-copper-cadmium alloys, known as the Alminal FIVE HUNDRED series, high mechanical strength is combined with outstanding hot and cold-working properties, and freedom from age-hardening at room temperatures. This makes possible the production of high strength extrusions and forgings of an intricacy and thinness of section formerly associated only with low and medium strength aluminium alloys. In addition it permits the material to be stored for long periods in the solution treated condition and then formed by pressing, bending or other cold working processes, before subsequent artificial ageing, to develop the high mechanical properties. The use of this material, therefore, eliminates the necessity for carrying out solution treatment immediately before cold forming or for refrigerated storage of solution treated material. Other advantages possessed by Alminal FIVE HUNDRED include exceptionally fine grain size in forgings and extrusions and remarkable uniformity of strength properties in the directions longitudinal and transverse to the grain flow.

businessmen who bribe officials, and propaganda speeches refer to the "crimes of the property-owning class," the cleansing activity has been partly aimed at acts by officials, whether misappropriation of money and materials or waste and negligence, for which the direct corrupting influence of capitalism cannot be held responsible. In some cases even workers have been called to account, as at Hangchow, where it was found that railway workers had made a practice of loading only two or three tons on 30-ton goods wagons. Often offenders are discovered to be former Kuomintang employees taken over by the new regime, and their delinquencies can be put down to the habits of the evil past. But the number of party cadres who have been involved has been such as to call forth some sorrowful sermons about good comrades who were not afraid of the lead bullets of the enemy in the old days of revolutionary warfare but have now fallen victim to "golden bullets" in the administration of the cities.

Puritans and Zealots

The People's Government must be given credit for a serious purpose in this campaign. There has been substantial testimony of foreign observers to the general honesty and integrity of Communist officials when they first took over control in Shanghai and other places. The puritan zealots of the "Long March" and Yenan tradition are no doubt anxious to preserve their party from degeneration in the midst of the sirens and lotus-eaters who lie in wait for the comrades of weaker will. There are also very urgent practical reasons for the campaign. The strain of the war in Korea requires a stepping-up of productive efficiency and an end to the hoarding of commodities, which was habitual during the wartime and postwar inflation under the Kuomintang and has revived with the Korean war inflation during last year. Peking claims that the anti-corruption campaign has already had a good effect on the national currency and that bank deposits have increased since the movement began, as money is being frightened away from hoarding and speculation. On the other hand, there is an obvious effort in the propaganda of the campaign to blame all the shortages and dislocations due to the Korean war on to the Chinese private business class. A reckless political exploitation of the scandals along these lines, together with the fear and mutual suspicion inevitably engendered by the prevailing system of denunciation, may depress economic activity rather than stimulate it. As long as Communist China pursues a NEP policy, leaving to private capitalism a sector of the economy which the state is not yet ready to take over, some security and some incentives for the bourgeoisie must be provided.

Iraq—Land of Promise—II

SINCE the first instalment of this article was written, the Iraqi Senate has passed the oil agreement reached between the Iraqi government of Nuri Pasha es Said and the Iraq Petroleum Company, and the measure has received the royal assent. Iraq can now, therefore, count with confidence upon the steady stream of vast earnings from its oil that were described in the last issue of *The Economist*. Deeply impressed by the size of the sums involved, its people seem to approve of what their parliament has done. Three main opposition parties—left-wing groups which consider that the notables of whom Parliament is largely composed do not represent "the people"—called a general strike in protest at the agreement. But their motive, which was one of pure party politics, did not capture public support. Shops in Baghdad stayed open and there were, surprisingly, no demonstrations. Nuri Pasha, who has brought off this common-sense achievement in an area that is elsewhere seething with emotion, is owed a debt both by his own people and by the free world.

The agreement is the third of its kind to be completed between a foreign oil company and a Middle Eastern state; the two which entered into force before it were those reached with King Ibn Saud of Saudi Arabia and with the Sheikh of Kuwait. It differs in one significant respect from its two predecessors. They were concluded with absolute rulers, with individuals in complete personal control of the coffers or pockets into which the proceeds were to flow. The Iraqi agreement was concluded with a parliament and, judging by present evidence, has the seal of public approval. A comparison with Persia is irresistible. Here are two countries, neither of them over-populated, and each capable of drawing great wealth from oil; each is endowed by nature with huge potentialities, particularly in the field of food production for hungry Asia. Yet, of the two, it is the nation of more ancient lineage that elects a parliament that would rather let its people starve than suffer the so-called indignity of foreign assistance, and the younger and less polished people that grasps the virtues of using stepping stones. The Iraqis will have shown a measure of maturity greater than that of any of their neighbours, except the Turks, if they now begin to regard themselves as the harnessers of satisfactory foreign aid, rather than as tools of malevolent outsiders.

A Free Hand For Experts

They have for years been plentifully advised as to how to develop their country for, in common with all their neighbours, they have followed the local fashion of commissioning expert technical reports on economic plans. But the point of securing such reports is not their composition, but their execution. The Iraqis are in advance of most of their neighbours in the consistency with which they have pursued the installation of a proper executive board. As long ago as 1947, senior Iraqi civil servants were preaching to your correspondent the sensible doctrine that no development was possible unless executed by a permanent team of men who were not subject to the whims of ever-changing cabinets. The Iraq Development Board was founded in 1950; its composition was described in *The Economist* of August 18th last. After over a year of work, it has produced its first report on the projects it intends to pursue out of the oil wealth of which it disposes.

Priorities are not easy to select in a country where there is so much to spend and so much to do, but it has rightly given first place to flood control. Iraq still suffers from deluges which do damage comparable to those of biblical and Babylonian tradition. Its published programme of works that can be begun without delay, or almost so, budgets for an expenditure of 65.6 million Iraqi dinars (1 dinar = £1) out of anticipated receipts of ID95 million in the five years 1951-55. (Under later amendments to the oil agreement the latter figure is likely to be in the neighbourhood of ID200 million.) Schemes that are being put under way without delay include the allocation of ID9.6 million to the Wadi Tharthar flood control scheme—above Baghdad, on the Tigris—for which Iraq was in 1950 granted a loan of $12.8 million by the International Bank; the contract for this is already allocated to Messrs Balfour Beatty. Other projects for which tenders are being sought are for completion of the Habbaniya catchment scheme, on the Euphrates, for use against floods and as a regulator; for a dam on the lesser Zab which will control flood and store water in the Kirkuk area; and for a dam on the Diyala which will bring about the recovery of lands once fertile round Kut. Over the five years, at least ID15 million is earmarked for roads; an important sum of lesser dimensions (ID2 million) is to be devoted to drainage on lands already irrigated. If more Iraqis would concentrate on this unspectacular job they could greatly raise the yield of lands which they are too apt to allow to relapse into salty wastes.

Of course the task of handling so much money over so short a period presents immense difficulties. One of the

first of those encountered has been well met; at first, the whole yield of oil revenue was to go to the Development Board, which was made so rich by comparison with the ordinary ministries that ministers tended to load it with projects which their own organisations ought properly to be handling, such as the building of schools or hospitals. Now the oil revenue is to be divided between the Development Board and the ordinary budget in proportions of 70:30. Other snags lie ahead. For instance, the country's administrative machine is weak; apart from the senior men who learnt their job in the days of the British mandate, the Civil Service contains too much under-educated manpower and too many young men who hate any job outside Baghdad. Next, labour requirements—particularly in the skilled and semi-skilled classes—will shortly far outstrip supply. Again, the increased spending power that is just round the corner will create serious inflation unless it is siphoned off by efficient organisation of imports, or of taxation, or both. Can so young a country organise economic operations which will be a novelty?

Whatever the difficulties ahead, it was better to start right away on execution of some of the projects than to wait upon changes in administrative practice, or upon an improved standard of education. Too many Middle Eastern statesmen are frightened of criticism and risk, and too few act upon the important principle that a faulty plunge is better than no dive. The senior permanent Iraqi member of the Development Board is not among the faint hearts.

Huge possibilities lie ahead. A few years from now Iraq will, if all present projects materialise, be short not simply of trained manpower, but of people; may not its great northern plains, once developed, hold out promise of a future to some of the Palestinian Arab refugees? Over the same period, it will earn far more money than it can spend; may it not be able to offer aid to a friendly neighbour which has equal economic potentialities but is unendowed with wealth from oil—the state of Syria? Next year, its young King—now at Harrow—comes of age and will assume the estate and burden of monarchy. Few young men have waiting for them a job so fraught with opportunities as well as cares.

A Victory for Vargas

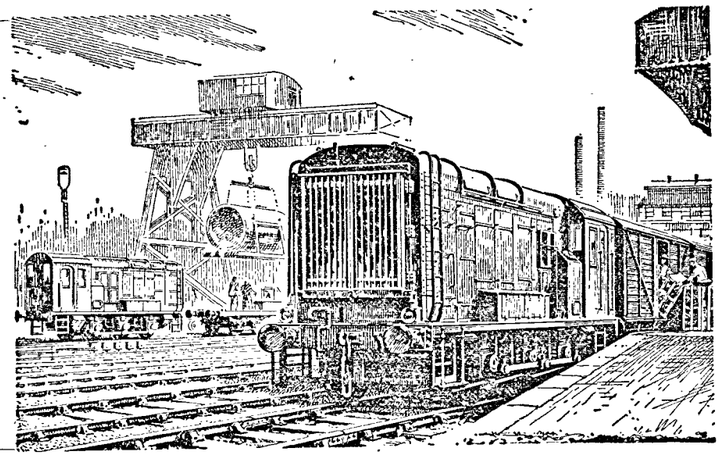
Most British and American companies operating in Brazil were taken by surprise last month, when President Vargas suddenly accused them of complicity in a "criminal plot" to defraud the country, and announced that in future their remittances of profits would be drastically curtailed. Yet this move, or something very like it, followed logically from recent developments in the internal politics of Brazil. It is the future course of those politics, rather than any purely economic factors, that is likely to decide how strictly the new decree on foreign capital will be enforced.

Just over a year ago Dr Getulio Vargas assumed the presidency, after winning an election in which he had presented himself as the champion of the common man. He had made promises about minimum wages and social security that were held to be quite unrealistic by all who knew the limitations of the Brazilian economy. He then proceeded to entrust economic policy to a thoroughly cautious and realistic financial expert, Senhor Horacio Lafer. Few Brazilians were surprised. To those who took their politics lightly, it was fully in keeping with "Getulio's" mercurial nature. Had he not, while absolute ruler of Brazil, sent to Europe the only Latin American troops who fought for democracy in the last war? Had he not just regained by democratic means the power which, in 1945, was seized from him by the Army in the name of democracy? But those who looked beneath the superficial paradoxes of Brazilian politics were impressed by the skill with which the veteran President first lured on to his band-waggon a variety of groups ranging from the ultra-Conservative to the near-Communist, and then struck out firmly along his own line.

Sooner or later, however, strains were bound to develop in the loose coalition which provided Dr Vargas with his majority. He had stood in the 1950 election as the candidate of the Trabalhista (Labour) Party. This is itself a somewhat divided body, but considerably to the left of the oddly named Social Democratic Party, the strongly conservative faction which was the main prop of the previous president, General Dutra. During 1951 many Trabalhista members became restive at the way in which the President's policy was developing, and in particular at the influence which the Social Democrats appeared to have over him. In December the idea of a complete break with Dr Vargas was openly mooted among Trabalhista deputies, some of whom were already discussing the possibility of a coalition with groups further to the left. Among the Social Democrats discontent was less widespread, but there was a certain amount of indignation at the systematic way in which the Dutra government's record was being discredited by the new administration.

In Brazil, moreover, personalities are at least as important as party labels. While the leaders of the Trabalhista and Social Democratic Parties have remained loyal to the President, the leader and virtual creator of the comparatively new Social Progressive Party, Dr Adhemar de Barros, has proved less amenable. Dr Adhemar is a highly ambitious man of only fifty, who boasts that it was he who got Dr Vargas elected in 1950. He is already preparing to get himself elected president when the current term ends, and his vast fortune and political control of the key state of Sao Paulo make him a formidable candidate.

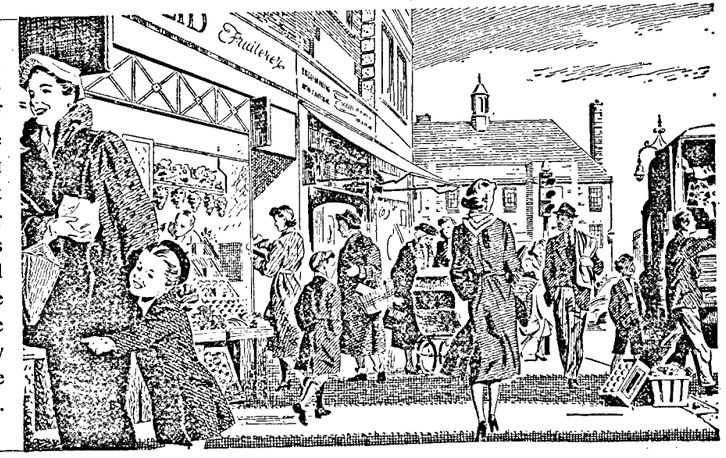
Colonels and Communists



Finally, Dr Vargas has also to contend with the Army, which in Brazil tends to live a life apart. The Army deposed him in 1945 in a mood of somewhat romantic devotion to democracy. But now the alarming element in the situation is the relationship between certain military officers and the proscribed Communist Party. It is relevant to recall that the outstanding Brazilian Communist, Senhor Luiz Carlos Prestes, was an army officer before his conversion to Marxism; and several of his former comrades in arms now hold senior commands.

The common ground between the Communists and the largely aristocratic officer caste is resentment at the part played by foreign capital in developing Brazil. An opportunity to exploit this theme arose in December, when the President asked Congress to pass two bills providing for the development of oil resources under state control but with the co-operation of foreign capital. General Estillac Leal, the War Minister, made himself the spokesman of military nationalism by delivering several speeches in which he not only attacked the whole concept of joint Brazilian and foreign development of the country's natural resources, but went out of his way to belittle the danger of Communism. These statements roused a storm of protest, but Dr Adhemar lent the War Minister his support, and a considerable body of both military and civilian opinion was clearly in sympathy with his views.

President Vargas's verbal onslaught against foreign capital at the New Year may be seen as one part of a brisk and effective counter-attack against all these threats to the unity of his government. To recover the confidence of the industrial workers, among whom strikes were increasing as a result of Senhor Lafer's refusal to let wages chase prices up a hectic inflationary spiral, Dr Vargas had already produced a new law on minimum wages and instituted tighter price controls. He now combined a further denunciation of



'ENGLISH ELECTRIC'

Every month Britain's railways carry more than 22 million tons of goods, and the marshalling of this enormous traffic requires powerful shunting locomotives of the utmost reliability. 'English Electric' diesel-electric shunters, handling loads of hundreds of tons, are doing this job 24 hours a day — not only in Britain but on railways all over the world.

bringing you

In the monthly total of freight transported by Britain's railways are 4½ million tons of food and general merchandise for the shops. 'English Electric' plays a vital part in ensuring that your meat, fish, fruit and vegetables are delivered regularly and on time — one more example of the many ways in which The English Electric Company brings electric power to the service of millions of people.

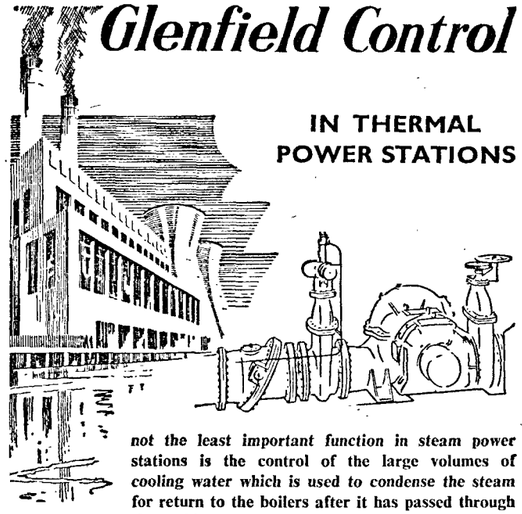
SIMON ENGINEERING GROUP



It often happens that several companies or divisions of the Simon Engineering Group bring their widely differing services to bear upon a single contract. A large new phosphorus factory near Bristol for Albright & Wilson Ltd. is a case in point. One division of Simon-Carves acted as consultant on siting and layout and is responsible for building and civil work; a second is dealing with materials handling and processing equipment, and a third with electrostatic dust precipitation; Simon Handling Engineers are supplying pneumatic discharging plants for unloading rock phosphate from ships.

Communism with his vigorous attack on the more predatory activities of foreign companies. A few days later he had a long talk with Dr Adhemar, who promptly declared himself in support of the President and specifically welcomed foreign co-operation in the extraction of Brazilian oil. A number of officers who had expressed support for the War Minister were placed under arrest. The truculent comments of certain United States businessmen on Dr Vargas's proposal to limit remittances of profits, and the suggestion made by the American Council of the International Chamber of Commerce that all new loans to Brazil should be suspended, rallied further sections of Brazilian opinion to the President's support.

When the smoke cleared, it was found that Senhor Lafer had set up a committee of financial experts to iron out the difficulties which the new decree might involve for foreign enterprises; General Estillac Leal had ceased to express his views so pungently; the Foreign Minister, Dr Neves da Fontoura, was issuing conciliatory statements and assuring all concerned that no formal protests had been made by the United States or any other government; and the oil bill was quietly introduced, by a Trabalhista leader, into a Chamber of Deputies from which nationalistic passions had been largely purged. Thus, as Dr Vargas began the second year of his presidential term, it seemed that he had successfully dispersed much of the opposition which had loomed so large at the end of 1951.

Transforming the South Sudan

[FROM A CORRESPONDENT]

ONE of the great difficulties facing all those who are trying to conceive a workable plan for the Sudan's immediate future is the fact that the Sudanese themselves are at sixes and sevens about what they want. Over 25 parties are enunciating programmes. The ordinary Sudanese is still further confused by the unscrupulous way in which party members distort facts to suit the cases they advocate. An example of the technique was furnished by Mr Khidr Omar, secretary-general of the Ashigga party, when he went lately to Paris to revile the British administration among delegations to the UN General Assembly. During a press interview he remarked, for instance, that the southern Sudanese were still in a completely backward and primitive state "because the British had never allowed the civilised and cultured Sudanese of the north to come in contact with them," and—by implication—had never done anything for them themselves.

Some idea of the falsity of this charge can be gained from a description of the ambitious experimental scheme which has been under way among the Azande tribe in the southern Sudan for the last six years. Its object is to turn this primitive people into a self-sufficient and reasonably progressive community. An initial loan of £E500,000 was made by the Government with which it was planned that the Azande should embark on growing their own raw materials, notably for cotton goods, soap, sugar and cattlecake, manufacturing their own finished goods, and providing for their own necessary imports; it was hoped that they would also have a surplus exportable to other parts of the Sudan with which to pay their way. An Equatorial Projects Board was set up to put the scheme into effect, with a British manager and senior staff, but otherwise staffed by Sudanese civil servants.

Before the board could be successful another major transformation was required to fit the Zande for his new agricultural role. He had previously been only a hunter. It was decided to shift and resettle the whole population of about 60,000 families away from their scattered dwellings in the forest and along the road to carefully planned cultivation areas. This resettlement was unique in the way in which it was carried out. Pilot lines were cut straight across country for as much as 20 miles, and off these, village lines were laid at right angles, forming, as far as considerations of land and water would allow, a neat geometrical pattern. On the village lines, each householder was allotted from 25 to 40 acres of land—entirely his on condition that one half acre at least (with another tenth of an acre for each additional wife) was used for cotton.

The resettlement took five years and was completed at the end of 1950. It was an immense achievement in planning and was carried out largely thanks to one Englishman who had been District Commissioner for twenty years and was able to persuade the Azande to co-operate. As a result, the whole district has been opened up, its lines of communication improved and administration made much simpler.

An industrial town has been built by a river in what was formerly forest land. The forest is now cleared away and a flat plain has emerged covered with buildings and the *bric-à-brac* of industry. There are a cotton ginnery, vast spinning and weaving sheds fitted with an air conditioner, machinery for crushing the cotton seed and extracting the oil, machinery for making soap; there is a power station and a saw mill; there are storage sheds, water tanks and, on the perimeter, rows and rows of little brick boxes with corrugated iron roofs to house the artisan staff. The power to drive it all comes from charcoal and to provide the charcoal the forest is cut down further and further afield so that the foresters must work against time to replace it with fast-growing trees. There are coffee and palm oil and sugar, as well as a milk herd and a beef herd living under the very noses of the tsetse flies.

All Hopes Surpassed

At present the Azande are the unskilled and the semi-skilled labourers in the factories. It is hoped that in time they will become the artisans, but meanwhile the skilled mechanics, the store-keepers, electricians and bookkeepers are northern Sudanese and it is entirely up to the Azande whether they will take advantage of the education offered in the future or whether they will let the northerners seize the plums for ever. The scheme was devised primarily for the advantage of the Azande and depends on their efforts. In 1950 they surpassed all hopes by producing eight million pounds weight of precious cotton from their half acre plots, which, because the spinning and weaving machinery was still dawdling on interminable African waterways and railways, was exported to England at last year's peak prices and realised an unexpected profit. Now spinning and weaving have begun and the first piece of damouria cloth was produced last September.

The products of the Equatorial Projects Board are sold in the district by a special trading division at the lowest possible economic price; and after local needs are satisfied they are sold elsewhere in the Sudan. The profits, being destined to further the social emergence of the Azande, are used for the running of an agricultural research farm and agricultural training college which are, of course, for the benefit of the whole of the southern Sudan, as well as for the provision of more schools, hospitals and football grounds.

This is a great upheaval in the way of life of the Azande—just how great it is as yet too soon to tell. At present they seem less significant as individuals than they were before because they have been de-tribalised; they are becoming the anonymous masses and the tribal markings cut into their cheeks no longer mean much. With urbanisation and education and money to burn people become unsettled. But if the scheme succeeds and if the desire for money replaces the present system of direction as a sufficient incentive to keep it going, then the Azande and their neighbours should at least be able to exist as a community that can stand on its own legs in the conditions that are spreading in Africa.

THE BUSINESS WORLD

Shaping the Budget

THE element of guesswork that enters into even the most scientific budget making will this year be unusually large. By wisely advancing the date of the budget so that his disinflationary measures can the more quickly be set to work, Mr Butler has at the same time aggravated his task of judging just how severe these measures need to be. When he opens his budget on Tuesday week, even the financial out-turn of the current year will be only broadly estimable. And when he turns to the wider forecasts of the shape of the national economy as a whole—to the expected levels of national income, production and investment that largely determine the magnitude of the changes the budget should try to bring about—he will know that the estimates before him are more than customarily prone to err. The scope for empiricism and personal judgment will, therefore, be abnormally wide.

It is doubly unfortunate that this unusual latitude should arise this year, for the state of the budget accounts as such will not imply to those who still judge budgets by the simple test of surplus or deficit that there is any need for austere measures. If the Government's pledge to apply fundamental remedies to Britain's chronic insolvency is to carry conviction, it must maintain for some time to come a greater degree of disinflation than that envisaged in any previous postwar budget (with the possible exception of the plan that Sir Stafford Cripps sponsored, but quickly diluted, in 1948). Given the heavy burdens that the nation's economy must now assume, this degree of disinflation cannot be ensured except by imposing sacrifices upon the broad mass of consumers, no matter what marginal contributions can be extracted elsewhere. Yet this unpalatable course has to be followed at a time when the budget accounts for the old year will be showing a large surplus on the conventional reckoning and when the estimates for the new year will be envisaging an unusual, though deceptive, buoyancy of revenue.

That is the rough shape of the problem that emerges from the decisions and objectives already indicated. Its full size and many of its salient features are still hidden from the outside estimator. He has to work this year without any of the array of official data that normally herald the approach of a budget—without an Economic Survey and without official estimates of the balance of payments for the old calendar year. In these circumstances, to attempt detailed estimation would be foolish; it is possible only to sketch the outlines sufficiently to show the nature of the Chancellor's problem.

The first fact, and it is a frightening one, is that during the course of this year a huge volume of resources must be subtracted from the supply available for civil use in the domestic economy. The Government is committed to an effort to bring Britain's external balance of payments into equilibrium, or better, in the second half of this year. If the actual deficit in the second half of 1951 is guessed at £375 million, this means that the new strain upon the domestic economy, from this source alone, must be at the rate of £750 million a year. To this great burden there must be added the weight of this year's increase in Britain's defence effort. The cost of the defence programme in 1952-53, excluding civil defence and certain expenditures borne on civil votes, is officially estimated at £1,462 million, or roughly £300 million more than the expected actual expenditure in 1951-52. In real terms, this probably represents an additional outlay of just over £250 million. The gross additional load upon the economy will therefore surpass £1,000 million.

This is a rough measure of the sacrifices that must be borne eventually if Britain is to achieve solvency and to maintain a defence effort that bears a tolerable resemblance to the programme adopted last year. But this year the impact will be heavily cushioned. The government has decided, not unreasonably, that changes of this violence cannot be brought about quickly without drafts upon capital. The hard facts of export marketing require that the drive for a quick increase in exports should be based on capital goods, and the output of these cannot be rapidly expanded; they must therefore be diverted from domestic capital projects. Secondly, to give still further relief, as well as to reduce demands for steel, the government is sharply curtailing licences for industrial and commercial building and is looking to the stiffer monetary policy and the suspension of the initial allowances to limit other forms of private investment. Thirdly, a substantial part of the £500 million of planned reduction in external expenditure will fall, not upon current domestic supplies, but upon stocks; instead of the recent rapid replenishment, there will be actual inroads, into both the "strategic" and the commercial holdings. If the several pressures upon home investment are effective, these three sources of non-recurring relief could release resources sufficient to carry, for the time being, at least half the gross additional burden.

A further portion may be carried by additional domestic production. Given the frictional losses to be expected from the first phase of any determined disinflation, while the necessary switching of resources is taking place, and given the continuing strain upon supplies of critical materials, it would be unwise to count upon any considerable increase in total output. An increase of between 2 and 3 per cent would be equivalent to one quarter of the total burden to be shouldered. Finally, the Chancellor has said that the government's civil expenditures in 1952-53, while maintained in money terms, will absorb 1½ per cent less of the gross national product; this implies the release of perhaps £150 million of resources.

On these assumptions—that very large and damaging cuts are quickly made in home investment, that production rises modestly, and that the defence effort is some £250 million bigger than last year—the projected £720-£770 million of import cuts and increased exports could be accommodated without requiring, in this initial phase, any large reduction in the real volume of domestic consumption or further immediate retrenchment in the government's civil expenditure. The financial gap to be closed by the budget, in order to maintain even the existing degree of disinflation, will however be much more substantial—unless it can be assumed that any considerable part of the work of curtailing consumers' expenditure will be done outside the budget, by monetary policy supplemented by the tighter rein on hire purchase, and by higher prices. The object is to ensure that these measures, acting in combination, produce an increase in total savings sufficient to enforce the required cut in the real volume of consumption and to neutralise the increase in net spendable incomes that accrue from the assumed rise in national output. There is no reason to suppose that personal savings will rise spontaneously, and gross new savings by businesses are more likely to fall than to rise. This means that part at least of the requisite increase in total savings must be provided by measures designed to reinforce whatever prospective surplus the Chancellor expects on the existing basis of taxation and subsidies.

*

Unless the problem is approached in this way, by looking first at the real resources that have to be provided, the budget accounts themselves will be dangerously misleading. But if the argument in real terms is understood, it will be seen that the magnitude of the current year's surplus and even the prospective buoyancy of the revenue have little bearing upon the difficult decisions the Chancellor must take. Because of the big rise in prices, and the big lag in defence expenditure, the Exchequer returns for the current year to date look very different from the forecasts made last April. Allowing for the projected reduction in the Exchequer contribution to the National Insurance Fund, Mr Gaitskell then expected the "above-line" surplus to drop from the £720 million of 1950-51 to only £80 million. Up to February 16th it had dropped by only £283 million (to £389 million), because revenue had risen by £403 million (compared with an expected rise of only £259 million in the full year) while expenditure had risen by £686 million (compared with an expected rise by £898 million). This shortfall in expenditure has occurred, moreover, despite the presentation of net new supplementary estimates for civil expenditure totalling nearly £220 million—mostly for strategic and commercial stocks. On the other hand, only £18 million of the £160 million allowed for supplementary defence expenditure is being taken up. The fact that a large part of these civil supplementary estimates were presented only last week makes it especially hazardous to try to guess the year's outturn. But, for what they are worth, comparisons with last year's experience as adjusted for recent trends in revenue and expenditure suggest an eventual above-line surplus of the order of £300-£350 million; this, it should be emphasised, is mainly a mechanical projection, not a forecast.

This means that the accounts for the ensuing year will look much stronger, in the technical accounting sense, than has so far been generally supposed. Although the yield from Customs and Excise (which have provided four-fifths of this year's excess of revenue over estimate) will suffer from the import cuts and the reduction of supplies subject to purchase tax, the return from direct taxes will rise substantially. Taxation paid by businesses will reflect the big rise in profits (as computed for revenue purposes) that accrued from the 1950 increment of productivity and the post-Korea boom in commodity prices, and the yield from PAYE will be swollen by the wages and salary increases that have gathered momentum throughout the past year. In addition, the full effect of the tax changes made last year (apart from the suspension of the initial allowances, which will not begin to affect the revenue until 1954) will yield about £80 million, of which, however, a net £58 will derive from the increase in profits tax. Finally, because the conventional accounts do not distinguish capital from current items, the prospective civil expenditure will be sharply reduced by the suspension of purchases for stock and the intended drafts on stocks. The prospective above-line surplus, on this misleading basis of accounting, is likely to be appreciably larger than that for 1951-52—even, conceivably, large enough to cover the "below-line" expenditure.

Very little of this financial gain, however, will represent an increase in the disinflationary effect exerted through the budget. Most of the additional revenue from business taxation will be paid from tax reserves already accumulated; any resultant financial stringency in industry is unlikely to produce reductions in dividends, and any repercussions upon investment outlays have already been brought into the reckoning of the "real" gap that has to be closed. So has the relief due to be afforded by the reduction in stocks. These items must not be counted a second time in the balance-sheet of disinflation, as they would be if their financial counterpart in the budget accounts were added in. Finally, it should be noted that the additional PAYE deductions, though paid out of current incomes, will arise only because those incomes have been increased.

The difficult task before the Chancellor, therefore, is to convince a bewildered public that the test of the need for further sacrifices is to be found in this stern and abstruse "real" accounting, not in the superficially healthy state of the conventional budget accounts. And he has the further, even more onerous, duty to make plain that the sacrifices required now have been greatly whittled down by the heavy drafts on capital—drafts that cannot be repeated next year. It is then that the full weight of the new burdens will have to be borne.

REPLACEMENT COSTS

In conjunction with the Association of Certified and Corporate Accountants, The Economist Intelligence Unit compiles indices showing changes in the replacement costs of different classes of plant, machinery, and factory buildings. All these indices are available for the last 14 years, and some for a longer period. Any index can be supplied and kept up to date in the future; combinations of indices or special ones can be prepared to suit individual requirements.

Steel and Enterprise—III.

Can Steel be Supervised?

THE Iron and Steel Bill to return the steel industry to private enterprise under public supervision was to have been laid before Parliament this week, but larger events have swept away that intention. As matters now stand, the bill may not be debated, and possibly not published, until April or later. Although the ways and means of denationalisation are still under discussion, the main provisions of the bill have been in draft for some weeks; this fact lends credence to the view that it will be primarily an enabling measure, establishing the intent and the power to dispose of the steel interests now owned by the Iron and Steel Corporation, rather than any specific method of doing so. But one provision of the new bill has been clearly foreshadowed; the Government's chosen instrument of public supervision will be an Iron and Steel Board on much the same lines, presumably, as the board set up by the Labour Government in 1946 as an interim measure pending nationalisation.

The concept of control through a board representing steel employers, workers, and consumers under an independent chairman may fairly be said to have been captured from Labour, and handed intact to the Conservatives, by the British Iron and Steel Federation. The Labour Government of 1945-50 was no doubt embarrassed when their improvised and temporary organ of supervision came to be extolled by the federation as the ideal method of asserting the public interest in steel, and as a complete alternative to nationalisation; politically, it will embarrass them still, as an Opposition, in the coming debates. But tributes to the efficacy of such a form of control need some scrutiny. The board's powers were similar to those of the prewar Import Duties Advisory Committee: they included the review of development programmes, supervision "as necessary" in "current matters," administration of any controls, and advice on general price policy and the fixing of particular prices. How far it effectively carried out these broad tasks has never been made clear. Its most direct responsibilities related to prices, and in 1947 it did carry out a full review of the standard margins of profit allowed on steel products. But the same thing was done two years later by the Ministry of Supply and both, in any case, must have been largely dependent upon the one central planning body for steel that is unmistakably effective—the federation itself. It is the nucleus of strength in the federation that makes it implausible to ascribe too much responsibility for postwar policy to any other body connected with the industry.

This point is clear in any examination of responsibility for steel development programmes. The original board examined the individual schemes comprised in the industry's 1945 development plan, which as a whole had already been approved by the Government. It has been said that it examined the "economic soundness" of individual schemes more closely than did the federation's development committee; it had, obviously, some potential influence in the granting of licences. Judgments about economic soundness, however, remained essentially the business of the companies concerned, who had to find the money; with an integrated steel plant costing some £75 per ton of annual output, it is doubtful whether any board could add much to the thoroughness of the companies' own scrutiny. The number and importance of schemes that the board had approved was at one time quoted as one index of progress towards completion of the development scheme: but some of these schemes may not have gone forward in the exact form that it approved.

Any attempt to compare development actually undertaken in the industry since 1945 with the original plan demonstrates that steel development is not a matter of settling one firm plan and fulfilling it to the letter; it is a process of continuous adjustment to circumstances. In broad terms, it appears that by the end of last year the industry may have spent almost exactly as much as in 1945 it expected the development plan to cost—some £168 million. But in the meantime the estimated cost of the full plan has risen to perhaps £300 million, while more than a quarter of the money actually spent has been laid out upon projects not specifically detailed in the 1945 programme. About £120 million appears to have been spent on schemes specified under the plan, and those now in progress may cost £70 million more to complete. Schemes estimated at about £70 million in the original plan, which might cost about £110 million at current prices appear to be in abeyance. On the other hand, work has been started upon about £100 million of development projects not detailed in the 1945 programme, and more than half of this amount has been spent. In all, work is now completed or in hand on projects estimated to cost about £290 million. In this estimate the schemes held in abeyance would presumably include the proposed new Scottish "riverside" steel plant, the "second Corby" on a greenfields site in the home orefields, the new steel furnaces and billet mill to be owned by several North-East Coast companies, and the second tinplate mill in South Wales. Each shows how circumstances can affect plans. The Scottish steelowners later decided against the riverside site, and Scottish supplies of coking coal may be declining, at least until about 1965; Stewart and Lloyds reluctantly decided that a new works based on home ore must await houses and labour; Consett are building a continuous billet mill alone; and it may be difficult to estimate the real need for a second new tinplate mill in South Wales until experience is gained on the first. Changing circumstances encouraged the partial replacing of these schemes by extensions of existing works. In the same way, if there was at one time a slackening in blast furnace development—of eleven major iron-making projects in the plan, four are complete, four in progress, and the remaining three, or developments in their place, are being started—it will have arisen mainly through the ability of some steelmakers in 1949 and 1950 to obtain plenty of cheap scrap to make steel, leaving them under less pressure to increase pig iron output. Such changes in a re-equipment programme are quite normal adjustments of industrial development. No tripartite board, or any other body, could prevent such reconsideration in the light of current experience or insist on the original

letter of a plan; nor is it easy to see how a board could exert much influence to compel a steelmaker to spend his money faster.

The responsibilities and potential effectiveness of a new board will depend to some extent, but not entirely, upon the method of denationalisation that may be adopted. An earlier article suggested that today there was no practical means of selling back publicly-owned steel companies to realise what were rightly held to be inadequate take-over prices in 1949. An alternative method—the disposal of steel plants to their former owners on long-term repairing lease—was examined. It is, indeed, probable that the Bill when published will provide for alternative methods of disposal. In either event, somebody must dispose of the steel assets, and, therefore, must own them in the first place. An Iron and Steel Corporation with modified powers might be the logical candidate; but personalities as well as organisation are involved here, and the Government may well decide to jettison the Corporation. Some form of holding and realisation company will be necessary as a successor to the Corporation. Its main purpose, in contrast to that of the Corporation, will be to divest itself of such securities. It should be a dormant form of trust, with the duty of servicing Steel Stock, not of influencing the steel industry. If such a holding company were to exercise supervision over the industry, it would amount to a hamstrung version of the present Corporation.

What are the functions for which an Iron and Steel Board is essential? The first, and one that clearly demands an impartial body with full access to the industry, is fact-finding. It was argued last week that the steel industry's system of equalisation of costs needs thorough and public examination. The task of inquiring into and reporting upon practices, problems and prospects of the industry would be one for the board; it could probably do such work more effectively than some outside committee or working party, or the Monopolies Commission. This would to some extent be a "once-for-all" job, but the board would also carry the responsibility of full and not merely formal reporting on the industry from time to time. It would, moreover, inevitably have to consider the best central structure for the industry, including its own proper functions. Its study need not impede the progress of disposals—least of all such practicable sales as the re-purchase of steel subsidiaries by engineering firms. But its work on the future development of the steel industry should not exclude the regrouping of existing steel plants, where such a policy can be technically justified. Enterprise in steel does not come about merely by restoring the *status quo ante* 1949.

The permanent functions of such a board in regrouping, prices, and future development, as in all else, could not be successfully carried out without effective representation of the labour side. The Act would need to define these functions in the widest terms. Only experience will show exactly what the board should—and could—do in these spheres. Its whole chance of usefulness hinges upon its relations and sharing of responsibility with the British Iron and Steel Federation, and these matters may eventually need defining. It has been argued that the board should have power to set up publicly owned steel plants if it considered them necessary in the national interest and if private firms refused to build them. This suggestion may have some attractions for the TUC, but it is probably not very

meaningful. Development for purely strategic reasons should be left to the Government, as it has been before. Development in the country's commercial interest that did not attract private entrepreneurs would be unlikely to appeal to a board that would have to justify the expenditure of public money.

It is, indeed, still open to proof whether the whole concept of an Iron and Steel Board purporting to supervise a privately owned steel industry has more than political significance. The real answer can come from only one quarter—the federation. The obvious danger in any such form of supervision is that the public body empowered to supervise may sooner or later become a mere echo of Steel House. Any body set up to supervise the steel industry must depend at first largely on the federation's expert knowledge—the corporation itself has been no exception. The federation ought to realise that here is a danger for the steel industry and for itself. No doubt the federation could, if it wished, submerge and capture any public body charged to supervise steel; there may even be an inherent danger that a supervisory body may tend of its own inertia towards such a posture of dependence. But, equally, to allow this to happen would be the most certain way of ensuring a second—and final—nationalisation when the political pendulum swings again. Public scrutiny will be sustained and sharp. The one hope of taking steel ownership out of politics—it may, indeed, be a slim chance—is to convince the electorate of the effectiveness of public supervision in this form. That means the genuine transfer of certain powers—and conceivably the sharing of some of the operations, such as the work of the economic and statistical departments—between federation and board; it does not imply, despite the notions in some people's minds, more power for the federation under a new public umbrella. The success of the experiment may well depend on the personalities, as much as the powers, of the board: bluntly, what is required is a chairman who can meet Sir Andrew Duncan on equal terms.

The three articles of this series, in sum, have suggested that the return of the steel industry to private control will be technically complex, but that it should be feasible. The exercise is desirable on many grounds, and particularly since it offers an opportunity for the attraction of the genuine private investor with risk capital into steel ownership and for the instilling of a greater measure of competitive enterprise into the industry. The immediate need of public examination of the industry need not delay the earlier stages of denationalisation. Only by such examination can the forms of effective public supervision of steel be rationally defined. How well such supervision may eventually work depends almost entirely on the co-operation of the industry's present private controllers. Such conclusions may not commend themselves to politicians, who often prefer to supply answers than to study questions. But denationalisation, if it is tackled without proper thought, may prove as irrelevant to the real problems of the British steel industry as was nationalisation—and liable sooner or later to irrevocable reversal.

Business Notes

The Test of Interest Rates

The authorities have quickly seized the opportunity presented by the success of the recent Southern Rhodesia issue by allowing another trustee borrower through the turnstiles. The newcomer wears an unfamiliar garb; for the first time for many years a stock has been offered at a discount of more than ten points, and thus, though technically a trustee security, is particularly ill-suited to the needs of trustees. The Government of Uganda is raising £5,983,000 (of which £1,733,000 had already been placed and a further £250,000 was reserved for residents in East Africa and Zanzibar) in 3½ per cent stocks, 1966-69, offered at 89. The loan offers a gross redemption yield of £4 8s. 7d. per cent, compared with the £4 10s. 11d. per cent offered by the longer Rhodesian stock at its issue price; but its appeal is primarily to surtax payers and other investors whose special tax position makes them more interested in net than in gross redemption yields, and on this basis the new stock is the more attractive. It is doubtful, however, whether the terms were primarily designed with this object, for there are now many existing gilt edged stocks that meet the needs of this type of investor. The choice of these unusual terms for a new issue, instead of marking a change of official policy as the market was prone to assume, was probably determined by the convenience of offering what is really only a second tranche of the small Uganda stock created two years ago, when the issue price was 98. This stock was quoted before this week's announcement at the wide price of 92-95, including about 1¼ of gross interest. Plainly, therefore, the authorities deemed it wise to repeat the successful tactics of the Rhodesia operation, by offering subscribers an appreciable turn. This means, in effect, that the price that has to be paid for avoidance of indigestion in the new issue market is a gradual pressure on interest rates. The result has been seen in some fairly sharp declines in Dominion and Colonial stocks and in a sagging tendency in British Government stocks. The new Rhodesian stock has receded from its early premium of ⅜ to one of ⅛.

Meanwhile, two authoritative denials have been given this week of rumours that the rising trend of interest rates was about to be made still more effective. The first denial, discussed in a separate note below, concerned the housing subsidies. The other contradicted recent press reports that an increase would shortly be made in rates offered on "small" savings. Lord Mackintosh, chairman of the National Savings Committee, pointed out that rates on certificates and bonds were increased "only" a year ago—a year in which, however, much has happened to the structure of market rates. Despite this big change, there is "no intention" to replace the existing series of certificates and bonds "at the present time." The return from 3 per cent Defence Bonds is particularly out of line; but Lord Mackintosh, always a skilful propagandist, actually argued that the market decline made the bonds the more attractive—because the right of holders to encash them at six months' notice relieved them of any risk of depreciation of capital value. The only imminent change in the conditions governing small savings is that the expected increase in the limit on deposits in the savings banks from £2,000 to £3,000 (but still subject to the limit of £500 upon deposits made in any one year) comes into effect on March 1st. The limit upon holdings of Defence Bonds was raised from £2,500 to £3,500 last October, while the limit for certificates was effectively raised when the new series was introduced twelve months ago.

Report on Purchase Tax

The publication ten days before the Budget of the report of the Douglas Committee on purchase tax and the utility schemes suggests that government action on its findings will be prompt. Unfortunately, the committee's recommendations are fundamentally based on a compromise; the changes proposed are satisfactory so far as they go, but they still preserve some of the worst features of the purchase tax. The report proposes the formal ending of the utility schemes as they now exist, but suggests that they should be largely replaced by the introduction of new classes of tax-free goods. These goods will, by definition, be simply those that are sold at or below tax-free limits which will be fixed for all articles now included in utility schemes. The second change recommended by the committee is that purchase tax should no longer be levied as at present on the whole value of the goods sold at prices above the tax-free limit; it should instead be charged "only on the excess, if any, of the value of the article over the tax-free limit." Thus some portion of the price of every article bearing purchase tax would remain tax-free, and this portion the committee has designated "D" for "fixed deduction."

Such a scheme has several obvious points in its favour, but it hardly solves the essential problem that was posed to the committee last July. This is the long-standing complaint of the textile industries and others that they can no longer take the risk of producing high quality goods for export without the assurance that such goods can, if necessary, be disposed of at home. The heavy weight of purchase tax makes this impossible today. The Douglas Committee, on a quick assessment of its report, does not seem to have produced a scheme that would reduce this discrimination against high-quality products. It suggests, indeed, that a flat rate tax of between 10 and 12½ per cent on all utility and non-utility items would fulfil the condition in its terms of reference that the total yield of purchase tax must be maintained. But the committee has preferred to recommend that the tax exemption limits under its new scheme should be set high enough to permit at least half the purchases of "each class" of goods now in the utility schemes to be bought free of tax. This means that "there is little room for reduction in the tax on the most expensive goods." In short, no relief is proposed for those sections of each industry that claim most need of it.

* * *

Towards the No-Par Share

Sir John Barlow's Bill to permit the no-par share in this country deserves general support. It is likely to need help from the Government if it is to be passed into law, for this session of Parliament does not promise great opportunities for the success of an unassisted private member's Bill. But what the Government has promised for Mr Harold Lever's private Bill on reform of the law of libel might equally be extended to the sensible reforms that Sir John is proposing. In essence these amount to permissive powers, with all proper safeguards, for companies to issue no-par shares. The notion that the ordinary share must carry a fixed cash denomination is a piece of antediluvian financial sentimentality. Yet it dies hard. The old fashioned think of the no-par share as a kind of trick; the critics of company finance on the Left would oppose it on the ground that it would rob them of one of their favourite instruments of propaganda—the expression of dividends as percentages calculated on shares of fixed denomination.

If the first of these attitudes is wrong, the second is positively mischievous. It has been allowed to do great harm and has bred misconception after misconception about profits, earnings, dividends, industry's real resources and the true nature of capital. For this reason alone, it must be hoped that Sir John's Bill will enjoy a fair chance to do what the Cohen Report and the Companies Act of 1948 failed to recommend and implement. It may be odd that this commonsense reform has to be left to the tumble of fortune that determines the fate of a private Bill. There may be no opportunity in future—short of the next revision of the Companies Act in, say, a couple of decades—for carrying it out. For that reason alone, it is to be hoped that the Government will be able to give their support to the measure and perhaps at some points to improve it.

* * *

Interest Rates and Housing Subsidy

The recent rumours that the increase in the cost of local authority housing in consequence of the higher interest rates charged by the Public Works Loan Board would not be offset by any corresponding increase in housing subsidy have proved incorrect. On the reassembly of Parliament on Tuesday, the Minister of Housing, Mr Harold Macmillan, declined to make any detailed statement about the new structure of the housing subsidies until he had met the representatives of the local authorities. But, under pressure on the specific point, he revealed that the increase "will be sufficient for that purpose"—sufficient, that is to say, to cover the effects upon local authority housing of both increases in the PWLB charges for loans.

It should be noted that this still leaves room for such changes in the subsidies as might necessitate some increase in rents from other causes; but it seems evident that the Government has thrown away an important opportunity for making a start upon the increasingly urgent task of getting rid of artificiality in the level of rents. There is no sign yet of any recognition that the problem of easing the housing shortage needs to be tackled from the demand side as well as from that of supply—or that adequate maintenance and conversion of existing housing properties might give quicker reinforcement of effective supply than can be obtained solely from new construction. If speed is of the essence, as the Government's general statements of policy profess, a realistic revision of the rent restriction provisions and of subsidies should be of the highest priority.

* * *

Two Per Cent Unemployment

Some 378,700 people were unemployed in Britain on January 14th, and there are indications that many more are out of work today—perhaps as many as 2½ per cent of the total working population. Even the January figure—less than 2 per cent—represents considerable hardship: but it almost certainly represents less unemployment than could reasonably be expected in a period of widespread shifting of jobs. Such a degree of unemployment may not in reality imply as much mobility as it would in a more flexible economy; people falling out of work in textile areas do not, for some time at least, become potential engineering workers, unless there is an ordnance factory a little way along the valley. Nevertheless, ordinary economic incentives eventually do move labour, with some friction and at some delay; and the increase, once again, of 10,000 in the labour force of the "metals, engineering and vehicles" section of industry shows that in broad terms labour is moving in the right direction.

Immense political temptations to soften disinflationary policy are bound to accompany the appearance of unemployment, particularly if its incidence is acute in one or two areas. Yet the increase in unemployment remains the only real indication that cracks are appearing in the rigid carapace of the economy. Increasing unemployment, it can be argued, can have the opposite effect of making workers stretch out the work to the utmost; but under-employment

of one form or another fairly soon becomes costly to the individual firm, and fewer firms now can afford to accept it for long. Movement from all areas is not equally desirable, and workers laid off by textile mills, if lost to engineering, may be hard to replace. But it is the forces of the market, at home and overseas, and not the Government, that are discriminating against soft goods. Suggestions that this degree of unemployment will result in special measures by the Government, or even weaken the tenour of the Budget, must surely be hard to credit. Its appearance is not the onset of depression, but the mark of power to change jobs and reorganise labour and production to meet contemporary needs. If two per cent of unemployment, in 1952, could send a Conservative Government scuttling for cover, the British economy might well be written off as a victim of incurable industrial arthritis.

* * *

Tumble in Commodity Shares

Commodity shares have taken a sharp fall this week, with the rubber market leading the way. Just before the weekend the price of spot rubber in the London market tumbled to its lowest point since July, 1950, and, with jobbers unwilling to take shares on their books, the *Financial Times* index of rubber shares fell by 10.7 points in two days. By the time the markets closed on Monday this index stood at 89.0, its lowest point since its inception at the end of 1949; such a recognised market leader as the £1 ordinary shares of United Sua Betong had lost 7s. 7½d. in the two days, to 44s. 9d. A rally was staged later in the week, but shares with a low standing in the market have now gone on to a yield basis of as much as 50 or 60 per cent, while "Suas," at a middle price of 48s. 1½d., offer a yield of 20¾ per cent. By Tuesday, moreover, the market had taken a cue from Wall Street and extended losses to almost all types of commodity shares. Base metals, led by Rhodesian coppers—but closely followed by tins, manganese and others—suffered particularly; even such a share as Rhokana, where any threat to the dividend seems far off, lost 1¼ points to 23¾. After the initial fluster rubber shares rallied sharply, but when the market closed on Wednesday copper shares were still falling, with Rhokana down to 22⅛.

In the rubber market danger signals have been flying for some time. The American stockpile programme will be completed soon and unless the United States then relaxes controls on the consumption of natural rubber and allows it to compete freely, or fairly freely, with synthetic, world consumption seems bound to lag behind world output. European consumption of rubber is also beginning to fall as a result of the decline in motor-car production. But for base metals such as copper, lead and zinc the immediate prospect—at worst—seems to be of decline from a state of immoderate inflation to a state of still exceptional boom. It is true that if rearmament, both in Britain and in Western Europe, is retarded the demand for these metals may become slightly less urgent, but the American defence programme is likely to remain as ravenous as ever for copper and zinc. Civilian use of most base metals is still curtailed both in Europe and in the United States; if these controls were taken off civilian demand would certainly increase slightly—even if not by as much as the American mobilisation authorities might fear. The "free markets" for copper, lead and zinc have been declining since last summer, but this movement will affect the profits of only a limited number of producers. As for tin, the London market price has still not weakened significantly below £980 a ton. If this price is maintained for the next month or so, the British Government is going to lose sterling on the recent Anglo-American metals deal, for not all of the 20,000 tons that Britain has agreed to sell to America at £944 a ton can come from the Government's present stockpile.

Japan's Anti-Export Drive

It is a sombre thought that sterling is now such a weak currency that Japan is carrying out an anti-export drive designed to prevent undue accretions of sterling to its reserve. The Japanese Government announced three such steps last week. First, it imposed an outright ban on the sale of 109,000 tons of steel to Britain unless payment is made in dollars or raw material supplies, or is accompanied by a somewhat vague promise that Japan will have access to iron ore resources in South East Asia. Secondly, it declared that letters of credit covering Japanese exports to the sterling area must not be opened more than three months before the execution of the relevant contracts; this measure seems aimed at exports that take a long time to deliver, especially heavy goods and other essentials for which there is a waiting list. Thirdly, it announced that transactions in forward sterling will be limited to a period of three months (previously the limit was a year), and it increased the discount for forward sellers of sterling to double the rate for the dollar. These measures are not free from some (for once, desirable) political undertones. Two of the countries that have recently been angling for a sterling-based trade in heavy goods with Japan are Communist China and Russia.

Nevertheless, the reasons for recent heavy accretions of sterling to Japan need careful probing. Last year's payments agreement between Britain and Japan was drawn up in the belief that Japan's holdings of sterling would mount to a seasonal peak of not more than £70 million in the summer, but that they would fall to such a low point in March that the average holding throughout the year would not be more than about £40 million; last March Japan may have been a net sterling debtor. But things have not worked out that way. At the moment, shortly before what is usually the seasonal nadir, Japan is believed to hold nearly £90 million in sterling. One reason for this has been a shortfall in exports to Japan that are usually paid for in sterling—such as Australian wheat and Siamese rice. Another has been the inflow of dollars into Japan as a result of the Korean war; this has made the previous veiled Japanese discrimination against dollar imports less necessary. Yet another has been the fact that Japanese industries have been running down their stocks of raw materials, partly out of sensible speculative motives and partly because of the Japanese Government's moderately successful internal disinflationary policy. But the major reason has simply been that Japan's industrial production has been increasing at the almost fantastic rate of 50 per cent per annum and has been flooding over into sterling area markets; here again some of the factors have been temporary ones—its grip on the Pakistan market, for instance, has been aided by that country's trade tiff with India—but the development as a whole seems indicative of a long-term trend. Fortunately some of the new measures to restrict Japanese exports to the sterling area will, on the reverse side of their medal, encourage Japanese imports from it. This is an opportunity for sterling area exporters that must not be missed. In official terminology Japan may not be quite a hard currency market yet, but in the years that lie ahead it is almost certainly going to become one.

* * *

Trade in January

Vehicle exports are still increasing and they played a major part in the record exports last month of £250 million. The latest trade returns show that the rise was still mainly concentrated on the metal-using industries, although restrictions on exports of non-ferrous metal goods are now taking their toll, for they declined slightly. Wool manufactures, on the other hand, are down by about a quarter compared with January, 1951, but cotton exports have been more or less maintained. The rise in imports to £357 million, the highest level since last October, was represented by larger

The household name of a service to industry

TO most people, the name Brown & Polson suggests cornflour, as directly as starch suggests ironing. Here are some facts that may surprise them:
The major work of the Brown & Polson Group is the manufacture of starch (and its derivatives and by-products) *for industrial use.* In 1951 the Group in Britain made and sold some 200,000 tons of starch products. The number of different starch products that made up the 200,000 tons was 400. At the time of writing, some 80 industries use starch products, and the list is still growing. Among the industries that use them are iron founding, oilwell drilling, and pottery making, and many others that seem just as unlikely to do so.

A Consultative Service

A series of advertisements following this one will review some of the industrial problems that Brown & Polson starch products have helped to solve. It is hoped that the series will suggest, to readers engaged in the management of industry, possibilities for using starch products in new ways, to solve problems that are troubling them. Enquiries into possibilities of that kind will be welcomed, and responsible experts will answer them.

This consultative service is a normal part of the process of marketing Brown & Polson starch products. Enquiries should be addressed to

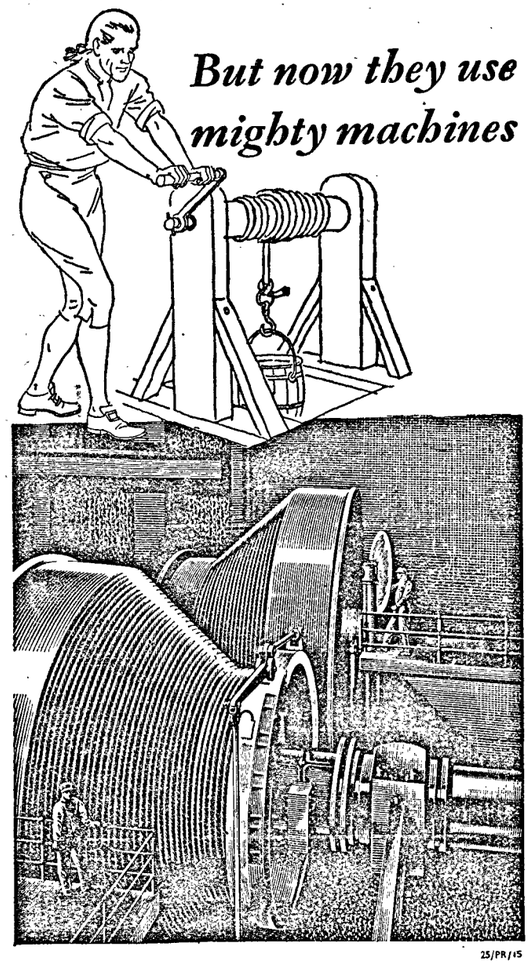
Backroom Boy with a bucksaw Although his name never appears Halloran is one of the most important contributors to the newspapers. In fact, it is on his bucksaw that the publication of the newspaper depends. For Barney Halloran* is a Newfoundland logger, on the pay roll of the largest paper mill in the world — Bowater's at Corner Brook. His job is to fell and cut the trees into four foot logs, using the length of his bucksaw as a measure. They are then ready for the journey to Corner Brook by sleigh, truck, train, ship or most usual of all, floating down by river, there to be pulped and processed into newsprint. Halloran stands five foot eleven in his socks, and weighs 200 pounds, according to the Medical Officer who runs the foot rule over every logger at the start of the season. According to the camp cook, his appetite is built in proportion! "He'd eat a cow between two biscuits." But Barney just smiles tolerantly, knowing that a logger without an appetite is as useless as an axe without a handle.



THE WHOLE WEALTH OF BOWATER CRAFTSMANSHIP, EXPERIENCE AND RESEARCH IN THE ART OF MAKING PAPER — THE 'KNOW-HOW' IN SHORT — IS FREELY AT YOUR SERVICE.

In the 200 years that have followed Axel Cronstedt's discovery of nickel in 1751, mining technique has progressed beyond the wildest dreams of his day. Underground development in the nickel mines now exceeds a total of 283 miles, and reaches well over a mile below the surface. Active development of new areas goes on all the time. New shafts are sunk, new and powerful hoisting equipment constructed, every mechanical aid called in to bring more nickel out of its rock-bound storehouse in the depths of the earth.

...you see DURALUMIN

REGD. TRADE MARK

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

While shortages exist at present, this is a passing phase. Now is the time to consider the use of aluminium alloys in your business so that your plans may be complete when the needs of re-armament are satisfied. Our development department will advise, entirely without obligation.

A modern design, without "Duralumin" —probably isn't!

JAMES BOOTH & COMPANY LIMITED

supplies of raw materials, particularly of oilseeds and crude petroleum. Food imports showed no effects of the cuts announced by the Chancellor last November; indeed the total spent on food rose from £99 million to £116 million, mainly owing to larger imports of wheat.

The vehicle group now contributes one-fifth of Britain's exports, having risen to £50 million—an increase of £10½ million compared with January, 1951. Australia is still the largest single market for cars, while shipments to Canada are now much smaller than they were twelve months ago. Exports of machinery reached a total of £38½ million or £9 million above the corresponding month in 1951. For textiles the results are very uneven. Cotton manufactures held comparatively steady at £18¼ million compared with £18½ million of a year ago. Wool manufactures, on the other hand, fell sharply from £17 million to £12¾ million. Silk and rayon exports were only slightly smaller and jute goods and cordage, alone of all the textile group, showed a small improvement on the year. Chemicals, drugs and dyes increased significantly from £10¼ million in January of twelve months ago to £14 million; exports to the United States were more than double the level of a year ago.

The most striking feature of raw materials imports was the sharp fall in raw wool and raw cotton imports. Raw wool imports dropped to £18¼ million—about half the level of a year ago; part of this fall was due to lower wool prices, the quantity received fell by 15 million lb to 65 million lb. Raw cotton imports fell by 26 million lb to 76 million lb, chiefly because of the much smaller imports of long staple cotton. Apart from oilseeds which rose to form the largest single group of raw material imports in January, 1952, other major increases occurred in timber and paper making materials. Timber rose by over £8¼ million to £17¼ million and paper materials more than doubled to reach £18¼ million. In future months imports of raw materials should fall, as the Government begins to draw upon stocks.

Poll Tax at British Airports

The wrath of the airlines has been roused by the Ministry of Civil Aviation's decision to impose a charge on each passenger landed at British airports. The sum is 5s. for passengers from Europe and 7s. 6d. for those arriving from greater distances and is intended to cover the cost of running the lounges and other facilities provided for passengers at the airport. The airlines already pay landing charges for each aircraft which range from an average of £6 5s. for a Viking flying in from Europe to £30 18s. 9d. for a transatlantic Stratocruiser. Operators have attacked the new charges as a further tiresome formality for their passengers and think it an unfortunate coincidence that they will be introduced on the same day as the new tourist services. But under the circumstances, the Ministry's action seems reasonable and appears to have been made in a form to avoid embarrassing the airlines.

The Ministry has published no recent trading accounts for its administration of British airports. Expenditure, excluding interest charges on capital and the cost of meteorological and navigation services, is running at £2,300,000 a year while revenue, in the form of landing charges and rents of hangars, booking offices and restaurants, amounts to only £1,600,000. The difference of approximately £700,000 is being met by the taxpayer. The last detailed accounts, for the year 1948-49, showed a revenue of only £1,300,000 compared with an expenditure of £3,500,000. The Ministry's methods of book-keeping have more than once attracted comment from the Committee of Public Accounts and it will certainly be argued that more efficient administration could reduce the cost of running the airports without expecting air passengers to contribute a further payment towards their upkeep. But when the Treasury is asking for immediate economies in Ministry expenditure, the most rapid results are obtained by increasing revenue. If the Ministry were to have raised this sum by any other means, say by raising landing charges, it would have put an extra burden on operating costs which could not have been passed on to the passengers because fares can be raised only by international agreement. The new charges, if they were borne by the operators, would be likely to cost British European Airways an extra £100,000 over the full year, British Overseas Airways between £30,000 and £40,000 a year and iPan-American would pay at least £1,500 a week on the basis of its present long-distance summer schedules. Operators can, if they choose, absorb this head charge but the general impression is that in all cases the passengers will be asked to pay. There are precedents for either course, for many airports in all parts of the world impose a head charge at arrival or departure and occasionally at both, and the British rate is modest by comparison with the $10 asked at some American airports, or the 12s. 6d. charged at Bermuda.

Atom Bomb Trials

The promised trials of the first British-built atomic weapons suggest that the development period of atomic research in this country has come to an end. These first five years have been largely occupied with design and building for the complex research and production organisation that practical work on atomic energy or atomic weapons demands. The heart of the organisation is the Harwell research station, with its two small atomic piles. A second station at Risley operates as a headquarters for plant design. Three further plants undertake the production of fissile materials. At Springfields, uranium metal is extracted from crude ore. The complex chemical operation of separating the metal into its two components, the basic atomic fuel uranium 235 and the non-fissile uranium 238, is carried out at Capenhurst. The plant at Sellafield is in essence an atomic furnace where uranium 235 from Capenhurst is used to convert staple materials such as uranium 238 into the fissile element, plutonium, which provides the explosive portion of many atomic bombs. The work of a fifth station at Aldermaston has not been described.

It might have been possible to construct and test these atomic weapons at an earlier date, but it is doubtful whether much would have been gained by doing so before the production of atomic fuels had been firmly established. The plutonium plant started early last year, and for a time quantities of plutonium were imported from Canada. The need to provide instruments for an atomic testing ground in Australia may have further postponed the trials, yet in existing circumstances the decision seems to have been right. To have used American testing sites would have involved revealing all details of the weapons to the American authorities. The design of these weapons and in particular of their exploding mechanisms, is the result of work carried out in this country in secret since 1946 and it would be of great interest, and conceivably of value, to the American Atomic Energy Commission. The reluctance of the British Government to reveal information of this nature without in turn receiving details of equal importance is easy to understand. One eventual result of the British attitude may be the modification of the American laws governing the exchange of atomic information, but that can hardly come quickly. And once the British authorities have gone to the expense and trouble of establishing their own land and sea testing grounds in the Commonwealth, the use of American testing facilities will have lost most of its attraction. It may thus happen that the British attitude to the free interchange of atomic information will harden just when the American viewpoint is promising to become more conciliatory.

Steel Still too Cheap

At the time that *The Economist* went to press the increase in steel prices that had been expected for several weeks had still not been announced. This indecision is quite extraordinary. All the reasonable, or at least all the cogently argued objections, appeared to have been met or overborne during the last three weeks. It would be interesting to know who in Whitehall has been fighting a rearguard action for the principle of selling a scarce and rationed material at less than the cost at which it can be produced at a reasonable profit and at about half the price at which more of it can be obtained from abroad.

The increase in price that is under consideration—some £4 to £5 a ton—appears not quite to cover the rises in costs that the steel industry will have to bear. These will include not only the rises in the prices of home-bought scrap, fuel oil, coal, transport and imported raw materials, but the cost of buying perhaps a million and a half tons of semi-finished and finished steel from abroad at world prices and selling it in Britain at the much lower home price. This final item is the element in the increase of price to which the Iron and Steel Corporation originally offered its main opposition—though Mr Hardie also felt that the steel companies owned by the Corporation, which appear to have shown handsome profits in 1951 compared with earlier years, might have carried the general burden of increased costs for at least a few months. This second point has partly been met by proposing an increase in steel prices of somewhat less than the total increase in costs. The first issue has been decided against him. The nationalised Corporation felt that it was not reasonable to ask British steel companies to increase the prices of their steel to offset a loss on foreign steel, particularly finished steel that the companies will never handle, when that foreign steel represents a marginal supply imported for exceptional rearmament purposes. It was argued that the Government should buy this extra steel and should sell it to "rearmament consumers" at the purchase prices.

This argument was not carried through to its logical conclusion. If Mr Hardie feels that selling foreign steel below its purchase price inflates demand, should he not deduce that the price of all British steel should be raised to the price at which foreign steel has to be purchased—at least to the price f.o.b. foreign ports? It hardly seems reasonable to invoke the price mechanism in part but not all of the market. Some of the steel is imported in ingots that will be rolled into finished products by British works, and very little of it in finished products that would be easy to identify with particular consumers; moreover, it is very doubtful whether the bulk of this American steel will be directly used for defence. Under the present steel allocation scheme, such a course might mean allotting to one consumer expensive imported steel and to another cheaper home-produced steel. On the question of profits, it may be questioned whether the increases in company earnings reported by the companies over which Mr Hardie is temporarily in control are upon the basis of full provision for depreciation in terms of replacement costs. Only if adequate provision were being made—which does not seem in any way certain—could the absorption of increases in costs, as an "anti-inflationary" measure, be justified. The case for freer operation of the price mechanism in steel has recently been examined in these columns. But it does not by any means compel acceptance of the heresy common in planning in this country since the war—that inflation is to be resisted by holding the prices of basic materials artificially low.

* * *

I.C.I.'s Development Programme

Last week Imperial Chemical Industries duly posted provisional letters of allotment to their ordinary shareholders offering them the right to subscribe for 10,093,023 new £1 ordinary shares at 40s. 6d. a share in the ratio of one new share for every £6 of ordinary stock held. With this step ICI's third postwar approach to the capital market is under way and for the third time the amount to be raised is about £20 million. The terms of the new issue are almost exactly identical with those of the first postwar issue made in 1948; the intervening issue in September, 1950, took the warmly debated form of the placing with institutional investors of £20 million of 4 per cent unsecured loan stock. Dealings in the new shares began in a lively market on Monday, when the price opened at 1s. 1½d. premium and then fell away to close at 9d. premium. The premium once narrowed to 6¾d. and is still no higher than 9d. In the prospectus accompanying the letters of allotment the directors report that preliminary figures show that net income before tax in 1951 exceeds the corresponding total in 1950. It is also their belief that the present rate of dividend—12 per cent—can be maintained on the increased capital. In 1952, when the new shares will rank for dividend payments, the directors intend to adjust the interim dividend so that it will represent in future a higher proportion of the total payment. These statements confirm the impression that the capital developments which absorbed the proceeds of the earlier issues, are bearing good fruit; the directors are confident that the projects to be financed by the latest issue will do so too.

By the end of last September, ICI's directors had authorised the spending of about £77 million on new capital developments and since then further extensions of productive capacity have been sanctioned. The greater part of this expenditure will provide increased capacity in the divisions that manufacture the company's most important primary products—such as alkalis, chlorine, dyestuffs and non-ferrous metals—though substantial sums are also being spent on developing the manufacture of pharmaceuticals and chemicals from the processing of oils. About £10 million is earmarked for the further development of the new synthetic fibre "Terylene," and another £5 million will be used in expanding the output of nylon. All these developments are "vital to the national economy," and as ICI, whose exports last year rose from £48.4 million to £57.5 million, must now be one of the biggest individual exporters in Britain, its capital construction programme is likely to be fairly near the head of any queue of official priorities. But even with the sun of official approval apparently shining on it, the present rate of capital expansion may be threatened by physical shortages in steel and other materials, and the delays that these shortages can cause.

* * *

Mining Manpower

By Easter there may be almost 710,000 men on colliery books; but from that peak mining manpower must be expected to decline gradually until the beginning of the winter. That is the prospect to be deduced from the seasonal flow of labour in and out of the industry, which follows a fairly consistent pattern. But it does not reduce the significance of an encouraging trend; the seasonal increase in manpower began rather earlier than usual this winter and by February 9th had brought the mining labour force to 706,500 men, compared with 705,300 the week before and with 697,900 a year before.

Juvenile recruitment during the first five weeks of the year was about 790 higher than in the same period of 1951, and it is about twice as high as in 1945. The result of this in terms of coal output is limited, since juveniles hardly contribute to production for about a year after entering the mines; but it is important as an index of morale throughout the industry. By 1945 parents' opposition to sending sons underground had slowed the influx of juvenile labour in the mining areas—the industry's only real reservoir—to about 9,000 a year. Perhaps the most encouraging sign in the coal industry today is that since then, during a period of intense

The Birmingham Tally Ho Coaches

MARTINS Bank has much pleasure in announcing the recent formation of a local Board for the Midland District of the Bank, with a District General Management situated in Birmingham. This is a development of the Bank's well-tried policy of decentralisation of control and it is intended to ensure even better service to its many friends in the Midlands by making the best use of local knowledge and associations.

CHAIRMAN OF THE LOCAL BOARD FOR THE MIDLAND DISTRICT: SIR WILFRID MARTINEAU, M.C., T.D., M.A.
DISTRICT GENERAL MANAGER: J. A. NAISBITT.

competition for young labour, the numbers entering the mines have been doubled and that the increase still continues.

There is still a need, however, for a further effort at recruitment from the "white" areas outside mining districts, not least because such recruits are more mobile. This could be complemented by the temporary transfer of such recruits from, say, Kent and Scotland, where youths are easy to attract, to spend a period of their training in the areas such as the West Midlands, where labour is most scarce; this might encourage them to try their luck there later. Various other measures are probably assisting juvenile recruitment. In certain areas special "nursery faces" for young miners are being worked and the youths are being given a chance at many different jobs within the pit. Moreover, the last two flat rate wage increases have given a disproportionate advantage to the young miner. Whether the industry is really holding its ground against the wastage of older miners that must be expected in the present decade is doubtful; but at least it is attracting more miners' sons than in earlier years in a much tighter labour market.

Those older miners, a number of whom stayed in the industry last year until the pension scheme came in, are at present leaving the industry in considerably greater numbers than at this time in 1951; but to the extent that the 1951 fall in such retirements represents a delay for the sake of the pension, its effect should soon be over. Re-entry into mining of men who left the industry has declined a little; though the pool of ex-miners is obviously self-replenishing, the National Coal Board believes it has declined in absolute size during the last year. Adult recruitment as a whole is thus slightly lower than last year, while at present the trend of wastage is upward. But these seasonal trends are having their effect on a labour force 9,000 greater in numbers than last year; so far as can be judged from present indications, the average number of men in the industry in 1952 seems likely to be higher than in 1951.

* * *

Contrasts in Stockpiling

The British Government's policy on stockpiling has turned full circle. In 1950 when every effort was made to isolate the cost of living index from the effects of devaluation, stocks of food and raw materials were run down and gold was hoarded instead. Last year that policy was reversed; the lack of raw materials was made good at the expense of the gold and dollar reserve. Now that the gold reserves of the sterling area are falling at a menacing rate, part of the stock is being sold for dollars. Last month Britain sold to the United States 20,000 tons of tin and 25,000 tons of rubber. This month it is to sell 30,000 tons of lead supplied to Britain under current Australian and Canadian contracts. In all, Britain should get some $90 million from these operations, which is almost equal to the amount of gold Britain had to pay to the European Payments Union in January.

The sale of bulk quantities of raw materials to the United States is one quick way of fortifying the dollar reserves. But these sales are being made at prices considerably below the peak levels at which some of the materials were brought. So it has been for the past five years. Whenever commodity prices were low, Britain has never had sufficient foreign exchange to buy supplies. Its purchases have had to be concentrated in periods of already high prices.

The United States is much better placed. It can choose when it will buy, and can also dictate, to some extent, the price that it is willing to pay. Up to the outbreak of the Korean war, the American authorities in charge of stockpiling operations bought heavily when commercial demand was also increasing. During the past year, they have sought better value for money; in the second half of 1951 expenditure on stockpile purchases amounted to only $349 million compared with $396 million in the first six months. The total value of the stockpile at the end of 1951 was given as $3,440 million.

The stockpile programme is in arrears except for rubber and some minor materials. During 1951 government stocks had to be raided to prevent American industry from going short. Some 55,000 short tons of copper, 30,000 tons of lead (Britain is now apparently making this good) and 10,000 tons of aluminium were released. In addition $40 million worth of materials (including aluminium, columbite, copper, nickel and lead) bought under contract by the stockpile authorities were diverted to industry and a further $120 million of materials diverted to other buyers, including Britain. If the US Munitions Board's recent report on stockpiling is to be taken literally, many commodities (particularly the metals) should be able to count on continued American support during the coming year. But that affords no assurance that prices will rise.

Meat from New Zealand

Britain is making every effort to encourage meat production in the Commonwealth. A fifteen years' agreement with Australia was signed some months ago. A similar agreement with New Zealand was announced this week. It is not a formal contract but rather an undertaking to buy the total exportable surplus of beef, veal, mutton and lamb from New Zealand during this period. For its part, New Zealand will undertake large-scale development to increase meat production by using fertilisers on hill pastures, by building more freezing works and by improving port facilities. Furthermore, New Zealand expects to send Britain 380,000 tons this year compared with 265,000 tons in 1951. Last winter New Zealand farmers held over the maximum number of lambs for shearing in the spring so that more carcases will be available this season and the average weight of carcases has also increased because of the good condition of the pastures.

If these larger shipments materialise—and at the moment there is every indication that they will—home production and imports from New Zealand together could provide 1,380,000 tons of meat compared with last year's consumption of 1,360,000 tons. In that case, over the whole year, the average level of the meat ration should be the same as in 1951. But a squeeze may be felt before the spring home-killings and again before the late summer home-killings are available unless supplies are received from Australia or Argentina. Last year Australia sent only 65,000 tons. This year exports are not expected to exceed 50,000 tons because of drought. If this quantity could be shipped before the end of April, the Minister of Food would only have to worry about one lean period even if negotiations with Argentina were unproductive.

BEEF CATTLE (ENGLAND AND WALES)

	2 Years and over	1–2 Years	Under 1 Year	Total
Sept., 1950.....	485	415	442	1,342
Dec., 1950.....	470	417	446	1,333
Sept., 1951.....	533	442	411	1,386
Dec., 1951.....	498	413	422	1,333

One disconcerting feature that bodes ill for the future is the declining numbers in steer calves below a year old in this country. In the December census, cattle of two years and over showed an increase of 28,000 on December, 1950, which should imply a higher output of home-killed meat this year. But beef cattle between one and two years declined by 4,000 and those under one year by 24,000. It would seem that the policy of encouraging more beef production has not been conspicuously successful.

Malaya's Dollar Earnings

Malaya's surplus in visible trade with the United States reached a record level in 1951; at £114 million it just passed the £112 million earned in the previous year. This is surprising particularly as the United States stopped buying tin—one of Malaya's principal dollar exports—last March. The main item last year was rubber and the United States remained the largest customer. Admittedly its purchases of nearly 360,000 tons were 17,000 tons smaller than in 1950, but this fall was more than offset by larger purchases by other dollar countries. Moreover, the average price of 4s. 2d. a lb was higher than that of the previous year, so that total dollar earnings from rubber rose from £94 million to £203 million. Unfortunately, 1952 promises to show a very different picture.

The story of tin is completely different. Proceeds from the sale of tin to the United States, which is virtually the only dollar country to buy Malayan tin, fell from £28 million to £3 million; the tonnage exported to the United States fell by 94 per cent. During the year the United Kingdom and other European countries partly made up for the sharp decline in American purchases and bought 15,244 tons—about double the amount in 1950—out of Malaya's total exports of 65,000 tons.

The prospects for Malayan trade in 1952 are far from bright. Tin production seems to be holding its own for the present, as the mines are generally compact units that can be fairly readily defended. Attacks on the rubber plantations are growing and tree slashing is widespread. In 1951 rubber production fell by 15 per cent mainly because of communist attacks and it is likely to fall further this year, especially if stronger military measures are taken. Moreover the price of rubber has fallen sharply and unless the United States permits free import and consumption of natural rubber, the average price this year will be far below the 4s. 2d. of last year.

Shorter Notes

The two working parties set up after the Commonwealth Finance Ministers' conference last month have now completed their first series of meetings; they have submitted interim reports to the Commonwealth Governments and agreed to meet again in a few months' time. One of these working parties—under the chairmanship of Sir Arthur Salter—is prospecting the difficulties that lie along the road to sterling convertibility, and the other—under the chairmanship of Mr J. G. Foster (the Parliamentary Under-Secretary for Commonwealth Relations)—is studying the opportunities for a more co-ordinated approach to investment and development programmes within the sterling area.

*

It was announced in Parliament this week that the National Film Finance Corporation was to be given powers to borrow up to £2 million from non-Governmental sources, but no indications are available of what these sources may be. The Corporation by last summer had already lent out most of the £6 million it had received since 1949 to assist British film production. In August the former President of the Board of Trade stated that it would be authorised to borrow another £2 million from its bankers on Treasury guarantee; whether the new borrowing powers are in addition to this authorisation, and whether this new borrowing will also be guaranteed, is not clear.

*

A printing error in *The Economist* last week cited reports from Paris that the French Government intended to stick courageously by its predecessors' plan to raise "most direct taxes and all indirect taxes (except those on essential foodstuffs) by 100 per cent." Even at this pre-Parliamentary stage, courage does not, of course, go as wildly far as this; the figure was a misprint for 10 per cent. The Finance Bill is likely to be made public, and to come up against Parliamentary opposition, next week.

*

The Abbey National Building Society increased its total assets from £122.2 million to £136.3 million last year. New mortgage advances (at £29.3 million) were much the same as in 1950; after allowing for repayments, mortgages outstanding rose by some £13.8 million to £118.3 million and investment holdings by some £400,000 to £13.6 million. The shares account rose by £15 million to £122.5 million and deposits and loans account by £2.4 million to £21.1 million—indicative of strong and continued personal savings through the building society movement despite the increase in interest rates on national savings certificates last year. The Abbey National continues to pay the traditional rate of 2¼ per cent on shares and 1½ per cent on deposits (both, of course, tax free). One of its only slightly smaller brothers, the Co-operative Permanent Building Society (which raised its charge for new mortgage lending last month) has this week stepped its interest rate on shares up to 2½ per cent.

*

A Business Note on page 174 of *The Economist* of January 19th on air charter business stated that Silver Cities was the only British charter company that had equipped its fleet with new and not second-hand aircraft. This statement is misleading and it should be pointed out that Olley Air Service, Ltd., to give one example, operates Dove aircraft that were purchased new from the De Havilland company.

Established in 1845.
All classes of insurance transacted including Fire, Life, Accident, Motor, Marine and Aviation. Represented throughout the world.

ROYAL INSURANCE COMPANY LIMITED

Company Notes

Imperial Tobacco.—The full accounts of Imperial Tobacco disperse mysteries that were conjured up by the preliminary statement of its profits in the year to October 31st last. The trading profit of the holding company (which in effect means the tobacco company) fell from £19,706,459 to £19,206,280. The trading profits of the group as a whole (thanks largely to the increased profits of subsidiaries engaged in manufacturing cigarette papers, in printing and in other trades) rose from £21,880,302 to £23,284,604. The profits of both the holding company and the group, however, include a "special surplus" arising from the sale of tobacco purchased before devaluation; this surplus amounted to only £2,845,000 last year, compared with £6,209,000 in 1949-50. Whether this special surplus should be called a "fortuitous" profit or not is a matter for accounting debate; in any case, it clearly is not a distributable profit and the company has transferred the £1,344,262 of it that the tax collector has left to leaf replacement reserve—as it did with the £3,073,455 that the tax collector left the year before.

The group's balance sheet is dominated by a £19.3 million rise in stocks, to £130.4 million. This reflects, probably in not very unequal proportions, a real rise in stocks of unmanufactured tobacco and a rise in leaf prices. Holdings of general materials and stores (especially packing materials) have also increased substantially but this probably has not had a very significant effect on the profits, nor apparently has much of the rise been accounted for by any increase in the duty element in stock values. The result of this rise in stocks has been that bank overdrafts have risen by £6.1 million to £34.5 million, despite the receipt of £14.8 million of cash from full payment of the unsecured loan stock issue of October, 1950. This is, of course, a direct result of the erosion of the group's liquid assets by the tax collector, who, thanks to his neglect of all adventitious elements accruing to profits, and of the needs for stock replacement, has taken £16.2 million, against £13.2 million the year before.

Years to October 31,	1950	1951
Consolidated earnings:—	£	£
Trading profit	25,113,638	27,180,748
Total income	27,760,629	30,155,622
Depreciation	1,087,378	1,264,293
Taxation	13,201,806	16,166,873
Leaf replacement reserve	3,073,455	1,344,262
Group earnings for ordinary stock	*7,189,993*	*8,135,634*
Ordinary dividends	6,611,097	6,310,592
Ordinary dividends (per cent)	32	32
Retained by subsidiaries	511,161	1,037,859
General reserve	...	800,000
Added to carry forward	67,735	138,515
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	15,994,105	17,516,695
Net current assets	95,388,153	111991327
Stocks	111061563	130369308
Cash	430,711	382,590
Reserves	55,429,316	59,427,892
Ordinary capital	37,563,049	37,563,049

£1 ordinary stock at 88s. 9d. yields £7 4s. per cent.

In any normal year the rise in bank overdrafts might touch off speculation about a new capital issue. But the year ahead does not seem likely to be a normal one for "Imps." The Government's recent decision to cut tobacco imports seems to imply that British tobacco manufacturers may get less than half the very generous allocation of approximately $110 million that they had to spend at last year's American tobacco auctions. Yet it has been announced that cigarette supplies in the shops should be little, if any, less than last year. In other words, "Imps" and its smaller brothers are going to be living on stocks this year—at any rate so far as non-Empire tobacco is concerned. This may not, perhaps, spell a very happy prospect for next year or the year after, but for the current year the company may well be turning its bank overdrafts down, instead of running them up, at the recent rapid rate. Provided that the demand for cigarettes is not forced below its present rate (by an increase in duty or a general recession), provided the full benefit of the recent increase in cigarette prices just about balances the continuing increase in costs (which seems a fairly reasonable assumption), and provided "Imps" continue to make the satisfactory manufacturing economies that they plainly achieved last year, then the present rate of profits should be just about maintained next year. But, in view of present clouds and future uncertainties, shareholders may have to wait for a long time before any prospect of an actual increase in their dividend appears above the horizon.

*

Hoover.—Hoover Ltd. has taken the plunge that I.C.I. pioneered last year and revalued its fixed assets at present-day prices. In his annual statement, issued prior to the full accounts, Sir Charles Colston reveals that as a result of revaluation the book value of fixed assets has been increased by £1,510,000 and that a corresponding book entry has increased capital reserves by the same amount. Revaluation has enabled the directors to make a more realistic provision for depreciation. Before striking the year's profit at £3 million (against £2½ million in 1950), £514,000 has been set aside for depreciation (against £389,000 a year earlier).

Meanwhile, the value of stocks and work in progress increased by rather more than £3 million, to approximately £5.5 million, last year. This increase, no doubt, was partially merely another symptom of the distortion of asset values by price inflation. It must also, however, reflect some expansion in turnover. Profits and turnover in 1951 were in fact "substantially larger than total turnover and profits for the entire period from the commencement of activities in 1919 down to the end of 1939." A greater part of the increase in sales was achieved in overseas markets; the company's exports were about two and a quarter times as large as in 1950. Profit margins were squeezed by the rise in costs early in 1951, but "this was corrected before the end of the year." The expansion of exports involved "serious sacrifices in the home market" and Sir Charles is confident that last year's fall in home sales of washing machines was due, not to the doubling of the purchase tax on electrical appliances, but to the priority given to export orders. Sir Charles's views on the decline in home sales of electric cleaners are far less explicit; he declares that demand was "satisfactorily maintained," but shareholders may wonder whether the fall in sales was in fact related to the increase in purchase tax.

Sir Charles makes no comment in his review on the new hire purchase arrangements, but he draws particular attention to material shortages, and expresses the hope that the government departments concerned with allocating materials will not stint those manufacturers that have made every effort to expand exports. Without adequate supplies, some of the plant in the company's newly built factories would remain idle this year, and it seem uncertain whether defence orders, on which the Cambuslang factory will be engaged, could take up the whole of the slack. Moreover competition abroad may become more severe; the effect of the fall in wool prices upon the Australian economy, for example, may lead to a contraction of a market that Hoovers have recently found so fruitful. In these circumstances Sir Charles reminds shareholders that the record achievements of 1951 and the higher dividend distribution—an ordinary dividend of 35 per cent is to be paid, against the equivalent on the new capital of 30 per cent—should not be taken as an indication of future trends. At the current price of 25s. 9d. the 5s. ordinary shares yield 6.8 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended February 16, 1952, total ordinary revenue was £136,260,000 against ordinary expenditure of £109,562,000 and issues to sinking funds £490,000. Thus, including sinking fund allocations of £20,943,000, the surplus accrued since April 1, 1951, is £367,493,000 compared with a surplus of £656,068,000 for the corresponding period of the previous year.

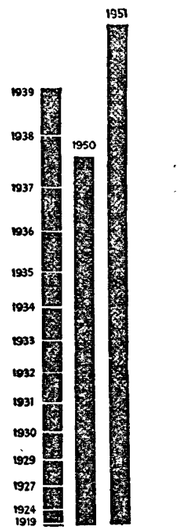
ALL PREVIOUS RECORDS SURPASSED

STRIKING EXPANSION IN EXPORT MARKETS

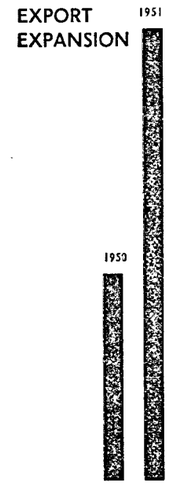
DISTURBING EFFECT OF PURCHASE TAX CHANGES



PROVISION OF INCENTIVES VITAL TO NATIONAL ECONOMY

SIR CHARLES COLSTON'S REVIEW OF WIDESPREAD RAMIFICATIONS

The annual general meeting of Hoover, Limited, will be held on March 31, 1952, at Perivale, Greenford, Middlesex.



The following is the review of the chairman and managing director, Sir Charles Colston, C.B.E., M.C., D.C.M., which has been circulated to stockholders covering the year ended December 31, 1951:—

In my last annual review I was able to report that 1950 had been a record year in the history of the company, surpassing by far all previous records. I am glad to tell you that in 1951 we made even greater advances. We substantially expanded our business and our growth was greater than at any time in our history. The increase in our turnover in 1951 was about *double* the *total turnover* in our peak year before the war.

During 1951 our turnover and profits were substantially larger than our total turnover and profits for the entire period from the commencement of our activities in 1919 down to the end of 1939, by which time we had established a large and flourishing business. In a single year we have eclipsed all the achievements of this period of 21 years—a remarkable tribute to the strength and capacity for expansion of our virile undertaking.

It is of significance to record that our expansion during 1951 took place in the export market. We have concentrated our energies on developing our markets abroad with gratifying results. These markets are more difficult and less profitable than the home market, but we have unwaveringly continued our policy of giving overriding priority to exports. This policy is plainly in the national interest, all the more so when the adverse balance of payments has again become so critical. It is also sound business for this company. We may expect competition abroad to become progressively more

severe. It is our duty, as well as to our advantage, to do our utmost to consolidate our hold on our export markets.

In 1951 our exports were about two and a quarter times as large as in 1950. This striking expansion has been fairly uniform in each of the principal departments of our business—electric cleaners and polishers, electric washing machines, and fractional horse-power motors.

PRIORITY TO EXPORTS

As an illustration of the extent to which we have given priority to exports, no less than 70 per cent. of our washing machine production was exported. More than 80 per cent. of our F.H.P. motor production was sent abroad, including the motors incorporated in various products subsequently exported by the manufacturers concerned. Nearly 40 per cent. of our electric cleaner production and the whole of our electric polisher production was exported. Taking the range of our manufactures as a whole, nearly 60 per cent. of our production went to markets abroad.

We have firmly established our leadership in the British electric cleaner and electric washing machine industries in the field of exports. During 1951 Hoover, Limited, exported nearly 50 per cent. more electric cleaners and 50 per cent. more electric washing machines than all other British manufacturers combined. Results of this order have only been achieved by reason of the quality and price of our products, the intensive efforts to build up our overseas organisation in many parts of the world, and our readiness to make considerable sacrifices of sales in the home market.

TRADE WITH THE COMMONWEALTH

We have made remarkable progress in Australia. The turnover of our subsidiary company there was about two and a half times as large as in the previous year. After initial difficulties, which we successfully surmounted, the Australian market has proved most receptive to our products. The fall in the world price of wool has a considerable influence on the economy of Australia, so this market may be more difficult this year.

In New Zealand we continue to be severely handicapped by rigid restrictions on the import of electric cleaners and washing machines, but we have succeeded in nearly doubling our sales of F.H.P. motors in this market.

In South Africa, in spite of import licence difficulties, we more than doubled our sales. Our exports to Canada consist of electric cleaner and washing machine parts for assembly, and we are making efforts to expand our sales in this potentially important dollar market.

THE EUROPEAN MARKET

Efforts are being made to forge ever closer links between the countries of Western Europe. We may entertain good hopes that it will be possible to build up a European community united in defence and closely knit in the economic field.

European economic unity would create one of the largest and strongest economic units in the world. The countries of Western Europe comprise a population approaching 200 millions, representing a market of exceptional importance. It is vital that the economic ties between Britain and the Continent should continually be strengthened and that trade in both directions should be enabled to flow as freely as possible.

EXPANSION OF EUROPEAN BUSINESS

We have devoted a great deal of energy to expanding our European business. I reported last year the striking expansion of our exports to the Continent, and I am glad to say that during 1951 this expansion continued.

Our subsidiary companies on the Continent have continued to make good progress. In France our sales have more than doubled. Our factory at St. Ouen, near Paris (Works No. 7), has increased its efficiency and succeeded in expanding production considerably without additional space. In Holland we almost doubled our sales, while in Belgium we achieved a useful increase over the remarkable figures reached the previous year.

In Switzerland our sales have been well maintained. Our subsidiary company in Italy, formed towards the end of 1950, is developing very satisfactorily. In Germany we have increased our sales, but these are still on a minor scale owing to conditions there.

THE UNITED STATES AND OTHER EXPORT MARKETS

There has been a useful increase in our exports to the United States, which consist principally of our "Dustette" Electric Cleaner and include also a number of our industrial products. Developments are in train which we hope will lead to a substantial rise in our exports to this vital market.

In South America we have done a worthwhile volume of business with some countries, but in others import restrictions have stood in the way. Our exports to South-East Asia are only of moderate dimensions. As the use of electricity in the home grows and the economies of the countries in this part of the world develop, they should become markets of importance for our products, but we cannot anticipate any major advances in the next few years.

Altogether we are exporting to 66 countries. The striking overall increase in exports which we have achieved, in spite of innumerable licence and currency regulations and restrictions, are a tribute to our enterprising export department and the efficient and energetic service which we have received from our subsidiary companies and agents overseas.

The large export business which we have built up, widely spread over so many countries, should prove to be a source of increasing strength to our company. This is all the more fortunate in view of the decision of the Chancellor of the Exchequer to cut down severely the supply of metal-using products to the home market in the urgent effort to wipe out our grave external deficit.

THE HOME MARKET

The priority we have given to exports has involved serious sacrifices in the home market. This has been particularly so in the case of our electric washing machines. We could easily have sold a much larger number of washing machines than in the previous year if we had not insisted on diverting for export large numbers of machines for which our dealers throughout the country were clamouring. As a result we sold about 15 per cent. fewer washing machines in Britain than in 1950. This sacrifice of a substantial portion of the home market was conscious and deliberate. We were confident we could recover it when supplies became available.

But our insistence on priority for exports should not lead to our being penalised in the allocation of materials. Manufacturers who in pursuance of Government policy have diverted supplies away from the home market should not have their home quota for 1952 reduced because they sacrificed home sales in 1951 for the sake of exports. That would be a poor return for the effort to increase sales abroad, especially having regard to the fact that they are usually less profitable than home sales.

I trust that in working out detailed policy in regard to allocation of materials the Government will take care to reward and not penalise manufacturers who have heeded their exhortations in the past to make the maximum effort to expand exports.

WASHING MACHINE FACTORY EXTENSIONS

During the last couple of years we have practically trebled our factory space in the South Wales Development Area. The first factory extension at Merthyr Tydfil (Works No. 4) has been completed, and the second factory extension there is almost complete. This factory, together with our factories at Cyfarthfa (Works No. 6) and Aberdare (Works No. 8) should give us the facilities for maintaining our electric washing machine production at a high level. It is gratifying that we have succeeded in establishing and consolidating a new and important industry in this Development Area, thus providing valuable employment.

I believe that in a few years' time the electric washing machine will be regarded as essential equipment in almost every home. There are large markets to be developed, not only in Britain but abroad. The development of these markets should proceed together in order to obtain the maximum advantages and economies of mass production, and so strengthen our markets overseas.

ELECTRIC CLEANER SALES

Demand for our electric cleaners in the home market during 1951 was satisfactorily maintained. In the early part of the year we sacrificed an appreciable volume of home business in order to keep our export markets fully supplied. In volume, our cleaner sales in the home market fell by about 12 per cent., but in terms of turnover the 1950 figure was practically unchanged.

The pre-eminent quality of our machines has given us a position of leadership in the industry, but our engineering and production departments are continually striving to improve still further the value and service that we give to the public. The Hoover electric cleaners are manufactured at our main works at Perivale (Works No. 1), where high efficiency of production has been achieved.

PURCHASE TAX

There is no doubt that the doubling of the purchase tax to 66⅔ per cent. is preventing many families of moderate means from acquiring an electric cleaner or electric washing machine, now recognised as essential labour-saving appliances in millions of homes. These industries, like other industries, have suffered from the sharply increased purchase tax. But damage is being done also because of the uncertainty in the public mind as to what further changes may take place in this tax.

What industry requires is a reasonably stable and uniform flow of orders so that production can be organised smoothly and efficiently. It is obviously unsatisfactory when there are unduly violent fluctuations in demand. There are, of course, seasonal fluctuations to which manufacturers and distributors have adjusted themselves. But if in addition to this the public at large are to be influenced by guesses, good or bad, as to the intentions of the Chancellor of the Exchequer in regard to purchase tax, a most abnormal situation can very quickly be created. If the public are led to think purchase tax is going up, they rush to buy. If, on the contrary, they are led to think purchase tax is going down, they refuse to buy. Both the rush to buy and the refusal to buy are unsatisfactory from the point of view of the orderly organisation of production and are contrary to the interests of the consumer.

I think it is undesirable that purchase tax should become a political issue. It should be taken out of the realm of politics. If not, it is likely to become the subject of agitation by one political party or another. Such agitation may have little practical effect on the level of purchase tax, but it will gravely unsettle the public mind and create those violent fluctuations of demand which are so injurious to industry.

The problem is a recurring one, as in the period prior to each Budget normal demand may be seriously distorted because of uncertainty about purchase tax. The difficulty flows from the customary financial procedure under which changes in purchase tax form part of the Budget. If such changes were not confined to the Budget, but could be announced at various times as necessary, then this abnormal period preceding each Budget could to some extent be obviated. Certainly some solution to this problem on the part of the Chancellor of the Exchequer is urgently necessary.

F.H.P. MOTOR EXPANSION

Very encouraging progress has been made in the fractional horse-power motor section of our business. The extension to our Cambuslang factory (Works No. 2) in the Scottish Development Area has been practically completed. This will enable us to gather together a number of our scattered units and effect appreciable economies. The additional factory space will leave us some scope for the further expansion of our production.

Our sales during 1951 were more than double those of the previous year. The new model F.H.P. motor which we launched has been well received both at home and abroad. It is a source of satisfaction that our F.H.P. motor business is so firmly established and is flourishing, as it is important to provide varied forms of employment in the Scottish Development Area.

At our High Wycombe factory (Works No. 3) we are manufacturing other industrial products including plastic commutators and switches, as well as our "Dustette" electric cleaner. The extension to this factory is almost finished and generally good progress has been made.

THE HOOVER ELECTRIC POLISHER

After years of intensive development the Hoover electric polisher, the latest of our famous products, has been successfully launched. It is now being marketed in 38 countries all over the world, and the speed with which this has been done is a tribute not only to its quality but to the strength of the organisation we have established. It is manufactured at our main Perivale works, and very satisfactory efficiency in production has already been attained.

The Hoover electric polisher has had to meet strongly established and severe competition, but it has won its way on its merits. It incorporates fine design and workmanship, and is of supreme quality. I am confident that it will constitute a source of added strength to our undertaking.

Our entire production of the Hoover electric polisher went to export markets during 1951, and we temporarily sacrificed the potential market in Britain. As must always be the case, however, we planned our production on the basis of substantial home sales in addition to exports in order to secure lowest costs of production. We propose to launch the electric polisher in the home market as soon as possible, and we trust that we shall not be penalised because we concentrated all our sales of polishers last year in the export markets.

HOOVER SERVICE DEPARTMENT

The work of our service department, with headquarters at our Park Royal factory (Works No. 5), has continued to be the key to much of the remarkable goodwill which our company enjoys. The work of this department is steadily expanding with the increase in the number of homes in which Hoover cleaners and Hoover washing machines are installed. The department maintains them in excellent condition and adds years to the efficient service which they can give to our customers.

DEFENCE PRODUCTION

We have obtained a number of orders in connection with the rearmament effort. A substantial part of the work will be carried out at our Cambuslang factory in the Scottish Development Area. Considerable tooling is necessary, and it will be some months

before production can commence. Our policy is to endeavour to obtain defence work where we can make the fullest use of our special skill and experience in the electrical engineering field.

In the early part of last year Mr Walter Puckey, our general works manager, was invited to serve as Deputy Controller of Supplies (Air) in the Ministry of Supply, and we agreed to second him to the Ministry. Mr Puckey has now retired from the Board of the company, and has been succeeded as general works manager by his deputy, Mr B. H. Dyson. Mr. Puckey rendered brilliant service to the company from the time he joined us in 1935, and we have no doubt that he will fill his important official post with distinction.

FINANCIAL RESULTS

The continued expansion of our undertaking has led to an increase in our consolidated profit from £2,475,000 in 1950 to a new record of just over £3 million (subject to audit). This annual review is being circulated without waiting for the completion of the detailed audit, as I think that in these difficult and uncertain times stockholders would prefer to know as early as possible how the company fared during the past year. The percentage increase in our profit is less than the percentage increase in our turnover for the year. The main factor has been mounting costs in relation to selling prices, although this was corrected before the end of the year.

INCENTIVE OF THE "A" ORDINARY SHARES

The results which have been achieved, in spite of the many difficulties, are impressive. I believe that the most potent single factor contributing to our progress has been the incentive which the "A" Ordinary shares have provided to nearly 100 of our senior executives. They are the spearhead of our business and it is on their determination, energy and skill that the continued advance of our undertaking so largely depends. We have made very exacting demands on them and they have responded with a degree of enthusiasm which I have found most heartening.

Incentive is the strongest weapon in the hands of management. In every section of the Hoover organisation the value of incentive has been proved to the full, and I am glad that we have been able to provide a real incentive also to our senior executives. The incentive of the "A" Ordinary shares has been a spur to the utmost exertions. It is also a shield for the stockholders. Our senior executives will benefit if profits rise; they will suffer if profits fall. That is a good thing for the company and for the stockholders.

DIVIDEND POLICY

The board has given much thought to the dividend policy which we ought to adopt. We begin with the fundamental principle that our first duty is to our stockholders, who are the owners of the business. We have a duty to the undertaking itself to make it strong and to develop it to the full. We have a duty to those who are employed in the undertaking. We are under a duty to have regard always to the overriding national interest. It should be possible to combine and harmonise all these duties.

NEED FOR CAPITAL RESOURCES

One of the most disturbing features of our national economy at the present time is that an increasing number of important companies are experiencing a growing shortage of capital resources. The considerable rise in prices has necessitated much larger working capital to finance stocks and work in progress. But of more fundamental importance is the pressing need to replace the equipment of industry by more modern and more efficient equipment. Otherwise, we cannot possibly maintain our place in an increasingly competitive world. Nevertheless, whenever one of our apparently periodical balance of payment crises occurs, one of the first casualties is our capital investment programme, thereby seriously affecting the possibility of improving our productive capacity.

The Chancellor of the Exchequer in his statement at the end of January announced that home investment was to be cut severely, involving sharp reductions in the supply of urgently required plant and machinery which, he was fully aware, were needed "in the long-term interest of our economic progress." It may well be that our external deficit is so menacing that these hard decisions are unavoidable, but the truth remains that failure to keep British industry supplied with the most modern equipment will gravely weaken the national economy.

CONTRAST WITH THE UNITED STATES

The economic strength of the United States, the fact that a nation numbering only about 7 per cent. of the total population of the globe have acquired so striking a position of economic dominance, is due not only to their skill and energy and their great natural resources, but also to the vast quantity of the most modern and highly efficient capital goods at their command. The Americans have the tools, the best tools, in immense profusion, and an immense job they can do as a result.

The United States economy, having achieved a truly phenomenal productive capacity, is able to provide an unrivalled flow of consumer products and defence products, and in addition can provide for investment in fixed capital on a colossal scale. It has recently been authoritatively stated that United States private investment (in addition to Government investment) in fixed capital is running at the rate of over $50,000 million a year. This is substantially larger than the total national income of Britain. The result is that American industrial equipment is far ahead of that of any other country, and is leaping still further ahead every year.

INCREASED SAVINGS IN BRITAIN ESSENTIAL

If the British economy is to obtain the more efficient capital goods which are so sorely needed, the volume of national savings must be increased. There is already a measure of compulsory national savings through the medium of taxation; the Government saves part of the proceeds of taxation which it uses for the purpose of capital investment. It is hardly feasible to increase such compulsory savings as this would involve heavier taxation, already so heavy that it is seriously stifling enterprise.

It is necessary to increase the total of personal savings, now woefully inadequate. It is estimated that in 1950 (the latest year for which figures are available) the total of gross personal savings amounted to little more than £300 million, less than £7 per head of the population.

Heavy taxation now makes the harshest inroads into surplus income, and it is no longer possible for a comparatively moderate number of well-to-do men to provide a large amount of savings. In order to increase appreciably the volume of national savings there must be sacrifices of present comforts, "abstinence" it used to be called, on the part of a considerable proportion of our people.

THE INCENTIVE TO SAVE

We should not underrate the difficulties. The higher cost of living has made saving much more burdensome; it is not easy to give up standards to which we have become accustomed. To induce more savings there must be a sufficient incentive. At present, unhappily, the incentive is steadily weakening.

It is painfully clear that the inflationary factors at work in our economy are very powerful. If prices rise, say, at an average rate of 5 per cent. per year, in the course of 20 years the price level will be up by about 165 per cent. Even if the average rise were only 3½ per cent. per year, prices would double in 20 years, that is, the value of money would be reduced to one half.

Now if families of moderate means sacrifice present comforts and conveniences in order to save, invest in fixed-interest securities, and wait for 20 years, what reward will they get? Will they get any reward at all? If inflation continues, as is probable, the capital that they will get back after 20 years, together with the interest earned during the period (after tax has been deducted) may amount, in terms of real worth, to less than the sum which they invested.

These obvious consequences of continued inflation are coming to be more widely understood. The inevitable result will be a growing disinclination to invest in fixed-interest securities of all kinds, and exhortations to the contrary will be of little avail.

INVESTMENT IN EQUITIES

How then are we to secure greater savings from a greater number of people? I think the short answer is that they should be given sufficient incentive to invest more in equities. A large number of people already invest in equities; participation in the capital of public companies has become very widespread. It is noteworthy that six of the leading British companies have between them more than a million shareholders. The number of investors can be increased, and the amount that they will invest can be raised provided there is an adequate incentive.

Investment in equities should protect investors against inflation. If they select sound companies and spread the risk, they should achieve a sufficient measure of safety as regards capital. But what return are they to receive? Here is the crux. Here lies the danger of recurring demands for dividend freeze and dividend limitation.

Such a policy, as has often been pointed out, tends to reduce Ordinary shares to the status of a rather junior Preference share. On this basis investors would find themselves in the disagreeable position that if companies in which they invest do badly they may lose part of their capital; but if the companies do well they will lose the reward they might reasonably expect. The policy of depriving Ordinary shareholders of an adequate participation in the success of companies in which they have risked their capital will undermine the possibility of increasing, and even of maintaining, the present inadequate flow of savings.

It is in the national interest that when companies are successful the shareholders should share in their success. A contrary policy would gravely discourage savings and may create fundamental disharmony between national policy and the reasonable personal interest of countless individuals. The State requires increased savings, and we should therefore so arrange our affairs that individuals are given the incentive to save more. This is essential to ensure a greater volume of risk capital.

INVESTMENT FROM ABROAD

We should endeavour to increase not only internal savings, but also investments from abroad, which in effect means the United States—almost the only source of possible foreign investment at the present time. But the United States is the land of free enterprise, where rewards for those who are successful are a matter for congratulation. This is one of the reasons why go-ahead companies in the United States can obtain the capital they require for expansion. American Investors will not be induced to invest in British industrial enterprises unless they are convinced that if these enterprises are successful they will receive an adequate reward for the risks to be taken.

DIVIDEND DISTRIBUTION

The Board of Directors of the company take the view that, subject to the need for keeping the company strong and preserving its power to expand, it is our duty and should be our policy to do the best we can for our stockholders. The Federation of British Industries has advised moderation and restraint in regard to dividend distribution, and this is certainly a wise policy in these difficult times, and a policy which the Board support.

After careful consideration of all the circumstances, the board recommend a final dividend of 1s. 3d., less tax, on each Ordinary stock unit, making a total for the year of 1s. 9d., less tax, compared with 1s. 6d., less tax, for the previous year. On the basis of the above distribution, the "A" Ordinary shareholders are entitled under the articles of association to a dividend of almost exactly 3s. 3d., less tax, per "A" Ordinary share. We consider that the increased return to the Ordinary stockholders is more than justified, and they in turn will welcome the additional reward to the senior executives who hold "A" Ordinary shares and who have contributed so much to the advance of the company.

The total net dividends which the Preference and Ordinary stockholders and "A" Ordinary shareholders will receive in respect of 1951 amount to approximately £498,000. It is of interest to record that the dividends which Hoover Limited have received from overseas subsidiaries in respect of 1951 amount (after deduction of taxation abroad) to £375,000, which is about 75 per cent. of the total net dividends we are distributing. The profits (after deducting all taxation) earned in 1951 as a result of our new ventures—the Hoover Washing Machine, Hoover F.H.P. Motors, and our subsidiaries abroad—substantially exceed the total net dividends which are being distributed for the year.

REVALUATION OF ASSETS

In order to give stockholders a more complete picture of our position, the board decided on a revaluation of the fixed assets of the company and its British subsidiaries as at December 31, 1951, on the basis of present-day values. This has been carried out by Messrs Leopold Farmer and Company, and the annual accounts which are being circulated to stockholders will show the assets as revalued. As a result of this revaluation, the book value of the fixed assets has been increased by a total of £1,510,000, and this has been transferred to capital reserves.

The revaluation of our fixed assets gives us a more realistic basis for calculating the amount which should be provided for depreciation each year. Before arriving at the consolidated profit of £3 million we have deducted the sum of £514,000 in respect of depreciation (compared with £389,000 the previous year) and this we consider adequate having regard to high replacement costs at the present time.

APPROPRIATIONS

After making full allowance for taxation, both abroad and at home, and in addition to the transfer to capital reserves arising from the revaluation of our fixed assets, we have transferred to general reserves the sum of £133,000. We have also transferred £157,000 to reserves for employees' superannuation schemes to which we attribute so much importance. Out of the reserves for contingencies the sum of £186,000 is no longer required and has been added to the amount carried forward. After providing for dividends as recommended above the amount carried forward is increased to £932,000, as compared with £413,000 last year.

During 1951 we invested out of our own resources a total of approximately £950,000 in additions to our factory buildings and in new plant and equipment. Our stock and work in progress has risen substantially by rather more than £3 million. The item "debtors" (which represents current accounts and does not include any hire-purchase debts) is up by some £570,000. The financial strength of the company is the result of the consistently conservative policy we have pursued over the years of ploughing back into the business an adequate portion of our profits.

EMPLOYEES' SUPERANNUATION SCHEME

The total which we have provided for our free superannuation scheme in Great Britain now amounts to £510,000. This is in addition to our long-standing contributory superannuation scheme. The provisions we have made for pensions for our employees undoubtedly act as an added incentive to put forward the best efforts possible.

In view of the shortage of manpower, it is desirable that a greater number of men, who are fit and efficient, should go on working after they reach the age of 65. As an inducement to do so, we propose to consider increasing the pensions payable under our free scheme by approximately 20 per cent. for each year after 65 that they continue to work with full efficiency.

TRIBUTE TO OUR STAFF

On behalf of the stockholders and the board, I desire to thank all those engaged in the Hoover organisation most warmly for their splendid work and their record achievements during the year. I should like to express to my colleagues on the board my deep appreciation of their invaluable support and co-operation.

THE FUTURE

The records achieved in 1951 and the resulting higher dividend distribution are not to be taken as an indication of future trends. We shall treat each year on its merits. Undoubtedly, we have many difficulties to face during 1952, all of which may not yet be apparent to us. Nevertheless, we have confidence in our products, our business is now widely spread over many parts of the world, and we have a magnificent team which thrives on difficulties. I may say on behalf of all of those in the Hoover organisation that we shall do our best.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

The ninety-fourth ordinary general meeting of Lloyds Bank Limited was held on February 15th at the Head Office, 71, Lombard Street, London, E.C.

In the unavoidable absence of the chairman, The Right Hon. Lord Balfour of Burleigh, D.C.L., D.L., Sir Jeremy Raisman, G.C.I.E., K.C.S.I., vice-chairman, presided.

Sir Jeremy Raisman spoke of the deep sense of loss which the whole nation felt at the death of his late Majesty the King and, after standing in silence as a mark of respect to his memory, the members present agreed that formal business only should be transacted.

The report and accounts were adopted.

TEACHER (DISTILLERS) LIMITED

CONTINUED WORLD DEMAND

The third annual general meeting of Teacher (Distillers) Limited was held on February 19th in Glasgow, Mr R. M. Teacher (the chairman) presiding.

The following is an extract from his circulated statement:—

At our meeting this time last year I stated that there was little hope of maintaining that year's high rate of profit and the accounts show the anticipated reduction from the record profit of the previous year. The trading profit for the year amounted to £609,384 as against £714,828 last year. After providing for taxation on profits, etc., the net profit for the group is £224,754. Taxation at £359,735 on the reduced profit is at a higher ratio owing to the higher rate of profits tax and income tax.

I must stress taxation, because it all shows how profits are so substantially eaten into by heavy taxation. The Scotch whisky trade, with its original millstone of excise duty, and now at the excessive figure of £10 10s. 10d. per proof gallon, is one of the most heavily taxed industries at the present time. Having borne this exceptional burden so long, when the time comes for some relaxation let us hope that it will be one of the first to get relief.

The home trade continues to be limited by quantity allocated, and while this quantity is readily sold, the excessive taxation, combined with steadily and steeply rising costs against reduced consumer spending power, has during the past year, greatly diminished the overwhelming demand of recent years.

Dollars continue to be the prime factor, and our exports of Highland Cream are being increased as much as possible to meet the Government's requirements within the limits of our stock position, and we remain in the top rank of dollar earners. At the same time, world demand for Scotch whisky continues, and some previously sterling areas are being brought in for preference.

Taken all over, our product holds its own in all markets, and we are, as I have said, exporting as much as possible within the limits of our stock position. You will see that these stocks are steadily increasing.

PROBLEM OF RISING COSTS

While the output from Ardmore Distillery shows an increase over last year, we are having to pay higher than ever prices for barley and, in fact, for all materials. Unlike other industries where the effect is immediate, we require to carry stock for such a long number of years before selling on the market that the present high costs, mainly due to inflationary conditions, do not have their full effect until such stock has been sold. It will be readily understood that while any fall in market values might result in a considerable loss, on the other hand an increase in proprietary brand prices, which is fully justified by conditions, would make Scotch whisky more of a luxury than ever. However, I can assure you that your board have acted, and will continue to act, on the conservative side.

Although the general position regarding supplies of wood for casks is still very difficult, our position in this respect has been much improved during the year under review.

Under present conditions and the uncertainties of the next few months, it is quite impossible to give any forecast of the future, but I can assure you that we will not spare any endeavour to maintain our present position.

The report was adopted.

BRITISH TIN INVESTMENT CORPORATION, LIMITED

INCREASED PROFIT

TIN PRICES: EFFECT OF AMERICAN ATTITUDE

MR ERNEST V. PEARCE ON THE OUTLOOK

The annual general meeting of the British Tin Investment Corporation, Limited, will be held on March 13th at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the chairman, Mr Ernest V. Pearce, A.Inst.M.M., circulated with the report and accounts:—

The profit for the year ended December 31, 1951, amounted to £577,767, an increase of £156,687 on that of the previous year. After making full provision for taxation there remains a balance of £300,194 which, with the balance brought forward from the 1950 accounts, makes available £388,530.

Deducting the interim dividend of 9 per cent., less tax, which absorbed £99,465, and was paid on August 18, 1951, there remains a balance of £289,065. Your directors recommend the payment of a final dividend of 18 per cent., less tax, and that the balance of £90,134 be carried forward. If these recommendations are approved by members at the forthcoming annual general meeting, warrants will be posted on March 13th.

UNQUOTED SECURITIES

There is, I think, only one item in the accounts on which I need comment—namely, the value, shown in the balance sheet, of "Securities not quoted." We have applied a portion of the profits we have realised on the sale of some of our investments in writing down this item. Members are aware that in the past we have been unable to place a value on an investment we have in a company having interests in Siam. We are still in that position, but thought it a wise precaution to take this action. We believe that this investment has considerable potential value but we realise that, notwithstanding the large amount of work which has already been done, much has yet to be accomplished before the particularly difficult metallurgical problem with which that company is faced is solved.

While the bulk of the corporation's investments consist of shares in tin mining companies, we have further implemented the policy of broadening our portfolio.

PRINCIPAL HOLDINGS

In order that members may have a clear picture of our investments we have segregated them and give below lists showing our principal investments in tin mining and miscellaneous mining companies.

TIN MINING COMPANIES

Amalgamated Tin Mines of Nigeria, Ltd.
Ayer Hitam Tin Dredging, Ltd.
Kamunting Tin Dredging, Ltd.
Larut Tin Fields, Ltd.
London Tin Corporation, Ltd.
Malayan Tin Dredging, Ltd.
Pengkalen, Ltd.
Petaling Tin, Ltd.
Rahman Hydraulic Tin, Ltd.
Rawang Tin Fields, Ltd.
Southern Kinta Consolidated, Ltd.
Southern Malayan Tin Dredging, Ltd.
Southern Tronoh Tin Dredging, Ltd.
Sungei Besi Mines, Ltd.
Sungei Way Dredging, Ltd.
Tekka Taiping, Ltd.
Tronoh Mines, Ltd.

MISCELLANEOUS MINING COMPANIES

Aluminium, Ltd.
Anglo-Newfoundland Development Company, Ltd.
Associated Manganese Mines of South Africa, Ltd.
British South Africa Company.
Consolidated African Selection Trust, Ltd.
Consolidated Mining and Smelting Company of Canada, Ltd.
Consolidated Zinc Corporation, Ltd.
De Beers Consolidated Mines, Ltd.
Hollinger Consolidated Gold Mines, Ltd.
Hudson Bay Mining and Smelting Company, Ltd.
Imperial Oil, Ltd.
International Nickel Company of Canada, Ltd.
Lake George Mining Corporation, Ltd.
Messina (Transvaal) Development Company, Ltd.
Mining Corporation of Canada, Ltd.
Mount Morgan, Ltd.
Nchanga Consolidated Copper Mines, Ltd.
Noranda Mines, Ltd.
Rhodesia Broken Hill Development Company, Ltd.
Rhodesian Selection Trust, Ltd.
San Francisco Mines of Mexico, Ltd.

TIN THE PREDOMINANT INTEREST

From these lists members will note that the board has varied its previous practice and set out the corporation's investments in greater detail. It should not, however, be assumed that all the shares now listed for the first time have been purchased during the financial year just ended. Here I would like, again, to mention that the predominant portion of the corporation's investments consists of shares in tin-mining companies.

During the year the War Damage Commission in Malaya has completed many of the assessments for claims for damage arising from the Japanese occupation and interim payments of 60 per cent. of the assessed awards have been paid. These awards have been or will be set off against advances which the companies have received for rehabilitation purposes.

PRICE MOVEMENTS

The average price of tin on the Singapore market during 1951 was £1,039, as compared with an average of £726 during 1950 and £597 during June, 1950, the month of the outbreak of the Korean war. Early in 1951 increased demand for tin by many countries, superimposed on American buying for their stockpile, was responsible for a rapid rise until, on February 14, 1951, the Singapore price was declared at £1,552—the highest price ever reached.

On March 6th of last year the government of the U.S.A. announced that no further purchases would be made for the stockpile; on March 12th all imports of tin into the U.S.A. by private dealers were prohibited and the Reconstruction Finance Corporation was appointed the sole importer. From this time the R.F.C. pursued an openly avowed policy of depressing the price by lowering the U.S.A. price in successive stages from £1,204—the price on March 30th—to £824 on August 1st. As a result the Singapore price reached the lowest price of the year—£793—on August 7th.

As showing the length to which the Reconstruction Finance Corporation were prepared to go in pursuance of their policy, they established a complete boycott of the Singapore market for some nine months of the year. The effect of this can be seen from the figures given below, which represent shipment of Straits tin to the U.S.A. during the years 1950 and 1951.

1950 ..... 44,590 long tons
1951 ..... 2,532 „ „

However, largely, I think, due to the widespread belief that sooner or later the U.S.A. would be compelled to resume purchases, the Singapore price rose substantially above the U.S.A. price of £824 during the remainder of the year.

ARRANGEMENT WITH U.S.A.

As a result of the recent visit of the Prime Minister to America it has been announced that in return for 1 million tons of steel an arrangement has been concluded, under which the United Kingdom has agreed to sell during 1952 20,000 tons of tin at the fixed price of £944 per ton f.o.b. Malayan or U.K. ports. The bulk of the 20,000 tons sold under the agreement will presumably be purchased in the Singapore market, and, judging from the present trend, at prices in excess of £944.

The agreement contains a provision that if during the period when the deliveries are to be made the U.S.A. Government agrees to pay any other supplier a price higher than U.S.$1.18 per pound (£944 per ton) f.o.b. port of shipment, an equivalent price will be paid to H.M. Government for any quantity which has not been declared as being available for shipment. It seems that H.M. Government will have to bear the difference, if any, between £944 per ton and the price at which they can obtain in the free markets such quantities as they must purchase in order to fulfil their obligations. Steel is so urgently required in this country that no one, I think, has cause for complaint at the terms of the agreement reached.

Production of tin in Malaya amounted during 1951 to 57,166 tons, compared with 57,537 tons in 1950. That production has been maintained at this level is proof, if any were required, of the loyalty, courage and devotion to duty shown by the men responsible for carrying out the day-to-day operations.

TIN: NO CAUSE FOR PESSIMISM

I regret to say that there seems to be no improvement in security conditions in Malaya since I addressed you last year. We have, however, the unequivocal declaration by H.M. Government that the British are not to be ousted from the country. Changes to be introduced in the administration as a result of the recent visit of the Secretary of State for the Colonies, Mr Oliver Lyttelton, will, it is believed, ultimately result in restoring order, but, as he pointed out, this will take time to achieve.

Short of a major political catastrophe, I see no cause of pessimism regarding the long-term outlook for tin for the following reasons:

(1) The fact that for the last 20 years prospecting in Malaya has been practically at a standstill and, as a consequence, it is unlikely that there will be any material increase in production there for some years.

(2) That the time will come, and it may not be far distant, when the severe restrictions imposed on the end uses of tin in the U.S.A. must be lifted.

WORK OF RESEARCH INSTITUTE

In conclusion, I wish to refer to the excellent work carried out during the last few years by the International Tin Research Institute in the laboratories at Greenford, Perivale, the funds for which are provided by producers in all the tin-producing countries.

After much patient and costly work the Institute has devised, among other things, two alloys which bid fair to absorb considerable tonnages of tin—they are a tin-nickel alloy and a tin-zinc alloy, both of which are today commercially established. These alloys represent an entirely new outlet for tin, and it is hoped that ultimately they will together absorb some 10-12,000 tons annually.

Research is essential if progress is to be achieved. It is expensive and results at times seem slow of attainment, but once attained they can be of inestimable value to industry. In order to widen the scope of its activities, the Tin Research Institute is appealing to all tin-producing countries to increase their annual contributions—some have already agreed—and it is hoped that at an early date agreement will be forthcoming from the remainder. I make no excuse for mentioning research in this statement, for I believe that it is of vital importance to the industry in which your corporation is so greatly interested.

RADIO RENTALS LIMITED

The fifteenth annual general meeting of Radio Rentals Limited was held on February 18th, in London, Mr H. F. Hunt (the chairman) presiding.

The following is an extract from his circulated statement:

I am sure you will consider the results achieved eminently satisfactory. The net profit of £157,434 represents an increase of £4,178. The volume of demand for our service was greater in total than we have ever previously experienced and television business is now a very important part of the company's business.

The balance sheet of the parent company reflects the consistently conservative financial policy which has been pursued ever since the company was incorporated. The free revenue reserves now exceed the issued capital by some £11,000, in addition to which there are capital reserves totalling £125,000. The investment in radio and television sets at £1,184,810, after making adequate provision for depreciation, compares with a figure of £847,480 in August, 1950.

To provide further working capital, it is proposed to make another share issue to ordinary shareholders of one ordinary share for every eight held at 10s. per share.

Progress has been very satisfactory since the end of the financial year under review, but it is difficult in these times to forecast future trading conditions. I am satisfied, however, that our company will continue to render the public an unrivalled and essential service in the provision of radio and television facilities.

The report and a resolution increasing the authorised capital of the company were adopted.

R. A. LISTER AND COMPANY, LIMITED

SATISFACTORY PROGRESS—INCREASED PROFIT

SIR PERCY LISTER'S REVIEW

The annual general meeting of R. A. Lister and Company, Limited, was held at Dursley on February 18th.

Sir Percy Lister, the chairman, who presided, said: Ladies and Gentlemen,—From the Consolidated Profit and Loss Account you will observe that the profit, before tax, is over £60,000 more than last year. This evidence of the continuity of satisfactory progress in a year in which there have been many abnormal difficulties is, I am sure, as much a source of gratification to you as it is to those of us concerned with the day to day problems of your Group of Companies. It should be noted, however, that the net profit, after taxation, due to the increase in the rate of Income Tax and Profits Tax, is over £8,000 less than last year, and this, despite a substantial increase in both the turnover and the gross profit.

BURDEN OF TAXATION

We all realise that as a result of the War and the difficulties which, politically and economically, have beset us since the termination of hostilities, and despite sacrifices already made by the Nation as a whole and the people individually, our new Government must of necessity impose fresh burdens upon us if its plans for the resuscitation of our National resources and the protection of our currency are to be successful.

Nevertheless, it cannot be over-emphasised that the current burden of taxation upon industry, if maintained, must impair its capital structure and undermine its efficiency, for not only does the Government today collect a very high percentage of the profits from industry, but it takes its share in cash despite the fact that in the vast majority of expanding businesses the profits are not in cash form, but almost invariably represented by increased book debts, stocks, work-in-progress and the like. The shareholder must leave a considerable percentage of his share of the profits in the business—a factor all too frequently overlooked.

You will observe that the amount set aside for depreciation of the fixed Assets has increased from £134,386 to £176,248 as a result of the purchase of additional plant and machinery.

INADEQUATE BASIS OF DEPRECIATION

Shareholders will realise that the historical cost basis of depreciation laid down by the Inland Revenue is entirely inadequate to provide the cash required to replace the plant and machinery at the current replacement values.

Turning to the Consolidated Balance Sheet, for some years past the Reserves have been shown under different headings, but the circumstances calling for the specific allocation of reserves in the past are no longer applicable, and we have deemed it desirable to group these under the two headings of General Reserve and Dividend Equalisation Reserve. We have allocated a further sum of £16,673 to General Reserve, bringing the total of these two Reserves up to £800,000, and leaving a Consolidated Profit and Loss balance to be carried forward of £524,776, an increase of £45,514.

DIVIDEND POLICY

But for the National importance of industry conforming to the appeal of the Chancellor to restrict dividends, coupled with, we believe, the necessity for conserving our liquid resources in view of the uncertain conditions which lie immediately ahead of us, we should like to have paid a higher dividend to our shareholders, many of whom enjoy no increased wage or income to offset the higher cost of living and taxation, but who have, nevertheless, provided us with the Ordinary Capital with which your enterprises have been so soundly built and operated.

If industry is to continue to obtain risk capital, then sooner or later those who provide it must be entitled to a fairer proportion of the profits earned.

The production capacity of your four main factories and their subfactories in England has only been limited by the labour and materials available to them.

During the year under review your Company has secured contracts for rearmament work, both from the United Kingdom and Canadian Governments, the latter contributing both to defence and dollars.

RECORD VOLUME OF BUSINESS AND ORDER BOOK

While there has been some deterioration of demand in some of the export markets, the worldwide nature of your Company's distributing organisation, coupled with the long and well-established reputation of the range of complementary products manufactured by your Group, I am happy to say, not only permits me to report on the record volume of business during the past year, but to advise you that we have a record Order Book.

Your Australian factory and Company continue to make progress and, whilst, since its formation, we have left the whole of the divisible profits of your Australian Company in that Company to take care of its steady development you will be pleased to note that their operations to date have exceeded our anticipations, and when the current capital controls permit, it is your Directors' intention to invite Australian financial participation in your Company's Australian activities.

The products of your Company are well established in many of the great basic industries of the World; they enjoy a high conversion value and contribute to valuable Dollar Returns or Savings.

The abnormal circumstances in regard to the supply of raw materials and bought-out components makes it fitting that I should express our thanks and appreciation to our suppliers, without whose co-operation we could not have accomplished these satisfactory results.

TRIBUTE TO DIRECTORS, STAFF AND EMPLOYEES

On your behalf, as well as on behalf of the Board, I should like once more to extend our thanks to the Directors, Staff and Employees in the service of the Lister Group of Companies in all parts of the World, through whose loyal co-operation and effort another record year has been achieved.

The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

Security Second

THERE are men in the Kremlin, and among the critics of Britain in Washington and Paris, who can calculate how much the British defence programme has been slowed down. There is no point in the British public putting on blinkers, as the Government's White Paper has encouraged it to do. The truth is that a large part of the rearmament that this country undertook last year is now unlikely to show practical results until 1955. It is then, not next year or in 1954, that the aircraft and guns so bravely planned twelve months ago may be an effective deterrent to aggression. That is the plain meaning of last week's statement on defence policy.

Thanks to Mr Bevan's friends, the controversy about defence has run too hotly in the past for the House of Commons to put party emotions aside in its debate next Wednesday. But at least the emotions should not be allowed to exclude a frank appraisal. The essential facts can be simply summarised. In 1950 Britain's expenditure on defence was running at a little under £800 million a year. The Labour Government decided to double this effort for the following three years. The famous £4,700 million programme therefore covered two things. There was about £2,400 million which would in any event have been spent on defence in 1951-54, unless the world had suddenly become safer than it looked before June, 1950. And, on top of this continuing expenditure, there was £2,300 million representing (if the plan worked) a once-for-all effort. This, it was hoped, was the cost of catching up with the perils of an insecure world. Whatever may have been true of the United States, the British programme was certainly not too big, in terms of the divisions and the fighter aircraft for the defence of this country that it was to have produced by 1954. This £2,300 million, not the total £4,700 million, was the true measure of rearmament, of the new strain that Mr Attlee's Government—including, for three months afterwards, Mr Bevan—thought the economy could sustain.

The strain has proved to be too much. The new Government has reconciled itself to carrying out rearmament at less than two-thirds of the pace that was set. Roughly, the original plan was to spend an extra £500 million last year, £800 million this year, and £1,000 million in the third year. The money figures are now, of course, distorted by the rise in prices. But if this is allowed for, it appears that of the £2,300 million of true rearmament expenditure, £300 million has been spent in the first year and another £500 million is now budgeted for the second year. There is no guarantee yet that the revised timetable will be observed any better than the original. But if it is observed, one third of the planned expenditure, in real terms, will be made in the first two years of the programme; almost two-thirds—equivalent to £1,500 million at 1950 prices—will remain to be done, on top of the basic £800 million a year, in what should have been the one remaining year. So sharp an acceleration will certainly be quite out of the question.

Roughly speaking, the speed of rearmament has been cut from 30 miles per hour to less than 20 miles per hour; on the present showing, the journey will take over twelve months longer than was intended. That sharply alters the whole basis of the programme. The need it was designed to meet was to make the greatest possible increase in strength quickly: it was to be a sharp heave, not a long pull. A big defence programme stretching into an undefined future is no consolation whatever for doing too little now ; on the contrary, it may be positively dangerous.

The slowing down of the current programme has now to be accepted as unavoidable—in part, at least, and for this year. The defence programme was practicable when it was begun. It demanded one quarter of the effort that this country devoted to defence in wartime. Plainly that was possible, without causing external bankruptcy, if there was enough determination to give up other things for the sake of security ; the sacrifices did not have to be large. What was always plainly impossible—as others beside Mr Bevan foresaw—was to carry out the defence programme if it was imposed on the economy as an additional demand on top of everything else, without any cuts to make room for it. Mr Bevan concluded that there should be no defence, and others that there should be cuts. But the last government tried to do the impossible, to provide defence without tears. There have been no sacrifices. It is the result of that which was inevitable. The three-year programme was not born dead, but it was killed soon after birth. And Mr Bevan's part was not the innocent one of the clever doctor who detected the death. His contribution was not to see that the programme was impracticable ; it was to say that defence—with tears—was unnecessary, and therefore to foster the political mood in which Mr Attlee's Government shrank from the economic policies that defence demanded, in which it went on willing the end but not the means.

This is the cause of the failure. It is not, as is so widely supposed, that the economic conditions pressing on this country have become more unfavourable. The British balance of payments was smashed by the rise in import prices that occurred in the winter of 1950. The terms of trade are now no more unfavourable than they were when the defence programme was begun. What was then not foreseen was that exports would expand so little and entirely fail to match the increase in import costs. And that is the other fruit of an inadequate economic policy, of the refusal to check inflation in the only possible way, by cutting consumption.

If defence policy is now to be put on a sounder basis, it is essential to destroy the comfortable belief that the programme has been slowed down in face of some economic necessity over which this country had no control. It is the economic consequences of past political decisions that have to be accepted as inevitable. The gap in Britain's overseas accounts has been allowed to grow until the point of collapse is close. Everything possible has to be thrown immediately into the gap at all costs. The exports that can be increased quickly are those of the engineering industries which also serve defence. And therefore, as an immediate expedient, rearmament must be cut for the sake of exports. There is no choice. A bankrupt Britain, a Britain unable to buy raw materials or to preserve sterling as an international currency, cannot be safe or contribute to the safety of others. When the need is so pressing, economic solvency must rank before military security.

But this is to put security second. It has become necessary because until now consumption, not solvency, has been put first ; the standard of living that the British people had achieved by 1950 has been treated as an inviolable right which could not be sacrificed to the requirements either of solvency in a harder world or of security in a more dangerous world. The consequences are that Britain is near insolvency and is making itself a little more secure only with painful slowness. The achievement is still, indeed, nothing to be ashamed of by comparison with most European countries. But both Government and Opposition recognise, if in rather different ways, that this country has duties of leadership second only to those of the United States. It must in the first place make itself solvent, but it must also try very soon to do more to make itself secure.

This is the spirit that should inform next week's debate. It requires on both sides of the House of Commons a frank recognition of an unpalatable situation and of its causes. It requires, even more, a common faith in the good sense of the British people, a belief that if the need for harsh and unpopular measures is honestly stated people will at least suspend judgment and see how the measures work out in practice. Whether the politicians can at this late stage summon up such courage may be doubted ; but it is greater security next year, as well as solvency this year, that depend on it.

Lisbon Illusions

IT is a pity that Nato nowadays puts so much into the shop-window without stating either the price or the quality of what it offers. During the Lisbon meeting of its Council that ended this week statements were made to the press which were as woolly as the speeches of Gladstone's declining years. Round figures, flat assertions, and high aspirations tumbled into print together, and it will need some plain speaking by Mr Eden if the House of Commons is to get a clear and firm picture of the state of North Atlantic defence. It is right that a certain secrecy should surround Nato's diplomatic and military discussions, and that this should be proof even against the appalling inquisitiveness of Congress. But to counterbalance this secrecy by talking airily of fifty divisions this year and 100 in 1954, by giving the impression that the German defence contribution has been settled when it clearly has not, and by pretending that Franco-German difficulties over a European Defence Community are not so serious after all, is a dishonest practice. It will not frighten the Russians but it may well lull the Europeans. It is all very well to build up the prestige of Nato in American eyes ; but if it is based on illusions there will be bitter disappointment one day.

The record of success is enough to need no gilding. Differences between the military and the civilian advisers which sharply divided the Ottawa conference in September have now been largely overcome. What can be done to ensure Europe's defence without too great an economic strain is now seen much more clearly than before. How to cut the frills of military expenditure and to make supply organisation more effective has been shown by General McNarney and his committee. The lesson taught by the appointment of the three wise men seems to have been learnt. Nato will henceforth supervise the military and economic effects of the defence policies of member governments and each year their capacity and progress will be reviewed by an international body. The main defence tasks of Nato can now be pursued on a basis of "firm goals for 1952, provisional goals for 1953 and, for 1954, goals to be used for planning purposes." This is the beginning of a new political and economic authority for the Council and its organs.

How it is exercised will depend on the powers assumed by the permanent headquarters that are to be set up in Paris with a secretary-general of distinction. Gone are the days when deputies of twelve foreign ministers sat in council, unable to vote or make recommendations as a body, able only to report views to their governments. Their places will be taken by national representatives with a status somewhere between that of a wartime Minister of State and a permanent official. This should mean that the council itself, which will continue to meet at regular intervals, will take only the most important decisions and the speed of Nato's business should be considerably increased.

It is in many ways a pity that this new start is to be made in Paris and not in London. Granted that for many governments it is difficult to find enough officials to meet the demands of Nato, the future European Defence Community and the OEEC, and that Paris offers a pleasanter life than London ; granted, too, that the sight of the Americans, British and Canadians firmly anchored to the Continent will reassure Europeans about their future ; the fact remains that some—but not all—European members of Nato cherish the secret hope that they will one day be strong enough to create a third force that could stand aside from the Soviet-American rivalry. They will not have the vital interest in developing the Atlantic community that Britain and Canada have, and the atmosphere of Paris may prove less invigorating for that idea than that of London could have been. But this decision has to be loyally accepted, with perhaps a reminder to allies that Britain's military contribution to the common defence is and will remain for some time far and away the greatest next to the American—three armoured divisions out of four and 1,400 aircraft out of 5,000 represents a very great peacetime effort.

★

On the broader aspects of an Atlantic policy the right things were said at Lisbon but it remains the job of national governments, and national governments alone, to do them. There was talk of a master plan to promote economic expansion and prevent inflation ; to increase raw materials production and control their use ; to share equally the burden of rearmament and to fix clear priorities for the distribution of military equipment by members. These things have been said before, but very little has been done about them that would not have been done without the exhortations of Nato. It is as well to realise that the idea of the "Atlantic community," frequently mentioned by Mr Acheson and Mr Eden, remains in the air, without any government—save perhaps the Canadian—showing a strong wish to define it more clearly. It can be argued that the community in fact exists already in the immense effort of planning and consultation that has already been made ; but it falls a long way short of the Lisbon declaration that

> members of the Council look forward to the time when the main energies of their work can be less concentrated on defence and more fully devoted to co-operation in other fields for the well-being of their peoples and for the advancement of human progress.

In this context a note of optimism was needed. Where it is dangerous and misleading is in connection with the European Defence Community. It is claimed that the relationship between the twelve members of the Atlantic Council and the six members of the defence community—all, except Western Germany, members of Nato—has been settled satisfactorily. This appears to mean that Western Germany, which has reserved its right to claim full membership of Nato, will be admitted to consultation with it, a compromise which is hardly likely to satisfy the Germans for long. It may mean, too, that the pledges to mutual defence exchanged between members of Nato will also be exchanged between the community and Nato, so giving the Germans both obligations to the larger body and guarantees from it. That is all well and good. What is alarming is the assumption or pretence that the treaty forming the defence community can be got past the French Assembly and the German Bundestag, both of which have laid down directly conflicting conditions for supporting M. Schuman and Dr Adenauer.

★

Both Ministers are said to believe they can get a vote for ratification if they are not rushed. It is said, too, that they have obtained from Mr Eden undertakings to consider how the European Defence Community can be held together by some guarantee like that given in the Locarno Treaty twenty-seven years ago. The calculation appears to be that if closer relationship between Britain and the community were possible, then many French objections to German claims and aspirations would fall away, so making easier Dr Adenauer's task before the Bundestag. If that is so, the sooner British—and American—public opinion get to grips with the problem the better. In simple terms it is this: Is the defence community to be built round a rearmed Germany so important to the future of Atlantic defence that British policy should do everything in its power to save it? And if so, what, if anything, could the Americans do to help?

It is only by seeking an answer to these questions, and by realising that the Lisbon conference did not find it, that the limits of what was achieved there can be properly understood. A European defence treaty there will certainly be, probably within two months ; but until it is ratified German recruitment cannot even begin. And ratification is unlikely, at best, for six months. In short, the question of how many limitations on German freedom will be accepted by the Germans and how few will be accepted by the French is still unsettled. And even if it can be settled it is not certain that the Germans will rearm. So long as this remains the situation, Nato's published estimates of divisions, production, burden-sharing—and even of the defence strategy itself—remain provisional and misleading.

Commonwealth with Solvency

AN interesting debate was initiated in the House of Commons on Friday of last week by a private member's motion which called, among other things, for "the closer co-operation and co-ordinated development of the Commonwealth and sterling area" and resisted "any attempt to make permanent any commitments which are designed to weaken imperial preference or other Commonwealth ties." It still requires quite an effort not to be surprised at the discovery that it was a Labour back-bencher, Mr Richard Adams, who, having been lucky in the ballot, chose this as the motion he wished to propose. The debate was somewhat diffuse; but it served what was presumably its main purpose: it demonstrated very effectively that there is nowadays an active unanimity of attachment, on both sides of the House, to the reality of the Commonwealth.

Very few people in this country will wish to disturb this unanimity. That is certainly not the purpose of these comments. It may nevertheless be of service to point out that some of the strands of thought that make up the attachment of contemporary public opinion to the Commonwealth and the sterling area are somewhat lacking in logic and perhaps even dangerously close to illusions. It is surprising, for instance, to discover how many people still regard it as practical politics to propose formal, and even mechanical, organs of Commonwealth government. The old idea of a federation did not come up in last week's debate, but its economic counterpart, the customs union, did. As Mr Gordon-Walker said, "even if one wanted it, it is a non-starter and we all know there are a lot of countries in the Commonwealth which will not look at it"—though he did not give the main reason, which is not so much the protectionist policies of some Commonwealth governments as the heavy dependence of nearly all of them on customs revenue.

The latest form of this familiar train of thought is the desire to have "a common economic and financial plan for the Commonwealth." This is Mr Adams's version of what he wants:

> There must be this common policy. There must be the controls necessary to ensure the stability of the area as a whole. There must be a survey of production and needs. . . . Having worked out our surpluses and deficits, having planned the resources of the Commonwealth to meet our needs, we must make contracts with the rest of the world, to ensure that our deficits are supplied and that our surpluses are made available to the other countries of the world.

Many people will think this is an appalling prospect. Even more people will be sure that any such plan would break down through sheer errors of estimation. Fortunately it is not necessary to argue either point, because the whole idea is, in Mr Gordon-Walker's term, a non-starter, and for the same reason as the political federation and the customs union: the countries of the Commonwealth would not look at it. It is very strange to observe how many of the best friends of the Commonwealth fail to see that its chief appeal to its smaller members lies in the freedom it guarantees—and that means, in the first place, freedom from direction by its larger members. Very few indeed of the members of the Commonwealth who have gained control over their own economic affairs—and that includes nowadays a lengthening list of crown colonies as well as the dominions—would surrender that freedom to a joint planning body. One may hazard a guess that the Labour Party would itself be very reluctant to do so; it is very much less pleasant to be planned against than to do the planning. It is not along such lines, but by means of bargains freely entered into and accepted as being of mutual advantage that a policy of Commonwealth development can be worked out.

*

The second and much more dangerous fallacy that appears to underlie much of the current enthusiasm for the sterling area is the belief that it offers to the people of the United Kingdom some means of avoiding the cold and cruel necessity of paying their way in a competitive world. Mr Adams made it clear last Friday that this was in his mind. He had no confidence, he said, in the measures hitherto taken to meet the economic problem of this island; "If we continue each time to take the same measures, which are to cut imports and attempt to expand exports, our standard of living in this island will steadily decline"; and the wide open spaces of Commonwealth development were offered as an avenue of escape from this cramping obligation to meet payments by receipts. The same general idea seemed to lie at the root of much of the advocacy of discrimination and of the attack upon GATT. If only the importunate non-British world could be held at bay—except of course for the grants and loans it should accept an obligation to provide—and the resources of the Commonwealth could be mobilised, how much more comfortable life would be.

It is true, as has often been contended in *The Economist,* that some degree of discrimination in trade will be necessary for as far ahead as can be seen. The sterling area and the other soft-currency countries are very unlikely at any time to be so adequately supplied with dollars and other hard currencies that they will be able to afford to trade quite so freely with those countries as among themselves. They will have, so to speak, to pay cash for their dollar purchases, whereas the rest can be left on account. For this reason, it has always been held in these columns that blanket promises not to discriminate are best avoided. But the limits of a policy of discrimination have also always been insisted upon. There are close limits to the extent that dollar-earning colonies can be forced by currency arrangements to buy British manufactures unless they are at least nearly the equal in price and quality of what can be obtained from elsewhere. Only to a very small extent does discrimination absolve the United Kingdom from the necessity to be competitive and to balance its accounts. It is certainly not a magic incantation by which the British people can afford to let the world go hang and retreat to cultivate their own garden. It is not their garden; it is Mr Nkrumah's and Mr Azikiwe's.

The sterling area is basically held together by two calculations of mutual interest. The other members are attached to the United Kingdom by the market that it provides for their exports and by the capital that it provides for their development. At the moment (though it may not always be so) it is the latter that most agitates the members of the area other than this country. To keep the sterling area together, it is not enough for the United Kingdom to offer markets, which it can do; it must also offer capital. Can it do so? If it cannot, then the sterling area will fall into decay. Its members will turn to the United States for their capital needs, and though there is no reason on the British side why there should not be a steady flow of American investment into the sterling area, if that flow becomes larger than the flow from London the sterling area will fall to pieces. It may not be true any longer that trade follows the flag. But it is certain that trade follows the loan. Those who advocate the development of the sterling area must work for a large and steady flow of capital from the United Kingdom to the rest of the area.

Most of them, to do them justice, recognise this. But very few of them appear to realise what this commits them to. The United Kingdom, though it runs a deficit of payments with the non-British world, is steadily in surplus with the rest of the sterling area. In 1949, for example, which was neither a very good nor a very bad year, this surplus amounted to £273 million. It is tempting to assume—and it is almost universally assumed—that at least this sum can safely be lent back to the sterling area countries for their development needs. But this is not so. For the United Kingdom's deficit with the non-sterling world—which amounted in 1949 to £252 million—has to be financed. Normally, the rest of the area has a net earning of dollars and other currencies which the United Kingdom can use to cover its own deficit; that is the theory of the sterling area. But these dollars are not given to the United Kingdom by the dominions or even by the colonies; they are sold. Part of the United Kingdom's sterling surplus is needed to buy these dollars. It is only the excess—the amount by which the United Kingdom's surplus in trade with sterling countries exceeds its deficit with other countries, or in other words the surplus (if any) in its balance of payments taken as a whole—that can safely be lent overseas. If more than this is lent (and in two of the last four years the figure has been negative) the penalty is either a draft on the gold reserves or an increase in the sterling balances, of which the one is only slightly more dangerous and undesirable than the other.

Wherever the logical analysis begins, it ends at the same place. It is only if the United Kingdom, taken by itself, is self-supporting—indeed, more than self-supporting—that the sterling area will hold together. The new conception of a Commonwealth of free peoples is as inspiring and as full of hope in its economic aspects as in the political. But so far from offering to the people of the United Kingdom any means of escape from the very painful necessity of paying their way in the world, regardless of what happens in so doing to their standard of living, it provides a new incentive and a new compulsion for them to suceed in that task. Commonwealth is no substitute for solvency.

University Development

MANY people who are convinced of the necessity of retrenchment nevertheless feel uneasy about its application to education, which is so obviously a nation-building branch of government expenditure. It is good news, therefore, that it has been found possible to make grants to the universities during the next quinquennium that will be at least large enough to maintain the present level of their activities and to consolidate the expansion that has taken place. The Chancellor of the Exchequer has announced that the total recurrent grant, which is £16.6 million in the present year, will be increased to £20 million in 1952-53, and will thereafter rise by between £1,000,000 and £1,500,000 each year to £25 million in 1956-57.

The extra £3,400,000 to be distributed in the coming financial year will certainly leave little or nothing over for further development. Rising costs have made it very difficult for the universities to meet their commitments on the grants that were settled five years ago, and even without a further rise in prices their liabilities are increasing. The main reason for this is the uneven age distribution of the teaching staff. In the rapid expansion that took place after the war young people were recruited to the teaching staffs; in 1947 the University Grants Committee estimated that over half of all university teachers were under thirty-five. The increments due to them as they get older therefore involve a heavy addition to university costs. Mr Butler hopes, however, that after the first year or two of the quinquennium, the grants would be enough to finance some further development, particularly in the fields of science and technology. Whether any such margin will in fact emerge depends, of course, on whether Mr Butler succeeds in halting the steady rise in costs. Once settled, the recurrent grants are not normally adjusted to changes in their real value (though within the last quinquennium additional grants were given mainly to finance increases in academic salaries. This rigidity has its dangers, particularly in times like the present. It is the price the universities have to pay for being given, unlike all other institutions dependent on public funds, five years' notice of the money available, so that they may lay their plans accordingly. Even if prices remain fairly stable during the next quinquennium, it is clear that the rapid postwar expansion of the universities has now been brought to an end.

*

This is as it should be, for the need of the moment is consolidation. The number of students is now 70 per cent higher than it was before the war, and if the expansion were to continue at the same pace, the universities would be in danger of outgrowing their strength. They have done what was required of them by the various committees set up after the war to study the need for graduates. Against the target of 90,000 university students, they had reported themselves able to accommodate 88,000; but that estimate was made in the hope of more new building than has actually been done, and the figure at present stands at 85,000. They accepted the guidance of the University Grants Committee about the directions in which this expansion should take place. They were able to achieve by 1947 the doubling of the number of students in science and technology, a target which the Barlow Committee on Scientific Manpower had set for roughly 1956. The University Grants Committee has been able to make some additional grants, over and above the block grants, for the development of these faculties. It has also made earmarked grants for specified

purposes. The largest has been devoted to medical education, which has benefited on a scale rising from £1,840,300 in 1947-48 to £3,198,000 in 1951-52. But in accordance with the recommendations of the Goodenough Committee—which in 1944 could not have foreseen the extent of the demand that the national health service would create—there has been only a small increase in the number of medical students; at some 14,000 it is only 500 greater than before the war. * University College. † Not available.

earmarked grant has been used to reorganise and reform medical education, in particular by establishing 55 new full-time chairs in clinical subjects. But one of the main recommendations of the Goodenough Committee—that the medical curriculum should be simplified and co-ordinated—has yet to be carried out.

Smaller earmarked grants, now running at between £250,000 and £400,000, have been used to make provision for dental, agricultural and veterinary schools, and for the social sciences. Entry to the dental schools, however at 600 a year, is well below the target of 900 set by the Teviot Committee and is quite inadequate. Still smaller grants have been devoted to oriental languages and to the establishment of university Institutes of Education, to organise the training of teachers. In none of these projects, however, have university authorities been obliged to undertake something against their wishes; applications for the grants have always exceeded the amounts available. Nevertheless, the University Grants Committee is opposed to retaining the system of earmarked grants permanently, for while the system does not interfere with the universities' freedom, it limits their ability to choose for themselves the proper balance of the various faculties.

The arts faculties have achieved their expansion without the help of an earmarked grant. A big expansion was desired, however, in order to make up the wartime deficit and to provide new manpower for the expanding needs of such professions as teaching and the civil service. The number of arts students has increased by 57 per cent as compared with before the war. The proportion to the total has fallen, but it is still over two-fifths of all university students. No committee has considered the future need for arts graduates, and this would be very difficult to assess. But it seems clear that this expansion has gone far enough for the present, at least until arts graduates are more willing to enter industry and until industry is more willing to employ them.

It would be surprising if so great and rapid an expansion had been achieved without some impairment of standards. Fortunately, this has not affected the ratio of teachers to students, which, on the contrary, has improved from 1:10 in 1938-39 to nearly 1:9 in 1950-51. (Oxford and Cambridge are not included in these figures, and if they were would no doubt improve the ratio still further.) Part of the improvement has been due to the introduction of new subjects for study. This is very important not only for the student, but also as the University Grants Committee points out in its report on the quinquennium,* because it should leave the teaching staff more time to conduct the research which is one of the chief functions of the universities.

The deterioration has been mainly in standards of accommodation. The 35,000 extra students have been packed in with very little new building. Oxford and Cambridge have been in the perhaps fortunate position of not being able to accommodate many more, and they have expanded by only 44 and 33 per cent respectively. London's expansion was limited by bomb damage and has amounted to only 40 per cent. But the eight English civic universities have increased their numbers by 123 per cent, the University of Wales by 85 per cent and the Scottish universities by 60 per cent. Most of these universities are in crowded parts of industrial towns, and have had to take over whatever makeshift accommodation was available in the neighbourhood. Two of them —Birmingham and Reading—are moving, or completing a move, to sites outside the towns. The University Grants Committee has been able, since the war, to help by distributing capital grants for building, acquiring sites and providing new equipment; and these capital grants have totalled £19 million in the first four years of the quinquennium which ends on March 31st next. But the need was estimated in 1947 at £50 million, without allowing for the rise in building costs that has taken place since then. There has been very little building of new residential accommodation, but altogether some 7,000 more places for resident students have been provided, by one means or another, since 1939; and the proportion of resident students to the total, at about 23 per cent, is only slightly lower than before the war. Most educationists are agreed that a period of residence is a valuable part of university

* University Development. Interim Report on the Years 1947 to 1951. Cmd. 8473. 1s.

life, and it is important that the future development of the universities should make provision of this kind. But it is obvious that little can be done during the next quinquennium. The capital grants, as distinct from the recurrent grants, are announced annually, and the figure for the first year is £5 million, compared with some £7 million in the current year. In present circumstances, it was not to be expected that these grants could continue in the first years of the new quinquennium even on the scale of the previous five years.

★

Much, therefore, needs to be done to consolidate the expansion that has already taken place, and it will be some years before there can be any question of increasing the university population still further. This is no tragedy, for the universities are on the whole confident that no one who could benefit from a university education is now being turned away. It is true that applications for university places, especially in the fields of science and technology, exceed the places available. But the University Grants Committee, on the evidence given to it by university authorities, believes that a continued expansion could only lower academic standards. It does not, however, believe that they have been lowered already by the influx that has already taken place.

It is certainly the right policy to refuse to sacrifice the quality to the quantity of university education. As the Committee of Vice Chancellors and Principals has observed, "academic standards once lowered are not retrievable, and Gresham's Law applies to them"—which is acceptable as a sentiment, despite its obvious misapplication of Gresham's Law. On the other hand, even after the expansion that has taken place, the proportion of university graduates in the working population remains lower in Britain than in many other countries. On the very highest levels of intellectual accomplishment, Britain need not fear comparison with any other country, either in science or the arts. But there is a weakness in what might be called the higher literacy—that is, in the proportion of young men and women who carry their studies or training to a level which, if it is below what is acceptable in this country for an honours degree, is nevertheless well above that to be gained from a secondary education alone. There is no doubt, for example, that the United States benefits greatly—especially, but not exclusively, in the scientific and technical field—from its ample supply of graduates, although the academic standards of its universities are on the average considerably lower than that of British universities. No one would wish the British universities to lower their standards; but there is undoubtedly a need for more educational opportunities at a standard somewhere between those of school leaving and university degree. Now that the postwar programme of university expansion has been largely achieved and a period of consolidation has set in, it is towards the filling of this gap that attention should be directed. It may be true that, in a nation of 50 million, the universities should not for the present be expected to accept more than about 30,000 entrants a year. It is emphatically not true that enough is yet done to equip the remainder either to realise their capacities or to serve the community. When resources are once more available, it is to this that educational policy should turn.

No Business in Moscow

NOT very much has yet appeared in print in the western countries about the international economic conference that is to be held in Moscow in six weeks' time. But plenty will be heard about it when the time comes—at least as much as was heard of the "intellectuals'" conference at Breslau in 1948 or of the youth rally at Berlin last summer. And many of the businessmen and economists in Britain and other western countries who have received invitations to attend—by no means all of them of left-wing sympathies—have been sorely perplexed for some time past in the attempt to make up their minds whether to go or not.

What has perplexed them and made them hesitate is the conviction, which is very widely shared, that the cold war cannot go on for ever. Either it ends in total war, or else it ends in an agreement to live and let live. No self-respecting non-communist businessman or economist will, of course, lend himself to Soviet propaganda; but equally he will be loth to turn down too hastily an invitation that might conceivably be the first step in a genuine attempt of reconciliation. This particular invitation certainly looks as if pains have been taken to meet the more obvious fears. The visitors from western countries, it appears, are not to be referred to, even in the Soviet press, as "bourgeois" or "capitalists" but as "representatives of economic spheres." To give at least the appearance of fair play, it has been ruled that "the conference will avoid any discussion of the respective advantages of different economic and social systems."

It is a picture that, if genuine, has a real appeal to men of good will all over the world, who have no sympathy with Communism but are appalled at the prospect of atomic war. A genuine conference might indeed perform a miracle. It might bring together businessmen, trade unionists and economists from all nations, freely chosen by representative organisations, freely granted visas to enter the Soviet Union regardless of their political views. They might discuss how world trade could be increased so as to develop resources and raise standards of living everywhere. Americans and British might explain how Communist policy has reduced east-west trade; and Russians and Chinese might explain how the American Battle Act has done the same. Such an exchange of home truths before the shrine of Stalinism would be a miracle worth risking several western businessmen's reputations to achieve.

The question is whether this is what the organisers of the conference want—or even if they did not originally want it, whether they have any intention of allowing it to happen. The evidence strongly suggests that they have nothing of the sort in mind; propaganda, and nothing but propaganda, is the intention. Those who are thinking of going should be invited to reflect on the

origin of the idea of this conference ; on the light that the current output of Soviet propaganda sheds upon its purpose ; and on the position in which they are likely (to judge from the evidence of past international conferences under similar sponsorship) to find themselves if they do go to Moscow.

As for the origin of the conference, it dates back to a proposal for an economic conference which was first made at the Berlin congress of the World Peace Council in February, 1951, as one of a series of frankly subversive instructions to the "partisans of peace." Since then the Communist demand for increased east-west trade has been built up as part of the campaign against western rearmament and American policy generally. There are arguments for everyone. Western Germany is told it must be free to trade with the East if it is to find markets. Britain and France are told that the Germans will win markets from them unless the Ruhr can sell to Asia and Eastern Europe. The Japanese are told they must trade with Communist China ; and the British are told that, unless this trade is resumed, the Japanese will compete heavily with them. American policy, it is said, drives the West towards lower standards, while Soviet policy aims only at higher living standards for everyone. If rearmament could be stopped, then the under-developed countries could thrive on the output of the West's heavy industries.

This is perfectly good economic sense—if it is meant sincerely. But even if the hypothesis be accepted for the moment that the Russians are genuinely seeking a basis for reconciliation and understanding, is it not very innocent to suppose that they would start with the field of economic policy, which would involve them at once in compromises on the central doctrines of their faith? Can they conceivably be in earnest when they paint a picture of under-developed countries being peacefully assisted by the heavy industries of the capitalist West, when it is the central doctrine of Marxism that such a thing is an impossibility? Such a conception of the purpose of this conference simply does not fit in with the rest of the evidence. On the other hand the alternative explanation of why it has been called—in the hope of driving wedges between the Americans and their allies by the repetition of simple ideas and attractive half truths, and thus to give the Soviet Union a military advantage by disrupting the West's attempt to make itself secure—fits in only too well. The intellectuals, youth, scientific and literary leaders, even the musicians have been called upon to play their part (sometimes unwittingly) in this campaign. Now it is the businessmen's turn. In November the general council of the World Federation of Trade Unions asked for "united working-class action in the struggle for improved living standards and against the economic and social consequences of war preparations." That is for the workers of the world. For the middle-classes the slogan has yet to be coined—by the Moscow conference. For the Communist agitation among the workers needs the support of a crypto-communist campaign among businessmen.

There may be some businessmen whose eyes are fully open to the purpose for which the conference has been called but who still feel tempted to go in order to provide an opposition within the conference and to insist on making anti-Communist speeches in Moscow itself. They should reflect on the position in which they will find themselves. The western delegations will not be representative. Most of those who go to Moscow will represent nobody but themselves. They have been invited by self-appointed "national preparatory commissions." In short, the Communists and their friends have not only chosen the whole of the eastern delegations they have also at least negatively chosen the western delegations too—they have decided who shall not be invited. The conference will, it is claimed, accept recommendations of working groups but its members will not be bound by the resolutions passed. What they will be is a foregone conclusion: less rearmament, more east-west trade, and co-operation between businessmen whose governments refuse to co-operate. Clearly the ayes will have it. Communist committee-work is very efficient. The contest, if there is any opposition, will be a match between gentlemen and players which the professionals will win easily and quickly. Any businessman who goes to Moscow in the belief that he will be able to strike an effective blow for anything that he believes in and the Communists do not is simply inviting the "Agitprop" experts to make a monkey of him—unless, indeed, he has very long experience of the methods of arranging committees and engineering expressions of opinion, and even then he will find that he cannot so much as carry his own countrymen with him.

*

Is the door, then, to be slammed? Is there to be no response from the West to any Russian initiative? Is the chance that it might be genuine to be rejected because it may also be spurious? Is western business never to try to come to terms with the Soviets? Is the dream of living and letting live to be abandoned?

By no means. It is possible to imagine an east-west economic conference serving a really useful purpose. But, if it is to do so, two sets of conditions need to be observed. The first relates to timing. The present moment, with Western Europe in renewed dependence on American aid, with a presidential campaign beginning and with the war in the Far East hanging as an imminent threat over the harmony of the western alliance, is not the time when any man of good will should take any action which, however undeservedly, will certainly be used as evidence by the enemies of western unity, whether they be Communist propagandists, Bevanites or Republican isolationists. The time is not yet ; and if the shoe of the cold war is beginning to pinch east of the iron curtain, a year's delay will certainly increase the chance of reason and moderation being found in the eastern delegations.

Secondly, if there is to be such a conference it must be sponsored and held in such a way as to preclude the chances of propaganda. The invitations should be issued jointly by a Communist and a non-Communist body—say the International Chamber of Commerce. What is called, in Continental parlance, the bureau of the conference must equally be bipartisan, so that the choice of speakers, the wording of resolutions and generally the management of the conference, shall not be manipulated for propaganda purposes. And above all the delegations must be chosen by the existing and accepted organisations of the different countries, so that the Kremlin does not have any say in who shall speak for British business.

If, in a year's time, the Communists suggest a conference under conditions such as these, it might be a very good thing to accept. But the odds are long against them doing anything of the sort.

It's the wise man who knows that if you take care of your shoes your clothes will take care of themselves.

LOTUS shoes are made for such, having an eye to the fine points of appearance. Their leather, their lines, their workmanship and multiple measurements provide each with the perfect fit.

* Denotes an unofficial estimate at least for 1951 where statistics are incomplete. In addition, the 1951 index numbers of manufacturing and mining production and the 1951 output of machine tools are based on 11 months only. 1949 manpower figures are not in every way strictly comparable with later years but they have been adjusted as far as possible. All figures are for United Kingdom except for housing, employment, electricity, wholesale and retail trades which are for Great Britain.

NOTES OF THE WEEK

Folly

Since Parliament reassembled a month ago the Labour party has provided no opportunity for doubting that its opposition would be incoherent and irresponsible. What was not clear until this week was the degree of ineptitude to which, under the lash of Mr Bevan and the Left wing, the leaders of the party would allow themselves to be driven. The result should have been easy to foresee. In the foreign affairs debate on Tuesday Mr Churchill did more than justify his fair warning that he had a full answer to the Opposition's charges against his conduct of the Washington talks. He made the Labour party look about as foolish as any political party has ever looked.

The party that has been accusing Mr Churchill of promising British support for American action against China is now shown itself to have been responsible, when Mr Morrison was Foreign Secretary, for a definite undertaking to the Americans. It was, in Mr Churchill's words, that

> in the event of heavy air attacks from bases in China upon United Nations forces in Korea they [the British Government] would associate themselves with action not confined to Korea.

There can be no criticism whatever of this statement. It is what any British Government would have said and would have meant. But the existence of this definite commitment, nine months old, makes it simply silly to attack Mr Churchill for saying that Britain would respond resolutely to fresh Communist attacks in the Far East. The insinuations about more specific undertakings were entirely unsubstantiated.

It is understandable that while he was in office Mr Morrison did not tell his party about his own undertaking. But it is quite inexcusable that he and Mr Attlee should have agreed to take up in opposition an attitude entirely in conflict with their own policies in office. And, however cynical the calculation, it is ridiculous to have done so when the inconsistency could be so plainly exposed. The incident will surely force the more sober members of the Labour party to reflect how little profit there may be in unrealistic opposition. A larger part of the party, unfortunately, is likely to be incensed with former Ministers, to feel cheated and let down. The more the moderates among the Labour leaders give way to Mr Bevan, the more humiliations of this kind they are likely to suffer. They may like to believe that they are swimming with the tide in order to be able to turn when the time is ripe; but they look more as if they have lost control and are being submerged.

* * *

Delay

It is a pity that Mr Crookshank on Monday made no attempt to explain why the Budget was being postponed from March 4th to March 11th. It was brought far forward of the normal date as an exceptional measure to match the closeness of the crisis. Without this, the second stage of Mr Butler's economic programme would have seemed hopelessly inadequate when he announced it a month ago. To let the date slip back again, even by one week, gives an impression of fumbling, a sense that the feeling of urgency is being allowed to pass. However good the reason for the delay, its effects are inevitably bad both at home and abroad.

The Chancellor, at least, cannot be blind to this. The failure to give any explanation—even if it had to be a partial explanation—is a serious blunder. It was always quite obvious that the Treasury would be hard put to it to have a Budget ready by March 4th. But it is not clear why what seemed possible on January 29th should be, for any purely technical reasons, impossible now. It would have been easy enough to accept the delay if it had been announced last week, as soon as Parliament returned to work after the late King's funeral. But it is hardly credible that the Treasury woke up to the inpracticability of the timetable only eight days before the end was due. Suspicions that the Cabinet is seriously divided about the broad lines of financial policy are therefore inevitable. At so late a stage, that is damaging. However wide of the mark the suspicions may be, they will prejudice the public's—and even the Conservative party's—acceptance of such severe measures as Mr Butler does announce on March 11th. Ministers depending on a narrow majority, and governing in a crisis, cannot afford to make many such blunders.

* * *

Malaise

The postponement of the Budget is unfortunately not the only thing of its kind. In other ways also the Government's control of public affairs seems at present to be just a little behind events. That is a state which it is not easy to correct quickly. The postponement of the Budget, the deferment of the defence debate from this week to next, the delay of business in progress caused by such accidents as half a day's debate on Mr Hardie's resignation from the Iron and Steel Corporation, the delay in putting the second reading of the National Health Service Bill back into the programme—all these things give an impression of malaise. It is the last impression that a newly elected government, staffed with Ministers who have been nourishing ideas in opposition for six years could wish to convey. There are extenuating circumstances, of which the King's death is the chief. But the Government ought not to have been thrown off its balance for so long.

It is often in minor ways that major disturbances make their sharpest effect in the House of Commons. The Government's attempt to dispose of the second reading of the Export Guarantees Bill is an example. Debate was not finished when the Bill first came before the House. It was to have been disposed of on Monday night (or rather on Tuesday morning), but the House adjourned just before 2 a.m. without taking the Bill. It was therefore put down again for Wednesday at the tail-end of much other business. The repetition in business statements of the same stage of what is a relatively small Bill is taken as a sign that the Government's plan of campaign is being frustrated. With so heavy a programme of business before it, the Government will find its supporters badly rattled if it allows this impression to remain.

* * *

Impudence

One cannot help admiring the naïve ingenuity of the Communist negotiators at Panmunjom when they claim that if the Soviet Union is not neutral in the Korean war, then no nation is. True, there is no evidence of the presence of Soviet ground forces in Korea; Stalin's policy in this campaign seems to be to fight to the last Korean, or, if necessary, the last Chinese. But only last week, on Red Army Day, the Communist press was boasting of the successes in Korea of Soviet tanks and jet fighters; and there has never been any secrecy about the steady flow of supplies of all kinds from Russia to the Communist armies, or any doubt that General Kim Il Sung's disastrous adventure had the Kremlin's blessing. The United Nations negotiators have all the more reason for resisting the demand that Russians should be among the truce supervisors in South Korea, since they had already renounced, at Communist insistence, the idea that the combatants themselves should share the task of supervision, and had agreed not only to be represented by such traditional neutrals as the Swiss and Scandinavians, but also to accept the Poles and Czechs, who are pledged up to the hilt in support of North Korea, as being "neutrals" too.

The demand for a Soviet share in truce supervision may only be a gambit intended to ensure that the Soviet Union is not left out of any eventual discussions on a Korean settlement. On the other hand, its sudden introduction at a point when the Panmunjom talks seemed to be making progress makes it difficult to dismiss the possibility that it is just another of the many devices for spinning the talks out that the Communists have exploited. The demand that all prisoners in UN hands must be forcibly repatriated is an even more obvious device of this kind; even Communist generals cannot really imagine that the United Nations could be so callous as to send the thousands of prisoners who wish to stay in the south back to face death or "corrective labour." The forced repatriations to Russia in 1945-46, and the mass suicides which ensued, are not yet forgotten.

Further indications that the Communists expect no early truce have been provided this week by their new propaganda theme, the charge that American aircraft have dropped "flies, fleas, ticks, mosquitoes, grasshoppers and spiders" carrying plague and cholera germs on North Korea. This charge, made formally by the Chinese and North Korean Foreign Ministers, "spontaneously" endorsed on the same day by numerous "mass organisations," and quickly taken up by the Soviet press and radio, is strongly reminiscent of the similar accusations of last May, which were launched with equal abruptness and efficiency and helped to distract attention from the loss of Seoul. Last year the accusation referred to smallpox, and UN intelligence found that this disease was in fact rife in the north. The new propaganda campaign may be simply intended to explain away the appearance of plague and cholera in Communist territory; but its intensity also suggests the need to rekindle the fighting spirit of the Communist armies after a year without a single victory.

Unreality in Paris

The fact that the crisis in France is a false one does not make it any the less serious. Its economy is now inherently strong enough to carry the rearmament and financial burdens which M. Faure's government seeks to lay upon it. But as a result of purely inter-party squabbles and the lack of a sense of responsibility in the Chamber, the French Treasury has nearly reached the end of its funds, speculation has undermined the franc, and the prestige of democracy under the Fourth Republic has sunk to its lowest point so far. By the time this issue appears, M. Faure may have secured the thirty or more votes of confidence which he was due to ask for on Friday night, in order to force the passage of his Finance Bill; this introduces a 15 per cent increase in taxes, economies in capital expenditure amounting to 70 milliard francs, and powers to reorganise social security and the nationalised railways. But even if he survives, which is not generally expected in Paris, the forces which have been at work during the past few days will remain in the field. The Socialists, who are at the root of the present trouble, refuse to accept the need for retrenchment, and the right wing parties are bitterly opposed to the minimum needs of taxation. Neither seems willing to make possible the normal give and take of compromise between parties inside the coalition.

The fact is that the blockage of the parliamentary machine has led to the breakdown of government in France. This is a matter of real danger to France's allies in the North Atlantic Treaty as well as to the French people. This political paralysis could yet undo much of the work done by the four foreign ministers in London two weeks ago and by the Atlantic Council in Lisbon. There is talk in Paris of a rapid solution to the crisis by means of a new government under M. Queuille, who has been backing M. Faure in his efforts to placate the Socialists, by the return of M. Pleven or by a nominal premiership under M. Herriot. The Gaullists still do not feel that the time is ripe for them to come to power and the Socialists are quite unwilling to lead a government on their own account. But unless an end can soon be put to the tendency of Frenchmen to shrug their shoulders at the perpetual *impasse* in their government, the cumulative effect of this situation may yet wreck the system itself. Perhaps the best hope is that the shock of a further devaluation of the franc, and the economic results which must follow from it, may change the mood of the Chamber before the false crisis becomes irretrievably real.

A Guarantee for Europe?

Something—nobody knows just what—has suddenly sharpened the attention of both political parties to Britain's relations with Europe. Men who cold-shouldered the Council of Europe and scoffed at the European army are now looking more closely at both. There is real concern on both sides of the House of Commons lest British policy, by some omission or blunder, should leave Western Germany to rearm in its own way and its own time, free from all the restraints that European institutions might provide. The deadlock that existed a fortnight ago between M. Schuman and Dr Adenauer, and still exists between Assembly and Bundestag, suddenly emphasised the risk that Britain might fail to create either an Atlantic or a European community.

Hard on the heels of these new thoughts have come the persistent reports that M. Schuman wants, and may get, from this country a "guarantee" of the European defence community with which he could overcome French fears of concessions to Germany. The technical objections of the professional diplomatist to the idea are probably impressive; but the word "guarantee" is obviously used not so much in a technical as in a moral sense. This is a case where the Foreign Office should adopt the wartime slogan of a famous headquarters: "The impossible takes a little longer." What M. Schuman wants is a form of British participation either in the European defence community or in the treaty setting it up which will convince the French that they will not be left one day alone with the Germans. If the Americans, too, could find some way of association, it is likely that British official objections to French ideas would quickly fall away.

What is needed now is a fresh study of the proposals for a European defence community and a searching debate on them in the House of Commons. A simple ABC of the EDC is given on page 531 of this issue, and even such a limited analysis shows that it is a much looser association, at any rate in its earlier stages, than many realise. It is precisely because it is loose that the French are dissatisfied with it, and ask why the British cannot slip on at least some of the harness. In finding the answer, Mr Eden needs all the help that informed public opinion can give him. It is quite useless to read passages of the Dunkirk and Brussels Treaties to an excited French Assembly.

* * *

Civil Spending

With the publication of the vote on account, the estimates of total expenditure in the coming year are complete, although the detailed estimates of the different departments will not all appear for some weeks. The total civil expenditure shown in the vote on account, excluding the revenue departments, is estimated at £2,279 million. This is less by £260 million than the corresponding total, including supplementaries, for the present financial year; but the saving

The Battle Act came into operation only last January and it is too early to see what effect it has had on east-west exchanges. The accompanying table shows the trade of the United States, Britain, France and Germany with iron curtain countries in 1950 and in the first nine months of last year. Britain has the largest trade with the USSR, China and the satellites and it has an import surplus with each of them. Exports to both China and the satellites declined during 1951, but exports to the USSR increased sharply in the third quarter. This was due to shipments of rubber which were previously sent from Malaya; the annual quantity is still being kept below 100,000 tons which is considered normal civilian requirements for the USSR. America sent nothing to the USSR last year but continued to import Russian goods on a fairly large scale. Its trade with China and the satellites has tended to decline, though its exports to China were still much larger than Britain's. France's trade with the USSR is small, though its imports from that country increased in 1951; larger imports were also received from China and the satellites. German imports from China rose sharply last year, especially in the third quarter, but Germany's trade with the satellite countries was smaller than in 1950.

The only striking feature on the export side was the sudden rise in British shipments to the USSR but this does not mean that the Russians are getting more rubber. What seems to have escaped notice is the fact that the United States, through its import surplus with the Russians, is providing them with a universally accepted currency that is an important means of fostering illegal transactions.

* * *

Instalment Buying for German Defence

Both the German Minister of Finance, Dr Schaeffer, and the heads of the Atlantic alliance declare themselves satisfied with the agreement on Germany's defence contribution which was reached this week. A week previously the divergence between them amounted to a total of over DM1.5 billion and this sudden solution is too good to be true. Clearly the satisfactory result of the final negotiations has only been reached by juggling and leaves room for different interpretations. Optimism should be restrained until it is seen precisely what Dr Schaeffer meant when he told a press conference that all Germany's requirements had been met, and that the disputed question whether economic aid to Berlin counts as defence expenditure had been left open.

The present agreement has been made possible by accepting the fact that there will be no European Defence Community until August 1st at the earliest. Germany will go on paying occupation costs until then, at a rate which the occupation powers will try to keep down to DM500 million a month. Germany's contribution to defence has now been broken down into monthly instalments, instead of being assessed as a lump sum for the Nato year beginning on July 1st. The monthly amount which Germany has undertaken to pay after August 1st, on the assumption that the EDC comes into force at that date, is DM850 million. To this will be added the expenditure on Berlin—according to the Nato idea of the agreement, only that part which the three wise men regard as legitimate defence expenditure—the mobile police, frontier guards, customs service and pensions to former regulars of the *Wehrmacht*. Whether the total sum for the Nato year will really amount to the DM11.25 billion proposed by them depends upon whether Dr Schaeffer has really agreed to count only a small proportion of the money spent on Berlin as part of Germany's contribution.

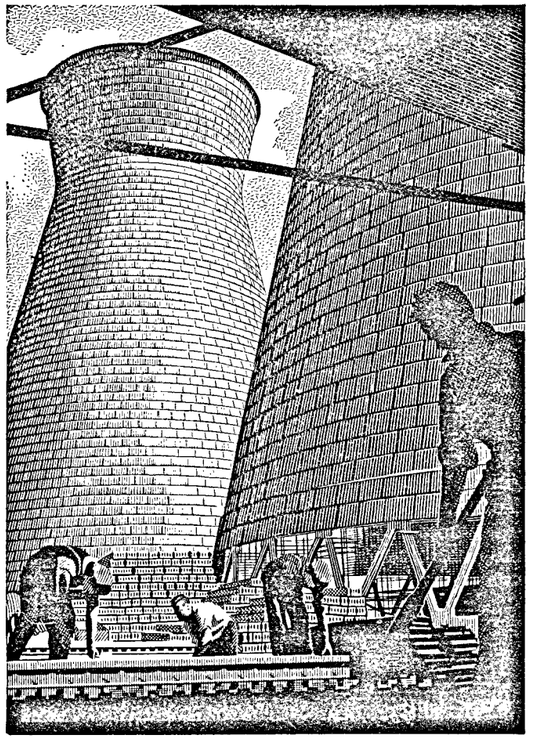
The Germans, who are interested to know what taxes they will have to pay, have been given a computation based on their financial year and an assurance that no fresh taxation will be needed. On the optimistic assumption that occupation costs will not be above DM500 million a month until they end, the total for the German budget year beginning on April 1st will be DM8.8 billion, to which will be added all or part of the cost of Berlin, police and the rest.

One point of particular interest to Britain seems to have been left for the European Defence Community to decide when it is formed. That is how much the Germans will pay towards the expense of maintaining non-German troops in their country after the occupation regime ends and Germany is paying for its own army. There is a general conviction in Bonn that, if the present occupation powers were forced to provide for themselves entirely, they would prove much more thrifty than hitherto. If German funds were eventually stopped, Britain would be forced to bear an additional £180 million a year, which might have to be paid in gold. Though this matter is hypothetical and distant, it cannot be ignored in the present negotiations on Germany's future.

* * *

To Swell or to Hop

Mr Macmillan made out a good case for the Town Development Bill on the occasion of its second reading. He accepted the view that a considerable dispersal of both population and industry from the large cities was desirable; and added that "if towns are not allowed to swell, they must be encouraged to hop"—which pithily states the Bill's purpose. He promised support for the rapid development of the new towns, where housing is at last getting into its stride; and he claimed that the Bill will enable the general policy of dispersal to be carried on "with a fresh momentum and on a wider front."



This speech should establish the Minister's credentials as a subscriber to the central aims of town and country planning. But is it consistent with his housing policy? Probably the quickest route to more houses would be to let the LCC and the larger towns go full speed ahead with building, whereas the aim of this Bill is to shift building to the smaller county districts. It is true that the "exporting" towns are expected to do much of the building in the new areas and to contribute to the cost. But will they respond to the invitation? If they do so they are sure to insist, as the LCC is already doing, that the housing which they finance shall be reserved for their own waiting lists. This arrangement would create more long-distance dormitories for city workers. It cannot be squared with the aim of establishing a sound industrial basis for new and expanded towns, upon which the Minister is also rightly insistent.

There is a danger that the present Bill will be satisfactory on paper and of little worth in practice. If the Minister is in earnest about planning aims, he ought to canvass more radical methods. One such would be to allow large local authorities like the LCC and Manchester to build new towns of their own. Another and preferable method would be to establish a regional housing authority for London, and perhaps other regions as well, to secure the speed and economy of large-scale operation while building in several places simultaneously. The local authorities do not like this idea; but the complications and mutual jealousies of the local government system are such that it may be the only way to get houses built both quickly and in the right places.

Victory for Commonsense

The real victory in the long struggle over identity cards was won last summer when Mr Clarence Willcock tested in the High Court the right of the police to ask people to produce their identity cards. Although he lost his case, the judges' comments on the use of wartime measures for peacetime purposes forced the police to change their practices. No longer could a law-abiding person be asked for his identity card because, for instance, he had left his car too long in a public street. After this, it was only stubbornness on the

OIL AND THE WATERFALL

THE 22-million-gallon-a-day "waterfall" in each of these cooling towers at Anglo-Iranian's oil refinery in South Wales is part of an expansion project that has already raised the refinery's production to twelve times its pre-war rate. This in turn forms part of a greater expansion programme on a world-wide scale. Anglo-Iranian and its associated companies operate nine refineries in the United Kingdom, France, Germany, Italy and Australia. A tenth refinery has just gone into production in Belgium and another new refinery is under construction now in the United Kingdom.

part of the Labour Government that made it retain identity cards for administrative purposes—stubbornness and an overwillingness to prefer the convenience of the administrator to that of the ordinary citizen.

It hardly, therefore, became Mr Marquand and Mr Shinwell to rise in protest at Mr Crookshank's mild taunt when he announced the end of identity cards last week. If Labour Ministers really believed in the permanent value of the system, they ought to have passed permanent legislation continuing it. A case might indeed have been made for continuing the national register, as distinct from the identity cards themselves, for it has been a useful means of providing information normally only obtainable every ten years by the census. But when economy is necessary, the Government is right to scrap the whole registration machinery—and save thereby 1,500 people in staff and about £500,000 in cost.

It is true that there can be no immediate bonfire of identity cards. Mr Crookshank was not able to follow the example of Mr Harold Wilson when announcing the end of clothes rationing and flourish his own torn identity card in the House. For numbers are essential to the working of part of the health service, and since the majority of the over forty million medical cards already have national registration numbers, they will be retained for this purpose alone and will be renamed national health service numbers. Identity cards will thus wither away rather than disappear overnight. But their passing nevertheless marks a notable victory over bureaucracy.

* * *

The Married on Marriage

Not everyone will agree with the opinion of the Married Women's Association, stated in evidence to the Royal Commission on Marriage and Divorce, that "the fundamental cause of disharmony in marriage is the gravely unsatisfactory economic position between the spouses existing at present." Are not quarrels over money as likely to be an overt symptom of disharmony as its cause?

But even if the proposition could be accepted, the association's remedies are surely dubious. It recommends that each partner to a valid marriage contract should be under a legal obligation to disclose to the other prenuptial liabilities and assets, and if disclosure is not made within three calendar months there should be right of recourse to a court. Further, common law maintenance of the wife must include something for her personal allowance, which she can spend without accountability on all "proper purposes." Husbands will note that "excessive expenditure on gambling, smoking or alcoholic indulgence and the like shall not be deemed a proper outlay of such allowance." They will also note that "wilfully inefficient housekeeping should become punishable by law."

Doubtless the association can make out a case for its recommendations. But how they will save more marriages, which should be the real purpose of both it and the Royal Commission, is somewhat obscure. One would have thought that once delicate matters like the housekeeping purse were wrangled over in court instead of privately the marriage in question was doomed.

* * *

Help Not Wanted

It is ironic that, at a time when the European members of Nato are competing for slices of American economic and military aid, nations in other parts of the world should be brusquely rejecting it. A United States mission to Mexico returned last week after the breakdown of negotiations on military aid for that country, and almost simultaneously the Indonesian government resigned as a result of differences between the ministers about the acceptance of US economic aid. Ireland, Burma and Persia have shown reluctance to enter into firm agreements about aid, and Mexico's example may well lead to further hesitation on the part of Chile and other Latin American countries. Europeans can hardly be blamed if they feel that, as long as they themselves have to achieve American aid, it is illogical that others should have it thrust upon them.

To some extent the difficulties have arisen from the United States Congress's insistence that recipients of either military or economic aid must now undertake to play their part in the free world's common effort to maintain peace. The value of such vague undertakings is questionable; and there is no doubt about their embarrassing aspects. Any government which countersigns the formulae required by the Mutual Security Act is presenting its domestic critics with an excellent opportunity of accusing it of being under American domination. But the problem only becomes serious where the recipient governments themselves are unstable. Elections were imminent in Burma and Persia when the question of giving these undertakings arose; in Mexico and Chile they have yet to be held, and it is generally assumed in Mexico that discussions on military aid will be reopened when the votes have been counted. In most cases, therefore, the difficulties involved in accepting American help are likely to be solved before very long; but it is hard to resist the conclusion that, given a little more flexibility, particularly in the matter of timing, they need never have arisen.

* * *

Pressure on Indonesia

Last Saturday the ten-month-old Indonesian cabinet of Dr Sukiman bowed to the storm and resigned over the terms on which aid was to have been received from the United States. The dispute began at the end of January when Indonesia asked the Americans if, in spite of the change from the Economic Co-operation Administration to the Mutual Security Agency, it could go on receiving aid on the old terms. Indonesian spokesmen emphasised that they could not accept aid on conditions identical with those applied to countries to which America intended to give primarily military rather than economic assistance, particularly as the economic development for which American money would be used would be exactly the same as before the MSA came into being.

In the end, Dr Subardjo, the Foreign Minister, accepted the American terms, although with much misgiving. Compared with $16 million received during the past two years, Indonesia is promised another $8 million before the end of June. As soon as his action became known, however, a political storm developed in Jakarta and threatened to engulf the whole government. The cabinet had already courted severe unpopularity by signing the peace treaty with Japan at San Francisco—it has not yet dared to introduce it into the Assembly for ratification—and by failing to secure the cession of West New Guinea from the Dutch at The Hague conference. Dr Subardjo thereupon resigned; but the whole government has since also found its position untenable.

*

The difficulty in Indonesia is that a small group of moderate and intelligent men stand at the head of a weak political structure, in which Communist propaganda, prejudice against western "imperialism" and fear of being dragged into war alike play on the minds of a volatile political community. Since independence was obtained at the beginning of 1950, Indonesia has on the whole been fortunate in its rulers, and they have done a good job in difficult circumstances. But they cannot afford to make mistakes, and least of all can they afford a foreign policy which may be made to appear to be dictated by a stronger western world.

It is probable that a new cabinet will be formed on a basis very similar to the old, that American aid will in fact continue,

and that Indonesia will honour the terms signed by Dr Subardjo. The present group of leaders has no intention of committing Indonesia to the Communist camp. But the events of the past month should be a warning to western statesmen that they cannot afford to force the hands of those who are willing to associate with them in Asia. If too much pressure is again put upon a middle-of-the-road government in Jakarta, this will be a trump card for the Communists, who are beginning to gain strength again after the blow dealt against them by the widespread arrests of last August.

* * *

The Commonwealth and Nato

In the Australian House of Representatives at the end of last week Mr Casey, the Minister for External Affairs, spoke of the risk that some members of the Commonwealth might soon be in closer touch with other Nato countries than with other members of the Commonwealth. There was a danger, he claimed, of the interests of countries like Australia being overlooked by members of Nato, whose decisions must inevitably affect the rest of the outside world in many ways. Two Commonwealth members only belong to Nato, Britain and Canada. But the principle about which Mr Casey speaks is the same as that involved every time Britain makes any move to ally itself more closely with its neighbours in Western Europe, as, for instance, through the Brussels and Dunkirk Treaties. And in this respect there have always been two points of view. One, particularly in Britain, holds that the United Kingdom must not commit itself too deeply in Western Europe because to do so is to abandon proper participation in Commonwealth strategy. The other puts its emphasis on the fact that, if the Commonwealth is to continue to mean what it has in the past, its younger members cannot afford to stand aside if Britain is at war; hence, any steps which Britain may take through alliance with its immediate neighbours to deter aggressors and stop war are to the advantage of the Commonwealth as a whole. The second is the more realistic point of view, and there can in fact be little doubt that British and Canadian participation in the Atlantic Pact is applauded rather than condemned by most people in the Commonwealth.

At the same time, it must be recognised that certain fundamental relationships within the Commonwealth are changing, through the strengthening of the younger countries compared with Britain. In the past, with the main weight of the defence burden falling on Britain, the other members of the Commonwealth have been able to subsist with relatively modest forces, in the knowledge that any aggressor would also have to reckon with the United Kingdom. Today, while the power of Britain is less than it was, the two Pacific members of the Commonwealth, Australia and New Zealand, have entered into specific defence arrangements with the United States, which are technically quite independent of any action that Britain might take in the event of an attack in their area. This has created a situation in which Britain may now lose touch with the detailed factors affecting the safety of the outlying members.

If the Commonwealth is to benefit and not suffer from these developments, the free flow of information between its capitals becomes more important than ever. If it cannot also be full, then the need for frequent personal contact between Commonwealth ministers is obvious.

* * *

Sir Hubert Henderson

Sir Hubert Henderson, who died last week, was one of the brilliant band of political economists who sprang up in Cambridge in the early years of the present century. The term is used advisedly, for all of them—and Henderson perhaps most of all—were from their undergraduate days active in public affairs. His only published book is a pellucid treatise on the theory of value, but this was, as it were, an accident, and his mind was never far from the stage of events. His life, like that of his contemporaries, was spent in alternation between the universities and public service. Three times he was called to Whitehall and three times he returned either to Cambridge or to Oxford. He also had an interlude—certainly not the least brilliant and fruitful period of his life—in journalism as editor of the *Nation* during Keynes's proprietorship.

The first word that comes to mind in connection with Hubert Henderson is charm. It was, in some ways, a deceptive charm, since it masked formidable controversial talents. It was a pleasure, for those who knew him, to watch him with his modest smile and feigned stupidity luring an opponent on to his destruction. Henderson was often in controversy because his views fitted into no recognised pattern. Starting as a radical, he had moved by the end of his life into a position that would generally be accounted that of the right wing; but on some issues, notably those that came to the surface at Bretton Woods, he could still find allies on the extreme left wing. There was never the tedium of the predictable about anything he said or wrote.

Henderson migrated from Cambridge to Oxford in the middle twenties. In his later years he occupied the Drummond chair, and he had been elected, but never installed, as Warden of All Souls College. He died within sight of that promised land.

The New Government

When three weeks ago we were told that Lord Derby was prepared to take office if called upon, and was ready with his list of Cabinet Ministers, we were lost in conjecture as to who these hitherto unheard of and unguessed at individuals could be. We might have puzzled our brains till doomsday without making even a distant approximation to the truth. Such a body of "village Hampdens," "guiltless Cromwells," and "mute inglorious Miltons," as Lord Derby's new Ministry, were probably never called upon to govern a great country. . . . Though we confess our uneasiness at seeing the destinies of this great nation committed at such a crisis to men so untried, and in all probability, so incompetent . . . yet we draw one consolation from the list of ministerial appointments, viz., how feeble, effete, and near to extinction the Tory party must be. From a political faction in which Mr Disraeli, Lord John Manners, and Sir John Pakington are great guns, the country, if it be true to itself, has little to fear. Our march forward may be more rapid . . . when the opponents of movement are in office. The Liberal party may be consolidated, united, and recruited while in opposition, and the Tories may only display their weakness, while handling the reins of power. It is too soon to speculate on the turn which affairs may take. . . . For one thing, however, we are especially and earnestly concerned, which is, that every man shall so act during this crisis that the commonwealth shall not suffer either in its material interests or in the character of its public men. . . . The corresponding ministerial difficulties of last year served only to bring out the unsullied honour and unselfish patriotism of our leading men into stronger and brighter light. No man impaired his influence; no man dirtied his hands. We hope and believe it may be the same now. We trust that no man among the defeated party can be found disposed to risk the safety or undermine the welfare of the country by depriving the actual Ministers of the means of adequately and promptly meeting the national emergencies; that no man will stain or hazard his reputation by joining with those whose opinions he does not share, and whose principles he cannot respect.

The Economist

Letters to the Editor

How to Grow More Food

Sir,—In your second article you discuss the possibility of raising output by a tax on farm land. May I suggest that another method of raising more food would be to place really high taxes on undeveloped or only partially developed land? All landowners, other than farmers, can neglect their land without any interference; and if the land which is now lying fallow, or being let for "summer grazing" only, or kept for amenity or the pasturing of ponies, was brought into full food production, it would go a long way towards solving the problem of providing food for livestock. In sections such as this, on the edge of a built-up area, a really large acreage of potential farm land is held by speculators as a nearly tax-free investment. In present conditions and legislation, they have every incentive not to allow this land to be developed properly; and this seems to be against the national interest and equity.

I would put forward the suggestion that all land over, say, an individual holding of one acre of garden should be subject to a fairly high land tax which would be a real disincentive for keeping land out of food production. If the land is farmed, the farmer should get a rebate on his acreage tax according to the classification given by the local Agricultural Executive Committee. The committees already take the differential fertility of the soil into account when giving their ratings. Land let for "summer grazing" should pay the full tax, since these contracts, though they may be useful to the landowner, usually harm the land for which nobody has any interest in maintaining or increasing fertility. Such a tax, I suggest, would bring more land into production, would eliminate the inefficient farmer, and would go a long way to providing the still desirable subsidies on fertilisers.—Yours faithfully,

GEOFFREY GORER

Haywards Heath

★

Sir,—Your articles are a true analysis of the reasons for the stagnation in our agricultural economy.

I would like to make a tentative proposal which can be immediately applied. It is simply to repeal the derating of agricultural land which was conceded to farmers during the depression of the 1920s. At present a farmer still pays rates on only one-eighth of the annual value of his land. If he had to pay full rates on his land no new Government machinery would have to be set up for its collection and of course the rateable value of a farm is roughly in proportion to the comparative value of that farm. It would be more palatable to the farmers if they were told that as a now thriving industry they should pay their full share to local taxation.

A further indirect benefit to the countryside would be that the rural areas of local government would no longer be subsidised to such a disproportionate extent from central government funds compared with urban areas. They would thus feel less like beggars when carrying out schemes of rural improvement, which are usually almost solely for the benefit of the farming community.—Yours faithfully,

EWEN STEWART

Edinburgh

★

Sir,—I am quite sure that the real obstacle to an increase in production on the land is shortage of capital. With building costs and the price of machinery at their present level it is quite impossible for a farmer to accumulate sufficient funds out of his net taxed income to invest in capital improvements. He can only finance such expenditure by borrowing from a bank and then recovering the cost over a period of years through the annual allowances which were granted to the agricultural industry under the 1945 Income Tax Act. The trouble is, however, that such allowances, in the case of new buildings, are spread over ten years, and in the case of machinery over something less. Meanwhile the farmer suffers from a chronic shortage of cash. The extent of such shortage is plain for all to see in the growth, during the last six years, of the overdrafts granted to the agricultural industry by the joint stock banks, in spite of the fact that during these years agriculture was enjoying great prosperity. If taxation were reduced I am sure that production could be expanded.—Yours faithfully, WILLIAM FOSTER

King's Lynn

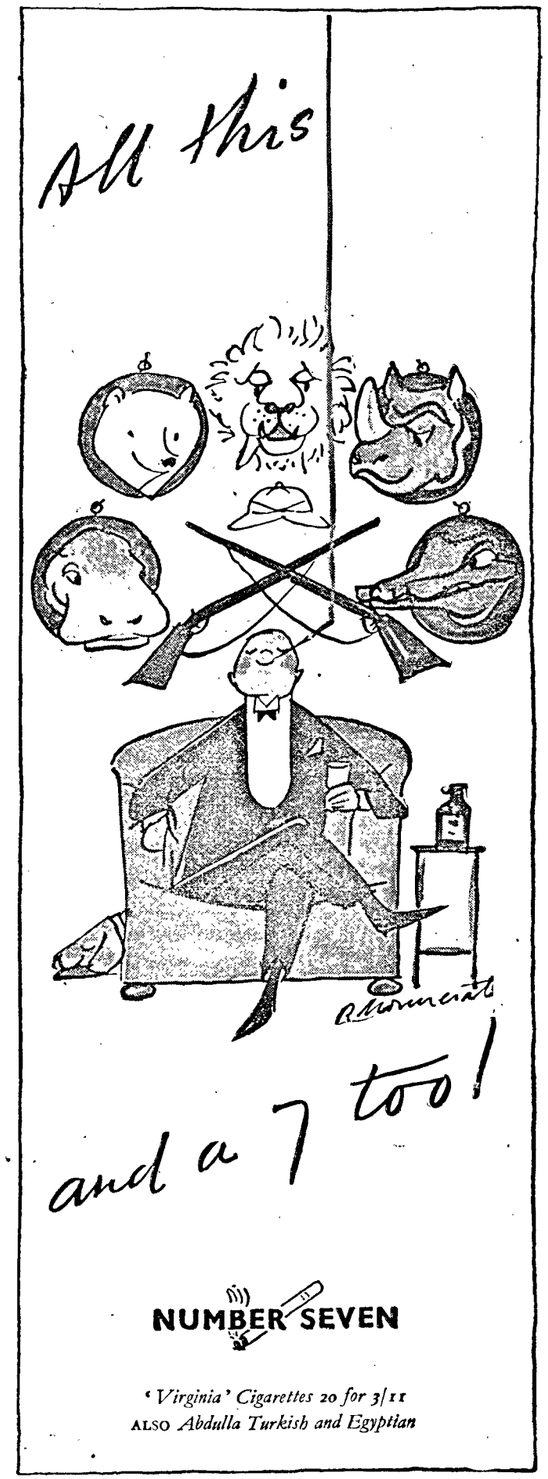
An Uncomforting Analysis

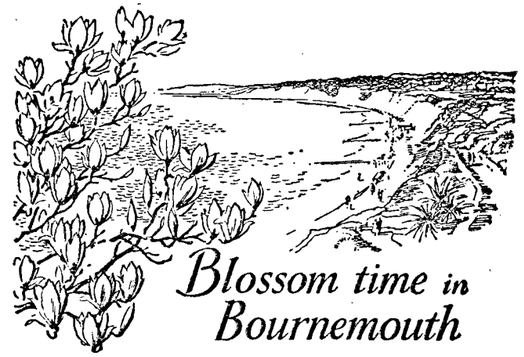


Inflation. By Paul Einzig. *Chatto and Windus.* 223 pages. 12s. 6d.

Before the war Dr Einzig was one of the most successful, as he was certainly the most unremittingly active, of interpreters of economic and particularly financial events to the man in the street. In language always clear though often entertainingly intemperate, with a driving conviction of his own rightness and of the positively immoral wrongness of the monetary authorities, he kept the public posted in what amounted to a biennial city column punctuated by special studies. A long silence broken only by what he himself described as a piece of escapism—his fascinating "Primitive Money"—is now ended; with "Inflation," Dr Einzig is recognisably back at the old stand.

It is, however, a different Dr Einzig who now resumes his role. The clarity is there, the capacity for marshalling and comparing large bodies of fact, the easy style; but the certainty and confidence have disappeared. Inflation is analysed, classified in its causes and manifestations, set in historical and political perspective, in a way which comes nearer to satisfying the most advanced theoretical purism than one would have believed possible in a popular work. The broad distinction between demand inflation and price or cost inflation, the finer distinction between monetary inflation in the narrow sense and inflation of purchasing power, and between the inflation of domestic overinvestment and the inflation imported by an adverse turn in the terms of trade, are so set out as to be comprehensible to the most complete economic tyro. And Dr Einzig does a beautiful job on the welfare state with its multiple inflationary drives.

Having accomplished all this, however, he finds himself in a *cul de sac*. Full employment is inflationary—at least, full employment policy as pursued under the present pressure of public opinion is inflationary. The welfare state is inflationary. High taxation, even when it results in budgetary surpluses, is inflationary in any situation where other inflationary influences are strongly at work. Physical controls merely divert the incidence of inflation. Permanent inflation can be compatible with ordered economic life only for so long as a sufficient number of people fail to realise its existence—and nothing will stop that realisation from spreading. The compulsory-savings, postwar-credits trick cannot be played twice in the same generation. Capital levies, blocking of accounts, and writing down of currency holdings, are appropriate only against a pure demand inflation and worse than useless against the inflationary situation of Britain in 1952. The best that Dr Einzig can offer by way of practical advice is a curious medley including state lottery loans, a campaign to induce the public to carry its spare cash in relatively inaccessible pockets, and—the "suspension" of the social services for "three or four years."



When he is driven to propose a measure at which anyone would boggle, it is not surprising that he conveys no impression of self-confidence. It is more surprising that he should, deliberately, explicitly and repeatedly, refuse to answer the question to which so many of his arguments eventually lead him. Can any policy be worthy of support,

SULPHUR

"BRING me fire that I may purify the house with sulphur" wrote Homer in the Odyssey. From these ancient medicinal applications, sulphur, in the form of sulphuric acid and other chemicals, has so extended its uses that today this yellow rock, which burns to form choking fumes, is one of the most important elements used as a raw material in modern civilisation. In recent times most of the world's needs for elemental sulphur—amounting to 5-6 million tons annually—have been supplied from deposits in the U.S.A., but these are fast becoming exhausted as more and more sulphur is needed for industrial, agricultural and other purposes.

Since the early 1930s, I.C.I. has been developing methods of making sulphuric acid from anhydrite, which is found in large quantities in many parts of Great Britain. It is fortunate, now that the sulphur situation is critical, that I.C.I. is thus able not only to increase its own production of sulphuric acid from British sources, but also to place its accumulated research and production knowledge at the disposal of some of the principal British acid users. Plans are indeed now going forward to install new plants which will make sulphuric acid from this indigenous raw material and thus reduce the need to import sulphur from overseas. I.C.I. has also converted other plants to utilise the sulphur recovered as spent oxide made in the purification of town gas.

River Journey

The Wilderness Voyage. By Peter Grieve. *Cape.* 216 pages. 15s.

Take a competent journalist, seasoned with much travel, salted with humour and mellowed with the milk of human kindness, set him loose on a river boat in a country where it is always tomorrow afternoon, and you may expect a travel book of more than average readability. "The Wilderness Voyage" fulfils this expectation.

The outstanding and refreshing difference between the usual Latin American travelogue and this story of a river journey through Amazonia is that the author was never jocose at the expense of the people he met. They were his friends; he admired their qualities and respected their differences; and he parted from them with affection and regret, paying tribute to the inherent dignity of lives which were poverty-stricken, lonely, and often brutal, but blessed with "time to stand and stare."

Conditions on small river steamers were primitive and congested, the food bad, the insects and heat a constant exasperation; but these drawbacks are dismissed as occupational risks inseparable from the endeavour to convey every "communicable revelation" of the Brazilian forest and the all-pervading network of rivers, which make human existence in it possible.

The book is enlivened with humour based generally on understatement, but rising, in the account of the author's indebtedness to Professor Castro de la Fayette, to an hilarity which qualifies the passage for inclusion in current anthologies.

Peter Grieve, whose early death is a loss to journalism and the reading public, wrote in his preface: "Much time in remote travel is consumed to no better purpose than it would be nearer home," but his own loitering from Belém on the Atlantic coast to Trinidad in Bolivia was certainly not misspent.

Towards Co-operation

Economic Aspects of Sovereignty. By R. G. Hawtrey. *Longmans.* 191 pages. 24s.

The first half of this book consists of six lectures on various aspects of imperialism, delivered twenty-three years ago to the Lowell Institute in Boston. It is a great tribute to Professor Hawtrey that they can be reprinted now without alteration. Far from reading like bargains from the shilling piles in the Charing Cross Road, they provide a highly stimulating background to the second half of the book, which is devoted to the somewhat gloomy task of tracing how the principles enunciated in 1929 worked out in 1951, and the more hopeful one of suggesting a way through the thicket.

Mr Hawtrey's first half is really the homework that we like to think we have already done. But newspaper articles and dinner table conversations leave a bed of dead leaves of opinion in our minds which is not always as fertile as real humus. Mr Hawtrey comes scratching down to bedrock, forcing us to think what we really mean by many of the phrases and concepts used so glibly. His lectures deal with sovereignty and property, sovereignty and economic development, communications and population, economic power and the economic causes of war. His fundamental question is how to dispense with the use of force, but

> when we seek to eliminate force from the [international] system, we find that force is fulfilling an indispensable function, the supersession of decayed or atrophied sovereign authorities by healthy and vital ones. We have to provide for this function in some other way.

The solution, which he puts forward rather tentatively in the second half of the book, is what he calls a "Composing Commission," a kind of mixture of Nato, the Economic Commission for Europe, the Council of Europe and The Hague Court,

> whose decisions would not be confined to applying a code of rules, but would be guided by conditions of expediency. Wherever an economic enterprise needed the intervention of more than one Government, it would take the place of the Governments concerned, and would supersede their authority in the matter.

Mr Hawtrey is better aware than most people of the reasons for past failures in international co-operation and of the present perils. Nevertheless, he sensibly refuses to be too downcast and sees hope in the present situation when plans for the combined defence of Europe lead on to plans for economic integration, which would be impossible but for the pressure of fear.

Scientific Miscellany

A Statue to Mr Trattles. By C. L. Boltz. *Butterworth's Scientific Publications.* 168 pages. 12s. 6d.

Mr Trattles was a merchant seaman who fell foul of a scientific theory. The Board of Trade tests, devised in consultation with some of the most eminent scientists of the time, proved that his colour vision was defective, and that he was thereby unfit for a mate's certificate. He refused to accept this, and raised a row which eventually reached Parliament. Mr Winston Churchill, then President of the Board of Trade (this was in 1909), instituted an inquiry which vindicated Trattles, and the colour vision tests for the Merchant Navy were modified. The theory in question fell into disrepute (it had not been by any means universally held, but had been foisted on to the Board of Trade by a combination of peculiar circumstances and personalities) and is now completely outmoded. Mr Boltz tells this instructive story in entertaining detail as a warning to scientists and others against holding opinions too dogmatically.

"Mr Trattles" is the most considerable item in this book, the rest of which consists of short articles and talks on a variety of scientific and technical subjects. Mr Boltz has chosen unsensational subjects, which he describes clearly. He obviously takes a great interest in colour and colour vision, and also seems attracted by small things (diamond dust, sand particles, colloids, experiments with models). There are also several short scientific biographies. The subjects are, however, not connected in any way, and as the author has not enough space to go at all deeply into them, the purpose of the book is questionable, in view of the number of good magazine and even newspaper articles available to the casual reader. Perhaps the one chapter which provides the justification (in combination with "Mr Trattles") is that describing the fascinating story of the dancing bees; this sounds like a Sherlock Holmes story and is every bit as exciting, both for the intricacy of the bees' "food signpost" system, and the patient skill of the naturalist von Frisch in unravelling the details. Everyone should read this story, and while it is available in other places, this is much the best popular account which the reviewer has come across.

The Poet and the Official

Freedom is the Right to Choose. By Archibald MacLeish. *Beacon Press, Boston.* 186 pages. $2.50.

It is the measure of the compelling magic of the late President Roosevelt that he persuaded the poet Archibald MacLeish to become an Assistant Secretary in the State Department. Mr MacLeish's book shows the impact of the official upon the poet, and the revolt of the poet against the official. Mr MacLeish is troubled by the negative, defensive mentality of modern America. "Who, we say, can imagine the word 'containment' in Roosevelt's mouth? But for all our scorn we know, or ought to know, that the defensiveness of our foreign policy is dictated not by the mentality of the Department of State but by the mentality of the country."

Elsewhere Mr MacLeish writes:

> The truth is that the place to remedy an unsatisfactory foreign policy is not in Formosa or Western Germany, but at home. Until the country recovers a sense of national purpose within itself, until it shapes again its national will, its foreign policy must continue to be defensive and Russia must be left the initiative she has held since the war's end.

Mr MacLeish is deeply concerned by the damage done to the mind and soul of America by General MacArthur and Senator McCarthy. He fears the freezing of American thought into the rigidities of an official dogma which would permit no heresies. "If freedom," he writes, "ceases to express the American faith in man and in man's unqualified right to find the truth for himself, it will shortly express a faith in established truth, in the rightness of official opinion." But Mr MacLeish's eloquent book is in itself a cheering assurance that the spirit of American liberalism is very much alive to the perils of a stratified community.

AMERICAN SURVEY

Atomic Rivals—or Partners?

Washington, D.C.

VERY soon after it had been announced in London that a British atomic weapon will be tried out in Australia this year, Senator Brien McMahon of Connecticut, the chairman of the Congressional Joint Committee on Atomic Energy, issued a more than usually interesting statement. Almost no attention was paid to it in the United States. Indeed most of the newspapers, suffering from one of their intermittent blind spots, dismissed it in a few lines, reporting what the Senator had said in his first and third paragraphs and missing altogether the news in his second paragraph, which read:

> This event is likely to raise in still sharper focus the problem of atomic co-operation between ourselves and Great Britain. The British contributed heavily to our own wartime atomic project, but due to a series of unfortunate circumstances, the nature of the agreements which made this contribution possible was not disclosed to me and to my colleagues on the Senate Special Atomic Energy Committee at the time when we framed the law. Now we may consider re-thinking the entire situation with all the facts before us.

This was the first public admission by the principal architect of the Atomic Energy Act, passed in 1946, that this anachronistically isolationist law was devised in ignorance of one of the relevant factors. President Roosevelt and Mr Churchill (Mr Mackenzie King of Canada concurring) had agreed during the war that the development of the atomic bomb should be a co-operative undertaking. All the theoretical and experimental knowledge Britain's scientists had gained, and the services of the scientists themselves, were freely surrendered. An international marriage was performed in order that the Manhattan Project should succeed. It did succeed, and the atomic bomb was born. Then, when the victory was won, Congress passed the Act which announced that there would be no further pooling of scientific resources. This policy of atomic isolation is now becoming less attractive, with the proof that British scientists have not been discouraged by being frozen out of the partnership.

Indeed, Congress, in close consultation with the Atomic Energy Commission, had given evidence some time before the impending British test was announced that it was aware that it might be missing something. In October last year the McMahon Act was amended to provide that some atomic secrets might be shared as long as such sharing would produce returns which would substantially promote and would not endanger the security of the United States. But secrets could be communicated only to friendly nations with adequate security regulations, and only so long as secret information on design and fabrication of atomic weapons continued to be withheld. A security-conscious friendly nation could be told some of the little secrets, but not any of the big secrets; and nothing was to be told, in any case, unless the telling was made worth while to the United States.

Even this, against the background of alarm and anger which had swept Congress a year or so earlier, after the revelation of the crime of Dr Fuchs, was considered to show a praiseworthy breadth of mind. But self-interest was the over-riding reason why the Act should be modified, in the view of the Atomic Energy Committee.

★

Not long afterwards—before Mr Churchill brought Lord Cherwell to Washington to talk to Mr Gordon Dean, the chairman of the Atomic Energy Commission, and his colleagues—the question whether Britain's first atomic weapon should be tested on the admirably equipped atomic proving grounds in Nevada became a topical issue. No report of what Lord Cherwell said to Mr Dean, and what Mr Dean said in reply, was published, so that the tenor of these talks is a matter for educated guesswork at the best. One of the educated guesses is that Mr Dean rather apologetically explained to Lord Cherwell that, while the Atomic Energy Commission would be happy to place the Nevada proving grounds and all their instruments and up-to-the-minute apparatus at the disposal of the British Government, it would be prevented by the McMahon Act, even as amended, from communicating to the British Government any data which would enable it to compare what the instruments and apparatus showed when the British atomic weapon was exploded with what these same instruments had shown when comparable American atomic weapons had been exploded. "We shall know what results you get" Mr Dean might well have said to Lord Cherwell, "but you won't know what results we got."

Senator McMahon, in the part of his statement generally reported in the United States, said:

> I might have wished that the British had seen fit to take advantage of our offer to make available a test site, subject to conditions which our law lays down. However, I can understand the British decision to go to Australia, and I wish them success in this venture which will enhance the peace power of free peoples.

It is highly probable that in their present frame of mind Senator McMahon, Mr Dean and most, if not all, of the Atomic Energy Commissioners will be well content if they read in their newspapers, some time this year, that the British test in Australia has been successful and has yielded valuable new information. Without such a development they cannot expect either singly or together to produce any swift metamorphosis of the recent mood of the Congress and the people—a mood which, especially since the Fuchs case, has recognised little distinction between the relative importance of keeping atomic secrets from enemies and from friends.

But there is little doubt that influences making for a liberalisation of this mood have lately become evident in America. It is now about two years since the most ardent and orthodox exponent of the security creed, Admiral Strauss, resigned from the Atomic Energy Commission.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Somewhat less nervous counsels appear to have prevailed since then. The coming tests at Eniwetok are to be conducted with as great an emphasis on security as ever; and it can be argued that the recent decision to stage a conducted tour for newspapermen through some of the hitherto sacrosanct reaches of Oak Ridge, Tennessee, and the plan to allow outsiders to watch the explosion of an atomic weapon in Nevada, have been dictated by a growing public anxiety about the immense sums of money which the Atomic Energy Commission is spending without giving any real public accounting. Nevertheless, whatever the reasons, a gentle loosening-up process seems to have begun, just as some Americans are beginning to doubt whether the decision to drive Britain into atomic independence was quite as wise as it seemed to be in 1946.

The *Washington Post* admonishes Americans that the wartime co-operation between England, Canada and the United States which gave the free world first place in the production of atomic energy has degenerated into a dangerous sort of competition. Representative Carl Durham, of North Carolina, the vice-chairman of the Joint Atomic Energy Committee, says: "It is foolish not to make an honest effort to get together on our Number One weapon." And Mr Dean, though he must be vaguer and more careful in any utterances he makes on the subject of co-operation with Britain and Canada, is able to say:

> We have recently entered a room, the door to which was labelled the atomic age. We are in that room and we have found that it is so large and so dimly lighted that we cannot begin to perceive its size or to recognise what is in it. And we do not know how many doors lead from this room into other rooms perhaps just as significant in the history of man.

The Americans who are feeling their way across the big, dimly lighted room are aware—better than are the members of Congress and the men in the street who are merely reading about it—that it is better and safer to have company in this sort of situation.

Choosing the Candidates

When Americans go into the polling booths on November 4th to choose their next President, they will actually vote not for one of the official candidates but for electors who will choose a President on their behalf. Even more indirect are the methods by which the parties themselves select their candidates for the presidency. Yet these preliminaries are just as important for the future of the country as is the presidential election itself; this year, for example, the Republicans will at this stage have to choose between General Eisenhower, Senator Taft, Governor Warren, Mr Harold Stassen and perhaps General MacArthur. Even then they may end up by rejecting them all for some dark horse that has not yet been entered.

The Democrats and the Republicans both nominate their candidates for President and Vice-President at special conventions, to be held in Chicago this year, beginning on July 7th for the Republicans and July 21st for the Democrats. These gatherings are attended by delegates from all the states and dependencies; the number from each state is governed mainly by its population, but is also affected by how the state voted in the last presidential election. About half these delegates, from two-thirds of the states, are selected at state conventions of their party or, in four states, by its state executive committee. This means that most of them are, in fact, picked by the party machine and that the party leader in the state can guarantee how they will vote at the national convention. And the party leaders are usually prepared to deliver these votes to the candidate who promises them federal jobs and patronage if he is elected.

Senator Taft is claiming that he has already obtained guarantees of almost all the 603 votes needed for the Republican nomination, even though so far the state conventions have hardly begun; most of them will be held during the next three months. But the result of the one that has already taken place in Oklahoma makes it look as if the Senator has been unwise to count his delegates before they are hatched. Only about half the state delegation there is now expected to support Senator Taft; the rest favours General Eisenhower.

It is in the south, too, that President Truman may have trouble with some of the Democratic party machines, should he decide to run again. But elsewhere Mr Truman can be sure, as the President almost always can, of his party's support, for there is hardly a Democratic official who does not depend in some degree on the Administration that has been in power for so long. To Woodrow Wilson, when he was President-elect in 1913, it seemed

> intolerable that any President should be permitted to determine who should succeed him—himself or another—by patronage or by any sort of control of the machinery by which delegates to the nominating conventions are chosen.

Many others felt the same and looked for a way of ensuring that presidential candidates should be selected not by party bosses in smoke-filled rooms at national conventions, but by voters in the pure air of the polling booth.

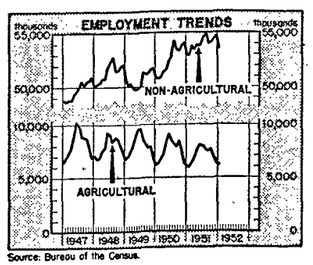
★

The solution, it was thought then, was the primary election in which the state delegation would be chosen, and told which candidate to support, by the free votes of the members of the party in each state. The first state to provide for such a primary election was Wisconsin in 1905, and by 1916 half the 48 states had them. Since then their popularity has declined and this year only 17 states will hold primary elections—two probably for Democrats only—nearly all in April or May, and always on the traditional Tuesday.

No two state primary laws are identical. In some states only delegates to the national convention are elected, in others the voters also express their preference amongst the presidential candidates entered. In most states the delegates are bound to support a particular candidate for the presidential nomination, although usually only for the first few ballots; after that the delegates elected in a primary election are almost as ready to follow the dictates of their local party leader as are those nominated by a state convention. President Truman is therefore not alone in thinking that the present primary system is "eyewash." When the time comes for the national convention it seems to make little or no difference how delegates have been chosen or whether candidates have entered primary elections or not. The classic example of the latter was Wendell Willkie's nomination in 1940, when he had not fought a single primary. But his nomination also showed that the party bosses do not always get their own way.

Wendell Willkie, four years later, provided another classic example, of the harm a primary can do to a candidate's chances; after his poor showing in the Republican primary in Wisconsin in 1944, he gave up trying for the nomination. There is a risk that the same thing may happen to General Eisenhower in the first of this year's primaries in one of the smallest states, New Hampshire, on March 11th. Everything is in his favour there and, if he loses as many as six or seven

The board accepted the chief argument of the unions, which is that "free riders"—those who are not members—are unjustly enriched, receiving all the benefits won without carrying any of the load. There are not many such "free riders" among the railways' non-operating employees; about 85 per cent are union members, and the majority of the remainder are supervisory and managerial workers who could not join in any case.



The railway managements who protest so bitterly against "compulsory unionism," as depriving workers of their liberty, and strengthening the grip of the unions on the industry, would have a better case if 40 of them had not recently signed union shop agreements covering over 200,000 workers. Congress itself gave the unions a green light when, in January last year, it repealed the ban on the union shop contained in the Railway Labour Act. The Taft Hartley Act, while outlawing the closed shop, permitted the union shop when the majority of the workers favoured it, and the Act has been amended to do away with the requirement that a formal vote must be held.

In a recent study of 2,600 labour contracts, the Department of Labour found that over 70 per cent of the 5.5 million workers covered enjoyed the union shop. This probably overstates its prevalence among the 16 million organised workers. Up to now, no board has ever placed the authority of the government behind the union shop, leaving it to collective bargaining. Even if the Wage Board decides to do so, it will be merely in the form of a recommendation, which is not binding. There is a difference between the position of the railways and other industries which may be affected. The carriers usually have accepted the recommendations of emergency boards, but if they should refuse to this time the unions cannot resort to a strike as long as the railways are operated by the government. In steel, there is no such prohibition.

* * *

Labour on the Farm

The question of bringing contract labour from Mexico for American farms is even thornier than usual in an election year with the farm vote at stake, but nevertheless it is once more being debated in Congress. Mexico refuses to make a long-term agreement on the employment of its nationals for seasonal work in the south-western states, unless adequate guarantees are given against the hiring of illegal Mexican immigrants; they are not protected by treaty and their pitifully low wages and miserable living conditions not only harm them but also depress the status of legal immigrants as well as, of course, that of all farm labourers. Last year more than half a million "wetbacks"—so called because many enter the United States by swimming the Rio Grande—were deported by US officials out of an estimated total of over a million.

Source: Bureau of the Census.

The dwindling supply of labour available to the nation's farmers makes it important that an agreement should be reached with Mexico for, as regular workers go to better paying industrial jobs, more dependence is placed on migratory labour. The exodus from the farms has been accelerated by the defence programme; the number of farm workers dropped sharply from 9 million at the peak of the 1950 season to 8 million a year later, but the trend began during the war. Farm wages were 11 per cent higher this January than they were a year ago, but even so they are still lower and hours are still longer than in factories. Raising wages to attract labour is not the policy favoured by the large commercial farmers who produce the bulk of the nation's crops; they want greater use of imported labour. There is no minimum wage for farm work and while some of the big farms use legal immigrants at previously agreed rates, many have what small farmers call an "indirect subsidy" since they hire wetbacks at wages as low as from 10 to 25 cents an hour.

Parallel to the drop in total farm employment is the trend toward fewer and bigger farms that are increasingly dependent on machinery and other labour-saving devices such as spraying and seeding from the air. On a completely mechanised cotton farm, for example, only ten man-hours are needed to produce a bale of cotton compared to the 155 man-hours required for a bale when only men and mules are used. These methods explain the apparently paradoxical rise in total farm output which has accompanied the drop in farm employment. If this increase in productivity continues, it will provide enough profit for still more mechanisation and make farmers less dependent on a large labour force.

Shorter Notes

As expected the steelworkers' union has postponed the strike, set for February 23rd, for a month, during which the Wage Stabilisation Board will go on trying to find an answer to the dispute between the union and the industry. This makes the third postponement of a strike originally scheduled for New Year's Eve, and Mr Murray, head of the union, has warned the country that his 650,000 members are running out of patience and will give no further extensions to the industry or the board.

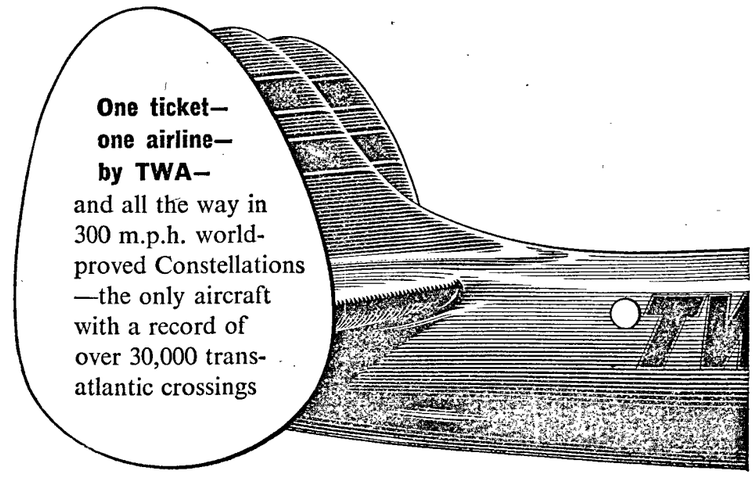
*

Republicans see a good omen for the future in their victory in a special Congressional election, the first of the year, held in a New York City district, where the vote has always been unpredictable. Thirty per cent of the voters turned out to elect a Republican to a seat vacated by a Democrat, in a campaign marked by strong Republican attacks on "Trumanism" and the three C's—crime, corruption and communism. The Democratic candidate evidently was not helped by his attempts to disassociate himself entirely from the Administration, a policy he carried to the extent of refusing to accept any support from regular party organisations.

*

The more Presidential candidates the better, as far as the manufacturers of campaign buttons are concerned. Their business has declined during recent elections, since, with the same candidates running each time, the majority of voters have been able to wear the same label in their buttonholes during successive campaigns. The profusion of Republican aspirants for the nomination this year has brought unusually brisk pre-campaign business (at $17.75 a thousand) to button headquarters, where Eisenhower, Taft, Stassen and Warren emblems are impartially turned out. In addition to the regular proclamation of favourites on lapel buttons, a new element has been introduced by Taft supporters, who, when they meet an opposing "I Like Ike" pin, can reverse their lapel to show a button with the retort "No Like."

*



After more than three years of thorough renovation, the White House will again be used as a Presidential residence this spring, when the Truman family moves back in from their temporary quarters at Blair House. The interior of the 161-year-old building has been almost completely rebuilt, as well as redecorated in colour schemes chosen by President Truman; his interest, some observers say, is evidence that he would like to go on living at the most coveted address in the nation, 1600 Pennsylvania Avenue.

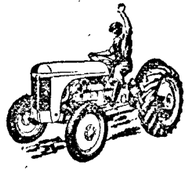
IS BRITAIN'S ECONOMY 76 YEARS OUT OF DATE?



At a time when Britain's whole economy is geared to the export drive, we are producing about as much food in this country as in 1875. Yet the whole success of the export drive depends ultimately on food production.

To sell goods abroad, prices must be competitive. Prices depend, through production and living costs, on the cost of food. The cost of imported food today equals more than half the total value of our exports, and is still rising. If we wish for a better future, therefore, we must grow more food — cheaper food — for ourselves.

Millions more acres can be brought under cultivation. The productivity of cultivated land can be increased. But this can only be done economically if we give farmers more economical machinery.

By enabling fewer men to grow more food at less cost, we can bring agriculture into line with modern industrial methods of production. Then, and only then, shall we get the cheaper food which is the basis of a sound economy. *Harry Ferguson Ltd., Coventry.*

THE WORLD OVERSEAS

What is the European Army?

ON February 22nd, the twelve members of Nato gave their general and particular blessing to a European Army which may or may not come into being; in general by approving M. Schuman's report on the present state of the Paris negotiations; in particular by endorsing a report by their own military committee which was bold enough to say that the military arrangements foreseen by M. Schuman would be militarily effective. Finally, Nato agreed on the physical and legal links between the European Defence Community (EDC) which would include Germany, and the Atlantic Organisation which at the moment does not.

If there was any idea still miraculously lingering in British minds that the details of the European Army need not concern them, the French assembly must have rudely shattered it last month. Whatever their precise relation, Britain and the EDC will have to be on the most intimate of terms if the hypothesis which Nato endorsed is ever to become a reality. The time has come when the most insular Briton must inform himself about the plans which six Continental countries have been preparing in Paris. The following is a summary of those plans as they stood at the beginning of this month.

I.—**Of what will the Army consist?** Land and sea contingents from France, Germany, Italy, Belgium, the Netherlands and Luxembourg. Norway, Denmark and Portugal, all members of Nato, stand outside. How many contingents from each country is not yet revealed—it may not even have been decided. But planners have been assuming that there will be something like 43 divisions, with appropriate supporting air strength, by the end of Nato's medium term programme—that is, by 1954. France and Germany will contribute in proportions of 14 and 12 respectively. All the land and air forces of the six member governments will automatically be transferred to the European Army with the exception of: National forces needed in overseas territories or for international commitments (as in Korea and Austria); forces needed at home as potential reinforcements for overseas contingents; police and gendarmeries. In the event of a crisis in law and order at home or abroad, members can apply to withdraw temporarily some of their European units. Apart from the police, these exceptions will not in fact apply to Germany; as it has no overseas possessions or other foreign commitments all its forces should in theory be European.

II.—**How will the Army be organised?** In present conditions of east-west tension it will be placed at the disposal of General Eisenhower's Supreme Command (SHAPE). SHAPE, at least, will say where and how it should be deployed. In time of war it would come automatically under its operational command. Common principles of recruitment, conditions of service, uniform, administration, equipment and training will form a special protocol to the European defence treaty. The French hope that these will include a common code of military—and, where applicable, civil—law, but most of the details are still under discussion. For land and air forces, there will be a basic national unit of varying sizes. For land forces it will roughly correspond in size to a division, though it will be much less self-contained for transport, communication and supplies. National infantry units will be 13,000 strong and armoured and mechanised units 12,600 strong, plus about 2,000 reserves. Integration will take place in army corps of three or four units of different nationalities (not more than 80,000 men in all) with an integrated general staff and full tactical and logistic support—fully integrated, in this case, at the brigade level. The army corps, to quote the French, will be "la véritable grande unité de bataille." For the air force, the national units will contain 1,200-1,800 men and 75 machines—roughly comparable to a "group" in the US air force. Integration will take place in the "tactical air command." The supply and maintenance services and full tactical support, including fighter, coastal and bomber commands, will be combined in even larger units called "tactical air forces."

III.—**Who decides production?** So far as men are concerned, proportions and targets will be allocated between members when the defence treaty is ratified. Alterations can be made only by unanimous agreement of the council of ministers (see below). So far as production is concerned the defence commission, the executive arm of the EDC (see below) will prepare an armaments programme for the community as a whole, submit it to the council of ministers and see that it is executed in the form approved by them. The commission should, for example, decide whether the Ruhr should produce tanks and artillery, or only parts for them.

In theory this should also include all arms, supplies and equipment needed by the army and air force, and implies standardisation and specialisation of arms production in member countries. In practice, this cannot happen for some time. The production, import and export of all war materials by member countries will be subject to approval by the commission, and, in the case of war material not for the benefit of the community, to licence.

IV.—**Who decides what shall be paid?** A common budget will in theory cover all the common expenses and receipts—including American military aid—of the community from the moment the treaty comes into force. How inclusive this will be—whether, for instance, it will cover supplies and equipment as well as arms—has yet to be defined. For the first two years, in any event, it will necessarily be limited by existing national commitments, by the slow development of the army, and by the peculiarities of each country's financial procedures. During the "pre-federal stage" of the community, national contributions will continue to be voted by national parliaments, in line, it is hoped, with the budget estimates as approved by the council of ministers. The ministers in turn will be guided by provisional estimates of expenditure and receipts made by the defence commission, and by Nato decisions on how the financial burden of rearmament shall be shared between the various countries.

V.—**Where does the political control lie?** It will be shared between national legislatures, an international council of ministers, and the "supranational" defence commission. A time in the future, when a responsible European assembly would have real political power over federal or confederate ministers, is a major assumption of the draft treaty. But for the present there will be a mixture of national checks and supranational balances. Broadly, the defence commission will be the executive of the community and will be truly supranational. In execution it has wide powers; but for all policy decisions it will be subject to the council of ministers, not only on specific problems but through the fact that the ministers can dismiss individual members of the commission. The council of ministers itself will decide by vote; some-

times by majority, in which case it will approach the supra-national, and sometimes by unanimity—the present formula of Nato. The council will in turn be guided by what it considers the national legislatures will agree to, more particularly in matters of finance where they have the last word.

There are to be two institutions that will be shared by the community and the coal-steel pool: a European court of justice, and a European assembly. (When the assembly is considering defence, France, Germany and Italy will send three extra delegates.) The court will interpret the defence treaty and the laws of the community. The assembly will have no real powers and few active functions beyond being able to complain about the budget estimates and censure the commission as a whole—when they must all resign. Its main function will be to draft a constitution for a European legislature with more positive powers, to take over at stage two of the EDC's political career.

VI.—**What are the relations between the council and the commission?** The defence commission will have nine members for six years each, three to be elected every two years by mutual agreement of member nations. While in office they are to have no national loyalties. They will organise training; inspect and control the administration of forces; supervise recruitment (which will be done nationally according to an international scheme), draw up mobilisation plans for men and resources, prepare armament and supply programmes and, in close consultation with national governments, the budget estimates; administer the same when approved; make junior officer appointments and recommend senior appointments to the council of ministers; maintain contact with SHAPE. In fact, they will constitute something very like a European ministry of defence.

The council of ministers, one from each country, will be the catalyst between the national parliaments and the commission. By unanimous vote, it may do the following: give the commission general directives; alter the composition of the forces and the details of the treaty, and decide that an emergency exists which calls for mobilisation. By unanimous vote also it must: nominate the senior officers and approve the total budget and the national shares of the total. By simple majority, it must approve the rearmament programme and the distribution of the budget under separate heads. By two-thirds majority, it can ask the commission to do anything within its competence and it can request the assembly to pass a vote of censure against the commission as a whole. But although voting in the council will be superficially one for one, there is for the case of the simple and two-thirds majority a formula which gives the larger contributors a larger voting weight.

Soviet Farming Record

THROUGHOUT the years of Soviet planned economy, agricultural development has always failed to keep pace with the growth of industry. This gap, due mainly to the fact that agriculture is less suitable for rapid planned expansion, has been further widened every few years by the vagaries of nature. It may now be gathered from the Soviet annual report that nature in 1951 has once again played havoc with the agricultural schemes of Russian planners. It is officially admitted that weather conditions have been bad in the Volga Valley, western Siberia, Kazakhstan and other regions. The results of the drought are unlikely to be as disastrous as in 1946 or any prewar famine year. But while industry has been forging ahead in 1951, agriculture has remained stationary, with the cotton and beetroot crop only slightly better than in 1950 and the grain, and probably potato, crops actually lower.

Thus little, if any, progress was made despite a substantial increase in acreage and further mechanisation. The total cultivated area, at about 380 million acres, is slightly larger than in 1940, though the grain acreage has not yet climbed back to the prewar level. The countryside has now at its disposal more tractors than the 523,000 available in 1940; for during the last six years alone over 670,000 tractors, in units of fifteen horse-power, were supplied to rural areas. It is claimed that 90 per cent of the ploughing and half the harvesting is now done by machines. In addition, the supply of fertilisers has apparently doubled since 1940. Yet, despite all this, the average yield is now only very slightly higher than before the war; for grain it is probably less than 4.5 quintals per acre.

The failure of the grain harvest must have been a particular blow to Soviet planners. For output was some 3.5 million tons lower than that of 1950, which was in turn 1.5 million tons short of objective. No actual shortages are likely to be felt in the Soviet Union. The proportion of grain earmarked for the towns, the so-called "commercial bread," was on the eve of the war 40 per cent and has been substantially increased since then. There should, therefore, be enough grain to feed the urban population and still leave a little for stocks. On the other hand, the Russians will probably have little surplus grain to throw on to the world market, and they must have hoped to use any such surplus as a powerful propaganda asset, particularly in Asia. Nevertheless, the greatest worry must be the long-term task of feeding the ever-growing urban population. Repeated failures of the grain crop may jeopardise to a certain extent further rapid industrialisation, which is the main Soviet objective.

(In Million Tons)

	1940	1950	1951
Grain	119·0	124·5	121·0
Cotton	2·7	3·75	3·75*
Sugar beet	21·0	23·5	27·0*

* The report claims that these figures were exceeded, without stating by how much.

As for cotton, a relatively poor crop will prevent the Russians from becoming completely independent of outside markets. Soviet propaganda assures its public that for the last ten years no cotton has been imported and self-sufficiency in cotton must be considered quite important, since the cultivated area was increased by one-fifth between 1950 and 1951. But the crop was only insignificantly higher, which implies a drop in the average yield. Heavy rains in Uzbekistan, where over half the crop is grown, have apparently spoilt the harvest.

Livestock production has again been disappointing. The original planned figures for 1950 have not yet been fulfilled. A revised, more modest three-year plan for livestock development in state and collective farms was drawn up, which was to be completed early in 1952. Even this, it would seem, has not been carried out; but it may be advisable to await some sort of a report on this plan before appraising Soviet livestock development.

Has this relative stagnation and the more obvious failures been due exclusively to natural calamities? It would seem that the dislocation created by the amalgamation of collective farms into larger units has also been a contributory factor. The amalgamation of some 245,000 farms into just over 120,000 should have ended early in 1951. During this transitional period the benefits of large-scale production could not yet be reaped, while all the disadvantages of reorganisation were felt. Collective farmers apparently took advantage of it to appropriate communal stock and tools. The larger units required the direction of agricultural experts, and it turned out that real specialists were still scarce. Last, but not least, the *Kolkhozniki* were frightened by visions of agro-towns.

When Nikita Khrushchev launched the amalgamation drive he spoke of bridging the gap between town and country, of transforming villages into rural towns and—by implication—of suppressing or reducing the remaining private plots. Thereby he has probably roused a slumbering volcano—the peasants' love of property. It is quite possible that in some cases the farmers answered by passive resistance and bad work, despite the repeated assurances of the authorities. Soviet propaganda, in fact, immediately proceeded to tone down Khrushchev's declarations. Lesser party dignitaries were allowed to criticise this member of the Politbureau, while reservations and limitations poured out from all quarters. Only last month *Bolshevik* proclaimed that

> the process of transforming the collective farm into the future commune must take place gradually, while farmers become convinced of the need for such change.

The idea of agro-towns has not been dropped, only put into cold storage. In the long run the Soviet rulers still wish to eradicate the social differentiation between town and country; but the moment is not opportune. Not only does the international situation make it dangerous to rouse peasant discontent, but the present priority given to heavy industry does not allow the shifting of scarce resources to rural building. Thus in 1951 only 400,000 rural houses were built, less than the average for the last five years.

The calculation of Soviet planners appears to be as follows: in the short run the main task is to raise agricultural output sufficiently to allow further rapid industrial expansion, and for this purpose amalgamation is sufficient. Soon, it is hoped, the benefits of large-scale production will begin to appear, and then the lag of agriculture behind industry will gradually decrease. In the race to close this gap an important role is to be played by the vast schemes of irrigation, aimed a reclaiming desert land and protecting other land from th threat of drought. These plans to "put nature on th defensive" are frantically advertised in the Soviet Union but since they form part, together with plans for canal building and hydro-electric development, of the so-calle "Great Projects" they may be better appraised in tha connection.

Renegades in Trade

THE balance of payments difficulties of the past few month have wrought havoc with Europe's scheme to free import from quota restrictions. One of the basic principles of th scheme was the right of member countries to restrict import if their external payments account was markedly in the rec Early last year Germany was told to control its imports i order to reduce its trade deficit. But it was clearly nc foreseen that within twelve months Britain would have t contract out, in part at any rate, or that France would hav to throw the whole liberalisation scheme overboard. Britai and France together account for some 40 per cent of intra European trade. And now, the whole future of the schem is in jeopardy.

Liberalisation was conceived in the summer of 1949 whe the United States was in the throes of its first postwa "inventory recession." Britain and Europe soon realise that the only bulwark to an unstable American economy la in the expansion of European trade, and that expansion wa not possible so long as trade was prescribed by bilater agreements. At first, the member countries of the Organisa tion for European Economic Co-operation agreed to abolis import quotas on at least half of their private trade in eac of the three main categories—food and feedingstuffs; ra

materials and manufactures. Twelve months later when the new European Payments Union was negotiated it was agreed to free in stages at least 60 per cent of private trade and then 75 per cent. A concession, however, was made in procedure. The 75 per cent was to apply to total private trade and the minimum of 60 per cent only to each of the three main categories. Thus countries could provide some protection for their domestic agriculture by freeing more than 75 per cent of their imports of either raw materials or manufactures, or both.

Widening Europe's Market

The simple formula of basing the percentage of private trade freed from quota restrictions on the actual pattern of trade that existed in 1948 enabled countries to keep to the letter of the scheme without increasing the volume of trade. If, for example, Britain imported azaleas under quota in 1948, but imported none in 1950 even when the quotas were abolished, this move counted so much per cent towards its objective to liberalise a certain proportion of its trade. Further, countries objected to the British policy of government import of foodstuffs which was excluded from the liberalisation scheme. Finally, so long as countries were left to choose which items they would free, the chance of creating a single European market—free from quotas, but not free from tariffs—was small. Hence a new technique was evolved early last year—the common list—where all countries agreed to abolish import quotas on the same goods in addition to the previous undertakings. Because the list was common to all countries, its scope was naturally restricted and covered in the main textiles and textile machinery. Even so, not all countries were able to comply. Apart from Germany, the exceptions were the smaller countries such as Austria, Denmark, Greece, Iceland and Norway, and even they agreed to adhere to the common list when they extended their liberalisation. Germany was a special case. It was allowed to revert to quota restrictions early in 1951 in order to reduce its chronic deficit with EPU. At the beginning of this year Germany freed once more 60 per cent of its private trade with European countries.

Last summer hopes that intra-European trade would soon be freed from quantitative restrictions were high. The exceptions that had to be made were not considered serious threats to the scheme. Indeed they were regarded as proof of its flexibility—a flexibility that did not curb a government's sovereignty over its domestic economic affairs. But the situation changed dramatically in the second half of 1951. Britain and the sterling area became a net debtor to EPU and had to meet 60 per cent of its deficit in gold; Britain and the sterling area were also running a large dollar deficit. Emergency measures were introduced in November and imports were cut by £350 million. Although only a few items on the common list were affected, something like a third of Britain's private trade with Europe was again subjected to import licensing. The additional import cuts of £150 million announced last January fell mainly on goods purchased by the Government or already controlled by licensing.

The French deficit with both EPU and the dollar area increased sharply in the last few months of 1951 and again in January of this year. A month ago the French Government announced that imports would be drastically cut; last week it renounced all its liberalisation measures and subjected all imports to quantitative restrictions. Just as Germany and the smaller countries were beginning to feel that they could play their full part in freeing intra-European trade, the two largest members of the European trading community had to contract out. And what of the future?

Britain is essentially a trading nation and it gains, not loses, from any move towards freer trade. The liberalisation scheme came from British initiative, and once Britain's balance of payments is again in surplus, it will no doubt abolish the recently imposed import restrictions. But if Europe's internal trade is to expand, liberalisation cannot be regarded as something to be jettisoned whenever the economy gets off an even keel. Admittedly a payments scheme that provided an effective deterrent to the constant creditor as well as to the constant debtor might help to ensure that commitments to free trade would not be frequently abandoned. But the vital prerequisite is for the participating countries to direct their domestic economic policies so as to maintain a balance in their overseas payments account. Autarky can only lead to trade restriction.

Holland: From Disinflation to Unemployment

[FROM A CORRESPONDENT]

At first sight Holland's economic and financial position during the past year has improved greatly, after the upheavals which were a consequence of Korea, devaluation and the general economic difficulties of the postwar world. Korea caused an upsurge of world market prices which was particularly disastrous for a country like Holland, depending on raw materials and foodstuffs from abroad. At the beginning of 1951, however, the Dutch government tightened the belt; it increased taxation, restricted credits, and raised discount rates. At the same time exports began to revive, partly as a result of domestic policies, and partly because of the revival of Holland's main export markets, particularly in Germany. In the course of the year many Dutch goods were sold in the western hemisphere, partly in Latin America, and the balance of payments improved considerably, although trade with the Benelux partner is still hopelessly onesided; Belgium exports far more to Holland than the other way round, and the progress of Benelux is at a standstill, if not in a state of complete crisis. But in the European Payments Union as a whole Holland's position is good, and even the deficit with the dollar area has been, if not bridged, at least considerably narrowed. The foreign currency reserve is steadily increasing, and as far as one can see at the moment, the deficit on the balance of payments for 1952 will not be 700 million guilders as was first estimated, but somewhere about 300 million. The national budget has been balanced and although the Minister of Finance looks duly pessimistic on appropriate occasions (as when new taxation bills are debated in parliament) it is evident from the published figures of tax yields that they are much higher than even optimistic observers dared suppose last year.

Fall in Demand

But there is one dark blot on the picture—unemployment is going up steadily. The most recent figures are: 128,000 people completely unemployed, 2,000 on half-pay, and 36,000 in the "DUW," a government agency for the promotion of public works. This is not so much unemployment as Holland had before the war; in 1938, for example, the numbers of completely unemployed varied from 250,000 to 360,000, and of "DUW" workers from 40,000 to 65,000. But it is far more than Lord Beveridge's famous 3 per cent estimate; this would lie, for Holland, somewhere between 90,000 and 100,000, and experts say that, if "invisible" unemployment is included, it has already reached the 200,000 mark and, worse still, is steadily going up.

Part of this is a consequence of the policies pursued by the Dutch government, part of it is simply caused by a natural fall in demand. The latter cause is evident in the slump in the shoe and leather industry, in textiles and in ready-made clothes. After Korea a buying spree started, but stopped, possibly from financial exhaustion, half a year later. The prices of these goods fell during 1951, but higher food prices resulted in a tighter—instead of a larger—family

WOMEN IN THE FACTORY NEED HELP IN THE HOME

CONSTANTLY the call comes for more women to work in industry, to increase production both for rearmament and for the export drive.
But if a woman is to work in a factory and at the same time run a home, she needs—and deserves—the best possible labour-saving equipment for her domestic duties.
We at Hoover Limited derive satisfaction from the knowledge that our electric cleaners are doing so much to relieve unnecessary domestic drudgery; and we are proud that their average retail price, exclusive of purchase tax, is only 30% higher than before the war, despite the fact that both quality and design have been improved. We are equally proud of our popularly-priced electric washing machine, specially designed for the very small as well as the larger home.
We look forward to the day when, with free supplies of raw materials available, we shall be able to maintain maximum production of both cleaners and washing machines. It is our aim to supply these *essential* pieces of equipment at the earliest occasion to all housewives in all sections of the community at the lowest possible prices.

HOOVER LIMITED

Makers of Electric Cleaners, Washing Machines, Polishers, F.H.P. Motors, Commutators, etc.

budget, and it is not accidental that the periods of large purchases of these durable consumer goods coincide with the periods of large withdrawings from the savings banks.

The slump in the building trade, on the other hand, is based on tighter financial controls. Fewer houses are likely to be built not so much because of shortage of materials, but because of the difficulty of financing housing projects. The municipalities, always large builders in Holland, are short of money, and propaganda for voluntary housing loans has had only incomplete success. The building trade, with about 7 per cent of all workers, has already 42,000 unemployed, or one-fourth of the total.

Prospects Not Bright

The prospects therefore are not bright, although some relief is in sight from half-pay systems. But the mechanisation and new equipment of the last few years have made many an unskilled worker almost unfit for employment, particularly in branches like the metal industries. Public works lighten the burden of unemployment by providing at least some work, but the psychological hardships of coarse, untrained manual work, loss of prestige and distance from the family remain, and the capacities for public works may be limited.

Politically the strange thing is that this policy, which can politely be called disinflation but is in fact deflation, is carried out by a government of nearly the same coalition structure as all Dutch governments since the war have had—with much social progressiveness in mind and on its programme, but now an increasing amount of Belgian-style *laisser faire* in its practical policies. Rearmament has made this necessary, but not less painful.

Parties and Politics in Italy

[FROM OUR ROME CORRESPONDENT]

SIGNOR DE GASPERI is now having to use all his powers of statecraft to hold his own in the Italian Chamber. He is beset on two sides: by the industrialists who are fighting bitterly against Italy's participation in the Schuman Plan now that this looks like being put into effect, and by the agriculturalists in his own Christian Democrat party who are trying to resist land reform. Dr Costa, the subtle leader of the Industrial Employers' Confederation—a powerful and well-organised group in Italy—has been telling the press that the Schuman Plan will put one sector of Italian industry under the orders of a non-Italian authority without any guarantee that international developments will not affect other sectors adversely. The leader of the sixty senators and deputies who oppose land reform is Signor Carmine De Martino. Until recently he had kept very much in the background, but lately the Wasps, as this group came to be called last year, has been very active under his leadership, and the government's manœuvring space has become very narrow.

The Wasps have been able to embarrass the government by virtue of the fact that there are two kinds of ballot in the Italian Chamber, secret and open. The Wasps began voting against the government in secret ballot early last year. When they do, the only way for Signor De Gasperi to re-establish his position is to insist on a vote of confidence—which has to be taken by an open ballot. So far the rebels have always come to heel when this happens, but the closeness of government majorities, and indeed the occasional government defeats, naturally have a bad effect on the government's prestige in the country. The Communists are quick to exploit this situation. Whenever they see an issue on which there is some opposition to the government's policies within its own ranks, they set in motion the procedure for bringing the debate to a secret vote.

This Communist tactic was adopted recently in the debates on state employees' pay, a topic on which the Christian Democrat trade union group is openly hostile to its government's attitude; this is one of the subjects which has driven a distressingly wide gap between the administration and its trade union supporters all over the country. Once a ballot is ensured in secret, whatever the original subject, the Communists know that other opponents of the government, like the Wasps, will vote against Signor De Gasperi out of sheer ill-humour.

Although making it clear that they would vote for the government when it comes to a vote of confidence, the Wasps have in fact received a bad press in the main middle-class journals. Signor De Gasperi, these point out, is now continually at the mercy of numerous followers whose political aims the public cannot grasp. It is true that the Wasp senators and deputies some weeks ago presented a bulky memorial to the party chiefs containing proposals for land reclamations, for the formation of mobile labour brigades, and for reducing the number of the Ministries. The public, however, already knows the sort of economic orthodoxy advocated by these Christian Democrat right wingers. What it wants to know is what their political plan is. All that is clear is that they dislike Signor De Gasperi's orientation of obstinate fidelity to a synthesis of liberalism and socialism, which is lofty in intention, cloudy in outline, and is kept working by the Premier's capacity to handle personally, with indefatigable adroitness, the tensions arising between his more and his less capitalistic, socialistic, nationalistic or theocratical colleagues.

Major Problems Remain

The load upon Signor De Gasperi (now Foreign Minister too) has become immense. It is an impressive fact that after four years of shepherding along the middle of the road Italy appears to be better off than at the beginning; but it is also true that the major economic and social questions are where they then were—the unemployed still unemployed, the outdated and redundant industries still outdated and redundant, the hesitant mood of the nation towards the great issues of foreign policy still hesitant (despite much pact-signing and some little rearming), and the prevalent Communism of the workers still prevalent. While most of the electors may still be as determined as they were in 1948 to keep out the Communists, they will when the new general elections take place, at latest in the spring of 1953, no longer feel that the mere exclusion of the Communists is going to set Italy on a short cut towards work for all, social justice, and *quieto vivere* in the international sphere—hopes which to some extent accompanied Signor De Gasperi in his triumph in 1948.

Meanwhile eyes are on the partial rehearsal of the general elections due at a much nearer date in the shape of provincial and municipal elections in Rome and farther south. Here it will be seen whether an anti-De Gasperi right-wing front can develop, on that specially favourable ground, and whose adherence and support it will win. Will the Monarchists and the Italian Social Movement ("neo-Fascists") really pull their weight together, as they say they will? Will the Liberals really fulfil their party directorate's pledge, uttered in distant Turin, to have no electoral truck with Fascists? Will Catholic Action, now presided over by the nationalistic Dr Gedda, join with the hierarchy in giving the same unequivocal advice as in 1948 to vote for Christian Democracy? Will the little "lay" democratic groups, from Social Democrats to authentic Liberals, really try to plough a lonely furrow? Some political expression the present feelings must achieve. The political astuteness and personal rectitude of Signor De Gasperi, fortified by a few impressive examples of devotion among his colleagues, will have to offset a truly formidable degree of discontent and bewilderment in the country.

Stick and Carrot in Poland

THE Poles have now published not only their economic balance-sheet for the past year, as the Russians and other east European governments have done, but also their detailed objectives for 1952. From these two documents and comments thereupon it is obvious that despite the admitted failure of agriculture Polish planners are determined to make the tempo of industrialisation still faster.

Partly because of a severe drought, partly because of "speculation and hostile subversive propaganda," agricultural output and supplies were much lower last year than in 1950. Even this year the damage is unlikely to be repaired, and production is expected to fall, at the best, slightly short of the level foreseen in the Six-Year Plan. Not so in industry. Industrial output, it is claimed, rose by almost a quarter in 1951 and should increase by nearly as much in 1952. Here there is no time lag compared with the Plan; on the contrary, by the end of 1952 industrial production should be nearly 17 per cent ahead of schedule. From the steeply raised annual targets it would appear that the Polish leaders intend to reach their long-term industrial objectives in 1954 instead of 1955, thus "fulfilling their Six-Year Plan in five years" on the Russian model. In fact President Bierut has already stated that it should be carried out nine months earlier than the original dateline.

	1949	1950	1951	Target* 1952	Target† 1955
Hard coal	74,100	78,000	81,900	86,000	100,000
Crude steel	2,304	2,515	2,792	3,325	4,600
Cement	2,301	2,512	2,688	3,266	4,950
Electricity‡	8,300	9,400	11,100	12,500	19,300

* New target. † Plan approved in 1950. ‡ Mn. kWh.

The achievements will certainly not be uniform. It will probably be difficult to accelerate the expansion of the coal industry, while the steel industry should make quick headway once the new mills of Czestochowa and Nowa Huta, near Krakow—expected to produce together 2.6 million tons annually—are fully exploited. The engineering and chemical industries are also forging quickly ahead, the production indices in the main branches rising by one-third to two-thirds every year. By comparison, output of consumers' goods is advancing at a snail's pace. Like Russia, Poland must pay for the rapid development of heavy industry by the relative curtailment of consumption, and despite all the assurances to the contrary this is apparent from the figures themselves. Thus, for example, in 1952 output of capital goods is expected to increase by nearly 30 per cent, that of consumer goods by less than 17 per cent. While in basic production Poland is quickly catching up with the industrialised western nations, it only produces one shoe per inhabitant per year and the target of one pair per inhabitant in 1955 may well not be reached. Output of textiles is progressing, but very slowly, and even so a large proportion is exported to the Soviet Union.

Increasing Burden of Defence

The discrepancy between heavy and light industry is an almost inevitable phenomenon in the rapidly expanding economies of the Soviet sphere of influence. But there are also other strains. Commenting on the Plan before the Central Committee of the Polish Workers' Party, Mr Szyr, the deputy chairman of the Planning Commission, complained of shortages of non-ferrous metals, which hindered the development of metallurgy. The Russians are probably unable to help in this sphere, since Mr Szyr talked of the need to become independent of "imperialist pressure." At the same time he spoke repeatedly of the need to step up defence production, which implies that the Polish economy is expected to bear another burden—to share in the rearmament effort of the Soviet bloc.

Another obstacle is apparently connected with the scarcity of manpower, particularly of skilled labour. This shortage is by itself a measure of the pace of expansion, since workers and employees (excluding agricultural labour) now number over five million, about one-fifth of the total population, compared with just over ten per cent in 1956 and an even smaller percentage before the war. True, this increase may be partly explained by the greater employment of women, who now account for nearly one-third of the total employed. Yet this must have been coupled with a rapid growth of the urban population, a growth which the Polish planners are intent on maintaining, if not increasing.

Thus, the stiffest tasks before them are really how to feed this expanding urban population, how to increase agricultural output and, last but not least, how to get larger supplies from the peasants. The problem must have faced the Polish rulers all along, and last year's drought has only emphasised it sharply. The crops were bad—an overall reduction of nearly five per cent compared with the previous year is officially admitted—the discontented peasant refused to co-operate, and the result was a shortage of potatoes and meat in the towns and of sugar beet and leather for industry, long queues outside shops, and even an indirect threat to the industrial plan. Assuming even that this year's weather will be more favourable, will the peasants cease to resist passively and what guarantee is there that they will not take advantage of any new shortages? In the report mentioned above Mr Szyr put a large part of the blame for the attitude of the peasants on the party's insufficient vigilance. Special meetings are now being held between the Workers' Party rural cadres and other groups to remedy that. But the authorities still seem to find it difficult to decide between a policy of coercion and one of cajolery.

All Depends on the Peasants

A recent move may well indicate that the government is in favour of sterner measures. The Polish *Sejm* has just decreed that each peasant will have to supply a certain number of cattle, pigs and poultry, according to the size of his holding. Formerly contracting was voluntary, and the authorities tried to encourage the peasants by prizes and tax reductions.

On the other hand this decree may be just an isolated act of desperation. Although Mr Szyr repeatedly referred in his speech to the lack of balance between town and country and to the inherent conflict between socialised industry and private agriculture, he made no mention of any plans for rapid collectivisation. He forecast only that the number of tractors available at special tractor stations would be increased by over 50 per cent. There is no doubt that collectivisation is the ultimate goal of the Polish planners. By the end of this year, however, state and collective farms combined are scheduled to account for less than one-sixth of the total arable land and agricultural output. This is certainly not enough to exercise a decisive role in the rural economy. Pressed by the incessant need to extract larger food supplies for the growing urban population, will the Polish rulers embark on a collectivisation drive despite the upheaval it may cause, or will they wait for a more suitable international situation to sap the peasant resistance? They must be pondering hard now on the danger of the stick and the ineffectiveness of the carrot, since it is on their ability to solve the peasant problem that the whole Plan and the planning system will stand or fall.

Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

THE BUSINESS WORLD

Purchase Tax and Utility

TO form an opinion about the report of the Douglas Committee on purchase tax and the utility schemes* (to which brief reference was made in *The Economist* last week) calls for fairly detailed knowledge of the origins of the utility schemes and also of the circumstances that led to the committee's appointment last July. It was set up jointly by the Treasury and the Board of Trade

> to review the present system of Purchase Tax affecting those classes of goods within which Utility schemes operate in relation to international agreements bearing on the internal taxation of imported goods and to the interests of the export trade, consumers and manufacturers

and in recommending any changes, the committee was instructed to have

> due regard to the need to maintain the advantage of the Utility schemes to consumers, the expansion of the export trade and the yield of Purchase Tax revenue.

The industries with utility schemes that came under the Committee's study are textiles, clothing, shoes and furniture. Utility articles do not attract purchase tax (with the exceptions of utility fur coats and fully fashioned stockings, which are both taxed at 33⅓ per cent). Non-utility products of these industries are taxed at three different rates. Clothing, shoes, furniture and bedding bear tax at 33⅓ per cent of the wholesale value, piece goods and household textiles at 66⅔ per cent and furs at 100 per cent. The utility scheme from its inception in September, 1941, has been the product of a mixed marriage between the Treasury and the Board of Trade. It was originally designed to provide the greatest volume of low and medium grade clothing, given the limitations of labour and materials in wartime. Manufacturers were cajoled and sometimes forced (by conditional allocations of materials) to produce utility clothing. Limited prices and standard specifications were laid down—the latter not to secure given standards of quality but rather to make price control effective. Exemption of utility clothing from purchase tax followed in August, 1942, in an attempt to limit the rise in the cost of living.

From this beginning there developed the incredible complications and the confused ideas that surround the utility schemes today. Some 539 specifications for boys' knickers and 781 specifications for men's shirts now exist and many hundreds of special licences have been granted giving the utility mark to goods that would be outside the specifications and, therefore, liable to purchase tax. The confusion of ideas arises from the common assumption that the utility schemes are an integral part of social policy—that they provide goods of guaranteed quality at cheap prices. If this was ever true, it is no longer so. The Board of Trade, in effect, decides how much of the output of these industries will be liable to purchase tax by the simple means of fixing the maximum prices for utility goods. The higher these prices are, the greater will be the volume of utility goods reaching the home market. But the rigid description of utility goods that was at first an essential feature of the scheme has been steadily loosened. A continuous process of piece-meal revision has left the Treasury with a residue of revenue problems and the Board of Trade with the unending task of adapting the utility schemes to meet the needs of producers and consumers as circumstances change.

★

Textile manufacturers have long complained that the utility schemes were prejudicial to British exports, because utility cloth was not of a quality to attract buyers abroad while non-utility cloth, with its extra burden of purchase tax, was unattractive to most buyers at home. The Board of Trade has shown some sympathy with this view, for during the last eighteen months it has modified one utility scheme after another so that manufacturers could adapt their production to take advantage of export opportunities without risk of severe loss if the goods had to be sold at home. Maximum utility prices have been raised, sometimes by as much as 30 per cent, and detailed descriptions of utility goods have been progressively abandoned.

This policy of relaxation has also cut the yield of purchase tax by increasing the volume of tax free utility goods on the home market. In 1948, before the wartime controls had been markedly relaxed, 72 per cent of cotton and linen cloth, 71 per cent of rayon cloth and 72 per cent of wool cloth delivered to the home market was utility. Some 62 per cent of all shoes (excluding those made of rubber) and approximately 90 per cent of the furniture was also utility. By 1950, changes in demand and more plentiful materials had reduced the proportions of utility cotton and rayon deliveries to 55 and 63 per cent but the raising of maximum prices had increased the deliveries of utility wool cloth to 85 per cent of the whole and of utility shoes to 97 per cent. Last spring, indeed, deliveries of utility wool cloth and utility shoes rose still further to 87 and 98 per cent of total deliveries respectively, while utility cotton cloth had fallen to only 54 per cent of total deliveries. It is generally believed that as a result of relaxations of the utility controls for cotton and rayon textiles made last spring, the proportion of utility goods of these materials is now nearer 80 per cent of the whole. The full effect of these latest changes in supplies on purchase tax receipts cannot have been felt until the latter half of 1951; but it is worth recalling that when the utility scheme for shoes was extended to cover the bulk of the industry's home sales, revenue from this one class fell from £12 million in 1948-49 to £3.4 million in 1950-51. In 1948-49, the total yield from purchase tax on shoes, clothing, household textiles and piece goods came to £95 million. In 1950-51, receipts were down

* Cmd. 8452.

to £83 million. The Board of Trade has since set in motion a chain of events that can only reinforce this decline, but the Douglas Committee was instructed to keep in mind a yield from purchase tax approaching that for 1950-51 which must be considerably higher than the current rate of receipts.

The British utility schemes have encountered much criticism abroad. At the meetings of the signatories of the General Agreement on Tariffs and Trade (GATT) in the spring and summer of 1951, there was concerted protest that the broadening of the utility schemes in the British home market discriminated against imported goods. This criticism was in fact justified for, with rare exceptions, foreign goods could not qualify for the utility mark and were accordingly liable not only to import duty, but also to purchase tax. The Douglas report quotes the case of a cotton dress fabric which, before the Board of Trade relaxed its regulations for utility cotton, sold as a non-utility product at 9s. 2d. a yard compared with 11s. a yard for imported cloth. Following the relaxations the British cloth sold as utility at only 5s. 2d. a yard while the imported cloth remained at 11s. As a result of these protests and of the accompanying threats of retaliatory action the Government undertook to make no further changes in the utility schemes until the committee had presented its report.

★

The report concludes that the single purpose of the 1,021 pages of utility price and manufacturing orders is to draw an arbitrary line between goods that qualify for the valuable concession of freedom from purchase tax and those that do not. The schemes no longer serve their original function of keeping prices down; maximum utility prices are now so high in certain classes that the bulk of utility goods are sold well below them. Except possibly for furniture, prices also bear no relation to quality because the detailed descriptions that once governed quality have been largely abandoned. Nor do they ensure that tax is borne by less-essential goods; evening shoes and dress suits can be bought tax free while some articles widely used in poorer households carry the full rate of tax.

Since the utility schemes are now composed of more patches than original fabric, the committee has wisely avoided any proposals that would make the patchwork even more complicated. Its terms of reference, however, call for "due regard to the need to maintain the advantage of the utility schemes to consumers"; and for this reason it has rejected the idea of a low flat rate of tax on all articles and decided in favour of a system that leaves a proportion of output of these particular industries free of purchase tax. But instead of purchase tax being levied, as at present, on the whole value of non-utility goods it would be assessed only on the excess of the total wholesale price above a tax-free limit. This suggestion represents a big advance on present methods. At one step, it removes the main grounds of complaint against the utility schemes. It removes any hint of discrimination against imported goods since these would rank for the same tax treatment as British goods; it reduces the heavy burden of tax where goods are priced just above the tax-free limit, and it suggests a means of checking the present decline in tax revenue. It has the further indirect advantage of placing the whole responsibility for defining the tax-free limits of production with the Treasury instead, as at present, of dividing it between the Treasury and the Board of Trade. It appears to have been in the committee's mind that these limits might be set annually as part of the Budget exercise and not open to further revision during the ensuing year.

There must be doubts, nevertheless, about the means that are proposed for applying this new system. The first problem is to estimate the level of tax-exemption at which goods in the utility classes would bring in a revenue of between £80 and £90 million a year. The committee was anxious that the proportion of tax-free output would be the same for all classes of goods and not range, say, from almost all the output of one class to barely half that of other classes. Plainly, then, the division between tax-free and taxed goods could not be fixed by reference to the present maximum utility prices. The committee, therefore, took as its starting point a survey carried out by the Social Survey into consumer spending in March and April last year. This survey, which has not been published, examined a number of purchases made by families covering a representative range of incomes from the highest to the lowest, and also the price paid for each article. When the purchases of each article were arranged in ascending order of value, it was found that if the price of the middle item in each list was taken as setting the tax-free limit, then, at current rates of tax, the revenue from taxing the upper half of the list by the method proposed would show no significant alteration compared with the tax yield under the utility schemes. On this evidence, the committee has recommended that the present rates of tax should be retained and the tax-free limit for each class of utility goods should be fixed in such a way that at least half the number of purchases would consist of goods carrying no tax. It follows that some tax would fall on goods that now bear none.

The statistical technique of sample surveys is highly developed, but it has still to be proved that the results are accurate enough to provide numerical data to form the basis of a fiscal system. For example, what changes will occur in the distribution of shoe sales, when roughly 48 per cent of the deliveries to the home market attract tax for the first time in several years? This part of the report is intriguing rather than conclusive. The whole operation of the "D" system needs much more convincing demonstration than it receives. The proposal to exempt half the purchases from taxation, and so keep the rate of tax on the balance unchanged, prompts comment on another count: it would still fail to provide encouragement for the production and sale of high-quality goods. Under the proposed re-arrangement, the amount of tax that they would attract remains almost unchanged. Admittedly, the new method of tax assessment proposed in the report provides so gradual a rise in the amount of tax levied above the tax-free limit that it offers the prospect of relief for producers and consumers of goods sold at prices just above that limit. But, for that very reason, the committee's assumptions that for social reasons the tax-free limit has to be set high enough to exempt at least half of the purchases from taxation surely call for proof. If all articles in a given class were to be taxed, the rate needed to bring in the desired revenue need not, according to the committee's own conclusions, be more than 10 to 12½ per cent on made-up articles and about 25 per cent on piece-goods. The committee interpreted its terms of reference to mean that such a flat rate of tax could not be recommended; yet it is simpler to administer than a scheme that divides output into a taxed and untaxed categories by methods that many producers and consumers will regard as recondite. The relatively low rate of tax would have provided the much-needed relief for quality goods without placing any intolerable burden on the cheapest products, and if the tax-free limit was fixed at almost any point below the half-way mark for purchases, the existing rates of tax could presumably have been reduced. No doubt these points will be studied by the Chancellor of the Exchequer. He has at least been armed with a report that throws full light on the anomalies and pretensions of the present utility arrangements.

Lower Prices for Used Cars?

PRICE control for secondhand cars has been considered officially, and turned down, on several occasions since the war. The idea still finds supporters; and a fortnight ago the official organisations of the motor industry and trade discussed its pros and cons in some detail. Such discussion is logical enough, for the supply of new cars to the home market remains hopelessly inadequate. Some 720,000 new cars have been sold at home since the war; there are still orders for 1,250,000 or more on the industry's books, of which only 60,000 are intended to be filled this year. The industry is "now making a further effort to discover whether any other steps can be taken to make the control of new car allocations even more rigid than it is now." In such circumstances, the argument that the sale of secondhand cars should also be brought under control is only human. Here is the one sector of the car market where demand still asserts its full influence on price. The trade associations have again rejected price control for used cars as impracticable, though it should be noted that in the United States the Office of Price Stabilisation, in conditions of much milder shortage, purports to control prices of used cars. But the proposal for similar controls in Britain must be judged in the light of current trends in the market for used cars—which are the only measure of the "free" demand for cars in general. The recent behaviour of prices is beginning to suggest that price control, as a means of moderating the premium that has been obtainable since the war for immediate delivery of a car, is not only impracticable but also is becoming less necessary.

The transformation in the car trade since the war can only be measured by recalling its prewar condition. In 1939, about two million cars were on the roads and new cars came onto the home market at the rate of 250,000 to 275,000 a year. If it is guessed that before the war cars changed hands on the average every two years, then the sale of new cars may have accounted for 20 to 25 per cent of the trade's turnover in units, probably 30 per cent or more of its money turnover, and between 40 and 50 per cent of its profit. Many dealers in the thirties circumvented resale price maintenance by the car makers by allowing exaggerated values for the purchaser's old car. Eventually the manufacturers, through the British Motor Trade Association, contrived to outlaw such competition between dealers by controlling the maximum "part exchange values" to be allowed in the 90 per cent of new car sales then involving such exchanges. This they did by refusing trade terms on new cars to dealers who departed from the values issued monthly in "The National Used Car Price Book."

Such control of part exchange values before the war was assisted by other measures that brought about an orderly price structure for second-hand cars. The trade papers published regular surveys of used car prices, while some large dealers and one private publishing company circulated elaborate guides about the second-hand market. Advertisements in the motoring press have always shown a remarkable uniformity in the prices that different dealers—and individual owners—quoted for a given car at a given date. In Great Portland Street, the physical centre of the London market, prices were equalised within close limits by jobbing traders who could make a living by sales between dealers, often clearing no more than a pound or two on each transaction. The pre-war car market was thus highly organised and well-informed; it was fed at the top by a carefully regulated supply of cars from the factories and drained at the bottom by the steady scrapping of cars from five to ten years old as repairs made them more costly to run; at the same time the number of aspirants to car ownership was increasing. The resultant price structure was simple and consistent. A year old car averaged about 75 per cent of list price, and for each successive year there was a reduction of about 20 per cent on the diminishing value. These steps in price were fairly uniform for the whole range of cars. The more popular of the lower-priced cars, such as the Austin Seven, held their price rather better than the average; so, to a greater extent, did luxury cars like the Rolls Royce and the Bentley. Medium-priced cars lost about 30 per cent of list price in their first year. But since the list prices of these medium-priced cars, in cost per lb of kerb weight, were often 50 per cent higher than the cost per lb of popular cars, they were evidently able to command a loyal public prepared to pay well for them both new and secondhand.

Today, the car trade is greatly changed. About 2,350,00 cars are registered, but the flow of new cars at the top of the market has been on the average only 120,000 a year since the war. If the average period of car ownership has doubled, say to four years, the 1952 quota of 60,000 new cars for the home market may represent little more than 10 per cent of the trade's turnover in units, though no doubt its contribution to total profit will be greater. The trade has to make up a considerable reduction in its earnings on new cars by the sale of used cars and by more service work, in maintaining customers' cars and also in reconditioning used cars for sale, the majority of them being of prewar vintage. The shortage of new cars at prices that have only recently risen far enough to begin to thin out eager buyers has entirely lifted the "downward step" structure of prices for prewar used cars; it now begins higher than current list prices for most postwar used cars, while many prewar cars dating back to the mid-thirties command higher prices than they originally cost. Control of second-hand car prices as a means of maintaining new sale prices has

no meaning today. The temptation, indeed, is of an opposite kind: to obtain a car just out of covenant at list price, a dealer might allow a buyer to jump the queue for a new one.

*

A sample of cars in the popular, medium-priced, and luxury ranges gives a broad picture of the current array of used car values. The first table compares the values per lb of kerb weight of prewar cars sold in 1939, and list prices for that year, with the current secondhand values of these cars. Even a 1935 car in the popular range still commands nearly 50 per cent above the 1939 list price; and a seller can still get the full 1939 list price for a medium-priced model 14 years old and a luxury car 16 years old. The second table shows the average current prices, again in terms of weight, of postwar used cars in the popular and medium-priced classes. In the medium-price range, 1950 models—the latest that are legally out of covenant—no longer command a premium over current new models. Prices in this range are beginning to move towards the prewar pattern, and declining in value by 10 to 12 per cent for each year of age. No average can fairly be quoted for higher-priced cars, though it may be noted that two diverse examples, the Jaguar and the Bentley, still command a premium for 1950 vehicles. These estimates imply that in free competition today the medium-priced cars might find it hard to command the loyal following that they enjoyed before the war.

An estimate of the future trend of used car prices must take account of the fact that the private customer no longer predominates in the trade. Before the war the proportion of cars sold for business purposes was generally put at about 40 per cent of the whole. Motorists for pleasure—including a considerable number of householders with incomes of between £5 and £10 a week—bought a majority of the cars that were sold. With a prewar initial cost of about £80 for a year-old Austin Seven, motoring for pleasure was possible at a total cost for running and depreciation of perhaps 25s. a week. Today such costs must be at least three or four times as great for a new postwar car purchased at list price (about four times that of 1939); and for a year-old car (now about seven times the corresponding price before the war), total costs must be even higher than four times. Salaries and the higher levels of wages have not risen enough to enable as many people today to afford £200 a year out of their net incomes for motoring as could afford £50 to £70 a year before the war. For many private motorists today, hire might well be a more economic proposition when they want to drive. It is the car owned by a business or operated to some extent for business purposes that dominates the postwar trade. An estimate of petrol consumption last year suggests that 80 to 85 per cent of petrol used by passenger cars was bought for commercial purposes; the costs and depreciation of perhaps 70 to 75 per cent of the cars on the road may be in one way or another chargeable against income tax, and as many as 85 per cent of new cars may be bought for business purposes.

Conflicting influences are likely to affect used car values this year. The reduction in the home quota of new cars to 60,000 would of itself tend to raise the values of used cars; but postwar experience suggests doubt whether supplies will be held down to this quota. In the same way, the two-year covenant that came into force in December, 1950, should hold 1951 cars out of the second-hand market and therefore bolster the values of those produced in 1950 and earlier. The British Motor Trade Association is still confident that no more than 2½ per cent of all covenants made have been breached. But it has given no estimate of the current rate of proved breaches, and the 11,782 investigated cases represent only those that aroused suspicion. Control of part exchange values before the war had important features that commended it to dealers; this is hardly true of the covenant scheme, and there is scepticism among some dealers about its present efficacy in all cases. These influences, nevertheless, would suggest some increase in used car prices in the next few months; so would the normal seasonal increase in demand in the spring.

But prices may also be affected by very important influences in the opposite direction, particularly so far as sales to business buyers are concerned. Any car so bought after April 5th—that is after the withdrawal of initial allowances—will cost the user much more than during recent years. With this change in mind, and encouraged by the tightening of interest rates and restrictions on capital investment, most prudent business houses will presumably already have expanded their fleets of cars to meet requirements for some time ahead. The influence of the budget may be in the same direction. An increase in petrol tax must be reckoned with; equalisation of vehicle tax between prewar and postwar cars has also been suggested. Disinflation, too, might be expected to promote lower prices; obduracy on the part of the banks might influence some private owners to sell their cars.

TABLE I—SECONDHAND PRICES OF PRE-WAR CARS, 1939 AND 1952

Prices in pence per lb. kerb weight	Popular Priced Cars*	Medium-Priced Cars†	Luxury Cars‡
List price 1939	19·1	28·6	97·0
1939 price of 1938 car	15·2	19·7	76·9
Price Jan., 1952, of car made in:—			
1939	49·9	42·9	161·0
1938	45·0	36·4	135·0
1937	37·8	27·4	115·0
1936	31·8	20·3	103·0
1935	27·9	16·4	94·0
Average appreciation, 1939 list to 1952 market price	163%	50%	65%

* Ford 8, Austin 7, Vauxhall 10, Morris 8, Standard 8, Hillman Minx. † Humber, Austin 18, Armstrong Siddeley, Lanchester, Daimler 15, Alvis. ‡ Bentley.

TABLE II—SECOND-HAND PRICES OF POSTWAR CARS, 1952

Prices in pence per lb. kerb weight	Popular-Priced Cars*	Medium-Priced Cars†
List price 1952 car (incl. tax)	77·4	119·3
Price Jan., 1952, of car made in:—		
1950	111·7	106·7
1949	103·5	97·0
1948	91·3	85·4
1947	82·9	75·5

* Ford Anglia and Prefect, Morris Minor, Austin A.40 (Devon model), Hillman Minx, Vauxhall Wyvern. † Singer, Sunbeam Talbot, Jowett, Austin Sheerline, Armstrong-Siddeley, Humber, Daimler.

None of these factors is measurable; but after April 5th the market for most used cars seems more likely to fall than to rise—and it might fall sharply. One or two medium-priced cars are already becoming harder to sell new at list prices; out-of-covenant values of these cars, on the average, no longer command a premium. In France, where for a time delivery of new cars was as protracted as it still is in this country, the market has now reached normal. Except for one or two popular models, fairly prompt delivery can be obtained, and used car prices now reflect a rate of depreciation on the list prices in line with prewar conditions. The car market in this country is unlikely to approach this state by the end of 1952, but there may well be increasing signs of a return to normal for cars in the medium price range. As new cars continue to be delivered, even in insufficient numbers, the logical trend would in any case be downwards. It may even be that towards the end of this year delivery dates will become shorter for some of the popular-priced cars, and that the premium obtainable for immediate delivery of a secondhand car will begin to shrink appreciably.

Business Notes

Size of the Budget

The Civil Estimates issued on Wednesday bear out the Chancellor's promise that the 1952-53 provision for civil expenditure, excluding quasi-defence items, would be about the same as the actual expenditure for the year now ending. The total civil vote for 1952-53, apart from that for the Revenue departments and the self balancing Post Office, will be £2,278.9 million; this represents a reduction of £64 million from the expenditure envisaged in the last budget (allowing for the £40 million reduction in the Exchequer contribution to the National Insurance Fund) and one of £260 million from the original estimates plus net supplementaries. As usual, however, the estimates include not only the defence portion of the Ministry of Supply expenditure that is reckoned in the defence budget, but also two directly traceable quasi-defence items—capital assistance to contractors and civil defence. The three items together are estimated at £176 million for 1952-53, compared with £136 million for the current year. When these are excluded, the total estimated civil expenditure therefore shows a reduction of £104 million from last April's estimates for 1951-52 and one of £300 million from the revised estimates. By far the greater part of this reduction reflects the expected decline in the provision for additions to strategic stocks and in the sums estimated for departments that are likely to be running down their trading stocks. By comparison with the revised estimates for 1951-52, the coming year's provision for strategic stocks is down by £128 million (to £61 million) while the votes for the Ministry of Food and the Ministry of Materials are down by £55 million and £50 million respectively, making a total decline of £233 million that seems to be mainly attributable to stocks.

If it were assumed that the total provision for 1951-52 will be expended, these calculations would leave some £70 million of the apparent decline in total civil expenditure in 1952-53 still to be explained. But in years in which supplementary estimates are large there is almost invariably a substantial shortfall of actual expenditure by comparison with the revised estimates. Since large adjustments often take place in the closing weeks of a financial year, it is risky to try to guess the expenditure likely to be charged in the remainder of the 1951-52 financial year; but if Supply expenditure during the last five weeks of this year were to show the same excess over last year as it has done in recent weeks, the year's civil expenditure would be some £100-£125 million short of the revised estimate. So far as can be judged at present, therefore, the final figures will broadly substantiate the Chancellor's estimate that the 1952-53 provision for true civil expenditure will roughly maintain the 1951-52 rate of spending.

* * *

Misleading Surpluses

On this basis, the 1951-52 total above line expenditure, including sinking fund, would be in the region of £4,100 million, or only about £60 million short of the total envisaged at the time of the last budget, despite the lag in defence expenditure. Even so, the above-line surplus of revenue will be very much larger than Mr Gaitskell then expected. A rough projection from last year's figures, adjusted for recent trends, would indicate an above-line revenue of some £4,400 million, compared with the budget estimate of £4,236 million; this would yield a surplus of around £300 million, whereas Mr Gaitskell budgeted for one of only £80 million. The prospective above-line surplus for 1952-53 is likely to be bigger still. The estimates for Supply services, including the £1,462 million for defence, £2,180 million for civil votes and provision for the revenue departments, stand at £3,686 million. If the additional cost of interest on the national debt is put at £30 million gross, and other Consolidated Fund Services are taken at the same amount as was provided twelve months ago, the above-line total of budgetary expenditure would be £4,300 million, a figure that will be well surpassed by the actual revenue secured in the current year.

In 1952-53 the revenue will be fortified by the first full year's yield of last year's tax changes (other than the suspension of the initial allowances), which should bring in £80 million. More important still will be the buoyancy of revenue from existing taxes. On the basis of this very tentative figuring, it will be seen that the yield of revenue has to rise by only £120 million to offset the prospective rise in ordinary expenditure, and it is likely in fact to be more buoyant than that. These calculations, it should be emphasised, take no account of the distortion that will be caused in the budget accounts by the new device of treating the sterling "counterpart" of economic aid from America as a deduction (of £85 million) from the defence requirements. This arrangement, which has been made to meet the wishes of the Americans, does not alter by one jot the amount of expenditure that has to be financed through the budget. But the fact that it may have the effect of enlarging the apparent above-line surplus makes it more than ever important to keep firmly in mind the warnings that emerged from the detailed survey of the budgetary problem in these columns last week. It was then shown that, despite the superficially reassuring appearance of the budget accounts, Mr Butler will not secure a sufficient disinflation to meet this year's emergency unless he fortifies still further whatever surplus confronts him on the existing basis of subsidies and taxation.

* * *

Delays in Defence Output

A valuable supplement to the information about defence production contained in the White Paper on Defence and the departmental estimates and memoranda issued this week is provided by a short interim report from the Select Committee on Estimates. This was specially prepared in time for next week's defence debate; it was released on Wednesday, and includes evidence taken as late as February 19th. This

late evidence affords a useful commentary on the Prime Minister's latest estimate of the cost of the defence programme as now £5,200 million, though hardly an explanation of it. The original sum of £4,700 million included the cost of the armed forces from 1951 to 1954 plus expenditure on re-equipment during that period; it did not, it may be noted, include expenditure upon atomic armaments. The figure of £5,200 million recently given by Mr Churchill was reached simply by adding about 10 per cent to take account of rises that have already taken effect in equipment prices "had it been possible to carry through within the three years the original programme as planned." But prices have continued to rise since, and in any case the figure did not represent an estimate of the costs of the armed forces for four years as well as the production of equipment. Such an estimate, according to the spokesman of the Ministry of Defence, "is quite frankly not possible." If a programme for a given piece of equipment cannot be met in time, it may be decided not to carry it out at all but to make a newer type slightly later. In these circumstances, the total estimates given in Parliament in huge round figures can have little real significance.

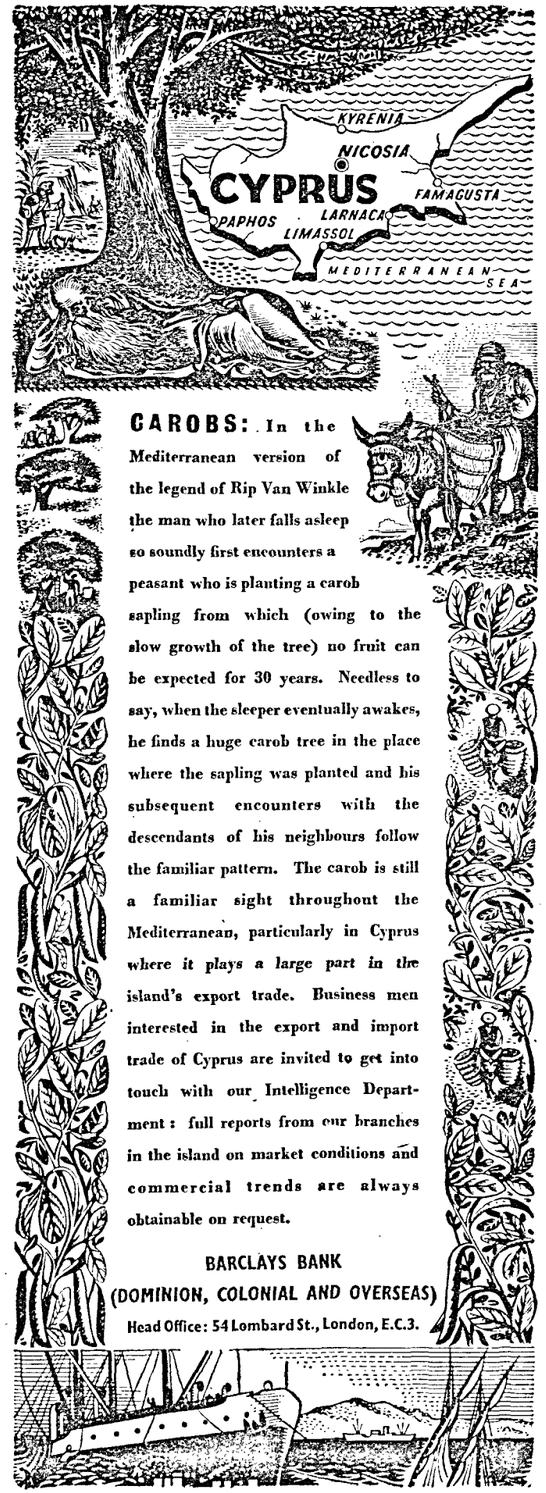
The report confirms that the main cause of the lag in defence production—measured, for example, by a 20 per cent fall behind the programme in deliveries of equipment from the Ministry of Supply to the service departments—is still the shortage of labour. There has been a general slackening in the general pressure of demand for labour throughout the economy, but the rearmament programme still remains only one of a number of increasing demands upon manpower resources. The defence industries probably took more than the whole of the net increase in the total labour force during 1951, but this was not sufficient. A memorandum by the Ministry of Supply to the Select Committee suggests that at the end of 1951 the factories actually working upon defence contracts had perhaps 25,000 workers fewer than had been hoped. But the metals engineering and vehicles group of industries as a whole, upon which most defence work falls, had 91,000 vacancies outstanding at the end of November, and this gives a more direct indication of the way in which its demands are growing. It can be inferred from the report that both the Admiralty's equipment suppliers and the Royal Ordnance Factories appear to be slightly more successful in recruiting general and skilled labour than do the aircraft and the machine tool industries, the two private industries most heavily engaged upon defence work; probably location of the particular yards and factories has some influence here. In view of this general shortage of labour, delays in deliveries of tools—except for the machine tool industry itself—have not hampered output as much as was expected, and though materials are short, only a few defence contractors complain that they are working "from hand to mouth."

* * *

Workers for Aircraft

Out of the total estimated expenditure of £727 million on defence production in 1952-53, more than 20 per cent will be upon aircraft. It is now admitted that the aircraft programme has met with serious setbacks during the year, largely from lack of labour. The industry has had the greatest difficulty in recruiting 23,400 extra workers since the end of 1950, and its labour force is still no higher than 177,000, 8,500 smaller than was needed to meet the production schedule. The White Paper on Defence published last week estimates that a further 50,000 workers will be needed by March, 1953, even though defence production will be spread beyond its original three-year limit and might therefore be expected to require a smaller number of men at its peak. According to the Navy and Air Estimates published this week delivery of aircraft, engines and spares from the industry to the value of £127 million is expected during the coming year compared with deliveries worth £95 million that were expected at the beginning of 1951-52. These aircraft will again consist almost entirely of variants of Venoms, Meteors and Canberras, together with a number of training and naval aircraft. The newer fighters produced by Vickers and Hawker are due to come into production during the year, and there is some chance that deliveries of these may start before it ends. By that time the first Valiant bombers may also be coming into squadron service.

Whether deliveries of aircraft will in fact reach the rate suggested in the estimates depends on whether the extra 50,000 workers can be found in time. During the past financial year the Ministry of Supply, which buys aircraft from the industry on behalf of the services, actually spent £18 million less on aircraft than had been allowed for in its estimates because the output of airframes and engines fell well behind. These delays can all be traced directly to lack of labour; among the factories most seriously affected last year was the English Electric plant at Preston, making the Canberra bomber. Here the company was competing for labour not only with established local industries, including a Royal Ordnance factory, but also with the new tank factory which is being built in the district. But as other manufacturers complete the tooling of their new production lines they, too, must expect to experience similar difficulties.



At first sight the recruitment of an extra 50,000 men would not appear an impossible task, but in gaining an extra 23,000 during the past twelve months, most aircraft manufacturers have exhausted the possibilities of local recruitment and this in itself may soon call a halt to the recent gradual rise in the number of workers entering the industry. Few factories are in districts where they can hope to gain labour from contracting consumer industries, so the industry is now almost wholly dependent on the transfer of more workers from other districts.

Realism in Steel Prices

The rise in steel prices that Mr Steven Hardie chose as an issue over which to resign his chairmanship of the nationalised Iron and Steel Corporation had already been discussed in these columns last week before his resignation became known. The arguments that Mr Hardie has since made public in great detail were there discussed in outline and judged on the whole to be unconvincing. The particular issue is one of respectable disagreement over economic policy upon which no opinion can be conclusive—though the same description can hardly be applied to some of the incidental arguments that Mr Hardie advanced in his press interviews or to the level of political debate stirred up over his resignation by his fellow-Socialists. The effect of his resignation and public apologia upon the timing of the increase in steel prices is interesting. The Corporation, with Mr Hardie in a minority, had in fact finally withdrawn its opposition to the slightly modified increases a fortnight before. The opposition that further delayed the announcement, to which reference was made last week, appears to have come from a somewhat unexpected quarter within the Cabinet. On February 19th Mr Sandys informed Mr Hardie that he was going to sign the order for an increase: on February 22nd Mr Hardie resigned with all guns firing; and on Monday Mr Sandys announced that the Cabinet had approved the increase and he had signed the order—though he did not then announce when the increase would become effective and the order was not, in fact, published until Wednesday. It may be, therefore, that Mr Hardie assisted in precipitating the announcement of the increase that he had opposed.

But by making the change in steel prices a political issue Mr Hardie also made most spokesmen of the steel industry chary of elucidating its economic background. Mr Sandys's own statement seemed designed to give a bare minimum of information. The increase was on the average about £4 a ton; it would cover £56 million of increases in costs amounting to £75 million a year, of which £29 million represented increases in costs at home and £46 million increases in the

Deposits as on 31/12/51 ...		**Pak. Rs. 438,200,000**

In selecting desirable trade relations for exports and imports with Pakistan, Habib Bank Ltd., with 45 branches spread over West and East Pakistan, can prove to be most helpful and you are invited to use our services.

The Bank is fully competent to handle all foreign exchange business, including opening and advising of commercial letters of credit, collection of documentary bills, remittances, etc.

FOREIGN BRANCHES: Bombay, Calcutta and Colombo.

CORRESPONDENTS & AGENTS at all important cities of the world.

AUSTRALIA AND NEW ZEALAND BANK LIMITED

In which are merged The Bank of Australasia Limited and The Union Bank of Australia Limited

The new Bank formed by the merger of The Bank of Australasia Limited and The Union Bank of Australia Limited, is known as Australia and New Zealand Bank Limited. The following points indicate some of the improved banking facilities and services which result from the merger.

RESOURCES · With an authorized Capital of £ENG.17,000,000 and the combined assets of the merging banks amounting to £A.475,000,000, Australia and New Zealand Bank Limited has powerful resources for the use of its customers.

LOCAL KNOWLEDGE · The knowledge and experience of local conditions in Australia and New Zealand, acquired by the merging banks in over a hundred years of banking, are at the service of the customers of Australia and New Zealand Bank Limited.

BRANCHES AND AGENCIES With the combined Branches and Agencies of the merging banks numbering nearly 600 in Australia and over 150 in New Zealand and Fiji, as well as an international network of Agents and Correspondents, Australia and New Zealand Bank Limited provides its customers with comprehensive and competitive banking facilities.

In the tradition of things well done

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

NATIONAL BANK OF INDIA LIMITED

cost of importing steel and steel-making materials; yet only £4½ million of the increase would be needed to cover in the home price the higher cost of imports of finished steel—£1 million for such steel from America and the remaining £3½ million for finished steel from elsewhere. The spreading of the cost of this imported finished steel over the price of all steel delivered in Britain was the second and more effective of Mr Hardie's arguments; indeed, he quoted counsel's opinion to argue that it was *ultra vires* the publicly-owned (and, therefore, presumably other) steel companies. Mr Sandys's estimate of the increase in the cost of this item needs clarifying.

*

On the whole of the million tons of steel from America the industry had expected a loss of about £26 a ton from selling it at home prices. A levy of 15s. 6d. a ton on British output of ingot steel to cover the loss on finished steel in particular has been in force since August (when Mr Hardie would have been more logical in obtaining his counsel's opinion); this would provide about £12 million a year for the purpose already. A total fund of £16½ million to cover the loss would imply that perhaps 600,000 tons of the 1,500,000 tons of steel that it is hoped to import this year might be finished steel, which seems reasonable. Whether this is so, and whether in that case the loss on American steel may require a large part of the existing £12 million plus Mr Sandys's "£1 million increase" might usefully be explained. But the arithmetic does not alter the principle. Mr Hardie wanted to sell about 11 million tons of British steel at a price that despite his equivocal evidence about profits is certainly too cheap, and about 1,500,000 tons of imported steel at its economic price. Mr Sandys and the British Iron and Steel Federation agreed to sell the British steel at what Mr Hardie's colleagues accepted as an economic price, and the margin of imported steel below its cost. Economic consistency is perhaps not to be sought here; but there is no doubt which course is more suited to the current conditions of steel shortage that have come about in part through inflation of demand while steel was too cheap.

* * *

Mr Hardie Makes Way

Arguments aside, Mr Hardie's departure from the nationalised steel corporation was logical and timely. No formal disagreements apart from the price issue may have arisen with the Minister. But the position of a convinced Socialist who had been appointed to bring the steel industry under state control, but since then instructed by a Conservative Government to "hold the position" while it put together the Bill for denationalisation that is now in draft, was obviously untenable.

It has naturally prompted the question whether the Minister might now decide to use the Iron and Steel Corporation, with perhaps modified powers, as the authority that must own steel securities during the period while the Government divests itself of control in one way or another. This might be logical, but it seems rather doubtful whether it will, in fact, be done. A draft so far prepared as the Ministry's Bill presumably is acquires considerable resistance to major amendment; and there might be misgivings within the private leaders of the industry over retaining in any form the instrument chosen for nationalisation. Mr Sandys has apparently found it easier to agree with Sir John Green, whom he has appointed as chairman, and with the Corporation's other members than he did with Mr Hardie; this is not surprising but equally not very important, except that some of the personalities concerned might conceivably hope for employment in a subsequent holding company or board. Nor should the Minister's stated intention to appoint a member in place of Sir John be taken as necessarily indicating any intention to prolong the life of the Corporation. The simple fact is that the 1949 Act lays down that the Corporation "shall consist" of a chairman and from six to ten members; after Mr Hardie's going reduced its total muster to a chairman and five, the Corporation was not properly constituted under the Act, and even its legal standing may have become questionable.

* * *

Royal Commission on Taxation

The Opposition intends to challenge the appointment of Lord Waverley as chairman of the Royal Commission on Taxation of Profits and Income, which was announced by the Prime Minister on Tuesday. Its motion of protest is to be debated next Monday, and it is easy to forecast the key in which the discussion will be pitched from the tone of the supplementary questions that followed the Prime Minister's statement. This statement recited the reasons why Lord Cohen had been unable, on his appointment as a Lord of Appeal, to continue to serve as chairman, and it also announced an important amendment in the Royal Commission's terms of reference, deleting the last condition of the original terms, which enjoined the Royal Commission "to make recommendations consistent with maintaining the same total yield of the existing duties in relation to the national income" and substituting therefor

> to make recommendations bearing in mind that in the present financial situation it may be necessary to maintain the revenue from profits and income; and, in so far as they make recommendations which would on balance entail a substantial loss of revenue, to indicate an order of priority in which such recommendations should be taken into consideration.

This change introduces a much-needed element of flexibility into the Royal Commission's work, for beyond doubt its original terms of reference were too restrictive to enable it to range into the larger issues of fiscal policy.

The challenge that has been set down, however, is not concerned with the revised terms of reference, but with the personality of the new chairman. Mr Gaitskell last Tuesday expressed himself at length and with vehemence on this point and concluded from the speeches and bearing of Lord Waverley when he sat as Sir John Anderson in the 1945-50 House of Commons that he was "quite unsuited to fill this post" and further that his appointment "only shows that the Government are determined to influence the conclusions of this Commission for their own party advantage." This is extreme language, which does injustice to Lord Waverley's ability and knowledge in this field and quite unjustifiably impeaches his independence of judgment and his readiness to give a fair hearing to the evidence presented to the Royal Commission. Yet, in more objective terms, there is matter for regret that the Government has not sought a chairman from the Bench. It is not that justice will not be done, under the new chairman, in these questions of complexity and controversy; but it is important that it should manifestly be seen to be done, by all sections of the community. The appointment of a chairman whom the Opposition chooses, rightly or wrongly, to regard as controversial is bound to weaken the authority of the Royal Commission's findings among its ranks and supporters.

* * *

More Uranium from South Africa

Reports that the project of obtaining uranium from the Rand gold mines is to be widened to bring in a number of new companies have an indirect bearing on recent announcements in this country about the progress of atomic research. The Prime Minister's statement that a full atomic armament programme had been undertaken followed a reference in the Navy Estimates to the possible use of atomic power in submarines. Marine engineers began work nearly two years ago on design studies for a nuclear power plant

of this kind and a stage must by now have been reached where construction of a prototype engine can be undertaken. As these and other projects develop they will call for a steady and increasing flow of uranium.

The South African mines promise to become one of the world's leading sources. By comparison with the few rich deposits the concentration of uranium in the gold-bearing ores is low—little more than one per cent—but the major cost of mining the ores will already have been borne in obtaining the gold so produced. Six mines have so far undertaken to treat the ores for uranium extraction by a process comparable to preliminary ore washing followed by rough refining. The project began in December, 1950, when the British and American governments, in conjunction with the South African atomic energy authority, agreed to provide machinery for these purposes on loan to four companies, West Rand Consolidated, Daggafontein Mines, Blyvooruitzicht Mines and West Reefs Exploration and Development. During the year Stilfontein and West Driefontein were also brought in, but the companies in the newly-extended scheme have not yet been disclosed.

Work has gone more rapidly than was expected, and uranium production should begin in a month or so. An indication of the speed and success of the project was given last week when the Ministry of Supply's supplementary estimates revealed that another £800,000 of plant had been supplied to the mines in addition to the £1 million worth allowed for in the full year's estimates. At present the Ministry gets its uranium from the Congo, the three other main deposits being in Canada, the United States and Turkistan. Commonwealth supplies will also eventually be increased by the recent discovery of reasonably high concentrations in the Rum Jungle of Australia.

* * *

New Hopes for Coal Exports?

The British promise to export two million tons more coal this year, which was made at the beginning of the year but continues to be produced with a flourish at each successive international conference on coal, must by now ring rather drearily upon European ears. But there are indications that it does signal a quickening of conscience about exports upon the part of the National Coal Board. In discussions upon fuel policy the Board is now beginning to speak of its duty to export as a reason for restraining the country's inland consumption of coal—in all forms ; and it seems possible that in its current review of the industry's national plan the Board's market forecasters may revise some of the none too optimistic export targets contained in the plan published in 1949.

Such a reassessment of the need for coal exports will presumably gratify the research and planning division of the Economic Commission for Europe, which this week published a report that holds recent British forecasts of overseas coal demand to be too cautious. This report, after tracing the obvious connection between the decline in British coal exports and the postwar shortage of coal in the rest of Europe, finds several grounds for criticism of the British industry. These too are obvious, but valid. It advocates " some means of keeping miners' wages in a more or less constant ratio to other earnings," more attention to attracting a better quality of manager to the industry, and price policies that would give an incentive to economy of consumption, arguments that are familiar to readers of *The Economist*. It makes also the less common point that in comparison with France and probably this year with Western Germany, the investment programme Britain has sanctioned for its coal industry looks inadequate. In fact, British capital expenditure in the industry in 1950 and 1951 fell below that envisaged in the Coal Board's own long-term plan, and the amount sanctioned for 1952 will be about the same as the £30 million spent last year, not the £38 million laid down in the original plan, which ECE took in making its comment. The amounts sanctioned for the other British fuel industries this year—some £40 million for gas and £140 million for electricity—also suggest that too little is being invested in mining development.

* * *

Recoil from the Australian Pound

At the end of last June Australia's total overseas reserves stood at an all-time high of £A843 million (or approximately £675 million sterling). By February 13th they had dropped to £A508 million, and were still falling with a resounding clatter. Up to the end of last year, overseas investors do not seem to have realised what was happening. Between June and December, Australia's sterling reserves fell by approximately £A245 million ; the figures are complicated by the funding of about £A62½ million of Australian-held British Treasury bills in November, but they are believed to be broadly correct. In this period Australia was running a visible deficit of £A215 million, and an overall deficit (on a conservative estimate of its customary net invisible payments) of not less than £A300 million. Even after allowing for some drawings on the existing World Bank loan of $100 million, there must therefore have been some capital inflow into Australia in this period ; the assumption that the Australian pound would not follow any new devaluation of sterling had apparently become sufficiently ingrained to make the Commonwealth still a magnet for funds scared away from London by sterling's plight.

Since the beginning of January, however, there have been signs of a rude awakening. Australia has now returned to a season when it is probably running a small visible surplus, but its reserves have been falling since early January at a rate of about £A15 million a week. It seems clear that speculators are now trying to draw some of their capital back. They are not, however, finding this as easy as they expected. Whenever speculative funds have been transferred to Australia in the past few years, their owners have been warned that they will not necessarily be accorded automatic rights of withdrawal. There are now reports that—at any rate for very large transfers—the teeth of the trap may be springing shut. The plight of those with funds in Australia must not, of course, be exaggerated. Repatriation is still allowed in reasonable amounts, and there seems no danger that the Australian pound will go to a wider discount against sterling in the foreseeable future ; in fact, if the World Bank experts now in Australia recommend a new $150 million loan (as is widely expected), confidence in the Australian pound may well revive. But, as the chairman of Australia's new merger bank, the Australia and New Zealand Bank, emphasised this week, the fall in wool prices, at a time when farmers are still spending heavily from their inflated savings, has clearly caused a severe deterioration in the country's external balance. The same factors are also at work in New Zealand, where fairly sharp import cuts are now inevitable. The Reserve Bank of New Zealand's sterling balances (which, in the past, have represented about two-thirds of New Zealand's total overseas assets) had fallen from a peak of £87 million last August to £21½ million by the end of January ; last year these balances recovered rapidly from a seasonal nadir of £47½ million from the end of December onwards, but there has been no sign of such a recovery so far in 1952.

* * *

Increased Fares

The Transport Tribunal has this week confirmed the revised scheme submitted by the British Transport Commission for passenger charges. This will now take effect in the London area on March 2nd and in the rest of the country on May 1st. The principal changes in charges were summarised in *The Economist* of January 26th. They entail a minimum fare on London Transport bus and train services of 2d., and for the country as a whole a standard single

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office : 38 Bishopsgate, London, E.C.2
West End (London) Branch : 28 Charles II Street, London, S.W.1
Manchester Branch : 52 Mosley Street, Manchester, 2
Liverpool Branch : 27 Derby House, Liverpool, 2
New York Agency : 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE "N.P.I." POLICY

not only creates capital out of income, but at a chosen retirement age the fortunate policyholder can apply this capital to provide an income for the rest of his life, without the anxieties of investment. And for fifteen years this income is tax-free.

Please write for the fully descriptive leaflet.

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

ESTABLISHED 1835

48 Gracechurch Street, London, E.C.3

railway fare of 1¼d a mile and an increase of one-fifth in standard season ticket rates.

But the effect of the increases may be very different for those passengers that have hitherto enjoyed the benefit of sub-standard fares and season ticket rates. The Commission may not increase by more than 42 per cent any sub-standard fare or rate during the twelve months after the scheme comes into force; this, however, is intended as a mitigation of hardship rather than a dilution of the principle which the Commission has been vigorously asserting that standard scales should prevail unless commercial considerations suggest that greater revenue can be obtained at sub-standard rates. There may be shocks in store for passengers hitherto travelling at sub-standard fares which owe their origins to competition between companies before the 1923 grouping or to the efforts of former railway companies to attract traffic to new services. The decision on every sub-standard rate rests upon the Commission's estimates of the effects upon revenue of lifting it to, or towards, the standard.

Pool Petrol to Stay

Unless Mr Lloyd is prepared to demonstrate that continuing to run British vehicles on pool petrol will afford really significant economies, the decision that he announced this week not to introduce premier-grades of motor spirit must appear as simply one of those "public relations cuts" of which the Government's predecessors were so fond. There is, certainly, some saving: distilling a lower-grade motor spirit from the crude does enable the largest possible output of all types of petroleum product from the refineries. But it also involves a technical misuse of the six catalytic crackers that are particularly important equipment in the new refineries in this country. These crackers are designed to produce a considerably higher grade of motor spirit than pool, and continuance of the present low-grade uniformity means operating them at less than full advantage.

The decision will do more than postpone the day when competition between brands arrives to justify the extensive development of exclusive filling stations that the oil companies have been carrying out for the past eighteen months; branding can have no significance when the petrol is the same no matter what name appears on the pump. It may, indeed, hamper motor engine development by preventing British car makers who have to sell the same car here and overseas from emulating foreign competitors in raising compression ratios. But its worst feature seems to be the refusal to take full technical advantage of the large refinery capacity that has been created in this country since the war. According to a recent estimate by the *Petroleum Times*, the refineries so far operating saved the country, on the basis of current prices, no less than £60 million in 1951 alone, by enabling it to take some 62 per cent of its petroleum imports in the form of crude instead of refined products, compared with about 18 per cent before the war.

* * *

"Suspending" the TDR's

Next week, for the first time since mid-1940, the banks will find themselves without any Treasury deposit receipts in their holdings of Government floating debt. The vestigial amount of £15 million that remained last Saturday matured during the week, and Mr Butler has confirmed by a written answer to a Parliamentary question that there will be no replacement of these maturities. There is no intention, however, to allow the TDR system to lapse entirely. The Chancellor stated that "the arrangements between the Treasury and the bankers concerned will not be terminated"; although seasonal and other factors will cause a "suspension" of TDR borrowing at this time of the year, "the scheme retains its usefulness . . . if and when the need arises, it may well be brought into operation again." This accords with general expectations. No new calls for loans against TDRs had been made since end-September, and at the time of the launching of the new monetary policy the total outstanding was already down to only £175 million, compared with £525 million at the beginning of 1951 and with the peak figure of £2,225 million reached in September, 1945. It was virtually certain, therefore, that the issue would run off entirely during the "revenue" quarter of the current year; but, equally, there was no doubt that the authorities would be unwilling to relinquish entirely a device that offers particular advantages under conditions when the Government needs to borrow heavily from the banking system, as it did during the war. Although it is much to be hoped that such conditions will not recur, the authorities are merely acting with reasonable prudence in deciding to keep the "arrangements" in being.

It is also to be hoped, however, that unless such conditions do recur their actual recourse to TDR borrowing will consist merely of small "token" issues designed exclusively for this limited and technical purpose. The distinctive feature of this form of borrowing is that it is made by direct calls on the banks, which are virtually required to provide the amount sought. Moreover, they cannot in practice secure repayment of the TDRs before maturity (except to the extent that they are transferring funds to the Treasury in payment of their own or their customers' subscriptions to any government loan currently available on tap) and can never be sure that maturing issues will not be replaced by new borrowings. In recent years, when the only Government issues on tap have been tax reserve certificates, the pre-encashment facility has ceased to have any real significance, so that, even before the change in monetary policy, the TDR was one of the least flexible of bank assets and was widely disliked. Now, under a regime of more orthodox monetary control, when the banks have to watch the ratio of their liquid assets (cash, call money and bills), any considerable use by the Treasury of TDRs would be particularly undesirable. The object of the new policy should be to ensure that the banks respond to the normal pressures of the market-place, and they should be left as free as possible to manage, as they think fit, such liquid assets as orthodox official policy makes available. The authorities should not feel themselves free, as they have been in the past, to reduce the supply of liquid assets merely by the expedient of switching Treasury borrowings from bills to TDRs. If the supply of liquid assets is larger than the needs of orthodox monetary discipline dictate, the right way to reduce the supply—in default of budgetary measures to reduce the Treasury's need to borrow—is by making open funding issues on the market.

New Money for Films?

Under a new Bill introduced in Parliament this week the National Film Finance Corporation, which has been lending Government money to film producers during the last three years, is empowered to borrow up to £2 million "from other persons" for the same purpose. The original company set up by the state obtained funds from its bankers under Treasury guarantee. The Corporation has obtained its finance from the Consolidated Fund, through the Board of Trade, and the new money it may raise from outside is also secured, in the long run, by a clause in the original Act under which, when the Corporation is wound up after March 8, 1954, its outstanding liabilities will be met out of public funds.

It is not easy to discern the advantage of this arrangement. Whether a corporation set up by Parliament to lend public money, which has already been obliged to write off large amounts of the funds it made available to films that have made a loss, is a useful instrument to channel private money into film production seems doubtful. It is probably fair to say that the NFFC, under Mr J. H. Lawrie, has been more successful in controlling the amounts spent on many of the films it has financed than have other backers of films in the past. During its period of existence, too, there has occurred a closer attention to efficiency in making films and a slight general improvement in the prospects of the British film production industry, partly for reasons outside its influence. But this use of a Government-sponsored body to invest private funds under an implied long-term guarantee seems yet one more dubious expedient in state support of an industry that is always ailing or convalescent but never quite recovers. Since in the long run the new arrangement still means that the state will bear the risk, it might be preferable for the Corporation to keep to public funds.

Confused Outlook for Copper

Dearth of copper is, at the moment, one of the most serious obstacles facing American industry. Recent reports from the other side of the Atlantic suggest, however, that supplies may become easier in the second half of the year. Admittedly, the "stretching out" of the rearmament programme has enabled the Defence Department to hand back small quantities of the copper allotted to it, and meanwhile world output of copper is increasing—American production itself is expected to rise from 1,070,000 long tons to 1,120,000 tons this year. But consumption in the United States is rising even more steeply; last year it totalled 1,220,000 tons and unofficial forecasts for this year put the figure as high as 1,425,000 tons. Imports from Canada are to rise from 56,000 tons to 71,000 tons, and supplies from Chile will no doubt meet most of the remaining deficit. In any case the 50,000 tons which were withdrawn from the stockpile a few months ago must be replaced this year. Given these prospects, the chances of freer supplies of copper this year seem remote. Probably the American reports reflect the fears of the copper producers that continued shortage will hasten the switch to aluminium—which is already so extensive as to cause a minor revolution in the use of metals. At least one big copper company has already entered the aluminium field.

In 1952 total supplies of copper for this country may reach 370,000-380,000 tons, if there is no serious interruption to Rhodesian output; in January and February Rhodesian production fell below the expected level because of transport and coal difficulties. Britain's first quarter allocation from the International Materials Conference amounts to some 98,000 tons including scrap. Allowance must be made for increased imports of blister copper later in the year to ease the shortage of scrap, and on this basis, consumption of primary metal in 1952 will probably absorb the entire prospective supplies—370-380,000 tons compared with last year's consumption of 335,000 tons—with the same restrictions on use. Fortunately, stocks should ease what looks like being a very tight year.

Free market prices of copper have recently been falling and the premium over the world price has narrowed considerably. A week or so ago, Chile, which is allowed to sell 20 per cent of its production outside the IMC allocation scheme, reported substantial sales to Germany and other Continental countries at around 35 cents a lb compared with the world price of 27½ cents. Now Chile seems to be finding difficulty in disposing of the 20 per cent "free quota" and according to reports it would be willing to forgo its free quota in exchange for a rise of 6 cents a lb in the official price of copper. The weakness in the spot market does not necessarily indicate that the shortage is passing. The IMC allocation scheme has enabled countries to cover their most essential needs at the world price and given present uncertainties in world commodity markets, buyers are no longer disposed to buy copper at any price.

"PUNCHBOWLE Tobacco stood me in good stead through the most harrowing Examinations," says this South African College-man.

Staff Mess, ... Mines, South Africa.

Dear Sirs,
During my three years at College I enjoyed your PUNCHBOWLE Tobacco, and it stood me in good stead through the most harrowing Examinations.
I now find myself as a junior official on a gold mine, with none of my favourite Tobacco—a very bad state of affairs.
I wonder if you would be good enough to let me know how this situation can be remedied.
Yours faithfully,
.....

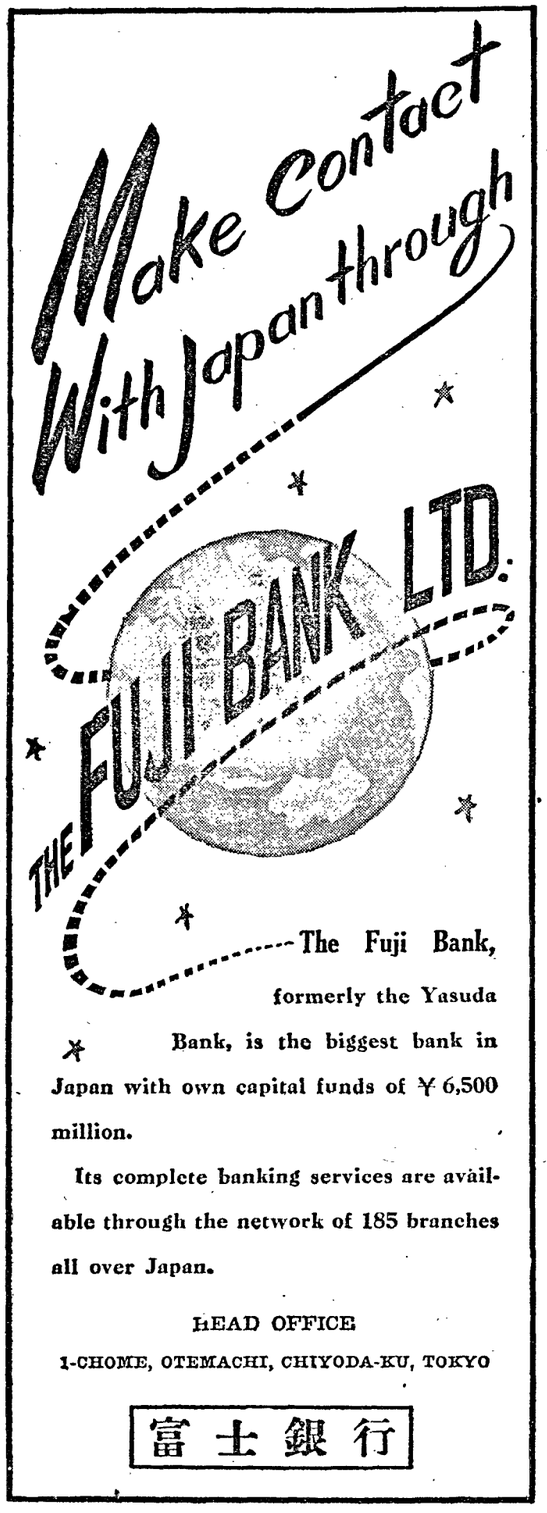
Freedom for Lead?

The disappearance of the free market premium for spot supplies of lead has raised hopes that private dealings in this metal in the London market might soon be resumed, and a formal request to this effect was recently made to the Ministry of Materials by metal merchants. Since the beginning of this year, lead has commanded the same price in the free market as the official American price; eight months ago the free market price was nearly double the New York price. During the past fortnight the free market price for zinc has also fallen to the official American level, and while "free" it was last summer. Copper and zinc, however, are both copper still commands a premium it is much smaller than allocated by the International Materials Conference in Washington; lead is not. Further, most of Britain's lead requirements come from the sterling area.

Consumption of imported refined lead in this country last year amounted to 163,000 tons or almost the same as in 1950. But the monthly rate declined almost continuously from 16,300 tons in January to 9,400 tons in December, and consumption in the first two months of this year is reported to have shown no improvement on twelve months ago. Slightly more English refined lead was used in 1951, while the consumption of scrap increased by 13,000 tons to 109,000 tons. Imports last year rose by 3,000 tons to 175,000 tons; increased supplies from Canada, Mexico and Peru in the second half of the year made up for smaller quantities from Australia. Shipping difficulties reduced Australian supplies last year, and in the earlier months of the year led to a fall in stocks. At the beginning of last year stocks amounted to 62,000 tons. By the end of April they had fallen to 25,000 tons but a later recovery raised the total at the end of December to 77,000 tons.



Stocks should be adequate particularly if, as seems likely, consumption has passed its peak. Normally Britain can count on 130,000 tons from Australia, to cover about 80 per cent of its import requirements. The risk of incurring a dollar loss under private trading would therefore seem small. But a London market would have only a limited value without arbitrage facilities with the New York market. And until the United States becomes a permanent importer of lead (as it is of tin), the dollar loss from arbitrage dealings could be large. No doubt this risk makes the Ministry of Materials cautious about handing lead back to private trade.

* * *

American Rubber Policy

The United States Government has decided to hand back the importation of natural rubber to private trade from the beginning of April. The Government became the sole importer on December 29, 1950, in order to secure, so it said, adequate supplies for its stockpile without driving up prices. Whereupon the price of rubber rose to its peak of 72d. a lb two months later. Any move from government to private trading is welcome, but it would be wrong to assume that American consumption of rubber will necessarily increase in coming months. Existing controls on civilian use of natural rubber are to continue and for the first quarter consumption is limited to 105,000 tons. In addition some 45,000 tons of natural rubber latex is expected to be used this year, making prospective total consumption for the year of 465,000 tons.

The return to private imports implies that the American stockpile has reached its minimum figure of a million tons, though only some 850,000 tons was actually in the United States at the end of 1951. The remainder was either afloat or awaiting shipment. The question now arises whether the American authorities will ease the restrictions on the consumption of natural rubber. A slight increase in the monthly rate might well be permitted. But the ultimate target for the stockpile is said to be 1,250,000 tons, and if the United

The Fuji Bank, formerly the Yasuda Bank, is the biggest bank in Japan with own capital funds of ¥ 6,500 million.

Its complete banking services are available through the network of 185 branches all over Japan.

HEAD OFFICE

1-CHOME, OTEMACHI, CHIYODA-KU, TOKYO

富士銀行

States Government intends to complete this extended programme this year, the hope for any major relaxation of controls would seem to be small. At least the rubber producers can console themselves with the expectation that total American imports in 1952 should be of the same order as last year, when they totalled 730,000 tons.

But it is not so much the size of American imports that is worrying the rubber producers as the way in which the stockpile has been used in the last few weeks to depress the price of rubber. Technically, releases from the stockpile can be made only in cases of emergency, and during the past year no such releases of rubber have been made. The authorities, however, can turn over their stock of rubber, and recently they have been doing this by selling spot and buying forward. What is, perhaps, even more galling is the publicity given to these tactics in the United States. Last year's resentment about producers "gouging" the American public has been turned into glee, now that the United States is trying to turn the tables on the producers.

Shorter Notes

The international conference on German debts opened at Lancaster House on Thursday. Some thirty-one countries are attending this conference, which is expected to last for at least two months. The indications are that the proposals that the German Government will lay before creditors in the opening rounds of this bargaining bout may be somewhat shabbier than there was reason to hope a month ago.

*

The maximum credit period normally permitted for British acceptance credits covering exports to non-sterling countries has been reduced from 120 to 90 days; the Bank of England will only allow new acceptance credits in excess of this period for exceptionally long bonds. Although the number of existing acceptance credits with more than 90 days before maturity is believed to be relatively small, some foreign importers have apparently been helped to build up short speculative positions in sterling by 120 day credits. In any case, the movement to cover short positions following the announcement of the new decision on Wednesday was sufficient to lift the sterling dollar spot rate in London above the official support point of $2.78 for the first time in some weeks; the rate closed on Wednesday at $2.78¼-$2.78½.

*

The British Electricity Authority is raising from April 1st the charges that it makes for bulk electricity supply to the Area Electricity Boards. The demand charge—which broadly may be taken to represent capital and indivisible costs of generation—is to be raised from £4 2s. 6d. to £4 5s. 6d. a kilowatt. The running charge remains at 0.33d. a unit, with certain variations in accordance with the price of coal in different areas.

*

Wage rates rose by £352,000 for just over a million workers during January, and the index of rates of wages rose by one point to 127 (June, 1947=100). The interim index of retail prices, which has the same base date, was 132 on January 15th, compared with 130 a month before.

*

In advance of the annual report to be issued on March 18th, Mr J. F. Thompson, the chairman of International Nickel, has announced that the company's receipts from the sale of nickel and other metals in 1951 are estimated at $286,700,000, as compared with $228,071,346 in 1950. The company has been working at full capacity and has installed emergency facilities several months earlier than had been originally planned, and was thus able to mine 11,800,000 tons of ore, compared with 9,849,000 tons in 1950. This increase of nearly 2 million tons came entirely from underground ores; production from underground workings reached a new record level of 7,780,000 tons. At the same time the extensive underground development programme was brought a step nearer completion; by the end of next year no more surface ores will be mined and the company then expect an annual production of 13 million tons from its underground workings.

Company Notes

Bowater Paper.—The Bowater Paper Corporation and its thirty-six subsidiaries earned bumper profits of £11.4 million in the year to September 30th last, compared with £5.9 million in the year before. The British mills made the greater part of their earnings not from their major product of newsprint but from other descriptions of paper and board, which are also subject to control, both as regards tonnage (whether for home or export markets) and prices. "A not unappreciable part of increased earnings" arose on stocks of raw materials and of finished goods. When the controlled prices of the latter were increased last year the corporation was quick to pass on these price increases to their customers. Despite this, demand remained high enough for all sections of the organisation, from the pulp mills in Newfoundland and Scandinavia to the paper mills in Britain, to go on working at substantially full capacity. Just over £5 million, against £1.9 million, of the year's profits had, however, to be provided for taxation, and the directors consider that a good part of the remaining net earnings should be retained as a protection against any future fall in prices. As there are some indications that prices have in fact reached their peak, subsidiaries in Britain have wisely put about £1.5 million to specific reserves to guard against this contingency.

In the balance sheet, the value of stocks is shown to have risen from £9,930,299 to £16,346,597—a rise "attributable not to their greater volume so much as to their enhanced cost." Trade credit seems to have been granted to the corporation quite readily; "accounts payable and accrued" have risen from £2,409,810 to £3,973,858 and "bills payable and acceptance credits" from £2,128,746 to £3,485,000. The apparent ease with which credit has been obtained and the substantial retentions from profits—subsidiaries alone have ploughed back nearly £2.7 million (against £1.1 million)—have enabled the corporation to finance high-priced stocks "equivalent to several months requirements" without imposing any great strain upon liquid resources. At one time the Bowater group had hoped to secure a further expansion in production at home this year, but this no longer seems possible now that the government has re-instituted control over its purchases of raw materials by rather rigid rationing of its dollar expenditure. Nor can the boosting of profits by further price increases be expected to continue indefinitely. It would be over-optimistic for shareholders to look much beyond the maintenance of the dividend of 15 per cent. that has now been recommended on the increased ordinary capital.

Linen Thread.—In addition to its mills in Britain and Northern Ireland, Linen Thread has subsidiaries as far afield as the United States, Canada, Australia, Brazil and Japan, and its fortunes are now more closely bound up with overseas than with British markets. In the year to September 30th last overseas interests contributed 57 per cent of the group's trading profit of £2,894,910 (against £2,065,365) while half of the profits earned by the British mills came from direct exports. The chairman, Mr. George Knox, is therefore concerned in his address with far-flung trends in demand — and his outlook is a gloomy one. In Australia, last year's earnings showed a substantial improvement, but the chairman declares that the control of prices and profits (and arbitrary increases in wages) make it difficult to secure a satisfactory return on the money invested by the company. In the United States, he warns shareholders that there is evidence of overproduction and of a decline in activity—a

matter of considerable moment to Linen Thread as the profits of the American subsidiary, converted at the present rate of exchange, form a substantial proportion of the group's sterling profits. In anticipation of a shortage of its principal raw material, the company made substantial purchases of Belgian flax at the beginning of the financial year. As yet, therefore, production has not been threatened by a lack of raw materials. But a fall in the price of cotton and jute has already forced the company to write down the value of part of its stocks, particularly of those held in the United States.

An increase in the volume of stocks, coupled with the increase in prices over the year as a whole, has led to a rise in the book value of stocks by £2,702,256 to £7,973,727. The chairman points out that with stocks at this value, the highest in the company's history, "even a modest recession in price would necessitate a considerable write-down." A serious fall in value is not expected, but Mr Knox reminds shareholders that the company's reserves, totalling £7,032,818 (against £6,522,358), should be weighed against "the types of assets by which they are represented." Mr Knox believes that the immediate future will be "a period of readjustment following on a tremendous spate of activity," and that profits in the current year are likely to be lower than in 1950-51. Sales to date have been almost

maintained, but new orders are not being placed on the scale of a year ago, and the volume of work on hand is falling. Despite last year's high profits, the ordinary dividend has therefore only been maintained at 15 per cent.

★

Borax Consolidated.—In the year to September 30th last, Borax spent about £1 million on increasing its productive capacity and on the modernisation of plant, and enjoyed a booming sellers' market. As a result, its group trading profit rose from £1,490,489 to £2,238,687. Demand was stimulated by stockpiling by consumers who feared a future shortage; in meeting this demand the Borax group broke all previous production records—and, by securing a larger spread for overheads, kept down its own production costs. Unfortunately, however, raw material costs and freight and handling charges raced ahead; last September ocean freight represented nearly 33 per cent of the price of borax c.i.f. European ports, compared with just over 15 per cent in June, 1939. Inevitably, these rising costs are reflected in an increase in stock values, from £1,375,147 to £1,950,901, but this has been weathered without any sign of strain upon liquid balances. The fall in net current assets, from £2,589,072 to £2,307,086, is explained by the chairman as being due to heavy capital expenditure and to increased tax liabilities in the United States. Equity shareholders have not been neglected in this year of records; a dividend of 10 per cent is to be paid on the deferred ordinary capital of £3,000,000 as increased by the 100 per cent. scrip bonus; this compares with the dividend of 15 per cent paid in 1949-50 on the original capital of £1,500,000.

The future, however, does not look as bright as the past. The chairman warns shareholders that since the end of the financial year the company has been confronted with a buyers' market. Demand has fallen away and is not expected to revive until the large stocks built up by many customers last year have been run down; moreover, increased competition is expected from two new ventures in the United States. Already production has been reduced, so as to avoid the accumulation of unwanted stocks in the group's own warehouses. In many ways

Ordinary capital	1,500,000	3,000,000

£1 deferred stock at 33s.xd yields £6 1s. per cent.

1950-51 was an exceptional year for Borax; it remains to be seen whether the distribution now made to equity shareholders is equally exceptional.

★

English Electric.—Last December, when English Electric placed £3 million of a new debenture stock issue with the Prudential Assurance and made an offer to its ordinary shareholders of 1,179,577 £1 ordinary shares at 55s. each, the directors stated that profits in 1951 were in excess of those earned in 1950. A preliminary statement now shows that group profits before taxation and depreciation have in fact advanced by over 18 per cent on the year, from £3.8 million to nearly £4.6 million. In his last annual statement, the chairman, Sir George Nelson, drew attention to the modest margin of profit earned on turnover, and the latest increase in profits seems likely to represent a genuine expansion in sales. After allowing for heavier charge for taxation (nearly £2.3 million, against £1.9 million), group net profits have risen from £1,049,892 to £1,326,721, but the ordinary dividend (for which the newly issued ordinary shares do not rank) is only maintained at 15 per cent. Any hopes that may have been aroused by the decision to raise the interim dividend from 4 to 5 per cent have now been dashed by the announcement that the final dividend has been reduced from 11 to 10 per cent. The directors are apparently placing emphasis upon the ploughing back of profits so as to make good the shortfall between the £6 million odd raised by the debenture and equity capital issues last December and the £9 million or £10 million to be spent on the new Metherton factory and on other capital developments in the next two years. At the current price of 56s. 3d.xd. the £1 Ordinary shares yield 5⅓ per cent.

★

Harrods.—In the year to January 31st, the "consolidated net profit" of the Harrods group fell from £1,526,963 to £1,349,816; this figure is struck before tax, but after putting £14,000 (against £47,445 a year earlier) to a reserve for the replacement of assets. Thanks, presumably, to the higher rates of income tax and distributed profits tax, the provision for taxation has increased from £877,116 to £878,987, and net profits have therefore slumped from £649,847 to £470,829. This gives a much more slender cover on the maintained ordinary dividend of 20 per cent. With profit margins being squeezed by the increase in costs and with customers beginning to fight shy of higher prices, Harrods is not likely to be the only department store to report lower profits this year. After the preliminary announcement, the £1 ordinary stock units were marked down 1s. 3d. to 55s.; at the current price of 52s. 6d. xd the yield is £7 12s. per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended February 23, 1952, total ordinary revenue was £109,983,000 against ordinary expenditure of £84,146,000 and issues to sinking funds £740,000. Thus, including sinking fund allocations of £21,683,000, the surplus accrued since April 1, 1951, is £392,591,000 compared with a surplus of £749,677,000 for the corresponding period of the previous year.

LEEK AND MOORLANDS BUILDING SOCIETY

ANOTHER EXCELLENT YEAR'S RESULTS

The annual general meeting of the Leek and Moorlands Building Society was held on February 25th at Leek, Staffordshire.

Sir Ernest Johnson, JP, the president, in the course of his speech said: When I had the pleasure of addressing you some 12 months ago, I made some comments on the vast national expenditure. The previous Government satisfied themselves that re-armament is necessary in the interests of the world. The present Government has endorsed that policy. It is left for the nation now to bear the expense and to suffer the burden and the implications of the programme to rearm.

I firmly believe that one of the ways to assist the country would be for increased savings, as distinct from increased taxation, to be allowed to play their part.

Building societies—representing as they do over four million of the population of the country, and having entrusted to their care funds exceeding £1,200 million—can be relied on to play their part in a great savings drive.

I am glad to find that this Government is at last encouraging home-ownership. By granting licences to persons anxious and willing to build their own home, expenditure on subsidies is reduced.

The year 1951 has left its mark upon the national economy—I cannot think that the year 1952 is likely to be as satisfactory a year. What I do feel is that united through sound finance—harder work—maintenance of fine quality workmanship, the nation can march along the road to a future which will bring stability, security and a better living.

CHAIRMAN'S ADDRESS

In moving the adoption of the report and accounts, Councillor Gilbert Tatton, the chairman, said: During the year 1951 shareholders' balances increased by £1,460,000 and the amount of savings in our share capital comes to £17,795,000. Savings on deposit show an increase of £278,000, so that during the year 1951 the total increase in savings balances on shares and deposits amounted to £1,738,000, making a total sum invested in the Society of £20,323,000. This is the first time in the history of our Society that the total savings have exceeded £20 million, and is a measure of the confidence of the public in our Building Society.

Last year I expressed the hope that I might be in the happy position of presenting to you another excellent report. I feel I have done so, as the year's results show a continuation of that financial strength and stability for which the Leek and Moorlands Building Society is noted throughout the country.

VICE-CHAIRMAN'S REMARKS

Seconding the motion, the vice-chairman, Mr F. Leslie Davenport, JP, said: I view with some apprehension the forthcoming Budget, because there is no doubt that financially the country's position is a very difficult one. Nevertheless, I do feel that building societies, representing as they do the savings of the people, should receive some concession by way of taxation, and I hope the Chancellor has not overlooked the important part they play in "mopping up" surplus income and channelling it into real thrift. It would seem to me that on these grounds alone building societies are so assisting the nation at this difficult time that they merit favourable consideration.

The report was adopted.

HART AND LEVY

RECORD TURNOVER

The fifty-fifth annual general meeting of Hart and Levy, Limited, was held on February 28th at Leicester, Sir Tresham Lever, Bt, the chairman, presiding.

The following is an extract from his circulated statement for the year to October 31, 1951:—

Turnover shows a considerable increase on that of the previous year and is a record for all time. The trading profit is £207,457, as against £203,405. During the past year the rates of both Income Tax and Profits Tax have been further increased. Therefore, in spite of reduced expenses, the balance left for distribution is only £54,634, as against £53,026 a year ago. The directors recommend a final dividend of 10 per cent on the Ordinary shares (making, as in the preceding year, a total of 20 per cent).

DIFFICULT CONDITIONS

The results have been secured in spite of the serious difficulties encountered over the last six months of the trading year and the increased rate of tax. I need not enlarge on the violent fluctuations that have occurred in the wool and cotton markets, and I referred last year to the possible loss on long delivery commitments then existing. In order to preserve our labour force and the volume of production in our factories we had to maintain an adequate supply position, with the result that in taking up our forward commitments, substantial losses did, in fact, arise. I reminded members last year that the credit on general reserve of £120,000 provided a safeguard against such eventualities, and it is with satisfaction I can report that these losses have been absorbed in the trading results under review, and that our general reserve stands intact at the above figure.

Government restrictions still preclude the contemplated expansion of our manufacturing units, but we have been able during the past year to modernise and develop further our subsidiary company interests which have made a valuable contribution to the Group results. The loan and current account of the subsidiary company has risen steeply in the last twelve months from £198,761 to £301,030. This figure is entirely covered by the value of stocks held. These have not only increased in quantity to supply the wider demand, but there is also a big reduction in the value of the commitments of the subsidiary company.

SATISFACTORY STOCK POSITION

The high stock position is brought about to some extent by customers postponing their deliveries and also by our action in reducing the forward commitment position in the last trading year. Such a policy inevitably resulted in increased liabilities to our bankers and to creditors. We have nevertheless thereby assured that our immediate stock requirements are fully provided for, and as the present year progresses we expect that the amount of our investment in stocks will considerably decrease, with a corresponding reduction in the figure of bank indebtedness.

It is most difficult to forecast trading for 1952, but in spite of all the difficulties that have been experienced, we have substantial orders on our books. Although conditions are obviously more difficult than when I addressed you last year, we are sure from our experience of sales to date that our goods are being better received by our customers than ever before, and we are confident that your company will be able to obtain a good share of the trade available in the increased competition that has now returned to our markets.

The report was adopted.

MANCHESTER SHIP CANAL COMPANY

VOLUME OF TRAFFIC AGAIN A RECORD

The ninety-fourth ordinary general meeting of this company was held on February 29th, in Manchester.

The chairman, Mr Leslie Roberts, CBE, in the course of his speech, said:—

The net revenue for 1951 is shown as £835,014, compared with £887,141 in 1950—a decrease of £52,127.

After adding to the net revenue £18,031 brought forward, setting aside £110,000 for Income Tax and deducting £342,631 for Loan and Debenture Interest, the balance available for dividends and reserve amounts to £400,414.

£35,000 has been appropriated to the Reserve for Contingencies, and it is proposed that out of the balance of £365,414 the following dividends, amounting to £349,693, should be paid:—

3½ per cent on the Manchester Ship Canal Corporation 3½ per centum Preference Stock.

5 per cent on the Preference Shares.

3 per cent on the Ordinary Shares, carrying forward £15,721 to next year's account.

RECEIPTS AND EXPENDITURE

Receipts from Tolls, Ship Dues, Traffic Rentals, Towage and Sundry Receipts exceeded those of the previous year by £131,000. It is noteworthy that last year the tonnage of toll-paying traffic for the first time exceeded ten million tons. This is the fourth successive year in which we have been able to report the making of a new record in the volume of traffic handled at the port.

Expenditure on the working of the Ship Canal showed an increase of £190,000. Of this amount, dredging accounted for £112,000, maintenance for £34,000 and the working of locks, sluices, swing bridges and ferries for over £20,000.

The dredging costs, which have had to be charged against revenue in 1951, amounted to no less than £377,000. This is by far the highest expenditure which we have had to face in any year. In 1950 the comparable figure was £266,000, and in the ten years before that the average was under £200,000.

UNOFFICIAL STRIKES

Last year I told you that our good record of freedom from industrial disputes had been broken by an unofficial strike, and I have already alluded to the subsequent six weeks' stoppage of work at the docks, which took place in the early summer. This strike, like its predecessor, was brought about by the activities of the Port Workers' Unofficial Committee, and the issue was connected with overtime working. I need not trouble you with details, except to say that both the stoppages were entirely needless, as there was adequate machinery for the investigation of the dispute. Some of you will have read the report on the second strike, which was issued by the Minister of Labour and National Service, and was in condemnation of the men's actions. It is a tragedy that the Manchester dockers should allow themselves to be misled as readily as they have done. I profoundly hope that good sense will prevail in the future, and that the time has come when each individual docker will start to think for himself. When he does this he will not allow himself to be influenced to join unofficial strikes, but will have proper regard for the constitutional procedure which is available within the industry. It is natural that a docker's first loyalty should be towards his mates, but it is a pity that his loyalties are sometimes misdirected.

BROOME RUBBER

RECORD RESULTS UNDER GREAT DIFFICULTY

The eighteenth annual general meeting of Broome Rubber Plantations Limited was held on February 27th in London, Sir Lionel Smith-Gordon, Bart. (chairman) presiding.

In the course of his speech the chairman said:

Last year, I prefaced my address with a tribute to our staff in the East, both European and Asian, for the courageous way in which they had carried out their daily duties for two and a half years, or more, in conditions of extreme danger. During the past year, conditions have, if anything, worsened, and the difficulties and dangers of administering the estates have increased.

As a result of adverse factors, the actual crop obtained was 2,679,408 lb, which was some 30 per cent lower than the amount we had expected. This reduction in output is not indicative of a falling off of the productive capacity of the trees, for we are confident that given an adequate labour force, working in peaceful conditions, output would rise to its former levels.

FORWARD SALES COMPLETED

You will, I feel sure, appreciate that in the light of these disheartening difficulties with which the management has to contend, it is not possible to take a normal view of the past year's results, although, in fact, they mark a record in the history of the company. As stated in my speech last year, we made forward sales for delivery over the year 1950. These commitments were all met during the year under review, and there were no contracts outstanding at June 30, 1951, nor have we made any further forward sales.

We made a trading profit of £147,840. Debenture interest, depreciation, etc., amounts to £12,195, and £20,000 has been set aside as a provision for replanting expenditure. Taxation calls for £77,000. We have put £15,000 to general reserve, which we trust will be the nucleus of a substantial sum, if future profits permit. Two interim dividends, amounting to 15 per cent, have been paid, and we propose a final dividend of 10 per cent, making 25 per cent for the year, and to carry forward £3,321. At the same time, we have declared an interim dividend of 5 per cent on account of the current financial year ending June 30th next. The results for the six months July-December, 1951, amply justify this distribution.

In this connection, it is interesting to note the heavy toll the governments extract. The export duty, etc. (paid directly or indirectly) in Malaya amounted to no less than about £47,500, while taxation demands in the UK and Malaya are estimated at £77,000, or a total of £124,500, which is a staggering figure, compared with the sum of £31,715 we are able to distribute among the members by way of a dividend, after deducting tax.

REPLANTING

In view of the difficult conditions prevailing, a temporary halt was called to our annual programme of replanting approximately two hundred acres, and no new areas are being undertaken at the present moment.

The assessment officer of the War Damage Commission has already visited two of our properties, and we hope it will not be long now before our claims are agreed and a substantial portion of the assessed damage is received in cash. The total of the amended claims submitted amounted to £45,000.

The report was adopted.

BAJOE KIDOEL RUBBER AND PRODUCE COMPANY, LIMITED

DIVIDEND 25 PER CENT.

SIR ERIC MILLER'S STATEMENT

The fortieth annual general meeting of The Bajoe Kidoel Rubber and Produce Company, Limited, was held on February 27th at the registered office, 1-4, Great Tower Street, London, E.C.3.

The following is an extract from Sir Eric Miller's address, which was read by Sir Eric MacFadyen, who presided:—

After transferring £20,000 to general reserve and a like amount to dividend equalisation reserve, we recommend the payment of a dividend of 25 per cent, less tax, at 9s. 6d. in the £, for the year 1950-51 and, if that is approved by the meeting, the balance carried forward on the parent company's profit and loss account will be £70,592.

In our 1950-51 working period we account for 1,408,781 kgs. of rubber and 654,000 kgs. of coffee, which after covering taxation in Indonesia showed a net profit of Rp.4,520,149 and Rp.1,273,571 respectively which, converted into sterling at Rp.32 to the £, shows in round figures £140,000 attributable to rubber and £40,000 attributable to coffee.

PROFIT ON COFFEE

Although the profit on coffee is overshadowed by the profit on rubber, it nevertheless made a respectable contribution to our income and is proving a useful second string, as it has done during most of the company's 40 years' existence.

Whereas in prewar days most of the Robusta coffee produced in Indonesia was exported, there is now quite a good offtake for local consumption; the actual marketing in Java is being well handled by the co-operative Coffee Bureau. Owing to unfavourable weather at blossoming time, our 1951-52 crop of coffee will be some 100,000 kgs less than the 1950-51 total of 654,000 kgs, but prices are holding up well.

MARKET VALUES

I notice that the £1 stock units of the Bajoe Kidoel Company have been changing hands at under 15s., showing a market capitalisation well below the figure of the cash and British Government securities we hold in London and taking no account whatever of our estates, comprising 8,000 acres under rubber, of which no less than 4,500 acres are budded, mostly in bearing; then 3,000 acres under coffee and 800 acres under kapok, with appropriate buildings, machinery and plant. Our gross capitalisation, including current and all these fixed assets, is only £20 an acre.

I feel it my duty to focus your attention on these simple salient facts, so that you should not be frightened out of your holdings at what, on the face of it, is an absurdly low price, even in "jittery" times like the present.

TESTING TIME AT HAND

There are subversive elements at work, particularly in South East Asia, but the Indonesian Government are clearly doing their best to justify their newly-won independence by manfully grappling with the forces of disruption as and when they can be cornered. Now the prices for rubber and vegetable oils have declined materially from the heights they reached 12 or 15 months ago, the earnings of producers, from which that government derive important revenue by way of taxation, are automatically receding, so it behoves them to play their part in curbing inflation by reducing their own expenditure, which has tended to become astronomical, and by purging the trade unions of Communist leaders who have done so much to throw the whole economy out of balance.

The testing time is near at hand, and those who wish these islands well hope, as I do, that sound policies will be enforced before the economic stresses become too great.

Whilst preparing this address two important items of news have come in. Firstly, the Indonesian Cabinet have resigned as a result of differences within their ranks over the acceptance of American aid under the Mutual Security Act.

CHANGE IN US POLICY

Almost simultaneously came the announcement by the United States Government that they are returning the import of rubber to the usual market channels, but, and this is a very big but, they are retaining control over consumption and inventories. The transition is to be gradual, but as from July 1st manufacturers will have to satisfy their requirements by private purchases or from such stocks as the GSA may find it necessary to rotate. There is no mention of further stockpile purchases by the GSA, nor how these are in future to be made, an omission which we trust will soon be remedied.

The only possible justification for continuing controls by the US Government over the consumption of natural rubber would be a determination on their part further to build up their stockpile. It would appear that their "peril point" figure has now been covered, but there must be a large tonnage still to be acquired before their programme is completed. They have a great responsibility towards South East Asia, whose economy depends so largely on receipts from the sale of natural rubber, and the maintenance of restrictive controls over the consumption of it by US manufacturers would be quite indefensible today except for the definite purpose of enabling their stockpile to be more rapidly augmented than would otherwise be the case.

Not only are US restrictions on the consumption of natural rubber to continue, but simultaneously they are making arrangements to encourage the export of American-produced synthetic substitutes in substantial volume—and at a price which, according to *Natural Rubber News*, is based on their purchasing the principal raw materials which enter into the product at about half the price which private producers would have to pay today. In other words, the price would be higher for synthetics if the industry were operated competitively. We have not been told whether, when our own Government agreed to sell 25,000 tons out of the UK strategic stocks to the US Government, they impressed them with the importance of ensuring that the interests of the producers in South East Asia would be suitably safeguarded.

Dr E. A. Hauser, Professor of Colloid Chemistry in the Massachusetts Institute of Technology, has said some very pertinent things on that subject. He adds that, in spite of the systematic research which has been intensively pursued since the end of the war, so far all attempts have failed to produce synthetically a polyisoprene which, if subjected to X-ray diffraction studies in the stretched condition, would reveal an identity period as found in rubber. Bearing this in mind, he says it is more than doubtful if they will ever be able to produce synthetically an

artificial rubber which is comparable with the natural product in every respect, and queries the wisdom of using up natural resources for the production of an artificial product when a natural product of superior properties is available, even if its price is higher than it used to be. That strikes me as statesmanlike.

The report and accounts were adopted and the proposed dividend was approved.

CLEGG & ORR LIMITED

SUCCESSFUL YEAR'S TRADING

MR J. A. ORR'S REVIEW

The fourth annual general meeting of Clegg & Orr Limited, will be held on March 21, 1952, at the registered office of the company, 90 Great Bridgewater Street, Manchester, 1.

The following is the statement by the chairman, Mr J. A. Orr, which was circulated with the report and accounts for the year ended November 30, 1951.

PROGRESS OF REPLACEMENT AND RENEWAL PROGRAMME

At the end of this, the fourth year of the company's history, I am able to tell you of solid progress within our factories. In spite of many obstacles, the first programme, costing £678,000, for the replacement of plant and the renewal of buildings, has been finished and paid for without recourse to external borrowing, and, as the accounts show, some liquid reserves have been gained. We have taken advantage of all the allowances which the revenue authorities permit, so that the fixed assets now stand in the accounts at reasonable values.

The subsidy arising from the Cotton Industry Re-equipment Scheme has so far produced a sum of £35,000, but this is likely to be reduced by more than half, owing to a consequential cancellation of certain tax allowances; therefore, the scheme, though undoubtedly of some value, was not in our case a deciding factor in favour of re-equipment. We hope to receive a further sum when all our claims are agreed.

I hope that a prudent financial policy will make it possible to scrap plant and methods and to have new ones whenever such changes will give a saving in cost or an improvement in the quality. Thus it is intended to make gradual improvements as opportunity occurs and so avoid in future that complete renewal, which is both expensive and inconvenient.

ARRIVAL OF COMPETITIVE TRADING

Our operating companies, like most others, have enjoyed good trading up to December, 1951, and ought, with new plant, to be able to compete successfully both in price and quality; we have seen that for more than a decade the markets have been short of supplies and now, with increasing production of consumer goods, competitive trade has arrived. It must be remembered that this island country with its high population is dependent on foreign trade for livelihood, a fact which renders it especially subject to outside influences in these times of international stress. When to such considerations are added world shortages of raw materials and food, and less hours of effective work in an economy scarcely yet emerged from the chill clutch of wartime control, a potentially dangerous situation is apparent.

So your directors are mindful of these things, and, knowing that they have themselves striven to put their house in order so as to be able to compete successfully in a buyer's market, now face the more distant future with confidence. With these thoughts, however, you will not expect me to vary the somewhat gloomy forecast for the immediate future at which I hinted last year, though I repeat my belief concerning the sound competitive ability of the company.

E. Clegg & Son, Limited, now possesses 720 Northrop Automatic looms, supplied by new automatic Swiss and English preparation machinery and some new English spinning plant and card room machinery.

A. S. Orr & Company, Limited, now possesses 584 Northrop Automatic looms, supplied by new automatic Swiss and American preparation machinery, and new English spinning and card room frames, including drawing frames. An independent development section was established during last year and much work on quality control has been done.

Modern systems of costing, budgetary control, central stores, production study and personnel training are in full and effective operation.

TRAINING OF STAFF AND OPERATIVES

The training of staff and operatives has proceeded steadily and is beginning to show unmistakable signs of success. Your directors attach the utmost importance to the selection, training and welfare of all personnel, without whom the finest plant in all the world would be ineffective: in productive work your company has been well and truly served by its employees. The helpful attitude of all union officials and representatives of our workpeople has been invaluable during the period of our re-equipment and I feel sure we shall continue to work together and to understand each other's difficulties.

In both cases, the activity, the efficiency and the output per operative have improved considerably, but for the current year much must depend not only upon Government action at home but also upon events abroad during the next few months, and especially upon the quality of our yarns and cloths.

THE DIVIDEND

Bearing in mind the successful year's trading in 1951 and the dubious trading prospects for the near future, a dividend of 10 per cent. before deduction of tax is recommended.

There may be some disappointment at this unchanged rate observing the results of the year under review, but I consider that the directors have given proper consideration to your true interests and that it is wiser at present to keep a steady rate of dividend over as long a period as possible.

SENGAT RUBBER ESTATE

A PROFITABLE YEAR

The forty-first annual general meeting of this company was held on February 25th in London, Sir George Maxwell, KBE, CMG, the chairman, presiding.

The following is an extract from his circulated speech:

It has been a difficult year. The open warfare, which has enveloped Malaya for more than 3½ years, is still camouflaged by the Government by the fatuous word "banditry," and has been waged by the enemy with steadily increasing ferocity. We have had three separate incendiary fires started by the enemy, but the damage has not been heavy. About 1,000 young high-yielding rubber trees were slashed one night recently, but are expected to recover.

The old rubber yielded at an average rate of 592.24 pounds per acre per annum. The modern clones (still in their youth) of proved ancestry gave an average crop of 1,051.18 pounds per acre per annum. The three best fields yielded at the rates of 1,544 pounds, 1,417 pounds and 1,332 pounds.

The high price of rubber, however ephemeral it may have been, has given us a profitable year. The net profit has been £67,980, but provision for taxation (£43,320) reduces it to £24,660. Our replanting reserve, now standing at only £4,000, is an inadequate provision for the work yet to be done, and we have increased it to £10,000. The general reserve, now standing at £23,112 7s. 1d., has been brought up to £25,000.

We propose to pay a final dividend of 10 per cent (less tax), making a total dividend of 17½ per cent (less tax) for the year.

The report and accounts were adopted.

NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Bank will be closed from March 12th to March 25th, both days inclusive.
By order of the Board,
T. T. K. ALLAN, General Manager.
26 Bishopsgate, London, E.C.2. February 26, 1952.

PUSHFUL THINKING—the busiest directors usually have the most progressive thoughts and ideas about the development of trade. But because they *are* so busy, many such ideas lie dormant or die for the sake of—what? Co-operation and inspired drive by men of similar calibre—men of ideas trained and well experienced in *pushful* thinking, *practical* interpretation and *profitable* follow through. *You* may need the alert, go-ahead services of the qualified team at Townend-Smith Ltd. (Advertising), 40-41, Conduit Street, W.1. Telephone Regent 2600 or write for an appointment without obligation.

HONOURS Graduate in Economics, with practical turn of mind and full EXPORT experience up to executive level, seeks change offering more scope in home or export sales. Member of Institute of Export, knowledge of German, French, Spanish. Keen interest in current affairs.—Box 874.

YOUNG MAN, 27, seeks executive career commerce or industry in London. 1st Class Honours Law, Cambridge, Barrister, admin. experience other fields.—Box 887.

LARGE Industrial Group requires for its selling organisations an Accountant capable of dealing, on behalf of the Chief Accountant, with the daily management of the Accounting Departments under his control. Applicants must have professional qualifications or degree, experience in management of staff and office organisation and have knowledge of Commercial Accounting including budgetary control. Age 30 to 40. Good prospects for a keen and active man. Starting salary according to qualifications and experience.—Write giving age and full details of education and previous experience to Box 868.

ECONOMIST (agricultural) required to undertake survey of historical farm costings data for special purpose. The work might occupy a vacation, or be accomplished in 3 months "leisure" time. Minimum fee 50 guineas but up to 100 guineas would be paid if warranted by complexity and time occupied.—Box 869.

WORKS MANAGER required for old-established Company, manufacturing machine tools and electric control gear. Applicant must have first-class technical and engineering experience, and be good organiser. Preference given to applicant with public school and university, and/or engineering degrees.—Apply, Secretary, E.M.B., West Bromwich.

ACCOUNTANT/SECRETARY required for Tyneside family business, age 28-38. Minimum starting salary £1,000, excellent prospects. Must have top management qualities.—Box 888.

THE TRAINING OF TECHNICAL TEACHERS

Applications are invited from men and women of approximately 25 years of age and over, for admission to a ONE-YEAR COURSE OF TRAINING as full-time TEACHERS OF GENERAL COMMERCIAL AND PROFESSIONAL SUBJECTS, AND/OR OFFICE ARTS (SHORTHAND, TYPEWRITING AND OTHER SECRETARIAL WORK) in Technical Colleges and similar institutions.

Applicants who wish to teach general commercial and professional subjects, should have a University Degree, or professional qualification, or a Higher National Certificate in Commerce.

Applicants who wish to teach Office Arts should possess higher certificates of some recognised examining body in shorthand and typewriting, and should show evidence of a good general education.

In all cases applicants will be expected to show evidence of good business and other clerical experience.

The courses will begin in September, 1952. Recognised students will pay no fees and they will be eligible for maintenance grants for the period of the course.

Further particulars and application forms may be obtained from the following Colleges on receipt of a stamped addressed foolscap envelope.

Enquiries for forms should be endorsed "S/1/22."

83, New Kent Road,
London, S.E.1.

SECRETARIAT OF THE INTERNATIONAL RUBBER STUDY GROUP, BRETTENHAM HOUSE, 5 LANCASTER PLACE, STRAND, W.C.2, requires Senior Statistician or Assistant Statistician, depending on circumstances. University degree or equivalent in Statistics or in Economics (with Statistics) or in any other main subject (with Statistics). Knowledge English, French essential. Salary Senior Statistician £1,000 to £1,500, Assistant Statistician £600 upwards. Starting salaries for both posts depending on qualifications, experience, etc. Application by letter stating qualifications, references, age, married or single, etc. Final date March 20, 1952.

CONTINENTAL HOLIDAYS—not "organised" or mass produced but arranged as you or your friends may want. Paris—7 days from £12 10s.; Brittany—10 days from £16 10s. 6d.; Italy—15 days from £27 11s. 6d.; also the Rivieras, Spain, Austria, Switzerland, and other countries. Write for brochure or 'phone.—Business & Holiday Travel Ltd., Grand Buildings, Trafalgar Square, London, W.C.2. WHItehall 4114/5.

SIMENON IN FRENCH. List of his novels free on request.—Anglo-French, 72, Charlotte Street, W.1.

LADY, 27, B.Sc. Econ., Registered Statistical Assistant, experience includes analysis and interpretation of statistical data. Desires suitable post from April, 1952.—Box 891.

TRANSLATION.—Rapid service, German into English. Technical and Commercial material a speciality.—Apply by letter to "Translations," c/o Abbotts, Eastcheap, London, E.C.3.

THE *Economist*, June, 1946-December, 1951 (*Records and Statistics*, 1948 and 1949) for sale.—Reply W. F., 139, Clarence Avenue, Northampton.

FOR SALE: *The Economist* 31/5/47-2/2/52, lacking 17/1/48.—Box 884.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 52-54, High Holborn, W.C.2.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure: Economic Research Council, 18, South Street, London, W.1.

ESSENTIAL TO ALL BUSINESS MEN!—"Advantages of trading as a limited Co.," by T. A. Herbert, LL.B., Barrister-at-Law (post 1s. 8d.), from "EC," Anglo-French Press Agency, Ltd., 128, Albany Street, London, N.W.1 (EUS. 8308/8178), who have TRUST INVESTMENT C. REGN. for sale. Ready for use, complete, £20.

SALZBURG SEMINAR, Schloss Leopoldskron, Salzburg, Austria.—Scholarships are offered for sessions in Social Relations (Social Psychology, Sociology and Cultural Anthropology), May 28th-June 26th; General Session (History, Literature, Government, Social Psychology, and Philosophy) July 15th-August 23rd; Economic Problems in American Life, September 1st-28th. Study at the graduate level. Admission is granted on evidence of ability and accomplishment. General age range 23-35. Special consideration given to those engaged in teaching, public life, or creative work and to advanced students. For further information and application forms write to: The Education Secretary, World University Service, 59, Gloucester Place, London, W.1.

Postal Tuition for B.Sc. ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 760 Successes at Lond. B.Sc. Econ. Final Examinations, 1925-51.

Prospectus from the Director of Studies, Department P17 WOLSEY HALL, OXFORD

NATIONAL COAL BOARD

Applications are invited for the appointment of ASSISTANT INVESTMENTS MANAGER at London Headquarters. The duties of the post include the purchase and sale of marketable securities for the Board's superannuation and pension schemes, and continuous review of a large investment portfolio.

Candidates must have a sound knowledge of finance, investment and Stock Exchange procedure backed by some years' experience with a financial house or similar organisation. An Actuarial qualification is essential.

Salary will be up to £1,500 depending on qualifications and experience. The post is superannuable.

Apply in writing, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/436. Original testimonials should NOT be forwarded. Closing date March 15, 1952.

NATIONAL COAL BOARD—WEST MIDLANDS DIVISION

S.V. 881. Applications are invited from persons with good experience of machine accounting systems (Punched Cards Methods) to take charge of a Machine Accounts Section at Dudley, Worcs.

The salary scale will be £720 x £25 to £970 and commencing salary will be according to qualifications and experience.

Applications should give full details of age, experience and type of machine to which accustomed (Powers Samas, Hollerith, etc.) and applications should be made within one week of the appearance of this advertisement, to the Divisional Establishment Officer, National Coal Board, West Midlands Division, Himley Hall, Dudley, Worcs.

Amended.

SENIOR SCIENTIFIC OFFICERS; Scientific Officers; Patent Examiner and Patent Officer Classes.—The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1952. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1952, may eventually be announced. Successful candidates may be appointed immediately. The Scientific posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1952 may be admitted to compete before the result of their degree examination is known.

Age Limits: Senior Scientific Officers, at least 26 and under 31; for Scientific Officers and Patent Classes, at least 21 and under 28 during 1952 (or under 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales: Senior Scientific Officers (men), £812 10s.—£1,022 10s.; (women) £681 5s.—£917 10s.; Scientific Officers (men), £440—£707 10s.; (women) £440—£576 5s.; Patent Examiner and Patent Officer Classes (men), £440—£655. (Rates for women under review.) Somewhat lower rates in the provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S. 53/52 for Senior Scientific Officers and S. 52/52 and S. 128/52 for the other posts.

AN important Malayan Rubber Group requires a man of ability, (age 26-36) to assume, after training, an executive position in its Companies Department in London. Duties comprise officiating as Secretary to Boards, corresponding with the East, and ensuring that policy is executed. There is no accounting responsibility. Applications will only be entertained from men who are Graduates or who have had secretarial experience.—Details of education, employment and present emoluments should be sent to Box 480, Dorland Advertising, 18-20 Regent Street, London, S.W.1.

WANTED,—HIGHLY QUALIFIED EXECUTIVE to direct group of factories employing over 5,000 men; must have knowledge of production and sales; actual factory experience essential; salary not less than £3,000. Location of post is London. Written applications giving date of birth and education, full details of qualifications and experience of posts held (including dates) should be addressed to Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, W.C.1, quoting reference number K.C.63. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

MANAGER required by company with overseas connections to take charge of all production and development of special purpose machinery in a light engineering works. Appointment calls for first-class engineering and technical background, preferably University degree. Experience in development and other aspects of production essential.—Apply giving full details of experience, qualifications, etc. to Box M 4536, A.K. Advg., 212a, Shaftesbury Avenue, W.C.2.

ECONOMIC STATISTICIAN and Practical Engineer, 36, completing tour stats. adviser to Govt. Dept. (four fig. sal.), seeks post. Apprenticed Mech. Eng., B.Sc.(Econ.), Incorp. Statistician. Exp. Commerce Aircraft, Sales, Textiles, Management.—Write Box E 478, L.P.E., 110, St. Martin's Lane, W.C.2.

TRANSLATIONS from and into French (Technical and Commercial). Julian Jacobs, B.Sc., and Germaine Courtiau, New House, Worminghall, Aylesbury, Bucks. Tel.: Ickford 227.

THE HISTORY OF ZINC

China knew ZINC more than 300 years ago

The illustration shows Zinc smelting in China as described in the T'ien Kung K'ai wu A.D. 1637

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last 30 years a great Zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal, include the production of Sulphuric Acid, Zinc Pigments, Fluorine and Fluorine Compounds and ancillary products.

The Opportunity

MR BUTLER is not to be envied. Few Chancellors of the Exchequer are so fortunate as to feel no conflict between their duty and their desire to please. When Mr Butler took office just over four months ago duty seemed very plain and a course was laid out in which a stern, unbending budget was to be the culminating third act of a programme for solvency. The resolve, presumably, has not faded. But circumstances are making the carrying out of it more difficult; they are providing beguiling arguments for being very much less than stern; they are casting the cloak of a spurious virtue over facile expediencies.

The abstract nouns can be turned into figures. The estimates published last week make it possible to put a figure, within a million or two, on the total estimated ordinary expenditure for the financial year 1952-53; it will be about £4,215 million. It is already apparent that the ordinary revenue, without any changes in the rates or incidence of taxation, will be much more than that. Some of Mr Gaitskell's tax increases of last year will have a delayed effect in the coming year; there will also be what is usually called the "natural buoyancy" of the revenue, but would be better described as the effect of one year's inflation on the next year's revenue. The arithmetic is tedious, and necessarily approximate. It is enough for the present purpose to say that next year's ordinary revenue, on the basis of taxation as it now exists, can hardly be less than £4,700 million and may be quite a bit more.

In short, when Mr Butler rises in the House of Commons on Tuesday to open his Budget, and before he announces any of the changes either in revenue or in expenditure that he may have decided upon, he will find himself already in possession of an estimated surplus on next year's accounts (calculated on the conventional "above the line" basis) of some £400 or £500 million or even more. The temptation to be content with this must be very strong. It was all very well, the siren voices will say, to promise to be stern and unbending when the two adjectives seemed to be synonymous and equally necessary. But, as events have turned out, it is possible to be unbending in principles of financial orthodoxy without being stern. Why not be content with £400 or £500 million? Why impose fresh burdens, either of taxation (except, of course, the Excess Profits Tax to which the party is unfortunately committed) or of reduced social expenditure? All of these things will be unpopular; and if they are said to be necessary to close the inflationary gap, is that argument not contradicted by the emergence of unemployment of a volume unknown since the war? Devotion to sound finance is the path of virtue; but to insist on pushing the surplus even higher than £500 million would surely be a work of supererogation.

If Mr Butler himself does not feel these temptations, there are plenty of others in his party who do. How easy is the descent from logic and principle when there is an electoral advantage to be snatched

has been shown by the new rates of housing subsidy that were announced last week and are fully discussed elsewhere in this issue. There is no doubt what logic and principle say about housing. Conservative ministers know perfectly well that the demand for housing, though it is real enough, is vastly swollen by the wholly uneconomic rents at which houses, old and new, are made available. They know perfectly well that the mortgage placed by housing—a form of investment which, however desirable, is not in the main directly productive—upon the reduced resources available for investment of all kinds is the least defensible idiocy in their economic policies. Yet so far from making even a small move to correct these distortions and delusions, they have chosen to give housing a general licence of exemption from the tests of necessity and efficiency they are rightly imposing on all other forms of activity. For this there cannot be any form of excuse save the craven one of fancied party advantage at the polls. It is a shocking example of the way politics can play havoc with finance.

★

This is what Mr Butler has to resist. There is no doubt that his duty on Tuesday remains what everybody thought it was in the autumn. Whatever the size of the surplus he finds himself with, he should sternly increase it. His difficulty ought to be not to reach this conclusion, which emerges very clearly from the facts of the situation, but to find ways of explaining the necessity that will carry conviction to his audience both in the House of Commons and outside. Perhaps the easiest way of putting the argument to the ordinary man is to link it up with the necessary volume of saving. The condition of stability is that the community as a whole should aim to save—that is, to set aside out of its income—at least as much money as it aims to spend on projects of capital investment of all kinds. That is the condition of solvency and, as anyone with the merest nodding acquaintance with economic theory knows, it is also the condition of stability. There was never a time when it was more important that it should be observed than now. Since the community other than the state does not do enough saving, the budget surplus must make up the difference. Last year, it is now clear, Mr Gaitskell underestimated the amount of budgetary saving that was necessary—the subsequent inflation is the proof. Moreover, circumstances have changed in the intervening eleven months, and in nearly every case the change has been in a direction that makes a larger surplus desirable. Some of these changes are internal to the budgetary figures themselves: the estimates of expenditure for 1952-53 in several places are made by the artificiality of accounting practice to seem smaller than for 1951-52 without really being so, and to this extent therefore the surplus is fictitious. The programme of import cuts will remove goods from the market without reducing the incomes available to buy goods; it is an inflationary element that needs to be offset. The new export drive has the same effect. It is not necessary to particularise all these factors; the historical argument is convincing enough. In his three budgets of 1948, 1949 and 1950, Sir Stafford Cripps budgeted for surpluses "above the line" of £790 million, £469 million and £443 million. Looking back, one can see quite clearly that only the first of these three was really adequate to the necessities. Today, money is worth less and the danger is far greater. If Mr Butler is to achieve by his budget as much as

Sir Stafford Cripps achieved in 1948, he cannot possibly be content with the surplus that will exist when he rises to speak; he will have to increase it before he sits down.

★

Moreover, is this to be the limit of Conservative policy and of Mr Butler's ambition—to do as well as the Socialists did four years ago? Is it enough for them simply to keep the Socialist policy they inherited on an even keel? Surely the country has a right to expect more than that. Even those who entertained no hopes of a dash for freedom, or of the immediate restoration of competitive free enterprise, did expect to see the Conservatives making moves, however tentative they might have to be at the start, in four directions.

First, they are expected to move in the direction of creating some elbow room for enterprise. This can only be done by real disinflation. It will not be enough simply to prevent inflation getting any worse, which was the most that could be claimed for Sir Stafford Cripps even in his best year. Those who believe in this policy must not try to conceal from themselves the fact that it will result in some increase in unemployment. They must not be scared off it when unemployment rises to 2 or even 2½ per cent, which is still below the lowest figure that anybody has quoted as a possible long-term average. They must cling to their faith—which is wholly reasonable—that a policy of disinflation now will result in less unemployment over the next five years as a whole than any of the softer alternatives.

Second, they are expected to move in the direction of rebuilding the capitalist economy — meaning by "capitalist" not the private ownership of capital, but the system that depends for its progress on the steady injection of new capital into productive channels of investment. There is plenty of non-productive capital being created in Britain today, but far too little productive capital. The only way to make room for it is to increase the national rate of saving—which is the same thing as reducing the national rate of consumption.

Third, they are expected to move in the direction of restoring the price system, so that competing forms of expenditure can be judged on a comparison of their real costs, not their fancy costs as determined by a gentleman in Whitehall. There will never be sanity in economics so long as the patterns of consumption are bent out of the shape that the people really desire by an arbitrary mixture of subsidies and indirect taxes.

Fourth, they are expected to move in the direction of reducing the intolerable burden of taxation; if rearmament prevents them from doing so now, they can at least pave the way for reductions in taxation when it ends by insisting that its cost shall, so far as possible, be met out of reductions in other forms of expenditure.

All these four aims come together in next week's budget. It is Mr Butler's opportunity to demonstrate that there is something worthy of the name of Conservative economic policy and that he is not simply a projection of Sir Stafford Cripps and Mr Gaitskell. The tests, next Tuesday, will be simple. Will Mr Butler insist on strongly reinforcing his surplus? Will he do so, in the main, by cutting the subsidies? If both answers are yes he will have risen to his opportunity. If both answers are no, the opportunity will have been lost. It is very unlikely that it will offer itself again for many long years.

Will France Face the Facts?

THE crisis caused last week by the fall of M. Faure's government is not one that France or its friends abroad can take in their stride. It is the gravest that politicians and people have faced since the war. For the plain fact is that the parties of the centre, who must, somehow or other, govern France by agreement, cannot or will not pay the price of the role they have chosen to play in Europe and beyond the seas. To pay for the rearmament programme of 1952 a large deficit has to be met in the Budget. The coalition split on the familiar argument about how the deficit should be met—mainly by increases in taxation, as the Socialists and Popular Republicans (MRP) preferred, or mainly by cutting expenditure, as the Radicals and Independents wanted.

M. Faure tried to bring these two groups together by a budget that compromised between parties and between methods. He asked for another Frs. 190,000 million in new taxes and proposed a cut of Frs. 70,000 million in the credits for reconstruction and re-equipment and a rise of 1 per cent in employers' contributions to social insurance. The substantial and irreducible deficit which would then remain was to be covered by government borrowing. When the moment came to vote on taxes, eighty deputies from parties pledged to support the government deserted to the opposition—that is to say to the Gaullists, who are not really interested in making the present parliamentary system work, and to the Communists whose policy is for Russia and not for France. And this was only the climax of long arguments and bargaining that showed how immensely difficult it would be to form even a government of national union to defend the franc. The subsequent consultations have not as yet revealed any hope of building a wider base for a government than M. Faure or his predecessors enjoyed. The Socialists will not consider working with the Gaullists. The Gaullists themselves (save for a few who wanted to support M. Pinay's attempt to form a government) either will not co-operate with anyone (this is General de Gaulle's view) or at least make constitutional reform a pre-condition.

These details are mentioned not because they are of greater intrinsic importance than any others that emerge from periodic crises in the Assembly, but because they reveal the narrow views and demoralised mood that prevail there. If the third force coalition is once again patched together both the views and the mood will remain; for there are plenty of issues between the parties to split it wide open again once a budget has been voted. The crisis in parliament is, indeed, a reflection of a crisis in the deeply divided people, which, let it be said, sounds angrier with the politicians than it has been for a long time. The height of exasperation is reached when Frenchmen see their parliamentary representatives mishandling an economic situation which remains fundamentally sound. There is overwhelming evidence that the economy, with the American aid it receives, is much stronger than it was a year ago, thanks to the remarkable recovery achieved since the war. Last month the index of industrial production was the highest ever recorded; and the long and searching examination of French capacity that was made by the "three wise men" of Nato—one of them was M. Monnet—can leave no doubt that it is political, not economic, difficulties that bar the way to national power and self-confidence.

So much has been done to help and encourage France in its return to the front rank of powers, that its allies have earned the right, if not to remonstrate, at least to say very bluntly what seems to them to be wrong. First, it is clear that the constitution does not work. It was intended to keep extremists out of power; it has done that but at the cost of making parliamentary government ridiculous. There are, of course, some stubborn facts which would in any event make it difficult for France to have a very good government. For example, a large proportion of the French people, to judge by their votes, have no belief in democracy or the kind of behaviour that makes it work. It is also true that occupation and resistance brought further divisions into an already divided society. Nevertheless, it would be possible, with a different constitution and a different electoral system, to give France much better government than it has recently been getting. Proportional representation produces too many parties; and the constitution makes it impossible for a statesman who finds he cannot govern with these parties to make them face at the polls the consequences of their refusal. For all practical purposes, the deputy who votes a government out of office is secure enough in his own seat. And when an election does come, the complicated system of proportional representation results in the return of variegated splinters rather than strong parties. The constitution and the electoral law between them have the result that a French deputy is very unlikely to be held responsible for the consequences of his votes; the wonder is only that the system is not even more anarchic than it is.

SECRETARIAT LIBRARY 20 APR 1952 FOR GOVERNMENT USE

★

The remedies are perfectly plain. France needs a political system under which decisions can be taken and adhered to. That means that a government, if it cannot get a responsible decision from the Assembly, should have the right to appeal to the people. And it also means that the people, when appealed to, should vote in a way that gives the best possible chance of a clear yes or no, not fifteen shades of maybe. That General de Gaulle advocates constitutional reforms along these lines is a misfortune, since it results in anybody who supports them being dubbed a Gaullist. But the General happens to be right, and the obvious moral for the parties of the centre is to adopt his policy even if they cannot swallow him. They may be quite sure that if the parties that believe in democracy will not take the necessary steps to make it work, a party that believes in autocracy will come to power on a tide of popular disillusionment.

But constitutional reform cannot solve this budget crisis, nor the further financial crises that are bound to follow it in present conditions. They can be dealt with only by ensuring that Frenchmen pay their direct taxes loyally and punctually. There are two sides to this problem. Because government has been weak and the collection of the revenue inefficient, there is no public conscience against the tax-evader. Because this public spirit is lacking, no party feels it can command powerful support for an effort to collect more taxes. Someone must break this vicious circle once for all, if necessary by making a public example of defaulters and evaders. By putting a few rich businessmen and some recalcitrant peasants into prison after public trial a French government could show that it meant business. By

sending officials to study the methods of other countries with a view to their adoption in France it could give yet another warning. Whether sufficient revenue would then come in to make increases in the rates of taxation unnecessary no one can tell. It would certainly take time, and the bad habits of generations will not be cured in a matter of months. But someone must make a start ; and if the start is to be drastic, then the French Government will also have to improve the pay and working conditions of its civil servants.

The one thing that the outsider can say with dogmatic confidence is that the French fiscal problem can be solved if the political will to solve it can once be assured. There is nothing very intractable about the economics of it. Compared with many other countries of comparable wealth, France is not at all heavily taxed —for perhaps it would be more exact to say that the amount collected in taxation is not high. According to the figures contained in a recent report of the "three wise men," the gross national product of France in the present year is valued at Frs. 10,800 billion. The yield of the existing taxes at the end of 1951 was no more than Frs. 2,684 billion. If any British Chancellor of the Exchequer found himself confronted with this ratio, he would count himself fortunate to have such a large margin of taxable capacity in hand. There is nothing wrong with the economy of France that an efficient, fair, and—for these times—moderate system of taxes could not cure. The French have no valid claim on the economic sympathies of their allies until they have at least faced this fact.

At the moment of writing M. Pinay has failed to interest more than a small section of the Gaullists in taking part in a government. That could mean, among other things, that no aspirant to the premiership can accept their demand for constitutional reform without losing the support of other possible allies. It may mean, too, that M. Queuille, or some other man, will emerge with a government resting either on a leftish combination of Socialists, MRP and Radicals, or on a rightish coalition of Conservatives, Republicans, Radicals and MRP. If the former, then the tendency will be to tax harder ; if the latter, then the tendency will be to tax softer. Whichever happens, it is hard to see a cabinet of the immediate future going to the root of France's political problem. But the warning of this crisis should be clear. France cannot be counted on as a steadfast, solvent ally at the core of the European defence system, until it has the courage to give a Prime Minister power and a Finance Minister revenue. To put off the attempt at these reforms is to play the game of General de Gaulle's rally and, therefore, of the French Communists.

Her Majesty's Opposition

THE 57 Labour members of Parliament who on Wednesday night voted against rearmament have not split their party ; however divided in its doctrines and its policies, it will no doubt be held together by its determination to hold together. The thread is single, but it is made of steel. It is too tough to be cut by Tory jeers or public humiliations or any considerations of logic and honour. The ghost of Mr Ramsay MacDonald is still the most powerful personality in Labour politics. But the 57 have achieved by their open defiance of the party's leaders something no less decisive than a split. They have achieved what was no doubt Mr Bevan's deliberate and carefully calculated objective. They have destroyed the possibility that the Labour party's internal differences might be settled, or at least decently covered, by a compromise nearer to the Right than to the Left.

There are now only two alternatives open to the Labour party while it remains in opposition. It may continue to speak with two sharply opposed voices, to veer incoherently between conflicting policies—and to suffer continually such humiliations as were inflicted on it both last week and this. Or it may move quickly towards agreement on a policy that vaguely satisfies the fervour of the Left but is far removed both from what it did when it was in office and from anything that the British public may be supposed ever to have voted for. Mr Bevan has decided to take his stand, to make his party choose between standing uncertainly and going his way. In the difficult months to come, Her Majesty's Opposition will be either irresponsibly incoherent or irresponsibly inconsistent.

It was plain before this week that Mr Bevan's sympathisers in the party had grown in numbers. It was not plain that almost a fifth of the party was now ready openly to follow him in a direct challenge not merely to Mr Morrison and the other lieutenants on the Right but to Mr Attlee himself. The 57 voted not against the rearmament programme that most of them supported a year ago but against rearmament even as it has been slowed down by the new Government. The reversal of policy goes as far as ever Mr Bevan had urged. The blow to the party's official leaders could not be more direct. It means that the indirect blows will be even stronger. On the rearmament issue, where the inconsistency with past policy is plainest, the Left is at its weakest ; on other issues, and particularly on economic policy, it can certainly muster far more than 57 votes.

Up to a point, this is natural enough. It was always certain that in opposition Labour would move to the Left rather faster than most parties do. The concern of its responsible leaders was not to prevent this movement but to keep it within the channels of reason and realism. It was to ensure that the new, more left-wing policies grew gradually out of those that the party practised from 1945 to 1951 ; and it was to base this growth on a careful reassessment of the problems of British politics, of the facts of Britain's economic and financial position, in the next ten years. The fundamental criticism of Mr Bevan's buccaneering is that it will stultify this re-thinking. Because he has forced the pace, the struggle within the Labour party must now be a struggle on prepared positions and hardened attitudes. Either it will continue throughout this Parliament or Mr Bevan's policies—though not, in all probability, Mr Bevan himself—will win. In either event it can do nothing but harm both to the country and to the Labour party. Mr Bevan has decreed that for the next three years or more his party will be an effective political force only to the extent that it benefits from the Conservatives' mistakes and the country's misfortunes. That is not to say that it will be ineffective ; but it will be the effectiveness neither of reform nor of revolution but simply of nihilism.

The Phantom Divisions

THE Atlantic Council, while assembled in Lisbon, rashly allowed itself to say that some fifty divisions "in appropriate conditions of combat readiness" would be provided to defend Western Europe in 1952. As was pointed out on all hands, if "combat readiness" means the same as "ready to fight immediately" then the statement must be quite untrue and therefore inexcusable. Since then so much energy and calculation have gone to showing how twenty-five must be the right figure for effective divisions—as it almost certainly is—that the twenty-five ineffective divisions have been forgotten. Obviously, in some form or other they exist ; and the nature, location and readiness of these phantom formations are vital matters for public discussion, so long as Nato allows any figures at all to be known.

It is not fashionable to talk of these figures in national terms, but a moment's thought about the British element in General Eisenhower's army brings the realities into sharp relief. In Germany there are just over four divisions of British troops—three of them armoured—which make up the best peacetime striking force this country has had in modern times. They occupy a forward position opposite the Russians, chosen less on the advice of soldiers than on the insistence of politicians. If they were attacked this summer they would probably face odds of at least three to one on the ground and odds little more favourable in the air. This is generally known and accepted in the British Army of the Rhine, even if little thought is given to it in this country. What is less well known—it was not mentioned in the defence debate on Wednesday—is the lack of adequate reserves to support this spearhead of the British army, the lack of resources to enable them to make good casualties, refit and rest, should they get involved in fighting. Indeed, it may be asked whether there is any effective reserve at all for the British troops in Germany.

The answer that is usually given is that two divisions of the Territorial Army would be mobilised and specially equipped to play this part in war or in an emergency. It is, admittedly, far less unsatisfactory than the answer would have been in 1938 ; for the Territorial Army is getting well-trained men and can send battalions to camp at nearly full strength. But there the reassuring note ends and the next questions begin. How can Territorial infantry divisions provide adequate reserves for a force of the kind that the British have in Germany ? How quickly can they be mobilised and how quickly can they be moved to the Continent under war conditions ? How much training, physical and technical, do they need on mobilisation ? Is a fortnight's training a year enough to justify the title "reserve corps" for the Territorial expeditionary force ?

★

These are not questions to which the layman can provide the answers ; but they are the questions he feels impelled to ask. For if the answers are not satisfactory, as some good military judges think, then what must be the state of affairs in the armies that now stand, and will stand in future, alongside the British Army of the Rhine?

In no European country which is a member of Nato is there an organisation comparable to the Territorial Army in this country. The French system of mobilising reserves has been highly praised, but there is little evidence that over two million French reservists receive adequate training. The situation in Italy is not dissimilar. To the Belgians, Dutch and Scandinavians the problem is novel and their organisation still inadequate. How the American system would produce reserves speedily for Europe is unknown. So the evidence amounts to this: that systems of reserve training and mobilisation which, in most countries, are probably inferior to those of Britain, are expected to produce twenty-three divisions while this country produces two.

It is not unreasonable to assume that, in present conditions, they would appear slowly, in a matter of months rather than weeks, and that their quality would be uneven. Reservists who have had no training would have to be hardened and exercised in the use of their equipment. Reserve divisions would need training as divisions. Yet before units could be trained in formations their officers, of which there is a dearth in Europe, would themselves need training. Hundreds of thousands of men with wartime or conscript experience know how long these things take and can judge what is the gap between being a reservist in civil life and an "appropriate condition of combat readiness."

★

It is important that General Eisenhower's headquarters should now give much more attention to this problem of reserves and try to get the agreement of Nato governments to a common attempt to solve it. Indeed, the more SHAPE turns away from questions of high politics—American and European—to strictly military matters the better it will be for western defence. What was said at Lisbon gave the impression that the practical difficulties of turning a peacetime force of twenty-five divisions into a fighting force of fifty divisions had not been honestly discussed with the politicians. It is probably true to say that, of the fourteen members of Nato, only this country, Norway and Turkey have made a serious, long-term effort to provide reserves that are kept in fair training.

It will be argued by those who oppose rearmament that the forces stationed in Germany need be large enough only to act as a deterrent to local adventures. If that were true, then one American and one British brigade in Germany might be considered adequate hostages to fortune. But Continental peoples ask not for deterrents but for protection, and they have been persuaded to make their effort at self-defence only because they see six American and four British divisions on European soil. What has now to be considered is the temptation offered to an aggressor by the sight of ten crack formations, occupying an exposed position on an extended front without adequate reserves close at hand. Having taken this calculated risk for the defence of the West, Nato is now in honour bound to see to it that reserves are available to reinforce its main army not in a matter of months but in a matter of weeks.

SUBSIDIES IN PERSPECTIVE

No field of economic policy is so ridden with prejudice and mysticism as the subsidies. To present the facts about the subsidies is difficult and politically dangerous; to suggest that as instruments of social policy they are wasteful and inefficient, because they help all sections of the community and not merely the poor, evokes bitter hostility. In the thinking of many people, the subsidies have become a Sacred Cow, beyond examination and change. That it is a costly cow would matter less if there were clear gain for those sections of the community that are chiefly in need. In fact, the benefits are largely indiscriminate and dispensed without reference to need. The two articles below provide the basic facts about the housing and food subsidies.

I.—Cheap Housing

IF there were any gratitude in politics, the Opposition would surely have applauded Mr Macmillan's announcement of the revised housing subsidies, instead of trying to score debating points off it. No Minister of Housing and Local Government in a Labour administration could have exceeded Mr Macmillan in open-handedness. His decision, taken less than a fortnight before a Budget that ought to be tough, shows how far social policy has been debased into a political Dutch auction. It marks the uncritical acceptance by both of the major political parties of the fatuous proposition that the British birthright now includes the provision of houses at rents well below their economic costs—for those who are lucky enough to get them. Other householders less fortunate may ask why they should have to subsidise the lucky ones, without any test of the economic needs and means of those who pay and those who receive; but in the present state of party politics, they will get no rational answer from either side.

By raising the statutory housing subsidy from £22 a year to £35 12s. a year (for houses completed after February 28th) Mr Macmillan has entirely mitigated the effect on council house tenants of the rise from 3 per cent to 4¼ per cent in the rate at which the Public Works Loans Board lends to local authorities. From January, 1948, to November last year the rate remained at 3 per cent. Mr Butler then raised it to 3¾ per cent on the proper but long disregarded principle that these loans should not carry a concealed subsidy, and after the further setback in the gilt-edged market the rate was increased to 4¼ per cent last month. To compensate the whole of this rise in interest rates, so far as it affects local authority housing, by a corresponding increase in the subsidies invites the question whether the original exercise was worth while. It has certainly not been allowed to exert any disinflationary effect on the demand for housing, or to set local authorities on a determined path towards sensible standards in housing in return for realistic rents.

It must now be accepted that both parties are unwilling even to make a beginning towards a rational housing policy in which social aims might be matched to national and personal means. Both are victims of sentimental confusion in supposing that a local authority tenant must be assisted from other people's taxes and rates without any demonstration of need. Only the simple-minded would expect a comprehensive solution of the present tangle of housing economies, but Mr Macmillan's action has made artificiality so much the worse. The result will satisfy nobody. Mr Macmillan can claim that the increase in the subsidy covers the rise in interest rates. But it does not cover the additions to the cost and standards of council houses that have occurred since the £22 subsidy was fixed in 1946. The new scale of subsidy still presupposes a standard size house of 950 super feet, but many authorities are building houses of as much as 1,100 feet. The old subsidy was based on an estimated capital cost of £1,100 for the standard house, the loan charges on which (at a rate of 3⅜ per cent) amounted to £40 12s. a year, for a term of sixty years. It was assumed that management and repairs would cost £7 8s. a year, making a total cost of £48 a year, or 18s. 6d. a week. The £22 subsidy —£16 10s. from the Exchequer and £5 10s. from rates— reduced the weekly rent, on this assumed basis of costs, to a flat 10s. The new scale of subsidy is probably based on the assumption of an appreciably higher capital cost—perhaps rather more than £1,500. On such a sum, loan charges at 4¼ per cent together with management and repairs would absorb some £84 a year or, say, 32s. a week. Many local authorities would assert that the cost of a council house together with site and road is nearer £1,700 on which a full economic rent would be 35s.

The unpalatable fact is that the economic cost of a municipal house, built to generous standards, comes to between 48s. and 52s. 6d. a week, including rates. On the conventional assumption that a household will be prepared to devote a fifth of its income to rent and rates, such a house without subsidy could be afforded by a family receiving £12 10s. a week. The new subsidy of £35 12s. a year (of which £26 14s. is provided by the Exchequer and £8 18s. by the local authorities) will relieve the average tenant, irrespective of his means, of 13s. 9d. a week, leaving a net cost of about 18s. to 21s. to be covered by rent or partly relieved by a further

subvention from rates in addition to the statutory subsidy. The new scale thus disposes at least of the convention that 10s. is a "fair" rent for a council tenant to pay; if that was true when the old subsidy was fixed soon after the war, the rise in incomes has since made it absurd.

Many local authorities have sought to spread the excess of cost over subsidies of their postwar housing by pooling the rents of prewar and postwar houses, by using prewar surpluses on their housing accounts, or by charging deficits on their housing accounts to the rates. This last expedient has imposed on the rates, as a supplement to the statutory subsidy (now £8 18s.), an annual contribution that for certain authorities has reached £11 a year for each of their houses. That local authorities should sometimes be tempted to spread part of the cost of their housing over all their ratepayers instead of charging the whole to their tenants may be understandable; it is certainly expedient where a local authority owns a large number of houses which represent a powerful voting force. But that is to yield to the same temptations that pursue the central government, and to transfer yet a further arbitrary slice of the real cost of council housing from the tenants to the shoulders—not necessarily the stronger shoulders—of non-tenant ratepayers. The statutory subsidy, whatever it may be, should surely set the limit of the contribution from public funds.

Local authorities never lose an opportunity of complaining of their loss of independence and of ever-increasing interference from Whitehall. But they alone among landlords have full freedom to fix the rents of the houses that they own. They can, if they have the courage, spread increased housing costs over all tenants and fix rents according to the relative values and amenities of the houses they own; if, on the other hand, they lack courage, they can leave the rents of individual houses to be determined by the incidence of costs and subsidies at the time they were built, so that the way remains wide open for anomalies and inequities—as a comparison between the rents of prewar and postwar houses in some areas quickly shows. Too often they lack the courage because rent restriction of privately-owned property leads the council house tenant, handsomely subsidised though he may be, to suppose that he is being treated unfavourably. He does not see the cumulative deterioration of privately-owned houses that rent restriction causes; nor does he appreciate the plain fact that local authorities, which are not bound by rent restriction, have no excuse for failing to make proper provision for repairs to the houses that they own.

*

But if the local authorities are to go any distance towards a realistic rent policy they will need firmer government support than Mr Macmillan provided last week. The notion of what is a "fair" rent may have been raised from 10s. to about 20s. but that increase is well within the compass of the increase in wages of the last six years, and it is far below the true increase in housing costs. British standards of housing are high, but they will not remain high if the average tenant expects that the rent he pays should absorb a diminishing proportion of his income. Indeed, the time is long overdue for asking fundamental questions about the housing subsidies. At what goal do they aim? What is the limit that can be afforded? How should they be distributed? The local authorities are no longer limited by statute to the provision of houses for the working classes; they are supposed to provide houses to let for all. Almost certainly a greater proportion of the heavy subsidy payments of recent years is being wasted than was wasted before the war. In 1950, according to the National Income White Paper, housing subsidies cost the Exchequer £30 million and the local authorities £35 million; the latest increase in the subsidy payments pours many more millions into assisted housing. To give assistance where it is truly needed, and to avoid throwing assistance away where there is no true need, some advocate the introduction of "rent rebates"—a system under which economic rents are paid by tenants who can afford them and subsidies, graduated according to means, are paid only to tenants who cannot afford the full rents. Others suggest that the subsidies should be stopped, and that rents should be allowed to rise to their economic level, with assistance to needy tenants from a national subsidy pool. These proposals would make demands on central and local administration that would be acceptable only to those who believe that public servants can safely be left to ensure that public services are uniform to the ninth part of a hair from John o' Groats to Land's End.

*

More commendable solutions are likely to be found along other paths. First, the growth of the housing subsidies must be checked by allowing an appreciable part of the increases in housing costs (which are themselves only a reflection of increases in incomes) to fall upon rents. The new subsidies dip one toe into this cold water, but they also pour gallons of warm water into the other end of the pool. Secondly, the number of subsidised houses must be reduced by encouraging private building. It is fantastic that the man who wants to build his own house should have to meet the full weight of higher interest rates and at the same time support the rents of others—often of no smaller means than himself—who enjoy the artificial benefits of subsidised shelter. Swollen to their present dimensions, the subsidies redistribute incomes without reference to any declared principle. Thirdly, the local authorities must seriously consider every suggestion that promises a more economical design for houses and preserves all essential amenities in a more compact form with less circulation space. There will be plenty of cries of "lower standards," just as rent rebates would be denounced as a "means test" and private building as "speculators' paradise." Are housing needs and policy, then, to be left to claptrap? Or are broader views of the social welfare of all sections of the community to have a hearing? It would be easy to become pessimistic after Mr Macmillan's decision last week, for in truth the capricious boons and injustices of housing economics spread far beyond council houses; they urgently demand the modification of the rent restriction acts and reform of the system of valuation for local rates. All this is political dynamite, but if governments had a true conception of social welfare and the courage to take their eyes from the ballot box for a moment, they would surely reserve assisted housing for those in real need of it, and not offer it at large to the lucky tenants of local authority and rent restricted houses, leaving the taxpayer, the ratepayer and the landlord to foot the bill.

II.—Cheap Food

MR MACMILLAN has lacked the courage to start to tackle the housing subsidies. Will the Chancellor of the Exchequer have any greater courage when he turns to the food subsidies in his Budget next Tuesday? The postwar history of the food subsidies is full of brave words by Labour Chancellors about "ceilings," and in the last year or two a fairly effective limit of just over £400 million has been imposed on the total bill. At the same time, any pretence that the food subsidies mitigate the rise in the cost of living or restrain the demands for higher wages is no longer respectable. A broad section of the British public has come to believe that the first £400 million of its food bill (why £400 million is itself a matter of modern folklore) should be paid by someone else—which in fact means itself. Jekyll eats his subsidised breakfast and thinks he has a bargain; Hyde cheerfully lights a cigarette after the meal and pays nearly twopence to make the illusion of cheap food possible.

The illusion is less potent than it was, for the £400 million does not go nearly so far today. Food prices were allowed to rise last year by about 15½ per cent; there was no social upheaval (though there were heavy wage demands) and the £400 million remained intact. Since the subsidies represent nearly one-tenth of the total budget, that is something for congratulation. The average member of the British public spends about 9s. 1d. a week on subsidised foods—the value of the subsidies being equivalent to another 3s. 2d. a week—and about 7s. 6d. a week on other non-subsidised foods. He receives nearly a pound's worth of food for a net cost of 16s. 7d., without consideration of means. The road mender's loaf and the restaurant roll are both subsidised; millionaire and navvy alike eat some of their food cheap.

Facts about the subsidies are not given to simple statement. The latest official figures are to be found in the Ministry of Food's trading accounts for 1950-51 and they are reproduced in Table I. Comparable figures for 1951-52 have to be worked out from the average value of the subsidy per unit of food; these estimates are shown in the last column and are believed to be reasonably accurate, though they are not official. There are two kinds of subsidies: those that are intended to maintain the retail prices of basic foodstuffs below their actual cost and which may be called the "cost of living" subsidies; and those which may be called "welfare" subsidies, including the cost of providing milk and vitamin foods for children and expectant mothers free or at a reduced price as part of a national nutrition policy. In 1950-51 the "cost of living" subsidies accounted for 86 per cent of the total.

The bulk of the subsidies is paid on home produced food; in 1950-51 the proportion was 64 per cent and in 1951-52 it was probably higher. The concentration of the subsidies on home-produced food is in fact greater than these figures suggest, for British agriculture supplies barely 40 per cent of the ration requirements though it provides all the milk. The amount of subsidy per unit of food is thus heavily weighted in favour of home-grown produce. The two largest items among the subsidies are for bread and flour (£90 million) and milk (£65 million). Next comes meat and bacon (each costing about £45 million), eggs (£28 million), butter (£27 million) and cheese (£20 million); the other items are all under £20 million each. These subsidies probably absorbed £370 million in 1951-52, compared with £380 million in 1950-51. In addition, the Ministry of Food makes a net profit from dealing in certain foods, including canned and dried fruit, coffee, oils and sugar; it showed a net profit of nearly £40 million from such trading in 1950-51, but its dealings in 1951-52 were less active and its net profit may have been halved. After crediting these profits, the net "cost of living" subsidies may amount to about £350 million in 1951-52 against £343 million in 1950-51. The welfare schemes last year cost £36 million, fertilisers £11 million and the various agricultural schemes £10 million. For 1951-52 the total of all "welfare" subsidies has been estimated at a maximum of £60 million.

TABLE I—COST OF THE FOOD SUBSIDIES
(£ Million)

Commodity	1950-51 Home-Produced	1950-51 Imported	1950-51 Total	1951-52 Estimated
Bread and flour	21·2	65·4	86·6	90
Meat	22·8	11·0	33·8	47
Bacon and ham	29·6	12·9	42·5	45

Tea	,,	3 8	8½	19·3	16	0·31	48	5½	1

World food prices have been rising since 1949 and throughout the past year the cost of subsidies has been jammed hard against its ceiling, despite the rise in retail food prices. During the past twelve months the retail price of bacon and cheese has been raised by 10d. a lb, butter by 6d. a lb, tea, margarine and cooking fat each by 4d. a lb, meat by 3d. a lb, milk by 2d. a quart, sugar by 1d. a lb, flour by 7d. per 7 lb and the 3½ lb loaf by 1d. On present ration scales, these higher prices have added about 1s. 5d. to each person's weekly expenditure; to offset them by increased subsidies would have cost between £75 and £100 million in 1951-52 and nearly £200 million in a full year.

The Ministry is still having to pay higher prices for food. Australian, New Zealand and Danish butter has been increased by 7½ per cent; Australian and New Zealand cheese by 7½ per cent; Danish and Dutch bacon by at least 7½ per cent; and Australian and New Zealand meat by 10 to 30 per cent, according to grade. Prices for British farm produce were adjusted last autumn to meet the bulk of the increase in agricultural wages and the annual price review is now being made. The known increases in 1952-53 will cost about £50 million of which about half will be due to the higher cost of imported food. If the subsidies are to be kept within the present ceiling, this £50 million must be passed on to the consumer in the form of higher retail prices; it will represent about 4½d. extra on the cost of the weekly rations.

The impact of any reduction in the subsidies can be measured by its effect on retail prices or on weekly expenditure. Table II shows the relation of the subsidies to prices and to expenditure. Columns 2 and 3 give the current average retail price of the various subsidised foods and the average subsidy on each during the current financial year; column 4 shows what percentage rise in the retail price would result if the subsidy on each item were removed. The most heavily subsidised food is bread; the price would increase by over 50 per cent if the subsidy were removed. Cheese enjoyed a heavier rate of subsidy until the recent increase in its retail price; it still comes second and its price without subsidy would rise by 45 per cent; bacon and butter would each rise by over 30 per cent, and the other foods from between 17 and 27 per cent. In its adjustment of retail food prices during the past year, the Ministry of Food has evidently tried to spread the incidence of the subsidies more evenly among the different foods. The range of increase in prices of individual foods, if subsidies were abolished, would be much less than it was even six months ago.

The effect of changes in the subsidies on the retail price index depends on the weight given to particular foods. These weights are shown in column 5 and the effect on the index in column 6. The removal of the subsidy on bread and flour, for example, would raise the index by 1.56 points and would save £90 million. If the meat subsidy were abolished £47 million would be saved for a rise in the index of 0.74 of a point. Bacon, butter and milk would each raise the index by 0.6 of a point if their subsidies were removed and would yield £45 million, £27 million and £65 million respectively. The dropping of the other subsidies would raise the index by 0.3 of a point or less, for a saving of between £28 million for eggs and £10 million for sugar. If the Chancellor were concerned with the impact of the subsidies on the retail price index, he could aim at achieving the maximum saving for each unit increase in the index, as shown in column 7. Judged by this test, the largest saving would be achieved by abolishing the subsidy on margarine and cooking fat, followed by milk, eggs, bacon, cheese and meat.

The effects of a reduction in the subsidies on average weekly expenditure are shown in columns 8 and 9. The largest weekly outlay is now on milk, followed by bread and flour, meat, bacon and eggs. But the largest increase in weekly expenditure would be felt by dropping the subsidy on bread and flour, and the next largest by dropping the subsidy on milk. Next in line come bacon, meat and eggs. If recent experience is any guide it would seem that the public is less concerned about an increase in the index of retail prices than in weekly expenditure, for when the prices of bacon and cheese were each raised by 10d. a lb recently, thereby causing the index to rise by about a point, there was no perceptible reaction. Weekly expenditure increased by only a few pence.

These exercises should give encouragement to Mr Butler. He could save £65 million by taking the subsidy off milk though that would entail major changes in farm production since less milk would then be consumed; weekly expenditure would increase by only 4½d. and the index would rise by only 0.6 of a point. The milk in schools and other welfare schemes would provide for the needs of children and expectant mothers at free or at reduced prices. Abolition of the subsidies on eggs and meat would save some £75 million for an increase in weekly expenditure of 4¾d. and a rise in the index of 1.06 points. Consumption of both of these foods is now markedly seasonal because of greater dependence on home-produced supplies, and the effect of higher retail prices on the consumer would be felt only when home supplies form the bulk of the ration. At other seasons the public would gain, for at these times of the year the Ministry sells imported eggs and meat at a profit which it offsets against the subsidy on home-produced eggs and meat.

It is not difficult from examination of Table II to find ways of saving £200 million of government expenditure in return for an increase in consumers' average weekly expenditure of about 1s. 1d. and for a rise in index of retail prices of a little over 2½ points. This exercise suggests, indeed, that despite the threats and protests of the Opposition it should be possible to prune the subsidy bill without causing unnecessary hardship; a determined lopping would justify special protection for proved need.

In 1950, consumers spent £8,930 million on goods and services that actually cost £9,209 million. For every pound that they spent, another shillingsworth was thrown in "free." The subsidy bill of £479 million in that year exceeded one-tenth of the total expenditures of central and local authorities. Expenditure on such a scale would be a heavy burden, even if it achieved two eminently worthwhile aims—the mitigation of hardship and want, and the promotion of stable prices and incomes. The subsidies satisfy neither aim. There is no argument for spreading relief over all classes and incomes, whether they need it or not. Shelter and food are basic requirements for which a man should be prepared to work and pay—not things that he should expect to be provided, as the subsidies delude him into supposing, at the expense of others. One day—perhaps even next Tuesday—these simple truths may begin to take hold.

NOTES OF THE WEEK

Defence Justified

The politics of the occasion destroyed most of the real substance of the defence debate in the House of Commons on Wednesday. The leaders of the Opposition seem to have thought that at the weekly Labour party meeting the day before Mr Bevan's case had been discussed and defeated in private. During the afternoon they learned that they were mistaken, and the interest of all parties thereafter centred on the frantic scurryings round the corridors and whispered conferences to dissuade Mr Bevan's sympathisers from openly voting against the rearmament programme in principle. Mr Attlee had attempted to assert his authority, and how many of his party would spurn it became the real issue of the day.

Enough of this was known in the afternoon, when Mr Churchill spoke, for him to have great fun. He lost no opportunity to widen the split in the Labour party by praising its leaders for their zeal in defence preparations. But his speech was also effective in its exposition of defence policy. He pointed again to the circumstances which had led to the slowing down of rearmament: the financial crisis meant that a part of rearmament had to be sacrificed to exports. What he unfortunately did not show was whether the late Government's reluctance to sacrifice the standard of life to either rearmament or exports was being modified. In face of the programme's necessary inadequacy however, it is certainly right to concentrate more effort on that part of it which can give the most effective protection. The alarming superiority of the Russian MIG15 does indeed demand that "super-priority" should be given to the production of the latest and best types of fighter aircraft, even though few results of the effort will be seen for some time.

On such detailed points of defence policy Mr Churchill was convincing and reassuring. The orthodox Labour speakers could certainly find nothing to justify their professed lack of confidence in the Government's ability to carry out the defence programme. Mr Shinwell's main concern was to establish some common ground with the Bevanite faction, by insisting that the burden of rearmament should be shared "equitably" without damaging the social services and by protesting that the other Nato countries were leaving Britain to bear too much. Both he and Mr Attlee were too preoccupied with the threat from behind to attend seriously to their opponents in front. Their only valid point that was relevant to the motion was hardly new. It was the criticism that, distinguished as is the record of Lord Alexander, it is wrong to have a soldier as Minister of Defence, and a disadvantage to have him in the House of Lords. That may be important, but hardly important enough to be made the only solid prop for a motion of censure. It crumbled under the strain, and the Government's defence policy stands justified by default of detailed criticism.

* * *

Toryism Tried

The politicians who are awaiting Mr Butler's Budget with most anxiety are the Tory backbenchers. There are as many shades of opinion about what he ought to do as there are guesses about what he will do. On the whole, the "hard money men" have lately been cautious and Conservatives from industrial constituencies are increasingly inclined to talk about the political "impossibility" of tolerating more unemployment. But there is also some serious talk about the closeness of a sterling crisis; it is fair to say that the Conservatives at Westminster seem to be quite as conscious of the economic dangers as is the City.

The attitude of the backbenchers is complicated by the fact that their lot since the general election has not been happy. They have had to face in the House the taunts of an invigorated Opposition and in the constituencies the impatience and irritation of their own supporters at the new burdens, instead of the new reliefs, which the first four months of Conservative administration have imposed. Instead of being led, as they had hoped, into the attack against the errors and follies of the Socialists, the backbenchers have been called on to stand firm under the double attack of intransigent events and jeering critics. There has been no bonfire of controls and the two denationalisation measures, for steel and road transport, have taken an unconscionable time in the making. It is a tribute to the Conservatives' morale that under this strain they have grown baffled and impatient rather than dismayed.

This mood derives largely from Mr Churchill's dominance. He has not only gathered the reins of policy making and administration relentlessly into his own hands; he has also assumed complete control over the party's political strategy. He laid down, and enforced until last month, a policy of "no provocation," of trying, in the House and outside, to establish an atmosphere of national unity and common effort. When the Labour leaders spurned these gestures, partly because of Mr Bevan's prodding and partly because of their hopes of another election before too long, it was Mr Churchill himself who turned to driving a wedge between the Bevanites and the rest of the Labour party. His success, particularly on the China issue last week, delighted the Tory backbenchers as much as it dismayed his opponents. But the Tory rank and file do not want victories alone; they want to be in the fight. And that is where their leaders are giving them little opportunity. Neither they, nor even Mr Churchill's ministerial colleagues, are being encouraged to carry the war into the constituencies in the way that all true politicians enjoy. The spate of weekend oratory, much of it contradictory but much of it enlivening, that characterised Labour's period in office has dried up.

The main reason why the backbenchers' morale is still good is, of course, the division and ineptitude of the Opposition. But they also have an important consolation in the degree to which the Government has taken them into its confidence on matters of detail. Not only the 1922 committee but also the various specialist committees of the Parliamentary party have been widely consulted about many of the Government's measures; the ordinary backbencher feels that he can exercise, if not power, at least influence. He is being given, at second hand, a share in administration. This has its good side, but when the party is given little lead on general policy, its influence tends to work chiefly towards avoiding unpopularity in the constituencies. There seems to be little doubt that pressure from the backbenchers has delayed, if not modified, the Health Service Bill. And if such influence is a consolation, it is still a poor substitute for the full vigour of political battle that the real politician wants.

Truce Chances in Indo-China

There is a basis for a truce in Indo-China. Both sides would stand to gain and a clear division of territory could be made. But to say that a truce is practicable in view of the attitudes of Peking and Moscow to the struggle is quite another matter. Recent suggestions that an armistice might be concluded must therefore be treated with the greatest reserve. Two new developments have given rise to them. One is a change in French policy, detectable—but not admitted—in the recent comment by M. Letourneau, as Minister for the Associated States. He said that "France cannot on principle reject the slightest opportunity of ending hostilities." Paris had not previously shown willingness to negotiate with Ho Chi-minh since the collapse of the talks in 1946 and the original outbreak of the rebellion. The other development is that non-Communists in the Vietminh are reported to be increasingly anxious about the tightening of China's grip on the movement, through its complete dependence on Chinese supplies and the determination of the Communist element to dominate policy. Annamites—or Vietnamese, as they are now called—have long been strongly anti-Chinese.

The new French attitude springs from public dismay at the absence of any prospect of a decisive victory. It is no longer only the Left in France that wants to bring the Indo-Chinese war to an end, but the Right too. Before Marshal de Lattre died there had been hopes of building up a Vietnamese national army, strong enough to clean up an almost annihilated Vietminh, by the end of 1953. Now those hopes have been destroyed by the continued growth of Chinese aid to the Vietminh and by the recent French withdrawal from Hoa Binh. Whether the Chinese invade openly or not—and there now seems less chance that they may—the evacuation of Hoa Binh is a defeat and looks like the end of the de Lattre era, however much it is dressed up as a tactical move.

On the other hand, French and Vietnamese progress in the south has lately been promising, and it is this progress that makes a truce possible. If there is a stalemate in Tongking and a run of success for the French forces operating from Saigon, and if the Chinese abandon the idea of open invasion, the Vietminh might eventually come to terms. But these are big "ifs," and the one certain way for the French to lose the chance of a settlement on any but disastrous terms would be to relax their military and political efforts now.

Inside Egypt

In a country that is racked, as Egypt now is, with political and social discontent, any change of government is disturbing. It suggests disagreement in high places, and lack of continuity in policy. Yet the government of Aly Pasha Maher, when it fell on March 1st, was moving fast towards a state of impotence. He himself was a negotiator and a lover of orthodoxy; he spent his last days as Premier seeing all parties. In order to keep all in play, he was tending to concentrate on the "national will" to bring about British evacuation, on which all were agreed, and to soft-pedal the inquiry into the responsibility of certain Wafdist ex-ministers for the riots of January 26th. He was, therefore, the prisoner of the Wafd majority in Parliament.

His resignation was announced a few hours after he had agreed to, and King Farouk had countersigned, the suspension of Parliament. So quickly did a new cabinet get into the saddle, that there must have been foreknowledge and planning. It contains several members from the preceding government, but an entirely new feature is the potential hold of its Prime Minister upon a section of the general public. Whereas Aly Maher had no public or party following, Ahmed Negib Hilaly Pasha is the leading member of a moderate group within the Wafd which has for months opposed the get-rich-quick methods of some of the party's leaders. The public knows him as a good Minister of Education in the Wafd Government of 1942-45. He did not serve in the 1950 government because Nahas Pasha would not accept his terms for taking office; last November he was expelled from the party in connection with his revelation that the Minister of the Interior, Serag-ed-Din Pasha, was tapping telephones.

He stands—as all Egyptians do—for evacuation of the Canal Zone by Britain in order to fulfil the "national will"; but he insists equally on stamping upon the corruption which, as he said in his letter of acceptance of office, had become the "legal tender of political interchange." Whether he will succeed in either aim depends upon whether he has the moral courage to turn the inquiry into the riots against some of the leaders who expelled him from the party. By so doing he could split the Wafd, for the process would reveal how some of its leaders have cheated their following. Alternatively, he may—as the Saadists did in 1938—merely draw off from the Wafd a small group of educated men, who are too reasonable to excite and capture the allegiance of the crowd. His chances of successful negotiation with Britain will be no greater than those of his predecessors unless he takes the bolder line.

Dr Adenauer Stands Fast

The chorus of German objection to rearmament has not diminished since the Lisbon meeting. The latest blow to Dr Adenauer has come from the trade unions, whose leaders he has hitherto managed to win to his side. A congress of union officials from all over the country met at the end of last week to thrash out differences of opinion over defence, and issued a manifesto calling for the issue to be put to the country. Some weeks ago the central executive had declared that the Trade Union Federation supported a German contribution to defence, if social welfare were not affected by it. Immediately afterwards, however, the federation leaders were repudiated by a congress of Bavarian unionists, who always object to having their minds made up for them in North Germany or Bonn. It is true that Communists in the factories had helped; but they were only directing a powerful stream of sentiment into prepared channels.

The call for elections which came from the general conference of union officials largely duplicates the demand made by the Social-Democrat Party, as so many unionists are also

Socialists. But it inflicts further damage on Dr Adenauer's cause on the eve of elections in the new South-West state which has been formed out of three small states. The opponents of German aid in defending the West, whether neo-Nazis, Communists, pacifists or members of any other group, secure most of the publicity and impress a public which is all too ready to step on the biggest and brassiest bandwagon. These *Land* elections are particularly important because the Bonn Government may be frustrated if an opponent of Dr Adenauer goes to the Upper House as representative of the South-West state. Already the *Laender* are endangering the prospects of Germany's paying its present occupation costs, by refusing to raise the percentage of income and corporation taxes which the *Laender* pass to the federal exchequer.

Whatever resolutions are passed and local elections lost, Dr Adenauer has no intention of going to the country until the general elections are due in the summer of next year. Nothing can unseat the chancellor. The Bonn constitution was framed to avoid the weaknesses of the French and Weimar system and welds the government into position. A mere vote of no confidence in Dr Adenauer is not enough; the Bundestag must name the successor it wishes, and the chancellor can decide whether to ask the president to dissolve parliament. Dr Adenauer may secure a majority for the European defence treaty, helped by the fact that fear of a government by Socialists and trade union officials dominates his coalition. He is more justified in making the attempt than the critics who accuse him of killing democracy in Germany allow. It is true that the present Bundestag was not elected with any thought of setting up a new army, but neither was it given a mandate against defence. The question simply did not arise in 1949. A more serious objection to the Chancellor's tactics will hold good if he is successful in inducing the Bundestag to ratify the new treaties and is afterwards defeated at the next elections. The government which came to power in 1953 would then be pledged to secure a revision of the agreements or to repudiate them.

Unemployment and Unfilled Jobs

The widely ranging debate on manpower in the House of Commons on Monday was important chiefly for the light which it cast on the present degree of unemployment and its distribution between industries. Sir Walter Monckton, analysing the increase in unemployment over the last six months and comparing it with the similar but smaller increases which have marked the second half of each year since the war, elucidated a number of points from which it would be easy to draw wrong practical conclusions. The most striking thing about the present total of 378,000 unemployed is that its excess over the total in January, 1951, is more than accounted for by unemployment among women. At 162,000, the total of unemployed women is the highest for any January since the war; at 216,000, the total of unemployed men is the lowest since 1946. This distribution reflects the fortunes on the one hand of the textile trades and on the other of the engineering group of industries. In the first group unemployment has risen since last July by 59,000—a figure which understates the real change both because of short-time working and because many married women workers in Lancashire, having opted to stay outside the national insurance scheme, do not appear in the unemployment statistics. In the engineering trades, in spite of shortages of materials and switches of production, the increase has been only of 12,000, leaving the total lower than last year; though here again short time has increased and overtime working has diminished—though by a surprisingly small amount.

One may correctly infer from these figures both a measure of disinflation and a net shift of manpower in the right direction; it is possible for politicians to jump to the conclusion that further disinflation, wastefully increasing unemployment and reviving the apprehensive spirit of restriction, would be both unnecessary and positively harmful. But such a jump, however tempting, would be entirely mistaken. The most important of all the statistics employed in the debate was that in January there were as many unfilled jobs for men as there were at the same time last year. If manpower is to be moved from civil to defence industry and from home to export production, it is essential to keep spending—out of higher incomes—to a level that will exert no inflationary pressure on diminished home supplies. All parties are agreed that the less unemployment is generated in this transfer the better; but neither party ought, at this early stage, to exaggerate troubles that are in large measure an inevitable price of solvency.

* * *

Familiar Threats

The talk of industrial action by the workers in protest against Government policies is becoming wider and its motives are becoming more confused. But it is not thereby becoming more dangerous. Since it was condemned by Labour leaders of all the shades from Mr Deakin to Mr Bevan the Communist hand has been more plainly shown. It is reasonable to assume that there was some connection between last Sunday's unofficial shop stewards' conference at Sheffield and the meeting, in Vienna on February 12th, of the Metal Workers' Section of the World Federation of Trade Unions. The programme adopted by the shop stewards differs little from that pursued for years by the federation. They propose to set up a national organisation and to put a stop to short-time working by refusing overtime and to strike whenever workers are dismissed. They maintain that rearmament is inimical to peace and full employment.

It is most unlikely that the shop stewards will succeed where the Communist party has failed. It would be remarkable if many workers deprived themselves, for political reasons, of time and a half or went on strike in the interests of peace and full employment. It is much easier, as some of the miners' leaders in South Wales have proved, to induce people to take action in protest against something which affects them directly, like an increase in bus fares or the health service charges. Many Welsh miners are persisting, undeterred by the warnings of Sir Vincent Tewson and others, in their refusal to work on Saturdays—and some of them seem to be making up for it, in output and in earnings, by working harder earlier in the week. There is no obvious likelihood of full Saturday working being resumed; and if the Scottish miners have their way, the rest of the coalfields will soon follow the Welsh example. But if they do it will be because they are dissatisfied with wages, conditions of work and the cost of living—not because they think the rearmament programme is wrong or even because they are determined to put an industrial veto on the social policies approved by Parliament. Though some Communists among their leaders may be glad of the opportunity, the miners' motives, unlike those of the shop stewards, are personal and economic and do not depend upon policies determined in Vienna.

No Haste on Central Africa

By a coincidence the future of the Rhodesias was debated in both the United Kingdom and South African Parliaments on Tuesday—but from opposing viewpoints. In South Africa, Dr Malan spoke of a duty "to maintain Western European Christian civilisation in the Union," which, he said, was also the aim of the Europeans in the Rhodesias. These two territories could be a buffer between South Africa and "undesirable developments," by which he evidently meant the extension of the "disastrous" policy pursued in the Gold Coast. In the United Kingdom, on the other hand, Mr Griffiths and Mr Gordon Walker, as well as the Government spokesmen, spoke of the need for federation of the Rhodesias and Nyasaland as a means of providing a bulwark to withstand the spread of the ideas of Dr Malan's party.

Since Mr Griffiths and Mr Gordon Walker were responsible for the original federation proposals, it was unfortunate that the Opposition insisted, mainly for party reasons, on dividing the House at the end of the debate. To Africans, who cannot be expected to understand the intricacies of British political tactics, the division, which gave the Government a majority of only 18, will suggest that nearly half the House of Commons is opposed to the principle of federation, and it will be even more difficult to get them to discuss the proposals.

Ostensibly, the Opposition insisted on a division because it was dissatisfied with the assurances given by the Government both on the recent talks with Sir Godfrey Huggins and on the course to be followed if the Africans persist in refusing to consider federation. Yet Mr Lyttelton could hardly have been more definite. He denied that the decision to hold the conference in April meant that federation was being rushed through in spite of African hostility. He has asked African representatives from Northern Rhodesia and Nyasaland to meet him to discuss their fears before the conference starts, and they have been invited to attend the conference itself. The purpose of the conference is to draw up a draft constitution for the federation which can then be discussed in the three territories—hitherto discussion has not gone beyond the principle of federation. There will then be a later conference of all four governments to decide whether they should continue with federation or abandon it. Mr Griffiths and Mr Gordon Walker know that a government which is trying to reconcile two completely opposed points of view—the African and European—could not be more explicit than this. To ask for more will not promote the partnership between the races so eloquently urged by Mr Griffiths.

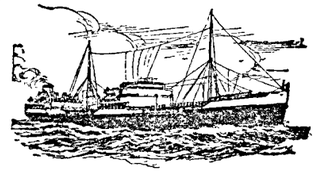
Ambassadors Not at Large

A new meaning has now been given to the phrase "diplomatic circles." It has long been an accepted right of diplomats to travel freely within the country to whose government they are accredited, and the gathering of political and economic information has been recognised as part of their proper duty. Only a few small military areas have been forbidden to them. Soviet Russia, however, has refused to conform to this diplomatic convention, preferring to revert to the almost total exclusion of foreigners which marked the earlier Muscovite regimes, but which had been largely liberalised by the later Tsars. Today everything in the Soviet Union is a secret, to be revealed only to selected and supervised visitors, and foreign diplomats, like foreign journalists, are regarded primarily as spies. Their freedom of movement has been steadily reduced, until at the present moment some 80 per cent of all Soviet territory is completely barred to them, while they cannot even travel more than 25 miles from their embassies in Moscow without special permission. The satellite states of Eastern Europe have mostly followed Moscow's lead in this respect, some with less rigour, some with even more.

Repeated protests against these violations of normal diplomatic courtesy among civilised nations having proved of no avail, the governments of the western democracies have reluctantly decided to apply corresponding restrictions to emissaries from the Communist world. The Atlantic Council agreed at Lisbon to treat Soviet and satellite diplomats on a strictly reciprocal basis. The Russian Ambassador in London will therefore be confined to a circle of 25 miles radius, with access to St Albans but not to Luton, to Guildford but not to Godalming. The Poles and Czechs will roam more freely, as long as western diplomats in Warsaw and Prague are allowed the same privilege; but Bulgarian diplomats in London will never, without special permission, get outside the built-up area. Even the severest restrictions of this kind will not, of course, create an equality of ferrous curtaining. In the west, Communist journalists and party members can supply east European diplomats with any information which is not already provided them by a free press; but in Russia and the satellite states, western diplomats have virtually no sources of information other than their own eyes. The significance of the new move lies, however, less in its immediate effects than in the evidence it provides that the western nations will no longer confine their reactions to intolerance and ill usage to formal protests. It is, in fact, the Atlantic partners' first co-ordinated action in the field of political warfare.

* * *

No Case for Cannibalism



It is being asked in Paris and London whether the prestige and effectiveness of the Organisation for European Economic Co-operation are to suffer from the growing economic role of Nato and Britain's triple commitment to consult with Europe, the Commonwealth and the Atlantic community. It is plainly wrong that those in charge of British policy, delighted with the firm foothold that Nato gives them outside Europe, should grow indifferent to the fate of an organisation that was a pioneer in teamwork between governments in Europe. Once the distribution of American aid passed out of its hands to those of Nato, a change of status became inevitable; but there is still time to consider how great this change should be.

Once the economic and military affairs of fourteen governments became intertwined by the planning of rearmament, it was right that Nato should allocate American aid; that the three wise men should work under Atlantic and not European

auspices, and that their job of supervision should become an annual event. But it does not follow that Nato can simply take the place of OEEC. For the latter can watch over the common economic interests of Western Europe, develop a highly personal co-operation between national representatives, and keep military considerations at arm's length—all in a way which is not possible for Nato.

In Nato it will become increasingly clear that the natural economic interest of the United States—as things are—often runs counter to that of Europe. It is claimed that its members enjoy "equal partnership," but Congress shows no sign of allowing it to do the kind of things that would make this equality real. The British cannot ignore this fact, either in their own or in Europe's interests. OEEC must remain strong enough to work on common problems of trade, payments, coal and steel production and on the occasional brainwaves—some brilliant, some not—that come out of the Chateau de la Muette. It must, in fact, prepare Europe's brief for Nato, if only because America's is so thoroughly prepared in Congress. It must help to keep a healthy balance in a body that, as it gathers power to itself, does not always show the Americans at their best.

* * *

Nato and the Slump

Fears that another economic slump is imminent are echoing round the world, and recently they have sounded as loud in the United States as in Europe. Unemployment, though still small, is increasing in most countries. Many manufacturers, particularly Americans, think that the era of shortages is passed and that a new era of surpluses is about to dawn; yet productive capacity is still expanding under the stimulus of rearmament. It is difficult to know just how real these fears are; a levelling off after a sharp rise often looks like a fall. But the Belgian Government has already suggested informally to the North Atlantic Treaty Organisation that it should call a conference to consider this potential depression. The initiative is understandable; for Belgium, despite its regular monthly gold income from the European Payments Union, sees its unemployment increasing at no mean rate and causing political difficulties.

The three wise men's report to the Lisbon Conference last month made it clear that a realistic approach to rearmament could not exclude economic welfare in its widest sense. Nato must concern itself with the diversion of industrial resources from civilian to defence production. Later on it must also be concerned with the problems of reverting from rearmament to a care and maintenance basis. If the Belgian request is agreed to, Nato would have to concentrate on more purely economic affairs much sooner than was expected. It has still to win its spurs, but that is no reason why the Atlantic powers should shirk the responsibility.

The real question is whether the slump that is being talked about would be wholly or mainly a result of rearmament, or whether it might arise from wider and more fundamental causes. The increasing unemployment in Britain and Europe occurs at present in pockets, both occupational and regional. It is concentrated largely in the textile industries. If labour were mobile that would be no bad thing, for resources would be freed for defence production. But labour, and especially female labour, is not mobile, and the present pockets of unemployment could lead to much more extensive industrial dislocation. If this is the problem that the Belgians have in mind, it is one that Nato can and should study.

On the other hand, it can be argued that the slump might be another version of the age-old problem of protecting either the value of money or the level of employment. Since the war Belgium has chosen to do the former; Italy, and more recently the Netherlands and Britain, have followed similar policies. Most other European countries have maintained a very high level of employment and let the value of money fall. These issues have world-wide implications and could be discussed effectively only under auspices much wider than Nato's. Clearly, the first thing to be done is to survey the extent of the problem; and for that purpose existing organisations are sufficient.

Dark Blue and True Blue

As the boatrace crews make their first appearance on the tideway Oxford may, without too strong a flavour of sour grapes, reflect that it can afford to allow Cambridge a small triumph between Putney and Mortlake while it is itself so strongly entrenched at Westminster. A correspondent has made some researches into the university education of postwar ministers, the results of which are summarised in the table. Oxford has produced more than half the men

UNIVERSITY EDUCATION OF MINISTERS

			Trinity Hall	1	–

of ministerial rank in the present Government, and it also had a long lead over the other universities in Mr Attlee's Governments. Four Oxford colleges seem to be favourite cradles of ministers: Christ Church, Magdalen, New College and Balliol; at Cambridge, only Trinity has this distinction.

The other universities have played a very minor part in the making of ministers. London, which now has more students than Oxford and Cambridge put together, has produced only one minister for every seven who went to the older universities; the London School of Economics, by repute so politically minded, has produced none. The formative period for contemporary ministers, however, was more than thirty years ago, and it may be that the newer universities have now their quota of embryo ministers. But the same preponderance of Oxford, with Cambridge second and the other universities far behind, is shown in the educational background of new entrants to the civil service—a fact that cannot be attributed to class privilege, now that 80 per cent of the students at Oxford and Cambridge are assisted by grants.

Is there some special quality in the atmosphere of Oxford? It has a higher proportion of arts students than Cambridge—74 per cent compared with 53 per cent at Cambridge in 1949; and its schools are more likely to stimulate an interest in politics, and to attract those who are already interested, than those at Cambridge—in particular, Greats as compared with the more formal study of classical languages at Cambridge, and Modern Greats as compared with the Cambridge Economics Tripos. Tradition, too, is no doubt an important if incalculable reason why British governments—even Socialist governments—speak with an Oxford accent.

Proud Inheritance

So well remembered . . . by A.E.C.

WEMBLEY EXHIBITION, 1924

The changed world of the nineteen-twenties quickened the pace of living as nothing else had done before. A hectic jazz-mad gaiety...a get-rich-quick ruthlessness, seemed to typify the times. Yet the ever-present stability of Great Britain lay close beneath the surface. Symbol of her true character...of her great Empire...of her advances in Science and Industry, was the Wembley Exhibition. From all over the country her people came: to wonder at the craftsmanship in the vast Palace of Engineering, to glow with pride at the Empire pavilions, and to fling their inhibitions aside in the spectacular Fun Fair. London belonged to the visitor that year: and no better example of British craftsmanship was to be seen anywhere than the buses of the capital — many of them built by A.E.C. in an already famous tradition. The new N.S. type had been produced the year before: though after thirteen years' service the famous old "B" type was still giving untiring service...members of a family whose enduring reliability was typical of the underlying solidity of the nation itself.

Guarded Fires

Some bad accidents will be prevented if the private members' Bill sponsored by Mr Bullard, and recently published, becomes law; it would make it illegal to sell a gas fire, electric fire or oil heater without a guard fitted to it. The need for such legislation was shown by Dr and Mrs Colebrook in their study of 724 cases of burning admitted to the Birmingham Accident Hospital.* Half these accidents were due to contact—usually momentary—with a domestic heating appliance. One in every six injuries was caused by a gas or electric fire, almost all of which were unguarded.

A guard that is strong enough to be effective has the disadvantage of making the fire look less attractive, and it is a pity that compulsion could not be applied only where there are children and old people, who are the most frequent victims. Guarded fires are already on the market, but the accident rate is still high enough to show that the good sense of parents cannot be relied upon. In making the use of guards universally compulsory Britain would be following the example of several countries, including Sweden and the United States. The Bill should be generally supported.

Spy Trial in Athens

The spy trial that has just ended in Athens has provided startling and sobering evidence of how little Communist activities can be curbed merely by driving them underground. Twenty-nine Greeks, most of them members of the banned Greek Communist party, have been on trial on charges of espionage and treason. Their activities were brought to light last November when the Athens police broke into two Communist hideouts in the city's suburbs. There they discovered, in concealed underground rooms, not only wireless transmitters and receivers, but also hundreds of coded messages, complete with their keys, that had been exchanged with a Cominform radio station near Bucharest.

Two points of special interest emerged from these messages. The first was that the Greek Communist underground had been supplying its exiled leaders with military intelligence. This included precise details of the armaments tanks used in the Greek Army and the exact penetration power of the projectiles fired by Greek anti-tank guns. This would all come in useful if the Greek Communists fulfil the pledge made by their leader, Zachariades, to attack the Greek Army once more with the help of the armies of the "popular democracies." The second point is that the extreme left-wing party called the United Democratic Left (EDA), which polled about 10 per cent of the votes in last September's elections, has been completely unmasked and shown to be, as was always suspected, nothing more than a cover for the Communists.

The main facts in the prosecution's case are not in dispute. The defendants were given a fair and open trial; seven of them were acquitted because of insufficient evidence. But a heated controversy on the political expediency of the death sentences passed on eight of the accused has been stirred up by a comparatively small section of opinion. This includes the left-wing of General Plastiras's party, the EPEK, and the debate may even help to disrupt the General's coalition government. It will be most unfortunate if the Greek authorities' efforts to expose and destroy underground Communist activities should be allowed to threaten the stability of the Greek Government.

Trieste Unsolved

The hopes entertained last autumn for settlement of the Trieste problem have now been dissipated. Italy and Jugoslavia may even be further apart than they were six months ago. Having made a special effort to reach agreement and failed, a long time may pass before they come up to the starting line again; it will in any case be increasingly difficult for the government in Rome, as the general election approaches, to accept anything but full satisfaction of Italian claims. The prospect of agreement has been shattered in the Italian view, because the Jugoslavs suddenly started talking about a settlement on vague ethnic principles instead of a definite ethnic line; and in the Jugoslav view because at Lisbon Signor De Gasperi rejected Marshal Tito's interim proposals for the joint administration of the whole territory of Trieste.

It is difficult to see why the Jugoslavs backpedalled first when, presumably through a genuine desire to reach a settlement, they have since sent one of their best men, Mr Velebrit, as the new Minister to Rome. If Signor De Gasperi accepts the present state of affairs and the continuing validity of the allies' declaration of March, 1948, both he and they will be accused in the elections of failure. If he prevails on the Americans and British to give Italy sovereignty over Zone A, he will be bitterly accused by all extreme nationalists of settling for far less than Italy's just claims. And even if he renews negotiations with Marshal Tito his own power to make concessions is becoming more limited.

* *The Lancet*, September 29, 1951; page 579.

Right of Asylum

England has always been the sanctuary—sometimes nearly the sole sanctuary—of the world. Against crime only—such crime as is punishable by the laws, and condemned by the moral sense, of all civilised nations—has she closed her doors. To misfortune, to failure, to heresy, to imprudence, to political iniquity even, she has always afforded, if not a welcome, yet at least an asylum. Huguenots flying from the fiery inflictions of bigotry; patriots escaping from the wreck of baffled and perhaps indefensible rebellion; monarchs flying from the vengeance, just or unjust, of their subjects, the victims of brutal tyranny, the victims of reactionary license; all alike have found in England a shelter and a home. . . . There are many among us who contend not only for the right of England to shelter refugees from any cause, but also for the right of these refugees to make use of the safety from pursuit thus afforded them, to plot and to prepare against the Governments from which we are protecting them. . . . We hold this doctrine to be both dangerous and indefensible. . . . It must be remembered that we, as a rule of national policy, acknowledge all Governments *de facto*, however they originate, and whatever be the principle on which they are based. We are on terms of amity, and in alliance with the rulers of every country with which we are not actually at war. We may harbour their enemies when defeated, but we may not assist them, nor allow them to make use of us to injure or assail our allies. When we see men fighting in the street, the feelings of humanity induce us to open our door to the one who is disarmed and overthrown, without any inquiry into the origin of the quarrel or the justice of the cause; but we do not allow him to fire from our windows on his baffled and exposed antagonist. . . . Our laws on this head are clear and just. . . . We are not Judges of the Right, we are simply Keepers of the Peace on our own soil. And all who value the inviolability of our Island Sanctuary, and the impartiality with which its shelter is afforded to the unfortunate of every sort . . . should join in deprecating in the strongest manner the ungenerous ingratitude of those who abuse our hospitality, and who repay the benefit by compromising the benefactor.

The Purity of Impure Competition

American Capitalism. By John Kenneth Galbraith. *Houghton Mifflin*, Boston. 217 pages. $3.00.

Professor Galbraith, of Harvard, has behind him a distinguished record in government service. This experience combines with his ability for lively generalisation to make him peculiarly at home in the border region between economics and social analysis. And, though too much love of epigrams occasionally makes him trite or misleading, he writes forcefully, clearly and without jargon. In sum, this is one of the most important, original and persuasive books on the general theory of economic policy written since the war.

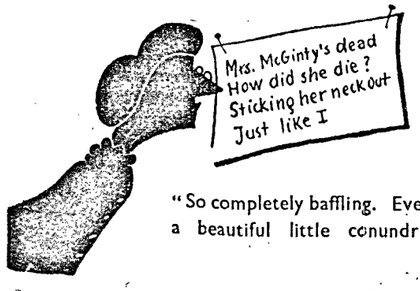
In the past ten years the American economy has worked extraordinarily well. Yet a deep uneasiness about it has persisted. What Mr Galbraith calls the "depression psychosis," the strong fear of instability, continues; and there is a genuine belief that increasing taxation and extending government intervention are undermining and may eventually destroy the free enterprise that is supposed to be the basis of the economy. What are the reasons for this contrast between practical success and inner uncertainty? Mr Galbraith's answer is that the ideas by which both conservatives and liberals judge the system no longer fit the facts of its operation. The classical doctrines of competition are still the implicit interpretation of American capitalism. They describe an economic system of high social efficiency, using its resources to produce at minimum cost what people most want; a system in which there can be no misuse of private power because no individual producer can influence the price of his product, and there is, therefore, no power to misuse. Government intervention is thus harmful or at least redundant. The American businessman still wants to justify himself in those terms. But plainly they do not fit the facts. The great corporations that now dominate large sections of the economy—and the distinctive and most efficient sections at that—plainly do control prices and possess the power that is abhorrent to American beliefs. There is therefore no guarantee that competition will enforce the most efficient use of resources and no *a priori* case against government intervention.

Mr Galbraith concludes that the American economy owes its virtues not to the pure competition of theory but to the imperfect competition that economists have too readily assumed to possess the defects of monopoly. He wants to make the oligopolist—the firm with only a few competitors, who shun price-cutting—respectable in theory as well as in fact. The moral rehabilitation rests on two main arguments. The first is that an economy of large corporations makes technical changes faster than an economy of "pure" competition, which indeed would probably nowadays be a static economy. The second, and more important, point is Mr Galbraith's theory of "countervailing power." The market power of the large corporation leads people who sell to it or buy from it to set up opposing positions of power which limit the exercise of the original power. The main examples of this process are the trade unions (which, significantly, are most effective in the industries dominated by large corporations), the farmers' price-support arrangements, and the chain stores and other large retailers who check the manufacturing corporations' power to raise the prices of many consumer goods.

This concept is important because it provides a guiding principle for pragmatic judgments on the merits of particular government interventions in the economy. Broadly, the state should encourage the development of countervailing power (as American governments have often, though not consistently, done) and attack or control "original" market power where there is no effective private check on its exercise. Here, in theoretical statement, is a doctrine both for the modern trust-buster and—provided there are not many of him—for the bureaucratic controller.

A short and simplified summary cannot do justice either to Mr Galbraith's analysis or to the practical wisdom of his detailed points. But two comments are essential. First, it is difficult entirely to share his enthusiasm about the technical progressiveness of the large corporation. Undoubtedly it introduces continual improvements in established products and processes more quickly than the firm with fewer resources for research. But can it be trusted to make, and apply, the really startling innovations that begin new industries? It was not, in general, the carriage-makers, or indeed established firms from any other industries, who first put motor cars on the market.

Secondly, as Mr Galbraith himself points out very clearly, countervailing power is effective in limiting the ill-effects of imperfect competition only in a buyers' market. He believes both that the American economy still tends to require propping up against depression, and that Keynesian policies can do the job fairly well. But he also recognises that the policies are not symmetrical: they are not so likely to be applied effectively in reverse, to prevent inflation; raising taxes and cutting government expenditure run, as he puts it, "against the current of politics." Inflation may therefore be the most persistent future tendency of the American economy, and in inflation the countervailing power of trade unions and chain stores does not work against the corporations. Mr Galbraith fully recognises this problem, but in dealing with it his prescriptions for government policy lose their clarity and their confidence. That will disappoint British even more than American readers. Until it is fully dealt with, the most brilliant attempt to provide a new philosophy for successful capitalism has not got more than half way home. But the half is indeed brilliantly done, and no one will read this book without seeing many things more clearly—and enjoying its terseness and wit.



A Myth Exposed

Industrial Democracy and Nationalisation. By Hugh Clegg. *Basil Blackwell.* 147 pages. 9s. 6d.

The postwar years, faced with the problems of full employment and large scale nationalisation, have understandably produced much theorising about industrial relations and a spate of blue prints for a better "industrial society." The majority of these ideas, however, are not based on a practical knowledge of industry, nor are they conspicuous for clear thought. The author of this book, a Fellow of Nuffield College, who, in his previous study "Labour Relations in London Transport," has already shown a capacity for painstaking research and an independent approach, performs a valuable service by his searching analysis of the meaning of "industrial democracy," a concept as nebulous in practical terms as evocative in its emotional

COLLINS 9s. 6d.

appeal. These essays, published under the auspices of the Fabian Society, are the more interesting because they expose some of the fallacies of traditional socialist "mythology," such as the belief "that there was a sufficient number of workers able and eager to take part in running industry once the obstacles of capitalism were removed."

Similarly treated is the assumption that a "socialist society would release other motives for labour and service to take the place of the desire for financial gain." It is surely encouraging to hear from a socialist source the frank statement: "If other motives do not come forward to take the place of cupidity in the pursuit of efficiency in industry, the case for socialism is so much the weaker." When the author concludes his penetrating destruction of the current illusion of "self-government in industry" with the statement "government of a whole industry by a union or by joint control would be autocratic and not democratic since there would be no opposition to defend liberty and check the government's excess," one can only hope that he will be read by as many trade unionists as possible. Indeed if the analysis of this slim volume can stimulate a reconsideration of the problems of industrial organisation among the leaders of the labour movement, there is still a chance that the party might emerge from its period of opposition with an industrial policy of greater relevance to the country's economic needs.

A Swedish Contribution

Wages Policy Under Full Employment. Edited by Ralph Turvey. *Hodge.* 88 pages. 6s.

This stimulating and meaty little book should induce a certain shame in English speaking economists. Four Swedish economists—Professor Lundberg, chief of the Business Cycle Research Institute at Stockholm, Mr Meidner and Mr Rehn, of the *Landsorganisationen* or Swedish TUC, and Mr Wickman, a specialist in welfare economics—introduce, debate and sum up the problem of combining full employment with economic stability and a rational distribution of manpower between different occupations. All four are Social Democrats, which implies that certain solutions to that problem are ruled out from the start. No totalitarian absorption of the trade unions, no transfer of their wage fixing functions to the state, no direction of labour, can be included in their policy; nor can, on the other hand, any mere acquiescence in a wage-price spiral which benefits the profit maker, and a group of strategically placed unions, at the expense of the rest.

Within a similar political framework, British economic thought has, with few exceptions, been content to note the existence of a problem: full employment enormously increases labour's bargaining power; bargaining power used to the full raises wages faster than productivity; the upshot is inflation both of demand and of costs. For a solution it is content merely to appeal to the public spirited restraint of the trade unions. This is not economics; it is not even—as the Swedish essayists demonstrate—practical politics beyond that short run in which union opinion has time to form itself. The present authors may not have produced a generally acceptable or even an agreed solution; but they have at least applied hard headed logic and good sense, instead of woolly wishful thinking, to a problem whose conditions they have seriously thought through.

Professor Lundberg discusses the norms of a desirable wage policy and offers some admittedly sketchy but suggestive observations on the actual determinants of wages over the last thirty years. Mr Rudolf Meidner neatly outlines the dilemma of free trade unionism and demands in its name an end to that excess monetary demand which is the panacea of so many academic friends of the workers in this country. Mr Gösta Rehn and Professor Lundberg then vigorously debate Mr Rehn's proposal to use indirect taxation as a means of keeping profits down and subsidies as a means of keeping employment up, while stimulating mobility by "very active measures" including direct grants for transfer to undermanned industries. Mr Krister Wickman, sympathetically critical of Mr Rehn's argument, lines up firmly with him and with Mr Meidner in condemning inflation plus repression as an instrument of employment policy.

Examples and arguments are mostly drawn, as is natural, from Swedish experience; but they are highly relevant to Britain and even to America. Mr Ralph Turvey, by his services as editor and translator, has earned the gratitude of—one must hope—a large public.

Italy and the German-Soviet Pact

L'Italia e gli Accordi Tedesco-Sovietici dell'agosto, 1939. By Mario Toscano. *G. C. Sansoni*, Florence. 96 pages. 500 lire.

Professor Toscano, who is in charge of the papers at the Italian Foreign Office, has already displayed his masterly technique in handling material of this kind. After his "Origins of the Steel Pact" we now have this analysis of Italy's part in the German-Soviet *rapprochement* in 1939. It becomes clear that, although Ciano seemed taken by surprise when Ribbentrop informed him on August 21, 1939, that he was leaving for Moscow, and although in his speech to the Fascist Chamber in the following December he condemned Hitler's new friendship, the Italians were all along informed of what was being prepared. In fact the Italian Ambassador in Moscow, Augusto Rosso, was ordered from Rome to support the German advances to the Kremlin in the summer of 1939, and through his friendship with Count Schulenburg, the German Ambassador, was kept well posted about their success.

Rosso's despatches to the Palazzo Chigi, which form the backbone of this study of Professor Toscano's, are remarkably intelligent; it is difficult to think of anyone else at that time who so clearly understood Soviet aims in general and Soviet suspicion of Great Britain in particular. Thus Rosso avoided the false conviction of Attolico, his colleague in Berlin, that Russia would come to terms with the western powers; on the other hand, he never over-estimated the permanence of Russia's friendship with Germany, perceiving that it could but desire to set the two "capitalist" groups at one another's throats.

In view of the coolness between Rome and Berlin which followed the German-Soviet Pact of August 23, 1939, it is interesting to learn that Ribbentrop while on his brief, dramatic visit to Moscow, found time to have a long conversation with Rosso. He reminded the Italian Ambassador that Mussolini himself had suggested to Goering in the previous spring an improvement in German-Russian relations, and that the pact he (Ribbentrop) had just signed was naturally envisaged as strengthening the Axis—steps would be initiated, he added, to square Japan. In fact, although they cannot be suspected of planning this in advance, the German-Soviet Pact helped Ciano and his friends to keep Mussolini out of the war until June, 1940.

America's Underworld

Crime in America. By Senator Kefauver. *Gollancz.* 254 pages. 16s.

This book, says Mr Gollancz's familiar saffron livery, "will fascinate anyone in the least interested in the anthropology of present-day societies." The implication is unfair. From first page to last there is no intrusion what-

THE CONTROL OF PUBLIC EXPENDITURE

Financial Committees of the House of Commons

By BASIL CHUBB 25*s. net*

This book is concerned with the institutions and procedures which the House of Commons has devised to ensure, within the limits of policy, that government expenditure conforms with its orders and that public business is conducted faithfully and economically. It resolves itself primarily into a study of the Select Committees of Public Accounts, on Estimates and on National Expenditure.

OXFORD UNIVERSITY PRESS

ever of the familiar jargon of "mores," "folkways" or "culture patterns." For better or worse, Senator Kefauver is no Myrdal, and his book is no "American Dilemma." It is an American "Newgate Calendar," a wonderful gallery of criminal types and trades. It is also a kind of underground Gunther—an Inside America's Underworld. Certainly it asks the same questions: Who runs it? How is it done? The answers, unfortunately, are patchy, and betray only too clearly the limitations on research by senatorial investigation. Material is coaxed, bullied, tricked and squeezed out of one obvious criminal after another, while the television cameras make of it a kind of round-the-clock gangster film. But the answers of these delinquents are seldom enough to convict them as individuals, much less to expose the full interlocking of their criminal conspiracies. The Senator has exposed a "situation," provided a myriad clues, given honest citizens adequate signposts to the major plague spots of their society and aroused a considerable, though probably evanescent, public indignation. Has he done more?

One short answer will be provided by the New Hampshire primaries on March 11th, and this book, as its campaign preface underlines, has obviously been written with one eye on the White House. If Senator Kefauver does ride to victory, his record as a crime crusader will be the main contributory factor. No doubt too his investigation will prove the undoing of several Democratic city and state machines in November. But at the same time his book makes it quite plain that it has not destroyed inter-state crime or dethroned *Signori* Frank Costello and Joe Adonis from their place at the controls. It will take more than trial by television to do that. The ethics of an acquisitive society cannot be changed by the discovery of the cathode ray.

French Fairyland

The Making of France. By Marie-Madeleine Martin. *Eyre and Spottiswoode.* 296 pages. 21s.

Mlle Martin's book, published in France in 1948, received the distinction of the *Grand Prix d'histoire* of the French Academy. The English reader of this translation is at once driven to speculate on the reasons for the award, for, although the book is based on a wide reading of history and literature, it is plain that Mlle Martin does not inhabit the mundane world of the ordinary historian. She prefers the fairyland of legend and myth, seeking the Holy Grail of the French national spirit. Her quest leads her from Merovingian Gaul into the enchanted glades of the France of St. Louis, through the formal landscape of the *Ancien Régime* out into the bleak wilderness of the liberal nineteenth century.

The kings of France are, for Mlle Martin, both the creators and the guardians of the French national spirit. As an ardent disciple of Charles Péguy she pays lyrical tribute to the achievements of St. Louis, who fused the interests of France and Christianity. "The harmonious hierarchy of the kingdom," she says "had at its apex a man who had himself arrived at the apex of his soul." The trumpets sound almost as loudly for Louis XIV, for he, like St. Louis, apparently had a mystical appreciation of the soul of France. His foreign policy represents the perfect marriage of the dual needs of French security and European Christianity, since he both secured the French frontiers from German invasions and preserved the Germans from conquest by Asia. Unfortunately the sceptics and rationalists of the eighteenh century refused to accept the traditions of hierarchy and patriotism so carefully cherished by the monarchy, abandoning them for "a pernicious ideology based on an inaccurate science of human society." At this point Mlle Martin's tone changes from lyrical piety to shrillness as she explains how the French national spirit came to be perverted by the radicals of the Revolution and the liberals of the nineteenth century. Yet in this dark period the spirit of France was reborn in Charles Maurras, who blazoned in the pages of the *Action Française* the true doctrines of patriotism.

Mlle Martin's book is a tendentious survey of French history in terms of a myth. Nostalgic musings form a poetic mist to obscure difficulties such as those connected with the relations of the Most Christian kings and the Papacy. The miasma arising from the romantic royalism of this book should encourage most readers to return to the healthier climate of evidence and dispassionate analysis.

Letters to the Editor

No Business in Moscow

Sir,—The Moscow conference may indeed be a trap, but have you not fallen into a more dangerous one? Far from inviting western delegates with "progressive" leanings, the organisers in each country have gone to great lengths to encourage the attendance of persons prominent in business and industry—and the more conservative their politics the better. To judge by their overtures in France, Italy, Japan and other countries, nothing would please them more than to have the British delegation handpicked by the Federation of British Industries. And with discussion of controversial economic as well as political issues ruled out, why should a deputation representing real British commercial interests allow the "professionals" to "win easily and quickly"?

The list of "arguments for everyone" which you describe as "perfectly good economic sense" is, unfortunately for us, just that. If Britons choose to ignore the arguments merely because the sincerity of their self-appointed proponents is doubted, there are others disinclined to take this risk.

Likewise, whether or not Marxists can be in earnest when they "paint a picture of under-developed countries being peacefully assisted by the heavy industries of the capitalist West," they are dropping this challenge squarely in our lap. The wariness of further American economic aid, when tied with Mutual Security strings, on the part of Mexico, Indonesia, Iceland, Burma, Persia (reported in your same issue), coupled with the repeated Soviet offers of capital equipment at Singapore, Rangoon, Tokyo and Bombay (and Moscow?), add up to something which must be taken seriously.

Active support of the Moscow conference is coming from responsible business circles in the under-developed countries, and sophisticated aloofness from Britain is not going to count for much among peoples who are thinking in terms of bread and butter.

The Russians' apparent ability to make good their tempting proposals (regardless of deprivations entailed within their bloc), plus renewed economic and political hazards in the West which you cite, do not augur well for an improved bargaining position after the year's delay which you favour.

You state that such a conference, if genuine, could be a "miracle" and "serve a really useful purpose." But rather than boycotting it because the communists have taken the initiative in organising it, in the circumstances surely a more realistic attitude for Britain is to send to Moscow the "tough and determined deputation" which a Conservative MP urged on Mr Eden.—Yours faithfully,

H. V. THOMLINSON

London, N.2

★

Sir,—Your cold douche of defeatism for the businessman attracted to the International Economic Conference prompts several questions:

1. You concede that "a genuine conference might indeed perform a miracle." Are miracles so unimportant that even the chance of one should be forgone?

2. You concede that the "arguments for everyone" are "perfectly good economic sense." Would not the Western world, then, only be strengthened by their recognition?

3. You explain that the purpose of the conference is to drive wedges into the Western alliance by the repetition of attractive half-truths. Is it the liberal tradition to suppress half-truths, or to rely on effective competition by whole truths?

4. Those whose hearts are sound and whose eyes are open will find themselves, you believe, in a minority. Is that any reason for making the minority as small as possible?

5. You talk scornfully of "making anti-Communist speeches in Moscow itself." Is this the only tactic? It is certainly a poor paraphrase for that speaking the truth in love (albeit

THE TIMES
REVIEW OF
INDUSTRY

PUBLISHED ON THE FIRST WEDNESDAY OF EVERY MONTH

An Additional Service

The quarterly Bulletin of the LONDON AND CAMBRIDGE ECONOMIC SERVICE, which has long been regarded as the most authoritative publication of its kind, will henceforward be published as a special section of *The Times Review of Industry*.

The Bulletin, which has ceased separate publication, will appear regularly in the March, June, September, and December issues, and will continue to be prepared by its own editorial committee.

The Bulletin in the March issue, just published, reproduces the familiar regular features, notably the index of industrial production and Sir Arthur Bowley's index of wages. The principal article deals with the general economic difficulties which form the background to the Budget.

bluntly) to which the Christian must feel himself impelled.

Your case against participation hinges on the pessimistic belief that, because Communists control the conference, the presence of men of a different persuasion could do no good to offset the danger of their presence being "used as evidence by the enemies of western unity." It is possible, on the contrary, that a strong British delegation, composed of men with goodwill but without illusions, could make a contribution to peace by laying our case before those who would otherwise not hear it, and by eroding a little the misunderstandings that bedevil policy-making in east as well as west.

Your pessimism can only be based on the assumption that the Russians see no way out of the cold war deadlock, save by increasing their own strength (in this case, through propaganda). This need be true of them only if it is true of us.—Yours faithfully,

W. G. McCLELLAND

Whickham, Durham

[It was, perhaps, not made sufficiently clear in the article that there has been no question of a British "delegation" being invited and that the procedure laid down for the conference excludes controversy. How "our case" could be publicly presented in Moscow without controversy is difficult to understand.—EDITOR.]

How to Grow More Food

Sir,—It is a fallacy that highly capitalised, heavily mechanised farms are *ipso facto* more efficient. There is no real warrant for this assumption. On the contrary, Mr F. G. Sturrock and other agricultural economists have shown that, even on the big arable farms of East Anglia, mechanisation (which has absorbed most capital in recent years) has not materially reduced the labour requirement per unit of crops and livestock, while it has, of course, substantially increased the manpower indirectly employed in food production through the construction, transport, servicing and fuelling of the machinery itself. In other words, the consumer and taxpayer now have to pay the costs, not only of farming proper, but of large sections of the engineering and chemical industries.

The individual farmer, of course, has little choice in the matter. If he cannot provide good "tied" cottages, he just cannot get good workers. He has to make up the difference, so far as he can, by buying machinery and other "technical aids" (often with borrowed money). My own view is that agriculture simply cannot compete on equal terms with industry for wage-labour. But it could attract in large numbers keen and energetic young men and women whose chief (and very natural) desire is for "a place of their own" and who, in many cases, are now emigrating.

How could such "places of their own" be provided? Not, I agree, by evicting from their homes sub-standard farmers, but rather by buying from them (by order if necessary) portions of their present holdings, thus leaving them their homes and at the same time impelling them to farm their remaining land more intensively and providing them with the working capital (the purchase money) to do so. Tenant farmers would, of course, receive "tenant right" and compensation for disturbance.

Economists may, perhaps, object that a decrease in average size of farms would reduce efficiency and tend to raise costs. I submit that this line of reasoning, however much it may apply in industry, is not valid as a general principle in agriculture. Our near neighbours, for instance, the Danes and the Dutch, produce far more food per acre than we do, and their rural standards of living and education are at least as good (probably better). Yet for years past they have pursued a consistent policy of creating more and more small family-sized holdings.—Yours faithfully,

JORIAN E. F. JENKS

Pangbourne

★

Sir,—I suspect that you are right for the wrong reason in suggesting that monetary incentives do not offer sufficient inducement to farmers because of high taxation. It has become, deplorably, quite common for shortfalls in production to be blamed on high taxation, instead of on lack of effort and foresight, bad management, and questionable business ethics. These faults are the result not of high taxation but of easy money, and are the cause of high taxation. That is why, as happened in Czechoslovakia, relaxation of taxation on succeeding units of income aggravates the trouble it is supposed to cure.

Suppose that, instead of giving the farmer cash subsidies, the country empowered the Ministry of Agriculture to equip and train teams of practical expert workers that could staff any farm on a self-supporting basis in their own mobile living quarters and allow the farmer and his family to have a well earned carefree holiday during which, according to his deserts, the farm would receive the best of care and attention, even to the extent of overhauling and repairing his implements and farm buildings, and redecorating his abode. The response to such a scheme, would, I feel sure, be so great that at no distant date the teams would become self-supporting financially at the farmers' own request.—Yours faithfully,

A. W. MORRISON

Glasgow

★

Sir,—Prices designed to give an adequate return in a normal season may well mean a substantial loss when weather conditions are such as we have experienced in the last two harvests. The loss of one animal in a herd of beef cattle may well mean the difference between profit and loss and however efficient one may be, these losses do occur. The Agricultural Committees are loth to use their powers to evict many so-called inefficient farmers because they know that this very inefficiency is caused by lack of capital, in most cases due to the effect of two wet harvests.

Since the material raising of prices in 1947 which injected £40,000,000 into the industry which was promptly spent by the farmers in manures, equipment, etc., there has been no further injection of capital to provide the means with which to counter the effects of a bad year or years, and consequently farmers have seen their capital resources gradually dwindling away. Bank credits are strained to the uttermost. Agricultural merchants, that great standby of the farmers in hard times, are unable to give as much or as long credit as they formerly did. How then, can the farmer produce more? If the country needs more food, the wherewithal must be provided with which to produce it. There are two essentials, the rapid provision of working capital and a long term policy. Had this last been allied to the injection of capital which took place in 1947, the situation might well have borne a different aspect today.—Yours faithfully,

R. HENSHAW

Upper Froyle, Hants

★

Sir,—I cannot believe for one moment that the solutions put forward in your recent issues are the right approach to British farmers. New taxes or new rates on land would inevitably discourage still further the vast majority of tenant-farmers, owner-occupiers and landowners who, despite continually rising costs and shortage of labour and materials have struggled for the past fourteen years to reach the targets set them by successive governments of whatever party. What the agricultural industry requires is not more taxation and control, but a clear long-term policy.

Tell them—and the urban population—the true facts. Tell them that the days of cheap food from abroad are a thing of the past and that even dear food is becoming increasingly difficult to obtain. Tell them that every encouragement will be given to farmers to plan ahead, knowing that what they produce is urgently and vitally required, and with sound and far-sighted leadership and a reasonable return on the capital involved, production will most certainly increase. The main increase must come from the poorer land. The well equipped farmer on good land will undoubtedly benefit from the help which his less well placed neighbour receives, but the existing high rate of taxation can, or could be made to, look after this.

We must never forget that the vast majority of farmers are small men on small farms—75 per cent are under 100 acres. They are and must be individualists and self-reliant or they would never tackle the day-to-day problems set by man and nature. They can be led but they "won't be druv."

No one who has studied the problem can disagree with the view that there is no room in this island for incompetent farmers. Existing legislation can deal with them. But the agricultural industry eagerly awaits the Minister's statement on long-term policy, and given the right lead, reasonable security and incentive, and the fullest possible share of the necessary tools, more food can and will be grown.—Yours faithfully,

W. R. BURRELL,
President, Country Landowners' Association

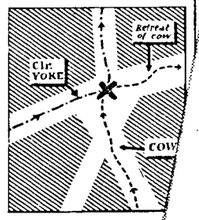
COUNCILLOR COLLIDES WITH COW

ESCAPES WITH SLIGHT ABRASIONS



Schwepton Mallet, Tuesday

A small automobile was the focus of what might have been an unpleasant event for Schweppshire this morning. Pedestrians were taken unaware when Councillor Alfred Yoke, turning past Galway Mansions, found himself face to face with an unguarded Shorthorn, which, but for Yoke's presence of mind, might have received serious injury.

POST has long campaigned for one way traffic in Waterworks Lane. Here, if further proof were needed, is further proof that yet another POST campaign should not be allowed to join the realm of lost causes.

AMERICAN SURVEY

Straws in the Presidential Wind

Washington, D.C.

THIS is no ordinary election year. Every week the position gets a little more complicated and a little more fascinating and there are more straws in the winds of conjecture and prophecy. American political pundits have always known how to make innumerable bricks out of the same few pieces of straw and, despite the millions of words which have been written on the subject already, they will find no difficulty in writing a few million more during the next four months. Not since 1920 have there been so many possible choices and so little certainty as to the eventual presidential nominees of both parties. Although many people suspect that, in the end, the voters will be faced with a dispiriting choice between Senator Taft and Mr Truman, there is enough doubt now to make speculation both profitable and attractive.

The addition of Senator Russell of Georgia to the list of Democratic starters adds another valuable piece of straw. In 1948, when the Southern lightning struck him—at the Democratic convention he got 263 votes on the first ballot without asking for them—he quickly ran for cover. This year, although he still knows, as he said a short time ago, that "a man with my geographic location and my ideas" cannot get the nomination of his party, he is prepared to invite the lightning. If his candidacy could be written off, as that of the Republican Mr Stassen can, as merely the delusion of an ambitious and stupid man, it would be unimportant. But Mr Russell is generally admitted to be the ablest parliamentarian in the Senate, and to have an exact knowledge of what is, or is not, politically possible. Therefore the announcement that he is prepared to run for President has considerable strategic significance.

The strategy concerned is, no doubt, that of the leaders of the Dixiecrats, the anti-Truman Democratic group in the South. In 1948, the group suffered from a lack of effective leadership and a candidate who was little more than a joke. It now has Mr James Byrnes, once a Supreme Court Justice and Secretary of State, in the new role of Governor of South Carolina, to provide political guidance, and a candidate who is one of the most respected of Senators and one who has supported Mr Truman on almost every important issue except that of civil rights. The Dixiecrats will go to the convention, therefore, with a solid bloc of delegates and a serious mission: they will go, in fact, to prevent the renomination of Mr Truman. They will be able to do it if Senator Kefauver, the only other Democrat who has declared his candidacy, takes enough delegates from the other flank of the party. If the Dixiecrats succeed in producing a deadlock, they will be agreeable, it is understood, to accepting Governor Stevenson of Illinois as a compromise candidate. And there is always the hope that the presence of Senator Russell in the race will persuade the President that he should withdraw in favour of Mr Stevenson before the convention even opens.

But, should this strategy fail, which it will if Mr Kefauver fades away before July, and Mr Truman be nominated again, the battle is still not lost. A month ago the Alsop Brothers analysed Mr Taft's chances in the election, if he is nominated. After giving him every state he could reasonably hope to carry, they concluded that he would still be 17 votes short of a clear majority in the electoral college. If Mr Russell were to run as an Independent Democrat, he could take enough votes from Mr Truman to prevent him having a clear majority either. Then the decision would be left to the House of Representatives, which might find itself unable to agree on any candidate except Mr Russell. This is, of course, the kind of dream which has deluded the Liberals in England so often; the dream of regaining lost power and prestige by providing the only possible compromise. But, in 1952, in the United States, it conceivably may be made to come true.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

★

Many things may happen before July 21st to make all these calculations irrelevant or unnecessary; for instance, the Republicans might nominate General Eisenhower. But the General's position is becoming daily more difficult. His boom has completely failed to start booming, his machine is being run by amateurs who are quite incapable of competing with Mr Taft's professional organisation and depressing accounts come back from Paris of his ignorance of his own country. He knows the internal politics and economies of a dozen European countries better than those of the United States and has been heard to observe, for instance, that twenty years of Democratic rule has ruined big business. The publication of a book called "What Eisenhower Thinks," however well-intentioned its appearance at this time, only reminds people that they have no idea what he does think, and adds to the demand that he should come home and tell them.

Senator Taft's thoughts, on the other hand, peculiar though many of them may be, are given an airing almost daily. At this moment everything seems to be going smoothly for him and the confidence in his camp is growing. But so, outside his immediate circle, are doubts about the honesty of his methods or his ability to collect independent votes. His curiously contradictory character was probably summed up by Mr James Reston in the *New York Times* two or three weeks ago better than anyone else has done it.

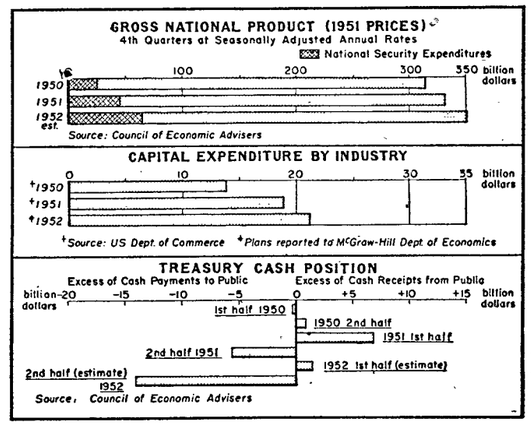
> More dubious assumptions are made about the senior Senator from Ohio than about almost any other man in contemporary American history. . . . He is popularly supposed to be a snappish, unpleasant character, but he is actually an attractive human being. . . . He is supposed to be well informed and intelligent, yet his speeches often reveal the most abysmal ignorance of history and his policies the most unintelligent estimates, even of his own best political interests. . . . He is assumed to be the very symbol of integrity, yet he has lent his name and influence to McCarthyism with more consistency and effect than any other man in the Republican party.

There is, indeed, considerable reason to fear that Mr Taft's burning desire to be President has led him to compromise with principle to such an extent that he would not be able to recover his balance if he reached the White House. Those who live near him in the Georgetown area of Washington and watch Senator McCarthy arriving to spend a quiet evening are no longer inclined to take the rumour that Mr McCarthy would be his Attorney-General as a joke. And some scurrilous personal attacks on his rivals in the New Hampshire primary election have been circulated which he certainly should have repudiated, even if he is not himself responsible for them. Above all, there remains the problem of General MacArthur and his place in the Taft campaign.

The Senator has said that he is satisfied that General MacArthur is his supporter and has suggested that the General should make the main speech at the Republican Convention. As he will not be a delegate, and therefore not eligible to make the "keynote" speech, General MacArthur will presumably play the role of elder statesman which Mr Hoover undertook in 1948. Publicly Mr Taft asserts that this speech will assure him the nomination by carrying the convention off its feet. But there is evident, among the Senator's supporters, an uneasy feeling that the convention, once off its feet, might nominate General MacArthur himself. Such things have happened. At the Democratic Convention of 1896 William Jennings Bryan made such a sensation with his famous "Cross of Gold" speech that he was himself nominated next day, which was more than the party bosses had bargained for. If something of the sort were to happen at Chicago in July it would serve Mr Taft, though not the United States, right.

Inflation or Recession?

[FROM A CORRESPONDENT IN NEW YORK]



IN Washington the official view is that this year and next will be years of prosperity and high employment, and of marked tendencies towards inflation which must be restrained by numerous economic controls. Hence the Administration will urge that expiring controls be re-enacted, and possibly will ask for new powers.

The official view is supported by many private analysts and is almost inevitable on the basis of the formal figures. According to the federal budget armament outlays will rise by about $20 billion in the next twelve months. The McGraw-Hill survey of industry's plans for capital expenditure reveals the intention to spend about 13 per cent more than last year. Official and semi-official estimates of the number of houses to be started this year range from about 850,000 to 1,000,000—the latter figure being much the same as the number started in 1951. Even if allowance is made for a substantial decline in the rate of inventory accumulation, this is a picture of a marked rise in the total of government expenditure and private investment.

Total output—the gross national product—should rise about 5 per cent, the Council of Economic Advisers believes, or by somewhere between $15 and $20 billion. This could be brought about by the combination of a rise in productivity, longer hours, and an increase in the labour force. The result would be a significant rise in the total of personal incomes and, with taxes rising less sharply, there would be a considerable increase in disposable income—that is, the proportion of income that is available to be spent or saved. Supplies of consumer goods could not keep pace, because of the demand of the armament programme for labour and materials, and it would be difficult to prevent another whirl of inflation.

The critical period will be the last half of the calendar year 1952, the argument runs. During the first half, the Treasury will have a cash surplus, owing to the concentration of tax payments in this period. But during the latter half, a cash deficit of $12 to $16 billion will occur. Material shortages much more acute than those today will then be combined with deficit financing to create a very tight economy. This may well be aggravated by greater consumer buying at that time, as supplies accumulated in the buying waves of the early Korean days run out and as fear of shortages again grips the consumer.

This is indeed a persuasive picture. But a very different interpretation has considerable support, and seems to be gaining ground despite—or perhaps partly because of—the shrillness with which Mr Keyserling, chairman of the Council of

Economic Advisers, upholds the official line. This opposite view rests essentially on four assumptions:—

1. That the armament outlays will not rise as rapidly as they are scheduled to do in the budget. Important support can be found for this belief in Washington and among businessmen. Some think that expenditures cannot rise as fast as the budget estimated that they will, others that they should not; a third group holds both views. As for revenues, the Treasury is believed by some observers to have underestimated receipts again—as it has done for the past several years. Furthermore, such deficit as there is will be financed in considerable part, at least, by tax anticipation paper (the equivalent of the British Tax Reserve Certificates), rather than by the traditional inflationary method of deficit financing through the banks.

2. That the return toward monetary orthodoxy and general credit restriction, which formally started just a year ago with the abandonment of rigid price support for long-term government securities, is exerting a more powerful force than is realised. Since lenders no longer have virtually unlimited access to central bank credit through the sale of government securities at pegged prices, they have been charging significantly higher rates; and what is equally or perhaps more important, they have been rationing credit, both short and long, in the strictly classical manner. The full effect of credit restriction was not felt at once, because of the existence of large commitments, but this cushion is wearing

thin. The rebellion of the Federal Reserve Board against the Treasury is having a powerful influence which will be increasingly evident as the months pass. Furthermore, the authorities are showing signs of even greater firmness: in a refunding operation announced in mid-February they offered a 2⅜ per cent medium-term bond instead of rolling the maturity into one-year paper, to be absorbed by the banks, as had become customary in recent years. This same policy may be pursued farther, it is rumoured, by more aggressive bidding than has been usual for savings to finance the Treasury's new money and refunding needs.

3. That the financial crisis abroad may serve to dampen economic activity. Import restrictions, necessitated by adverse balances of payments and declining reserves, seem to be spreading throughout the world. At the same time competition for exports is growing sharper, particularly on the part of Germany and Japan. Expenditures for armaments abroad as well as in America are being spread out over a longer period, thus lessening the immediate demand for materials.

4. That supplies of raw and other materials are, in fact, considerably more adequate than official figures early in the year suggested. Most materials can now be obtained either at home or abroad, and the premium prices which once were necessary are rapidly diminishing. As months pass, with a smaller demand for materials both in America and elsewhere, and with production continuing at a high level, a revision of the price structure can be expected. The effect on inflated inventories and other business commitments both in the United States and in foreign countries will be harsh.

*

This opposing argument is almost as persuasive as is the official one. Evidently, a situation exists in which the consumer may tilt the balance one way or the other. Should he save more in 1952 than he did in 1951—as he saved more in 1951 than he did in 1950—he could well turn the balance against inflation and perhaps into deflation. Should he, on the other hand, somewhat reduce the proportion of his disposable income that he saves, toward a figure closer to the average of recent years, he might push the economy into some inflation.

However, those who have most closely studied consumer attitudes and habits in these matters doubt whether there will be any important changes in 1952—unless the environment alters very markedly. Only an event even more startling to the consumer than the invasion of Korea, or the entrance of the Chinese into the war, it is said, seems likely to bring another great change in consumer behaviour. Traditional thinking and habit, and the reduction of liquid resources in recent years, strongly favour continued thrift ; while a slight decline in the rate of saving may occur, it should be small.

The Soviet Union, evidently, has an opportunity to exert a very marked influence on the United States economy. By action that would make war seem less likely than has been feared, it might reduce government spending and perhaps increase consumer saving, and thus hasten or induce some business readjustment. Alternatively, by action that would enhance fears of war, it might make it certain that military expenditures would reach, or even exceed, the budget estimates ; and also cause a reduction in savings by stimulating another run on the shops. This would tilt the scales towards inflation and more controls.

It is unlikely that business fluctuations have been permanently obliterated from the American economy. But unless there is some marked change in the Russian attitude, it seems possible that both of the now prevalent theses are, though apparently contradictory, nevertheless correct. One of them, when the necessary qualifications are added, may mean no more than that, for a time, perhaps for most or all of this year, the economy will be tight, with softness to come later this year or in 1953. The other, similarly qualified, would mean that the very slight softness now in evidence in some industries, notably textiles, might become more marked in the near future, to be succeeded by tightness and then some relaxation. In either case, the conclusion would be that things may remain much the same for some time, with continuing patches of scarcity and patches of softness.

American Notes

No Forty-ninth State

The attempts of America's two Pacific territories, Hawaii and Alaska, to reach the safe haven of statehood have once more been foiled, although by a narrower margin than ever before, and the happy ending to their story has been postponed until 1953 at least. The villain of the latest instalment was Senator Robert Kerr, of Oklahoma, who was believed to favour statehood for Alaska until he cast the decisive vote that sent the Bill off the Senate floor and back to committee by 45 to 44. In so doing the Senator hardly improved his chances, until then good, of being picked by President Truman to be his heir. On Monday a desperate attempt to obtain reconsideration of this vote failed.

There is little hope of the Bill being given another chance later in the session, since time presses and debates on statehood are certain to be prolonged by filibusters from Southern Democrats. The Southerners oppose the admission of these two new states to the Union because each would have two Senators who would presumably favour legislation giving equal civil rights to Negroes. So far the Southerners have been able to defeat such legislation by exploiting the Senate's facilities for unlimited debate, but an addition of four to the membership might make it possible for those who favour civil rights to change the rules.

This opposition recurs regularly in the statehood serial, but this year the plot has a new twist. Since Hawaii is expected to send two Republicans to the Senate and Alaska two Democrats it has always been supposed that, if one were admitted as the forty-ninth state, the other would at once be made the fiftieth. Hawaii, it is thought, has the best chance of admission, partly because the Republicans would all vote for it—the party divided equally in last week's vote on Alaska—and partly because Hawaii is richer and more populous than Alaska. But this time the Democratic leader, Senator McFarland of Arizona, unexpectedly insisted on bringing statehood for Alaska to the floor first. His argument was that, if Hawaii came first, the Republicans might help the Administration to bring it into the Union and then leave Democratic Alaska out in the cold. If Senator McFarland is a sincere advocate of statehood, his strategy was mistaken, for it has meant that Hawaii's admission will not even be debated this year. But the mistake may have been made on purpose, for the Senator has Southern sympathies.

* * *

Mr Morris Begins to Sweep

Mr Newbold Morris, appointed five weeks ago by President Truman to sweep corruption out of the federal government, is now getting down to business, after having moved his office out of the Department of Justice. This is one of the agencies alleged to be most in need of cleansing and as long as Mr Morris was working there his appointment could hardly be taken seriously. That he himself takes it seriously became clear a few days ago, when he announced that he would go back home to New York if the President did not dismiss any government employee who refused to answer, or lied in answering, a detailed questionnaire about the sources of his income. These questionnaires, 25,000 of which have already been distributed, are going to practically all administrative civil servants, including members of the Cabinet, and Mr Morris believes that a careful scrutiny of the replies will direct him to most of the government's dirty corners.

To help him get his information, and in order that no one shall be able to say that he did not have all the help he needs, President Truman has asked Congress to give Mr Morris two powers, seldom, if ever, given to an individual, that of granting immunity from prosecution to helpful witnesses and that of subpoenaing persons and documents he wishes to examine. Mr Morris himself does not want the first of these powers, and he is certainly not going to get it, but he does need the authority to issue subpoenas. This Congress can hardly refuse him, unless it wishes to be accused of hampering his work.

It was Congress which forced Mr Truman to appoint Mr Morris, but now it is becoming rather worried at the amount of dust he is threatening to raise. Not only may it blind the voters to the fact that Congress was the first to discover how dirty the Administration had become, but also some of it is sure to settle on those Congressmen who are responsible for much of the pressure on government officials to show favouritism to particular individuals and firms. The Republicans, moreover, are worried that Mr Morris, himself a Republican but by no means a regular one, may clean up the government so successfully that corruption will no longer be an election issue. Congress is therefore hurrying to take attention away from Mr Morris by starting up a whole new series of competitive investigations. The latest of these, into a dubious but profitable transaction involving the sale of government-owned surplus ships, has the added attraction that Mr Morris is himself connected with it, although there is so far no evidence that he knew what was going on.

Chill Wind for Shipping

The Federal Maritime Board announced last week that the American Export Lines will receive a construction subsidy of only 27 per cent on their two new passenger ships, the *Independence* and the *Constitution*, instead of the 45 per cent promised by the old Maritime Commission. If the line decides to accept the ships—it can refuse them at the new price—it will pay nearly $36 million of the total cost of $47 million, instead of $24 million. Two years ago the House Committee on Executive Expenditures took the Maritime Commission sharply to task for granting construction subsidies which it considered excessive and illegal. The Maritime Board, one of the two bodies which soon afterwards replaced the commission, has been struggling with the problem ever since and is far from satisfied with the solution it has reached. According to its chairman, Admiral Cochrane, the subsidy clauses of the Merchant Marine Act of 1936 are an administrator's nightmare ; he feels that unless the Act is revised to provide a more prompt and businesslike method of procedure, it will be difficult to continue building new ships under its provisions. Subsidies are granted to cover certain defence features, such as high speed, and to make the cost of an American-built ship no greater than if it had been built in foreign yards.

This is the second blow in two months at an industry which has been accustomed to smiles and subsidies. Mr Truman, in his budget message, not only did not announce any new merchant shipbuilding programme, but also asked Congress to do away with existing tax concessions designed to stimulate new construction. He condemned these as a hidden subsidy, difficult for Congress to review and difficult to end when the need for them had passed. This is considered a bad omen for the long-range shipping aid Bill, sponsored by the industry, to provide even more concessions and incentives to stimulate building. But an ill wind for American shipping may make it easier for other maritime nations to pay their way.

Banking circles the globe

BUSINESSMEN with foreign interests need a bank whose services circle the globe. The National City Bank of New York, with 56 overseas branches and banking correspondents in every commercially important centre, is well equipped to offer such services.

The London branches of The National City Bank are staffed by men who are experienced not only in British banking but also in the financing of overseas trade. They are, also, uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, the world-wide organization of The National City Bank is at your service.

THE NATIONAL CITY BANK OF NEW YORK

1812—ONE HUNDRED AND FORTIETH ANNIVERSARY—1952

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES—CITY: 117 OLD BROAD STREET, E.C.2. WEST END: 11 WATERLOO PLACE, S.W.1

Considerably more merchantships will be launched from American yards this year than last, a period which saw the United States slide from second to seventh place. Now that steel is easier, enough has been found to permit work to go ahead on all the thirty-five new Mariner freighters being built for the government. The chill wind which has set the industry shivering does not only blow from the White House, however. The great activity stimulated by the foreign economic aid programme is beginning to recede. For the first time in more than a year, the flood of ships flowing out of the reserve fleet has turned, and a few have been retired from active service. Charter rates on coal and wheat have been falling in recent weeks. Some of the slack is being taken up by military shipments, but the industry is looking ahead to a lean period when these too begin to decline.

* * *

New York's Cuckoo

The inflated cost of goods and services took the budget of New York State above $1 billion for the first time this year, but the equally inflated yield of income and corporation taxes enabled Governor Dewey to balance it without asking for an increase in taxation. His budget was therefore passed without controversy and the members of the Republican-dominated State Legislature are expecting to go home next week after an unusually short and peaceful session. But they may be delayed by the unsatisfied cuckoo in their nest, Democratic New York City. For weeks the Mayor, Mr Impellitteri, has been demanding more help from the state in balancing the city's budget. It passed the billion-dollar mark long ago, and is put at $1.5 billion for the financial year beginning next July, with a potential deficit of at least $200 million. Here inflation has pushed up costs without increasing revenue.

Well over half of the state budget is already devoted to aid for the state's cities ; of this 44 per cent, $270 million, has been earmarked for New York City. It is unlikely that Mr Impellitteri will get much, if any, more, although he has been asking for another $64 million and points out that the city provides 56 per cent of the state's tax receipts. The Republicans in Albany maintain that he ought to cut his proposed expenditure to the bone before coming to them for help, and suspect that he has padded his budget so that he can cut taxes in 1953, to coincide with the city's mayoral election.

It is because of this year's national election that no one, Republican or Democrat, is urging the most obvious remedy, an increase in fares, for the most expensive item in the city's deficit, the heavy losses on the operation of the municipal buses and underground railways. They might be covered if the present fare of 10 cents (9d.) were doubled, but even to put the fare up to 15 cents, as other cities have done, would, it is thought, mean a substantial loss of votes next November for the party responsible. However, state officials are now reported to be insisting that the transit system be transferred to an independent authority, in the hope that it would then be managed more efficiently, and that the sales tax be maintained at 3 per cent, instead of being reduced as has been promised.

Mr Impellitteri has already planned to impose a city tax on automobiles and liquor licences, to show he is in earnest, but other tax changes require the permission of the State Legislature. He has put forward various proposals for tax increases, of which the most likely to succeed is that for a tax on real estate, to raise $100 million and to be levied by the five counties making up the city, in order to get round the limit of 2 per cent on city real estate taxes in the State Constitution. But such a tax would be popular neither with voters who are property owners nor with those who are tenants, for it would almost certainly mean a rent increase.

New way of taking a swarm? No—an old way of winnowing; and they still have the knack of it in Brazil. These coffee beans have farther to go than a bee can fly. Down by mulecart and lorry and train to the coast—and thence across the seas to your breakfast table. British Insurance covers them all the way.

Giant Life Insurance

Fears of inflation have not cramped the phenomenal postwar growth of life insurance. At the end of last year 86 million policyholders owned insurance worth $253 billion, compared with $152 billion in 1945. Sales of new insurance faltered slightly in 1951, for the first time since 1942, but that was due entirely to a sharp fall in group insurance, which now makes up about a quarter of the total. This was the result of doubts about the position of pension and insurance plans under wage stabilisation. Now that the Wage Stabilisation Board has decided that employers' contributions to pension plans will not be treated as wages, there will be a scramble to make up for lost time.

Assets of the companies, on the other hand, continued to soar in 1951 ; they rose by $4.5 billion to $68.5 billion. These resources are the largest pool of non-governmental investment funds in existence ; the Metropolitan Life Insurance Company alone, with assets of almost $11 billion, is the second largest corporation in the world, exceeded only by the American Telephone and Telegraph Company. It has been a very sore point with the Federal Reserve authorities that, being pledged in the postwar years to support the prices of government bonds, they were forced to buy up

ASSETS OF US LIFE INSURANCE COMPANIES

vast quantities put on the market by the life insurance companies. The companies reduced their holdings from $21 billion in 1946 (nearly half of their assets at that time) to $11 billion at the end of 1951 (16 per cent of a much larger total). Mr Sproul, chairman of the Federal Reserve Bank of New York, took them to task last December for not acting with the responsibility their size should have entailed. But it has been usual, after a war, for the insurance companies to sell their government holdings to invest in higher-yielding industrials ; it was the monetary authorities who made this process so painless.

In this way, since 1946, about $10 billion, in addition to the normal growth of about $20 billion in assets, has become available for lending. If excessive funds for mortgages—some $12 billion—fed inflation, over $15 billion flowed into expanding industrial and business production. Through life insurance, thrifty Americans have a stake in pipe-lines and Canadian iron ore, paper mills, department stores, goods wagons for leasing to the railways and a host of other enterprises which would have been thought risky before the war. Last year, it is estimated, about $3 billion was invested in defence-supporting industry—a wide term.

During 1951, however, loans became conspicuously harder to get from the insurance companies. They believe they have reached the limit with mortgages, and in any case the government curbs on building are beginning to take hold. With the unpegging of government bond prices in March, these can no longer be turned into cash without loss, to supplement the companies' lending funds. Borrowers, in most cases, will have to show that their businesses make a contribution to the defence programme to obtain funds.

Television Switched Off

The hearings of committees of the House of Representatives, at least, will be off the air and off the television screens this election year. Mr Rayburn, the Speaker, in answer to a formal request, has ruled that committees may not permit the televising or broadcasting of their proceedings. The House rules make no mention of either television or broadcasting, and committees, he noted, are bound by the same regulations. In the freer Senate, committees themselves will continue to decide whether to be televised or not. It was the Senate crime investigation last year which first indicated the enormous potentialities of the new medium, both for good and evil. Unquestionably, great interest was stimulated in a serious public problem. Senator Kefauver's friends would also credit television with having made him a national figure overnight. But fears were aroused that the presence of television cameras might lead Congressmen to search for sensations and neglect their soberer duties ; that the legislators might be tempted to use hearings for their own political profit ; and that the rights of witnesses would suffer. The American Bar Association has just approved a report condemning the use of television and broadcasting at Congressional investigations and at any judicial proceeding.

The immediate occasion of Mr Rayburn's ruling was provided by a sub-committee of the Un-American Activities Committee, which had arranged for the television cameras to follow its search for Communists and former Communists in Detroit, Michigan. The ban came as a great blow to Detroit viewers, who had looked forward to the spectacle, and to Representative Potter, of Michigan, a member of the committee, who had counted on this television appearance to strengthen his claim to a Senate seat. In his view, and that of the television and wireless interests, the ruling is an interference with freedom of information. Others argue that any citizen has the right to attend open hearings and that television merely enables the many to exercise this democratic privilege ; that a healthy interest in public affairs is stimulated ; and that, if the rights of individuals are impaired, the fault lies not with television, but with the procedure of the committees themselves.

Republicans also believe, with some reason, that the ban robs them of the chance to make the most effective campaign capital of investigations into governmental corruption. Mr Rayburn's ruling is not final. The House can alter its rules whenever it chooses and some Republicans are suggesting it should in this case. But the signs are that most members would prefer to wait till campaign passions have cooled down to consider what safeguards should be erected before the television cameras and the microphones are invited back.

Shorter Notes

Three camps are being constructed in Arizona and Oklahoma, to hold more than 3,000 people, for the detention of possible spies and saboteurs in time of war or similar emergency. The McCarran Internal Security Act makes the Attorney General responsible for rounding up such persons, but it is being suggested that it might have been better propaganda to leave the construction of these "concentration camps" until they are actually needed.

*

Even steel makers themselves continue to be surprised at the remarkable increases in the national steel capacity ; the final figure for capacity on January 1st was 108,587,670 tons, over a million tons higher than it was expected to be. This figure, which will be the official one for all of 1952, is a rise of five per cent over January, 1951.

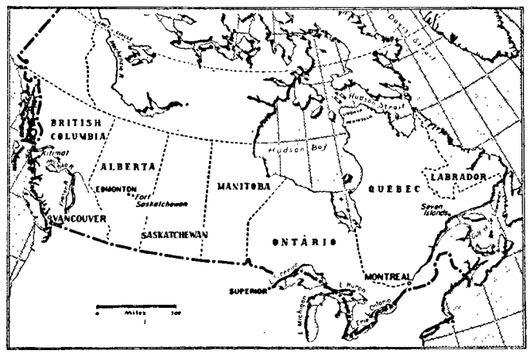
*

On January 1, 1952, there were 155,800,000 Americans, an increase of 4,668,000 since the last census was taken in April, 1950. The round total of 156 million must have been passed by now.

THE WORLD OVERSEAS

Canadian Plans for "Transforming Nature"

(From Our Ottawa Correspondent)



ON one of the worst days of this winter an earnest Englishman arrived in Canada to discuss migration schemes. He was one of the people interested in moving millions of British people from the United Kingdom to "other parts of the Commonwealth suitable for European settlement." The snow was banked four feet high down the Ottawa streets, the temperature showed about 40 degrees of frost, a biting wind was sweeping down across the northern forest direct from the polar ice-cap. And the earnest Englishman was asked if he really counted this frigid land among "those fit for European settlement." Canadians joke about this every winter. They say it was a mistake ever to have taken this country from the Indians. A few lucky ones escape to Florida or the West Indies for the worst part of the year. Most of them stick to their jobs, enjoy the skiing and skating, shovel small mountains of snow from their front doors, and have a very gay time inside their well-heated houses.

But the rigours of the winter have serious economic effects. Just as the work-cycle in the forests and on the farms is determined by the weather, so all construction work has to be planned according to the season. The cutters go into the forests during the autumn: in summer it is often too dry and the fire hazard from a chance spark stops work. Even in British Columbia, where the big trees grow, the moist climate cannot be relied on to permit work all the summer, nor do the usually soft winters preclude long periods when snow prevents cutting. In the east, where most of the smaller wood for pulp and paper comes from, the main cutting has to be done before the snow buries the forests. Then the logs have to be got out while the ground is still frozen. The forest roads are "ice-roads," built up by continual sprinkling with water, over ground that is impassable in summer. The winter's cut is piled on the frozen surface of the rivers, where it waits till the thaw comes and sends it chasing down stream to mill and factory.

In the same way winter is the time when heavy loads can be pulled into many parts of the north. Heavy tractor trains of "caterpillars" pulling big sleighs can travel over the muskeg and the lakes only when they are frozen. It was in winter that the main construction camps were established along the new railway that will bring iron-ore out of the heart of the Ungava-Labrador peninsula. All the rest of the supplies are being moved by air. Railway construction is here at its most up-to-date. A 350-mile line is being built from nowhere to nowhere through nowhere. It starts at what used to be a tiny fishing village on the north shore of the St. Lawrence estuary, called Seven Islands. It wiggles up through some awkward coastal mountains, and then winds north through deserted rock and muskeg to the unknown inland lake which has been chosen as the site for the new mining town. The construction camps are built at intervals along the route. Each has its own air-strip, and they are in communication with each other by radio-telephone and air lift. The first land communication will come with the railway right-of-way. All supplies, even the heavy equipment when needed, are carried by a fleet of aircraft working out of the base at Seven Islands.

This enterprise was fathered by the Canadian mining interests which discovered the rich ore deposits. The major part of the financing was done by American steel companies which will provide the main market for the ore. But only a small part of the still unsearched mineral areas of the Ungava-Labrador hinterland has been leased to the joint U.S-Canadian enterprise called the Iron Ore Company of Canada. The rest of it, and all the other metals besides iron-ore, is still untapped.

By 1954 ore will be pouring down this new railway to the new docks at Seven Islands. It will be loaded onto ore carriers now under construction in British shipyards, and carried (during the eight months of open water) up the St.

Lawrence to new docks near Montreal. From here, for the present, it will have to complete the last part of the journey to the steel mills of the Middle West by rail. But when the St. Lawrence Seaway is built—and it looks increasingly likely that it will be done as an all-Canadian project—the ore ships will go right through to the Lake Erie ports from Seven Islands. Then the annual tonnage might be increased from an initial 10 million tons to twice that amount.

Power Plant Inside Mountain

Of all other Canadian developments the one which matches the Labrador iron project in scale and drama is at the opposite end of the country in northern British Columbia. Here the Aluminum Company of Canada, a subsidiary of Aluminium Limited, has chosen an obscure and rather squalid Indian village called Kitimat as the site of the world's largest aluminium smelter. Kitimat lies at the head of one of the deep sea inlets which indent this coast like the Norwegian fjords. It is a heavily forested and extremely humid area, and timber mills will probably follow aluminium into Kitimat. Fifty miles south of Kitimat, across a spur of the coastal mountains, workmen are already at work in a huge hole in the mountains in which hydro-electric generators will be installed. Full capacity would amount to 2 million horse-power, but production will start at 450,000 h.p. The plans have prompted comic-strip remarks about the "bomb-proof power plant inside the mountain"; but the value of the mountain cavern is to anchor the machinery against the terrific rush of water. It will pour through a ten-mile tunnel under the coastal range, dropping from 2,800 feet above sea level to about 200 feet.

This water now finds its way to the sea hundreds of miles farther south down the thousand-mile course of the Fraser River. It is to be dammed on the Nechako River and its course turned backwards through the mountains. The big dam will raise the water-level over a stretch of a hundred miles on the inland side of the coastal range. The power from this hydro-electric installation would support a production of 500,000 metric tons of aluminium a year, well over one-third of the world's present production. The bauxite, much of it semi-processed in the form of alumina, will be shipped in from British Guiana and Jamaica via the Panama Canal; and the finished aluminium will go out in ocean vessels.

Work has been proceeding on this project throughout the winter, since rock work is a regular winter occupation. Farther south in the spectacular canyon of the Fraser River above Vancouver they have also been blasting rock to make a path for one section of the Trans-Canada Highway, which at this point will climb along the cliffside parallel to the precariously perched track of the Canadian National Railways' trans-continental line. The Canadian Pacific mainline clings to the opposite rockface. Every year there is a chance of the lines being blocked by snow-slides; but this year they have escaped—so far.

New Pipeline for Alberta Oil

The new oil pipeline from Alberta to the Pacific Coast at Vancouver will follow the CNR through much of the mountains; but this is one of the jobs that cannot be undertaken till spring. It will take two summers to complete the project, including the tank farms at both ends of the pipe and the additional refinery capacity at Vancouver. Once this is completed Alberta oil will be flowing out to market both east and west. The capacity of the present pipeline from Edmonton to the head of Lake Superior at Superior, Wisconsin, is being increased by "looping." From the head of the lakes the oil reaches Ontario by tanker—another seasonal operation, since the lakes are frozen during the winter.

The next project to bring Alberta's new-found riches to market will be a line for natural gas. When it will be built, and in which direction, has still to be decided; but in the meantime industry is moving to the gas. It is the raw material for a whole host of modern industries under the general heading of "petro-chemical." It includes plastics, synthetic rubber, cellulose (with wood-pulp) and many other new-fangled substances. At least three major plants are projected for the Edmonton area, all designed to make use of the natural gas. The gas has also attracted the new nickel refinery of Sherritt-Gordon mines. Their ore will be coming from a new mine at Lynn Lake in northern Manitoba. The railway is being pushed another 160 miles north, across difficult muskeg country of value only to trappers, to bring the ore out. It will go by rail to Fort Saskatchewan, near Edmonton, to be refined by a new leaching process which depends on natural gas. Output is expected to reach 17 million pounds of refined nickel and 15,000 tons of copper sulphide annually; and production should start in 1954.

Uranium in Saskatchewan

Northern Saskatchewan has its counterpart to Lynn Lake in the uranium mines now being developed. A crown company, Eldorado Mining and Refining, Limited, is primarily responsible for this development. It has proved its own mine, and will build a mill which could also treat ores from the various private mining ventures in the neighbourhood. It is the establishment of the one paying mine, which Eldorado has now assured, which is the key to opening up another wide area. This is the low-lying country at the headwaters of the Athabasca River, which feeds the Mackenzie and finds its outlet in the Arctic Ocean. In the past access was restricted to summer boats, winter tractor-trains and aircraft equipped with floats or skis according to season. But a year-round landing strip has now been built, and roads are projected.

If these are the most dramatic of Canada's new developments, they are still only samples. A capital investment of nearly $4 billion went into new mines, pulp mills, railways, and factories last year. Much of the development of resources is going on hundreds, or thousands of miles from the main centres of population. Much of it has to be crowded into the summer months, when mosquitos and black-fly are almost as great a menace as the winter cold. But considering what is being accomplished, Canadians find even their winter tolerable. The Indians have little chance of getting their country back. The earnest Englishman may fairly report that the country is "fit for European settlement." And Stalin must regard Canada as a mighty rival to the Soviet Union in the role of Nature's conqueror.

Hard Thinking in Athens

[BY A CORRESPONDENT]

SINCE the war Greece has been dependent on the British and the American taxpayer. It is estimated that since 1944 the country has received some $2,500 million in foreign aid, more than three times the entire foreign debt in 1939. Greece's difficulties have, of course, been quite exceptional. The civil war of 1947-49 caused immense destruction, and, in comparison with the other countries of Western Europe, retarded Greece's recovery by at least five years. Reconstruction has therefore been the first preoccupation of the ECA mission to Greece. In addition, the Americans have been working on a vast scheme for capital investment, in power schemes, for example, which are designed eventually to improve the standard of living.

Since 1950, however, two important changes have taken place in the American attitude. First, though they seem to recognise that Greece should be assisted beyond the deadline of June 30, 1952, there have been many signs that they were losing patience with the apparent failure of the Greeks to help themselves. And secondly, American emphasis has been placed less and less on reconstruction and development, and more and more on rearmament. In September, 1950, Marshall Aid to Greece was reduced for the first time. Last

AFRICAN OPPORTUNITY

The Economist Intelligence Unit now provides a service of quarterly reports on economic and business conditions in Southern Rhodesia and in about thirty other countries. These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from:

THE ECONOMIST INTELLIGENCE UNIT

22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1

December it was reduced again, and in the current aid year Greece will receive only $182 million, compared with $206.8 million in 1950-51. It is therefore natural that some hard thinking should have been going on in Athens, and that in the autumn Professor Varvaressos, a former Governor of the Bank of Greece, should have been asked by the government to report on the whole situation.

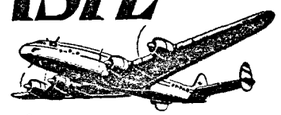
When he was Minister of Supply in 1945, Professor Varvaressos was responsible for producing and launching an ambitious plan for creating economic order. The plan misfired. Professor Varvaressos resigned, and has since been with the International Bank in Washington. His report, which has recently been published, is a masterly document surveying the whole field of the Greek economy. The Professor starts by assuming that American aid will continue to decrease, and sets himself two questions to answer: what, in that event, will happen to the country's economy, and what will be left of the reconstruction plans designed to increase the standard of living? He finds that the answer to both depends on whether confidence in the drachma is re-established. The hyperinflation of 1944 has been followed by a steady depreciation—at any rate until the last two years—in the drachma's external value. It is thus hardly surprising that, as he points out, millions of dollars which would otherwise have been used to cover the country's deficit or to build up an exchange reserve, have been spent instead on buying sovereigns for sale to the public. Nevertheless, Professor Varvaressos thinks the necessary confidence can be restored in the next few years if Greece can count on a moderate amount of American assistance and will take really determined steps to balance the budget, to restrict credit, and to improve the position of the balance of payments.

Tax Evasion

Forty-five per cent of the expenditure of the State now goes on defence. The Professor thinks half of this, or about drs. 1,500,000 million, is in excess of the normal figure, and is a proper charge against whatever foreign aid Greece may receive. He does not consider that the size of Greece's armed forces should be reduced in present circumstances, but he is of the opinion, shared probably by most British and American officials who have worked in Greece since the war, that some 20 per cent of the civil service is redundant, though the salaries of the remainder should be increased. On the other hand, he thinks revenue could certainly be increased if proper steps were taken to defeat tax evasion. For instance, though the income of the commercial and industrial classes has been more than doubled since 1939, their contribution to the revenue of the State has fallen by half, and he quotes an estimate that if importers of goods of secondary importance had made their proper contribution, the yield of direct taxes would have risen by between 55 and 100 per cent. Moreover, he suggests that Greek shipowners who live abroad and register their vessels under foreign flags should lose their Greek nationality.

It follows from the Professor's main thesis that he excludes any further devaluation of the drachma. He thinks, however, that the sale of sovereigns to the public by the Bank of Greece should continue, and that it should be made legal to conclude contracts in sovereigns. Moreover, he advocates the introduction of a kind of gold-exchange standard for transactions inside the country. Drachmas deposited with or advanced by the banks would be repayable at the same rate for gold as that current on the day the original transaction took place. Deposits would thus be encouraged, and borrowing in the hope of a further depreciation before the loan is repaid would cease to be a profitable operation. The Bank of Greece, now the main source of the funds used by the commercial banks, should further restrict the credits it grants to them, but this would be offset by the resulting growth in private deposits with the commercial banks.

Prices of locally manufactured goods have been pushed up too far by monopolistic practices—for instance, 60 per cent of the credit made available to industry has gone to the financing of only seven concerns. Smaller firms should be encouraged to create competition; and a proper control of prices of imported goods and local manufactures would secure a reduction of 20 to 25 per cent. This, given confidence in the drachma, would remove the pressure on wages. But the Professor is against the rationing of basic foodstuffs, which has been much canvassed in Greece during the past year. Finally, he thinks it is possible to close the gap in the balance of payments in five years if the cost of imports of military equipment is met out of American aid, if other imports are restricted severely to what the country really needs, which he thinks is far from being the case at present, and above all if a real effort is made to reorganise the country's tobacco industry.



A programme on these lines will not leave much over for reconstruction such as was originally envisaged by ECA. Professor Varvaressos in fact considers that the original plan must be greatly modified. He thinks caution must be exercised in establishing new industries, and that preference should be given to small concerns, especially in the provinces, which manufacture consumer goods, for this will increase competition and impede monopoly. In particular, he is opposed to the creation, originally viewed with favour by many Greeks and even by some of the American advisers, of certain basic industries such as the manufacture of steel, caustic soda and nitrogen, and the production of aluminium from Greek bauxite. Greece should instead concentrate on such capital investments in agriculture as will yield a quick return, for although he does not agree with those who hold that there is a surplus of agricultural labour, he thinks a very considerable increase in agricultural production is still possible. He also attaches great importance to public works, particularly housing schemes for the poorer classes; but he deprecates the building of luxury flats which has been so remarkable a feature of Athens in recent years. For the financing of such a programme he would rely on three sources: what can be found in Greece itself, what can be obtained from the United States after the needs of defence have been met (it will not be much), and such money as can be raised abroad through more normal channels, for instance from the International Bank. But he recognises that it is useless for Greece to expect to borrow abroad until it has reached a settlement with the holders of the pre-war foreign debt. And he thinks it is essential that, before any programme is decided upon, there should be a thorough clean-up of the civil service, including the abolition of the spoils system.

Prospects for Economic Reforms

Some will question the readiness with which Professor Varvaressos defends what they consider a lost cause—the possibility of restoring confidence in the drachma. Others will doubt his belief that deflation will bring back into circulation some of the sovereigns now in private hands, a hoary doctrine which has so far had little evidence to support it. All the same, the report will bring many Greeks back to earth after a period of gazing at the misty horizons produced by the expectation of unlimited American assistance. But will anything be done about the Professor's recommendations? So far the report has been well received in Athens, and even the trade unions have refrained from condemning it, though there are critics of his attitude to industry. Professor Varvaressos admits that if his recommendations are adopted years of steady effort will be needed before results can be expected. Above all, he thinks the present political parties should agree about the ends he sets before the country. With the present Plastiras government, threatened as it is by Field Marshal Papagos's Greek Rally, this may be too much for him to ask. Yet without strong political backing his report may well become merely another interesting contribution to Greek literature.

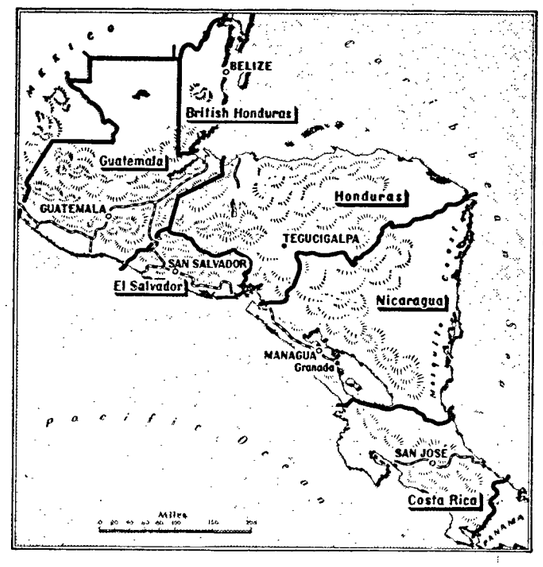
Tito Asks for the Tools

THE fact that Colonel-General Petko Dapcevic, Deputy Chief of Staff of the Jugoslav army, has made a stay in London does not indicate any change in his government's attitude towards closer links with Nato and the organisation of western defence. Last week, in an interview with the British United Press, Marshal Tito reaffirmed that Jugoslavia has not changed its attitude towards the Atlantic Pact and that it does not intend to do so. But this does not apparently rule out a close understanding with the Greeks. For Marshal Tito added that Jugoslav-Greek relations had improved so much that if there was an attack on the Balkans he believed that the two countries would take immediate measures for their joint defence. But Jugoslavia still fears the charge that it has lined up with western capitalism. Jugoslav leaders do not forget, and do not wish the west to forget, that they still have a Communist state; that, in spite of Soviet denunciations, they still try to maintain certain Communist principles; and above all, that Marshal Tito must keep the loyal support of his Communists. They believe that if Jugoslavia is attacked by the Russians or any of the satellite states, it would involve all Europe. Its best contribution to such a situation would be an army able and well equipped to fight the invader. Jugoslav leaders claim, and most foreign observers have confirmed, that the morale of the Jugoslav army is high in spite of the privations suffered by the country in recent years. They contend that, given equipment and aircraft of later date than those supplied hitherto, it could hold even the Danube plain until western forces were involved.

Military Advisers Refused

The same principle is being applied to Jugoslav relations with Turkey and Greece. There have so far been no signs of willingness to enter into any kind of regional pact. Belgrade also continues to refuse the offer of military instructors and advisers for the army. Most arms so far received are the same as those the Jugoslav army learnt to handle towards the end of the war. If it receives more recent equipment, then it is believed Jugoslavs can be sent to the west to learn its use. There are already a number of Jugoslavs in the United States under instruction.

This intransigent attitude has been maintained consistently and firmly in spite of considerable pressure, particularly from the United States, and the reasons behind it are not far to seek. Tito does not fear opposition from the right or from any non-Communists in his own country, but he cannot risk losing the support of his own Communist Party. His countrymen regard all staff talks as potentially more dangerous than useful. They have a characteristic supreme confidence in their own ability. In short, give them the tools and they will do the job—if necessary.



Central America—Five or One?

THE recent exchange of Notes between Britain and Guatemala amounted to a formal recognition that a new phase had begun in the old story of the little Central American republic's claims to the neighbouring colony of British Honduras. On both sides, the change has been brought about by federalist tendencies. British Honduras has been invited to join the proposed British West Indian federation; Guatemala has recently joined with its four neighbour republics in forming the Organisation of Central American States (OCAS). Last October, when the five governments were drafting this organisation, the small pro-Guatemalan faction in Belize appealed to them to support its opposition to West Indian federation. Guatemala, which carries its claims to the colony to the point of showing it as Guatemalan territory on official maps, responded to the appeal with enthusiasm; but to date it has been unable to extract from the other Central American states more than a cautious statement that their new unity would be "convenient" for the solution of the problem of British Honduras.

Whether this colony joins the West Indian federation is, of course, for its own legislature to decide. British Guiana has already declined a similar invitation. But the possibility of Guatemala's claims being backed by a united Central America lends some importance to the question of the degree of the five republics' unity. As yet their new organisation is purely consultative, and its chief practical objective is to free trade between its members. But the idea of a full-blooded federation has been mooted, with the support of the Nicaraguan government, which secured its discussion at the October conference. Is the new experiment in co-operation likely to lead to some closer form of union?

Jealous Separatisms Survive

If it does, it will completely reverse the dominant trend in this area. In the modern world, the division of the eight

million people of Central America into five separate states reflects a survival of jealous separatisms on a scale unknown in other continents since the fusion of the Italian principalities. Moreover, the differences between the Central American republics are more real than were those that divided the petty states of Italy or classical Greece. Guatemala is overwhelmingly Indian; most of its people live much as they lived before the Spaniards came, in self-sufficient communities based on maize, scarcely affected even by their own government. In Costa Rica a people mainly of pure European descent has created a prosperous smallholder economy largely based on export crops. The three other republics are alike in that their populations are predominantly *mestizo*, of mixed Spanish and Indian blood; but they have little else in common. El Salvador is a small but thickly peopled and well developed area clustered round a modern capital. In Honduras little more than a million people live

SIMON ENGINEERING GROUP

This is the first of a further series of notes on the Simon Engineering Group. What it is: the many things it does: why it thinks them worth doing. Briefly, the Simon companies design and build capital equipment for many essential industries, from coal mining and steel making to flour milling. In doing so they share in the achievement of three aims: to enhance the efficiency and competitive power of British industry in world markets; to maintain the world reputation of British engineering; and to earn by exports the foreign exchange which the world pays for first-class British experience and skill.

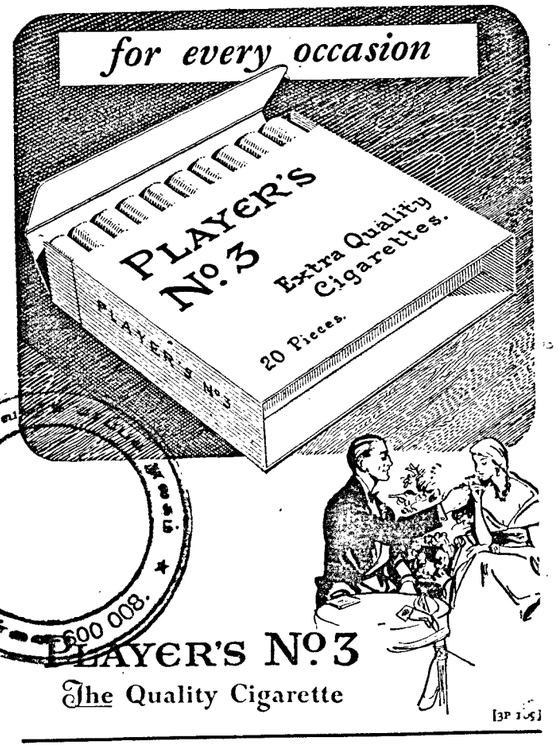
These facts are published to show what British workers can achieve in spite of difficulties, given opportunity and backed by enterprise.



It can be done

At one of the biscuit factories of Messrs. Carr and Company Limited of Carlisle, a building was demolished and a new two-storey bakehouse erected in its place in 10½ days.

Starting on a Friday evening in August 1951, two teams of 35 men worked twelve-hour shifts—the night shift under floodlights. Construction was carried out over machinery which could not be moved and all materials had to be hoisted across existing buildings. The programme—worked out in advance to the last detail —was fulfilled in spite of bad weather. At 7.30 a.m. on the following Monday week the new bakehouse —a steel framed building with pre-cast concrete floor and roof and brick walls—was completed and in production. It was the spirit of those men who worked all hours and in all weathers that saw the job through

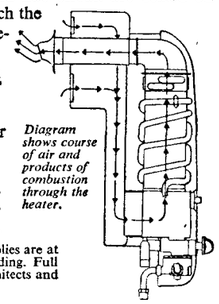
Gas Water Heater

This is a significant achievement, for the difficulties of applying the "balanced flue" principle to instantaneous gas water heaters had hitherto defied solution.

The important advantage of the new Ascot 715 is that the air intake and flue circuit are sealed off from the room in which the heater is installed, thereby eliminating downdraughts and vitiation of the indoor atmosphere. There are no visible flue-pipes either inside or outside the building.



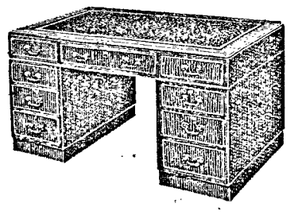


Diagram shows course of air and products of combustion through the heater.

Ten local authorities have already specified the Ascot 715 for their housing schemes.

ASCOT

As production is limited, supplies are at present restricted to new building. Full co-operation is offered to architects and all interested in new housing.

DECCA LONG PLAYING RECORDS

UP TO 50 MINUTES MUSIC ON ONE 12-INCH RECORD

This is Long Playing: Beethoven's Fifth Symphony, Grieg's Piano Concerto, Tchaikovsky's "Pathétique", "The Eroica", Gilbert & Sullivan's "Trial by Jury", The "Nutcracker" Suite—*each on one twelve-inch long playing full frequency range record.** Then the great operas: La Bohème, Die Fledermaus, The Mikado—*each on two;* Carmen, Butterfly, Tales of Hoffmann—*each on three;* Parsifal and Die Meistersinger *each on six.* Already there are 473 of these sensational 33⅓ r.p.m. Long Playing records, providing something for every musical taste—revolutionary in their playing time—transcending all others in their quality of reproduction—records which will never cease to thrill you, your family, and a host of envious friends. Decca Long Playing 33⅓ r.p.m. records may be played through your existing 78 r.p.m. radiogramophone or *a radio receiver* by the use of a Decca L.P. player costing from as little as nine guineas. The Decca Long Playing Advisory Panel (address as below) will gladly help you to choose the right one. Send the name of your instrument and its model number.

**Full frequency range recording is exclusive to Decca. It captures every musical frequency audible to the human ear, giving a brilliance of reproduction unobtainable by ordinary recording.*

The Decca 102 page L.P. catalogue, 1/6 from your dealer or direct from us.

THE DECCA RECORD COMPANY LTD., 1-3 BRIXTON ROAD, LONDON, S.W.9

in isolated communities across the face of a poor and rugged country the size of England. Nicaragua is equally empty and equally poor, but its people, unlike most of their neighbours, are lowlanders, bunched together in a central valley.

These differences have been perpetuated by geography. Barriers of distance, jungle and mountain have prevented any linking up between the small centres of population. The sea does not unite them, for in these tropical latitudes the coast is unhealthy and inhospitable, and all five republics have turned their backs on it; none of their capitals is on the sea. One result has been a striking divergence in political development. Costa Rica is one of the most democratic of Latin American countries; in Honduras, on the other hand, political consciousness hardly exists. Nicaragua, long torn between rival factions and twice in this century occupied by the United States at the request of a tottering government, has now been ruled by a typical Latin American "strong man," President Somoza, for fifteen years. In El Salvador conservative governments have maintained themselves without difficulty during the recent period of prosperity.

Coffee and Bananas

The largest of the five republics, Guatemala, which until 1944 was ruled by a small group of landowners and businessmen of Spanish or *mestizo* descent, has since become the most left-wing polity in Latin America. Its present government is dominated by the relatively small class of organised workers, chiefly *mestizo*, whose leaders play an active role in the Communist World Federation of Trade Unions. The government strenuously denies any connection with Moscow, but the tone of its propaganda and its encouragement of "partisans of peace" would suffice to show the closeness of its links with the Communist party even if some of its leading figures were not openly active in the party. However, anti-Communist feeling remains widespread in Guatemala, and there are signs that President Arbenz may have to make concessions to it soon.

Yet the Central American republics, politically and geographically divided as they are, share one characteristic: economic penetration from abroad. The region's two great export products, coffee and bananas, make all five states uneasily dependent on foreign markets, and particularly on the United States; and most of them are now trying to diversify their economies in order to lessen this dependence. But there is a major distinction between the two staples. While the coffee areas have been mostly developed by local planters, both great and small, the huge banana plantations are almost entirely the creation of foreign companies. Along the neglected and barely inhabited Caribbean shores of Central America, great areas of swamp and forest have been cleared and wholly new communities brought into being; their population consists largely of Jamaican immigrants, who constitute an alien element in all the republics except El Salvador. In the case of Guatemala the banana has even established itself on the Pacific coast, where, however, the local Indians have provided the labour.

US Interests Challenged

It is therefore hardly surprising that the brunt of the Guatemalan Government's "anti-imperialist" offensive is being borne by the United Fruit Company, the biggest of the American banana interests. This company is now reported to be seriously considering the abandonment of all its operations in Guatemala, owing to the impossibility of meeting the government's demands. If this step becomes necessary the blow to the economy of the country, which in 1951 exported nearly six million stems, will be very serious. In its efforts to squeeze the greatest possible concessions out of the United Fruit Company, Guatemala has undoubtedly aroused a certain reluctant admiration among its neighbours, who have watched the struggle with fascination and varying degrees of sympathy. But if its outcome is economic disaster, the other republics will draw the appropriate conclusions. The charter of the Organisation of Central American States does not oblige them to follow Guatemala's example by cutting the throats of the geese that lay their own particular golden eggs; nor are they likely to respond with enthusiasm to Guatemalan calls for joint action over British Honduras after such an object lesson. The tranquillity of the colony may thus depend on the extent to which Central American unity survives its first major test.

American Troops in Japan

THE American-Japanese Security Pact, which was signed at the same time as the Peace Treaty at the San Francisco conference, only provided a bare outline of the scheme for stationing American forces "in and around Japan." The details were left to be filled in by an administrative agreement between the two governments. This has now been negotiated and was signed on February 28th. It fixes Japan's contribution to the joint defence costs (which will amount to 17 per cent of the total budget in the next fiscal year), determines the base transport and labour facilities to be made available to the Americans, and provides for an extra-territorial military jurisdiction over American personnel, though the latter would be in future bound to respect Japanese laws. The agreement will require special legislation in the Diet to give effect to several of its provisions, and political observers in Japan expect stormy debates. The Socialist party, which opposed the ratification of the Security Pact, is expected to keep up its opposition to the particular legislative acts which it involves; while the Communists have concentrated all their resources of propaganda against it, representing the issue as one of patriotic, national resistance to permanent occupation and control of Japan by "imperialist" foreign troops.

A Parallel With Egypt

There is no doubt that the present Japanese government and its parliamentary majority regard the Security Pact as a good investment for Japan and wish to co-operate loyally in putting it into effect. Minister of State, Okazaki, who negotiated the administrative agreement, has declared that it involves no humiliation for Japan because, now that the free nations of the world have united and decided to pool their manpower, equipment and strategic facilities for defence, it is natural to station forces in the common interest wherever they are most needed. The question is whether this line of argument will, in the long run, carry conviction with a population which has so long been conditioned to respond to emotional nationalist appeals and has now recovered from the sense of helplessness which prevailed in the period immediately after the war. However willing the Yoshida Cabinet may have been to enter into the defence arrangement with the United States, the Americans may later on be confronted with a situation in Japan similar to that which Britain has had to face in Egypt over the defence of the Suez Canal.

The Japanese Communists are credited with plans for provoking incidents against Americans in the hope of forcing them to fire on crowds and then working on the national feeling thus aroused. It will not be easy to transform the American units from occupation troops into garrisons stationed by agreement on the territory of a friendly sovereign nation, and much will depend on the tact and foresight of the officer selected for the command of these garrisons.

THE BUSINESS WORLD

Rearmament and Engines

THE Prime Minister said in the course of the defence debate last Wednesday that "deliveries of modern aircraft are seriously behind the original programme" and he went on to announce that steps had been taken to advance the production of the newest types of fighters. The Vickers and Hawker fighters, to which he made special reference, are due to come into production late this year, and orders will presumably be placed for the new de Havilland and Gloster all-weather fighters more rapidly than was first intended. Mr Churchill's statement implied that much of the delay in re-arming the Air Force is due to the tardiness with which new types have been ordered in the past and to the smallness of those initial orders. Had they been placed earlier, the prime cause of the present slow rate of deliveries—namely the shortage of workers—might to some extent have been avoided. If, however, the granting of "super-priority" speeds-up the rate of aircraft production, then other causes of delay, that are today of secondary importance, will have to be taken into account. A case in point is the production of aero engines. Progress during the past year gives no grounds for complacency. If a shortage of labour last year in the Preston factory of English Electric Ltd. had not led to setbacks in the production of the Canberra bomber there, deliveries of these aircraft to the RAF would almost certainly have been held up for want of engines.

The reduced output of Avon engines does not stem from lack of labour; this shortage is less important in engine production than in other aircraft factories. In a recent memorandum from the Ministry of Supply to the Select Committee on Estimates, it was stated that by the end of 1951 the air rearmament programme (including components but excluding radio equipment) was 15,000 workers short of the number needed to meet production schedules. The air-frame manufacturers, who were employing 81,000 men at the end of November, would have needed a further 6,400 workers, but the engine manufacturers, employing 45,600, were then only 2,100 workers short of their requirements. This small shortage of labour had no direct effect on the rate of engine production. The White Paper on Defence stated further that 50,000 extra workers would have to be recruited by March, 1953, if the industry was to meet the revised and more modest rearmament programme for this year and next. But of this total, probably not more than 11,000 are needed for the engine factories where, moreover, much of the work is machine minding that can be done by unskilled workers, including women.

The cause of delay in engine production lay rather in the shortage of certain important engine components that are produced for the most part by companies outside the aircraft industry. The critical components are the blades for engines with axial compressors. The Society of British Aircraft Constructors, in its memorandum to the Select Committee, has stated that "it has been found necessary to limit the number of Avon engines which can be produced in 1952 entirely due to the limitations imposed by the supply of compressor blades."

★

At the moment, the Canberra is the one Avon-powered aircraft in production, and the engine is being made only at the Rolls-Royce factory at Derby. By the end of the year the tooling up of four new production lines for Avon engines will either be finished or nearing completion. One is at the new Rolls factory being built at Glasgow; the other three will be in factories belonging to the Bristol Aeroplane Company, to Napier Ltd. and to the Standard Motor Company. The other axial compressor engine now in production is the turbo-prop Mamba produced by Armstrong-Siddeley, and used in certain naval aircraft, while the same company's axial jet Sapphire, an alternative to the Avon, will shortly be in production. This gives some indication of the increase in axial engine production that is expected by the end of the year. Within the period covered by the Air Estimates, engine deliveries of all types are expected to rise in value from £23 million in 1951-52 to £41 million in 1952-53. The average price of a jet engine is £6,000 to £8,000.

★

Since production of compressor blades has failed to keep pace with the modest engine production schedules of 1951 and the greater part of 1952, it may be pertinent to ask whether it will be able to meet a five-fold increase in blade requirements by the end of the year. The difficulties involved go deeper than the provision of extra tools and factory space; they involve a re-assessment of the technique by which these blades are now made. An axial compressor is built up of 2,000 rotor blades ranging from 3 to 15 inches high. Their efficiency, and from this the performance of the engine, depends on their manufacture to a complex aerofoil shape that it not easily reproduced in quantity. When the number of blades needed was small, about 20,000 a month, they were rapidly and accurately produced by die-stamping. One company, High Duty Alloys Ltd., specialised in this type of work, and Rolls-Royce has also produced small quantities of blades. Each set of finishing dies can produce 3,500 to 5,000 aluminium blades after which it loses accuracy and needs re-facing. When harder materials are used, as they are in many sections of the compressor, the life of the dies is proportionately reduced until, in working stainless steel, a set of dies makes barely 500 blades. At the peak of the rearmament programme, engine manufacturers might need, in round figures, a million blades a month—some authorities, indeed, would double this estimate. Die-making is a slow process that involves considerable hand-finishing, and it is recognised as impracticable to provide enough dies by such methods for blade production of this order.

The Ministry of Supply plans to meet part of its requirements by other means. High Duty Alloys, which has already achieved a five-fold increase in output from existing capacity during the past twelve months, will continue to die-stamp blades at its existing plants and at a new factory now being tooled-up in Cumberland; about 40 per cent of total requirements will be produced by this method. Other factories are tooling up to die-stamp "over-sized" blades, getting many more per die and finishing them to form on special machines. This is less easy than it sounds, because the machining of these blades presents special difficulties that are without precedent in machining experience. The fact that the Ministry has ordered four or five different types of machines, some British and some American, suggests that it has not reached final conclusions about them. Most of these machines have been designed either within the aircraft companies, or by machine tool makers, which has led some observers to wonder whether the solution to rapid and accurate blade machining is not more likely to come from the one or two small companies that specialise in blade production and that have their own highly individual methods of working. Only one of these companies has so far been able to agree with the Ministry on terms. But however satisfactory the machines may be, it remains in principle wasteful of resources and manpower to produce components needed in these quantities by methods that involve so many separate operations.

Whatever the developments that may eventually be made in blade-producing technique, the supply of blades during the rearmament period appears to rest on a number of assumptions that have yet to be demonstrated as realistic. The first is that sufficient dies can be produced to make possible the accurate die-stamping of several hundred thousands of blades a month and that there will be in addition a further supply for the preliminary rough forging of these blades and of a large proportion of the balance. This is an optimistic but not an entirely unreasonable assumption. The Ministry's programme further assumes that the tools and machines will be delivered on time for the new blade factories, but the work on the plants is already some months behind and the rate of deliveries suggests that further delays are likely. But the biggest gamble is undoubtedly the assumption that the new blade-finishing machines will meet expectations. If any one model fails to do so, it may not be possible to obtain an equivalent quantity of precision-stamped blades.

★

Production of these particular components therefore does involve a particular risk to air rearmament, but only to the extent that this depends on axial engines. Rather more than half the engines that will be produced in the present programme, the de Havilland Ghost and the Rolls Royce Nene and Derwent, have centrifugal compressors. These big, vaned discs can be machined without trouble by standard profiling methods, and there is no reason to expect that supplies of such engines will fall below expectations. A change in policy, involving a shift in production to the newer, axial engined fighters might, however, change these proportions and so increase the demand for compressor blades.

The views on this question of as authoritative a pioneer in gas turbine development as Sir Frank Whittle cannot be ignored, despite the Minister of Supply's statement this week that "I do not consider that his criticisms call for any changes in our development policy." Much of Sir Frank's dissatisfaction with engine development in this country has been over the cessation of all research on the centrifugal compressor. The value of such further research in Russia has been demonstrated in Korea. The size, and the fuel consumption of a centrifugal engine is higher than that of an axial engine of the same power, and no British airframe designer would contemplate using such an engine today, even if one of sufficient power was in existence. But evidence obtained in Korea of the vulnerability of the axial compressor to damage from ice, debris and cartridge cases has led a number of experts to revise their opinion of the value of axial engines, for casualties from these causes have been high. Debris guards are hastily being developed, but if these keep out particles, it follows that they also reduce the flow of air to the engine, and therefore affect its efficiency. Many of the experts now remember that under similar conditions the centrifugal compressor acts as a mincing machine.

★

In spite of its technical superiority to the centrifugal engine, the axial engine does have certain major drawbacks; and even though its superior performance appears conclusively to outweigh them, Sir Frank's arguments cannot be dismissed as lightly as many in the Ministry and the industry would dismiss them. His recent successful petition for the extension of a patent did, moreover, bring to light further evidence to justify his attitude. This patent was old, dating back to the first jet engines. It related broadly to methods for pre-compressing the air before it reached the main engine compressor. Raising the compression ratio in this way leads to a big drop in fuel consumption. Since the high fuel consumption of the jet engine severely limits the range of the aircraft, this is clearly of great importance, and in particular to bombers. Work was started on this design by Power Jets Ltd. when the company was still permitted to carry out active development. But in 1946 when it was turned into a patent-holding company, and its research functions were taken over by the newly established National Gas Turbine Establishment, the work stopped and does not appear to have been resumed until some years later.

Security makes it difficult to obtain all the facts necessary to form a balanced opinion of jet engine development in this country, but this at least seems clear. Remarkable engines have been designed, but apparently without much consideration about putting them into production. Blades, for example, might have been designed from the start in a way that made it possible to produce them by less extravagant methods. Moreover, the development of other, possibly more important, engines appears to have been needlessly delayed. Nor has it ever been explained satisfactorily why the man who was responsible for developing the jet engine has held no post connected with engines since he resigned from a post in the Ministry of Supply in 1948. Much of the value of his original work lay in designing a jet engine that could be put into production several years ahead of any others then being developed. Such an advantage would be immensely valuable today.

Business Notes

The Tightening of Credit

The latest figures from the clearing banks, those for the February make-up, give the first clear measure of the extent to which the new monetary discipline is restraining the creation of credit. They make it plain that the restraint has developed more quickly than had generally been expected. Paradoxical though it may seem at first glance, the demonstration of this has to be sought rather in the behaviour of bank advances and investment portfolios than in the trend of bank deposits—despite the fact that net deposits showed a record fall of £262 million in the five weeks to which the statement relates. The whole of this spectacular decline was attributable to the Government's big seasonal surplus of revenue, and to the fact that the cash thus made available for the customary repayments of governmental indebtedness to the banking system was strongly reinforced by the accrual to the Treasury of the sterling counterpart of the heavy deficit that Britain is still running on the external balance of payments. But although this explains the month's decline in deposits, it does not explain why the decline was £54 million greater than the similar movement in February, 1951. Rather unexpectedly, the whole of this difference appears to have been attributable not to any increase in the rate of Government repayments to the banking system, but wholly to the effects of the new monetary policy upon the private sector of the national economy.

During the five weeks to February 20th, bank advances rose on balance by £21 million, in contrast with increases of £62 million and £39 million in the comparable periods of 1951 and 1950 respectively—in each of which periods, however, demands upon the banks were reflecting a steep rise in import costs. For this reason, not all of the slackening of the rise in advances ought to be attributed to the toughening of bank lending policies ; but a glance at the trend over the past three months demonstrates very clearly that this has been a powerful influence.

* * *

Trend Over Three Months

In the three months from November 21st, aggregate bank advances have risen by only £8 million, whereas in each of the comparable periods of 1950-51 and 1949-50 they rose by over £90 million and in 1948-49 (probably a better basis for comparison) by £52 million. This is a pronounced change of trend, for although it is possible that repayments of bank advances out of the proceeds of new issues have been particularly heavy this year, there is no doubt that the banks have had to meet further increased demands from the nationalised public utility industries. At the same time, the restraint of credit to the private sector of the economy has been working in yet another way. The pressure upon bank liquid assets that has induced the marked toughening of lending policy has also led the banks to sell investments. In the past month the aggregate investment portfolio shrank by a further £11 million (though this further reduction was attributable to the actions of only four of the eleven banks). In consequence, investments and advances combined rose by only £10 million during the month, in contrast with £76 million in February, 1951, when the banks were adding to their investment portfolios. This contraction in the demands from the private sector more than accounts for the steeper fall of deposits during the month, so that the repayments of governmental indebtedness actually appear to have been slightly smaller than in the similar period last year.

Naturally, these repayments have caused a steep fall in the banks' liquid assets, since only £51 million of them could be concentrated upon the small residue of Treasury deposit receipts (clearing bank holdings of which had been reduced to only £14½ million by the make-up date). In consequence, holdings of cash, call money and bills have dropped by £217 million, compared with a decline of £189 million in February, 1951, and the liquidity ratio has declined from 33.7 to 31.8 per cent, its lowest level since the launching of the new monetary policy. The change in the ratio of "risk" assets (advances and investments combined) has, of course, been still more marked ; it now stands at 65.8 per cent, compared with 62.3 per cent in January and 55.7 per cent last October.

* * *

Industrial Output Sinks

Industrial output in January appears to have been very slightly lower than a year before, thus continuing the trend of the last six months, in which the increase in production began to shrink and eventually vanished entirely. The official index for January is expected to come out at 139-140, compared with 137 in December and with 141 in January, 1951.

Complete figures for last year show that in fact an increase of only 2.7 per cent over the average for 1950 was achieved ; against the forecast of a 4 per cent rise (though it must be noted that the official index has recently a rather more unfavourable picture than does the unofficial London and Cambridge index). The official index suggests that in the manufacturing industries output rose by only 3 per cent over the year, compared with its annual increases of roughly 10 per cent during the previous three years. Mining was the only major industry in which production rose more rapidly than a year earlier. Since the industrial labour force continued to rise at much the same rate as in recent years—about 2 per cent each year—Whitehall now agrees that there was no significant increase in productivity. During a period of increasing shortage of raw materials, and of under-employment of labour before inactive industries began to be pressed by costs to dismiss workers, that was perhaps to be expected. The present outlook for supplies of metals, and for orders for consumer goods, suggests that the current stagnation in output must be expected to continue for some months. No appreciable improvement can be counted upon before the second half of the year, when steel at any rate should be more plentiful—and when, less certainly, demand for textiles may revive.

INTERIM INDEX OF INDUSTRIAL PRODUCTION (1946=100)

	All Industries	Mining and Quarrying	Total Manufacturing	Building and Contracting	Gas Electricity and Water
1947	108	102	109	111	103
1948	121	110	123	122	109
1949	129	113	132	127	113
1950	140	114	146	133	120
1951 (prov.).	144	118	150	130	127

Britain's EPU Deficit Declines

The customary unofficial but trustworthy advance information of the latest European Payments Union settlement, that for February, has come from Paris this week. It reveals no change in the basic position, that is in the domination of the position by two major debtors, France and the United Kingdom. Some comfort is, however, to be drawn from the indication that Britain's deficit for February has been reduced to $75 million or about half the January figure of $151.4 million. Even this reduced deficit will have involved a substantial gold loss—roughly $60 million—since the United Kingdom is now in the fifth tranche of its quota with EPU and settles additional deficits to the extent of 80 per cent in gold. The reduction of the United Kingdom deficit with Europe is in part due to the first though still modest effects of the import cuts decreed last November. It is also the reflection of substantial purchases of sterling area commodities by France, where such imports have been made as a hedge against the growing risk of a devaluation of the franc. The improvement in the British position is, therefore, to some extent the counterpart of a further deterioration in the French deficit, which on preliminary indications appears to have amounted to $143 million in February. This, after allowing for gold payments, will bring France's total deficit with EPU to around $430 million, leaving a margin of only $90 million before the quota of $520 million is exhausted and France is brought to a point at which further deficits with Europe will have to be settled 100 per cent in gold. There are reports from Paris that this position is in fact on the point of being reached and that France will ask for special help from EPU just as Germany did when it found itself in a similar position towards the end of 1950.

While France and Britain continue to dominate the debtor side of the position, Belgium remains an inveterate creditor. Its surplus for February was slightly over $40 million. Of this, under the special arrangements made with that country, the first $20 million will be covered by gold payment and the balance will be added to the credits granted by Belgium to EPU. The fact that so many members of EPU are at or near the limit of their quotas emphasises the need for a considerable revision of the agreement before its present span of life expires on June 30th next. The Managing Board of EPU considered the whole position at a recent meeting and is now preparing a report for consideration by the Ministerial Council of the Organisation for European Economic Co-operation towards the end of this month.

* * *

Increased Steel Allocations

As had been expected, Mr Sandys was able to say this week that the amount of steel allocated for the second quarter of this year showed "a very slight increase." Details of these second allocations have now reached consuming industries ; and so far at least protests have not been vociferous. Though he fofecast that imports of steel should rise considerably in the third and fourth quarters as the American steel begins to arrive, Mr Sandys refused to make prophecies about the amount of future allocations. In the debate, Mr Strauss found it politically convenient to doubt rather sourly whether all the American steel promised would arrive ; whether it might not be of types that Britain does not need or "would find it awkward and inconvenient to feed into our steel industry" ; and whether Britain might not receive only "the surplus that the Americans do not want" without any say in the types it was sent. He produced no evidence to support these doubts ; nor did Mr Edelman in his contention that the Prime Minister had "bought a pig in a poke." It would no doubt be preferable, as Mr Jack Jones suggested, to obtain steel-making materials and keep British furnaces busy. But some of the critics need reminding that America is not trying to find customers ; Britain has been trying to find steel.

Adjustments have been made in the allocations that aroused most protest in the first period of this year, but the Ministry presumably still lacks an up-to-date statistical basis for its sharing of steel. The figures of deliveries by industries under the ægis of Government departments ceased to be taken in 1950, and new ones cannot have been ready in time for the allocations this month. The more generally useful statistics of deliveries that the British Iron and Steel Federation has published in the meantime have ceased ; and henceforth the figures even on the clumsy departmental basis are to be published only once a year. The Federation's figures for 1951, incidentally, bear out its earlier estimate that steel consumption last year would be little more than in 1950: deliveries totalled 10,789,000 tons, compared with a consumption of perhaps 10,725,000 tons in 1950. For 1952 the Federation's own estimates would suggest that 11,200,000 tons of finished steel would be available ; but the recent White Paper on Defence suggests that the total may in fact reach 12½ million tons of finished steel. Of this, it estimates, rearmament production will require a million tons (which suggests that munitions requiring large amounts of steel quickly, such as shells and bombs, may play a big part in production this year). Whatever the validity of the various estimates, the British economy seems certain to receive more steel by the end of this year than at any time except some of the peak war years ; but until the imports that will cover the margin begin to arrive, that is small comfort for consumers living from hand to mouth.

* * *

The Rise in Unemployment

Sir Walter Monckton's opinion, expressed in the manpower debate this week, that unemployment figures for the middle of February, which will not be published for nearly a fortnight, will be "somewhat higher than for those of January," no more than confirms outside expectations. Common sense would suggest that the upward trend will continue for some time, though Mr Robens's prediction of "a million unemployed" by the end of this year probably takes extrapolation too far. The most important non-seasonal factor in the increase in unemployment by the middle of January, after all, appears still to have been the textile recession—not the shift towards defence production from other industries that are short of materials. Unemployment of men in January was the lowest for any January since 1946 ; the general increase was entirely due to the growth in unemployment of women, 162,000 being unemployed in comparison with 103,000 in January, 1951, and 107,000 a year before. Of the growth of 193,000 in total unemployment between July last year and January, 59,000 came from rising unemployment in the textile and clothing industries. When—and indeed whether—a complete recovery in demand for textiles can be expected is debatable. But it would seem too gloomy to write off some seasonal improvement this spring, which should—eventually—offer their former jobs back to some of these women workers.

The anxiety expressed by members for constituencies where unemployment has increased disproportionately was understandable: but some of the general anxiety about Sir Walter's Notification of Vacancies Order seemed to arm that innocuous and probably ineffective measure with powers that it does not possess. The Minister put it into perspective by saying that the main effect expected was to bring within the knowledge of the employment exchanges the fairly large proportion of workers—perhaps 30,000 out of a total of 80,000 a week changing jobs—who have been finding new jobs upon their own responsibility. The persuasive powers of the exchange officials can thus be brought to bear upon all the workers who leave jobs. Sir Walter's—and Mr Robens's—faith in the efficacy of a Labour Supply Inspectorate, to scrutinise firms' demands for labour and suggest ways in which the additional output required could be achieved with the fewest possible extra workers, is hard to share without more evidence. The new system, indeed, may assist in oiling the turnstiles for labour that already appears to be moving in roughly the right direction. But its positive powers hardly justify any fears ; nor, unfortunately, any confidence that it will bring about the desired shift fast enough.

Signs of Life from IMF

In the early days of February an unusually important meeting of the Executive Board of the International Monetary Fund took place in Washington at which fundamental issues of policy were considered. What was at stake at this meeting was nothing less than the role that the IMF might be called upon to play in meeting the balance of payments difficulties that now face a very substantial sector of its membership. The executive directors of the IMF had to consider first the question of the ban placed on the sale of dollars to member countries in receipt of other forms of dollar assistance from the United States. Marshall dollars have now ceased to flow and have been replaced by dollars made available through the Mutual Security Agency. These are linked more specifically to military aid and cannot be said to offer direct assistance to the civilian economies of the countries concerned. In these circumstances should the ban on IMF sales of dollars to recipients of MSA aid continue? That was one of the basic questions to be discussed.

The other concerned the interpretation of the conditions on which the IMF should make its assistance available to member countries. This involved a partial resurrection of the old controversy between the two schools of thought that respectively support and oppose the principle of "automaticity" in the access of members to the facilities of the fund. This dispute goes back to pre-Bretton Woods days and it is unlikely to have reached final settlement at this latest debate. It would appear, however, that some agreement was reached in favour of diluting the somewhat abstract and "theological" considerations regarding the position of any applicant for help that the IMF, largely under United States pressure, has hitherto regarded as the proper criteria on which to judge applications for such assistance.

As a result of this meeting, a new set of "instructions" is said to have been issued to the Managing Director. It is to be expected that on the basis of this the IMF may in the relatively near future spring back to life once more. On this assumption, and if the United Kingdom government wishes to avail itself of these new facilities, it could over the ensuing twelve months secure from the IMF dollars equivalent to a further 25 per cent of its quota, or around $300 million. If other members of the sterling area, which are also independent members of the IMF, similarly exercise their right to draw the maximum quota of dollars from the fund over the next twelve months, a further total of over $200 million could be mobilised. This might prove a welcome means of overcoming the serious decline in the gold and dollar reserve of the sterling area that appears inevitable over the next few months—but resort to this short-term help would be justified only if the longer term measures designed to ensure the solvency of the sterling area, not least among them the forthcoming British budget, reveal the necessary measure of vigour and courage.

* * *

Building Societies on the Brink?

It now seems clear that, once budget uncertainties are out of the way, the Building Societies Association will have to look again at its recommendation of last November that interest rates should not be raised above the 2¼ per cent dividend on shares and 4 per cent charge on mortgages that is still the norm throughout the movement. In his address at the annual meeting of the Abbey National Society last week, Sir Harold Bellman argued that the present pattern "embodies substantial justice" to both shareholding and borrowing members, but emphasised that the board "is closely watching the trend in interest rates and will feel free to make any adjustment which is clearly required."

Meanwhile, one of the reasons for the Association's "standstill" recommendation of last November emerges from some estimates in the current issue of the *Building Societies' Gazette*. As shown in the accompanying table, the *Gazette* estimates that shareholders put £96 million of new money into the movement last year; thanks chiefly to the continued buoyancy of this form of saving, building societies were able to increase their mortgage lending by some £101 million and to increase their other assets by £3 million in 1951. It is true that the book value of investments, which the *Gazette* estimates to have fallen by £5 million, now

probably exceeds current market values—Sir Harold Bellman revealed last week that the book value of the Abbey National's holding of British Government securities (at approximately £13½ million, all in dated stocks) exceeds market values by £654,000. But the movement has recently built up strong published reserves against this depreciation of investment values, and when the Association met last November it did so against a background of such apparent radiant health that it is easy to see why it yielded to the temptation to recommend members to leave well alone.

* * *

New Pressure on Borrowing Rates

There were three other factors that may have reinforced the building societies' traditional propensity towards stability of rates last November. First, they may have believed that the Conservatives' more sympathetic attitude towards home ownership would open up an expanding market for mortgage lending, provided charges were kept low. Secondly, the influx of funds into the movement was then approaching its height; it must be remembered that last year's good record was achieved despite quiet business early in the year—when the movement suffered somewhat from the more attractive terms offered on national savings certificates. Thirdly, the improvement in the supply of savings last autumn was being reported from all over the country; thus the Halifax, the giant of the North, expanded its total assets by £11.7 million, to £177.2 million, in 1951, while the Abbey National's assets also expanded by £14.5 million, to £136.6 million.

Since November, however, outside interest rates have risen further than some leaders of the movement may have expected; in his address at the annual meeting of the Co-operative Permanent Society last week Mr Harry Score dwelt at some length on the proper relationship between building society and other interest rates. In consequence a number of societies—led by the Co-operative Permanent, the Temperance Permanent and the Scottish Amicable—have broken away to a higher range of rates based on a 2½ per cent disbursement on shares and a 4½ per cent charge on mortgages. Finally, from next month, the Inland Revenue is going to assess the surtax payer on grossed-up instead of net receipts of building society interest—for tax purposes

The Archipelago takes the biscuit!

A manufacturer of biscuits, anxious to expand his export trade in dollar markets, had heard that Colombia had recently relaxed its ban on the import of these goods. "Can you confirm this?" he asked.
Reference to Colombian Decree No. 1141 of 22.5.51 provided an immediate answer. Imports of biscuits, though still prohibited on the mainland, could be accepted on the Colombian Archipelago of San Andrés y Providencia. From no other source could our client have obtained such quick and detailed information.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

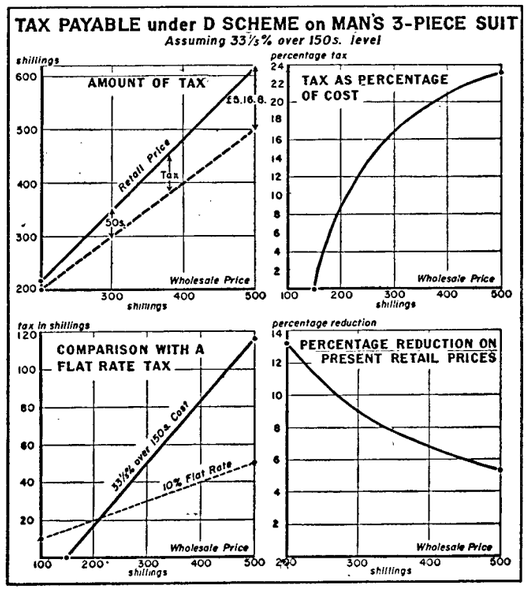
Quality *Sans* Utility

Since the report of the Douglas committee on purchase tax and utility schemes was published two weeks ago, the Board of Trade has held a series of meetings with representatives from the industries most closely concerned in an attempt to devise a quality mark to replace the old utility sign. The Douglas report has effectively demolished the fiction that the utility mark gives any indication of the quality of the goods that bear it, and this task might, therefore have been considered unnecessary. But only a minority of people will ever read the report thoroughly; and when the utility schemes are dropped the Board of Trade can be certain of attacks from the Left on the grounds that it is abandoning the principle of a guaranteed minimum quality.

The Douglas committee suggested that industries should be encouraged to draw up minimum standards in co-operation with the British Standards Institution, but the BSI moves at a snail's pace; and the Board of Trade needs to have a scheme ready, at least in outline, by Budget Day. Some method of describing wool cloth could probably be introduced at short notice; much of the ground-work has already been covered during negotiations on the more controversial question of wool labelling. This, indeed, would be a big advance on the utility scheme, which did no more than define wool cloth as any containing more than fifteen per cent of wool. Minimum standards for cotton and rayon too, would certainly be easy to devise, although they might be too technical to have much meaning for the consumer. Made-up goods like clothing and furniture present greater practical difficulties; here work done by the Clothing Development Council might be used as a basis for agreement.



Whether these proposals would in fact prove any more effective than the utility schemes has yet to be demonstrated. The level of quality is more likely to be protected by competition between the producers. Standards of quality have not declined, as they might have been expected to do, as utility controls have been relaxed in the last year. Given the present temper of the home market, such competitive pressure is likely to have much more influence than all the ingenious proposals now being discussed.

* * *

Tax under the "D" Scheme

The effect that the Douglas report's recommendations would produce on the market for the higher quality textile goods is causing concern in this section of the clothing industry. The sale of these goods was actually encouraged under the utility schemes because the slight difference in quality between an article that could be made to sell at maximum utility prices and one that was a little more expensive was not big enough, in the eyes of the consumer, to justify paying the full rate of purchase tax on the non-utility article. The "blind" spot was a frequent object of criticism in the general trade; but it did give the producers of the highest quality goods a special chance to attract the more discriminating home customer. The committee's recommendations would reverse this position by reducing the amount of tax payable by goods just above the tax-free limit, but leaving the sum paid on higher quality clothing almost unchanged.

The following charts, which have been prepared by a manufacturer of high-grade clothing, show how this, in effect, increases the comparative burden that tax imposes on the quality article. On the rough assumption that the tax-free limit for a man's suit is fixed at 150s., and if the rate of tax remains at 33⅓ per cent as the committee suggests, a 200s. suit bears only 16s. tax, but a 500s. suit bears £5 16s. 8d. tax; at present the expensive garment bears only the same percentage tax as the cheaper. In the same way the tax payable represents 8 per cent of the cost of a 200s. suit, but nearly a quarter of the cost of the 500s. garment. If a flat rate tax of 10 per cent had been recommended, which would

bring in the same revenue as the scheme proposed by the committee, then the 200s. garment would still pay less than 20s. tax, while the dearer one would pay only 50s.

The effect of the D scheme on retail selling prices is to reduce the price of the 200s. suit by more than 13 per cent, and that of the 500s. suit by less than half that percentage. The committee apparently argued that such quality goods did not stand in need of tax relief because they have a home market whatever their price. Few producers of such goods would agree with this contention, and they have good reason to believe that their small home market would contract still further were the scheme to be adopted. These are among the manufacturers of clothing as well as piece goods who do a considerable export business; the clothing manufacturer referred to above has sold £1 million worth of goods in the highly competitive United States market since 1939, although his total labour force is less than 400. Goods of this standard are frequently the only kind that can be exported to markets like those in North America, where lively home industries are further protected by steep tariff barriers. They have, therefore, more than a prestige value, and might well expect a measure of relief at least equal to that proposed for other non-utility producers.

British Motor in Embryo

The Morris-Austin merger has been brought a step nearer completion by the incorporation of the British Motor Corporation Limited, the new holding company, and by a proposal to convert all the prior charge capital in the two companies into 5 per cent £1 cumulative preference shares in the new corporation. The whole of the amalgamation

NEWS FROM THE FISHING INDUSTRY

The problem of fishing the near waters

It is the waters within a few hundred miles of the British coast that contain the choicest varieties of fish such as sole, turbot, plaice and hake. Here lie the traditional fishing grounds of Britain. In 1939 they showed signs of being gravely overfished, but immediately hostilities opened, many grounds were closed and, in a world at war, the fish were left to breed in peace. 1946 and 1947 provided bumper landings from these rested waters, then, again, the decline set in. Today we are back where we were in 1939.

As a result an extra burden is thrown on our distant-water fleet, but a burden which, thanks to the abolition of controls, they have borne well. Once more trawlermen have personal incentives to seek new fishing grounds . . . to search for fish more vigorously and more widely. Thus from the Arctic Ocean, the White Sea approaches and coastal waters of Africa come thousands of tons of fine fish to make good the lighter hauls from nearer home.

British Trawlers know their job!

scheme will fall to the ground if less than 90 per cent of the equity shareholders in the original companies agree to the exchange of their holdings into an equal number of 5s. ordinary shares in British Motor; in addition, the preference share offer, details of which are shown in the accompanying table, must be separately accepted by at least 90 per cent of the preference shareholders. There seems to be no reason why both groups of shareholders should not give their approval, as the insurance and the investment trusts committees have in effect, if not explicitly, advised them to do. The technical advantages of the original merger scheme were discussed in *The Economist* of December 1st; by extending the merger offer to holders of preference shares the company will save £650,000 in stamp duties (ultimately to the advantage of ordinary shareholders) and will secure a simpler capital structure. The bait for preference shareholders lies

partly in the improved marketability of a BMC preference share over that of the constituent companies' shares, partly in the fact that the new offer lays any possible bogy of losses on liquidation; but chiefly in the fact that preference shareholders will all receive a slight increase in income without any sacrifice of capital rights. On the basis of recent market valuations, however, the holders of the Austin 7 per cent preference shares gain the least, and these were the only preference shares to be marked down after the offer had been made known. The element of equity in the dividends paid on the Austin 20 per cent preferred ordinary shares has been recognised by an offer of a mixture of preference and ordinary shares in British Motor.

If the offer is accepted—and with an institutional seal of approval upon it, acceptance seems likely—the issued capital of the new corporation will consist of £9,241,126 in 5 per cent £1 preference shares and £4,826,359 in 5s. ordinary shares. Highly geared though the new capital structure is, the additional cost of dividend payments on the new preference shares is slight; last year's combined net profits would cover a year's dividend on the new preference capital more than nineteen times. This estimate is a conventional reckoning in which provision for depreciation is based upon historical costs. Clearly, however, the directors must have taken some account of the cost of replacement before announcing that the profits of the new corporation should justify an annual ordinary dividend of not less than 52 per cent; if this rate of dividend is paid, both the existing ordinary shares of Austins and Morris (both at 31s. 3d. xd. on Wednesday) yield no less than 8.3 per cent, compared with 7.4 per cent for such a smaller rival as Rootes. The slate has been wiped clean for a fresh start—at least as far as the financial arrangements are concerned—by the declaration of dividends upon existing shares for the period up to the date of exchange at the end of this month; these dividends include equity payments based on an annual rate of 50 per cent. Once technical economies have been effected—and at the outset these may be most marked in the manufacture and assembly of vehicles overseas—the full measure of the strength of this new giant, now seen in embryo, will be revealed.

Policy for Fuel

The evidence submitted by the Federation of British Industries to the Ridley Committee on National Fuel Policy is a workmanlike statement of what may be called the conventional case for such a policy; but the FBI has been more venturesome than most other advocates in risking its own forecast of fuel supply and demand. It thinks that the National Coal Board's estimate in its long-term plan that demand for British coal in 1965 will total 230-250 million tons is about 50 million tons too conservative; even today, it thinks, the true demand for coal for all purposes—including exports—is probably 10-20 million tons more than the NCB is supplying. Its recommendations are familiar: encouragement—possibly fiscal—of greater fuel efficiency in industry and the home, more private generation of power in factories, a switch from steam locomotives on the railways, and "a

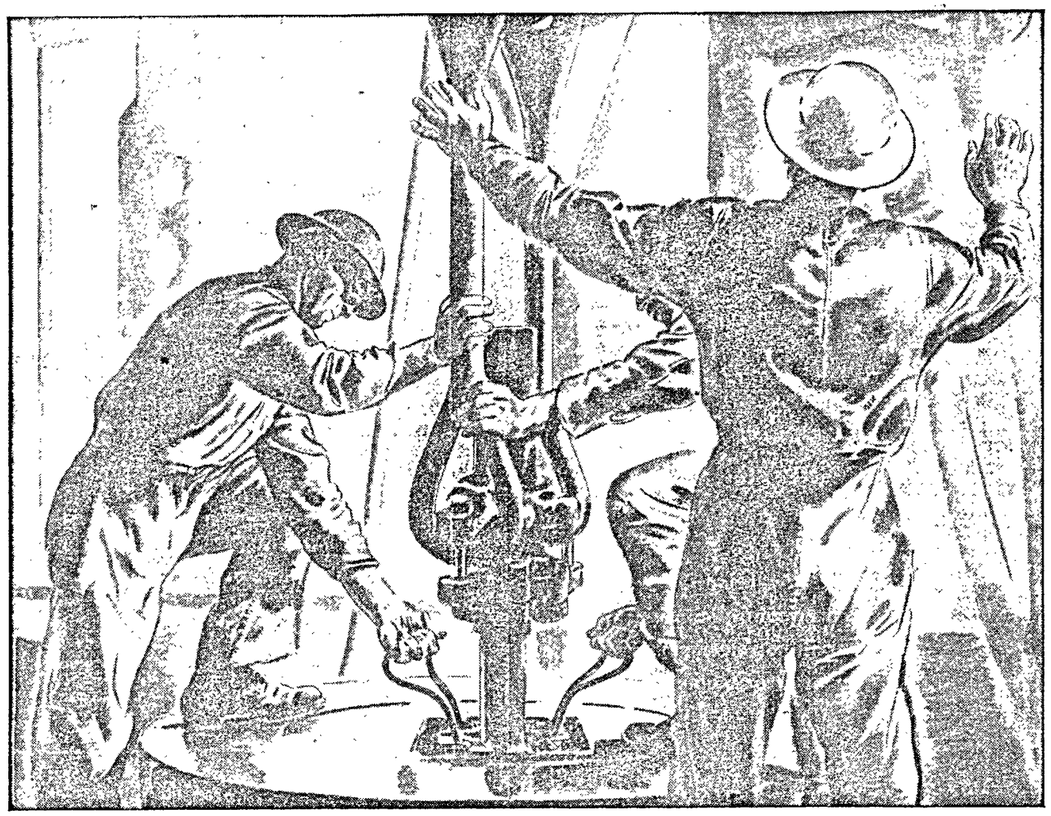
policy aimed at promoting the choice of the most efficient fuel for each main category of use." Like the recent pamphlet on the subject by two Conservative MPs, the statement says rather less about methods of promoting such a policy; and in particular does not mention the pricing of different fuels.

On this particular point—which would seem the pivot of any national fuel policy—the Ridley Committee will be able to find much plainer speaking in the report made last week by the Economic Commission for Europe on the European coal problem. This report quite bluntly raises the question of pricing policies for electricity, and criticises the complacency with which this industry usually brushes away suggestions of tariffs related to a consumer's demand at the time the power is taken. Some such policy may well be the only one that could achieve any real measure of fuel co-ordination and bring about the use of the most efficient fuel for each purpose.



* * *

Electric Fires Find a Champion

One purpose that the Ridley Committee may really achieve is to weed out the basic data for fuel policy—the technical comparisons between different fuels. One dogma, based upon comparisons of "coal economy efficiency" by the Egerton Committee in 1945, has just been challenged. Mr O. W. Humphreys, director of research of the General Electric Company, has declared that not only is the electric fire not an inefficient form of space-heating, but that

> . . . at present generating and distribution efficiencies (it) shows a marked saving in coal consumption when compared with open coal fires (including the latest types) and openable stoves (and) . . . compares very favourably with closed coke stoves for periods of occupation of less than 9-13 hours.

Previous judgments against the electric fire have taken the "coal economy efficiency" of the appliance in distributing the heat of the coal consumed. Mr Humphrey bases his defence upon considering in addition the ways in which different appliances distribute heat, the wall and air temperatures required for comfort, the time needed to build up and bank solid fuel appliances, their excess of consumption

We've solved some problems in our time!

IN 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would preheat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity *inside a diameter of 1¼ inches* and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

through burning too fast, and the excessive ventilation they induce. His elegant and plausible argument is unlikely to silence the solid fuel enthusiasts, but it may make them re-examine their central theses. It is, incidentally, one of the first forcible statements from electricity's side of this argument; and it may even embolden the BEA into arguing its own case—which may be right or wrong, but should not go by default.

* * *

On Not Buying a New Car

The latest steps taken to police the sale of new cars at home seem to leave things much as they were. The customer, who already has to say whether he has had a new car delivered to him since the war, now has to give further details of any other cars that he owns. As in the past, the retailer is enjoined not to sell a new car to any customer with a postwar car unless there are "exceptional circumstances" to justify it. These circumstances are taken to mean that the vehicle is beyond economic repair or that the business buyer has a "special need" to add to his existing fleet.

The sale of a new car, however, remains a private transaction between customer and any one of the 8,000 registered dealers, and the dealer is still the arbiter of whether the customer qualifies for a new car. He has to pass on to the trade associations the customer's signed declaration of his existing transport as well as the signed covenant form, but he is under no obligation to take steps to check its accuracy. The British Motor Trade Association can prosecute a customer who makes a false declaration; but, as in the case of violations of the covenant, the BMTA cannot start proceedings unless it has knowledge of the transaction, and this is not likely to be volunteered by either the dealer or the buyer.

Announcing these new measures in the House of Commons last Monday, the Parliamentary Secretary of the Ministry of Supply did go on to describe one change that may be important. For the past few years orders for cars have not been dealt with in chronological sequence, but according to a rough order of "priorities" laid down by the Ministry of Supply for the guidance of the industry. As a result, probably not more than half the 500,000 orders placed in 1946 have been met, although more than 750,000 cars had been delivered to the home market by the end of 1951. In future, said Mr Low, delivery will be made "in rotation according to the date of order," although there will still be priority for special cases. This might go some way to remove the main source of grievance among those who have waited five fruitless years for a new car while their neighbours have had comparatively early delivery. But the present high prices of cars, combined with the recent check to exports, may well do more to smooth out new car deliveries than control measures such as these.

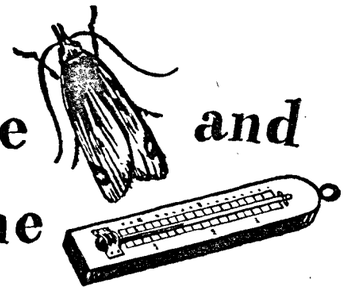
* * *

New Trade Agreement with Germany

A new trade agreement between Britain and the Federal Republic of Germany was signed in London this week. It covers the year 1952 and is concerned solely with the trade governed by quotas. It does not, therefore, impinge on the liberalised sector of trade. For this reason it is impossible to determine in advance how the new agreement will affect the total trade betwen Germany and the United Kingdom. Even where Britain has retreated from open general licences and has subsituted global quotas for previously liberalised European imports, the German exporter will have to compete for his share of the global quota, and no prediction can be made at this stage of the success that may meet these efforts. The new agreement, however, takes into account the changed position of the two countries in the European Payments Union since the signature of the previous agreement, covering the year 1951. Over the intervening period Germany's position has undergone a revolutionary change for the better, while that of the United Kingdom has moved, with equal force, in the opposite direction. The German Government has, therefore, increased certain of its quotas for imports from the United Kingdom and the colonies, notably those for textiles and cocoa. The quotas given by the United Kingdom for imports from Germany are for the most part based on those of the 1950 or 1951 agreements. There will, however, be an important increase in the quantities of steel that the German Government will make available for export to the United Kingdom. The tonnage for 1951 was 45,000. This year's figure should be more than twice the quantity.

* * *

Unshed Load



Only about half a dozen power cuts have taken place in Britain this winter, compared with 150 between October, 1950, and March, 1951; reductions in voltage have been more frequent, but also greatly reduced in comparison with former years. This improvement in electricity supply has enabled the regional authorities to relax loadspreading arrangements in industry from the beginning of this month. It has come about partly because much more generating capacity has been in commission. In 1951 some 1,113,000 kW of plant was brought in, as against 965,000 kW in 1950. At the end of January this year the British Electricity Authority had a total generating capacity of 14,143,000 kW, compared with 13,175,000 kW a year before. Perhaps 12 per cent of this total must be expected to be out of commission for repairs at any one time; though concentration of much annual inspection and maintenance into the summer months has somewhat reduced the proportion of plant "out" for this purpose during the winter. That squeezing of repairs into the summer months, incidentally, combined with bad weather to make power cuts more frequent last summer than ever before—and, by arousing public concern, perhaps made this winter's loadspreading arrangements more effective.

The effect of those arrangements is impossible to measure. But it is certain that the growth of demand for electricity has in fact moderated considerably in the last six months. The greatest load on the generating system that was actually met this winter—12,631,000 kW on January 13th—was a million kilowatts higher than the largest load during the previous winter. But the maximum potential demand on the system this winter is estimated to have been 13,543,000 kW (on December 13th), only 100,000 kW higher than the maximum of 13,448,000 kW on December 18, 1950. For the moment, the gap is clearly being narrowed. Loadspreading will have contributed to this; so will milder weather; so will some slackening in industrial activity through shortages of materials. Those are temporary factors. It is too early to decide whether other, less temporary, causes may be partly responsible for the recent flattening in the rate of increase in consumption of electricity, and other fuels. But the BEA, like the National Coal Board, has at least gained some respite. Experience this winter would argue the need for the fastest possible progress on the new 275,000 volt "super-grid." For the few power cuts that have been necessary have not come about through lack of generating capacity. They were caused by lack of interconnection capacity on the transmission system between different regions of the existing grid, which was never designed for the transfer of large blocks of power on a national scale.

More Comets

Plans to build the de Havilland Comet in the Belfast factory of Short Brothers and Harland will relieve much of the pressure on the existing Comet lines at Hatfield. The aircraft are coming off these lines at the rate of approximately one every month; shortage of space and of labour makes the prospect of more rapid production unlikely. Shorts will still

The and the

Moth-grubs like fur. But moth-grubs dislike cold: in fact, at 36°-40°F. they lie harmless, and at 12°-16°F. they lie down and die.

So refrigeration is the answer to the storage problem of the furrier. He uses a cold room in which low temperature can be kept constant or varied at will. And refrigeration is the answer to a lot of other people's problems too!

If you've a cooling problem, consult

Business Car Hire LOWERS your costs

Many famous British companies are using our special Business Car Hire Service—*to their profit.*
They have discovered, as you will, that this individually planned service often reduces travelling costs to a considerable degree.
For meeting clients at airports or docks, for making sales calls or for entertaining—in fact, for all your journeys a fine new chauffeur-driven car is always at your service... bringing your company added prestige and efficiency. Only the large resources of Daimler Hire Ltd. can offer such facilities—and *guarantee* absolute reliability.

CARS INCLUDE *latest model* 1951 *Daimler limousines, Humber Pullman limousines, Humber Super Snipe saloons.* DRIVE YOURSELF SERVICE *provides Humber Super Snipe, Standard Vanguard, Humber Hawk, and Hillman Minx saloons.*

By Appointment Motor Car Hirers to the late King George VI

Daimler Hire Ltd.

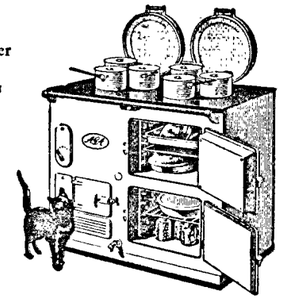
The **AGA** *Cooker*

Regd. Trade Mark

as an instrument of public policy

THE AGA COOKER represents the first—and still far and away the most significant—attempt to put domestic chores on the same level of efficiency that we expect of a progressive and prosperous industry. It is an extremely successful attempt: the man who made it was, after all, a Nobel Prizewinner.



THE AGA's original appeal was, among other things, to its owner's sense of thrift: it cost next to nothing to run. Now, this private advantage is a public virtue. People have got to have cooked meals, hot water and warm kitchens—and ultimately (except for a very few who depend on oil, wood or peat) they can only have them as a result of burning coal. If this consumption is by any other sort of appliance than an Aga Cooker, more coal will be burned.

THE AGA has a guaranteed maximum fuel consumption, however much its owner uses it. Thermal efficiency is so complete that the gases from combustion actually become heavy, and so that they can rise easily up the chimney it is necessary to combine them with a secondary air supply, warmed for the purpose by passing under the ashpit.

IF ALL cooking and water heating were done as efficiently as they are by the Aga Cooker, there would now be no fuel crisis.

BUT THE AGA has more than efficiency to offer in the public interest. It makes an important contribution to social stability by effectively raising the standard of living and 'house-pride' of every Aga-owner. It provides essential services to the highest conceivable standard. It enormously lightens the daily labours of the housewife. It expresses and continues the tradition of more than a century of British progress, by increasing people's leisure and adding to their opportunities for recreation and for acquiring culture.

THE AGA-OWNER is not only a more efficient fuel-user: he is a better citizen. The place of the Aga is not only in the home: it is in the national economy as well.

The makers of the Aga Cooker would be glad to send a copy of their latest book, *The Saga of the Aga* to anyone who writes and asks.

have considerable idle capacity at Belfast, even when part of the factory has been tooled up for production of the Canberra bomber, and there is no shortage of labour in the district. It is in de Havilland's interests to reach a high rate of Comet production while the aircraft is still the only pure jet airliner on the market. With approximately 45 orders in hand, production is fully booked until some time in 1955, and a number of airlines have expressed their reluctance to place orders now for such late delivery. Under the new arrangement, whereby Shorts will build aircraft to de Havilland's order, the first Belfast-built Comets will be ready for delivery in 1954.

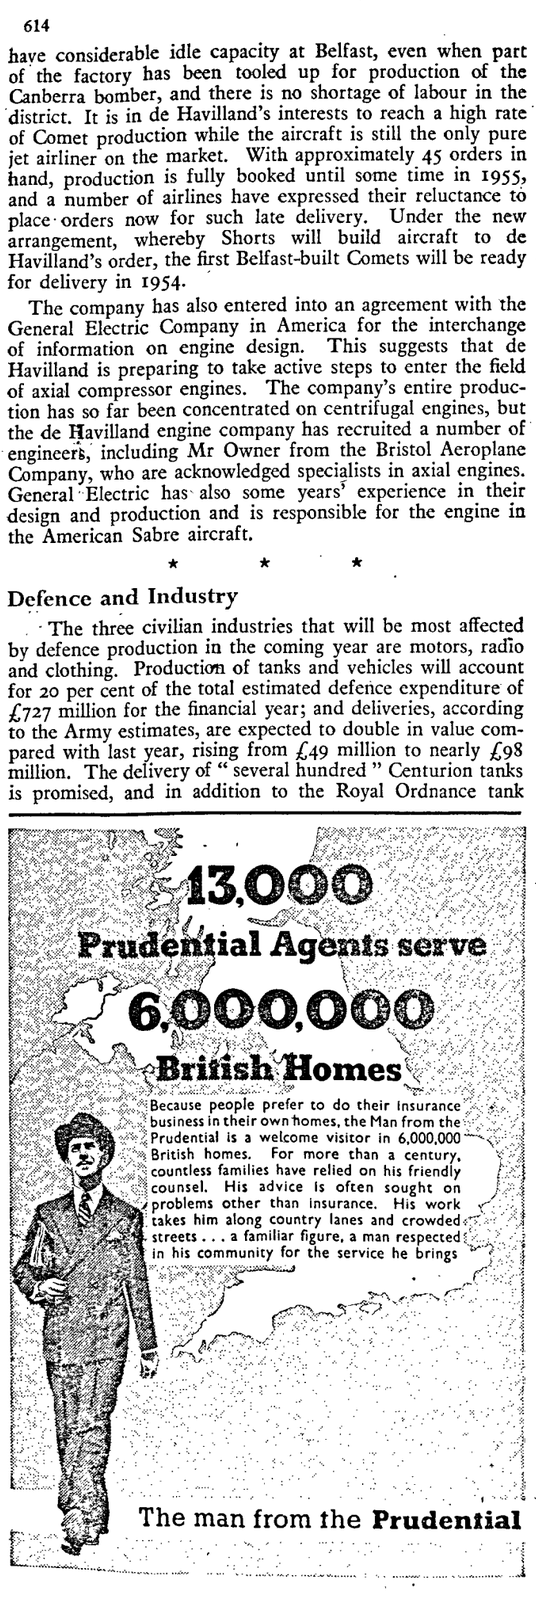
The company has also entered into an agreement with the General Electric Company in America for the interchange of information on engine design. This suggests that de Havilland is preparing to take active steps to enter the field of axial compressor engines. The company's entire production has so far been concentrated on centrifugal engines, but the de Havilland engine company has recruited a number of engineers, including Mr Owner from the Bristol Aeroplane Company, who are acknowledged specialists in axial engines. General Electric has also some years' experience in their design and production and is responsible for the engine in the American Sabre aircraft.

* * *

Defence and Industry

The three civilian industries that will be most affected by defence production in the coming year are motors, radio and clothing. Production of tanks and vehicles will account for 20 per cent of the total estimated defence expenditure of £727 million for the financial year; and deliveries, according to the Army estimates, are expected to double in value compared with last year, rising from £49 million to nearly £98 million. The delivery of "several hundred" Centurion tanks is promised, and in addition to the Royal Ordnance tank factory at Leeds, and those operated by Vickers-Armstrongs, work was started last year on two new factories, which may come into production during the period covered by these figures. Engines for the tanks are being made by the Rover Motor Company.

Within the motor industry, tooling up for army vehicles should be completed shortly, and the memorandum attached to the Army estimates reports that quantity production of nearly all the new vehicle designs will start in the course of the year. The existence of these lines does not directly affect the production of passenger cars, but they are expected to make serious inroads into the total supply of materials allocated to the motor industry. These army vehicles are included in the total of 230,000 commercial vehicles that the industry is expected to produce this year, suggesting that there might be an appreciable fall in the output of civilian commercial vehicles.



Production of ammunition, which will be carried out mainly in the Royal Ordnance factories, accounts for a quarter of total expenditure and "other major items in the programme" are described as warship construction and repairs, clothing and radio equipment. The Air Force expects to spend £21 million on radio equipment and the Army £7 million, both nearly twice as much as was estimated for the previous year; the Navy gives no separate figure. This programme will begin to make serious demands on the capacity of the radio industry and is more than likely to affect production of civilian radio and television receivers. The three services together expect to spend £67 million on clothing compared with £42 million last year; this may provide some welcome employment for the clothing industry although the margin of profit on such contracts is in normal times considered unattractively small.

Freight Rate Prospects

The sentiment of the share market is such at the moment that a drop of only 4.6 points in the Chamber of Shipping index of sterling tramp freight rates for January (followed, it is true, by indications of a further slight decline in the general level of sterling freights) caused a far greater decline in the value of tramp shipping shares than did a drop of 24.8 points in the index for June last. But this alarm about the future of tramp freight rates is not as yet shared in the Baltic Exchange. The freight index for January stands at 163.9, which is still substantially higher than the lowest monthly figure of 1951 (149.3 in August), is a good deal higher than the figure for the previous January (151.9), and is not much lower than the average for the whole of 1951 (173.7), which compared with an average of only 84 for the whole of 1950.

The fact that freight rates in most markets are showing a tendency to decline from recent high levels cannot be taken as an indication that the bottom is beginning to fall out of the market. On the contrary, the slight recession may be not only temporary, but possibly beneficial. Two major factors have influenced the easier trend. First, the mild winter has relieved the urgency for immediate shipments of coal from America to Europe. In such circumstances, charterers can afford to wait for the chance that a shipowner will accept a cheap rate for a voyage that would otherwise have to be undertaken in ballast. Thus occasional shipments have been made recently at rates up to $1.50 below the prevailing standard rate of $10.50; but meanwhile large numbers of vessels have already been chartered for consecutive voyages up to the end of the year at the standard rate, and a good number of unfulfilled orders is still circulating in the market. In the second place, this decline in the urgency of trans-Atlantic coal chartering has been accompanied by an almost complete cessation of homeward grain chartering by the Government's grain bulk-buying agencies. Sooner or later, large quantities of grain must be imported by Britain and other grain-consuming countries.

Company Notes

English Electric.—Last December's issues of new ordinary shares and of a new debenture stock by English Electric were partly prompted by the company's plans to spend well over £9 million on the new Netherton factory and on other capital projects, and partly by the knowledge that bank loans would be less easy to obtain in the future. But these issues—like the other issues made by the leading electrical manufacturers—were in any case made necessary by the continuing growth in turnover, importance and strength of the electrical industry since the war. The need for a more permanent base to support an expansion of business is quite evident in the balance sheet of the group drawn up on December 29th. An increase in the rate of production—and probably higher prices, too—led to a rise in the value of stocks from £15,203,354 to £21,046,196, and in debtors from £12,678,343 to £15,510,453. Despite the relief given by the receipt of £2.5 million from the £3 million debenture stock issue and by the growth in "payments received on account" from £10,176,705 to £13,728,347, a further £1,915,105 had, therefore, to be borrowed from the banks, bringing the group's indebtedness to them to £7,018,641. Since the end of the year the £6 million odd received from the rights issue to equity shareholders and from the private placing of the new debenture stock has been used to pay off this loan. The group, however, will still need liquid funds to support a further increase in turnover at a time when the costs of materials and wages are rising; it is probably for this reason that the directors have retained over £930,000 (against £640,000) in general reserves and in additions to the carry forward.

	Years ended Dec. 30, 1950	Dec. 29, 1951
Consolidated earnings :—	£	£

Cash	924,058	666,935
Reserves	7,729,770	9,232,011
Ordinary capital	4,128,520	4,128,520

£1 ordinary stock at 56s. 3d.xd yields £5 7s. per cent.

The latest advance in trading profits, from £4,085,342 to £4,762,088, might in other circumstances have justified something more than the maintenance of the ordinary dividend at 15 per cent. But this year may see yet another increase in sales—possibly not wholly confined to defence orders which represent about a fifth of the group's output; if it does, the case for maintaining a dividend of 15 per cent on the increased equity capital of £5,308,097 will hardly be ignored.

*

Associated Electrical.—The value of deliveries by the AEI group to its customers in 1951 amounted to £61 million, compared with £55 million in 1950; simultaneously the group's trading profits advanced from £8,440,000 to £10,321,000. Part of these increases may merely reflect higher prices, but it seems probable that there was also a genuine expansion in sales. With orders in hand, some with delivery dates in 1955, worth over £135 million, the need to expand production and productive capacity readily explains last month's offer of 2,217,649 new £1 ordinary shares to shareholders. The new money will be quickly absorbed in financing heavier stocks, in helping to meet the cost of capital extensions (upon which about £5.5 million will be spent in the next three years), and in repaying bank indebtedness that stood at just over £2 million at the end of the year.

Despite the £6.6 million raised by the new issue, substantial sums have still to be ploughed back to help to finance future developments and to provide against the increased cost of replacement; last year, £1,250,000 (against £950,000) was set aside for this latter purpose over and above the £880,000 (against £810,000) provided for depreciation. Once the tax collector has gathered in £5,400,000 (against £3,960,000) the "net profit available for distribution" has therefore risen only slightly, from £2,496,000 to £2,524,000 and an ordinary dividend of 20 per cent is again to be paid on the old capital. An order book of £135 million is almost sufficient guarantee in itself that the directors should be able to live up to their own expectations and pay a dividend at the same rate on the new capital of £8,870,596 in 1952. The market's confidence in the future prosperity of the group is reflected in the comparatively low yield of 5½ per cent that AEI's £1 ordinary shares offer at the current price of 72s. 6d.

*

Tate and Lyle.—A breakdown of receipts and expenditure included in the full accounts issued by Tate and Lyle indicates that the margin of profit earned on turnover last year was relatively slight; it was probably still slighter the year before. Sales in the year to September 29th last brought in nearly £99.3 million, compared with a gross turnover of about £84 million in 1949-50. But once £83 million (including duty of £12.7 million) had been spent on raw materials and another £12.7 million on operating costs of all kinds, and once provision had been made for plant renewal and depreciation, gross profits were only £2.8 million; of this £1.8 million was earmarked for taxation and £551,250 went to shareholders for the maintained ordinary dividend of 20 per cent. Obviously the income that accrues directly from sugar refining is of paramount importance to shareholders in Tate and Lyle, but it would be interesting to know what margins of profit are earned by Silvertown Services, the company that Tate and Lyle hived off to take care of its transport requirements. All that can be recorded is a jump in the Silvertown group's trading profits from £571,875 to £967,895. Not the least surprising fact thrown up by the new income analysis is that Tate and Lyle earned nearly £46.4 million from exports, representing about 47 per cent of gross receipts.

	Years ended Sept. 30, 1950	Sept. 29, 1951
Earnings :—	£	£
Trading profit	3,052,558	3,723,868
Total income	3,119,249	3,784,439
Depreciation	500,227	729,455

General reserve	594,000	350,000
Added to carry forward	*Dr. 244,086*	20,028
Balance sheet analysis :—		
Fixed assets, *less* depreciation	8,429,025	8,783,037
Net current assets	3,009,447	3,312,472
Stocks	4,920,716	6,161,819
Cash	36,451	37,169
Reserves	4,030,328	4,400,266
Ordinary capital	5,250,000	5,250,000

15s. ordinary stock at 52s. yields £5 15s. per cent.

A rise in the book value of stocks from £4,920,716 to £6,161,819 has imposed a further strain upon liquid resources; cash balances total only £37,169 (against £36,451) while bank and other short-term loans to the company have risen from £1,952,000 to £3,044,000. Apart from this unwelcome sign of strain—all too familiar in the balance sheets of leading British companies—the full accounts once more justify the blue chip standing that the 15s. ordinary shares enjoy.

Statistical Summary

EXCHEQUER RETURNS

For the week ended March 1, 1952, total ordinary revenue was £118,217,000 against ordinary expenditure of £103,852,000 and issues to sinking funds £3,333,000. Thus, including sinking fund allocations of £25,016,000, the surplus accrued since April 1, 1951, is £403,622,000 compared with a surplus of £769,546,000 for the corresponding period of the previous year.

COMPANY MEETINGS

BANK OF LONDON & SOUTH AMERICA

LOWER VOLUME OF UNITED KINGDOM'S EXPORTS

LIMITED MARKET FOR TEXTILES AND CONSUMER GOODS

MR FRANCIS M. G. GLYN ON CONDITIONS IN LATIN AMERICA

The ninetieth Annual General Meeting of the Bank of London & South America Limited will be held on April 1st in London.

The following is an extract from the circulated statement by Mr Francis M. G. Glyn, the chairman :—

In my Address last year I described British shipments to Latin America during 1950 as disappointing in view of the devaluation of sterling, the primary object of which was to stimulate exports. The volume of those shipments was in fact about 10 per cent higher than in 1949, but expressed in dollars their value was $70 million lower. The picture for 1951 is still less encouraging. The apparent increase in our exports to Latin American countries in 1951 over 1950 in terms of sterling is more than accounted for by the increase in their prices ; if the price factor is eliminated these exports fell in volume by 10 per cent compared with 1950 and were no higher than those of 1949.

UNITED KINGDOM TRADE DEFICIT

I would also draw your attention to another aspect of our trading with Latin America. Between 1949 and 1951 the value of our imports from Latin America rose from £184 million to £334 million. The greater part of this increase is attributable to price, since the volume rose by only 14 per cent. This rise in import prices, when related to the much smaller increase in export prices, shows that the terms of trade had moved strongly against us by 1951. A given amount of our exports to-day probably buys no more than three-quarters of the imports from Latin America that it bought in 1949. Thus, in spite of an increase in the adverse balance of our Latin American trade from £48 million in 1949 to £171 million in 1951, we have obtained additional imports worth but £40 million at 1951 prices—the volume of our exports today probably buys no more in each year. There is little need for me to stress the significance of this movement to the economy of the United Kingdom.

CAUSES OF LAGGING EXPORTS

It is not my intention to consider here the purely internal influences affecting the level of our exports ; this has been done fully and adequately elsewhere. I wish to describe, however, the influences which have prevented us from selling more in Latin America. The problem at present is this—that we cannot sell as much as we would like of those goods which we have available, while other goods, which are urgently required, we cannot supply. It is well known, for instance, that British textiles and some other consumer goods are at present available for sale abroad if buyers can be found. Argentina and Brazil, two of our great textile markets in the past, have not for some time allowed foreign exchange resources to be used to buy abroad large quantities of consumption goods, especially textiles. This situation is due to the emergence of local textile industries and their need of protection, as well as to the policies pursued in these countries, by which available exchange tends to be diverted to the purchase of capital goods. In the last few years Argentina and Brazil have thus ceased to be large-scale markets for British textiles, and they are unlikely in the future —the truth must be faced—to revert to this position. The import requirements of fast-developing Latin American countries are changing more and more from the consumption goods of the past to industrial and agricultural machinery, transport equipment and many other types of heavy capital goods, chemicals and fuel.

AMERICAN ACCOUNT COUNTRIES

It would not be out of place again to make a plea for more attention to be paid by British exporters to some of the countries of Central and South America, particularly American account countries under the terms of present United Kingdom exchange regulations, exports to which are equivalent to dollar exports. Of these countries—apart from the United States itself—Colombia is the largest in which your bank operates, though equally important from the economic point of view is Venezuela ; others are Ecuador, El Salvador, Guatemala, and Nicaragua. Coffee is their main export except in Ecuador, where it is normally exceeded by cocoa, and in Venezuela, in which it has been reduced to insignificance by oil. They are consequently all prosperous at the present time, since for a considerable period now coffee has been giving consistently high returns, and they are in a position to purchase abroad on a liberal scale. In none of them is there exchange control worthy of mention (with the exception of a prohibited list of imports into Colombia). The markets of these countries, though limited in size, are therefore wide open to the entry of competitive goods from abroad.

But are British goods competitive ? In quality they are probably unmatched, and in price they doubtless compare favourably in most lines with at least the American equivalent. But in sales technique, knowledge of the market, servicing, supply of spares, adapting designs and materials to the need of the market, eagerness to sell and delivery dates we are continually being told that we are behind the United States. Moreover, in spite of the 1949 devaluation of sterling, we are by no means having it all our own way now even in the matter of price. Reports are received that we are being much undersold by some countries, particularly by Western Germany and Japan. While our exports during 1951 have been static or declining, the German contribution has been increasing by leaps and bounds. In 1951 Germany sent exports to Latin American countries to the estimated value of $370 million, compared with $153 million in 1950 and $32 million in 1949.

INVESTORS' DIFFICULTIES

The would-be investor in Latin America has a treble risk to run. He must contend not only with the economic factors involved in the investment itself but also with possible difficulties of remittance ; and even if the risks involved on both these points are assessed favourably he must still consider the political climate of the country in which he is placing his funds. Young countries often regard the development by foreign capital of their resources—which may be vast and untouched—as the one hope of economic progress and of raising the standard of living of their peoples. But as time goes on the benefits which have accrued and still accrue to the country from the foreign investment are forgotten by its people and propaganda arouses feeling against the foreign investor, who has often been made a scapegoat on which to lay the blame for a country's economic or political difficulties and mistakes. It is forgotten that the original investment was a venture in the success of which both the investor and the country concerned shared and still share, and that the great wealth produced by a successful enterprise, as well as the secondary activities arising therefrom, would in all probability not have been created but for the assistance provided by foreign funds.

RESTRICTIONS ON REMITTANCES

Remittances are now legally restricted both in Argentina and Brazil—in the former to 5 per cent and in the latter to 8 per cent of the registered capital investment. The value of these remittances must be judged against the risks that the foreign investor takes of losing his investment, and the higher returns that local investors expect and receive upon their ventures. It must also be remembered in the case of Brazil that earnings over 8 per cent cannot now be ranked as foreign capital entitled to the right of remittance. When these factors are taken into consideration there can be little hope that such measures to restrict the return on foreign capital investments will attract more funds to these countries. This is particularly the case, since there is always a danger that, owing to shortage of foreign exchange or other reasons, long periods will occur—as they have done in the past—during which no remittances of any sort are sanctioned.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The totals of the balance-sheet now amount to £170,915,045, compared with £165,885,093 a year ago, an increase of over £5 million. It will be appreciated that by applying the exchange rates as shown in the report to the relative foreign currency items for balance-sheet purposes, variations in the equivalent sterling amounts have arisen which preclude an accurate comparison between the component items at December 31, 1951, and the corresponding amounts in 1950, but it would be fair to say that the general effect of these variations has been to reduce the real increase.

The profit and loss account discloses a net profit of £359,871 for the year under review, compared with £82,749 for the three months ended December 31, 1950. It will thus be seen that our earning capacity has been well maintained, and that the additional capital which you provided last year has contributed towards this end.

The interim dividend of 2 per cent, less income tax, paid last August absorbed £53,025, and after transferring £200,000 to contingency reserve, your directors now recommend the payment of a final dividend of 4 per cent, less income tax amounting to £106,050, making for the year a distribution of 6 per cent, less income tax, on the issued capital of £5,050,000.

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and twenty-first meeting was held on March 6th in Edinburgh, and in the absence, through illness, of the President, the Right Honourable The Earl of Stair, KT, DSO, the chair was taken by Mr J. N. Shaw, CA, chairman of the board of directors.

Mr Shaw, in the course of his remarks, said:

The report and accounts in your hands show that the Society's affairs progressed satisfactorily during 1951. Perhaps the most striking feature of the year is to be seen in the large increase in new business, bringing with it a corresponding increase in our premium income. My predecessor in office, in his speech last year, drew attention to the fact that for the first time our premium income had exceeded £1 million. The figure was £1,007,000. As you will see from the report the premium income for 1951 was just short of £1,220,000—a substantial increase indeed. Net new sums assured increased from £3,402,814 to £4,342,300; these figures include group life assurances amounting to £98,224 and £574,816 respectively.

The funds have increased by nearly £600,000, and the total assets shown in the balance sheet now exceed £16 million. The effective gross rate of interest earned on the funds over the year was £4 19s. 10d. per cent. I think that the corresponding gross and net rates for the past three years will interest you. They are as follows:

	1949	1950	1951
	%	%	%
Gross	£4 14 1	£4 18 7	£4 19 10
Net	£3 10 9	£3 13 4	£3 14 6

We may regard this recent improvement in our rate of interest with considerable satisfaction. On the other hand, there is a material increase in commission and expenses of management. The extent to which this is related to the improvement in our new business is a necessary factor in healthy growth, but in part, of course, the increase is due to inflation and to this extent it is a matter over which we have little control.

FAVOURABLE MORTALITY EXPERIENCE

Claims by death are some £40,000 less than the previous year at £323,584. The year's mortality experience has been excellent and the results are about 43 per cent better than allowed for in the actuarial tables which we use in our calculations.

Although there has been, as you are all well aware, a substantial general fall in the market values of most classes of investments during the year, there is, however, a useful margin on the right side between the market value of our Stock Exchange securities and the value at which they appear in the balance sheet.

I mentioned earlier that last year our group insurance sums assured exceeded half a million pounds; in addition, we arranged pensions amounting to nearly £150,000 per annum. The great merit of group life assurance and pension schemes is that they can be arranged for companies and firms of any size, large or small, and can usually be adapted without difficulty to meet the particular requirements of any employer. One further point, which also is perhaps not generally appreciated, is that it is possible, if a firm so desires, to make arrangements which will cover not only employees, but also existing pensioners. I strongly recommend any member who is interested in these questions to give us the opportunity of advising and assisting him.

The adoption of the report and accounts was carried unanimously.

JOHN WHITE FOOTWEAR

UPWARD TREND OF SALES

RECORD EXPORTS

MR JOHN WHITE'S STATEMENT

The eighteenth annual general meeting of John White Footwear, Limited, was held at "Prospect House," Higham Road, Rushden, Northamptonshire, on March 6th, Mr John White (chairman and managing director) presiding.

The secretary (Mr L. W. Bradshaw, FCCS, FIAC) read the notice convening the meeting and the auditors' report.

The following is the chairman's circulated statement in respect of the company's trading year 1951:—

I am very pleased once again to present my report to you, and to make a general review of our progress to date.

FINANCE

The group profit for the year under review before charging depreciation is £268,009, which is within £2,490 of the corresponding figure for the previous year. As shown in the separate schedule to the accounts, capital expenditure of £71,894 has been incurred during the year and, as in previous years, full depreciation has been written off. At £36,365 this is some £14,000 greater than the depreciation charge last year and accounts for the slight decrease in the group net profit.

The consolidated balance sheet shows an increase of £300,000 in our stock position. This is due to market conditions, to which I shall refer later, although since the date of the balance sheet a considerable reduction has been made. A further £50,000 has been transferred to stock reserve, bringing this figure to £100,000.

The Treasury has given consent to the capitalisation of reserves amounting to £94,083 5s. for the purpose of making an issue of bonus shares to ordinary shareholders in the proportion of one share for every two ordinary shares held. It is recommended that the balance on the excess profits tax postwar refund account, together with £39,064 5s. of the share premium account, be used for this; and accordingly an extraordinary general meeting has been called to follow the annual general meeting to pass the requisite resolutions.

PRODUCTION

The report will have conveyed to you that 1951 has again shown an upward trend in sales, and the total pairage produced has also been considerably increased. That there is no corresponding increase in profit is occasioned by the fact that the full rises in material and production costs were not passed on to our customers.

During the last few months of the year sales generally declined, and there was also some recession during this period from the former peak leather prices. This recession is not to any large extent revealed in the price of the manufactured article because the cost of almost every component used has been, and still is, rising rapidly. Steel grindery, as well as rising in price, is becoming extremely scarce. In addition, wages have been increased and provision has also to be made for an extra week's holiday with pay. Every practicable step is being taken to control the rapidly increasing costs of manufacture, as instanced by the installation of generators at our Newton Road group of factories, which will have the effect of offsetting to some extent the greatly increased cost of electricity from the grid.

LADIES' FOOTWEAR

A most important development this coming year will be the introduction of a range of ladies' walking shoes. These are in an advanced stage of preparation. Samples will shortly be in the hands of our representatives, and we shall have supplies in the hands of our stockists to coincide with the commencement of a striking national advertising campaign in a few weeks' time.

EXPORT

I am pleased to report there has been an increase in export sales of more than 100,000 pairs over 1950, making our performance in this field an all-time record. The development of the United States market is a particularly pleasing feature of this expansion. Our goods have proved themselves to be most acceptable to both United States and Canadian markets; and, when the plans we now have in hand come to fruition, considerably increased sales are visualised in these territories.

A visit was recently paid by our export sales manager to North America and the British West Indies, resulting in a considerable fillip to our sales. In spite of very much more competitive conditions now prevailing, export prospects for 1952 are very good. A fact that merits particular mention is that for every working week of the year, we made for overseas markets no fewer than 12,000 pairs of men's leather walking boots and shoes, every pair bearing the "John White" signature, which is becoming synonymous with good footwear throughout the world.

ADVERTISING

During the past year our large-scale national advertising has continued strongly to increase the public appreciation of our productions, and we have used our 50 million advertisements a month to publicise new lines and features.

During the coming year, advertising will also contribute to the introduction of a range of ladies' walking shoes. A striking national advertising campaign will commence in a few weeks' time, and thereafter every suitable method of advertising technique will be employed in support of this new venture.

Our efforts overseas have also been supported to the full by our advertising department; by the use of press, radio, display material and other media. More than 14 overseas territories are constantly serviced in this way.

PROPERTY AND PLANT

During the year under review, many important additions and alterations have been made as follows: Our Manton Road, Rushden, production unit has been converted, so as now to give us an additional capacity for approximately 5,000 pairs weekly. New buildings and stockroom at Hazelwood, Rushden, with a floor area of 7,000 square feet. At Prospect House, Rushden, a new directors' room and conference room have been provided. Land has been acquired in Shirley Road, Rushden, for extending our transport department. At our head offices at Higham Ferrers, a new sample room and waiting room. For our Newton Road, Rushden, factories—electrical generators have been installed—and plans are in hand for further generators in other production-units.

The total productive covered floor space of our factories is now about 4½ acres. The whole of the equipment and machinery throughout the organisation is modern in design and is being constantly kept up-to-date and maintained at the highest level of efficiency.

TRIBUTE TO STAFF

I would like to conclude by saying that our progress has been made possible by the loyal and able support of our workpeople, managers, sales staff and executives to whom I give my sincere thanks. Finally, I am sure everyone will be pleased to learn that the New Year has opened in a most promising manner.

The report and accounts were adopted; the proposed final dividend of 30 per cent, less tax, making 38½ per cent, less tax, for the year, was approved; the retiring director, Mr B. M. Lindsay Fynn, BCom., FCA, was re-elected; the remuneration of the auditors, Messrs W. J. Thompson and Co., was fixed, and at a subsequent extraordinary general meeting the proposed bonus issue of one share for every two held was sanctioned.

SECOND BRITISH ASSETS TRUST, LIMITED

SATISFACTORY RESULTS— INCREASED EARNINGS

MR ALASTAIR C. BLAIR'S REVIEW

The seventy-third annual general meeting of the company was held at Edinburgh on March 6th, Mr Alastair C. Blair, chairman, presiding.

In moving the adoption of the report and accounts, the chairman said: Since the last annual meeting Mr W. H. Fraser has resigned from the office of chairman of the company and I have been appointed in his place. While Mr Fraser presided over us the company did very well and we owe much of our present prosperity to his untiring energy and skill. Fortunately he still remains with us as a director and we continue to benefit from his experience and his advice.

The company's investments in USA and Canada now represent 36 per cent of our total valuation. Part of the increase in this figure is caused by our having bought more dollar investments: part reflects the greater rise over the year of American investment values as compared with those of UK. As in previous years the valuation does not include the premium ruling in London.

YEAR'S RESULTS

From the revenue account you will see that our income still continues to rise. Total income is £238,576 against £205,503 last year, and the net earnings for the ordinary capital have risen from £65,150 to £79,348. We feel that on account of the capital gearing of the company, percentage figures for earnings and dividends on the ordinary stock are sometimes misunderstood, and we have decided accordingly to state them in this report and in future in terms of shillings and pence per stock unit of 5s. In doing so we are coming into line with American practice, which we think is more satisfactory.

On the present basis of profits tax, which however may be altered, the company will not become liable for some years, because of past allowances.

In all our present uncertainties, it is difficult to forecast what the future may hold, but our estimates indicate that we should be able to recommend the same rate of dividend at this time next year.

SCHEME OF ARRANGEMENT SANCTIONED

Since the report was issued, the Court of Session has sanctioned the Scheme of Arrangement which had been approved by the holders of the different classes of capital and by the company at the meetings held on December 27th. The increase of the company's capital to £1,200,000 by the creation of 200,000 new ordinary shares of £1 each has therefore become effective, and the voting rights and borrowing powers are now as set out in the Scheme of Arrangement. Prints of the Memorandum and Articles of Association as amended will be available for those who require them at an early date.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

RECORD NEW BUSINESS

In presenting the 114th annual report of The Scottish Provident Institution at the meeting on March 4th, the chairman, Mr R. Y. Weir, OBE, CA, referred with pleasure to the record new business of the year 1951.

He pointed out that although 1949 and 1950 had each produced a new high record, the figures for 1951 exceeded the 1950 figures by more than one third. He remarked that such an increase was notable even in a year when life assurance companies generally had reported larger new business figures and went on to consider some of the reasons for the general increase. He observed that, although part of the increase could be accounted for by the fall in the value of money, the higher level of industrial production had led to larger personal incomes and that many persons now enjoying an improved standard of living were learning the virtues of saving and the value of life assurance to that end. He looked for a considerable extension of life assurance business in that field. The importance to the country of real saving was becoming more widely understood today and institutional saving had in recent times been the only method showing positive results.

He also referred to arrangements which the Inland Revenue authorities were prepared to approve for the provision of pensions by way of life assurance and to the new business which had been secured from this source. On this technical subject the services of the Institution's representatives were available at all times and he could promise ready assistance and skilled advice.

SUBSTANTIAL ADDITIONS TO FUNDS

In reviewing the accounts for the year, Mr Weir made special mention of the fact that, for the first time in the institution's history, the premium income had exceeded £2 million and the net interest income £1 million. The interest income represented an improved yield of £4 15s. 3d. per cent gross or £3 14s. 1d. per cent net after deduction of income tax, calculated upon the total funds, including the general reserve fund. The claims and other outlays for the year had been within the estimates and it was satisfactory to know that the year's operations had resulted in an increase in the total funds of nearly one and three-quarter million pounds to over £30 million, the highest figure so far attained.

In closing his speech, the chairman emphasised the special strength of well-managed life assurance funds even in times when there had been a general reduction in the market value of securities. The institution had still a very satisfactory margin between the market prices of Stock Exchange securities and the values at which they stand in the balance sheet, and this surplus, of course, formed a valuable reserve against the possibility of further depreciation.

The report was adopted.

ALLIED LEATHER INDUSTRIES

UNSETTLED TRADING CONDITIONS

The fourth annual general meeting of Allied Leather Industries, Limited, was held on February 29th at the Grosvenor Hotel, Victoria, London, S.W., Mr H. G. Barlow (chairman and joint managing director) presiding.

The following are extracts from the chairman's circulated statement: As a result of the exceptionally good trading conditions in the first nine months of the year, the group trading profit is £150,990, compared with £85,997 last year, and the net profit, after taxation, amounts to £91,956, compared with £28,073.

The directors recommend a final dividend of 7½ per cent on the ordinary stock, making 10 per cent for the year. In view of the increased profit, your directors might with justification have increased the ordinary dividend but, in view of the extremely unsettled conditions obtaining in the hide and leather markets at the present time, they have thought it wiser to set aside £50,000 to contingencies reserve, leaving a balance of £4,917 to be carried forward. The balances in subsidiary companies have increased during the year by £25,554, making the total profits carried forward to next year £56,807 as against £26,785 brought in.

Last year I pointed out that we were trading on a continually rising commodity market. In fact, sales continued to expand until the end of April, when an easing of hide prices made buyers more cautious. There have followed months of continually falling hide prices, and until the stocks built up through buyers over-purchasing in the early part of 1951 have been absorbed we cannot expect to return to more normal business.

PURCHASE TAX HANDICAP

Trading in leather goods continues to be made doubly difficult by the high rate of purchase tax applied to our products. As other countries develop their industrial capacity it is increasingly obvious that we in this country will have to depend more and more upon design and craftsmanship, and I am at a loss to understand a policy which, so far from encouraging the development of craftsmanship (and I am not here referring to leather goods alone), penalises it, in nearly all cases, by singling out the resultant product for the highest rate of purchase tax. This encourages a swing toward mass-produced articles (using cheaper or substitute materials), which attract a substantially lower rate of purchase tax, but which are becoming increasingly difficult to export in competition not only with the vast mass-production facilities of the USA, but also with Japan.

Although we have had our fair share of the market so far, it is impossible for me to attempt to throw much light on the future with trading conditions as uncertain as they are and the dark cloud of further taxation on the horizon.

The report was adopted.

MENTMORE MANUFACTURING COMPANY, LIMITED

INCREASED SALES

The sixteenth annual general meeting of this company was held on February 29th in London.

Mr A. Andrews, chairman and joint managing director, in the course of his speech, said:—The profit for the year ended October 13, 1951, totalled £236,571, compared with £225,990 for the previous year. The corresponding net figure, after providing for income tax and profits tax is £103,815 as against £112,091.

The increase in turnover was maintained throughout the year. Our products sold remarkably well in home and export markets. Our increased sales have been spread over all our products. Your company introduced a ball point ink pencil some two years ago and sales have been phenomenal, but it is interesting to note that in addition to enjoying record sales for our pencil we have seen a corresponding increase in our sales of Platignum and Mentmore fountain pens.

According to Board of Trade figures, the overall sale of fountain pens manufactured in this country increased by 1,200,000 during the twelve months ended October 31, 1951. This period practically coincides with our financial year. Our sales increased by 1,100,000 and so we were responsible for practically the whole of the overall increase in fountain pen sales in this country. Our export figures increased considerably, and in fact the proportion of export sales was rather higher than anything we have achieved in the past.

The report was adopted.

GOVERNMENTS STOCK AND OTHER SECURITIES

INCREASED DIVIDEND

The eightieth annual general meeting of this company was held on February 28th in London.

Mr H. C. Drayton (the chairman) presided, and, in the course of his speech, said:

For the year under review our gross revenue totalled £175,600 as against £151,800 last year.

Your directors recommend a dividend of 9 per cent on the deferred stock, and propose that £9,000 be used to write down investments, leaving a balance of £10,600 to be transferred to revenue reserve account. That account will then stand at £104,800 which at the present rate of Income Tax is equivalent to 31.3 per cent on the deferred stock. Shareholders will also recollect that this 9 per cent dividend which we are recommending is payable on a larger capital. Although we only had the use of that money for nine months, shareholders are receiving a full year's dividend and at an increased rate over the previous year.

There is no need for me to enlarge upon the difficult times and I do not, particularly at this meeting, wish to point out to the Government, as I have done a great number of times, how things can be put right, i.e., by decreasing the number of civil servants and thus reducing taxation. Nevertheless, we have got these difficulties ahead of us and I must ask you to excuse me from telling you what our revenue is likely to be this year. However, I can with confidence say that you can look forward to the maintenance of the present dividend of 9 per cent.

The report was adopted.

CROWN AGENTS FOR THE COLONIES

COMMERCIAL OFFICER required by the Government of Gold Coast for the Department of Commerce and Industry for two tours of 18 to 24 months in the first instance. Salary according to qualifications and experience in the scale £992 to £1,335 a year, including allowances. Outfit allowance £60. Free passages and liberal leave on full salary. UNITED NATIONS is seeking statisticians for immediate or future appointment at United Nations Headquarters, New York. Candidates should be University graduates in Statistics or in Economics, Mathematics or Sociology allied with Statistics. Preference will be given to candidates with higher degrees or with practical experience in Statistics.

Facility in English is essential and working knowledge of either French or Spanish is desirable.

Entrance base salaries range $4,250 to $5,750 gross equivalent to $3,600 and $4,800 free of all taxes, plus cost of living and other allowances.

Send full particulars including age, nationality and record of employment to Recruitment Section, Bureau of Personnel, United Nations Headquarters, New York City, U.S.A.

Applications which do not meet minimum requirements will not be acknowledged.

AN important industrial organisation in London area requires an experienced Investment Analyst, aged 30-37, competent to supervise a large investment portfolio. Must have a sound knowledge of economics, finance, investment and Stock Exchange procedure, backed by some years' practical experience with a finance house or similar organisation. An accounting qualification is desirable but not essential. Salary approximately £1,500, dependent on qualifications and experience. Pension scheme. Applicants should state (in confidence) present position and salary.—Reply to Box 879, quoting reference A1.

EDITORIAL ASSISTANT required by London oil periodical. Languages, also Degree including Economics essential: knowledge of international trading desirable. Details of qualifications, experience, etc., to Box "FE/79," c/o 95, Bishopsgate, E.C.2.

ABLE ADMINISTRATOR (36), seeks post such as Director/Senior Executive leading Trade or Professional association. Admiralty staff and destroyer captain in war: then head of department in large industrial firm; now in third year key temporary post Whitehall concerned economic/industrial affairs. Would start about £1,500 if scope, prospects attractive.—Write Box 900.

IF you appreciate beautiful Gold and Silver Coins in finest condition, you cannot afford to miss our selection of choice specimens. Personal attention given to postal enquiries.—L. S. Forrer Ltd., 178, Piccadilly, London, W.1. (Regent 6974.)

SOLICITOR, specialising manufacturing and patent agreements and general/company work—five years with leading City firm—present salary £1,200, former staff officer, seeks secretarial or executive post in industry.—Box 898.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations: B.Sc. Econ., LL.B.; and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal tuition for Prelim. Exams. and for the professional exams. in Accountancy, Secretaryship, Law, Sales Management, &c., and many intensely practical (non-exam.) courses in commercial subjects.

More than 50,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request, mentioning exam. or subjects in which interested to the Secretary.

METROPOLITAN COLLEGE
(G3/2), ST. ALBANS *or call 30 Queen Victoria St., London, E.C.4.*

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. Postage on this issue: Inland and Overseas 2d.—Saturday, March 8, 1952.

once again, is unquestionably right, however much trouble it may cause to the road transport industry, and however much capital the Opposition (which would almost certainly have done the same if it had remained in office) may be able to make out of the subsequent increases in fares. And lastly, if any money were properly left over for concessions after these changes there can be no doubt that Mr Butler was right to concentrate it on the income tax, and in particular on those features of it that affect most severely the incentive to effort. Some will regret that he raised the starting point of income tax instead of lowering the starting rate—to remove two million people altogether from the ambit of income tax is not, at this juncture, an unmixed gain—and others will wish that he had found it possible to raise the upper limit of the earned income allowance—the sudden jump in the marginal rate of tax on earned incomes, from 7s. 4¾d. in the £ just below £2,000 to 11s. 6d. in the £ just above £2,025, is fully as severe a deterrent to effort and enterprise as any that affects weekly wages. But these are relatively minor criticisms beside the important point that the relief was properly concentrated on direct taxation.

★

Where there is so much to praise, it may seem churlish to cavil. Politics is, after all, the art of the possible, and the government's narrow majority is hardly an encouragement to boldness in imposing burdens on the electorate. Yet if this were to become the only test of a minister's performance, the standards of public life would soon be lowered. Judged by the objective tests of the nation's needs, it has to be said that Mr Butler's Budget, for all its merits, has two grave defects—one which affects the health of the British economy in the longer run, the other bearing directly on the battle for the pound that is now being waged.

In the short run, it does not greatly matter what forms of expenditure are cut, provided the total of all forms is brought down within the nation's means; capital cuts are, within limits, interchangeable with cuts in consumption. But in the long run it matters very much indeed what is cut. To leave consumption alone and balance the accounts by drawing on stocks and by restricting capital investments is obviously the easier course, and to pursue it for an isolated year or two may not do much harm. But it is no less obviously a policy of sacrificing to present comforts the hope of progress in the future. It is astonishing to see a Conservative Chancellor following the socialist precedent and treating capital as the obvious whipping-boy of economic policy. Britain may by now be an anti-capitalist country in the sense that the rich man who lives on the fruit of invested capital is no longer a popular figure. But it cannot possibly afford to be anti-capitalist in the sense of refusing to encourage, foster and cultivate the steady growth of productive capital. Capital is what industrial nations live by; it is what sustains the standard of life their peoples can enjoy. One expected the Conservatives to make a start towards correcting the vulgar prejudice against capital, to encourage thrift and stimulate investment; it is very surprising to find Mr Butler protecting consumption at any cost to capital.

Nor is this all. Within the general neglect of capital, there is a special popular prejudice against the profits of enterprise. Here also one could have expected the Conservatives to try to correct their opponents' error. But they prefer to pander to it by imposing a new Excess Profits Levy which is indefensible in theory and will be arbitrary in practice. If heavier burdens on unearned income are necessary, they should have been imposed within the framework of the income tax, where they would affect all forms of unearned income and not pick out for differential punishment precisely that form of income that is most closely connected with enterprise and efficiency. It is sad to see an honest and realistic Budget tarnished by such a disingenuous attempt to steal the clothes of the Opposition.

★

The excess profits levy, however, is imposed only for the duration of the emergency. It may be held that even things that run contrary to long-term policy may nevertheless be right in an emergency. The argument would be more acceptable if it had not been trotted out so many times before and if a more definite term could be set to the emergency. It would be more tolerable if this latest additional levy on risk capital formed part of a balanced programme of sacrifice for all. But it does not—and this is the second and even more serious criticism of the Budget. It is not a grim budget, or an austerity budget. The reason why it is so unexpectedly popular is that nobody—save for the road transport industry and the ordinary shareholder—is being called upon for the sacrifices that everybody had been led to expect. Ever since they came into office, ministers have used the firmest language about their determination to do whatever was necessary to save sterling; the only meaning that the public could attach to these warnings was that further efforts and sacrifices were to be required—and the public, on the whole, was ready to make them. Mr Butler began his speech by announcing the most ominous figures of the drain on the reserves that have yet appeared; the obvious inference to those who listened to him was that the Budget was going to be even more severe than had been expected. Between these admonitions at one end of the speech and the concrete proposals at the other end, as Mr Gaitskell pointed out, there was the sharpest contrast. The reason why Mr Butler excited such jubilation on the benches behind him was that they thought the Budget would win them votes in by-elections which they had fully expected to lose. Yet it could almost be elevated into a general principle that, in a nation facing bankruptcy, a popular budget must be an inadequate budget. Once again a public that has been warned of imminent disaster has, in the event, been let down lightly.

That this psychology is, in present circumstances, dangerously wrong does not require reinforcement by any statistical demonstration. But the economic argument is almost as persuasive. The keystone of the Budget is Mr Butler's decision that enough resources can be made available for defence and exports in the coming year without cutting consumption below the level of the expiring year and that consequently the surplus on the Budget, reckoned on the conventional basis, of rather more than £500 million that he found ready to his hand, is large enough. A decision on this crucial point is compounded of a number of subsidiary judgments, and on nearly every one of these Mr Butler seems, to the outside observer, to have been determined to take an optimistic view. He seems to have underrated the volume of resources that will have to be shifted if the defence and export objectives are to be attained—the diversion of manpower was not so much as mentioned. He seems to have exaggerated the extent to which imports can be cut without reacting adversely on exports. He has put the prospective gain from invisible exports very high. He has taken a sanguine view of the probable increase in the total output of the country—certainly of the extent to which there will be an increase unmatched by a parallel increase in spendable incomes. Like Mr Gaitskell a year ago, he is relying heavily on rising prices to t consumption and allowing very little for the contrary effect of rising wage rates. On any one of these points, the Chancellor may well be right and his critics wrong. But when he strains for the favourable assumption on every one at once, the odds against his being right become formidably long.

★

Yet if ever there was a time to make quite sure that the job is done properly, it is now. The reserves leave desperately little margin for mistakes; and if the Chancellor was to run any risk, it should clearly be that of going too far. An excess of severity could be corrected; another excess of leniency might be fatal. Translated into budgetary terms, this means that Mr Butler should have reinforced his surplus by another £200 to £300 million. The ideal way to do this would have been to cut out the subsidies entirely, or almost so; in which case he could have granted his concessions on income tax and social security payments and still have had an adequate surplus. There is no reason why this should be considered politically impossible. After all, it was considered politically impossible, only a short time ago, to touch the subsidies at all, and by cutting them by 40 per cent. Mr Butler has incurred nearly as much odium as he would have had to bear if he had gone the whole hog. But if his colleagues would not have supported him in this, then at least the income tax concessions should not have been afforded. To have budgeted on these lines would not have elated Mr Butler's party; it might well have cost it votes. But it would have put the soundness of British economic policy, and the determination of the United Kingdom to do its part in saving sterling, beyond any question. As it is, the people have been taught once again not to take seriously any cries of "wolf" that may threaten to disturb their sense of economic security.

It was suggested last week in this place that Mr Butler had a unique opportunity to reverse the post-war drift of economic policy, and that the two primary tests of whether he had seized it would be whether or not he reinforced his surplus, and whether or not he cut the subsidies. He has passed one test, the smaller, and failed the other. The verdict on his Budget must therefore be a mixed one. He has done at least as well as any other post-war Chancellor of the Exchequer, and probably better. It is difficult to imagine either another Conservative Chancellor or any Labour Chancellor showing so much realism and courage. But all this is still less than the situation required. The opportunity has not, indeed, been wilfully disregarded. But equally it has not been firmly grasped.

SECRETARIAT LIBRARY 2 MAY 1952 GOVT.

Precedence in Defence

THANKS chiefly to Mr Churchill, the debate on defence in the House of Commons last week illuminated its subject as well as the quarrels within the Labour Party. The rearmament programme rests, as the Prime Minister emphasised, on the assumption that for the present the atom bomb in the hands of the United States will deter Russia from starting a general war. If that assumption were false, if war seemed imminent, the programme would be criminal folly in its inadequacy. Fortunately, Mr Churchill presumably chose his words carefully when he described American atomic power as "rapidly growing and already overwhelming"; he no doubt had in mind not only the rate of production of bombs but also the belief that the Russians' ability to check strategic bombing of their country remains weak. But it was a pity that he did not go on to define more closely the purpose and nature, on these assumptions, of the rearmament programme; the debate showed how widely they are still misunderstood.

The point of rearmament is that it would be foolish to rely on an ally's lead in one weapon, however dreadful and powerful, permanently to frighten the possible aggressor. It is by its nature a lead that may after a time slip away, or with the development of new weapons or new defensive strategies become irrelevant, at a surprising speed. The rearmament programme of the western countries is an insurance against this danger. It has two main purposes. It is, first, to build up over the next two or three years balanced forces strong enough to make general war look too costly for the Communists even if the West has no particular lead in atomic or other weapons. Secondly, it is to become strong enough to deter local aggressions, as in Korea, without using the atom bomb. The particular purpose of British rearmament, in this context, must be to make this island as secure as possible against air attack and to make a full contribution to the deterrent forces stationed in Europe, the Middle East and parts of the Far East.

In the past two years the politicians, anxious to present rearmament as the servant of large ideals, have put too much emphasis on the second part of this objective. Mr Churchill provided a proper corrective by treating it as an urgent response to dangers that directly threaten the lives and homes of the British people. Britain is not only a place to live in. It is a workshop, the centre of Atlantic communications, a bridgehead for American power and an essential part of the European defence system. To say that defence begins at home is therefore not selfish isolationism. That is out of the question. There is no land defence for Britain in Britain. To hold a fairly advanced line on the Continent is the essential condition for an adequate air defence of this country. The place for the British army, as well as for important units of the fleet and of the air force, is abroad. That is where they are. Of the army's eleven effective divisions, five are in Europe and six are spread over the rest of the eastern hemisphere. There are now no regular combatant units here at all.

In the circumstances this, disquieting though it is, is as it should be. The mistake is to imagine that as long as this shield is spread outside, strengthening the troops of allies, little more need be done here as a preparatory measure. Many people seem still to assume that if war should come, this country would have, as in 1939-40, a space to get its own defences in order while, at the least, a holding action was fought on the continent. In fact, one cannot suppose that the Russian strategists have ignored the obvious lessons of Hitler's failure to destroy or at least to neutralise British strength. If the Russians did march westwards, they would certainly seek at the same time to dislocate and disorganise the most important industrial targets that would immediately lie within range —the ports and cities of this country. Hitler tried, but too late. And it would be ridiculous to draw any conclusions from his failure without recognising the great size of the Russian air force, the possibilities of atomic bombing, the vastly increased effectiveness of mines laid from the air, and the rapid development of guided missiles which were in their infancy as recently as 1945. In another war, this country must expect to be at the centre of battle from the beginning, and to remain there even if western forces are able to maintain themselves on the continent.

If these are the tasks the inadequacy of present defences is patent. The main test to be applied to the rearmament programme is not whether it is too big or too little by some notional standard. Obviously it cannot meet within the next year or two all the minimum requirements for effective defence. The questions are whether, within those requirements, it puts first things first and whether it promises to carry those first things to some moderately satisfactory state within the next two years.

*

With eleven divisions overseas, Britain is already making in manpower an entirely fair contribution to the forces ready to meet local aggressions. It is urgently necessary to equip those forces with more Centurion tanks, with more modern weapons, and better vehicles. Tank production, at least, is reported to be "satisfactory and increasing," and much work has been done on the modernisation of the last war's anti-aircraft weapons and vehicles; production in quantity of new types is barely beginning or, in some cases, hardly in sight. There are, however, even more urgent tasks. Important as it is to increase the effectiveness of the army per unit, immediately it is even more important to increase the number of reserve units that Britain could quickly contribute to the defence of Europe.

As yet the number of national servicemen who have completed their full-time service and passed into the reserve army is only one-third of the 300,000 that will be reached in 1954. In the meantime, the recall for 15 days' training of "Z" reservists from the last war has proved to be more valuable than most observers had expected; it is rightly being repeated this year. But of the ten effective reserve divisions to which Mr Churchill looked forward—making a total army, with one extra regular division to be formed, of 22 divisions—only two could this year be ready for action within a few weeks. The immediate obstacle to making the reserve army more effective is a shortage not of equipment so much as of officers, warrant officers and NCOs—both volunteers for the reserve army itself and regulars to form the nucleus of the training staff. An imaginative policy to attract more part-time volunteers has yet to be devised. Much, however, has lately been done in all the services to attract more regulars by improving both pay and conditions of service, and a promising increase in recruitment has followed. The army now proposes to go further by offering a career engagement of 22 years from the start of service. It is essential for the country to understand that the conception of a well-trained and ready reserve army, which is the more economic alternative to a prolonged period of conscription, depends entirely on the attraction of a larger and highly competent force of volunteer regulars; whatever proves to be necessary to this end should be done without hesitation.

The manpower problems of the army are, however, of almost minor significance compared with the enormous tasks involved in making Britain somewhat more proof against attack from the air. There are four main forms of possible attack: bombing, minelaying, guided missiles, and air-borne landings. The last it would be technically possible to carry out from bases in Eastern Germany, before an enemy army began to move overland towards the Channel. Fortunately it is the danger against which some provision can be made most economically. Mr Churchill was able to report "rapid progress" during the past few months in giving a combatant value to the modern army's enormous administrative tail—to the 249,000 soldiers at depots and training centres in this country. All now have small arms and they have been organised into 502 mobile columns, which will gradually be grouped into larger units and presumably be given some support in heavier equipment. They will be strengthened by the seven additional, fully combatant battalions to be formed during this year by combing men out of the administrative tail. And they should also have important support from the reconstituted Home Guard—though it is too early to judge whether that will attract the numbers hoped for.

The Russian navy might well be able to put into the Atlantic twice as many submarines as the Germans ever did, but it is unlikely that they would be as efficient and it is probable that anti-submarine action would quickly be more effective than in the last war. Mines, particularly those laid close to the ports, would probably be a greater danger to convoys. Where the navy last year reported a total force of 63 minesweepers, with 41 more under construction, this year the strength is put at 146, with 65 more under construction (of which 35 are for inshore work). A volunteer force to watch for mines dropped near the coast is also being recruited. It is by no means certain, however, that sweeping of the most modern type of mine will be possible.

The main defence against minelaying, as against bombing and guided missiles, must be to prevent as many as possible of them from being dropped or launched. The four main instruments of defence are radar, anti-aircraft weapons, fighter aircraft, and bombers to attack the aircraft bases and the sites from which guided missiles come. Little information about the development of the first two has been made public. The inferiority of the British fighters now in service to the Russian MIG 15 is well known; it is less serious for defence against enemy bombers than for offensive operations. But the decision to give what Mr Churchill called "super-priority" to the production of the newly-designed fighters is plainly right on every count, though it does not mean that many will be in service next year. It would be a doubtful measure only if it meant delay in producing the new medium bomber, the Valiant; whatever is done to strengthen air defence as such, there is little doubt that far too many bombers and missiles may still get through unless the bases from which they come can be effectively attacked. It is more doubtful whether, among competing needs, the production of a heavy bomber should be given as much priority as it seems to have. But it is important to note that while the various aircraft programmes gather momentum, the RAF is drawing valuable strength from North American production—the F.86 for fighter command, the Neptune for coastal command, and the Washington for the medium bomber force.

The layman is bound to take the decisions of the service departments largely on trust. But as far as can be judged, it does look as though the pressing needs of defence are being met in a reasonable order. The priorities are about right. But there is no ground whatever for complacency about the speed at which the first things are being done first. The whole range of air defence—radar and new anti-aircraft weapons as well as aircraft—involves relatively light demands for metals and other materials. The narrowest bottleneck is the supply of labour to the factories making these things. The pace at which production can be increased therefore depends relatively little—in this most important section of the defence programme—on sacrifices of exports and industrial investment, which the state of the British economy genuinely will not permit. It depends primarily on the release of manpower by sacrifices of home consumption through a rigorous financial policy. If the politics of that were more bravely faced, the effectiveness of the military defence against air attack could be increased more quickly. Civil defence, unfortunately, is another question, which will be discussed in a further article.

Plus Ça Change

Perhaps there never was a country whose prospects, both immediate and remote, were so gloomy and perplexing as those of France. . . . She has three rival Pretenders to the throne—besides a numerous party who insist that there shall be no throne at all. There are the Legitimists, embracing the highest and most polished society in France, strong in fanatical attachment to an intelligible though unsound principle, and supported by nearly the whole weight of the priestly caste. There are the Orleanists, who include within their ranks the great majority of the commercial and financial classes, a vast proportion of the *bourgeoisie*, many of the chief officers of the army, and nearly all the eminent and experienced politicians of the country. There are the Bonapartists, thirsting for the re-establishment of the Imperial regime and the revival of the Imperial glories, strong in the support of the army whose soldiers have known no spoil and whose marshals have reaped no glory since Napoleon's dethronement;—strong also in the blind attachment of the peasantry, whose dull ear no name except Napoleon's has ever reached. Lastly, there are the Republicans of every shade and hue;—stern devotees of a theory; the poetical adorers of a phantom; the interested promoters of misrule;—the idle, who disdain to labour; the criminal, who live by plunder; the savage, whose element is uproar; and the anarchists who hate every Government because they have made themselves amenable to all. These are the hostile sections who, secretly or loudly, are warring for the possession of their country,—none of whom are able thoroughly to conquer, none of whom are willing frankly to submit. Each party, when in power, seeks to govern in a manner which it is impossible for the others tamely to endure; none are willing heartily to amalgamate; and none seem able to divide authority generously with their rivals. Whichever party chances to be uppermost for the time, no one for a moment dreams that the internecine and exhausting strife is ended. The struggle seems likely to be eternal.

The Red Army Quickens Step

IN last week's budget debate in the Supreme Soviet, one speaker sought to show the peaceful nature of Marshal Stalin's policy by claiming that in 1952 Soviet expenditure on arms would be much less than that of 1940. This was a somewhat remarkable statement; for Mr Zverev, the Finance Minister, had just presented a new defence estimate of 113.8 billion roubles, the biggest the Soviet Union has ever faced in peacetime, and almost exactly twice as large as the 1940 figure of 56.7 billion. The 1952 estimate is, indeed, bigger than that presented in 1942, when Russia was already a battlefield.

The value of the rouble has declined since 1940, while war has become more costly; and it is impossible to deduce from the new budget figures whether the Kremlin feels war to be nearer than it was in 1940, or further away. But the rapid expansion of the Soviet arms programme is seen clearly enough. The 1952 defence estimate is 18 per cent greater than last year's figure, 37 per cent greater than in 1950 and 70 per cent above the 1948 level. From the published figures alone it is not possible to detect any sudden acceleration of the upward trend which has marked Soviet defence spending since 1948.

Such an acceleration cannot, however, be ruled out. The Soviet government reveals no details of its expenditure, and it is thus very easy for it to transfer large parts of the cost of its arms programme to other budgetary headings. The heading "Defence" covers only the direct expenditures of the service ministries on the maintenance of the armed forces and the purchase of their arms at cost prices: it does not include the constitution of military installations or armament factories, which appear under "grants to the national economy." Moreover, it is clear from Mr Zverev's statements that the development of atomic energy is paid for out of the "social and cultural" funds; and the cost of the large para-military forces maintained by the Ministry of the Interior (MVD) appears under "administration and justice." The best available evidence suggests that in reality defence spending now amounts to not far short of a third of the budget; and it must be remembered that the Soviet budget, unlike those of the West, covers something like two-thirds of the whole national income.

What is clear, even from the published figures, is that the arms programme is being stepped up at a pace which gives little encouragement to the Russian people's hopes

In 1948 Soviet policy demanded of Germany reparations, demilitarisation, a ban on Fascism and a share in controlling the Ruhr. Admittedly, as western policy moved towards European integration and German rearmament, Soviet policy moved stage by stage towards proposals that would impede the formation of a European army within the North Atlantic Treaty Organisation, but always, it seemed, with the object of keeping Germany disarmed and with the hope that unity would gradually bring a powerful Communist party on to its political stage. Lately, Stalin must have felt that even if the European Defence Community came to nothing, an American alliance with an independent and rearmed Germany might be the desperate alternative. He, therefore, now offers the Germans independence, rearmament and a partnership—alliance is specifically excluded—based on trade. Von Seeckt and Radek must be stirring in their graves.

Perhaps the Americans gave the Russians the cue for this dramatic entry. They have recently proposed for Austria a new start: withdrawal of occupation forces by all four powers, and the formation of a national army. If that would get the Americans out of Austria, a similar proposal for Germany might get the Americans out of Europe. It is with this main purpose of Soviet policy in mind that the new proposals must be examined.

* * *

For the Record

During the Palais Rose talks which began this time last year the Soviet purpose seemed to be simply propaganda and frustration of western negotiations with Dr Adenauer. Then came an offer from East Germany by Herr Grotewohl which seemed to promise all-German elections and a peace treaty. To his discomfiture Dr Adenauer's government took him at his word, drew up an electoral law for free elections, and persuaded the western powers to ask the United Nations to find out whether free elections would in fact be possible in the two Germanies. The Uno committee set up to do this has been refused entry into the Soviet Zone.

Then a few weeks ago Herr Grotewohl tried to influence the French Assembly's debate on the European Defence Community by addressing to all four occupation powers a request for a peace treaty. When asked why he made no mention of all-German elections, he declared that the peace treaty was the vital matter; whether elections came before or after it was unimportant. The Soviet Ambassador in Eastern Germany replied by demanding a peace treaty on the basis of Potsdam, executed by an all-German government. This would have meant demilitarisation and only limited sovereignty for the new state. In other words, the Russians had apparently shelved their proposal for elections throughout Germany and were suggesting a treaty which would calm French fears of a powerful, reunited Germany more than western integration plans could hope to do.

Hitherto it has not been clear to every western mind that the Soviet alternatives to western policy for Germany were undesirable. In particular, the vision of a neutralised and demilitarised Germany has attracted many. These doubts are now removed; the "middle way" for Germany should now be seen to be an impossibility, and Moscow's motives should be clear. The western powers must reply to the latest Note, and they can insist once again that free elections, a united Germany and the retention of occupation troops might provide a basis for compromise with Moscow; but that a united Germany without occupation troops and free elections does not. It becomes more than ever important to bring about the European Defence Community; but that does not mean scrambling ahead at panic speed and pretending that the French Assembly and the Bundestag will be easily and quickly persuaded to accept it and the new contractual arrangements with Germany.

Lord Ismay for Nato

The North Atlantic Treaty Organisation now has a Secretary-General. Into the shoes prepared for Sir Oliver Franks steps, not Mr Pearson of Canada, not Dr Stikker of the Netherlands, by General Lord Ismay, hitherto Secretary of State for Commonwealth Relations. It would not immediately strike the eye that the same shoes would be likely to fit the two men, and Lord Ismay's particular qualifications and experience are very different from those of the British Ambassador in Washington. But the general has many advantages denied to the don.

He is a soldier whose repute is great across the Channel and the Atlantic. As head of the civilian organs of Nato he will be able to represent the civilians to Shape, and Shape to the civilians, each in their own language. Nato's most pressing problem is to reconcile its military with its civilian interests, and perhaps nobody could do it better than a general acting for the civilians. Secondly, Lord Ismay's strong link with the Commonwealth will bring more prominently into the scene the third leg of the tripod on which the British would like to see Nato rest, and perhaps not a minute too soon. Finally, Lord Ismay is the confidant and adviser of Mr Churchill. With his appointment the British Prime Minister is assured of a new and intimate view of affairs Atlantic and European, to the certain benefit both of the affairs and of the British Government.

Where Lord Ismay may find difficulties in his new job is in the slightly more remote, but no less important, non-military sphere. His functions include not only liaison with military headquarters but the control of the civilian secretariat (mainly concerned with economics and information), the chairmanship of the civilian representatives who are now going to sit in permanent session with the authority of the council itself, and who will determine how the organisation shall develop beyond its immediate, military, preoccupations. There is also much to do in the way of co-ordinating national delegations. These are functions which may well require more experience of civil administration, economics, and the intricacies of European and Atlantic politics than Lord Ismay himself possesses. But they need not present any difficulties that the appointment of a complementary deputy to the Secretary-General, preferably from one of the continental countries, could not overcome. With such support Lord Ismay could be a source of great strength and unity in what has so far been too diffuse an organisation. Without it he may be a harassed man.

* * *

Tory Social Reform

For the second year in succession a Chancellor of the Exchequer has made important changes in payments under the social services. But whereas last year Mr Gaitskell confined himself to the national insurance and assistance schemes, Mr Butler has proposed increases over a much wider range.

Mr Butler said that it was the Government's wish to help those whose needs were greatest, but he has not observed this principle in every case. Family allowances, which are to be raised from 5s. to 8s. a week, although payable irrespective of the parents' means, are in fact an efficient form of social service payment, since they are taxable. Similarly, the small increases proposed for public service pensioners will undoubtedly relieve genuine hardship. The higher basic rate of pensions for those disabled in war or industry has less justification—if the criterion is to be solely one of need. The majority of the 700,000 war disabled (of both wars) are in full-time employment. Their disablement pensions are, therefore, a tax-free addition to wages and salaries. The war disabled who are in greatest need are the 20,000 whose disability prevents them from working and the 18,000 who have to do work inferior to their old job. These, together

with war widows, could be effectively helped at a smaller total cost by increasing the unemployability and other supplements.

If this is true of war pensioners, who are a diminishing liability, it is much more true of those who draw benefits under the industrial injuries scheme—whose numbers will gradually increase. Here, again, a disabled person's benefit can be a tax-free addition to wages, and help should have been similarly concentrated on those whose injury or illness has caused them a real loss of earnings. If, however, industrial injuries had to be treated in the same way as war disabilities—as the trade unions have always insisted—the higher benefits ought to be paid for by higher contributions, on which a decision has yet to be made.

The new favours given to the industrial sick and injured make the contrast between their benefits and those drawn under the national insurance scheme even more marked than before. The basic industrial injury benefit will be 55s. a week. The basic national insurance benefit for the sick and unemployed will still be 26s. a week. Old age pensioners, however, will receive, if Mr Butler's proposals are accepted by industry, a uniform benefit of 32s. 6d.—the distinction drawn last year between the old and the elderly being abolished. This increase in pension, will be met by higher contributions from employers and employed. What is still unknown is the new rate of national assistance. If it merely takes into account the rise in food prices, it will presumably be raised from 30s. to 31s. 6d. a week. But the rise in other prices may well impel the National Assistance Board to go farther than this—with the result that national assistance, even without the rent allowance, may still be above the new rate of old age pension. The prospect of insurance and assistance indefinitely chasing each other upwards has not been avoided by Mr Butler's proposals.

* * *

Poll on the Budget

The Gallup Poll whose results were published in the *News Chronicle* the day before the Budget yielded some interesting evidence about public opinion on government spending and taxation; one fact has considerable political significance. Family allowances are by a large margin the social service which most people (32 per cent) would cut first and fewest people (9 per cent) would cut last; less than half as many (14 per cent) would cut food subsidies first, while those who would preserve them to the bitter end are only a few points behind those who would similarly give priority to housing. A social service that embodies a real transfer according to need apparently ranks much lower in popular esteem than an out-of-one-pocket-into-the-other piece of fiscal legerdemain "benefiting" all consumers indiscriminately. This must have been distressing news for the Chancellor. But a recognisable degree of altruism surely appears in the choice of betting and football pools as the most popular candidates for increased taxation; out of the 54 per cent who assigned first place to these, there must have been patrons of both, and the fiscal naïveté shown by reliance on such a source of finance does not detract from their public spirit.

More important, and more encouraging to Mr Butler, is the fact that the tax most frequently chosen for reduction was income tax; it was also next to the bottom in the list of taxes which people would choose to increase. Traditionally, direct taxation is fair taxation, the time-honoured method of soaking the rich, an impost on whose increase the People, the Common Man, could always look with an equanimity tempered, if at all, by malicious pleasure. Indirect taxation, on the contrary, was the wickedly regressive instrument of fiscal oppression for this same Common Man. The few years during which, with wage-rates rising and exemption limits and allowances comparatively stable, PAYE has brought home to the average wage-earner his status as a taxpayer, have evidently brought about a radical shift in this popular attitude—a shift that the Opposition would be wise to remember in their attacks on the Budget. It is a change that is likely to outlast the present ranking in popularity of government expenditures.

* * *

Watching for Restrictive Practices

The Board of Trade, in its annual report on the working of the Monopolies Commission, shows some doubt whether all the commission's recommendations will be effective. It says of the dental goods industry that "it is not yet apparent that the commission's criticisms of the industry's arrangements have been effective at all points."

The dental goods industry, the first of the three industries on which the commission has so far reported, was the only one for which an Order was made. This followed the recommendation, made perhaps in the innocence of youth, that exclusive dealing and collective boycott should be "prohibited." In its two later reports the commission's more cautious phrase was that "this should cease." To draft an order of this kind without leaving loopholes is certainly difficult. If industry will play ball, it is more satisfactory that informal settlements about changes in trading practices should be agreed between the industries and government departments concerned. This method is being followed for the cast iron rainwater goods and the electric lamp industries. It makes it possible to renew discussions if there is reason to think that the terms of the settlements are not being observed.

The Monopolies Commission, which has too much on its plate already, has no responsibility for seeing that its recommendations are carried out unless specifically asked to do so by the Board of Trade. Where an order has been made, its observance is a legal matter; but otherwise the task of supervision would normally be left to the interested departments. They may be able to perform it adequately while they have only two or three industries to watch. But will they be able to do so when a large number of industries have been asked to mend their ways? A special supervisory body may then be needed. At the commission's present rate of progress, this will not be a problem for some time. But the Monopolies Bill—now put off at least until the next session of Parliament—will speed up the work, presumably by allowing the commission to divide itself into panels. Probably, too, it will make possible horizontal investigations throughout industry of specified practices—the obvious first candidate being exclusive dealing, which is the practice complained of in most of some forty industries that have been suggested to the Board of Trade as ripe for investigation. To prevent such a practice on a wide scale would certainly be too much for the existing machinery of supervision.

* * *

Stagnation in Korea

The last few weeks have done nothing to make it any clearer whether the Communists mean to have a truce in Korea or not. As General Ridgway said on Tuesday, the talks at Panmunjom have reached a point where it is impossible to guess what will happen next. The United Nations representatives are unfortunately less able to force the pace than they were in the earlier stages of the negotiations last year. One reason has been that there has been almost no heavy fighting on the battle front since last November. This has removed the pressure that created even the little sense of urgency at one time detectable in Communist behaviour. It is notable that the American Budget Director, Mr Lawton, in testimony given in answer to Senator Taft's questions in the Congress economic committee at the end of January, con-

firmed that the United States budget for the year 1952-53 assumes that the fighting in Korea will be virtually over.

Another reason for stagnation in the truce talks is the trap into which the Americans have fallen on the question of prisoners of war. In order to get from the Communists the maximum number of facts about the prisoners in their hands, General Ridgway's command several weeks ago handed over the names of all prisoners captured by the United Nations. Now that many thousands of these men have elected not to go back—and the UN authorities have decided not to force them to go—even the release of the others is difficult. For once the exchange had been made, the Communists could check off on their lists the names of those who have not returned and order reprisals against their families.

Although the truce has stalled, so has the war, and there are a number of factors working against any return to large-scale fighting. One can be seen in the frenzied communist accusations that the Americans are waging bacteriological warfare, which suggests that the epidemics in North Korea may be serious. General Van Fleet, the commander of the Eighth Army, has lately said that he does not expect a communist spring offensive, though he could stave off any attempted break-through if it came. This kind of statement is always dangerous, as it may be suddenly and disastrously proved wrong. But because indefinite continuation of a state of neither peace nor full war may prove quite as difficult for the Americans and their allies to sustain as a renewal of all-out fighting, there seems a strong chance that the Communists may have chosen this tactic.

* * *

Prospects of Pinay

M. Pinay has won his majority by the remarkable number of 192 votes. The parliamentary Gaullists as well as the Socialists abstained in his favour. Yet another government of the centre has been confirmed in office. For the first time since General de Gaulle, the Prime Minister of France has a following in the country strong enough to influence his parliamentary position. It was this that made M. Soustelle say on Monday, "Gaullisme sans de Gaulle, c'est néant," and on Tuesday defy the General's express command by leading the parliamentary Gaullists to abstain. The great question is whether M. Pinay has acquired his popularity by firing the country's resolution or by lulling its fears. The present sources of his appeal are not entirely reassuring. There is, first, his own comforting, sensible and essentially bourgeois personality. He is the man with whom most Frenchmen would choose to face a crisis. Then there is his promise to keep down prices, and specifically his reversal of the decision to increase the cost of electricity by 10 per cent. Without wondering how it can be done, the public took this right to their hearts. Finally, there is his promise to give up the attempt to raise new taxes.

These are the reasons why he is being applauded in the cinemas, and why only the Communist deputies dare to vote against him. But this, alone, is not the programme which will save the franc. If M. Pinay is not going to raise new taxes, he can only steer the government into solvency by cutting expenditure, by greater public borrowing, and by increasing the yield on existing taxes.

Little government expenditure can be cut; little money will be lent to the government (though M. Pinay estimates the need at 400 billion francs in the current year) unless, for the first time in many years, Frenchmen can be persuaded that prices are not going to rise and the franc is not going to fall. This cannot happen unless taxes are paid in full. But if M. Pinay is going to stand by this, his most important and least appreciated promise, he must offend the salaried workers by granting an amnesty to the non-salaried who have not paid in the past. And he must offend the backbone of his own and the Radical party, since the main burden of tax enforcement must fall on the small businessman and shopkeeper. Is his popularity deep enough or his courage great enough? It may be, but it will demand more than the endearing traits of the "little man" which have so far been his main recommendation.

* * *

The Commonwealth Defends the Pound

The sterling area has gone into battle to defend the pound, but with different countries using diverse tactics. Indeed, it is clear that the plan of campaign discussed at the meeting of the Commonwealth Finance Ministers could have defined only the broad objective of bringing national payments accounts into balance. Australia's import cuts, especially of consumer goods, were designed so as not to discriminate against any particular country or currency area; but they will hurt the British more than anybody, for it is principally consumer goods that this country will have to offer this year. New Zealand, on the other hand, is controlling imports only from non-sterling countries, and for this purpose members of the European Payments Union are regarded as part of the sterling area. South Africa has made a general cut which will affect imports from non-sterling countries more than those from the sterling area.

The present bout of import slashing was begun by Britain last November. Although it is the easiest and quickest way of reducing a balance of payments deficit, it can have serious repercussions. A more permanent solution lies in expanding exports, and for Australia and New Zealand, at any rate, that means expanding agricultural production. A survey prepared by the Commonwealth Economic Committee* shows that their output has risen less, compared with the four years immediately before the war, than in Britain, Canada, South Africa, or even the United States. In Britain and Canada the agricultural labour force has been maintained or increased, more machines are employed and more fertilisers are used; whereas in Australia and New Zealand the labour force has tended to decline and its effect has been accentuated by a shortage of equipment. The steady rise in the price of wool from 1946 to last March encouraged their farmers to switch to pastoral farming; at the same time there has been, particularly in Australia, a development of secondary industries.

So long as Australia held large sterling balances, it was able to expand its industries without reducing domestic consumption, and the Australian people consumed a larger proportion of agricultural output. Recently those balances have been reduced to a dangerously low level, and if Australia is to get capital goods from abroad it must first build up an export surplus of foodstuffs. The government still hopes it can maintain favourable terms of trade by forcing Britain to pay higher prices for meat and dairy produce; but Mr Butler's cut in the food subsidies will mean that Australia, and other suppliers, can exact higher prices only if the British public is willing to pay them.

More Power for Hospital Boards

The Ministry of Health is gradually restoring to the regional boards some of the powers it took from them in its efforts to prevent the hospitals from overspending. In 1950, two big checks were imposed on hospital management committees. They were told to send to both the boards and the Ministry a monthly statement showing their actual expenditure under the various subheads—food, salaries, drugs and dressings and so on—compared with their estimates. The regional boards had to submit to the Ministry a similar monthly statement of their own expenditure.

* Review of Commonwealth Agriculture. *HMSO.* 7s. 6d.

The second check restricted the transfer of savings under one subhead to meet increased expenditure under another. For the first two years of the health service, management committees were able to make these transfers subject to the approval of the regional board; and provided the sum was not too large prior approval was often dispensed with. From 1950, however, transfer of savings had to have the permission of the Ministry of Health. Since the Ministry could not possibly know the individual circumstances of all the management committees, this would-be check on extravagance only resulted in penalising the economical committee and encouraging over-budgeting on all the subheads.

The Ministry has now decided that this power to approve transfers of savings should be restored to the regional boards—a step which was recommended by the Select Committee on Estimates last summer. Further, management committees will in future have to send their monthly returns of expenditure only to the boards, which in their turn will send to the Ministry a summary for the region as a whole. These changes are welcome for two reasons. First, they mark a break away from the centralised control over the hospitals which the Ministry had been building up. Fourteen regional boards are better able to control the finances of some 375 management committees than the Ministry. Their second merit is that, together with the simplified arrangements for estimating which came into force last autumn, they make hospital financing much more flexible. The Ministry has still some way to go before hospitals are given block grants and allowed to retain their unspent balances. But at least it has made a start.

Uproar Over Fares

The agonised protests against the increase of fares in the London area reflect considerable discredit both on the public intelligence and on the London Transport Executive. It is not the increase itself, following with a long lag on rising costs, which is discreditable; compared with most things, London transport is still cheap, and the increase was brought about by due process of law after the independent Transport Tribunal had heard and adjudicated upon the relevant evidence. What is discreditable is rather the executive's astonishing disregard of the need, before making so drastic and onerous a change in their charges, to explain to the travelling public why the change was necessary and how it was going to work out. Explanation was particularly necessary because the general rise in fares, reflecting increased costs, was being made the occasion also to remove historical anomalies by which some fares were relatively cheap even at the old level of costs. This ironing-out was overdue, and so was the tightening of the rules governing early morning fares. But public relations can seldom have been so abysmally mishandled by any corporation whether public or private. The executive had time enough in which to present and explain its case; it had its own advertising media, to say nothing of others, ready to hand; and it must have realised that the casual estimate of a 20 per cent increase would be so far out of line with reality for a large minority of its passengers as to be rather worse than no estimate at all.

Inept public relations, however, do not excuse the attitude that the last fortnight has shown to be typical of the London travelling public. It is an attitude often enough, though less vociferously, displayed in other connections: the belief in the Englishman's inalienable and heaven-bestowed right to get for less than cost anything whose full economic price seems to him inconveniently high. The campaign of protest has demonstrated all the unreason of the small child reviling the bad naughty table on which it has banged its head. It is true that for the traveller the collision is unavoidable, since his fare is far more often than not an essential working expense. That fact is not, however, the Transport Executive's fault, nor would it justify a subsidy largely payable out of the traveller's own pocket. It is a daunting thought that the uproar in London is likely to seem in retrospect the mildest of curtain-raisers when, on May 1st, revised fares come into effect over the rest of the country. Meanwhile Mr Maclay must derive a grim satisfaction from explaining to Opposition questioners that the Minister of Transport's powers of intervention are strictly limited by the terms of Labour's nationalisation statute of 1947.

* * *

Labour Attachés

The Opposition has been pressing the Government for an assurance that the number of labour attachés serving in British embassies and legations will not be cut during the general reductions in the foreign service; but it failed to make all the points that can be made in favour of these useful officials. At present 21 of them are serving abroad, and they are covering all but 18 of the countries in which Great Britain is diplomatically represented. Their main duty, as Ministry of Labour men, is to publicise and spread British methods of maintaining peace in industry, as well as British trade union practices; but they serve other valuable purposes. For example, they move in a stratum of foreign society which is unknown to the average diplomat. They meet large numbers of people who are not officials, and who are not asked to official parties. If the right man is picked in London, he is admitted to a fraternity that stretches across frontiers. His grasp of what the common man thinks and does is often more extensive, and less likely to be founded upon hearsay, than that of colleagues with a purely diplomatic training. His use as an information officer may be secondary to his role as a contact man, but it is equally valuable.

Again, in countries with nascent but under-developed labour movements—for instance, the countries of the Middle East—the right man can help to shape trade union activity

along lines that will render it resistant to Communism. Some good work of this type has been done in both Egypt and Persia. The only possible justification for cuts, if they must be made, is to save money; they must not be a prelude to abolishing this useful work. They would be best made in countries which have the most in common with Britain, where there is little to teach and social mixing is not discouraged by traditional habits. The recent creation of a new post in Madrid suggests that the value of the labour attaché's job is understood in the Foreign Office.

More Delving at the Docks

While Mr Butler was making his revelations in another place, their lordships managed to keep their minds wonderfully concentrated on delays in handling cargo at the docks. It was a discussion among men with special knowledge—Lord Winster, Lord Ammon, Lord Waverley, Lord Runciman; and finally Lord Leathers replied for the Government with an announcement that yet another investigating committee would be set up. It will be called the Ports Efficiency Committee—but this brisk name can hardly prevent fears that it will be just another paper-chase.

Plenty is known about the docks. There have been working parties on the turn-round of shipping and on mechanisation. There have been inquiries into dock strikes at London and Manchester. The port authorities and the Dock Labour Board are well aware of the problems; and so too are their lordships, as the debate on Tuesday showed. And it still remains true that the turn-round of ships in British ports is on the average 20 days, compared with 17 days before the war. Some of the delay is unavoidable. Ports which were built for the large coal exports of bygone days are not always suited to exports of other goods. These must be crowded into the ports that can take them. The average ship is larger than before the war and takes longer to load. There is a shortage of cranes, of lighters and of deep water berths. Hold-ups are caused by the fact that the working day in the wharves and warehouses is shorter than in the docks. And finally, there is the most intractable part of the problem, the restrictive practices of the dockers—such as their refusal to work new machines or to make up full gangs by amalgamating incomplete ones.

Discipline is admittedly weak in the industry. The Dock Labour Board is a buffer between employers and workers, and trade union leaders have to play incompatible roles as champions and judges. But this part of the problem is already being dealt with in the discussions between both sides of the industry and the Ministry of Labour; it is hoped to find an alternative to the Leggett Committee's rejected proposal for a disciplinary body of employers and unionists. The main task is to improve industrial relations, and it is hard to see how the appointment of another committee can be anything but a last resort of the baffled.

* * *

The Index of Retail Prices

The days of a really satisfactory index of retail prices are still very distant. The new inquiry into household budgets is only in preparation and the results cannot be expected until 1954. In the meantime, the existing index is to have some renovations. The Cost of Living Advisory Committee has received a lengthy report from its technical committee on the working of the interim index and has accepted most of the recommendations. There are to be two main changes. The index is to be weighted acording to the estimated pattern of consumption in 1950, revalued at present-day prices, instead of according to the prewar pattern revalued at 1947 prices. Secondly, the higher rents of new houses and flats will be taken into account; previously, the index included only rents of dwellings in existence when it started in June, 1947. These changes will be made in the February index and although continuity will be preserved in the total figure it will be broken in the separate components.

It is the prewar element in the weighting which has done most to bring the present index into disrepute. Ironically enough—for criticism has implied that the index has been understating the real rise—the technical committee calculates that on either a 1947 or a 1950 pattern of consumption the rise between June, 1947, and August, 1951, would have been a few points smaller than that actually shown by the official index. Admittedly, the alternative weightings have to assume that working-class consumption has changed since 1938 in much the same ways as that of the nation as a whole. But this is probably not far wrong and the result should be at least a more realistic picture, if not entirely the true one. On the other hand, the committee has found that the price increases of some things, particularly of rent, have been underestimated. By a fortuitous balancing-out of the various errors, the present figure for the total index is about right. But it might not have contrived to be so lucky in the future.

A change in the basis of the index coinciding with the cuts in the food subsidies is bound to arouse suspicion. But that will be unjustified. Enough is known about the new weighting to deduce that subsidised foods will have as much importance in total, although there will be relative changes between the individual foods. The reduction in food subsidies will probably increase by about 3 points the total price index calculated on either the old or the new basis.

* * *

The Infirm Old

In spite of the many other demands on their finances, the local authorities are making steady progress in setting up "care and attention" homes for old people. According to the fourth report of the National Corporation for the Care of Old People, in England and Wales over 500 local authority homes are now in being, and more will be set up. In addition there are many homes established by voluntary organisations; the corporation has assisted by grant as many as 150.

Since the provision of homes for the comparatively ablebodied is thus well under way, the corporation is continuing the policy announced in its third report of restricting its grants to homes provided for the infirm old. Many old people cannot be accepted in the "care and attention" homes because they need a certain amount of nursing care and medical attention—but not enough to justify their admission to hospital. The corporation is, however, supplementing its efforts to provide rest homes for the infirm with investigations into the kind of care at home that is needed to enable old people, to live independent lives as long as possible. But the provision of rest homes will attract its main attention for the time being. They will be particularly difficult to run. They are not intended for the chronic sick, and those responsible for running them will have to resist attempts to flood them with people who should be the hospitals' responsibility. Yet co-operation with the hospitals will be essential for success.

It will be interesting to see how the corporation's proposed three experimental rest homes, two of which will be financed from the gift made by the people of South Africa, will get over these difficulties. It would also be interesting to know whether the definition infirm will cover the mentally infirm. If not, here is another need to which the corporation might direct its attention. Too many old people are ending their days as certified patients of mental hospitals because there is no other provision for them. Others could be discharged from mental hospitals if they had a suitable home to go to. Both groups provide a great opportunity for a pioneering venture such as the corporation aims to encourage.

War Communism and NEP

The Bolshevik Revolution, 1917-23, Vol. II. By E. H. Carr. *Macmillan.* 397 pages. 30s.

The first volume of Mr E. H. Carr's "History of Soviet Russia" gave rise to animated controversy. This was perhaps not surprising. The volume dealt with such explosive matter as the rise of the Bolshevik Party, the revolution and the formation of the Soviet State. In other times Mr Carr's treatment of these subjects might have been considered a model of detached objectivity. But in the climate of cold war it is precisely objectivity and detachment that provoke controversy. Some readers expect a book on Russia to substantiate the denunciation of Bolshevism with which the speeches of politicians resound. Denunciation may or may not be good politics; it would certainly make poor scholarship. And the clamour for denunciation, if carried only a little farther, may become indistinguishable from the attitude of the Zhdanov school in Russia, which can also brook no objectivity or detachment in the scholar.

This, the second volume of Mr Carr's work, contains less inflammatory material, or at any rate less material that lends itself to dilettante traffic in abstract principles. It deals with the economic outlook of Soviet Russia in the first years after the revolution. Mr Carr describes in broad and sharp outline the almost total economic and social disintegration of Russia that resulted from the war. He then analyses Bolshevik economic policies, as they gradually evolved from agrarian revolution and "control over industry" (but not yet nationalisation) into the fully fledged system of War Communism, as it took shape in 1920. Several books have been written on these developments; but no writer has treated them so thoroughly, systematically and lucidly as Mr Carr. Even more than the first volume, this book is primarily a history of policies and institutions, especially of institutions. Those who want to learn how such bodies as the Supreme Council of the National Economy, the various economic commissariats, the Planning Commission, etc. came into existence, how they grew, how and through what machinery they functioned and how they built up that machinery can do no better than to read Mr Carr's book. They will also find described there in some detail the process by which War Communism ran into an impasse, broke down and gave place to the New Economic Policy of 1921.

Mr Carr has been careful to point out which elements of War Communism Lenin's government saved from the debacle and incorporated in the New Economic Policy. Apart from this, his story makes it clear that some of the policies that had been abandoned in 1921 were revived and applied in different contexts a decade later, during collectivisation and the first Five Year Plan. Some of the Utopian expectations of the earlier period were, incidentally, revived at the same time; the hope that money was about to "wither away" and that a planned, moneyless economy would be achieved. The reader gets the impression that Soviet economic policy moved through its various phases in circles, repeating up to a point the same actions and reactions in ever new combinations, but that every one of its circles began on a different plane and developed on a different scale.

A special feature of this volume, which makes it an ideal reference book, is the double arrangement of its material. Each of the main chapters describes a certain phase: for instance, "The Impact of the Revolution," "War Communism," "From War Communism to NEP," and "NEP: the First Steps." These chapters are split into similar sections, so that the reader interested in, say, agriculture or finance can easily follow its evolution throughout the periods under discussion. Whichever way it is read, the factual narrative runs on smoothly and clearly.

The third volume of this series, which the publishers say is "in preparation," will be devoted to Soviet foreign policy in 1917-23, about which much more has been known in the West than about Soviet economic policies and institutions. It seems, therefore, that, although controversy may centre on the first and the third volumes, this, the second volume, forms the core of Mr Carr's impressive and scholarly achievement.

Presidential Letters

The Roosevelt Letters. Being the Personal Correspondence of Franklin Delano Roosevelt. Volume III, 1928-1945. Edited by Elliott Roosevelt. *Harrap.* 541 pages. 30s.

It was remarked of the first two volumes in this series that the personal and family correspondence they contained gave very little hint that their author would be a great president of the United States. The third volume is devoted almost entirely to the presidential period, since even the years of the Governorship of New York, 1928-1932, are clearly a period of presidential expectation. (There is hardly a letter which does not include a Dale Carnegie touch to possible friends and influential people to "come down to Albany and talk things over"). Without any doubt this volume exceeds in interest and importance all that has gone before it. These letters are the product of an easy, confident maturity, the pronouncements and directives of a born leader, and the monologues and asides of a consummate political actor. They are seldom memorable documents in themselves, in the way that a comparable volume of Mr. Churchill's would be. There is hardly a notable phrase or a striking perception to be found anywhere. The best that can be said for Mr Roosevelt's epistolary style is that it is effortless. In fact, they are the letters of a man whose natural medium is speech and gesture rather than pen and ink.

But this does not mean that they are dull reading. There can be no such thing as dull Rooseveltiana. The magnitude of the man's role and his insatiable appetite for life guarantee that even the most trivial of these communications (and many of them are trivial) is welcome. The book is in no sense an ordered or balanced, much less a complete, collection. Indeed, it seems as if no principle guided the anthologists, beyond considerations of news value, as interpreted by the readers of the popular American weekly in which these first appeared. But for all that it is good to have them, and to have them so soon. Many of them, such as the letters to Stalin or Mr Churchill, are historical documents of prime importance, such as in an earlier age would have collected the dust of decades before they were released to a curious world. Clio has become almost as prying as a Washington columnist.

The Struggle for Europe

by CHESTER WILMOT

★ **The book** that is *already* influencing our diplomatic and military outlook.

★ **Mr. Attlee** reviews it in the *National Review* under the heading TRUTH ABOUT THE WAR, endorsing the theme and argument of the book.

★ **American** publication March 28 — author flying over specially. German, French, Dutch, Norwegian translations in hand.

★ **Fourth printing** now making 125,000 copies. 25s.

COLLINS

Hope for the Present Age

Christianity in European History. By Herbert Butterfield. *Collins.* 63 pages. 7s. 6d.

This book contains the Riddell Memorial Lectures at Durham University for 1951, three lectures which survey the contribution of Christianity to European civilisation. So short a book as this is the most difficult kind of book to write without superficiality or lack of proportion; and the difficulty is multiplied when the subject has hitherto attracted little but propaganda or generalisation. Professor Butterfield has attained both balance and profundity.

The book's essential argument is that the common conviction of the value of the individual human being, a conviction which has begotten so many of our social reforms, cannot survive if cut away from its historical foundation in Christian belief; that it is doubtful whether liberalism has any future apart from the particular doctrine of man inherited from Christianity. Sometimes the author asserts a little too strongly that the more hopeful elements in our society are derived from a Christian background: one cannot agree, for example, that "modern internationalism is the system of medieval Christendom with the religion evaporated out of it." But the case is fairly argued.

Social historians usually attribute to Christianity the graces rather than the structure of a civilisation. Christianity did not try to abolish Roman serfdom but brought with it a lower suicide rate, the end of gladiatorial shows, the flowering of ecclesiastical architecture; it softened Roman manners but did not save Roman society. Yet the author contends that it contains a working solvent for any social order. Although Christian preachers have endemically accepted the society in which they lived and attempted to bolster it with moral exhortation, the principles they proclaim contain an absolute standard whereby the society is always under potential judgment. Thus the Reformation happened not because the medieval Church had done its work badly but because it had done its work well; and modern society is likewise under the judgment of an ideal standard of social life regulated by the law of love.

The most refreshing thing about the book is the unusual atmosphere of hope, a hope which has survived a just diagnosis of the ills of our age.

The Roots of Communism

The Origins of Totalitarian Democracy. By J. L. Talmon. *Secker and Warburg.* 366 pages. 27s. 6d.

This is a book of unusual importance, for it probes into a matter that is now of universal concern and lays bare some facts about it that should be widely understood. Dr Talmon writes well and vigorously, although he might with advantage have pruned away some of the less necessary details in his work.

Stripped to essentials his argument is this. What is variously called communist tyranny or people's democracy is not, as is ordinarily supposed, something outside and alien to the Western tradition of life and thought. On the contrary it is a vigorous growth from those same eighteenth-century roots which gave life to the ideal of liberal democracy. These roots were, first, the idea of natural order, that attainable social harmony when liberty would be fully realised in equality and virtue, and, second, the notion of sovereign man, the free, responsible individual, possessed of inalienable rights and master of his destiny. These incompatible ideas generated that new secular religion, that political messianism which torments the modern world.

Dr Talmon's particular concern is to trace the early and most markedly formative stages of this development, which were completed just before 1800. To this end he first seeks to show how, in Rousseau's work, the idea of individual liberty and what he calls the notion of a final salvationist order rubbed uneasily together. Next he turns to the Jacobins, who held that there was a perpetual conflict in society between virtue and selfishness—an idea easily translated later into the Marxian dogma of class warfare. It was this idea of a righteous and inevitable social conflict which enabled the Jacobins to practise coercion while preaching extreme individualism. Babeuf and his disciples then gave the whole matter a decisive twist. Individual liberty, they believed, could find proper expression only in an egalitarian communist society, which was the inevitable end of the warring motions of the historical process. Thus the messianic tradition of revolutionary violence was brought to birth, for no temporary setback could hinder its preordained consummation, while coercion and brutality on the part of the supposely enlightened would hasten its coming. Others have already noticed the connection between the dogmas of modern totalitarian democracy and the ideas of the French Revolution, but Dr Talmon can justly claim to be first in exploring the inwardness of the matter.

Notebook of a Social Scientist

Productivity and Trade Unions. By F. Zweig. *Basil Blackwell.* 240 pages. 21s.

The author of this book, according to the dust cover, sets out to avoid "generalities, statistics or formulas," and bases his study on personal interviews. His conclusions seem to be based on rather flimsy evidence.

The book consists, first, of five chapters of "General Remarks," which chiefly concern what Mr Zweig calls "the value of the situational approach"—by this he means that individual devices to raise productivity cannot be successful except in the context of good industrial relations, which are dependent on numerous factors.

There follow five studies of industries: building and civil engineering, cotton, iron and steel, printing and engineering. These studies do not, as the title might have led one to expect, address themselves directly to productivity as it is affected by trade union activities. It is true that one of the headings under which each industry is analysed is entitled "Productivity standards," comparing current standards with productivity before the war. But the studies are simply descriptive of working conditions generally. They go on to recount hours of work, wage levels, conditions of entry and the names of trade unions. Facts with a direct bearing on productivity, such as promotion by seniority in the cotton industry, emerge only incidentally. The studies read like a research worker's notebook.

Nevertheless some interesting points are brought out. One is the readiness of some employers to accept, even to approve, practices that restrict output—provided these are applied universally throughout the industry—usually on the ground that they saved argument. Employers' views on the effect of full employment led Mr Zweig to the convincing conclusion that, apart from industries where productivity is largely governed by the speed on the machines, the ill-effects of full employment are felt least in the most attractive industries. These get the pick of the best workers, who are, by and large, the contented workers, with established habits of work not easily upset.

There is some good material in this book, but it is untidy. Mr Zweig somewhere observes that a sense of social betterment is a "pathfinder" which helps the social scientist "to co-ordinate all the miscellaneous small facts of life

TIN

THE element tin has been known and used since the earliest days of history. Egyptians of the 14th century B.C. alloyed it with copper to make mirrors, and Homer tells in the Iliad how Hephaestus, the god of Fire, used tin to decorate a shield for Achilles. Tin obtained from the moors and streams of Cornwall was the one famous product of Ancient Britain. A natural tin oxide—"cassiterite"—is still mined in Cornwall today, but most of the world's supply comes from alluvial deposits in Malaya and Indonesia and from ores mined in Bolivia, Africa and Australia. By far the most important uses of tin are in the production of tinplate for the canning industry, and the tinning of articles such as milk churns and kitchen utensils. Tin is also an important constituent of alloys such as gun-metal and bronze, and it is used to make bearing metals, soft solder and pewter. Compounds of the element are used in dyeing and medicine, and in the production of glazes and enamels.

Besides manufacturing tin dichloride for use in the dyeing and finishing of silk, I.C.I. produces large quantities of tinned copper sheet and tubes for dairy and food-producing equipment.

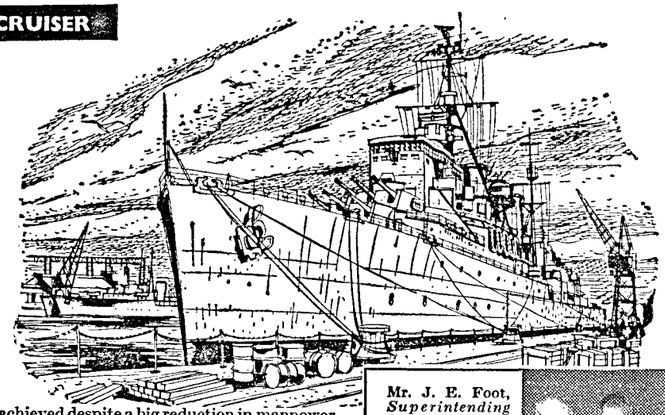
THE CASE OF THE CAPTIVE CRUISER

Was there a "secret weapon" to set her free?

H.M. Dockyards, serving one of the largest naval forces in the world, were faced with a serious problem.



World War II had suddenly increased their inventory of ships' supplies to almost 300,000 items. Handling this increase with hand accounting methods had become almost impossible despite extra manpower and overtime.

As a result, the movement of stock to keep ships supplied was held up by paperwork.

To free these ships, a new accounting system was needed at once. The Admiralty directed an immediate investigation of all methods and systems. Machine accounting specialists of Burroughs Adding Machine Ltd. were called in.

After investigation, Burroughs specialists suggested a simplified system for handling stock cards and ledgers. They specified Burroughs High Speed Accounting Machines, Duplex Adding Machines and Adding-Subtracting Machines for the job. The authorities acted on these recommendations.

Today, the issue of supplies in the Royal Dockyards is never held up by paperwork. Increased speed of inventory accounting has been achieved despite a big reduction in manpower.

Mr. J. E. Foot, *Superintending Naval Store Officer of one of H.M. Dockyards, examines one of his Burroughs High Speed Accounting Machines.*

With him on the right is Mr. S. F. Harmer-Elliott, *one of the Burroughs men who helped solve the Case of the Captive Cruiser.*

WHAT ABOUT YOU? If you think your business could benefit from faster figuring, call in Burroughs. They can advise you on all the latest machines and systems, for Burroughs make the world's broadest line of modern record-keeping machines; Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm equipment.

Call in Burroughs today. Sales and service offices in principal cities around the world.

Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

which would otherwise be dissipated and dispersed in a shapeless agglomeration of small and meaningless facts." His readers may be left wondering whether it was their own sense of social betterment that was at fault, or whether Mr Zweig's approach was not rather too situational.

Modern Religion

Religion in Britain Since 1900. By G. Stephens Spinks, in collaboration with E. L. Allen and James Parkes. *Dakers.* 256 pages. 18s.

This is an addition to the excellent series of books entitled Twentieth Century Histories. Other volumes already published deal with broadcasting, morals, the theatre, flat-racing, etc. Some of these subjects are obviously tougher assignments than others, and it is hard to imagine a more difficult task than that undertaken by the authors of the book under review. Flat-racing seems a simple matter by comparison; even morals. . . .

One can imagine how a book on "Religion in Britain Since 1900" might have been written by G. M. Young or G. K. Chesterton. Two very different books, no doubt, but both alike works of art and expressions of personal judgment. Dr Spinks and his collaborators have not tried to do this, and the result is not a work of art but an industrious and somewhat ill-planned compilation. When one has read it one has learnt many things one did not know before; one is much instructed, but not greatly enlightened—and rather fatigued. The weakness of the book is in bad planning. The occasional inaccuracies, such as the surprising statement that Scotland had a population of only 800,000 in 1843, are of no great matter.

Nonetheless there is much good writing and good judgment in the book, as for example the following paragraph:

> At first some of the new methods seemed to be somewhat remote from the world's problems. The revival of interest in liturgical studies . . .; the redemption of moribund cathedral life from the levy of sixpence a head to view "the place where thine honour dwelleth"; the re-living of the contemplative life by newly established religious orders; the glowing use of old arts in glass, metal and stone; the erection of churches as striking as any buildings designed by modern architects. . . . The million radio receivers from which came the sounds of the Daily Service or Sunday Evening Community Hymn-singing bore witness to the new attempt of organised religion to carry out its Master's instruction, "Go ye into all the world."

It should be added that the authors seek to cover every sect or persuasion in England, Scotland, Ireland and Wales. This conscientious all-inclusiveness is one of the reasons why the book rather lacks drive and direction.

Letters to the Editor

Partnership or White Supremacy?

Sir,—In *The Economist* of January 26th an unfair comparison was drawn between the earnings of European and African miners on the Northern Rhodesian copper mines. The article stated that "a black miner's cash wage may not exceed 2s. a day, while the average white worker earns £100 a month." No mention was made of the fact that the African miner gets free housing, all his food, articles of clothing and equipment and free medical treatment, whereas the European mine-worker has to pay rent and buy his own food and clothing. Today the average overall or real earnings of the African underground worker are 5s. per day, made up by an average basic rate of 2s. per day, plus food and accommodation, awards and bonuses, etc., and there are men on the mines who earn £17 for thirty working days. Housing and food are subsidised.—Yours faithfully,

G. PERKIN.

Government Information Department, Lusaka.

Concealing the Crisis

Sir,—The most dangerous feature of the present economic crisis in Britain is that hardly anybody really believes in it, except the people who have to try to deal with it. The experts know that the nation is overspending. The changes in the balance of payments, the drain on the reserves, the reactions of foreign opinion are all real to them, for they have to deal with these matters at first hand. But to the man-in-the-street such happenings are like moves in a remote, gigantic, ghostly game of chess which he can neither understand nor control. The money matters that are real to him are those relating to his own income and expenditure. He is a microcosm of the nation, and he sees the nation's fortunes in terms of the happenings in his own smaller and more familiar world. When he and his fellows have to curtail some part of their expenditure in order to keep within their incomes, then they are living their individual parts in the crisis of the whole. If no such necessity forces itself upon each one of them how can they understand or believe what they are told about the insolvency of all of them together?

We shall not be far wrong if we assume that the practical effect on the public of propaganda on economic matters in peacetime is nil if the propaganda has no counterpart in the reader's or listener's personal experience, and tells him nothing to his advantage. It is his own direct experience that counts. And it is just here that the lack of any clear connection between national and personal well-being in our economic arrangements fairly bluffs us out of our senses. As soon as the crisis begins to touch us in the one way we could not fail to understand, namely, in our personal spending, it is automatically warded off for the time being by a rise in our money incomes. This only happens directly to a small proportion of the population through the operation of "escalator" clauses in wage agreements, but other incomes move in sympathy to such an extent that a presumption has now taken root in the minds of most of us that our real incomes can and should be maintained in all circumstances by suitably adjusting our supply of money. A spurious success in insulating ourselves physically from the crisis has led to our losing all mental contact with it as well.

The vital question "Can we produce more, or must we consume less?" does not force itself upon our attention, for we find ourselves faced by no such choice in our own daily round. At the worst, it only seems necessary for us to accept the fact that if we want more, we must produce more; to which we generally add the comfortable rider that if we want more production, we must offer more consumption as a bait. Bemused in this way, we believe that we can refuse to sacrifice one jot of our hard-won leisure while still keeping our standard of living intact.

That is the situation we are in. We have deprived ourselves of the means of realising that a crisis exists, or of softening its impact by yielding a little to it in its early stages. The historical processes by which we have been brought into this position may not be directly reversible, but it is time we realised that we can make no progress in obtaining a national response to the crisis as long as we go on allowing it to be concealed from us and pretending that we are too stupid to understand it. The longer we continue with our present game of bluff, the more drastic and uncontrollable will be the eventual reckoning.—Yours faithfully,

O. M. MEARES

Guildford

Canada's Doubled Output

Sir,—Your Ottawa correspondent's otherwise excellent summary, in *The Economist* of February 23rd, of the growth of the Canadian economy errs in one minor but not insignificant particular. The item in the national accounts labelled "gross domestic investment" includes capital expenditures of government-owned businesses (i.e. the Canadian National Railways, Trans-Canada Air Lines, etc.) and special war-time capital outlays by foreign governments, but *not* construction or other capital expenditures by government departments at any of the three levels of government.

If the latter category were included, gross domestic investment in Canada in 1950, for instance, would have approached 27 per cent of gross national product, rather than the "over 21 per cent" suggested by your correspondent.—Yours faithfully,

V. G. HOBBES

Montreal

AMERICAN SURVEY

Aid in the Lion's Den

Washington, D.C.

THE message requesting $7.9 billion for foreign aid which President Truman sent to Congress last week, and the coast-to-coast radio and television talk with which he followed up this far-from-popular appeal, seemed to reflect a conviction within the White House that Senator Taft and his fellow "retreatists" could no longer be handled with the gloves on. The time had come to be a good deal rougher.

In the message to Congress, the President's language was notably plain. He said:—

> The policy of retreat would deprive us of armed forces [abroad] which, if called upon to fight for the defence of their own countries, would at the same time be fighting for the defence of ours. . . . It would require us to become a garrison state and to impose upon ourselves a system of centralised regimentation unlike anything we have ever known. In the end, when the enemy, encouraged by our retreat, began to organise the rest of the world against us, we would face the prospect of a bloody battle—and on our own shores. The ultimate costs of such a policy would be incalculable. It would be a mandate for national suicide.

In the broadcast, one sentence was stronger still. The President said that renewal of the Mutual Security Programme

> may make the difference between life and death for many of you who are listening to me tonight.

The advice given to Mr Truman in the last few weeks may well have taken into account not only a widespread restiveness over the amount of money to be given away to foreign nations in a single year, but also a considerable and general dismay over the scale of the total of federal expenditures proposed for the year beginning next July.

The Chamber of Commerce of the United States has recently produced a map of the country upon which all States west of the Mississippi River are shaded or hatched in, so that a third of the land area or less is left in a white, unshaded condition. Above the map is a legend reading: "The 1953 Federal Budget of $85.4 billion is Greater Than All the Incomes of All the People West of the Mississippi." Below is a key which shows that military spending as provided for in the new budget would require a sum equal to the incomes of all the people in the States of Washington, Oregon, California, Arizona, Nevada, Utah, Idaho, Montana, Wyoming, Colorado, New Mexico, Oklahoma and Texas. The $7.9 billion requested for foreign aid equals the total income of all the people in North Dakota, South Dakota and Nebraska and of most of the people in Minnesota and Kansas.

A few days earlier, readers of one of the Sunday issues of the *Baltimore Sun* had been confronted with a diagram seventeen inches high which graphically demonstrated the following propositions:

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

1. That if the money President Truman is seeking for the new budget were assembled in the form of $1,000 notes and if the notes were piled one on top of the other they would reach 5.79 miles into the sky—that is, above the Empire State Building, through the layer of rain clouds at normal height, above the effective altitude of a Constellation, above Mount Everest and into the thin air where B29 bombers fly.

2. That if the $85.4 billion were stacked up in silver dollars the coins would ascend 153,734 miles, or nearly three-quarters of the way to the moon.

There were many who considered President Roosevelt's budget for 1940, providing for federal spending of $9.2 billion, to be quite ruinous. There was concern and even consternation over Mr Truman's budget for 1950 (covering a fiscal year that ended a few days after the Korean war had begun) which involved $40.2 billion of federal spending. But now there is a budget which sets out to provide $51.2 billion for the military alone.

It is not surprising that in an election year the temptation to suggest that this is Mr Truman's fault is sometimes irresistible. A paragraph which first appeared in a Washington magazine, *United States News and World Report*, and which was taken up by the *Readers' Digest*, and has since attracted a good deal of attention, said:

> All Presidents through Franklin Roosevelt, in 156 years, took from the public in taxes $248 billion. Two world wars in there. Harry Truman, in six years, took from the public $260 billion. Even so there isn't enough tax money to pay current bills.

*

Nothing is clearer than that those who call for, and those who promise to effect, economies which offer some prospect of bringing down federal expenditures are now the most closely in tune with the public mood. Senator Douglas, of Illinois, a progressive Democrat, says:—

> One of the things Congress must do is ride herd on the military and on the civil authorities and try to make them squeeze $4 to $5 billion, at the very least, out of the budget.

And Senator Byrd, of Virginia, who stands for economy in government, has proposed an itemised budget of his own, in opposition to that of the President. It undertakes to reduce the year's spending to $76.8 billion, and an important part of its provisions is that a ruthless 5 per cent should be cut out of the military estimates.

If, between now and the moment this summer when it will be able to adjourn and go off to fight the election, Congress votes all the funds the President asks—and if, as seems most likely, it refuses to give him the new taxes he seeks—the prospect is that a $14.4 billion federal deficit will be created, and that the national debt will be raised to $275 billion. It is manifestly hazardous to attempt to predict how much Congress will be able to squeeze out of the $85.4 billion. But it is safe to say that there is some doubt whether the budget cuts inflicted in Congress last year actually saved all their sponsors boasted they would, when account is taken of the expenses incurred and old spending programmes left.

The public desire to see some money saved has already been reflected in the recent Congressional investigations of alleged waste and extravagance in the armed services. Not for some time has the army been as obviously on the defensive in this respect as it now is. When last month Mr Frank Pace, the Secretary of the Army, appeared before the Armed Services sub-committee in support of his department's budget requests, he earnestly explained that every soldier and every civilian employee was receiving special "cost-consciousness indoctrination."

This was the background against which the President's request for $7.9 billion for foreign aid was submitted to Congress. The message and the broadcast made out a strong case, and put it into tough language. Little mercy was shown toward the "retreatists," and no encouragement was given to the school of thought which holds that, while all or most of the money for military aid may have to be voted, it will be possible to withhold all or most of the money for economic aid. Indeed, the President is asking for more in economic aid than was granted last year—$2.4 billion as against $1.4 billion—and less for arms. But in deference to Congressional feeling, the $1.8 billion of economic aid for Europe is described more accurately this year as "defence-supporting funds." Mr Truman also assured Congress and the nation that

> the cost of the Mutual Security Programme, together with the much larger costs of our military services and other defence measures, are well within our economic capacity.

But of this Congress is far from convinced. Faced, as Senator Bridges, the Republican leader, put it, with "terrific expenditures, back-breaking taxes, and inflation"—as well as an election—it promises to take a good look at all foreign spending.

American Notes

New Hampshire Wants a Change

The Eisenhower boom, which was beginning to look like a damp squib, has at last gone off with a satisfactory bang in New Hampshire. In the primary election last Tuesday 46,441 Republican voters made the General their choice for Republican Presidential candidate, compared with only 35,691 for Senator Taft and 6,673 for Mr Harold Stassen. And all 14 delegates elected to represent the state at the Republican nominating convention next July are supporters of General Eisenhower. In the Democratic primary, Senator Kefauver scored an equally clear victory over President Truman: 20,240 votes to 16,128, and all the delegates to the Democratic convention. The political pundits who flocked to New Hampshire to study this first test of the voters' mood in this election year do not seem to have improved as prognosticators since 1948. All of them were forecasting a defeat for Senator Kefauver, and, if not a victory, at least as near one as could be expected, for Senator Taft in a state where the leading Republicans were all on General Eisenhower's side.

For this reason, if the General had not done well in New Hampshire, his chances of the Republican nomination might have fizzled out altogether. Now he may be encouraged to think he can get the nomination without campaigning for it—and that is the way the General wants it. But there are more primaries to come, in some of which Senator Taft is sure to do well; nor can the nomination be won by primaries alone. Once the first enthusiasm is over, Senator Lodge, Mr Paul Hoffman and the General's other supporters may regret this victory a little, for it will make it even more difficult for them to induce General Eisenhower to come home. On the other hand it makes it easier for them to convince him that, if he does come, he should be able to settle down in the White House.

Its present occupant must be wishing he had never entered the New Hampshire primary. Mr Truman did so in order to give the Democratic machine in the state someone to work for, and in the hope of nipping Senator Kefauver's candidature in the bud. The state machine failed to deliver the votes and Mr Kefauver has been presented with a victory instead of a walkover. However, New Hampshire, a tiny state, and one that is safely Republican, has little importance in Democratic politics, and Mr Truman can still have the Democratic Presidential nomination if he wants it.

The New Hampshire election is full of contradictions, all of which will undoubtedly be over-explained during the next few weeks. General Eisenhower stayed away and won; Mr Truman stayed away and lost. Senator Taft and Senator Kefauver both covered the state with a personal down-to-earth appeal; one won, one lost. Mr Taft is supposed to be liked by farmers and disliked by labour voters; the opposite proved to be the case. The only safe deduction from the results seems to be that New Hampshire voters, who came to the polls in unexpectedly large numbers, want a change, whatever their party. Republicans would rather have a romantic Eisenhower in the bush than a familiar Taft in the hand, and Democrats would rather have a gay young Kefauver fresh from crime-busting than a tired Truman who, however honest he may be himself, seems unable to escape from his dishonest friends.

* * *

Ducking UMT

The House vote to send the plan for universal military training back to committee means that Congress has successfully ducked an embarrassing election issue. Last year the scheme was approved in principle; this session of Congress was to consider the details worked out by a Presidential commission. The proposal was that all eighteen-year-olds should be required to undergo six months of training; after this, they would spend seven and a half years in the reserves. What the supporters of UMT had not bargained for, though they should have, was that the whole case against it would be revived in an election atmosphere. Religious, educational, trade union, and farm groups deluged Congress with letters and Senator Taft suggested the plan be postponed for three years. UMT, it appeared, was more controversial even than corruption, communism or taxes, and it was left to the American Legion, the largest of the ex-servicemen's organisations, to carry the whole burden of defending the scheme.

Friends of UMT can, and do, take comfort from the fact that they were outmanœuvred, rather than defeated. The House Armed Services Committee had made the Bill more appealing by adding certain safeguards for health and morals; Mr Vinson, the chairman, was prepared to go further and insert a five-year time limit, as well as a provision that there should be no universal military training as long as conscription was necessary. The hostile Republicans, joined by a few Southern Democrats, so arranged matters, however, that the Bill the House had to consider was the original bleak Administration draft, lacking all the softening touches added in committee. The Democratic leaders found it impossible to rally their forces in time to prevent this happening, and in the end the Bill was sent back to committee by 236 votes to 162.

The main argument for UMT is that, in the long run, the trained reserves it would produce would provide much greater security at a cost far lower than that of maintaining three or four million men in uniform at $10,000 a year each. This would take time. Military manpower is so scarce

that the Defence Department only proposed to set up a small experimental training scheme this year, hoping to enlarge it later. But critics of the swollen military budget should, logically, be supporters of UMT to a man. Even the Senate, however, which, with only a third of its members up for re-election, has less to fear than the House, shows no disposition to rush in where others feared to tread. Senate consideration of UMT will be put off until the "climate is more favourable"—which is almost certain to mean next year, if then.

* * *

Metals Begin to Thaw

The International Materials Conference has come under attack in Congress just as the freeze on supplies of metals for American civilian industry, for which the IMC is blamed, is beginning to thaw. Lead has been freed from allocation, zinc may follow before long ; some aluminium producers now occasionally have surplus capacity ; while steel alloys are still very difficult, certain types of steel, notably sheet and strip, are easily available. Steelmakers are reminding themselves that it is only in the last year that it has become the rule rather than the exception for the industry to work regularly at over 100 per cent of capacity ; at the end of last week one company actually closed down two small furnaces.

This comparative plenty at the time when, only a few months ago, it was thought metals for civilians would be at their scarcest is explained partly by increased output, but more by the "stretch-out" in the defence programme, which has reduced the military demand for metals during the next few months. Furthermore, now that the Controlled Materials Plan for steel, aluminium and copper has settled down, manufacturers are not bothering to take up their allocations until they need them ; there is a suspicion that some of them never will be needed, unless there is an improvement in the retail demand for consumer durable goods. Finally, it appears that in some cases lack of copper has prevented firms from using all the steel and aluminium to which they are entitled. A few weeks ago, automobile makers refused increased supplies of steel unless they were also promised more copper.

The shortage of copper remains the most serious single scarcity but the IMC cannot be blamed for that, since the United States is apparently not able to buy as much as it is entitled to, because the American price is fixed so low. Copper is available at a much higher price in Chile, and spokesmen for Detroit, and other areas which are seriously affected by unemployment in civilian industries, are pressing the Administration to arrange for this copper to be bought. More will probably be heard of this in the discussions on renewal of the Defence Production Act, which authorises price controls. It also authorises the allocation of materials, and it is being suggested that provisions for the automatic decontrol of metals as they become plentiful should be inserted in the Act. The mobilisation authorities are against this, for they suspect that the present thaw may turn out to be only temporary. But it is already being forecast that it may be possible to celebrate the next New Year by abandoning the Controlled Materials Plan and returning to a simple priority system for defence orders.

*

Meanwhile, however, extra copper and aluminium have been found for the automobile industry, which will be able to make over a million cars in the second quarter of the year, compared with 930,000 in the first. Restrictions on construction are also being relaxed ; permission has been given for over 600 new religious and municipal buildings to be started, for a number of commercial buildings, held up for over a year, to be finished, and for a few to be begun in areas where there is serious unemployment in the construction industry. The light structural steel for these is guaranteed, but the heavy structural steel needed for roads and factories is still very scarce. Partly because of this and partly because of the lack of copper and components, industrial expansion is no longer being encouraged by the government unless it is urgently needed for defence.

The Air Force is, however, insisting that a further expansion in aluminium capacity is needed, in order to be sure that there will be enough for the aircraft industry and for substitutes for other metals, should full-scale war break out. Under present plans aluminium capacity will reach 1.5 million tons a year by 1954 and will be adequate for all anticipated civilian demands as well as for the present defence programme. It is now being suggested that another 300,000 tons a year should be added, to be obtained partly by increased imports from Canada, partly by another domestic expansion. But the industry, already afraid that it is growing too fast, is showing no enthusiasm for the idea.

Vote for Corruption ?

The President's plan to reform the Bureau of Internal Revenue goes into effect this week unless a "constitutional" majority—49 members—can be found to oppose it in the Senate. Despite all the indignation over tax scandals, there is a risk that it may. The reorganisation would replace the 64 Collectors of Internal Revenue, who are political appointments, with 25 Regional Commissioners, all under civil service. The House, which has no voice in appointing tax-collectors, has not objected, but in the Senate, which values its remaining plums of patronage, the Executive Expenditures Committee has voted by seven to five against the change. Of the seven, five were members of the Republican Party, which has made so much capital out of Democratic dishonesty.

Mr Truman will make himself no friends in the Senate with his charge that some Senators are more interested in patronage than in good public service and more interested in keeping the corruption issue alive than in cleaning up the government. (Mr Truman himself has an interest in burying it as quickly as possible.) But his plain speaking will make it more difficult for the Senate to perpetuate a system which has brought disgrace on the Internal Revenue Bureau and is condemned by most experts on government.

It is more doubtful whether the President was on equally strong ground in ordering the Department of Justice and a number of other departments and agencies to refuse to turn over their files to the House sub-committee trying to find out whether the department has been lax in prosecuting cases of tax fraud. The Attorney-General refused the request on the ground that it would impose a costly and intolerable burden to turn up the records on all cases in which the department had refused to prosecute during the last six years or in which it had taken no action for a year or more. The President flew to support him and to condemn the committee's "dragnet" approach. It is true that when the investigation was authorised the committee was instructed to confine its attention to cases in which there was specific evidence of wrong-doing. It is equally true that the President is entitled to withhold executive files from Congress, and in some cases should do so. But a more co-operative attitude would inspire greater confidence that nothing is amiss, and that the truth is not going to be lost sight of in quarrels over executive and Congressional rights.

Loyalty on the Rack

In the Foreign Service, years spent in the Far East are classified as hazardous, and credited at time and a half. They have proved so indeed for four high-ranking diplomats whom Senator McCarthy and Senator McCarran have charged with Communist sympathies. The second to go is Mr Edmund Clubb, head of the Office of Chinese Affairs, who, though cleared for loyalty and security by the State Department, has resigned rather than live out a crippled career in a dark corner of the Historical Policy Research Division. This will not end the troubles of the State Department, which was neither candid nor courageous about the clearance. It was left to Senator McCarthy, whose informants are everywhere, to reveal that Mr Acheson himself had cleared Mr Clubb, on the strength of a second review of the evidence, after the department's security board had handed in an unfavourable verdict. Senator McCarran is now proposing a new inquiry and threatening to cut off Mr Clubb's pension.

Of the three others in the fast-thinning ranks of Chinese experts, Mr Vincent, completely cleared (unless the President's Loyalty Review Board should decide on its own authority to reopen the case), has returned to his banishment in Tangier ; Mr John Paton Davies, also cleared, is in Germany ; Mr John Stewart Service is still struggling to reverse his dismissal, made necessary by the Loyalty Board's finding that his loyalty was open to "reasonable doubt." Mr Service insists that, as a court of final appeal, the Board has no right to reach down and reverse favourable verdicts at lower levels. The Board does not agree. It is known, thanks to Senator McCarthy's spies, who provided him with minutes of one of its meetings, that the Board has long been dissatisfied with the State Department's failure to discharge any one on loyalty grounds—an alarming sidelight on its impartiality. Some members actually criticised the State Department for not reaching the high quota of dismissals scored by other departments.

Meanwhile, Mr Owen Lattimore, whom Senator McCarthy once called the chief architect of Far Eastern policy, has after eight months been given a day in court before Senator McCarran's Internal Security Committee to deny the charge of Mr Louis Budenz that he was once a Communist party member. Professor Lattimore was an indignant and aggressive witness, and the day stretched into ten as the committee relentlessly tried to trap him in inconsistencies which might serve as the basis for a perjury charge. Mr Lattimore, apparently, is not frightened of a judicial investigation ; he is anxious that the courts should decide who is the perjurer, Mr Budenz or himself.

It is only the investigation of Senator McCarthy, author of so many of these miseries, which has been hanging fire. Now, however, the committee appointed to look into Senator Benton's charges against him has been so angered by his "outrageous vilification" of the investigation that it has demanded and will secure a showdown—a Senate vote on whether the inquiry should continue.

Orange Squeezes

Last summer west coast orange growers realised that California was being swamped with fruit from Florida, coming in as concentrated frozen orange juice in tins, and thus getting round the California laws that forbid the import of competitive fruits and vegetables on the excuse that they might carry plant diseases. More important, this frozen juice, one of the most successful postwar products, was driving California oranges out of their national markets, for most Americans nowadays buy their oranges in this form—if they buy them at all. Californian growers have always sold most of their crop fresh, for everyone except obstinate Floridans agrees that California oranges are handsomer than any others. But once squeezed all oranges look much the same. California has also lost the advantage of its summer crop, which Florida does not have, for frozen juice can be put on the market all the year round. California oranges are more expensive than Florida ones, largely because wages are higher on the west coast than along the Gulf of Mexico. Furthermore, it costs much less to transport the concentrated product from Florida than from California to the important markets in the east and mid-west.

But California has never yet admitted defeat by Florida. Once the extent of the threat to the state's chief crop was realised, the fruit growers' co-operative began to make frozen orange concentrate under its own famous branch name of "Sunkist." To capture a market, prices were cut, sometimes as low as 15 cents for a six-ounce tin. But this could not continue for long, for a profit cannot be made on the Californian product at anything below what is regarded as the normal price of 23 cents ; the Florida concentrate can be sold satisfactorily at 19 cents. In 1950 six-ounce tins were selling as high as 29 cents ; but this winter the price has fallen to an average of 17 cents. Two years ago a box of Florida oranges sold at $3.75; now the price is 50 cents and the fruit is rotting on the trees. This is not the result of competition from California, but from the new orange groves planted in Florida in 1946 and now beginning to bear. The Florida orange crop, at 75 million boxes this season, has doubled since 1946 ; in that year 225,000 gallons of the frozen concentrate were made. Now that amount is exceeded on many days during the season. But over 10 million gallons, about one-third of last year's output, were unsold when the new season opened.

In fact, the concentrated product, which once was thought to be the answer to the seasonal fluctuations in the orange market, has so far only accentuated them. But this year's glut both of oranges and of frozen juice is sure to eliminate some of the growers and some of the manufacturers who rushed into what looked like a dazzling thing in 1946. The Florida growers' co-operative is copying the Californian one and making its own "Seald Sweet" brand of concentrate, so that its members are no longer at the mercy of the manufacturers of the well-known brands. It is these manufacturers, however, who by nation-wide advertising and distribution have made the frozen concentrated juice popular, and both they and the growers are taking comfort from a recent estimate that eighty per cent of Americans still do not buy it. Even so, at the new low prices about a million gallons are being sold each week.

THE WORLD OVERSEAS

From Maher to Hilaly

THE man and the methods have changed in Cairo ; the Egyptian government's objectives have not. They are still " pursuit of the national question," by which is meant British evacuation and the " unity of the Nile valley," and a purging of the worst elements in Egyptian public life. By this is meant a permanent silencing of the Wafdists who used office in order to feather their nests and, inside the administration, the cancellation of all " exceptional promotions " accorded by the Wafd government to its friends. The two aims appear unconnected, but are not so. For the Wafd is the only party in Egypt possessed of a nation-wide machine, and of the apparatus for arousing public clamour. Therefore, to succeed with a purge, any non-Wafdist Prime Minister must be able to outbid the Wafd for public favour. In the present state of public opinion in Egypt, almost the only method of doing this is to produce some very plain evidence—comprehensible even to the illiterate—that success with " the national question " is attainable by negotiation.

The new premier, Hilaly Pasha, is going about this business in a manner different from his predecessor's. Aly Maher believed that, in order to reach a settlement with Britain, he must have internal calm, and that this calm could only be sustained if the Wafd party, with its majority in Parliament, at least acquiesced in his domestic policies. It is unlikely that he really believed in the sincerity of those Wafdist leaders who pledged their support for him, but he believed that he held two trump cards. One was the Origin of Fortunes act—the act, unused as yet, whereby anyone can be challenged to declare the source of capital acquired over the last ten years ; Aly Maher reasoned that this Act, if brandished at a selected list of Wafdists, would keep them quiet. His second card lay in his belief that they would tolerate him in the knowledge that any successor would be less accommodating.

The Wafd's Black Record

He may have been right, but there are powerful influences in Egypt, including advisers inside the Palace, that wanted to seize the chance to exploit the Wafd's black record in order to break its leadership. The first sign that Aly Maher's policy might not work was the Wafd's refusal to vote a sum of E5 million to be used for compensating victims of the riots of January 26th. Aly Maher thereupon obtained from the King the signature of a decree dismissing Parliament for a month. At wind of this decree, the Wafd voted the £E5 million. Aly Maher therefore pocketed the decree and did not use it. His Ministers of Finance and the Interior expressed the disagreement with this policy that was felt by wide circles outside the Cabinet. This pressure upon him forced his resignation. With him there disappeared the most competent cabinet that Egypt has, perhaps, ever had.

In thirty hard working days he had, with the assistance of Abdel Motaal Bey at the Ministry of Finance and Mortada el-Maraghy Bey at the Ministry of the Interior, done much to restore sanity. He had reduced the prices of sugar, kerosene and bread and had begun to tackle the clothing prices ; he had allowed Abdel Motaal to remove the chief government functionaries from the cotton market who, under Wafdist rule, had been manipulating the bourse and cotton trade in pursuit of a policy which seemed peculiarly suitable to the operations of a chosen few ; he had allowed Maraghy Bey to remove some chief security officers whose behaviour had been at least inefficient ; he had withdrawn the disaffected auxiliary police from the Canal Zone and Cairo ; he had allowed the civil authorities in the Zone to resume contact with the British Army in a progressive restoration of normal civil conditions ; and some " patriots " in the Zone who had organised their private gangsterdom had been thrown into gaol.

Without question he was doing good work and most people felt sorry that he had been halted so soon. At least he has the satisfaction of knowing that his credit stands high. But many believed that he had not struck deeply enough at the roots of disorder. Although the Parquet had arrested hundreds of people believed to be connected with the crimes of January 26th, people felt that the Ministry of Interior itself had not been purged enough because of Maher Pasha's reluctance to challenge many of the Wafdist appointments. Furthermore, the large quantity of arms circulating among the resistance forces had not been collected and were a menace to internal security. As many of these arms were held by fanatical patriots who recognised only their own view of patriotism, the danger of assassinations was great. Parliament was entirely dominated by the Wafd. Both deputies and officials could be relied on to work for the maintenance of Wafdist influence. Palace advisers and Maraghy Bey and Motaal Bey believed that neither security nor progress could be achieved under these conditions.

Hilaly Pasha, Aly Maher's successor, had refused office after the riot of January 26th, but took it now. He at once issued the Public Prosecutor's forthright report on responsibility for the riots. This deeply implicated the Wafd Minister of the Interior, Serag ed Din. The buttons are off the foils ; the decision whether not to break, or to try to break, the Wafd has been taken. The Wafd has retaliated by announcing that it will not support Hilaly Pasha's government ; the meeting at which it decided on this policy is said to have been inharmonious. On the " national question," it has reiterated the well-known aims, but has launched a fresh appeal to nationalistic fervour by adding that it " rejects any form of common defence." By this stand it intends to make Hilaly's path to Anglo-Egyptian negotiations as difficult as it can.

If Hilaly remains master of the situation, these negotiations may not occur immediately. He has said that the solution of the Anglo-Egyptian question is " the first thing with which I was entrusted," but that " I am as yet only at the beginning of my study of the question ; I cannot fix a definite period for the conclusion of my study." Meantime, together with Maraghy Bey, whom he retained at the Ministry of the Interior, he is pursuing his onslaught upon the Wafd's former iniquities upon the home front. The present Parliament is unlikely to meet again.

Hilalys' future hangs, first, upon whether a split in the Wafd has occurred and, secondly, upon whether, if this has not happened, the army can once again be relied upon to tackle the crowd should the Wafd decide upon a course of violence. Either situation would be more likely to develop in his favour if he felt sure that the British were ready to reiterate, and to start executing, their undertaking to evacuate subject to suitable multi-power arrangements for Middle East defence. His chances would be still further improved if as part of these arrangements—better arms and training for the Egyptian army were known to be on the way.

After the Indian Elections

[FROM OUR CORRESPONDENT IN INDIA]

THE Congress party has achieved its expected victory in the Indian elections, but it is clear that it has been returned to power only on probation. The electorate felt it owed the party a debt for services rendered ; but now that independence, integration and a democratic constitution have been achieved, it wants from its government honesty, food, cloth and housing. The electorate has also made it plain that Congress candidates have to be worthy of its trust ; 28 ministers, including three chief ministers, were defeated at the polls. Many Congress successes, moreover, were obtained on a minority vote through the divisions of its opponents ; in fact one successful congressman actually forfeited his deposit. Nowhere did Congress get more than 60 per cent of the vote ; in most states it got between one-third and a half.

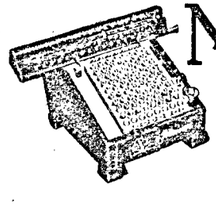
The most ominous result of the elections has been the failure of the Left Centre, in whom it was hoped to find an opposition. The spray of recent splinters from the Congress, the Kisan Mazdoor Praja (KMP), the Krishikar Lok, the UP dissidents, all failed miserably. But of far greater importance is the failure of the Socialists. Nobody except Congress gained more votes than the Socialists who scored ten million to the Communists' six, but, even in Bihar (where they got one fifth of the vote) or in Bombay city (where they got one-third) they did not obtain enough seats to be taken seriously. Parties, to keep their vote and their workers, must, as the Liberals have discovered, have some chance of getting power. Much in India will turn on whether the Socialists now leave their somewhat ivory tower and turn to hard work and concrete programmes, or whether, despite the efforts of their leaders, their followers succumb to the Communist siren-cry of Left unity.

The Communists, by contrast, have made every vote tell. They got only 6 per cent of the poll, but this has given them 6 per cent of the seats concentrated in an area sufficiently small and compact to enable them to be effective. In three-quarters of India they secured no support at all—in Bombay, for example, they got only one seat, in the Uttar Pradesh and Bihar, none. They failed miserably with their chosen people, the proletariat. Around Calcutta, that hell of the working classes, they got only three out of 21 labour constituencies. The Communists' success has been confined to Bengal, Tripura, Madras, Hyderabad and Travancore-Cochin. But there they have done well enough to be a formidable factor. In Tripura they claim a majority—but since Tripura is still centrally administered, this is of limited importance. In Bengal they got 28 seats out of 238, mostly from the area round Calcutta and there is a danger that they will hypnotize the smaller Left parties who won another 16 seats.

Of all the Communist victories those in the three southern states are the most important for, in Madras and Travancore-Cochin the Congress has no majority, and in Hyderabad its majority is only 11. In Madras, the Communists have 61 seats out of 375 ; in Hyderabad, 42 out of 175, in Travancore-Cochin 32 out of 108. These figures, however, minimize their real strength for two reasons. The first is that within the states, their victories have been very concentrated. In the Telugu country of Hyderabad and Madras, in seven contiguous districts where until last November an almost Malayan guerrilla war was being fought against them by the army and police, they got 60 out of 101 seats. In the rest of the Telugu country they got only 13 seats ; nevertheless, were Mr Nehru to concede the Telugus their demand for an Andhra State, the Communists might well be the core of its first Government.

The second reason is also the explanation for the Communists' present great importance in the south. A considerable proportion of the members of these three Assemblies, who are neither Communist nor Congress, prefer the Communists

R.S.V.P.



Our social intercourse is peppered with these little formal Gallicisms. French is, indeed, not only the language of formality—the diplomatic language—but, pre-eminently, it is the language of the table. It is the language of the *connoisseur*, the *gourmet* ; it is the language of the *carte du jour* ; that being so, it is the language of the *chef de cuisine* below stairs in the Connaught Rooms. Here, where no fewer than twenty of the most sumptuous banqueting halls are gathered together under one roof, London enjoys a veritable *chef d'oeuvre* every night : it is an amenity which has no equal anywhere on earth.

to Congress. This is true of the Peasant and Workers Party (10 seats) and the Scheduled Caste Federation (5 seats) in Hyderabad; the KMP (35 seats), the Tamil Nad Toilers' Party (19 seats) and some Independents in Madras; and some Independents in Travancore-Cochin. The Peasants and Workers are Marxists under another name, but the Tamil Nad Toilers are a local caste party of the Vannyas, and most of the KMP are Conservatives. The Communists will therefore have to pay a high price to get a minimum coalition programme agreed. In Madras they have already consented to pay compensation to small zemindars. Nevertheless the chances are that they will not be able to form a coalition government even in Madras. In all three southern states, however, they have already emerged as the core of the only formidable opposition the Congress will have to face anywhere, while their 27 seats in Parliament (compared with 346 for Congress so far) may be just enough for effectiveness. If this relative effectiveness makes them, as it might, the focus of all discontent, their strength could grow quite rapidly.

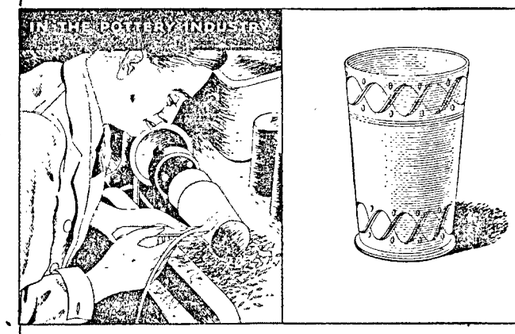
As always, and everywhere, it is society's omissions, rather than Communist commissions, which gave the Communists their successes. The Telugu districts where they got their votes are districts of rack-rented tenants and numerous landless labourers; elsewhere they got many votes from the hungry, under-employed coir workers of Travancore-Cochin, from the idle hand-loom weavers of Malabar, idle for lack of yarn, and from the lower middle class of Bengal which has been so hard hit by inflation and partition. In the guerrilla districts, past police "repression" has been their best electoral trump, which more than blotted out their own past atrocities. Everywhere they throve most where they had agitated most. In Hyderabad they also benefited from the widespread distaste of the people for their Nizam and their transferred resentment against a Congress which had made the Nizam Rajpramukh. In Andhra, the splits and mud-slingings of Congress, the evil repute of the Congress factions in office, and the Centre's refusal of an Andhra State, were all pressed into service in favour of the Communists. Many Congress defeats, too, and not only by the Communists, were due to the widespread and not unjustified belief of the southerners that they are neglected by Delhi. They have the most rigid food procurement and the lowest ration, the highest state taxes and the least central aid. The Communist successes are already paying the southern states dividends; it has been announced that they will get more rice.

The Communists have, for the first time, emerged as a possible opposition, limited and local though their support still is. The choice for the elector five years hence will be economic, not moral, and the Communist talk is all of land, food and housing. It is part of this new emphasis on economic issues that Congress has almost completed the change from a national movement to a conservative party of an almost English type. Though social reforms still continue, where practicable, there is now in general little talk of the welfare state, food subsidies have just been almost entirely abolished and nationalisation is no longer a panacea and a menace. The Five Year Plan, which was one of Mr Nehru's major planks, emphasises all the old-fashioned virtues; work, efficiency and thrift, production and investment. Congress and Communists alike are committed to turning India into a modern, industrialised state.

German Claims to Eastern Markets

According to the East German news service, some West German businessmen recently attended a meeting in Berlin to discuss the forthcoming unofficial Moscow conference on east-west trade. They were invited by the Liberal-Democratic party, the eastern zone's version of the conservative Free Democratic Party. Their hosts asked them to see that the economic newspapers of Western Germany published articles in favour of the Moscow gathering, and explained frankly that one of its objects would be to find ways of evading the restrictions on exports to the Communist countries imposed by the American Battle Act.

A number of factors tend to make German industrialists and traders, especially in the Ruhr and Hamburg, lend a particularly ready ear to propaganda for the Moscow meeting. Scanning British and other trade statistics, Lloyds list and the passage of ships through the Kiel canal, the Germans conclude that their competitors are taking trade with the Soviet Union, China and the satellites which is forbidden to them. A Panamanian ship which was forced to unload its cargo, destined for China, in Hamburg last year, is now sailing on the east-west trade route under a Polish flag, and other vessels still flying the emblem of Panama continue to discharge in Chinese Communist ports. Above all, the British still sell machinery and rubber for Soviet timber and grain. It is true that the Bonn government has to apply the same restrictions as other countries receiving American aid, and no more; but the Germans find themselves subjected to more rigid supervision than their competitors.



The German industrial and trading world has no Communist leanings whatever, and has pledged itself to aid in western defence production—in the first place by increasing steel and coal output. But they regard Soviet Russia as their natural trading partner. They have not woken up to the vast changes that have taken place in the Communist sphere. Poland, Central Europe and the Balkans are no longer countries eager to sell great grain surpluses to Germany for manufactures—in fact, these areas are suffering from food shortages owing to the over-rapid pace of industrialisation, peasant resistance to collective farming and the Soviet Union's stockpiling. But the Germans do not realise that times have changed. They remember not only the days when Germany was dominant in the Balkans as almost the sole purchaser of surplus grain, but the earlier period of the Soviet-German treaty of Rapallo, when German industry and a government-sponsored credit institute helped the infant Bolshevik republic to establish itself. The Germans underestimate Russia's industrial progress; and, in any case, they see that China has now taken the USSR's place as a vast under-developed country bent upon industrialising itself.

The United States, by contrast, is a competitor which, it was hoped in Germany, would be unable to maintain its

THE HOUSEHOLD NAME

OF A SERVICE TO INDUSTRY

Brown & Polson starch products

WHEN liquid glaze dries on pottery ware, it leaves an even coating of finely powdered glass, which very easily rubs off before it is fired. The mere touch of a finger leaves a noticeable thin patch in the finished glaze.

MODIFIED STARCH AS A GLAZE BINDER

The Brown & Polson Group recommended the mixing of modified starch with the liquid glaze, to bind the glass powder to the ware until it was fired. This is now the main use of starch products in the pottery industry.

MODIFIED STARCH BINDERS FOR REDUCING BREAKAGE

Some potteries are using modified starch binders experimentally for strengthening the ware itself before it is fired. They have proved that modified starch mixed with the clay can treble the strength of the delicate, unfired ware, and so save costly breakage during handling and trimming. Modified starch binders have also been widely used for strengthening the big fireclay containers (called 'saggars') in which pottery ware is first fired. Stronger saggars save oven space, for they can be stacked higher without collapsing.

The development of modified starch binders for the pottery industry is one example of the kind of service that the Brown & Polson Group has performed for many widely different industries, and is ready to perform wherever opportunity exists. Enquiries will be answered by responsible experts. They should be addressed to:

UNICORN LEATHER CO. LTD., (Department ET5) Woodhill Works, Bury, Lancs.

CARRON THE ROYAL CHARTER COMPANY FOUNDED IN 1759

Would a better Canteen help production in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

SPEED THE NEW HOUSES

There is PLENTY OF **LEAD** for Water and Gas Pipes, and Roof Flashings

Lead Industries Development Council, Eagle House, Jermyn St., London, S.W.1

You may think you are right—

but have you proved it?

If your business uses duplicating, you are probably convinced that you know which duplicator will give you the best service — but have you *proved* that your conviction is right? Roneo believe that the only way to arrive at a true answer is to have a comparative test of all duplicators—including, of course, Roneo '500.' We know that a side by side test will prove beyond doubt the great advantages of Roneo '500.'

● Considerable saving in running costs. ● Really automatic inking giving continuously even work without stopping to re-ink. ● Interleaving, with blotting or other paper to prevent smudging, is unnecessary. ● No proofing. The very first copy is usable. ● 16,000 copies from a lb. of ink ● Quick clean colour change in 25 seconds. ● Better standard of work with greater speed.

Write for booklet "Let's take a back seat", which gives users' reports on Roneo '500' that may help you to economise.

exports of consumer goods and capital equipment once defence production began. Instead, German business circles have noted with consternation that American industry is capable of giving the world not only "guns and butter" but "guns and the whole cow." The first signs of a recession in steel and of unsold stocks of textiles made German industrialists and traders more determined than ever to secure a firm standing in the under-developed areas of the world. The danger signals from America heightened interest in the Moscow conference, at which China and other Far Eastern countries will be represented. So have the Australian import cuts, and the latest trade treaty with Britain, which obliges Germany to take more British surplus textiles than before.

Restrictions on east-west trade naturally irk the Germans more than other businessmen, because they apply to exchanges with their fellow-countrymen on the other side of the Elbe. Interzonal trade is now at a standstill, except for smuggling and barter deals by individual firms. The fault lies more with the Russians than with the Allied bans. The Soviet authorities have refused to comply with the Bonn government's condition for concluding a new interzonal trade agreement—that Berlin trade should not be hampered. On the contrary, the Russians have just cut off electric power to West Berlin, and the Federal Republic has retaliated in kind. True to Soviet tactics, the Russians are demonstrating their power over Berlin, at the same time as offering the Germans peace, unity and a national army.

The Ruhr is watching with some concern the way in which the eastern zone is making itself relatively independent of steel. Even fine alloy steels will be produced on a fairly large scale next year. However, the latest East German statements on the fulfilment of the 1951 plan prove beyond doubt that Allied restrictions on trade have seriously affected the economy of the Soviet zone. The Minister of Planning, Herr Rau, has admitted that 21 per cent of the zone's imports were to have come from western countries, but that the foreign trade plan had not been fulfilled. Troubles in the great new steelworks on the Oder have, however, been due chiefly to another cause: the callous treatment of the workers (who include thousands of women). Owing to labour unrest the plan for crude steel production has not been fulfilled. The yearly plan in Eastern Germany as in other Soviet-controlled countries is more than a target. It is a law, and people who break it must suffer the penalties. In consequence, some of the old Communists, such as Selbmann and Lohagen, who have domineered over East German economic life since 1945, have been reprimanded and demoted. The whole central designing bureau has been disbanded and other reforms and purges have been ordered.

On both sides of the Elbe the urge to resume free trade is irrespective of any desire for political reunion. In Western Germany, the appeal of national unity is watered down by the well-to-do man's fear of having to share his wealth with a poor relation. And for their part the East German Communists seem to have been ordered to fulfil the economic plan and overcome the shameful discrepancy between the two Germanies before the parts are reunited. Forces, therefore, are working for a resumption of trade, despite restrictions and political differences. It is a sign of the times that the new Federal German trade treaty with Poland was very smoothly negotiated. Subject to approval by the High Commissioners the treaty provides, among other things, for the exchange of West German rolled steel products for rye, some of which will probably come from the former German territories east of the Oder-Neisse line.

HOW MUCH DEPRECIATION?

With rising prices, many business executives are concerned with the provision they should make for the future replacement of fixed assets. The Economist Intelligence Unit, in conjunction with the Association of Certified and Corporate Accountants, has compiled indices showing changes in the prices of different classes of new plant, machinery, and factory buildings. All indices cover the years from 1938, and some a longer period. Combinations of indices, or special ones, can be prepared to meet individual needs. Each index is kept up to date quarterly.

From Suvorov to Rokossovski

APART from the Americans, there is no nation on earth in whose history the idea of a constitution has played so great a part as the Polish. The traditional constitution of the old Polish Commonwealth, with its *liberum veto* which permitted a single man to obstruct legislation, is generally considered to have been one of the main causes of Poland's fall in the 18th century. The constitution of 1791, a noble document inspired by the ideals of the American and French Revolutions, was hailed as the prelude to national revival. But it was followed by the armed intervention of Catherine II of Russia and her accomplices, the Emperor of Austria and the King of Prussia. The hopes of 1791 were trampled down by the soldiers of Suvorov; even so, they inspired generations of Polish patriots.

The first constitution of the Polish Republic, in 1921, was similar to that of the Third Republic of France. In particular, the President of the Republic had only very limited powers. This won it the hatred of Marshal Josef Pilsudski, who had been Head of State from 1918 to 1921, and increasingly regarded himself as the sole repository of all the virtues of the Polish nation. Having seized power by force in 1926, he took his time in abolishing the constitution. The process was formally completed in 1935, when a new constitution, of an authoritarian type, was introduced and carried by a trick of procedure in a hostile Parliament.

The 1935 constitution never commanded the loyalty of the majority of the Polish people. When Poland was again partitioned by the heirs to the King of Prussia and Catherine II, it was generally assumed by the fighting Polish people that liberation would bring a new regime. This view did not, however, prevail in the Polish emigration. The leaders of the Polish Government in exile were democrats, but among the officers, diplomats and civil officials who implemented their policies the heritage of Pilsudski was still honoured. Even so staunch a democrat as Premier Mikolajczyk felt unable to repudiate the 1935 constitution. This refusal of the exiles to declare invalid a regime imposed by fraud and maintained by force, was exploited against them by the agents of Moscow.

Continuity with the Past

Even today the Polish emigration—which far exceeds in quantity and quality the emigrations from the other East European countries—is torn in two on the issue of the 1935 constitution. After his experience in postwar Poland, Mikolajczyk decided to repudiate this legacy of the Pilsudski era, and part of the Peasant Party exiles support him. On the other hand the 1935 constitution is upheld not only by followers of Pilsudski, but also by the conservative Nationalists who were Pilsudski's bitterest enemies and—most surprisingly of all—by the Socialists. Their argument is that the legality of the Polish State must be preserved, even in so unsatisfactory a form as this. This triumph of legalism over

political commonsense can only be explained by the passionate desire of the Polish leaders to maintain continuity with the past. The elder statesmen of today's Polish emigration spent the formative years of their lives either in exile or in rebellion against foreign rule. They feel a strong compulsion to prove to the world Poland's historic right to an independent existence. This mentality must and can be sympathetically understood by friendly nations. But it undoubtedly impedes common action with other European exiles, who have not the same psychological background.

It might have been feared that the devotion of the exiles to the "fascist" 1935 constitution could be exploited by Communist propaganda within Poland. This is, however, unlikely to produce much effect at a time when a close copy of the "glorious Stalin Constitution" is being forced on the Polish people by the Bolshevik successors of the Governors-General of the Tsars. Already in 1947 the "popular democratic" regime introduced a "small constitution," which combined certain articles of the 1921 constitution destroyed by Pilsudski with others resembling the constitutions of the other East European satellites. Now a complete constitution has been published in draft form for "public discussion," and will doubtless be enacted with the customary enthusiasm in the near future. That it has been produced so much later than the other east European constitutions is probably due to knowledge in Moscow of the exceptional strength in Poland of anti-Russian nationalism.

Presidency Abolished

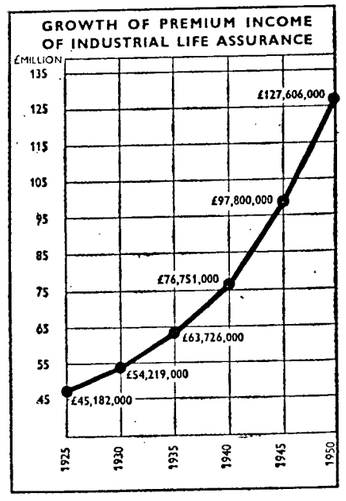
Minor concessions are made to Polish national feeling. The white eagle remains the coat of arms of Poland. The Speaker of the parliament preserves the traditional title of "Marshal." The body which performs the functions of the Presidium of the Supreme Soviet of the USSR is called the "Council of State." But essentially this is a replica of the Stalinist constitution. The office of president is suppressed. Its ceremonial function is held by the Chairman of the Council of State. This brings Poland into line with all the other people's democracies except Czechoslovakia. It will be interesting to see if Bierut, who now holds the Presidency, will take on the decorative post of chairman or will concentrate on the office which represents his real power—the general secretaryship of the party. The local organs of government—the National Councils—correspond to the Soviets—not of course to the more or less democratic and representative soviets of 1905 and 1917, but to the emasculated soviets of 1936. Judges are elected, which means nominated by the same body that nominates the parliamentary candidates. The functions of the Public Prosecutor are not specified in the Constitution but are laid down in separate laws. It may, however, be assumed that the office is endowed with the same all-embracing powers to which the holder of its Soviet prototype, Andrei Vyshinski, owes his career.

Unlike the constitutions of the other satellites, the Polish one actually mentions in its text the institutions of collective farm, tractor station, labour competition and shock worker. At the same time it guarantees the right to inherit land. There is the usual impressive series of rights and liberties, accompanied by the less impressive "escape clauses" which nullify them. The right to leisure, for instance, is ensured by the organisation of collective "recreational facilities." Equality of women with men includes the right of women to go down the mines and to do night work and heavy labour, from which the labour laws of the "reactionary" prewar regime excluded them. Religious freedom is guaranteed, but "abuse of freedom of conscience and religion for purposes endangering the interests of the Polish People's Republic is punishable." Freedom of association does not extend to bodies "whose aims and activities are directed against the political and social structure or against the legal order of the Polish People's Republic."

The interpretation of such phrases, and the nomination of those who will fill the various elective posts in the executive and legislative hierarchy, belong to a body not mentioned in the constitution—the Polish United Workers' Party. Unlike its august model, the All-Union Communist Party (Bolsheviks), which is mentioned in article 126 of the Stalin constitution, the Polish party prefers to remain in the background. The formal reason for this is that other parties still nominally exist and participate in the government. Probably the real reason is that Moscow does not yet consider that Poland has advanced sufficiently to deserve the honour of a complete copy of the Stalin constitution.

For the real power is held not even by the Workers' Party but by Moscow. Of this fact there is a very tangible proof in Warsaw—Marshal of the Soviet Union Konstantin Rokossovski. Eminent among the heroes honoured in the Soviet Union, and therefore entitled to compulsory veneration in the "popdemocracies," is Suvorov, who drowned Poland in blood in 1793. His successor, Rokossovski, worthily followed his example, bringing not liberation but enslavement. Suvorov destroyed Poland's true constitution: Rokossovski instals a "constitution" prefabricated in Moscow. Few Poles—few even of Poland's few Communists—will have missed the parallel.

Strong Men of the South



WHEN General Batista overthrew the government of Cuba on Monday, he was reverting to a Latin American tradition which is somewhat outmoded. "Strong men" still rule a fair proportion of the twenty republics south of the Rio Grande, but in recent years their methods of attaining power have shown an interesting change. Time was when every dictator ousted by a rival, or by a popular uprising, was expected to devote the rest of his life to plotting a violent return. Today it is more fashionable for such a man to recover power not by bullet but by ballot. Ex-presidents have been inspired by the example of Dr Getulio Vargas, who won the presidential elections of 1950 in Brazil and thus regained by democratic means the office which had been wrested from him in 1945 after his long spell of absolute power; but not all of them, once in power, are as likely to observe the constitution as Dr Vargas. In Chile, for example, General Ibanez, whose dictatorship ended over twenty years ago, is contesting the election which is due this summer; and General Batista himself was, until this week, inviting Cubans to vote for him in June.

The smooth execution of Monday's *coup* was in part the result of long practice. It was General Batista's fifth revolution, and his influence with the Cuban army has been unrivalled for over twenty years, although his principal aides now seem to be captains instead of sergeants. But to some extent he has also reminded other neighbouring governments how easily they can still be overthrown by a military *junta* if they fail to keep the active loyalty of their peoples. The blend of splinter politics and corruption which has marked Cuban public life in recent years is not unique in Latin America, or unparalleled in other continents; and the lesson that democracy must win respect if it is to survive is a salutary one however small a country it comes from.

In view of the prevalent habit of tarring all Latin American countries with the same brush, it is good that another recent event has demonstrated the vitality of democracy elsewhere in that region. The constitutional reform in Uruguay this month is the fruit of a long period of stable two-party politics, during which the opposition has loyally resisted all temptation to seek by violence the power it has never obtained through the polls. Its reward is now to be given a voice in the government at the insistence of its triumphant antagonists.

Ten million open doors

IT IS OVER TWO HUNDRED YEARS since Edmund Halley, the astronomer, turned his attention from the stars to the study of population statistics. At about that time a similar problem on a modest scale was engaging the attention of some fishermen in Kent. They were concerned with the uncertainties of this mortal life because, being prudent men, they were anxious to make some provision for their families if their scanty earnings ceased through sickness or death. And so they joined together, as did many other similar local groups, to set up a common fund to which members made weekly contributions. These were collected (for the fishermen were sagacious men who knew the value of incentives) at the local inn.

As far as the 'Old Dredgers' of Faversham were concerned thrift was a wholly personal matter. Today, however, it has a wider, national significance. Careless spending lies heavily upon the conscience of the dutiful citizen. He knows that if he saves money, then, in some mysterious way, it is good for the country. In the long run, of course, it is also good for the dutiful citizen. Nevertheless, the fact has to be faced that for every score of us who would willingly travel a mile to spend a pound, there are only a few who would cross the road to save sixpence.

IT is all the more surprising, therefore, to find that people do manage to save money—and, moreover, to save it consistently. Most of them—indeed, about four out of every five families in the country—do this by paying insurance premiums to agents who call regularly at their homes. This is a form of thrift that satisfies an urgent personal need. It offers immediate relief from anxieties with which the provident fishermen of Kent were very familiar. And it is a way, in many cases the only way, of giving men and women in this workaday world the confidence to make their own plans for a future in which, through endowment assurance, they and their children have a personal stake.

THIS service originated about a hundred years ago as a means of making life assurance available for folk of modest means. It has succeeded in revolutionising the thrift habits of the nation. The Victorian pioneers of industrial life assurance recognised that saving, even if it could never be made effortless, could at least be made easy. This they achieved by introducing a regular collecting service—and with it, the insurance agent. Today it is he who keeps alive the habit of thrift in ten million households whose doors are opened to him, week in and week out, throughout the length and breadth of the land. The savings of many millions of these families depend upon the personal service which he brings to their homes; and the nation depends upon it to the tune of over £40,000,000 net savings every year.

THE agent's success as a missionary of thrift arises less from what is commonly understood by salesmanship than from the services which he offers his policyholders, whose confidence and goodwill are of supreme importance. The essence of his job is to take pains to understand other people's problems. This is exemplified by the care with which he arranges his routine of weekly 'calls'. He knows how very slender is the thread that holds intact the resolution to put by ready money for future needs. And so he adjusts his methods to suit his policyholders. Many, although by no means all of them, are weekly wage-earners. This means that the agent's timetable, which takes him, on an average, to several hundred homes between one pay-day and the next, must take into account local circumstances and customs and the personal convenience of the people from whom he collects premiums.

THESE premiums total, at the present rate, about £130,000,000 annually. Twenty years ago they amounted to less than half this figure. The consistent increase in the volume of premiums collected is a reflection of the agent's ability not only to initiate, but to help sustain the habit of thrift among his policyholders. But if he were no more than an efficient collector of premiums he would scarcely be regarded, as he is in so many homes, as a family friend and confidant. When claims arise his policyholders look for quick and sympathetic attention; and his counsel is sought upon a hundred-and-one problems, many of them only distantly related to insurance. Above all, he is the man who can provide assistance and advice on the spot.

HERE, perhaps, is to be found one of the most important of all savings incentives. It springs from the recognition that thrift begins at home. It is here that motives, means and opportunities are examined in the light of domestic circumstances that vary widely between family and family. To these personal problems the voluntary thrift movement developed by the Industrial Life Offices brings a personal service that has become a factor of immense importance to the nation's economy.

Issued by the Industrial Life Offices

THE BUSINESS WORLD

The Budget

BOTH in its details and in its general shape, Mr Butler's budget has taken the world by surprise. Hardly anyone supposed, before the event, that the budget could match the exacting needs of this year of crisis unless it fortified, perhaps substantially, whatever surplus confronted the Chancellor on the basis of 1951-52 rates of taxation and subsidies. Actually, Mr Butler has given away in reliefs more than he is taking back in tax increases and cuts in subsidies, thus whittling down his prospective surplus by some tens of millions. This, he asserted, would still be adequate for the two purposes most immediately in view—the convincing of overseas opinion that Britain means business in its drive for external solvency, and the keeping of inflation at bay in this year when import cuts and export efforts are depleting supplies of goods at home. Not all outside observers will accept this view; and in any case it arouses grave doubts about the Government's attitude to the problems of 1953, when there will no longer be either scope or excuse for drastic raids on the nation's capital resources.

Mr Butler's budgeting, seemingly at variance with earlier assumptions about the need for sternness, springs partly from estimates that suggest that the total strain to be imposed upon domestic resources by the effort to close the external gap may be somewhat less violent than that implied by the unusually sketchy data previously available. Unquestionably, he can also plead that, while the budget is softer than had been expected, the monetary policy is substantially harder. The increase in Bank rate from 2½ to 4 per cent, which will lift rates for commercial and industrial borrowings to levels that should provide real deterrents, should impress overseas opinion and, by narrowing the short position against sterling, should play a valuable part in helping the gold reserves to surmount this year's "hump" of pressure, in the critical phase before the cuts in imports give their full relief. Scarcely less significant is the evidence this move affords that the government is prepared, despite criticism from the Left, to lean still more heavily upon monetary policy as an instrument of domestic disinflation. There may be reason to hope, therefore, that if the budget formula proves to have been too mild to keep inflation in check, monetary measures will be allowed to redress the balance—though only within the limits set by an apparent tenderness towards the consumer goods industries and a reluctance to push disinflation to the point needed to induce transfers of labour, two attitudes that have disquieting implications for 1953.

The statistical foundations of the budget are this year less clearly discernible than at any time since Sir Stafford Cripps introduced the principle of disinflationary budgeting in 1948. That is no criticism of the budget as such, and some may even feel it to be an improvement, for the long exercises in higher economic analysis have always been bewildering to the great majority of the Chancellor's audience—inside as well as outside the House. But the first test of the adequacy of a budget still has to be the manner in which it fits into the pattern of the national economy as a whole; and although Mr Butler did not attempt to construct the "savings-investment" account upon which expert commentators have previously relied for their judgments on this pattern, he fortunately gave sufficient data to indicate his underlying line of argument.

It differs significantly from the line unofficially deduced from his end-January speech. It then appeared that the gross displacement of resources required to bring the external account into balance, or better, in the second half of this year would be at an annual rate of at least £750 million (representing some £500 million of cuts in external expenditure and around £250 million of additional exports, principally of capital goods diverted from home investment). Since then, the Chancellor now reveals, it has been decided that Britain's effort must be stiffened still further: whereas it was first planned to reduce the non-sterling deficit from £575 million in the second half of 1951 to £100 million in the second half of this year, now the object is to extinguish this deficit altogether (after taking credit for external aid), and accordingly the Government has imposed a further £100 million of import cuts. This naturally makes the whole task correspondingly more arduous; yet the Chancellor founded his budget on the assumption that the required displacement of resources in 1952-53, compared with 1951-52, will be £600 million—a substantially smaller sum than had been guessed previously.

Three considerations explain this rather puzzling discrepancy. First, it is now evident that the cuts in overseas expenditure previously announced represented cuts on a programme, not estimated reductions on the actual expenditure of the previous year. The three sets of cuts, totalling £600 million, including some invisible expenditure, are now equated to a reduction of £350 million in actual expenditure upon imports in the calendar year 1952 compared with 1951 and one of £300 million or more in the fiscal year 1952-53 (on the basis of 1951-52 prices). Secondly, the fact that the cuts are smaller than had previously been supposed does not mean that the Government is envisaging a residual deficit on the balance of payments as a whole. It assumes that in 1952-53 the contribution made by the cuts in imports will be supplemented by a gain of £200-£250 million from improving terms of trade and net invisible income and by a net increase of £50 million in exports (after allowing for a sharp decline in exports of consumer goods). This hoped-for total improvement of £550-£600 million is reckoned to be roughly equivalent to the actual total deficit incurred in the fiscal year 1951-52; in the calendar year 1951, the estimated total deficit was £516 million. Finally, it should be noted that a large part of the steep increase in the deficit in the second half of that year (when the annual rate was £800 million) was attributable to stockpiling, now to be sharply curtailed; earlier calculations based on the half-year's experience may, therefore, have been a little misleading.

Because of the cuts in stockpiling, the Chancellor expects that only about half the reduction of £300 million or more of imports in 1952-53 will be felt as a depletion of currently available supplies; but when allowance is made for the diversion of goods to export markets, the effective additional strain that has to be borne to close the external gap (without crediting external aid) is estimated at £200 million. A further £200 million of real resources has to be found for the defence programme, so that the total new strain upon current domestic resources is £400 million. Mr Butler assumes, rather optimistically, that £250 million will come from additional production; that £50 million will be released by the economies in the Government's civil expenditures (a smaller sum than had been implied by his previous estimate that the cuts were equal to 1½ per cent of the national income); and that civil investment will fall by not less than £100 million. He thus neatly balances his "real" account, and concludes that even in this year of emergency there is no need to cut the real level of consumption; the only need is to prevent it from rising. The vulnerable points in this argument are the assumptions about the terms of trade, invisible exports and the level of production, any one of which, or all three, could easily disappoint the Chancellor's hopes. Together they account for £500 million of credits in his balance sheet; he has, however, a possible hidden reserve in the assumption about investment. If monetary policy were toughened, the cut here could probably be raised much beyond £100 million; but it is a deplorable prospect that, in this year when the consumer is being saved by drastic raids on capital, the only expedient remaining for new setbacks is to make still bigger raids.

Even so, this "real" accounting is more acceptable than the financial reckoning. The last step in Mr Butler's underlying thesis is the assertion that no budgetary action is needed to achieve his aim of stabilising the real level of consumption—despite the fact that personal incomes

* This figure does not take account of the net saving in expenditure resulting from the reduction of food subsidies and increased payments of pensions, insurance benefits, family allowances, etc.

are now substantially above last year's average level, despite the new pressures likely to be provoked by the cuts in subsidies, and despite the further increment that will accrue to spendable incomes if his estimates of additional production are realised. The outside investigator has been given no means of testing this assumption for himself. The Chancellor merely asserted, without any statistical documentation, that it will cost consumers this year £400 million more to buy the same volume of goods as last year, and that this strain on their pockets will be just equal to the additional sums they spend—without presupposing " any great increase " in voluntary saving. This is the most dubious assumption of all ; it is, in principle, precisely the one upon which Mr Gaitskell leaned so heavily—and, as events proved in the end, so dangerously—last year. He, it is true, had not unsheathed the monetary weapon ; but it remains to be seen whether Mr Butler is prepared to use it to prevent wages from chasing prices—for the purpose, not primarily of cutting investment to relieve consumption, but of putting a direct brake upon consumption itself. In this context, too, it appears that the only emergency expedient is the possibility of cutting capital further.

By the standards of the past, the Chancellor's premises would have dictated a no-change budget ; and, judging by these standards, Mr Gaitskell professes an inability to understand why the budget was introduced before the conventional time. Mr Butler, however, has new and more hopeful standards. All the more important of the considerable changes he has made—with the one strident exception of the new excess profits levy—derive from the conviction that the drive for bigger output and greater efficiency must at last be inspired by relief from the burden of taxation upon incentive and must be supported by a more realistic structure of prices. It may be that the first touch of this wand will yield a gain that will make good at least part of any gap left open by over-optimism in the other calculations.

★

On the 1951-52 basis of taxation, the Chancellor had in view for the new fiscal year a surplus that reached the most optimistic of unofficial guesses. He put the additional yield from direct taxation at no less than £430 million so that, despite the steep fall expected in miscellaneous non-tax revenues, his total estimated ordinary revenue was £4,778 million, or £338 million more than the expected out-turn of 1951-52. Ordinary expenditure for 1952-53 accorded roughly with the unofficial forecasts and, after the arbitrary subtraction of the £85 million sterling counterpart of external aid (causing a corresponding understatement of real expenditure), it is shown as £4,240 million. Hence the prospective above-line surplus was £538 million on the conventional accounting (or £687 million on the alternative classification, which excludes capital items).

The Chancellor's concessions, taken as a whole, provide for the disbursement, in a full year, of no less than £314 million, of which some £260 million will be financed by additional taxation and postal and telegraph charges. In 1952-53, however, the net disbursement will be at only half this rate, absorbing £27 million, and thus reducing the prospective surplus to £511 million on the conventional reckoning and £660 million on the alternative classification. Only some of the changes, it should be noted, are reflected in the financial statement (and in the tables reproduced on page 657), because some of them will be the subject of supplementary estimates and others have still to be worked out in detail.

The only tax increase—apart from the new Excess Profits Levy and the increases concealed in the redistribution of purchase tax, analysed in detail below—is that in petrol duty, which will bring in an additional £66 million both this year and next. The Chancellor explained this increase partly by the need to enforce economy in the use of a burdensome import and partly by his desire to enlarge the resources available to him for the granting of incentive reliefs and for the mitigation of hardship elsewhere. The main fund for this purpose was, of course, that provided by the cut in the provision for food subsidies from £410 million to £250 million ; but a small contribution will come from the increases in postal charges (£10 million this year and £14 million next). Of the £160 million saving on subsidies in a full year, a net £80 million will be disbursed in additions to pensions for old age, war service, industrial injuries and public servants ; these are the changes that remain to be brought into the budgetary accounts, so that a net £80 million has to be added to the prospective surplus shown there.

This £80 million, with the £76 million expected this year from petrol and postal charges, provides finance for the greater part of the large reliefs in income tax. These reliefs, detailed on page 666, will cost £180 million this year and an additional £49 million next year. The Chancellor justified his acceptance of this rising burden in 1953-54 by the fact that then the Exchequer will be reaping the harvest of the new EPL—which will contribute only a nominal £1 million this year but will provide next year a net £100 million, after allowing for the effects of the associated changes in profits tax and the consequential loss of income tax. This is a line of reasoning that defies the logic of disinflationary budgeting: the tax reliefs on personal incomes will boost consumption, whereas the additional taxation of companies, while possibly reinforcing the other restraints upon investment outlay, will mainly be paid merely out of accumulated savings ; it is not to be expected that dividends will be reduced correspondingly and consequentially. This, however, is the problem of next year's inflationary gap ; and the Government, in this as in other respects, is in no mood to anticipate the troubles that lie ahead. In the accounting for this year there is, fortunately, no big flaw of this particular kind—though the same point arises, in principle, on the petrol tax. To the extent that the tax on commercial transport and on industry is not immediately passed on to final consumers, it will in effect be paid from current profits, so that the result of the budgeting is to shift resources from saving to spending. The real inroad into the surplus is, therefore, rather larger than appears—adding yet another morsel (of a few tens of millions) to the doubts about the budget assumptions as a whole.

THE TAX CHANGES

	Estimate for 1952-53	Estimate for a Full Year
	£	£
INLAND REVENUE :—		
Income Tax :—		
Increase in the earned income relief to 2/9ths, subject to a maximum allowance of tax on £450	— 42,000,000	— 53,000,000
Extension of 2/9ths relief to total income not exceeding £250	— 250,000	— 1,000,000
Increase in the single allowance to £120, in the married allowance to £210 and in the child allowance to £85	— 67,000,000	— 84,000,000
Alteration of the reduced rates of tax to 3s. in the £ on the first £100 of taxable income, 5s. 6d. on the next £150 and 7s. 6d. on the next £150	— 71,000,000	— 91,000,000
Surtax :—		
Increase in the limits on the amounts which qualify for relief from Surtax when paid into certain Trust Funds by Lloyd's underwriters	...	— 1,000,000
Excess Profits Levy and Profits Tax :—		
Imposition of the Excess Profits Levy at 30 per cent net	+ 5,000,000	+200,000,000
Reduction in the rates of Profits Tax to 2½ per cent net on undistributed profits and to 17½ per cent net on distributed profits, allowing for consequential effect on Income Tax. Increase in directors' remuneration allowable for director controlled companies	— 4,000,000*	—100,000,000
Income Tax and Profits Tax :—		
Additional allowances to mining concerns operating abroad	...	†
Abolition of time limit for carry forward of business losses	— 225,000	— 250,000
Withdrawal of special deduction in respect of tied houses let for less than their full value	+ 700,000	+ 750,000
Stamp Duty :—		
Reductions in certain rates of stamp duties on conveyances of property other than stocks and marketable securities	— 2,500,000	— 3,500,000
TOTAL INLAND REVENUE	—181,275,000	—133,000,000
CUSTOMS AND EXCISE :—		
Customs :—		
Hydrocarbon oils	+ 63,500,000	+ 63,500,000
TOTAL CUSTOMS	+ 63,500,000	+ 63,500,000
Excise :—		
Hydrocarbon oils, petrol substitutes and power methylated spirits	+ 2,500,000	+ 2,500,000
Entertainments duty	— 500,000	— 250,000
Purchase tax	‡	‡
Betting duty	negligible	negligible
TOTAL EXCISE	+ 2,000,000	+ 2,250,000
TOTAL CUSTOMS AND EXCISE	+ 65,500,000	+ 65,750,000
MOTOR VEHICLE DUTIES	— 850,000	— 1,300,000
POST OFFICE :—		
Postal services	+ 3,630,000	+ 4,180,000
Telephone services	+ 5,775,000	+ 9,415,000
Telegraph services	+ 230,000	+ 200,000
TOTAL POST OFFICE	+ 9,635,000	+ 13,795,000
TOTAL	—106,990,000	— 54,755,000

* Viz. :—Profits Tax — £8,000,000, Income Tax + £4,000,000.
† The cost in future years will depend on factors which it is not possible to forecast.
‡ It is estimated that the replacement of the Utility exemptions by the system of deductions from wholesale value will not substantially affect the total yield of Purchase Tax.

Excess Profits Levy

THE measure of the drain imposed by the new excess profits levy on company savings and industrial capital is the £100 million net that the Chancellor hopes to secure in a full year, after allowing for the collateral changes in profits tax that he proposes. By the standards of company taxation that have become conventional in recent years, this may not seem a grievous sum ; on the old scale of profits tax the Chancellor expected to obtain £460 million in the year 1952-53. But there is no pretence in the new EPL that it is concerned with the " fortuitous rise in company profits because of the abnormal process of rearmament," to quote the Conservative party manifesto. It is based on a normal standard of the average profits of 1947, 1948, and 1949, with no optional years, long before rearmament became a factor in profits. The Chancellor, indeed, declared that he was not prepared to bring into the average the profits of 1950, and still less those of 1951, on the grounds that " the profits of both these years were inflated by the events following the outbreak of the Korean war." No definite time limit has been announced for the operation of the levy ; " it must continue during the period of the emergency."

The Chancellor had already promised to follow American precedent in devising the levy. He has done so, to all intents and purposes, in his selection of the standard years, and precisely in fixing the rate at 30 per cent of excess profits over the standard, with a limit of 18 per cent of total profits. Thus the 18 per cent limit will come into play when chargeable profits exceed two and a half times the standard profits. As already announced, EPL will be chargeable from the beginning of this year. It will apply only to companies " and other bodies," but not to individuals and partnerships—an obvious saving in administration since the latter are caught under surtax. As a result, the number of EPL assessments should be materially fewer than the 80,000 assessments to EPT at the wartime peak when individuals and partnerships were included. The second change, also in the direction of simplification, marks a departure from EPT precedents of even wider importance. The rates of 30 per cent EPL and the 18 per cent limit on total profits are both net rates ; the levy will not be deductible for either income tax or profits tax purposes. The 30 per cent net rate was justified by the Chancellor as being equivalent to the 60 per cent gross rate to which Dr Dalton reduced EPT at the end of the war.

The collateral changes in profits tax are of great importance. During the EPT regime, profits tax was charged only as an alternative, if higher, to EPT. " We cannot " said the Chancellor " be so generous this time." He has therefore introduced a new conception into company taxation—a three-tier system consisting first of EPL, secondly of profits tax (both to be calculated at net rates and not deductible for income tax purposes) and thirdly of normal income tax. The rates of profits tax are to be reduced, with effect from the beginning of this year, to 2½ per cent net on undistributed profits and 17½ per cent net on distributed profits (compared with approximate net rates of 5 per cent and 25 per cent respectively imposed by Mr Gaitskell a year ago). On this, the Chancellor claimed that he had loaded the reduction in favour of

companies that increased their reserves; "thus we fulfil the promise we gave in our election manifesto to reduce the tax on profits ploughed back into the business." Of the promise "to revise the existing system of taxation on commercial and industrial profits"—which was widely assumed to hold out the expectation of a revised basis of assessing profits, taking into account the replacement costs of capital assets—there was no mention in the budget speech. On the Chancellor's own estimates, it will in future be more difficult, not less difficult, for industry to maintain and expand its real capital, for the additional £100 million that he proposes to levy would otherwise have been available to fortify industry's equipment.

This is the broad nature of the levy and the collateral changes in profits tax that are proposed. There are other points of detail that will be of great importance for certain concerns. First, an alternative capital standard will be provided, too limited to attract the majority of established companies, and to all appearances insufficient to protect new businesses whose profits have grown appreciably since the base years from swingeing EPL payments. In substitution for its actual profits, a company may adopt a capital standard of 8 per cent of its paid-up share capital (not its capital employed in the business) for each of one or two of the standard years, or 10 per cent for each of the three years. These rates will be 2 per cent higher, in each case, for director controlled companies. For new businesses set up from July 1, 1948, the standard will be 10 per cent on the paid-up share capital. Standard profits will be increased by 10 per cent of the amount of profits retained in the business and of new share capital raised; but no allowance will be made for capital raised in other forms. Thus the many companies that have made large issues of loan and debenture stocks (largely to avoid the payment of Profits Tax on dividends had they raised new preference capital) will obtain no relief; the interest on such prior charge capital will, of course, continue to rank as a deduction for computing taxable profits.

A further complication arises from the need evenly to distribute the impact of the initial allowances. For plant and machinery these ran at 20 per cent until April, 1949, when they were raised to 40 per cent; from April 5th next they will be abolished. The effect has therefore been, in the base period, and particularly in the last part of the base period, to raise apparent profits, and in the first chargeable year, 1952 (except for the first quarter) to lower them. Companies will, therefore, be given an option to take 20 per cent for plant and machinery and 10 per cent for industrial buildings, both for the standard period and for all chargeable periods, or to have no allowance in any period.

A minimum standard of £2,000 will be provided, and director-controlled companies will be allowed to charge directors' remuneration as an expense, subject to the new limits, which allow an increase from £3,500 to £4,000 where there are two full-time directors, and from £4,500 to £7,000 where there are four or more.

*

The precise impact of these changes can hardly be computed until fuller details of them are given in the Finance Bill—as the Chancellor's speech indicated; this is likely to be a lengthy and formidable document. Even then, it will be very difficult to translate them into precise terms for individual companies. The option for initial allowances, for instance, may make a considerable difference to the end result; companies do not normally reveal in their accounts the extent of the interest-free loans that they have built up during the operation of initial allowances, and which they will be repaying from January, 1954, onwards; and even if they did, the choice of alternatives would still rest with the individual company. Another complicating factor, on which the financial statement is silent, is the effect of the new changes in profits tax on the liability to make good non-distribution relief granted in earlier periods in the event of a later distribution of capital or income.

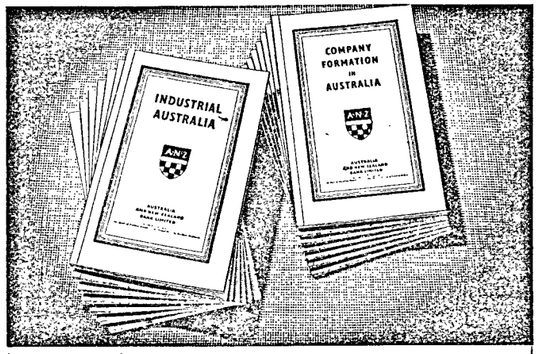
The effect of the new EPL and the revised profits tax are best illustrated at this stage, in a number of *pro forma* examples. Mr Butler explained that on its standard profits a company would pay income tax at the standard rate, or 47½ per cent, together with tax on undistributed profits of 2½ per cent, making 50 per cent as a basic charge. On any sums distributed from standard profits it will pay an additional 15 per cent (representing the difference between the two profits tax rates). Thus the maximum liability to tax, assuming no excess profits above the standard and a full distribution or a nil distribution of available profits, will be as follows:—

EXAMPLE I—Standard Profits	100
(a) Full Distribution	
Income Tax	47·5
Undistributed Profits Tax	2·5
Distributed Profits Tax ..... (15% of gross dividend of 74·1)	11·1
Net Dividend ..... (74·1 gross *less* tax at 9s. 6d.)	38·9
	100·0
Total Tax payable	61·1
Total Tax hitherto payable ..... (income tax and profits tax)	66·25
(b) Nil Distribution	
Total Tax payable	50·0
Total Tax hitherto payable	52·75

This example shows that the new profits tax and income tax combined will absorb 61.1 per cent of profits where a maximum dividend distribution is made and no EPL is payable, compared with 66.25 per cent under the old regime. The minimum tax payable, with no excess profits and no dividend payment, will be 50 per cent, against 52.75 per cent.

This is the simplest case. The next example is where the full 30 per cent EPL is payable. The following table shows the calculations, on the limiting assumptions of full distribution and nil distribution:—

EXAMPLE II—Standard Profits	100·0	
Chargeable Profits	200·0	
(a) Full Distribution		
Income Tax	95·0	
Undistributed Profits Tax	5·0	
EPL (30% of 100)	30·0	
Distributed Profits Tax ..... (15% of gross dividend of 103·8)	15·5	
Net dividend ..... (103·8 gross *less* tax at 9s. 6d)	54·5	
	200·0	
Total Tax payable	145·5	= 72·75%
Total Tax hitherto payable		66·25%
(b) Nil Distribution		
Income Tax	95·0	
Undistributed Profits Tax	5·0	
EPL	30·0	
Total Tax payable	130·0	= 65·0 %
Total Tax hitherto payable		52·75%



Banking with Barclays

A banker's work

touches life at an extraordinarily large number of points and in the nature of things he must in his working life learn quite a lot about the reason for the success or failure of people in every form of business. His experience can be of great use to others embarking on a particular venture, and if you are launching out in uncharted seas it will almost certainly be a good thing to have a chat with one of our managers. He will tell you of the ways in which Barclays can help.

BARCLAYS BANK LIMITED

Spotlight on Australia

To meet the requirements of those contemplating business or manufacture in Australia, two booklets have been issued by the Australia and New Zealand Bank Limited.

"Industrial Australia"—containing authoritative information on industrial resources, markets, labour and finance.

"Company Formation in Australia"—a general guide to Company Law, with notes on current taxation.

Copies of these booklets will gladly be sent on request.

AUSTRALIA AND NEW ZEALAND BANK LIMITED

In which are merged
The Bank of Australasia Limited and The Union Bank of Australia Limited

Head Office: 71 Cornhill, London, E.C.3.
Telephone: Avenue 1281.

Branch Offices in London:
4 Threadneedle Street, E.C.2.
263 Strand, W.C.2.
6 Albemarle Street, Piccadilly, W.1.

Centred where thrift and reliability are national characteristics, the

Scottish Amicable BUILDING SOCIETY

is the soundest possible Anchor for investment at 2½% income tax paid

President: LORD INVERCLYDE. Vice President: LORD ALNESS. Trustees: JOHN CAMERON, D.S.C., Q.C., and SIR STANLEY ROUS, C.B.E. Chairman and Managing Director: WM. S. ALLISON, D.L., J.P.

NAME _____

ADDRESS _____

DATE OF BIRTH _____

This example shows the effect of EPL in depleting net dividends, where a full distribution is made, and in depleting reserves where no distribution is made. In practice, cases will lie between the two extremes. But in the first case, tax will in future absorb 72.75 per cent of total profits, against the maximum rate of 66.25 per cent hitherto; and in the second case, the net residue for reserves, after tax, will be reduced from 47.25 per cent to 35 per cent of total profits.

*

The third case illustrates the effect of the maximum levy of 18 per cent on total profits, again on the two assumptions of full and nil distributions:—

EXAMPLE III—Standard Profits	100·0		
Chargeable Profits	300·0		
(*a*) *Full Distribution*			
Income Tax	142·5		
Undistributed Profits Tax	7·5		
EPL (18% of 300)	54·0		
Distributed Profits Tax (15% of gross dividend of)	21·4		
Net dividend	74·6		
(142·1 gross *less* tax at 9s. 6d.)	300·0		
Total Tax payable	225·4	=	75·1 %
Total Tax hitherto payable			66·25%
(*b*) *Nil Distribution*			
Income Tax	142·5		
Undistributed Profits Tax	7·5		
EPL	54·0		
Total Tax payable	204·0	=	68%
Total Tax hitherto payable			52·75%

On a full distribution, with EPL at maximum rate, total tax absorbs 75.1 per cent of profits, leaving 24.9 per cent for net dividends, against 33.75 under income tax and the old profits tax. On a nil distribution total taxes absorb 68 per cent, against 52.75 per cent under the old order, resulting in a net loss to reserves of no less than 15.25 per cent of total profits.

These exercises could be multiplied to suit any combination of circumstances. They lead to the summary conclusion that for every 100 above standard profits liable to EPL at 30 per cent, 80 is paid in tax with a nil distribution, and 84½ on a full distribution; for every 100 liable to EPL under the 18 per cent rule, 75.1 is paid in tax on a full distribution, and 68 assuming a nil distribution. Thus the incidence of total tax on marginal increments of profit is high in both cases, and particularly so at all stages until chargeable profits exceed two and a half times standard profits. It may assist in the working out of sums for individual cases to point out that the division of the residue of profits after income tax, undistributed profits tax and EPL have been deducted from the total involves the grossing up of the net dividend to be distributed, since the 15 per cent additional profits tax on the distribution has to be based on the dividend before allowing for income tax. Where x is the net dividend to be distributed, the 15 per cent profits tax represents $0.15x$ multiplied by 1.93 (i.e. 40 divided by 21, to gross up the net payment). It will be found that the 15 per cent profits tax will be equal to two-sevenths of the net dividend.

*

These formal exercises may point the way towards an assessment of the effects of the new EPL. But their detailed application must needs be a fairly prolonged task. There is no conclusion immediately applicable to the ordinary share market save one; EPL does involve a depletion of industrial reserves that is, paradoxically, proportionately heavier (as compared with the old regime) in those cases where no distribution of dividends is made than is the case where a full distribution is made. The difference at the margin (again assuming full distribution) is no more than 4½ per cent of profits under the 30 per cent rate, and 7.1 per cent under the 18 per cent rate. Growth is taxed less severely under the Chancellor's new EPL than it would have been under all previous examples of excess profits taxation. That is an important mark on the credit side.

Income Tax Changes

MR BUTLER'S income tax changes justify the claim he made that they were designed to make radical changes in the incidence of income tax and to lighten the burden, particularly on extra earnings. He demonstrated that the income tax suffers from three major defects: the starting point of liability was too low; the rates were too high; and the graduation was too steep. By changes in the personal allowances and earned income relief Mr Butler has sought to answer the first objection, and will exempt two million people from tax. The single allowance is raised from £110 to £120, the married allowance from £190 to £210, and the child allowance from £70 to £85. The earned income allowance is raised from one-fifth to two-ninths subject to a limit of tax on £450 (corresponding to maximum relief at £2,025) against £400. This has the effect of reducing the average rate of tax, though it imparts no additional incentive beyond the maximum limit, and results in a particularly sharp increase in the effective rate of income tax and surtax when the maximum point is passed.

The graduation at the lower end of the scale is to be made much smoother by the revision of the reduced rate areas that Mr Butler proposes. Hitherto, the first £50 of taxable income has been charged at 3s. in the £, the next £200 at 5s. 6d. and the rest 9s. 6d. In future, the first £100 will be charged at 3s., the next £150 at 5s. 6d. the next £150 at 7s. 6d. and the balance at the standard rate of 9s. 6d. This will mean that the married man with two children will not begin to pay tax at the full rate until he is earning £1,000 a year. The Chancellor claimed that by this method he would provide an incentive to longer and harder work, reducing the effective rate of tax on earned income, including overtime. In all, these reliefs will cost £180 million in the current year, and will be made effective in PAYE computations after June 8th; the full year cost is put at £228 million.

The Chancellor deserves praise for a measure of assistance to those living on small fixed incomes. Pensions already qualify for earned income relief; but small fixed incomes did not and this caused particular hardship in cases where the taxpayer had not qualified for age relief at 65. All incomes below £250 will in future qualify for earned income relief of two-ninths, whether earned or not.

Purchase Tax and the "D" Scheme

THE proposed changes in purchase tax on goods produced under utility schemes and hitherto tax free are not expected to make any difference to the total yield of the tax, but they are likely to have far-reaching consequences in other directions. They follow closely the lines recommended in the Douglas report on the economic effects of purchase tax for industries with utility schemes. This report was fully discussed in *The Economist* of March 1st. It was concerned with the clothing, textiles and furniture industries; but furniture is specifically excluded from the Budget proposals. The liability to purchase tax of the products of these industries previously depended upon whether or not they conformed to utility specifications and could be sold within maximum utility prices. Goods that met both these conditions were free of purchase tax (or in a few cases were taxed at a much lower rate); those that did not satisfy the two conditions were taxed at the full rate.

The Budget proposals leave all but one of the rates of tax unchanged but they entirely change the basis on which these rates are levied. The rate on piece goods remains at 66⅔ and on other articles at 33⅓ per cent, but the rate of tax on fur trimmed coats is reduced from 100 per cent to 33⅓ per cent, while utility furs are now taxed at 100 per cent instead of 33⅓ per cent. In future all clothing and textiles will be free of tax so long as their wholesale price does not exceed a certain datum limit, and utility specifications will no longer be employed. When the goods exceed these datum wholesale prices, they will attract purchase tax, not on their entire wholesale price as at present, but only on the excess of that price above the tax-free limit.

The President of the Board of Trade announced late on Thursday that the utility specifications and the maximum prices for these goods would be dropped, although price control would be kept on nylon stockings which must be one of the few commodities still generally sold at, and not well beneath, maximum permitted prices. The trade associations have undertaken to work out quality specifications to replace the old utility mark but Mr Thorneycroft made it clear that the use of any new quality sign would have no bearing on whether or not any given article was liable to purchase tax. The general impression is that these schemes are fairly far advanced. The utility scheme for the furniture industry remains unaltered, as does the method of levying purchase tax on furniture. The justification for this is that the scheme still serves to guarantee a minimum standard of quality in goods where structural defects can so easily be concealed. It is clear, however, that the utility furniture scheme cannot continue indefinitely.

The tax-free datum prices have been fixed for each class of goods in the way suggested by the Douglas Committee which decided, after studying evidence on consumer spending collected by the Government's Social Survey, that if the division between taxed and tax-free goods should result in half the purchases being taxed and the other half untaxed, then, at existing rates of purchase tax, these goods would bring in the same revenue as in 1950-51. This was £83 million. Presumably there is sufficient corroborative evidence within the Government's departments to cross-check the accuracy of the calculations, and to justify the choosing of the tax-free limits that have now been fixed.

The new scheme is a big advance on existing methods. It removes two of the major objections to the utility schemes — that they discriminated against foreign imports (which are now to be rigidly curtailed) and that they prevented the sale of better quality goods at prices just above the top utility prices. It also gets rid of the irritating anomalies created by the utility schemes and will be far more simple to administer. There are more than 1,000 specifications for cloth in operation. For these the new schedule will substitute only three: class "A" covering wool and wool mixtures; class "B" covering all non-wool cloth, including silk, nylon, oilcloth and plastic sheeting (all of which are outside the utility schemes); and class "C," which will occasionally be used to distinguish linen from other non-wool cloths. The articles themselves are grouped into broad categories, with a maximum tax-free wholesale price fixed according to the class of cloth used.

Until the prices below which goods will be free of tax had been announced, it was not possible to deduce the effects of such a scheme on retail prices. In many cases these tax-free limits are less than half the present utility ceiling prices. The accompanying table shows the amount of tax which certain top-quality utility goods will now bear. The tax-free limit is in each case a wholesale price; to convert this into a presumed top retail price for tax-free goods it is necessary to add to it an approximate retail margin of 30 per cent on men's clothes and 33⅓ per cent on women's clothes.

PRICE CHANGES UNDER THE "D" SCHEME

	Maximum Utility Prices		Tax Free Limit		Tax Liability under D Scheme	New Retail Price of same goods
	Wholesale	Retail	Wholesale	Retail*		
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.

Cotton dress cloth	8 2	10 3	4 0	5 4	2 9	13 0

*Estimated.

The figures show that the burden of the new tax will vary widely over the present utility field and in some cases may be unexpectedly heavy.

This is because the proportion of utility deliveries varies from one industry to another; where the utility maximum was high, the tax-free limit has to be set very low if it is to exclude half the number of purchases. To take one example, utility shoes have in the last year or so comprised 98 per cent of home deliveries; this explains why shoes would appear to attract a higher proportion of tax under the "D" scheme than men's or women's suits. The tax-free limit for piece-goods also appears low in relation to today's top utility prices because 87 per cent of the wool cloth deliveries are utility. But the proportion of goods made at these maximum utility prices is small and though they are tax free they have been hard to sell. The bulk of utility production today is probably of goods at prices more in the region of the new tax-free limits. For example, cotton gaberdine, retailing at 24s. 5d. a yard, is among the most expensive utility cotton cloths. It will now attract 10s. tax. But the average retail price for the majority of utility cottons is about 5s. 8d. a yard, with a wholesale price of 4s. 5d., only 5d. above the tax-free limit. In future the average cloth in this category would attract no more than 3d. a yard purchase tax. The effect on retail prices will therefore not be marked except for goods near the top utility prices.

As a result, the initial effect of the scheme may well be to divide production into four distinct classes. At the bottom will be the goods that remain tax-free. Second will come those utility goods, hitherto tax free, that now become liable to tax. This will deprive them of the competitive advantage they have enjoyed over the third category of goods, the non-utility articles of medium quality that are now ranked for tax on their full wholesale price but will in future be assessed on that price less the tax free limit. These are the goods in the "blind spot," many of which are suitable for export but have been taken out of production because they could not sell at home in competition with the best quality tax-free utility goods: and the budget will perhaps encourage production of such goods more than it does of any other class. There is, however, an impression in the textile centres that too strong a case has been made out for these goods at the expense of the fourth category, the highest quality goods, in the price of which the budget affords no noticeable reduction. Quality goods form the spearhead of those British textile exports, particularly in the dollar markets, that reform of the utility schemes was partly designed to help; and such goods might have expected to receive at least equal treatment with goods of medium quality. That they do not is undoubtedly the main weakness of the budget proposals on purchase tax, but one that could only be corrected by a reduction in the rate of tax. Since the tax-free limits have had to be set so low in order to maintain revenue at existing levels, it is perhaps understandable that the Chancellor did not feel prepared to take the risk involved at this stage in setting the limits even lower in order to reduce the tax rates.

Cut in the Subsidies

MR BUTLER has not shirked the task of tackling the food subsidies. He has fixed the new limit at £250 million; the old one which has been in force for two years was £410 million so that the Exchequer will save some £160 million. But the burden to be passed on to the consumer in the form of higher prices will be larger, because the Ministry of Food's purchase prices have risen. As an article on page 572 of last week's issue pointed out, if retail food prices were kept at their current level the annual subsidy bill would have risen to £460 million. Hence some £210 million is now to be passed on to the consumer in higher prices. The increase in weekly expenditure on rationed foods was estimated by the Chancellor to average 1s. 6d. per person. The effect on the interim index of retail prices will be to raise it by about three points, and the rise will probably be slightly more in the new index to be introduced shortly because food (and in particular subsidised food) has a higher weighting than in the old index.

All rationed foods are apparently to share in the price increases but bread and flour, milk and meat—the three largest items of the subsidy bill—will be most affected. The retail price of a 1¾ lb loaf will rise from 6d. to 7½d. and flour from 4d. a lb to 5¼d.; in each case the subsidy is halved and the total saving will be about £45 million. Milk is to go up by 1d. a quart; this is to be done by not making the seasonal reduction of 1d. a quart in the spring and by raising the price by a penny in the late summer. Again the subsidy is almost halved (unless farmers are given higher prices under the annual price review now under negotiation), and the Exchequer will save £30 million. The price of meat is to be increased by 4d. a lb; the average subsidy for the whole of 1951-52 was 3½d. a lb, but it was lower in the first part of the year. If no further increases in prices have to be paid to home and overseas suppliers, the meat subsidy would be abolished, though the Chancellor did not specifically mention this point. The Ministry apparently expects to pay slightly more for home-produced meat and the total cost of the subsidy on meat might fall from £47 million to, say, £7 million, saving the Exchequer £40 million. The subsidy on tea is to be abolished. The retail price will rise by about 8d. a lb to 4s. 4d., yielding a net saving of £15 million. These four items together reduce the annual subsidy bill by £130 million. The further £80 million is to come from the other subsidies, details of which are to be announced later.

The annual cost of the subsidies on margarine, cooking fat, butter, cheese, eggs, bacon and sugar amounted to a little over £150 million in 1951-52. If these subsidies were halved, some £75 million would be saved. It may well be that the subsidies on butter, eggs and sugar will be reduced by more than 50 per cent and those on cheese, margarine and bacon by less. By such changes the Government could save the required £80 million for an increase in weekly expenditure of 5d. The higher prices of bread and flour would add 4½d. to the public's weekly food bill; milk 2d., meat 2½d. and tea 1d., making a total of 1s. 3d. at current ration scales. The fact that the Chancellor estimated the increase at 1s. 6d. would suggest that rations will be increased in the coming months rather than reduced. But the important thing that the Ministry of Food must consider in adjusting the retail prices is that it does not make a profit on imported supplies to mask the actual subsidy paid to home farmers.

Exactly half of the £160 million saved from these indiscriminate subsidies is to be given back to the needy. The largest single hand-out from the Exchequer—£37 million in a full year—will go to increase family allowances, from 5s. a week for each child after the first to 8s. Another large segment may go to National Assistance payments, the ultimate protection for all who slip through the mesh of the existing social security system into real want. The new rates here have not yet been decided but the National Assistance Board may be expected to take into account the Government's new yardstick, that the country can afford—and ought now to afford—32s. 6d. a week for a single person and 54s. a week for a married couple in uniform benefits under the National Insurance Scheme.

The increases in National Insurance benefits themselves will be initially financed by increases in the weekly contributions of both employers and employees, by about 7½d. a week for men and 5½d. a week for women. These figures, however, are apparently not yet "hard" estimates as the levels for benefits, particularly old age pensions, are not yet decided upon. The Chancellor indicated some doubt about whether the present system of differential pensions for those over and under 70 was the best method to induce people over 65 to stay at work. The Minister of National Insurance is to discuss this point with the trade unions and other interested parties. Since an increase in insurance contributions leads to a fall in income tax receipts, the public authorities' surplus as a whole is likely to lose about £10 million even in the early years of the new scheme—once it goes through.

The Government also proposes to raise industrial injury benefits from 45s. to 55s. a week, with appropriate increases for widows; this will cost £3 million a year—but some of the strain may be taken by a small increase in weekly contributions. The standard basic rate for war pensions will also go up from 45s. to 55s. a week for the totally disabled, with *pro rata* increases for the partially disabled and some increases for war widows. These improvements will cost £10 million a year. Finally public service pensioners—retired civil servants, school teachers, policemen, long-service soldiers, and so on—will also get an overdue increase. The amounts concerned are not yet decided upon, but they do not seem likely to be big—Mr Butler believes that they should not exceed £20 a year.

In all, these reliefs for the needy will cost £80 million in a full year—though they will cost more later as the number of old age pensioners increases. In view of the time needed for the introduction of legislation, the cost in this financial year will be substantially less—but then the saving in the food subsidies will also not become immediately effective. The net saving from the re-alignment of social services as a whole will therefore be £80 million even in 1952-53. To have achieved this while still making the really poor less poor is an accomplishment that calls for congratulation, but also for the reflection that such a reform should have been carried through by any professed "social welfare" government long ago.

Other Tax Changes

Petrol

For the third year in succession, duty on motor fuels goes up: this year from 1s. 10½d. to 2s. 6d. a gallon for motor spirit and other light oils and for diesel oil used in road vehicles. This brings the price of motor spirit to 4s. 2¾d.-4s. 3¼d. a gallon according to zone, and that of "derv" fuel to 3s. 9⅛d.-3s. 9⅝d. a gallon (since this fuel is sold only wholesale, a comparable price for motor spirit would be about 3s. 11¼d. a gallon). This constitutes the largest increase in revenue during 1952-53 in the budget proposals; having been imposed from the evening of budget day, it will be in force for a few weeks of the old financial year, and is estimated to yield £63,500,000 in 1952-53. Since the current rate of duty was expected to yield £5 million more in 1952-53 than the £200 million expected in 1951-52, total receipts from oil duties in the coming financial year are put at £271 million.

The bulk of this increased burden will be borne by industrial road users. Buses and coaches consume just under a million tons of motor fuels a year, three-quarters of it diesel oil; this means that about £8 million a year of the increase will fall upon public transport, to be met from economies or profits or passed on direct to the public. About £22 million a year may be paid by goods vehicles, which consume more than two million tons of motor spirit a year, and more than 300,000 tons of "derv" fuel. On the basis of estimates of petrol consumption, about £20 million will be paid by car users; unofficial estimates of the proportions of car mileage chargeable to business purposes suggest that £15 million or more of this sum, too, may count as an addition to the transport costs of industry.

Motorists for pleasure alone, therefore, may contribute no more than 10 per cent of the increased duty on petrol. Their share of the change made by the Chancellor in equalising car duty at £12 10s. a year for all private cars (which will come into force on January 1, 1953, and will cost the Exchequer £850,000 in 1952-53 and £1,300,000 in a full year) may, however, be more generous. They own perhaps 25 per cent of all cars registered and presumably a somewhat greater proportion of the prewar cars still running, since most of the 750,000 cars delivered to the home market since the war have gone to business users. The smallest of these prewar cars will incur an increase in vehicle duty, as will cars registered since 1947; but motorists running the higher-powered cars registered earlier, and still paying 25s. per horsepower, will from the beginning of next year receive some relief to offset their higher fuel costs. Removal of this anomaly—which in time, of course, would have disappeared of itself—is a small measure, but it does end a discrimination against this class of motorist that the small margin of revenue involved could never sufficiently justify.

*

Mr Butler made no reference to a more important anomaly in this group of duties. Probably 600,000 tons or more a year of the motor spirit and light oils that fall within the category affected by the increased duty, and bear perhaps £5 million of the £63,500,000 increase, is consumed for purposes not connected with road transport—in agricultural tractors driven on petrol, in civil aviation, and as solvents in a wide variety of industries. Certain Conservative members, in opposition, have in earlier years argued the case for exemption of these consumers, but Mr Butler has followed Labour Chancellors in refusing to accede to such a plea. He also decided against suggestions that "derv" fuel might be given preferential treatment in any increase in motor fuel duty. Such preference is fairly common in other countries upon the ground that increases in the cost of this fuel, used predominantly in public service vehicles, are passed on to the final consumer more quickly than increases in other transport costs. London Transport, for example, which is at present preparing to justify its latest fare increases to the Central Transport Consultative Committee, estimates that the budget will add more than £1 million a year to its diesel fuel costs.

* * *

Postal Charges

Higher charges for the telephone service will make up most of the extra revenue required to balance the accounts of the Post Office, which at existing rates estimates its cash deficit for 1952-53 at £14,000,000. The present surcharges of 15 per cent on rentals are raised to 50 per cent (which in London will mean a rental of £8 a year for private subscribers compared with £6 today); the number of local calls allowed free is reduced from 100 a half-year to 50; and charges for connection, transfer and removal are also increased. These increases take effect from July 1st; they will yield £5,775,000 in 1952-53 and £9,415,000 in a full year. Rates of postage for excess-weight letters in Britain are increased, as are those for all airmail letters and packets except "Air Letters," and postal registration fees. These increases take effect on May 1st, and together with a rise in the scale of charges on postal orders from July 1st, should yield £3,630,000 in 1952-53 and £4,180,000 in a full year. Increases in the charges for private telegraph and telephone services supplied by the Post Office will yield £230,000 in 1952-53 against £200,000 in a full year; these rentals are largely paid in advance, and the increases are to be applied in respect of bills for 1952-53 paid before the beginning of that financial year.

* * *

Entertainments Duty
