Another technique found in certain campaign literature is the use of an exaggerated guilt-by-association and name-calling. It seems perfectly ethical to point out the financial and other backers of one's opponent, but many campaigners do not stop there. Republican candidates in recent years have been identified as "tools of Wall Street," "Nazi sympathizers," and proponents of "slave labor." Even the Democratic candidates for President have been labeled "pro-Communist," "tools of the fifth column," and "warmongers."

Most of these charges result from taking a portion of an opponent's speech out of context or from "card-stacking" in one form or another. The misuse of statistics, quotations, circumstantial evidence, and innuendo are likewise tricks of the campaign propogandist. Personal defamation and slander of an opponent are old political devices.

Many persons are rightly incensed at the tactics of smear politics, barefaced lying, and outright misrepresentation in American elections today. Yet there is considerable improvement over the slanderous campaigns of yesteryear. Ridicule, sarcasm, and name-calling are used much more judiciously today than during the nineteenth century, especially by the candidates themselves. A decade ago, Charles Michelson, former Democratic publicity director, stated:

> Nobody has ever been able to formulate a code of political ethics. Despite the fine altruistic language of party platforms, the habit has always been to smite the opposition, regardless of Marquis of Queensberry rules, whenever and however the opportunity offers.

Very few campaign managers would take issue with this description of the philosophy of campaigning. At the same time, the objective observer and many candidates would like to see a decline of those campaign appeals obviously designed to elicit nonrational responses and to arouse group prejudices and hatreds. In 1952 many suggestions appeared in Congress for the development of a code of ethics for campaigns or for the creation of a Fair Elections Commission which would investigate defamatory literature, malicious misrepresentation of facts, and excessive expenditures. Perhaps recognizing the difficulty of formulating objective criteria, most congressmen showed little interest in these proposals. Public opinion probably offers one of the best ways to control excesses, but investigations remain useful in focusing attention on unethical practices.

WHAT WINS AN ELECTION?

Anyone attempting to discuss campaign methods is invariably invited to reveal the "secret" of those methods which are likely to be the succesful ones. There is, of course, no sure formula, and the cautious observer will seldom feel that he can diagnose the reasons for victory after an election, let alone point out in advance the techniques for winning it. Sometimes slogans offer a concise explanation or hypothesis. Lincoln's "Vote Yourself a Farm," Wilson's "He Kept Us Out of War," Harding's "Back to Normalcy," and the opposition party's brilliant 1946 slogan, "Had Enough? Vote Republican!", at least expressed in concise terms the mood of the country.

This suggests that conditions will have much to do with defeat and victory, and the party which can best identify itself with the temper of the electorate has taken a long step toward victory. "Taft Can't Win," the slogan used by Eisenhower supporters, undoubtedly hurt the Senator in many Presidential primaries. But did voters support other Republican hopefuls out of a fear that Taft could not win, or because of his attitude toward foreign and domestic issues or for other reasons? Slogans and catch phrases do not necessarily win elections.

A vigorous grass-roots organization with plenty of canvassing and doorbell ringing may, in a close election, turn the tide. One Congressman who has been re-elected many times believes this is

the most effective of all methods. "I'd rather have two line workers than a $1,000 contribution," he said; "and by workers, I mean guys not too proud to canvass, ring doorbells, and make a sales talk." To help with the "sales talk," most parties now prepare campaign "manuals" and "textbooks" for their workers, telling them how to approach voters, and providing answers for commonly raised questions.

At election time the electorate broadly falls into four groups. First are the workers and the hard-core following of the party and the candidate. Second are the loyal partisans who seldom aid the party, but who can practically always be depended upon to vote a straight ticket. A third group may be thought of as party sympathizers, or persons who have a nominal party attachment, but who can be enticed away from time to time. Finally there are the complete independents with little or no sentiment for party labels, who gravitate from one party column to another in order to vote for "the best man." In two-party states, the first two classes of voters numerically almost cancel each other out at the polls. The problem with these two groups is largely one of reinforcement. Rallies, speeches, and flamboyant literature help them to keep up their courage and enthusiasm and rationalize the rightness of their views.

Since the party sympathizers and the independents will, in the final analysis, determine who will be elected, common sense dictates that most energy be directed toward them. Party sympathizers need to have their loyalties renewed, and symbols and propaganda devices are methods bolstering this. At the same time that one is trying to activate and hold one's own nominal adherents, an attempt must be made to drive a wedge between the nominees and the nominal adherents of the opposition party.

Public opinion polls indicate that there are more Democratic than Republican sympathizers today.[6] Republican strategy, then, will try to get former Roosevelt supporters, Democrats critical of the Fair Deal, and Democrats disturbed over corruption and over foreign and domestic policies of the Truman administration to vote Republican in 1952. Democrats, on the other hand, must try to keep their sympathizers from straying and momentarily following the Republican party. Thus both activation and conversion will be necessary techniques for winning the votes of this group.

The job confronting the campaign manager with the independents is similar. It consists in getting them registered and stirred from their lethargy so that they will vote. Although many so-called independents are indifferent, a great many are not. Appeals to party loyalties and symbols and slogans are not likely to win many converts. In local elections a "pocketbook" appeal to property owners and taxpayers, a school appeal for parents, a recreation program for sportsmen, and so on are likely to be more effective than demagogic appeals to "Americanism."

In the 1952 national elections Republican campaigners will undoubtedly try to win independents by keeping the "corruption" issue alive, criticizing the Democratic foreign policies, and emphasizing high living costs and the need for a change. While "Communism in government," "bureaucracy," "socialism," and similar appeals may bring great applause before loyal partisans, the appeals have worn thin with many independents who have heard them for many years. Democratic strategy will probably point to the high standard of

[6] In March 1952 the Gallup poll estimated that there were 21,500,000 Democratic voters, 18,500,000 Republicans, and 15,000,000 independents.

living which will be "endangered" by a change, and will defend the administration's foreign policy. It will continue to assert its friendship for farmers, workers, and ethnic groups.

All of this suggests that the cardinal rule of campaigning is adaptability, flexibility, and opportunism. Methods that will elect a man mayor in New Orleans will not necessarily be effective in Boston or Boise. The campaign practices in the Democratic primary for governor in South Carolina are quite different from those in Minnesota. The tactics will be conditioned by the abilities of the candidate and the social environment of his constituency. Hence, a careful analysis of both must be made and expediency followed.

Notwithstanding the success of Truman in 1948, the majority of students of politics believe that comparatively few people are converted during a campaign. In a close election, however, the converts may determine the outcome. Campaign methods which fail to induce the already converted to appear and vote on election day may result in the loss of election by default. Activation, therefore, is a basic objective of the campaign. A campaign may provide a clue, though an imperfect one, to candidates and issues and may focus the attention of the citizen on his government. The voter believes that on the whole the great debate has been healthy and has resulted in a satisfactory collective judgment. These psychological and intangible values are perhaps more important than the question whether campaigns determine the outcome of elections.

SUMMARY

Campaign methods have not changed drastically in the past century. The parade, street banners, rallies, curbstone speeches, and slogans and shibboleths remain with us. Where our forefathers referred to "Old Hickory," "Old Rough and Ready," the "Little Giant," and "Honest Abe," we have spoken of the "Happy Warrior," "F.D.R.," "General Ike," and "Mr. Republican." Music and songs probably enjoy a little less vogue, but they have not disappeared, and campaign verse continues to appear. The great developments in the press have enabled marked increase in the amount and forms of literature. Where only a handful of citizens heard the voices of men who would be their representatives, virtually everyone is now able to hear the candidate speak, thanks to the microphone.

The most interesting aspect of the 1952 general election from the point of view of methods will be the great experimentation with television. It seems somewhat dubious that it will completely revolutionize campaign methods, but it will, like radio, make electioneering more extensive and expensive and will increase the dramatic and showmanship aspects. The increased role of women and of nonparty groups during the present era is especially noteworthy; these have also accelerated the tempo and broadened the basis of the campaign.

The great proliferation of campaign methods and the means of rapid communication to conquer the nation's magnificent spaces should have had the result of reducing the length of Presidential campaigns. Unhappily this has not happened. Presidential preconvention campaigns start at the beginning of the year. From the time of the first Presidential primaries and state conventions in March until early November there is virtually a continuous campaign. In recent years the national parties have waited until about September 1 to begin the actual Presidential speechmaking, even though acceptance speeches were made at the national conventions. A few states have

put their primaries in September, thus drastically reducing the length of campaigns for state offices. This practice seems altogether meritorious. The Republican national convention in 1952 was held in July, two weeks later than usual, but, with the primaries as early as usual, there is no noticeable reduction in the length of the 1952 campaign. The fact that Roosevelt in his last two elections waited until about the last three weeks before campaigning would indicate that long months of wearying speechmaking is not always necessary.

He served as assistant professor of political science at the University of Maryland and Queens College and as research assistant to the New York State Legislative Committee on Industrial and Labor Conditions. He has contributed to numerous professional journals and is author of Smear Politics: An Analysis of 1940 Campaign Literature (1941) and American Politics and the Party System (1949), and co-author of Current American Government (1943).

Racial, Religious, and Sectional Interests in 1952 Election

By HAROLD R. BRUCE

THERE is considerable reason for the belief that racialism and sectionalism may prove vital factors in the Presidential election of 1952. Basically, they are really two phases of one political situation: the contest for the 128 electoral votes of the eleven states of the so-called Solid South. There are ramifications, however, that reach out far from the Southland into many industrial centers of the North.

It has been a traditional proud boast of American political analysts that, as compared with foreign governments, the American party system has been free of sharp cleavages along economic, class, sectional, racial, and religious lines. Like all generalizations, this is only partly true, though more true than false, for our major parties have sought followings and voter support in all economic groups, all religious bodies, all sections, and all social strata.

HISTORICAL PARTICULARIZED PARTIES

The exceptions have projected interesting temporary organizations into the party scene. The Know-Nothing party polled eight electoral votes for Millard Fillmore in 1856 on a narrow program that opposed the election of naturalized citizens to office and the alleged influence of the Roman Catholic Church in American government. At no other time has the religious question been injected so vigorously into a national campaign as in respect to the Democratic party candidacy of Alfred E. Smith in 1928. The fact of his Catholic faith was used strongly against his selection in the Democratic national convention and unquestionably weighed heavily against him in the election.

The most distinctive and most nearly successful venture in a national party organization erected on an economic-sectional foundation took place during the period 1876–96. First it was the Greenback party of the newly settled West, an agrarian discontent movement, seeking the retention of the greenbacks (national currency) in circulation and demonstrating its strength by the election of thirteen of its members to the House of Representatives in 1878, only to disintegrate shortly thereafter.

A second vehicle of western and southwestern agrarian discontent moved in to threaten the stability of the biparty political system, beginning in 1892. The Populist or People's party soon gathered sufficient voting strength to constitute a serious challenge to the preeminence of the eastern financial and commercial interests in the councils of the two major parties. James B. Weaver, its candidate for the Presidency in 1892, polled one-twelfth of the national popular vote. It is a matter of very interesting speculation as to what the party might have become or accomplished had not Bryan swung the Democratic convention of 1896 to such a liberal reform position as to cut the ground from under the Populists and enlist their support of his own candidacy. This campaign marked the party's demise.

NATIONAL APPEAL NECESSARY

In stressing the generalized character of the major American parties, no intent is implied of overlooking the par-

ticularism of their appeals and followings. There are some special Republican appeals to people of wealth and property, and some special Democratic appeals to industrial workers and the debtor class. There has been a clearly discerned tendency for the more prosperous classes to vote Republican and for the less prosperous and labor to vote Democratic. There are also geographical areas of Democratic and Republican dominance, as the South and upper New England, although no section of the country can be called as strongly Republican as the Solid South is Democratic. But each of the two parties is broadly national and comprehensive in its program, interests, and activities, if for no other reason than that no party can concentrate its appeal upon a distinct social or economic class and hope to win the election.

The consequences of this situation are inescapable and give to the parties some of their most distinctive characteristics. Only one course of action is possible if each party is to seek a following among all groups of voters and endeavor to encompass a multiplicity of national interests: compromise, concession, and avoidance of disruptive or alienating factors. One result is the fashioning of platforms that are frequently colorless and evasive. American politics is not a matter of mobilizing one homogeneous economic, social, or geographical group against another homogeneous group, but rather of building up the largest aggregate of heterogeneous supporters against another similarly nondescript aggregate.

Even though the sectional aspect of the major parties be stressed, as is often done in analyses of them, a realistic picture will be obtained only as they are both viewed as sectional coalitions. A complete sweep of one section alone is not enough to enable a party to put its nominee in the White House or hold control of either house of Congress. Republican victories have been contingent upon combining the midwestern grain and dairy farmers with the eastern business interests. Bryan almost succeeded in capturing the great prize in 1896 on a more integrated combination of the agricultural South and West, but the possibilities of this union faded immediately thereafter. Since 1932 the Democratic party has won by uniting the support of the agricultural South with that of the urban states of the Northeast.

It thus appears that our major parties must each appeal to a great variety of clashing sectional, class, and social interests. They cannot appeal too concentratedly to any one of these without antagonizing the others. A party that stakes all on the labor vote will lose the farmer and middle-class votes; one that devotes itself to the industrial East will alienate the West and the South. The combinations of groups and sections essential to victory produce the complex political pattern and the indistinctness of the American party scene.

That "politics makes strange bedfellows" is an old, hackneyed American saw, but never more true than in the present. It would be difficult to find a more curious political combination than the Democratic party of the past twenty years: a coalition of conservative, agricultural, antilabor, anti-Catholic voters of the South with the liberal (radical?), urban, prolabor, Catholic voters of the North and Northeast. Roosevelt was able to mold and hold it together as a working force (with defections in the Senate), but the precariousness of its unity was shown by the Dixiecrat secession in 1948. Were it not for a similar incongruity of unified action among eastern business interests and western farmers, the Republicans could be more sanguine of their chances in this year's November election. Almost as if thumbing their noses at their party leaders, Republican and Democratic conservatives in Congress vote together on controversial legislation in opposition to the combined vote of the liberals of both parties. The whole testifies to the lack of cohesion and unity within each party.

GROUP INTERESTS IN ENGLAND

The party systems of Great Britain and western European countries provide a much closer identification of special interest groups with particular parties. During the long Conservative-Liberal division of English voters, the Conservatives defended the institutions of the monarchy, the Established Church, and the empire, the social and political status quo, and the nation's political traditions, with the voting support of the nobility, the landowners and their workers, the big business and financial interests, and the upper social class in general. The Liberal party amassed the votes of the middle and labor classes in a campaign for social, economic, and political reforms, and thus the lines were sharply drawn.

When the Labor party moved in on the scene, the first effect was to draw off the vote of the trade unionists, to confuse the issues between that party and the Liberals, and finally to pre-empt the anti-Conservative field as the Liberal party dejectedly slumped to a bad third-place position. During the past decade the Labor party's comprehensive socialist program and its nationalization legislative record of 1945–50 have intensified the cleavage between right and left.

Each of the currently major English parties characterizes the other as a "class" party—with good reason and factual proof. The Labor party was founded as the political vehicle of the labor movement; the trade unions are officially ensconced within it. Despite the important role played in it from the beginning by the intellectuals within its ranks (the Fabians, notably) and the large support won from the middle classes since it broadened its program in 1918, the party continues to appeal primarily to the urban working class, and organized labor provides the solid core of its party strength.

Currently, the Conservative party has not forsaken its defense of capitalism, although it has accepted most of the nationalization put into effect by Attlee's Labor government. In its efforts to thwart the further extension of socialism in British economic life, it seeks to add the support of the middle class to its traditional clientele among the people of property, of wealth, of business and industrial interests.

As compared with the American political situation, sectionalism in Great Britain is less important, the class pattern is less complex, the economic divisions are more explicit, and the programs and leadership of the parties are much more important to the voters. The party program offered in an election becomes a legislative mandate to the successful party, and the party leader automatically becomes Prime Minister and actual chief executive of the government. The voter is naturally, therefore, more party conscious and more impressed by the party programs than by the personality of the parliamentary candidates in his election district. Also, party unity and discipline among the members of the House of Commons are infinitely more conclusive and rigid.

GROUP INTERESTS IN FRANCE AND GERMANY

The multiparty system of twentieth-century France precludes the sharp delineations of French parties along economic and class lines that characterize British parties: there are not fifteen to

twenty different social classes to be severally represented by this number of parties that commonly participate in parliamentary elections.

One party feature that stands out in contrast with the American and British political situations is the persistent existence of a party closely identified with the interests of the Roman Catholic Church. The prolonged and bitter struggle in republican France over the relations of church and state, spectacularly presenting the issue of clericalism at the turn of the century, produced a nation divided politically among ardent Catholics, nominal Catholics, and anticlericals. The Center party of the Third Republic era was the Catholic party, right of center and in the conservative bloc.

The interests of the church have been promoted in the contemporary Fourth Republic, first by the Popular Republican Movement (MRP) and now by the Rally of the French People (RPF). The MRP had the largest single party group in the second (1946) constitutional convention and elected the second largest group of Deputies to the first National Assembly in 1946. The Catholic hierarchy openly urged Catholics to vote the MRP ticket in these elections. When de Gaulle withdrew from this party in 1947 to found his present RPF party, he took most of the party following with him into what is quite distinctively a conservative, urban, Catholic party. The labor vote is dispersed among the Communist and several Socialist parties.

Characteristic of those continental countries in which free elections have been and are permitted is the existence of a Catholic party in Germany. During the imperial era it was the Catholic Center party, strongest in the Catholic sections (Bavaria, Silesia, and Rhineland), vigorously hostile to socialism, defensive of the monarchy, and maintaining a conservative position on all public questions. In the present postwar period the Christian Democratic Union, successor to the old Catholic Center party, occupies a prominent place in the politics of the Federal Republic of Germany, or West Germany. It provides leadership in the dominant conservative bloc, and its chieftain, Dr. Konrad Adenauer, has been the Chancellor of the new republic from its establishment.

FOCUSING ON 1952 ELECTION

Now, what of these particularistic factors in the American Presidential election of this fall? What bids fair to be the impact of these upon the outcome of the election? How are they serving as influential forces in the party plans and in party councils, and how did they serve in the strategies of individual aspirants for the nominations?

The religious factor can be summarily dismissed: there is no indication that it will be injected into this year's campaign, any more than it has been in the past. It does not seem likely that the President's ill-fated effort to send an Ambassador to the Vatican can be inflated into a campaign issue now. But the racial, sectional, and economic factors are extraordinarily prominent.

During the last several elections the voting strength of the Democratic party has rested on a combination of organized labor, big-city political machines of the North, and the assured votes of the eleven Solid South states. This won elections for the party but it represented a fundamentally inharmonious coalition and aroused the resentment of the traditional major element in the party—the southern Democratic leaders and forces. Prior to 1936 the southerners possessed a veto power over party nominations, in the party rule that set a two-thirds majority vote in the convention as the requirement for nomination. The southern bloc of delegate-votes was sufficient to block a nomination unacceptable to that element in the party. But the abrogation of the rule, at Roosevelt's instigation, in the 1936 convention fundamentally altered party control and aroused deep southern resentment.

No Democratic candidate can hope to win the Presidency today apart from the combined support of the three above-named elements: organized labor, Northern urban machine forces, and the South. What is present to endanger this unity? True, the labor forces of the Congress of Industrial Organizations and southern planter aristocracy have far more of inherent conflict than of agreement, but clever party leadership and the quest of the spoils and power of national government control have held them together for the past twenty years. A new issue, however, based on a long-standing one, now projects a breach within the party that has the party leaders floundering and apprehensive.

THE DIXIECRATS

The almost impromptu organization of the States' Rights (Dixiecrat) party in 1948 was the handwriting on the wall that is striking terror in the hearts of Democratic chieftains today. Persistent and energetic efforts on the part of President Truman to have Congress enact a compulsory Fair Employment Practices statute were blocked by a filibuster in the Senate organized by the Senators from the southern states that would have been most affected by the legislation.

Southern opposition and fears were whipped to a new height of bitterness by the adoption of a strong FEP plank and the renomination of the President by the 1948 Democratic convention. Southern party leaders would not accept the party action and they would not switch to the party of Lincoln and Grant, so their only recourse was independent action. The election results were not important to the 1948 outcome: four states (39 electoral votes) were carried by the ticket that consisted of two relatively obscure state governors. But the dynamite in the situation that threatens the victory of the party in 1952 is quite something else!

The President has not relinquished his advocacy of his Negro civil rights legislation, especially of a compulsory Fair Employment Practices law. He is undoubtedly honestly motivated, sincere, and acting on principle in his stand, but political strategy is also assigned by those who are critics of his leadership and of this program. Negroes have given the Democratic party the margin of victory in key northern industrial states since 1936. Coincidentally, Negro demands for faster progress toward equality and civil rights have become an important factor in Democratic politics. The result is a puzzling dilemma: To hold the northern Negro vote, the party must continue to advocate the Truman FEP and civil rights programs; to do so, however, will consolidate, enlarge, and intensify the southern Dixiecrat secession; and the party needs both groups (the southerners, positively) to win!

Southern Democratic leaders are keenly aware of the strategic position that their section occupies in the party's fortunes this year. They are under no necessity of arguing that their protests are no idle threats, because the Dixiecrat action of four years ago serves adequately as an object lesson to northern leaders of what can be done this year on a larger scale with more direful consequences to the party.

[LATER: The motivation in the naming of Senator Sparkman, of Alabama, to be the running mate of Governor

Stevenson on the ticket is so obvious as probably to make the move of little effect.]

THE RUSSELL CANDIDACY

The whole southern pattern of action revolved about the candidacy of Senator Richard B. Russell, of Georgia, for the party Presidential nomination. Russell's candidacy was originally a strategic move against President Truman's renomination. The President, personally, was a principal target for southern criticism. He symbolized what the South disliked in the civil rights program and northern dominance in the party councils. After the failure of the Dixiecrat bolt at the 1948 convention to alter the course of the convention's actions, opposition to the President and his FEP program intensified in the South.

In effect, the Russell candidacy announcement for 1952 was an ultimatum to northern Democrats. There was little likelihood of Russell's selection as party standard-bearer at Chicago, but he constituted a living threat of a much more serious defection of party strength unless the South was appeased. The price of a South that would be solid and sure in 1952 was a compromise or more moderate civil rights plank in the Democratic platform, and a candidate acceptable to that section of the country. If Truman and FEP could not be stopped inside the party, the South would bolt, run another and stronger Dixiecrat campaign, and wind up throwing the election to the Republicans. Truman, if nominated, would have been confronted with a Southern revolt; without those Deep South 128 electoral votes and possibly 48 more in the border states, he never could have been elected.

How much the Russell announcement had to do with the President's decision not to run is not known, but the chronological sequence of the two announcements and the inferences freely drawn in political circles indicate an influential causal relationship between the two. A third-party ticket (no idle threat this year) headed by the powerful and respected Senator Russell, supported by an immensely better organized and directed, much wider, Dixiecrat movement, and building on a vastly greater popular opposition to the President, would bring the tenuous Democratic national coalition smashing down to ignominious defeat.

Certain it is that the Truman withdrawal hit a hard blow at Republican anticipation of an easy victory. The revolt that was seething all over the Southland was anti-Truman, not anti-Democratic; and Truman's retirement opened the way, at least, for the South to close ranks and give its votes to the Democratic party nominee again. The big question (at this June date of writing) is what will happen in the South if the party at Chicago selects a candidate with Mr. Truman's backing to run on a platform endorsing his civil rights policies?

THE NORTHERN NEGRO VOTE

Closely correlated with the civil rights issue as it affects the Democratic party unity in the South and the November polling in that section is the dilemma faced by the party in respect to the Negro vote in the North. This is another bequest to the party by the New Deal–Fair Deal administrations. It sounds strange indeed to be speaking of the Negro Democratic vote, after the long identification of party lines in the South with the color line there. But a changed racial-political condition now exists that adds confusion and perplexity to Democratic planning.

The change was inaugurated by the large wartime northern migrations of Negro workers. They first congregated in the industrial centers of the East and

the Middle West; but as the movement has continued (nearly a third of the Negro population now lives in the North) they have spread out more widely, as seen in the large numbers now settled in West Coast industrial areas. Local political machines quickly saw the political potential in these new arrivals, and Democrats vied with Republicans for their affiliation. That they were breaking down the post-bellum color line in the party deterred Democratic urban bosses and machines in Harlem, Detroit, and South Chicago not at all. Then came the New Deal appeals for equal rights, followed by Truman's "President's Committee on Civil Rights" report and his dogged pressure for a compulsory FEP program. Results followed activity; some say political strategy paid off in a new bloc of Democratic votes.

In any event, developments now point up the importance of the Negro vote in the North. Originally a Republican vote below the Mason and Dixon's line, it began to shift to the Democrats in the early New Deal days and by 1940 had become largely a Democratic vote. It is said that by 1944 the Negroes were voting Democratic two to one in the North, and that in 1948 the proportion for Truman was even greater. The potential Negro vote, outside of the South, is estimated now to be in excess of 3,000,000 and steadily increasing. But its real significance does not lie in the total figure. It lies rather in its strategic diffusion in normally close congressional districts and states. Its vote could be pivotal this year in a dozen or more touch-and-go states in the North. It was held to have been a vital factor in the election outcome of some seventy-five non-South congressional districts in 1948.

CAN THE BREACH BE HEALED?

Thus it is true that race is a continuing, or even a newly vital, issue in American politics. While southern Democratic leaders and the Dixiecrats remain adamant in their opposition to lowering the party barriers to the Negro forces, northern Democratic leaders continue to woo the Negro vote with advocacy of civil rights, FEP, removal of local racial discriminations, and social welfare and housing programs. The fashioning of any semblance of effective party unity this year calls for most skillful political wizardry and artistry. The question is, can *compromise* within the party, on the candidate and the civil rights platform plank, do the trick? If failure results, if the Dixiecrat threat is revived in more vigorous and broader operations, the Republicans will be in a very favorable position.

Harold R. Bruce, Ph.D., Hanover, New Hampshire, is professor of government at Dartmouth College. He was a member of the New Hampshire Constitutional Convention in 1948 and is a frequent writer and lecturer on political subjects. He is author of American Parties and Politics (1936) and A College Text in American National Government (1952), and co-author of The American Political Scene (1938).

Measurement of Voter Attitude

By Charles W. Smith, Jr.

EVERY four years the great game of politics reaches a climax in the United States as the sovereign voters pass judgment on the achievements and promises of the major parties and elect a President. In the weeks and months preceding the election, all over the United States, at country stores, in little towns, and in big cities, interested Americans discuss the campaign and speculate about the outcome. The process by which a President is nominated and elected filters the people's will through a kind of irregular filter, but it is as American as a Missouri country school. It is what the people desire, and in that sense it is democratic. The election is the authoritative expression of the people's will.

Government by Sample

Aristotle described democratic government as government in which important decisions were made by the general body of citizens, and officials were chosen by lot. As far as the officials are concerned, this might be called, in the technical language of opinion pollsters, government by probability sample. In our vast modern state where the mass of the citizens cannot serve collectively as a legislative body, if we followed Aristotle we might extend the application of the principle of government by probability sample. Occasionally an opinion pollster grown enthusiastic about public opinion polls suggests that government officials would do well to follow the polls. This would amount to government by a sample of the population chosen by the pollsters.

Americans thus far have given little evidence that they want to be governed by sample. In fact, when the polls conspicuously fail to predict election outcomes successfully, the expressions of pleasure indicate the existence of some positive hostility toward anything like government by sample.

When the polls failed in 1948, many Americans believed that their failure was wholesome for democracy. The "terrific licking" taken by pollsters, newspapers, and radio commentators "was a splendid thing for the country," declared the *Raleigh News and Observer*. "The people alone should decide elections." The *Philadelphia Inquirer* said: "Perhaps it's a healthy thing that the polls were so convincingly off base. Any feeling that they offer a reliable substitute for the ballot box in determining American political sentiment must disappear." The *New York Times*, seeing in the election results a demonstration of the independence and unpredictability of the voters, said, "Power still resides in the masses of the people, where it belongs." When President Truman happily told the 1952 convention of Americans for Democratic Action that the 1948 election results "set back the science of political forecasting for a full generation," he received a sympathetic response.

Not all political forecasting arouses the unfriendly feeling which was reflected in the President's statement and in the comment of the newspapers. This feeling is inspired by polls which achieve such scope and reputation that they seem to rival the electoral process as channels for the expression of the popular will, and to serve as instruments for influencing opinion as well as for reporting it. As predictions merely, they are interesting to citizens who like to speculate about probable election results, or follow the scores of the game of politics.

Opinion Measurement by Political Leaders

A well-managed political organization has at hand machinery for keeping in touch with public opinion in a way that may be superior to the commercial polls. This type of opinion measurement, on which political leaders base analyses and predictions, is very old. How well it works depends upon the efficiency of the organization and the astuteness of the leaders.

Early in March 1800, Thomas Jefferson wrote to James Madison a letter in which he analyzed the prospects for the coming election. He said that, leaving out Pennsylvania, New Jersey, and New York, the states seemed to be about equally divided. He had had favorable reports from members of his party about prospects in these three states. He wrote:

> Still these are the ideas of the republicans only in these three States, and we must make great allowance for their sanguine views. Upon the whole, I consider it as rather more doubtful than the last election, in which I was not deceived in more than a vote or two. If Pennsylvania votes, then either Jersey or New York giving a republican vote, decides the election. If Pennsylvania does not vote, then New York determines the election. In any event, we may say that if the *city* election of New York is in favor of the republican ticket, the issue will be republican; if the federal ticket for the city of New York prevails, the probabilites will be in favor of a federal issue. . .

This was a keen analysis of the situation. In the election New Jersey went Federalist, Pennsylvania's electoral vote was divided, and, thanks to a Republican victory in New York City, New York's electoral vote was Republican.

More recently, Jefferson's political descendant, James A. Farley, has stated that in every campaign in which he participated as manager with Franklin D. Roosevelt as top candidate on the ticket, he made a practice of sending to Roosevelt a documented report on the probable outcome of the election, usually on election eve.[1] Mr. Farley's most remarkable prediction was that of 1936, when he predicted that Roosevelt would carry every state except Maine and Vermont, at a time when the *Literary Digest* poll was predicting a Republican landslide, and the newer polls, although indicating a Roosevelt victory, were far from predicting the sweeping victory that occurred.

Even such an astute political field marshal as Mr. Farley could not be expected to foretell election results with 100 per cent accuracy every time; but as long as he headed the party organization, his predictions were always worthy of high respect. Like Thomas Jefferson's, they were the products of a combination of art and scientific method. Information was gathered from local areas, and the discerning mind of the master politician interpreted it as no mere statistician could.

Those of us who are not Thomas Jeffersons or Jim Farleys, or who do not have their facilities for gathering information, must depend more upon evidence gathered by others if we wish to try to foresee the political future. Ordinarily we cannot place complete reliance upon the public predictions of political leaders who may be keeping their fingers on the public pulse, because their statements are likely to be overly optimistic, issued primarily to influence opinion rather than to inform it. We may turn then to the com-

[1] James A. Farley, *Behind the Ballots* (New York, 1938), p. 324.

mercial public opinion polls and get reports on voter attitudes that purport to be more objective every few days as the election approaches.

HISTORY OF POLLING

The general public first became widely interested in polls largely as a result of the publicity attending the *Literary Digest* poll. The *Digest* method of polling was to mail ballot cards to millions of people whose names were drawn chiefly from telephone directories. It was successful in predicting the winner of Presidential elections until 1936, when it indicated that the Republican candidate would win by an electoral vote of 370 to 161. In the election he actually received only eight electoral votes. That ended the *Literary Digest* poll.

The chief weakness of that poll was that it did not reach a representative cross section of the electorate. Particularly in the depression years, many people in the lower income groups did not have telephones, and were therefore not listed in the telephone directories. For this reason the ballots were not mailed to a representative cross section. The ballots that were returned seem to have been even less representative. Apparently the collecting of ballots by mail was an even greater defect in the polling technique than the unscientific choice of a cross section in the first place.

Three polls using more scientific methods entered the business of forecasting Presidential elections in 1936. They were associated with the names of George Gallup, Elmo Roper, and Archibald M. Crossley. In 1936, 1940, and 1944 they were successful in picking the winning candidate. However, the Gallup and Crossley forecasts of state-by-state electoral votes were not as impressive as their predictions of the national popular vote, and they almost always overestimated the Republican vote.

Mr. Roper's *Fortune* poll predicted popular vote results with remarkable accuracy, but avoided the more difficult task of predicting state-by-state electoral votes. After Roper's 1940 sectional figures were made available, Daniel Katz pointed out that the error in one section of the country was as high as 12 per cent, and in no section of the country was the error less than 4 per cent.[2] The relatively large Roper errors had canceled themselves out. This seems to be a hazardous way to arrive at accuracy.

By 1948 the pollsters had outgrown the caution that had been reflected in their pre-election statements of earlier years. The Gallup poll stated flatly that Governor Dewey would "win the Presidential election with a substantial majority of electoral votes." Mr. Roper said that his inclination was to predict the election of Governor Dewey "by a heavy margin," and added that the validation of public opinion testing in political areas was complete; "it is known that a scientifically conducted and antiseptically clean survey will coincide with the actual choice of the voters within a close limit of error."

The election that followed was a disillusioning affair. In 1948 there was a Dewey landslide of pollsters and journalists, but not of the voters; or it might be more appropriate to say that the pollsters and journalists got their feet off the ground and simply floated up into the clouds together. The election brought them down with a dull thud.

Under such circumstances, when a pollster wants to believe, and wants others to believe, that his poll was not really so great a failure as it seemed,

[2] Daniel Katz, "The Public Opinion Polls and the 1940 Election," *Public Opinion Quarterly*, Vol. 5 (Mar. 1941), pp. 52–78.

one of his first rationalizations is that public opinion must have changed between the time when the last poll was taken and the time the election was held. Shortly after the election results became known in 1936 the editor of *The Literary Digest* was quoted as saying:

> We may not have reached a representative cross section of the population in distributing the ballots. On the other hand, the last returns were received some weeks ago, and there may have been a shift in voting sentiment since then.[3]

In February 1949 Dr. Gallup told the Iowa Conference on Attitude and Opinion Research, "The biggest error which we and other polls made was in not taking a last-minute poll." Mr. Crossley said, "We did not catch the late Truman upsurge because we assumed campaigns do not change many votes and stopped polling too early."[4]

VOTERS DECIDE EARLY

Apparently most voters do make up their minds well before the end of the campaign, in an ordinary election year. An intensive study of an Ohio county during the campaign of 1940 led Paul F. Lazarsfeld to conclude that in a sense "modern Presidential campaigns are over before they begin." The study indicated that only a small percentage of the people were so undecided that campaign propaganda could convert them, and the decisions of these voters would not considerably alter the ratio of Democratic and Republican vote intentions which existed before the campaign began.[5]

Of course this conclusion, drawn chiefly from a study of the electorate of one county in one campaign, may not always be applicable. However, in the absence of some unusual factor, the changes in the last few weeks of a campaign are probably ordinarily inconsequential in their effect on the election result. If a steady trend toward one candidate is in progress, the polls should be able to discover it, and they should report it with some suggestion as to its probable effect on the election results. Although a trend of this kind is likely to have only a negligible effect on the voting balance in the few days intervening between the last pre-election polls and the election, a failure to interpret it correctly is a polling failure.

WHAT POLITICIANS THINK OF POLLS

The attitudes of politicians toward the commercial polls seem to vary greatly. President Truman holds them in contempt; but Charles W. Van Devander reported in 1944 that Governor Thomas E. Dewey had "never run for office without employing the private services of the Gallup poll to assay his chances of election."[6] Charles Michelson once expressed the view that the polls had a claim to validity comparable to that of astrological charts.[7]

In their public statements during campaigns, politicians tend to be particularly critical when the polls are going against them. Politicians consider it good strategy to try to create the impression that they are winning, and incline to minimize anything that tends to create an adverse impression.

ACADEMIC VIEWS

After the election of 1948 the pollsters were not left to the mercies of the politicians, nor were they left to evaluate their own mistakes without

assistance. Individual academic authorities on public opinion presented diagnoses, and the Social Science Research Council appointed a Committee on Analysis of Pre-election Polls and Forecasts which recruited a technical staff to carry on an intensive investigation. Out of the research and cogitation of this staff and committee came a fat volume entitled *The Pre-election Polls of 1948* containing information on the polling procedures used, discussion of problems involved, conclusions as to the sources of error, and recommendations for opinion measurement procedures in the future.

One of the chief criticisms by the academic authorities was directed at the use of the quota sampling method by the commercial polls.[8] When the quota sampling method is used, the procedure is somewhat as follows: The managers of the poll find out that the total adult population of the country contains a certain percentage of such elements as men, women, farmers, urban dwellers, people in different income brackets, Democrats, and Republicans, and then they send interviewers out to interview a given number of people containing the same proportion of each of these elements as the general population.

The academic authorities contended that better cross sections could have been obtained by a procedure called probability sampling, in which the final determination of the particular individuals to be polled is left to chance, and the element of choice by interviewers is eliminated. When the probability sampling method is used, the country is broken into geographical units and subunits, until finally the interviewers are directed to interview adult inhabitants in every third house in each block, or whatever is the desired proportion, in selected areas.

The theory of probability sampling is that such a procedure "is in conformity with statistical laws"; therefore "it is possible to calculate precisely the probability that the margin of error in any given sample will not exceed a given amount."[9] This should not be interpreted to mean that when the polls report the answers which respondents in such a cross section gave to the strangers who interviewed them, the statisticians can calculate precisely the probability that the margin of error in the opinion reported will not exceed a certain amount. What it means is that theoretically the sample will contain the correct proportion of white persons, the correct spread of persons of different ages, persons with typical amounts of education, and similar characteristics, subject to a calculable margin of error. There is no way by which the margin of error in the report of opinion can be calculated.

Dr. Gallup objected to dogmatic assertions that probability sampling was superior to quota sampling for use in election polls, and cited evidence which indicated that it had not proved superior in practice.[10] At the Iowa Conference on Attitude and Opinion Research he said that random sampling "has certain definite advantages under certain definite conditions," but he added that it was not "a cure-all." He stated that the Gallup poll had carried on experimental work through the years to prove its techniques, and that a new department was being established which would have the sole function of carrying on experimental work and trying out new suggestions for the improvement of polling techniques.[11]

COMPARATIVE RELIABILITY

In a period when the polls are thrust into public attention, as they were in 1936 and in 1948, questions are raised as to their reliability and their social usefulness. When they are evaluated with such criteria in mind, one of the basic facts to be remembered is that Presidential election polls, as a rule, are considerably more reliable than polls on public questions and issues.[12] This is true primarily for two reasons: (1) Presidential election polling is done with more care, one feature of which is the use of larger samples; (2) most of the people being polled have heard about the candidates, have formed fairly definite opinions about them, and the question they are asked is clear and definite.

In contrast, when a poll is on an issue, replies come from people who are at all stages of forming opinion, and who have widely different degrees of interest in the subject and widely different degrees of knowledge about it. Under such circumstances different polling agencies may get very different results on similar questions. A slight variation in the wording of the question may make a considerable difference in results. When the opinion that pollsters are attempting to measure is such that a slight difference in the wording of a question will cause a significant change in the results, the interpretation of results should be made with great skill and caution. Most newspaper readers who read the reports of polls do not make that kind of interpretations.

SPECIFIC HAZARDS

Behind the replies, the degrees of knowledge and interest of the people who give them are highly important. In this connection a statement made by Angus Campbell, University of Michigan Survey Research Director, is pertinent. He said:

> We have consistently found in our studies of the adult population that not more than a quarter of the people of this country are sufficiently familiar with world affairs to converse readily in terms of specific people, issues or events. . . . At the other end of the scale is a fraction of about equal size who seem virtually oblivious to such matters. They do not follow the news and their knowledge of such monumental developments as the Marshall Plan, the NATO, or even the United Nations is virtually nil. Between these high and low quartiles are the remaining half of the people, having some general acquaintance with what is going on in the world but little specific knowledge.[13]

Nevertheless, commercial pollsters report issue poll results in a tone of certainty, sometimes even to the tenth of a per cent! Stuart Chase wrote in 1948 that none of the commercial pollsters really liked to do polls on Presidential elections. "Mr. Gallup, indeed, complained of stomach ulcers every four years," he said.[14] None of the pollsters complain of getting stomach ulcers from conducting polls on issues, because nobody can come up next

Wednesday morning and prove definitely that their results were wrong.

Even though Presidential election polls are likely to be considerably more reliable than polls on more abstract subjects, they involve particular problems. Many persons who are legally qualified to vote will not vote on election day, and the pollster has no way of finding out certainly which ones will vote. People vote for various reasons. One of Mr. Dooley's characters said: "'I'm with Clancy's candydate,' he says. 'He niver offered to enlist for th' war,' he says, 'but 'twas Clancy put Terence on th' polis foorce an' got th' school f'r Aggie,' he says." [15]

Whether because the citizen is grateful for a job, or because he is a farmer who wants farm subsidies continued or a worker who remembers a time when government was less friendly to labor or a businessman who wants favorable legislation, or for some other reason, some voters will take the trouble to vote and others will not. Those who have a vital interest at stake, those who are angry, those who have a crusading spirit, are more likely to vote than those who feel no strong emotional urge. Furthermore, they are likely to count for more in their influence on others. An efficient organization will get out some voters who would not otherwise vote.

Another problem, one not peculiar to election polls, is that of getting correct information from respondents. The average individual likes to go along with the crowd. If he thinks he is not going along with the crowd, he may give a noncommittal answer when a stranger comes around and asks him how he is going to vote. A pollster may also find it difficult to get revealing information from some respondents when they have little enthusiasm for either candidate. Doubtless a number of voters in 1948 simply voted for the candidate whom they considered the lesser of the two leading evils.

[15] Finley Peter Dunne, *Mr. Dooley in Peace and in War* (London, 1899), p. 90.

INFLUENCE OF THE POLLS

A few critics of the polls consider them an unmitigated evil. A few would like to see them abolished, or at least regulated by the government. One of the charges brought against them is that they influence elections because of bandwagon psychology. How much influence of this kind they exert in Presidential elections is problematical. In 1948 they may have had more influence in the opposite direction, causing the Republicans to develop a debilitating self-confidence.

The influence of preconvention polls, when candidates are struggling for the party support which will give them the nomination, is another matter. Because party leaders are anxious to nominate a candidate who can win the election, they may pay considerable attention to the polling reports which purport to show the relative popularity of the candidates with the electorate. Democrats may be a little less inclined than Republican politicians to pay attention to such polls. They have had the experience of winning elections when the polls were against them. They have been accustomed to having the newspapers against them in both national and local elections, and they have found that such opposition need not be fatal.

Actually, the preconvention polls are less reliable than the pre-election polls. They are somewhat comparable in accuracy to polls on issues.

The preconvention poll must be considered an agency which may influence the nomination, and which may be used in an attempt to influence the nomination as a newspaper attempts to influence the nomination through its editorials and its treatment of the news.

In the period preceding the 1952 Republican national convention, the myth that "Taft Can't Win" was largely a creation of the polls. Except for the polling reports, no very substantial evidence was presented to justify such a conclusion. Consider the following bombardment of releases: On February 13 a poll report was that Taft and Eisenhower were running "neck-and-neck" among Republican voters; March 2 that Taft polled 34 per cent and Eisenhower 33 per cent among Republican voters, but that Eisenhower held a big lead among independent voters; March 5 that the voters would prefer Kefauver to Taft if they were pitted against each other; March 7 that the voters would prefer Eisenhower to Kefauver; March 19 that Eisenhower led Kefauver, but Kefauver led Taft in thirteen southern states; April 9 that Eisenhower led Taft by a slight margin among Republican voters and was preferred by independent voters by more than three to one; April 12 that Eisenhower was the favorite Republican candidate among veterans; April 18 that Kefauver led Taft; April 20 that Eisenhower beat Kefauver; April 25 that Democratic county chairmen thought either Governor Adlai Stevenson or Senator Kefauver could beat Taft; May 1 that Eisenhower was favored over Taft by both Republicans and independents.

Such polling bombardment constituted one of the most serious kinds of opposition that Senator Taft had to face in his campaign to win the Presidential nomination, the success of which depended upon the support of victory-famished Republican politicians.

THE REMEDY

To say that the polls are wolves in sheep's clothing would be a harsh and unjustified characterization, but they are not all sheep. Their influence has not been wholly good, but they have contributed to the development of improved techniques of opinion measurement—a desirable development. As Jane Ace says, "We have to take the bitter with the better." The polls should not be destroyed or taken over by the government, and we should be wary of government regulation. The remedy for the potentialities for harm in the commerical polls lies in the development of more sophisticated readers.

The citizen who desires to speculate perspicaciously about the outcome of the election will find the polling reports useful. He should consider them as evidential rather than prophetic, and he should make some allowance for their tendency to overestimate Republican strength. He may familiarize himself with Louis H. Bean's studies of election trends and Mr. Bean's estimates for the coming election, remembering always that the trend curve may make a bobble in its upward, or downward, course this year. He may also get enlightenment from history in regard to the relative weight of prosperity and corruption as campaign issues, and the types of candidates that have been elected and have failed to be elected in the past. When the intelligent citizen has done all of this, if he wishes to know the outcome of the election at the earliest possible moment, he will still have to sit up on election night and listen to the returns coming in over his radio.

Charles W. Smith, Jr., Ph.D., is a public opinion analyst in Washington, D.C. He has taught political science at Indiana University, Rutgers University, the University of Alabama, and the University of Kentucky. He is the author of Roger B. Taney: Jacksonian Jurist (1936) and Public Opinion in a Democracy (1939), and co-author of Government and Politics in Alabama (1941).

Participation in the Forthcoming Election

By Harold F. Gosnell

RECENT surveys show that the highest participation in voting is to be found among the well-to-do, the business executives, the best educated, the professional people, men; the lowest participation is to be found among the women, the young people, laboring people, people with only grade education, Negroes, and those in the lowest economic levels.[1] In the last thirty years the general pattern of electoral participation has not changed much.[2] There has been a gradual trend toward higher participation among women, laboring people, and Negroes, but these groups still have considerable indifference and apathy to be overcome. It may be expected that the proportion of adult citizens who will vote in November will not be much larger than in recent Presidential elections.

Analysis of Pre-election Polls

To their great grief, the polling organizations found it extraordinarily difficult to forecast the size of the vote in 1948. An examination of their figures will show the size of the problem. We are indebted to the Social Science Research Council for the most elaborate analysis of the pre-election polls that has yet been made.[3] The staff report by Mosteller and others furnishes some of the raw figures which we have never had before.

For instance, Crossley gives the number by states of those whom he excluded as nonvoters. This gives us the basis for estimating from his figures the percentage of probable turnout. As compared with the estimates of the other pollsters, Crossley did a very careful job. He showed considered ingenuity in working out his so-called filter questions which he used in estimating turnout.[4] When we compare his estimates with the average turnout as calculated from the census figures by Key, Crossley's percentages do not look very well.[5] In the eleven southern states that Key studied, Crossley's error in percentage points varied from 10 in Alabama to 56 in South Carolina. In the two northern states that Key studied, Crossley's error in percentage points was 7 in Ohio and 12 in New York.[6]

Roper did not give his state-by-state figures, so it is possible only to make a nation-wide analysis of his estimate of turnout. In the poll which he conducted October 25–28, he included a category of "won't vote." Of the 3,501 interviewed, only 8.7 per cent said that they would not vote. The estimated percentage of adult citizens voting in 1948 was about 52.[7] Roper's participation would be 92 per cent, or an error of 40 percentage points. This would be reduced 5 percentage points if half of the "don't knows" were included.[8] This would still leave an error of about 35 percentage points.

Gallup also failed to give his state-by-state figures on his estimated turnout. In his October 15–29 survey he interviewed 2,972 persons, of whom 314 said that they would not vote.[9] This gives an estimated turnout of 89 per cent, and if we make the same allowance for those who said they were undecided that we did for Roper, we reduce Gallup's estimate to 84 per cent. This would give Gallup an error of 32 percentage points in estimating turnout, which is not much less than Roper's.

The pollsters were certainly far off in their estimates of probable turnout in 1948. If they use substantially the same methods, it is doubtful whether they will do much better this year. People will not tell an interviewer frankly that they will not vote. Probable nonvoters cannot usually bring themselves to give a candid answer to the casual interviewer.

The unsatisfactory character of the polling data on the question of participation makes it necessary to use these data with caution in estimating total vote to be cast. On the other hand, even though the estimates of turnout may be off by a considerable margin, the surveys will still show considerable about the character of those who will not vote.

Turnout by Party Preference

As far as the two major parties are concerned, nonvoting has been and probably will be more prevalent among persons with Democratic leanings than among those with Republican leanings. Considering the trends in the economic composition of the parties, this is to be expected. The Democrats draw more heavily from the laboring people, Negroes in northern cities, young people, and those with only grade education.[10] Since these are the groups with the lowest voting records, it follows that if the proportion of the eligible voters that came to the polls should increase, this would benefit the Democratic party under present circumstances.

The Republican party in the past twenty years has lost its majority position, but the minority who now classify themselves as Republicans are a more active political group than those who classify themselves as Democrats.[11] The greater intensity of the convictions of the Republicans is indicated in Woodward and Roper's study, which showed that the Republicans were more active and used more emotionally tinged words in describing their political views on selected topics than did the Democrats.

Republicans are in the minority, but they fight harder; they feel more intensely about politics. They are older men and women, and some of them have become bitter about the events of the last two decades. Even the death of Franklin D. Roosevelt has not soft-

ened their attitude toward the chief architect of Democratic politics during the thirties and forties.[12]

The independents have about average interest in politics. In the scale worked out by Woodward and Roper, the persons who classed themselves as independents showed about the same proportions of very actives, fairly actives, fairly inactives, and very inactives as the total adult population. The independents thus fall between the self-styled Republicans and the self-styled Democrats. Gallup found the participation of the independents about the same as that of the Democrats. Since those who tell the interviewers that they are going to vote Republican are more active politically than the other groups, it follows that the Republicans must make deep inroads into the so-called independent vote if they wish to win Presidential elections.

In the 1948 election Gallup's surveys showed that those who told the interviewers they were leaning toward Wallace, the Progressive party candidate, were just as little likely to say that they would not vote as those who were leaning toward the Republicans. In other words, Progressives were apparently about as active as Republicans.

GETTING OUT THE VOTE

Political scientists have never agreed about the significance of the size of the poll.[13] Is a small poll a bad sign? Does a large participation indicate a healthy democratic process?

There is no definite answer to these questions. Under some circumstances a small vote may not be alarming. In council-manager cities the election of a council-at-large has never brought out as many voters as mayoralty elections have. Yet, the council-manager cities have in general been well governed and the voters have been satisfied.

A high participation may reflect unusual strain in the body politic. Before the advent of Hitler, the Germans showed a great interest in voting. They were torn by dissension. In spite of the New Deal and Fair Deal haters, American politics has never reached such a high level of tension.

Woodward and Roper found that only 1 per cent of their sample of respondents got a score of 10 or higher out of a total possible score of 12 for political activity.[14] Nearly 40 per cent were classified as very inactive. The very active ones were those who voted regularly, discussed public issues with others, belonged to organizations that took stands on public issues, wrote or talked to Congressmen or other public officials to give their own opinions on public issues, worked for election of political candidates within the last four years, and contributed money to a party or a candidate within the last four years. Nonvoting is thus part of a person's total attitude toward politics. Those who did not vote did not do the other things regularly.

As the level of education rises, we would expect the level of participation in government to rise. The number of college graduates is still small in proportion to total number of adults. Within

[14] Woodward and Roper, *op. cit.* note 1, p. 876.

the educational system itself, more concerted efforts can be made to prepare students for active political life.[15]

As various economic pressure groups become interested in politics, they may be expected to aid in getting out the vote. For many years, business groups have been heavy contributors to party campaign funds, and businessmen are among the most active voters. During the past twenty years, trade unions have shown an increasing interest in politics, and labor organizers have been active in getting out the vote.[16] If consumers were better organized, they would become more active voters.

In the United States the political parties are still the backbone of the vote-getting machinery. The parties raise funds and recruit workers to bring the voters to the polls. The Kefauver and other investigations have shown that the parties in the great urban centers find it easier to obtain funds from the underworld than from other groups. Party precinct workers expect rewards in the form of political patronage and special favors. The citizens in the lower income groups who wish to enter politics are faced with unpleasant choices. If they do not line up with the party machines, their chances of success are small. If they become members of the party organization, their voices are silenced on many reform issues.

Should the government lighten the burden of the parties in mobilizing the electorate? In what ways might the government aid candidates without interfering with freedom of choice?

[15] T. H. Reed and D. D. Reed, *Preparing College Men and Women for Politics*, New York, 1952.

[16] Lubell, *op. cit.* note 11, points out that in the 1950 senatorial campaign in Ohio the labor leaders assumed that a large vote would be an anti-Taft vote. It did not turn out that way.

Some forty years ago it was proposed in the United States that the government itself undertake to give financial aid to candidates for elective office.[17] Except for a limited amount of free radio time, little has been done to implement such a proposal in this country.

CAMPAIGNING SUBSIDIZED IN JAPAN

In postwar Japan, however, a full and logical application of the government's responsibility to promote freedom of candidacy has been made. With the elimination of the former militarist and expansionist leaders, it was necessary to encourage the participation in politics of those who were without organization support and who lacked the funds necessary to conduct a modern election campaign. It was assumed that in a democracy all persons, regardless of means or status, should be accorded equal opportunity in seeking public office.

For the 1947 elections a National Election Administration Commission was established, with nine members named by the National Diet.[18] This Commission's duties included the administration of the appropriation which paid subsidies to candidates for the conduct of their campaigns. The subsidies were in the form of gasoline ration coupons, free passes on public transportation facilities, free radio time, payment for newspaper advertisements, space in the election gazette, free postage, a limited supply of free paper, and an opportunity to take part in the free competitive speech meetings.

[17] President Theodore Roosevelt, in his annual message to Congress in 1907, recommended that Congress provide an appropriation "for the proper and legitimate expenses of each of the great national parties."

[18] National Election Administration Commission Law (Law No. 152, December 7, 1947) and Handbook of Laws for Japanese Diet Elections, 1947.

Judging by the size of the polls, the Japanese election laws have been quite successful. In 1947 some 68 per cent of the eligible vote was cast; in 1949 it rose to 74 per cent, and in 1950 to 80 per cent.

A corollary of the limited subsidy plan in Japan has been a limit on the total amount of money that each candidate can spend on his own account. According to American standards, a low limit is applied.[19]

The Japanese laws have brought about a wider participation in running for elective office. In the 1947 elections a considerable number of farmers, teachers, labor leaders, journalists, doctors, and housewives were elected to the House of Representatives.[20]

COMPULSORY VOTING

Compulsory voting is an older device which has been used by a number of European and other countries to see that the voters perform their duties on election day. It has been particularly successful in Australia.[21]

If compulsory voting were to be used in the United States, it would mean that the registration and voting laws would have to be strengthened and made more nearly uniform, and that voting administration would have to be centralized. The most ignorant citizens would probably cast blank ballots, but they would be under pressure to inform themselves and make the most intelligent choices that they could. Compulsory voting would probably help the Democrats more than the Republicans under present circumstances. As far as the tone of politics is concerned, compulsory voting would be an improvement, since it would reduce the need for large political organizations, large campaign funds, and patronage rewards for party canvassers who round up voters. The parties would have to concentrate on winning the support of the voters, not merely bringing out the faithful.

[19] It is $220 at the prevailing exchange rate for each candidate for the House of Representatives.

Harold F. Gosnell, Ph.D., Washington, D. C., is adjunct professor of political science at the American University. He has been associated with the Department of State, the Bureau of the Budget, and the Office of Price Administration, and was on the faculty of the University of Chicago for twenty years. He has served as research consultant to various national committees on economic and social problems. His books include Why Europe Votes (1930), Grass Roots Politics (1942), Democracy: The Threshold of Freedom (1948), and Champion Campaigner: Franklin D. Roosevelt (1952). He was co-author of The American Party System (1940–48).

1952 Republican Platform
Adopted by the Republican National Convention
July 11, 1952

PREAMBLE

We maintain that man was not born to be ruled, but that he consented to be governed; and that the reasons that moved him thereto are few and simple. He has voluntarily submitted to government because, only by the establishment of just laws, and the power to enforce those laws, can an orderly life be maintained, full and equal opportunity for all be established, and the blessings of liberty be perpetuated.

We hold that government, and those entrusted with government, should set a high example of honesty, of justice, and unselfish devotion to the public good; that they should labor to maintain tranquillity at home and peace and friendship with all the nations of the earth.

We assert that during the last twenty years, leaders of the Government of the United States under successive Democrat administrations, and especially under this present Administration, have failed to perform these several basic duties; but, on the contrary, that they have evaded them, flouted them, and by a long succession of vicious acts, so undermined the foundations of our Republic as to threaten its existence.

We charge that they have arrogantly deprived our citizens of precious liberties by seizing powers never granted.

We charge that they work unceasingly to achieve their goal of national socialism.

We charge that they have disrupted internal tranquillity by fostering class strife for venal political purposes.

We charge that they have choked opportunity and hampered progress by unnecessary and crushing taxation.

They claim prosperity but the appearance of economic health is created by war expenditures, waste and extravagance, planned emergencies, and war crises. They have debauched our money by cutting in half the purchasing power of our dollar.

We charge that they have weakened local self-government which is the cornerstone of the freedom of men.

We charge that they have shielded traitors to the nation in high places, and that they have created enemies abroad where we should have friends.

We charge that they have violated our liberties by turning loose upon the country a swarm of arrogant bureaucrats and their agents who meddle intolerably in the lives and occupations of our citizens.

We charge that there has been corruption in high places, and that examples of dishonesty and dishonor have shamed the moral standards of the American people.

We charge that they have plunged us into war in Korea without the consent of our citizens through their authorized representatives in the Congress, and have carried on that war without will to victory.

FOREIGN POLICY

The present Administration, in seven years, has squandered the unprecedented power and prestige which were ours at the close of World War II.

In that time, more than 500 million non-Russian people of fifteen different countries have been absorbed into the power sphere of Communist Russia, which proceeds confidently with its plan for world conquest.

We charge that the leaders of the Administration in power lost the peace so dearly earned by World War II.

The moral incentives and hopes for a better world which sustained us through World War II were betrayed, and this has given Communist Russia a military and propaganda initiative which, if unstayed, will destroy us.

They abandoned friendly nations such as Latvia, Lithuania, Estonia, Poland and Czecho-Slovakia to fend for themselves against the Communist aggression which soon swallowed them.

They required the National Government of China to surrender Manchuria with its strategic ports and railroads to the control of Communist Russia. They urged that Communists be taken into the Chinese Government and its military forces. And finally they denied the military aid that had been authorized by Congress and which was crucially needed if China were to be saved. Thus they substituted on our Pacific flank a murderous enemy for an ally and friend.

In all these respects they flouted our peace-assuring pledges such as the Atlantic Charter, and did so in favor of despots, who, it was well known, consider that murder, terror, slavery, concentration camps and the ruthless and brutal denial of human rights are legitimate means to their desired ends.

Tehran, Yalta and Potsdam were the scenes of those tragic blunders with others to follow. The leaders of the Administration in power acted without the knowledge or consent of Congress or of the American people. They traded our overwhelming victory for a new enemy and for new oppressions and new wars which were quick to come.

In South Korea, they withdrew our occupation troops in the face of the aggressive, poised for action, Communist military strength on its northern border. They publicly announced that Korea was of no concern to us. Then when the Communist forces acted to take what seemed to have been invited, they committed this nation to fight back under the most unfavorable conditions. Already the tragic cost is over 110,000 American casualties.

With foresight, the Korean war would never have happened.

In going back into Korea, they evoked the patriotic and sacrificial support of the American people. But by their hampering orders they produced stalemates and ignominious bartering with our enemies, and they offer no hope of victory.

They have effectively ignored many vital areas in the face of a global threat requiring balanced handling.

The people of the other American republics are resentful of our neglect of their legitimate aspirations and co-operative friendship.

The Middle East and much of Africa seethe with anti-American sentiment.

The peoples of the Far East who are not under Communist control find it difficult to sustain their morale as they contrast Russia's "Asia First" policy with the "Asia Last" policy of those in control of the Administration now in power.

Here at home they have exhibited corruption, incompetence, and disloyalty in public office to such an extent that the very concept of free representative government has been tarnished and has lost its idealistic appeal to those elsewhere who are confronted with the propaganda of Communism.

They profess to be following a defensive policy of "containment" of Russian Communism which has not contained it.

Those in control of the party in power have, in reality, no foreign policy. They swing erratically from timid appeasement to reckless bluster.

The good in our foreign policies has been accomplished with Republican co-operation, such as the organization of the United Nations, the establishment of the trusteeship principle for dependent peoples, the making of peace with Japan and Germany, and the building of more solid security in Europe. But in the main the Republican party has been ignored and its participation has not been invited.

The American people must now decide whether to continue in office the party which has presided over this disastrous reversal of our fortunes and the loss of our hopes for a peaceful world.

The Republican party offers, in contrast to the performances of those now running our foreign affairs, policies and actions based on enlightened self-interest and animated by courage, self-respect, steadfastness, vision, purpose, competence and spiritual faith.

The supreme goal of our foreign policy will be an honorable and just peace. We dedicate ourselves to wage peace and to win it.

We shall eliminate from the State Department and from every federal office, all, wherever they may be found, who share responsibility for the needless predicaments and perils in which we find ourselves. We shall also sever from the public payroll the hordes of loafers, incompetents and unnecessary employees who clutter the administration of our foreign affairs. The confusions, overlappings, and extravagance of our agencies abroad hold us up to the ridicule of peoples whose friendship we seek.

We shall substitute a compact and efficient organization where men of proven loyalty and ability shall have responsibility for reaching our objectives. They will reflect a dynamic initiative. Thus we can win the support and confidence which go only to those who demonstrate a capacity to define and get results.

We shall have peace-building objectives wherever this will serve the enlightened self-interest of our nation and help to frustrate the enemy's designs against us.

In western Europe we shall use our friendly influence, without meddling or imperialistic attitudes, for ending the political and economic divisions which alone prevent that vital area from being strong on its own right.

We shall encourage and aid the development of collective security forces there, as elsewhere, so as to end the Soviet power to intimidate directly or by satellites and so that the free governments will be sturdy to resist Communist inroads.

In the balanced consideration of our problems, we shall end neglect of the Far East which Stalin has long identified as the road to victory over the West. We shall make it clear that we have no intention to sacrifice the East to gain time for the West.

The Republican party has consistently advocated a national home for the Jewish people since a Republican Congress declared its support of that objective thirty years ago.

In providing a sanctuary for Jewish people rendered homeless by persecution, the State of Israel appeals to our deepest humanitarian instincts. We shall continue our friendly interest in this constructive and inspiring undertaking.

We shall put our influence at the service of peace between Israel and the Arab states and we shall cooperate to bring economic and social stability to that area.

Our ties with the sister republics of the Americas will be strengthened.

The Government of the United States, under Republican leadership, will repudiate all commitments contained in secret understandings such as those of Yalta which aid Communist enslavements. It will be made clear, on the highest authority of the President and the Congress, that United States policy, as one of its peaceful purposes, looks happily forward to the genuine independence of those captive peoples.

We shall again make liberty into a beacon light of hope that will penetrate the dark places. That program will give the Voice of America a real function. It will mark the end of the negative, futile and immoral policy of "containment" which abandons countless human beings to a despotism and Godless terrorism which in turn enables the rulers to forge the captives into a weapon for our destruction.

We shall support the United Nations and loyally help it to become what it was designed to be, a place where differences would be harmonized by honest discussion and a means for collective security under agreed concepts of justice. We shall seek real meaning and value for our regional security treaties, which implies that all parties shall contribute their loyal support and fair shares.

We shall see to it that no treaty or agreement with other countries deprives our citizens of the rights guaranteed them by the Federal Constitution.

We shall always measure our foreign commitments so that they can be borne without endangering the economic health or sound finances of the United States. Stalin said that "the moment for the decisive blow" would be when the free nations were isolated and were in a state of "practical bankruptcy." We shall not allow ourselves to be isolated and economically strangled, and we shall not let ourselves go bankrupt.

Sums available by this test, if competently used, will be more effective than vastly larger sums incompetently spent

for vague and endless purposes. We shall not try to buy good will. We shall earn it by sound, constructive, self-respecting policies and actions.

We favor international exchange of students and of agricultural and industrial techniques, and programs for improvement of public health.

We favor the expansion of mutually advantageous world trade. To further this objective we shall press for the elimination of discriminatory practices against our exports such as preferential tariffs, monetary license restrictions, and other arbitrary devices. Our reciprocal trade agreements will be entered into and maintained on a basis of true reciprocity and to safeguard our domestic enterprises and the payrolls of our workers against unfair import competition.

The policies we espouse will revive the contagious, liberating influences which are inherent in freedom. They will inevitably set up strains and stresses within the captive world which will make the rulers impotent to continue in their monstrous ways and mark the beginning of their end.

Our nation will become again the dynamic, moral and spiritual force which was the despair of despots and the hope of the oppressed. As we resume this historic role, we ourselves will come to enjoy again the reality of peace, security and solvency, not the shabby and fleeting counterfeit which is the gift of the Administration in power.

National Defense

On the prudent assumption that Communist Russia may not accommodate our own disgracefully lagging program for preparedness, we should develop with utmost speed a force in being, as distinguished from paper plans, of such power as to deter sudden attack or promptly and decisively defeat it. This defense against sudden attack requires the quickest possible development of appropriate and completely adequate air power and the simultaneous readiness of co-ordinated air, land, and sea forces, with all necessary installations, bases, supplies and munitions, including atomic energy weapons in abundance.

Generally, we shall see to it that our military services are adequately supported in all ways required, including manpower, to perform their appropriate tasks in relation to the defense of this country and to meet our treaty obligations.

We shall co-ordinate our military policy with our foreign policy, always seeking universal limitation and control of armaments on a dependable basis.

We shall review our entire preparedness program and we shall strip it clean of waste, lack of co-ordination, inertia, and conflict between the services. We shall see that our fighting men in Korea, or wherever they may be, shall not lack the best of weapons or other supplies or services needed for their welfare.

Communism

By the Administration's appeasement of Communism at home and abroad it has permitted Communists and their fellow travelers to serve in many key agencies and to infiltrate our American life. When such infiltration became notorious through the revelations of Republicans in Congress, the Executive Department stubbornly refused to deal with it openly and vigorously. It raised the false cry of "red herring" and took other measures to block and discredit investigations. It denied files and information to Congress. It set up boards of its own to keep information secret and to deal lightly with security risks and persons of doubtful loyalty. It only undertook prosecution of the most notorious Communists after public opinion forced action.

The result of these policies is the needless sacrifice of American lives, a crushing cost in dollars for defense, possession by Russia of the atomic bomb, the lowering of the Iron Curtain, and the present threats to world peace. Our people have been mired in fear and distrust and employees of integrity in the government service have been cruelly maligned by the Administration's tolerance of people of doubtful loyalty.

There are no Communists in the Republican party. We have always recognized Communism to be a world conspiracy against freedom and religion. We never compromised with Communism and we have fought to expose it and to eliminate it in government and American life.

A Republican President will appoint only persons of unquestioned loyalty. We will overhaul loyalty and security programs. In achieving these purposes a Republican President will co-operate with Congress. We pledge close co-ordination of our intelligence services for protecting our security. We pledge fair but vigorous enforcement of laws to safeguard our country from subversion and disloyalty. By such policies we will keep the country secure and restore the confidence of the American people in the integrity of our government.

Small Business in a Free Economy

For twenty years the Administration has praised free enterprise while actually wrecking it. Here a little, there a little, year by year, it has sought to curb, regulate, harass, restrain and punish. There is scarcely a phase of our economic and social life today in which government does not attempt to interfere.

Such hostility deadens initiative, discourages invention and experiment and weakens the self-reliance indispensable to the nation's vitality. Merciless taxation, the senseless use of controls and ceaseless effort to enter business on its own account have led the present government to unrestrained waste and extravagance in spending, irresponsibility in decision and corruption in administration.

The antimonopoly laws have been employed, not to preserve and foster competition but to further the political ambitions of the men in power. Wage and price controls have been utilized, not to maintain economic stability, but to reward the friends and punish the enemies of leaders of the party in power.

Neither small nor large business can flourish in such an atmosphere. The Republican party will end this hostility to initiative and enterprise.

We will aid small business in every practicable way. We shall remove tax abuses and injurious price and wage controls. Efforts to plan and regulate every phase of small business activity will cease. We will maintain special committees in Congress whose chief function will be to study and review continuously the problems of small business and recommend legislation for their relief. We shall always be mindful of the importance of keeping open the channels of opportunity for young men and women.

We will follow principles of equal enforcement of the antimonopoly and unfair competition statutes and will simplify their administration to assist the businessman who, in good faith, seeks to remain in compliance. At the same time, we shall relentlessly protect our free enterprise system against monopolistic and unfair trade practices.

We will oppose federal rent control except in those areas where the expansion of defense production has been accompanied by critical housing shortages. With local co-operation we shall aid slum clearance.

Our goal is a balanced budget, a reduced national debt, an economical administration and a cut in taxes. We believe in combating inflation by encouraging full production of goods and food and not through a program of restrictions.

Taxation and Monetary Policy

Only with a sound economy can we properly carry out both the domestic and foreign policies which we advocate. The wanton extravagance and inflationary policies of the Administration in power have cut the value of the dollar in half and imposed the most confiscatory taxes in our history. These policies have made the effective control of government expenditures impossible. If this Administration is left in power, it will further cheapen the dollar, rob the wage earner, impoverish the farmer and reduce the true value of the savings, pensions, insurance and investments of millions of our people. Further inflation must be and can be prevented. Sound tax and monetary policies are essential to this end. We advocate the following tax policies:

1. Reduction of expenditures by the elimination of waste and extravagance so that the budget will be balanced and a general tax reduction can be made.

2. An immediate study directed toward

reallocation of fields of taxation between the federal, state, and municipal governments so as to allow greater fiscal freedom to the states and municipalities, thus minimizing double taxation and enabling the various divisions of government to meet their obligations more efficiently.

3. A thorough revision and codification of the present hodgepodge of internal revenue laws.

4. Administration of the tax laws free from politics, favoritism and corruption.

We advocate the following monetary policies:

1. A Federal Reserve System exercising its functions in the money and credit system without pressure for political purposes from the Treasury or the White House.

2. To restore a domestic economy, and to use our influence for a world economy, of such stability as will permit the realization of our aim of a dollar on a fully convertible gold basis.

AGRICULTURE

The good earth is the food storehouse for future generations. The tending of the soil is a sacred responsibility. Development of a sound farm program is a high national duty. Any program that will benefit farmers must serve the national welfare. A prosperous agriculture with free and independent farmers is fundamental to the national interest.

We charge the present Administration with seeking to destroy the farmers' freedom. We denounce the Administraton's use of tax money and a multitude of federal agencies to put agriculture under partisan political dictation and to make the farmer dependent upon government. We condemn the Brannan plan which aims to control the farmer and to socialize agriculture. We brand as unscrupulous the Administration's manipulation of grain markets during the 1948 election campaign to drive down farm prices and its deliberate misrepresentation of laws passed by the Republican Eightieth Congress which authorized a long-range farm price support program and provided for adequate grain storage.

We condemn as a fraud on both the farmer and the consumer the Brannan plan scheme to pay direct subsidies from the Federal Treasury in lieu of prices to producers.

We favor a farm program aimed at full parity prices for all farm products in the market place. Our program includes commodity loans on nonperishable products, "on-the-farm" storage, sufficient farm credit and voluntary self-supporting crop insurance. Where government action on perishable commodities is desirable, we recommend locally controlled marketing agreements and other voluntary methods.

Our program should include commodity loans, on all nonperishable products supported at the level necessary to maintain a balanced production. We do not believe in restrictions on the American farmers' ability to produce.

We favor a bipartisan Federal Agricultural Commission with power to review the policies and administration of our farm programs and to make recommendations.

We support a constructive and expanded soil conservation program administered through locally controlled local districts and which shall emphasize that payments shall be made for practices and improvements of a permanent nature.

Flood control programs should include the application of sound land use, reforestation and water management practices on each watershed. These, so far as feasible, should be decentralized and locally controlled to insure economy and effective soil conservation.

We recommend expanded agricultural research and education to promote new crops and uses, new markets, both foreign and domestic, more trustworthy crop and market estimates, a realistic trade program for agriculture aimed at restoring foreign markets and developing new outlets at home. Promotion of world trade must be on a basis of fair competition.

We support the principle of bona fide farmer-owned, farmer-operated co-operatives and urge the further development of rural electrification and communication, with federally assisted production of power and facilities for distribution when these are not adequately available through private enterprise at fair rates.

We insist that an adequate supply of manpower on the farm is necessary to our national welfare and security and shall do those things required to assure this result.

The Republican party will create conditions providing for farm prosperity and stability, safeguarding the farmers' independence and opening opportunities for young people in rural communities. We will do those things necessary to simplify and make efficient the operation of the Department of Agriculture, prevent that Department from assuming powers neither intended nor delegated by Congress, and to place the administration of farm programs as closely as possible to state and local levels.

LABOR

The Republican party believes that regular and adequate income for the employee together with uninterrupted production of goods and services through the medium of private enterprise are essential to a sound national economy. This can only be obtained in an era of industrial peace.

With the above in mind, we favor the retention of the Taft-Hartley Act, which guarantees:

To the working man:

The right to quit his job at any time.

The right to take part in legal union activities.

The right to remain in his union so long as he pays his dues.

The right to protection against unfair practices by either employer or union officials.

The right to political activity of his own choice and freedom to contribute thereto.

The right to a job without first joining a union.

The right to a secret ballot in any election concerned with his livelihood.

The right to protection from personal financial responsibility in damage cases against his union.

To the labor unions:

The right to establish "union shop" contracts by agreement with management.

The right to strike.

The right to free collective bargaining.

The right to protection from rival unions during the life of union contracts.

The right to assurance from employers that they will bargain only with certified unions as a protection against unfair labor practices.

We urge the adoption of such amendments to the Taft-Hartley Act as time and experience show to be desirable, and which further protect the rights of labor, management and the public.

We condemn the President's seizure of plants and industries to force the settlement of labor disputes by claims of inherent Constitutional powers.

NATURAL RESOURCES

We vigorously advocate a full and orderly program for the development and conservation of our natural resources.

We deplore the policies of the present Administration which allow special premiums to foreign producers of minerals available in the United States. We favor reasonable depletion allowances, defense procurement policies, synthetic fuels research, and public land policies, including good faith administration of our mining laws, which will encourage exploration and development of our mineral resources consistent with our growing industrial and defense needs.

We favor stockpiling of strategic and critical raw materials and special premium incentives for their domestic exploration and development.

We favor restoration to the states of their rights to all lands and resources beneath navigable inland and offshore waters within their historic boundaries.

We favor protection of our fisheries by domestic regulation and treaties, including safeguards against unfair foreign competition.

PUBLIC WORKS AND WATER POLICY

The Federal Government and state and local governments should continuously plan programs of economically justifiable public works.

We favor continuous and comprehensive

investigations of our water resources and orderly execution of programs approved by the Congress. Authorized water projects should go forward progressively with immediate priority for those with defense significance, those in critical flood and water shortage areas, and those substantially completed.

We favor greater local participation in the operation and control, and eventual local ownership, of federally sponsored, reimbursable water projects.

We vigorously oppose the efforts of this national Administration, in California and elsewhere, to undermine state control over water use, to acquire paramount water rights without just compensation, and to establish all-powerful federal socialistic valley authorities.

PUBLIC LANDS

We favor restoration of the traditional Republican public land policy, which provided opportunity for ownership by citizens to promote the highest land use. We favor an impartial study of tax-free federal lands and their uses to determine their effects on the economic and fiscal structures of our states and local communities.

In the management of public lands and forests we pledge the elimination of arbitrary bureaucratic practices. To this end we favor legislation to define the rights and privileges of grazers and other co-operators and users, to provide the protection of independent judicial review against administrative invasions of those rights and privileges, and to protect the public against corrupt or monopolistic exploitation and bureaucratic favoritism.

VETERANS

We believe that active duty in the armed forces of the United States of America during a state of war or national emergency constitutes a special service to our nation and entitles those who have so served to aid and compensation in return for this service.

Consequently we propose:

That the aid and compensation given to veterans of previous wars be extended to veterans of the Korean conflict;

That compensation be fairly and adequately adjusted to meet changes in the cost of living;

That aid be given to veterans, particularly disabled veterans, to obtain suitable employment, by providing training and education, and through strict compliance with veterans' preference laws in federal service;

That the Veterans' Administration be maintained as a single, independent agency in full charge of all veterans' affairs, and that the Veterans' Administration manage veterans' affairs in an efficient, prompt and uniform manner;

That the Veterans' Administration should be equipped to provide and maintain medical and hospital care of the highest possible standard for all eligible veterans.

SOCIAL SECURITY

Inflation has already cut in half the purchasing power of the retirement and other benefits under the Federal Old Age and Survivors Insurance system. Sixty million persons are covered under the system and 4.5 million are now receiving benefits.

The best assurance of preserving the benefits for which the worker has paid is to stop the inflation which causes the tragic loss of purchasing power, and that we propose to do.

We favor amendment of the Old Age and Survivors Insurance system to provide coverage for those justly entitled to it but who are now excluded.

We shall work to achieve a simple, more effective and more economical method of administration.

We shall make a thorough study of universal pay-as-we-go pension plans.

HEALTH

We recognize that the health of our people as well as their proper medical care cannot be maintained if subject to federal bureaucratic dictation. There should be a just division of responsibility between government, the physician, the voluntary hospital, and voluntary health insurance. We are opposed to federal compulsory health insurance with its crushing cost, wasteful inefficiency, bureaucratic dead weight, and debased standards of medical care. We shall support those health activities by government which stimulate the development of adequate hospital services without federal interference in local administration. We favor support of scientific research. We pledge our continuous encouragement of improved methods of assuring health protection.

EDUCATION

The tradition of popular education, tax supported and free to all, is strong with our people. The responsibility for sustaining this system of popular education has always rested upon the local communities and the states. We subscribe fully to this principle.

CIVIL RIGHTS

We condemn bigots who inject class, racial and religious prejudice into public and political matters. Bigotry is un-American and a danger to the Republic.

We deplore the duplicity and insincerity of the party in power in racial and religious matters. Although they have been in office as a majority party for many years they have not kept nor do they intend to keep their promises.

The Republican party will not mislead, exploit or attempt to confuse minority groups for political purposes. All American citizens are entitled to full, impartial enforcement of federal laws relating to their civil rights.

We believe that it is the primary responsibility of each state to order and control its own domestic institutions, and this power, reserved to the states, is essential to the maintenance of our federal Republic. However, we believe that the Federal Government should take supplemental action within its constitutional jurisdiction to oppose discrimination against race, religion or national origin.

We will prove our good faith by:

Appointing qualified persons, without distinction of race, religion or national origin, to responsible positions in the government.

Federal action toward the elimination of lynching.

Federal action toward the elimination of poll taxes as a prerequisite to voting.

Appropriate action to end segregation in the District of Columbia.

Enacting federal legislation to further just and equitable treatment in the area of discriminatory employment practices. Federal action should not duplicate state efforts to end such practices; should not set up another huge bureaucracy.

CENSORSHIP

We pledge not to infringe by censorship or gag order the right of a free people to know what their government is doing.

EQUAL RIGHTS

We recommend to Congress the submission of a Constitutional amendment providing equal rights for men and women.

We favor legislation assuring equal pay for equal work regardless of sex.

STATEHOOD

We favor immediate statehood for Hawaii.

We favor statehood for Alaska under an equitable enabling act.

We favor eventual statehood for Puerto Rico.

DISTRICT OF COLUMBIA

We favor self-government and national suffrage for the residents of the nation's capital.

INDIAN AFFAIRS

All Indians are citizens of the United States and no longer should be denied full enjoyment of their rights of citizenship.

We shall eliminate the existing shameful waste by the Bureau of Indian Affairs which has obstructed the accomplishment of our national responsibility for improving the condition of our Indian friends. We pledge to undertake programs to provide the Indians with equal opportunities for education, health protection and economic development.

The next Republican Administration will welcome the advice and counsel of Indian leaders in selecting the Indian Commissioner.

CIVIL SERVICE

We condemn the flagrant violations of the Civil Service merit system by the party in power.

We favor a personnel program for the federal career service comparable to the best practices of progressive private employers. Federal employees shall be selected under a strengthened and extended merit system. Civil servants of ability and integrity shall receive proper recognition, with merit the sole test for promotion.

DELIVERY OF MAIL

We pledge a more efficient and frequent mail delivery service.

GOVERNMENT REORGANIZATION

We pledge a thorough reorganization of the Federal Government in accordance with the principles set forth in the report of the Hoover Commission which was established by the Republican Eightieth Congress.

We denounce the duplicity in submitting to Congress for approval, reorganization plans which were represented as being in accordance with the principles of the Hoover Commission recommendations but which in fact were actually intended to further partisan political purposes of the Administration in power.

CORRUPTION

The present Administration's sordid record of corruption has shocked and sickened the American people. Its leaders have forfeited any right to public faith by the the way they transact the Federal Government's business.

Fraud, bribery, graft, favoritism and influence-peddling have come to light. Immorality and unethical behavior have been found to exist among some who were entrusted with high policy-making positions, and there have been disclosures of close alliances between the present government and underworld characters.

Republicans exposed cases of questionable and criminal conduct and relentlessly pressed for full investigations into the cancer-like spread of corruption in the Administration. These investigations uncovered a double standard in federal tax law enforcement—lenient treatment to political favorites including even some gangsters and crooks but harassment and threats of prosecution for many honest taxpayers over minor discrepancies.

Besides tax fixes and scandals in the Internal Revenue Bureau, investigations have disclosed links between high officials and crime, favoritism and influence in the RFC, profiteering in grain, sale of postmasterships, tanker ship deals in the Maritime Commission, ballot box stuffing and thievery, and bribes and pay-offs in contract awards by officials in agencies exercising extraordinary powers and disbursing billions of dollars.

Under public pressure, the Administration took reluctant steps to clean house. But it was so eager to cover up and block more revelations that its cleanup drive launched with much fanfare ended in a farce.

The Republican party pledges to put an end to corruption, to oust the crooks and grafters, to administer tax laws fairly and impartially and to restore honest government to the people.

REPUBLICAN EIGHTIETH CONGRESS

The Republican party does not rest its case upon promises alone. We have a record of performance which was grossly defamed by the party in power. The Republican Eightieth Congress lanuched the program to stop Communism; unified the armed services; authorized a seventy-group Air Force which the President blocked; enacted a national service law; balanced the budget; accumulated an eight-billion-dollar surplus; reduced taxes with 70 per cent of the tax savings to those with incomes under $5,000; freed 7,400,000 wage earners in the lower brackets from having to pay any further income tax at all; allowed married couples to divide their incomes for tax purposes, and granted an additional $600 exemption to those over 65 years of age and to the blind; enacted the Taft-Hartley law for equitable labor-management relations; passed the first long-range agriculture program; increased social security benefits; and carried out every single pledge they made to the voters in the 1946 election.

CONCLUSION

Upon this statement of truths and this pledge of performance, the Republican party stands confident that it expresses the hopes of the citizens of America and certain that it points out with integrity a road upon which free men may march into a new day—a new and better day—in which shall be fulfilled the decent aspirations of our people for peace, for solvency and for the fulfillment of our best welfare, under the guidance of Divine Providence.

Report of Committee on Platform and Resolutions to the Democratic National Convention July 23, 1952

Preamble

Our nation has entered into an age in which Divine Providence has permitted the genius of man to unlock the secret of the atom.

No system of government can survive the challenge of an atomic era unless its administration is committed to the stewardship of a trustee imbued with a democratic faith, a buoyant hope for the future, the charity of brotherhood, and the vision to translate these ideals into the realities of human government. The Government of the United States, administered by the Democratic party, is today so entrusted.

The free choice of the Democratic party by the people of America as the instrument to achieve that purpose will mean world peace with honor, national security based on collective pacts with other free nations, and a high level of human dignity. National survival demands that these goals be attained, and the endowments of the Democratic party alone can assure their attainment.

For twenty years, under the dedicated guidance of Franklin Delano Roosevelt and Harry S. Truman, our country has moved steadily along the road which has led the United States of America to world leadership in the cause of freedom.

We will not retreat one inch along that road. Rather, it is our prayerful hope that the people, whom we have so faithfully served, will renew the mandate to continue our service and that Almighty God may grant us the wisdom to succeed.

Twenty years of progress

Achieving prosperity. An objective appraisal of the past record clearly demonstrates that the Democratic party has been the chosen American instrument to achieve prosperity, build a stronger democracy, erect the structure of world peace, and continue on the path of progress.

Democratic party policies and programs rescued American business from total collapse—from the fatal economic consequences of watered stock, unsound banks, useless and greedy holding companies, high tariff barriers, and predatory business practices, all of which prevailed under the last Republican administrations. Democratic policies have enabled the Federal Government to help all business, small and large, to achieve the highest rate of productivity, the widest domestic and world markets, and the largest profits in the history of the nation.

The simple fact is that today there are more than four million operating business enterprises in this country, over one million more than existed in 1932. Corporate losses in that fateful year were over $3 billion; in 1951, corporate profits, after taxes, reached the staggering total of $18 billion.

Democratic policies and programs rescued American agriculture from the economic consequences of blight, drought, flood and storm, from oppressive and indiscriminate foreclosures, and from the ruinous conditions brought about by the bungling incompetence and neglect of the preceding twelve years of Republican maladministration. Economic stability, soil conservation, rural electrification, farm dwelling improvement, increased production and efficiency and more than sevenfold increase in cash income have been the return to farmers for their faith in the Democratic party.

Democratic labor policies have rescued the wage earners in this country from mass unemployment and from sweatshop slavery at starvation wages. Under our Democratic administrations, decent hours, decent wages, and decent working conditions have become the rule rather than the exception.

Self-organization of labor unions and collective bargaining, both of which are the keystone to labor management, peace and

prosperity, must be encouraged, for the good of all.

Unemployment is now less than 3 per cent of the labor force, compared with almost 25 per cent in 1932. Trade union membership has reached a total of 16 million, which is more than five times the total of 1932.

The welfare of all economic and social groups in our society has been promoted by the sound, progressive and humane policies of the Democratic party.

Strengthening democracy. We are convinced that lasting prosperity must be founded upon a healthy democratic society respectful of the rights of all people.

Under Democratic party leadership more has been done in the past twenty years to enhance the sanctity of individual rights than ever before in our history. Racial and religious minorities have progressed further toward real equality than during the preceding 150 years.

Governmental services, democratically administered, have been improved and extended. The efficiency, economy, and integration of federal operations have been advocated and effectuated through sound programs and policies. Through co-operative programs of federal aid, state and local governments have been encouraged and enabled to provide many more services.

The Democratic party has been alert to the corroding and demoralizing effects of dishonesty and disloyalty in the public service. It has exposed and punished those who would corrupt the integrity of the public service, and it has always championed honesty and morality in government. The Loyalty Program of President Truman has served effectively to prevent infiltration by subversive elements and to protect honest and loyal public servants against unfounded and malicious attacks.

We commend the relentless and fearless actions of congressional committees which, under vigorous Democratic leadership, have exposed dereliction in public service, and we pledge our support to a continuance of such actions as conditions require them.

The administration of our government by the Democratic party has been based upon principles of justice and equity, and upon the American tradition of fair play. Men who are elected to high political office are entrusted with high responsibilities. Slander, defamation of character, deception and dishonesty are as truly transgressions of God's commandments when resorted to by men in public life as they are for all other men.

Building peace with honor. The Democratic party has worked constantly for peace—lasting peace, peace with honor, freedom, justice, and security for all nations.

The return of the Democratic party to power in 1933 marked the end of a tragic era of isolationism fostered by Republican administrations which had deliberately and callously rejected the golden opportunity created by Woodrow Wilson for collective action to secure the peace.

This folly contributed to the Second World War. Victory in that war has presented the nations of the world a new opportunity which the Democratic party is determined shall not be lost.

We have helped establish the instrumentalities through which the hope of mankind for universal world peace can be realized. Under Democratic leadership, our nation has moved promptly and effectively to meet and repel the menace to world peace by Soviet imperialism.

Progress in the new era. The Democratic party believes that past progress is but a prelude to the human aspirations which may be realized in the future.

Under Democratic party leadership, America has accepted each new challenge of history and has found practical solutions to meet and overcome them. This we have done without departing from the principles of our basic philosophy that it is the destiny of man to achieve his earthly ends in the spirit of brotherhood.

A great Democrat—Franklin Delano Roosevelt—devised the programs of the New Deal to meet the pressing problems of the 1930's. Another great Democrat—Harry S. Truman—devised the programs of the Fair Deal to meet the complex problems of America in the 1940's. The Democratic party is ready to face and solve the challenging problems of the 1950's. We dedicate ourselves to the magnificent work of these great Presidents and to mold and

adapt their Democratic principles to the new problems of the years ahead.

In this spirit we adopt and pledge ourselves to this, the Democratic platform for 1952.

OUR FOREIGN POLICY

Our goal is peace with honor

Peace with honor is the greatest of all our goals.

We pledge our unremitting efforts to avert another world war. We are determined that the people shall be spared that frightful agony.

We are convinced that peace and security can be safeguarded if America does not deviate from the practical and successful policies developed under Democratic leadership since the close of World War II. We will resolutely move ahead with the constructive task of promoting peace.

The Democratic program for peace and national security

Supporting the United Nations. Under Democratic leadership, this country sponsored and helped create the United Nations and became a charter member and stanchly supports its aims.

We will continue our efforts to strengthen the United Nations, improve its institutions as experience requires, and foster its growth and development.

The Communist aggressor has been hurled back from South Korea. Thus, Korea has proved, once and for all, that the United Nations will resist aggression. We urge continued effort, by every honorable means, to bring about a fair and effective peace settlement in Korea in accordance with the principles of the United Nations Charter.

Strong national defense. Our nation has strengthened its national defenses against the menace of Soviet aggression.

The Democratic party will continue to stand unequivocally for strong, balanced defense forces for this country—land, sea and air. We will continue to support the expansion and maintenance of the military and civil defense forces required for our national security. We reject the defeatist view of those who say we cannot afford the expense and effort necessary to defend ourselves. We express our full confidence in the Joint Chiefs of Staff. We voice complete faith in the ability and valor of our armed forces, and pride in their accomplishments.

Collective strength for the free world. We reject the ridiculous notices of those who would have the United States face the aggressors alone. That would be the most expensive—and the most dangerous—method of seeking security. This nation needs strong allies, around the world, making their maximum contribution to the common defense. They add their strength to ours in the defense of freedom.

The Truman Doctrine in 1947, the organization of hemisphere defense at Rio de Janeiro that same year, the Marshall plan in 1948, the North Atlantic Treaty in 1949, the Point Four program, the resistance to Communist aggression in Korea, the Pacific Security Pacts in 1951, and the Mutual Security Programs now under way—all stand as landmarks of America's progress in mobilizing the strength of the free world to keep the peace.

Encouraging European unity. We encourage the economic and political unity of free Europe and the increasing solidarity of the nations of the North Atlantic community.

We hail the Schuman plan to pool the basic resources of industrial western Europe, and the European Defense Community. We are proud of America's part in carrying these great projects forward and we pledge our continuing support until they are established.

Support for free Germany. We welcome the German Federal Republic into the company of free nations. We are determined that Germany shall remain free and continue as a good neighbor in the European community. We sympathize with the German people's wish for unity and will continue to do everything we can by peaceful means to overcome the Kremlin's obstruction of that rightful aim.

Support for the victims of Soviet imperialism. We will not abandon the once-free peoples of central and eastern Europe who suffer now under the Kremlin's tyranny in violation of the Soviet Union's most solemn pledges at Tehran, Yalta, and Potsdam. The United States should join other nations in formally declaring genocide to be an international crime in time of peace as well as war. This crime was exposed once more by the shocking revelations of Soviet guilt as disclosed in the report filed in Congress by the special committee investigating the Katyn Forest massacre. We look forward to the day when the liberties of Poland and the other oppressed Soviet satellites, including Czechoslovakia, Hungary, Rumania, Bulgaria, Albania, Lithuania, Estonia and Latvia and other nations in Asia under Soviet domination, will be restored to them and they can again take their rightful place in the community of free nations. We will carry forward and expand the vital and effective program of the "Voice of America" for penetration of the "Iron Curtain," bringing truth and hope to all the people subjugated by the Soviet empire.

Support for the nations of the Middle East. We seek to enlist the people of the Middle East to work with us and with each other in the development of the region, the lifting of health and living standards, and the attainment of peace. We favor the development of integrated security arrangements for the Middle East and other assistance to help safeguard the independence of the countries in the area.

We pledge continued assistance to Israel so that she may fulfill her humanitarian mission of providing shelter and sanctuary for her homeless Jewish refugees while strengthening her economic development.

We will continue to support the tripartite declaration of May 1950, to encourage Israel and the Arab states to settle their differences by direct negotiation, to maintain and protect the sanctity of the Holy Places and to permit free access to them.

We pledge aid to the Arab states to enable them to develop their economic resources and raise the living standards of their people. We support measures for the relief and reintegration of the Palestine refugees, and we pledge continued assistance to the reintegration program voted by the General Assembly of the United Nations in January 1952.

South Asia: A testing ground for democracy. In the subcontinent of South Asia, we pledge continuing support for the great new countries of India and Pakistan in their efforts to create a better life for their people and build strong democratic governments to stand as bastions of liberty in Asia, secure against the threat of Communist subversion.

Collective security in the Pacific. We welcome free Japan as a friendly neighbor and an ally in seeking security and progress for the whole Pacific area. America's security pacts with Japan and with the Philippines, Australia, and New Zealand are indispensable steps toward comprehensive mutual security arrangements in that area. Our military and economic assistance to the Nationalist Government of China on Formosa has strengthened that vital outpost of the free world, and will be continued.

Strengthening the Americas. In the Western Hemisphere, we pledge ourselves to continue the policy of the good neighbor. We will strive constantly to strengthen the bonds of friendship and cooperation with our Latin American allies who are joined with us in the defense of the Americas.

Disarmament remains the goal. The free world is rearming to secure the peace. Under Democratic leadership, America always stands prepared to join in a workable system for foolproof inspection and limitation of all armaments, including atomic weapons. This nation has taken the leadership in proposing concrete, practical plans for such a system. We are determined to carry on the effort for real, effective disarmament.

We look forward to the day when a great share of the resources now devoted to the armaments program can be diverted into the channels of peaceful production to speed the progress of America and of the underdeveloped regions of the world.

Helping other people to help themselves. Even though we cannot now disarm, we will go forward as rapidly as possible in developing the imaginative and farsighted concept of President Truman embodied in the Point Four program.

We will continue to encourage use of American skills and capital in helping the

people of underdeveloped lands to combat disease, raise living standards, improve land tenure and develop industry and trade. The continuance of even stronger and more vigorous Point Four programs—sponsored both by this country and by the United Nations—is an indispensable element in creating a peaceful world.

Upholding the principle of self-determination. In an era when the "satellite state" symbolized both the tyranny of the aggressor nations and the extinction of liberty in small nations, the Democratic party reasserts and reaffirms the Wilsonian principle of the right of national self-determination. It is part of the policy of the Democratic party, therefore, to encourage and assist small nations and all peoples in the peaceful and orderly achievement of their legitimate aspirations toward political, geographical and ethnic integrity so that they may dwell in the family of sovereign nations with freedom and dignity.

Expanding world trade. The Democratic party has always stood for expanding trade among free nations. We reassert that stand today. We vigorously oppose any restrictive policies which would weaken the highly successful reciprocal trade program fathered by Cordell Hull.

Since 1934 the United States has taken the lead in fostering the expansion and liberalization of world trade.

Our own economy requires expanded export markets for our manufactured and agricultural products and a greater supply of essential imported raw materials. At the same time, our friends throughout the world will have opportunity to earn their own way to higher living standards with lessened dependence on our aid.

Progressive immigration policies. Solution of the problem of refugees from Communism and overpopulation has become a permanent part of the foreign policy program of the Democratic party. We pledge continued co-operation with other free nations to solve it.

We pledge continued aid to refugees from Communism and the enactment of President Truman's proposals for legislation in this field. In this way we can give hope and courage to the victims of Soviet brutality and can carry on the humanitarian tradition of the Displaced Persons Act.

Subversive elements must be screened out and prevented from entering our land, but the gates must be left open for practical numbers of desirable persons from abroad whose immigration to this country provides an invigorating infusion into the stream of American life, as well as a significant contribution to the solution of the world refugee and overpopulation problems.

We pledge continuing revision of our immigration and naturalization laws to do away with any unjust and unfair practices against national groups which have contributed some of our best citizens. We will eliminate distinctions between native-born and naturalized citizens. We want no "second-class" citizens in free America.

OUR DOMESTIC POLICY

Economic opportunity and growth

The United States is today a land of boundless opportunity. Never before has it offered such a large measure of prosperity, security and hope for all its people.

Horizons of even greater abundance and opportunity lie before us under a Democratic Administration responsive to the will of the people.

The Democratic Administration has had a guiding principle since taking office twenty years ago: that the prosperity and growth of this nation are indivisible. Every step we have taken to help the farmers has also helped the workers and business. Every improvement in the status of the worker has helped both farmers and business. Every expansion of business has provided more jobs for workers and greater demand for farm products.

A stabilized economy

Combating inflation. The Democratic Administration early recognized that defense production would limit the amount of goods in civilian markets, and subject our economy to heavy inflationary pressure. To prevent this from resulting in ruinous inflation, the Administration proposed pay-as-we-go taxation to keep the national debt as low as possible and to prevent excess money pressure on scarce goods and services.

Direct controls were also proposed to channel scarce materials into highly essential defense production, and to keep prices down.

In 1951 and 1952 Republican Congressmen demonstrated their attitude toward these necessary measures when they sponsored amendments which would have destroyed all controls.

Prices. We shall strive to redress the injury done to the American people—especially to white-collar workers and fixed-income families—by the weakening amendments which the Republicans in Congress have forced into our anti-inflation laws.

We pledge continuance of workable controls so long as the emergency requires them. We pledge fair and impartial enforcement of controls and their removal as quickly as economic conditions allow.

Rents. We strongly urge continued federal rent control in critical defense areas and in the many other localities still suffering from a substantial shortage of adequate housing at reasonable prices.

Full employment. The Democratic Administration prudently passed the Employment Act of 1946 declaring it to be national policy never again to permit large-scale unemployment to stalk the land. We will assure the transition from defense production to peacetime production without the ravages of unemployment. We pledge ourselves at all times to the maintenance of maximum employment, production, and purchasing power in the American economy.

Integrity in government finances

We solemnly pledge the preservation of the financial strength of the government. We have demonstrated our ability to maintain and enhance the nation's financial strength. In the six full fiscal years since V-J Day, our fiscal policy has produced a $4 billion budget surplus. We have reduced the public debt $17 billion from the postwar peak.

We have demonstrated our ability to make fiscal policy contribute in a positive way to economic growth and the maintenance of high-level employment. The policies which have been followed have given us the greatest prosperity in our history. Sustained economic expansion has provided the funds necessary to finance our defense and has still left our people with record high consumer incomes and business with a record volume of investment. Employment and personal incomes are at record levels. Never have Americans enjoyed a higher standard of living and saved more for contingencies and old age!

Federal taxes. We believe in fair and equitable taxation. We oppose a federal general sales tax. We adhere to the principle of ability to pay. We have enacted an emergency excess profits tax to prevent profiteering from the defense program and have vigorously attacked special tax privileges.

Tax reductions. In the future, as in the past, we will hold firm to policies consistent with sound financing and continuing economic progress. As rapidly as defense requirements permit, we favor reducing taxes, especially for people with lower incomes. But we will not imperil our nation's security by making reckless promises to reduce taxes. We deplore irresponsible assertions that national security can be achieved without paying for it.

Closing tax loopholes. Justice requires the elimination of tax loopholes which favor special groups. We pledge continued efforts to the elimination of remaining loopholes.

Government expenditure. We believe in keeping government expenditures to the lowest practicable level. The great bulk of our national budget consists of obligations incurred for defense purposes. We pledge ourselves to a vigilant review of our expenditures in order to reduce them as much as possible.

The American farmer and agriculture

We know that national prosperity depends upon a vigorous, productive and expanding agriculture.

We take great pride in our party's record of performance and in the impressive gains made by American agriculture in the last two decades. Under programs of Democratic administrations the net agricultural

income has increased from less than two billion dollars to almost fifteen billion dollars. These programs must be continued and improved.

Resource conservation. The soil resources of our country have been conserved and strengthened through the Soil Conservation Service, the Agricultural Conservation Program, the Forestry and the Research programs, with their incentives to increased production through sound conservation farming. These programs have revolutionized American agriculture and must be continued and expanded. We will accelerate programs of upstream flood prevention, watershed protection, and soil, forest and water conservation in all parts of the country. These conservation measures are a national necessity; they are invaluable to our farmers, and add greatly to the welfare of all Americans and of generations yet unborn.

Grass-roots administration. We will continue the widest possible farmer participation through referenda, farmer-elected committees, local soil conservation districts, and self-governing agencies in the conduct and administration of these truly democratic programs, initiated and developed under Democratic administrations.

Price supports. Under the present farm program, our farmers have performed magnificently and have achieved unprecedented production. We applaud the recent congressional action in setting aside the "sliding scale" for price support through 1954, and we will continue to protect the producers of basic agricultural commodities under the terms of a mandatory price support program at not less than 90 per cent of parity. We continue to advocate practical methods for extending price supports to other storables and to the producers of perishable commodities, which account for three-fourths of all farm income.

Abundant production. We will continue to assist farmers in providing abundant and stable supplies of agricultural commodities for the consumers at reasonable prices, and in assuring the farmer the opportunity to earn a fair return commensurate with that enjoyed by other segments of the American economy.

The agricultural adjustment programs encourage the production of abundant supplies while enabling producers to keep supply in line with consumer demand, preventing wide fluctuations and bringing stability to the agricultural income of the nation. We pledge retention of such programs.

We pledge continued efforts to provide adequate storage facilities for grain and other farm products with sufficient capacity for needed reserves for defense, and other emergency requirements, in order to protect the integrity of the farm price support programs.

Research. We are justly proud of the outstanding achievements of our agricultural research. We favor a greatly expanded research and education program for American agriculture in order that both production and distribution may more effectively serve consumers and producers alike, and thus meet the needs of the modern world. We favor especial emphasis on the development of new crops and varieties, on crop and livestock disease and pest control, and on agricultural statistics and marketing services.

Marketing. We must find profitable markets for the products of our farms, and we should produce all that these markets will absorb. To this end we will continue our efforts to reduce trade barriers, both at home and abroad, to provide better marketing and inspection facilities, and to find new uses and outlets for our foods and fibers both in domestic and foreign markets.

Farm credit. We have provided credit facilities for all agriculture, including means by which young men, veterans of military service, and farm tenants have been encouraged to become farmers and farm home owners, and through which low-income farmers have been assisted in establishing self-sustaining and fully productive farm units. We will not waver in our efforts to provide such incentives.

Crop insurance. Crop insurance to protect farmers against loss from destruction of their crops by natural causes has been created and developed under Democratic administrations into a sound business operation. This program should be expanded as rapidly as experience justifies, in order that its benefits may be made available to every farmer.

Rural electrification. Democratic administrations have established the great Rural Electrification Program, which has brought light and power to the rural homes of our nation. In 1935, only 10 per cent of the farm homes of America had the benefits of electricity. Today 85 per cent of our rural homes enjoy the benefits of electric light and power. We will continue to fight to make electricity avaliable to all rural homes, with adequate facilities for the generation and transmission of power. Through the Rural Telephone Program, inaugurated by the Democratic Eighty-first Congress, we will provide the opportunity for every farm home to have this modern essential service. We pledge support of these self-liquidating farm programs.

Co-operatives. We will continue to support the sound development and growth of bona fide farm co-operatives and to protect them from punitive taxation.

Defense needs. We will continue to recognize agriculture as an essential defense industry, and to assist in providing all the necessary tools, machinery, fertilizer, and manpower needed by farmers in meeting production goals.

Family farming. The family farm is the keystone of American agriculture. We will strive unceasingly to make the farm homes of our country healthier and happier places in which to live. We must see that our youth continues to find attractive opportunity in the field of agriculture.

The Republican Party Platform is loud in its criticism of our great farm programs. We challenge Republicans and other enemies of farm progress to justify their opposition to the program now in operation, to oppose the improvements here proposed, or to advocate repeal of a single vital part of our program.

A fair deal for workers

Good incomes. There can be no national prosperity unless our working men and women continue to prosper and enjoy rising living standards. The rising productivity of American workers is a key to our unparalleled industrial progress. Good incomes for our workers are the secret of our great and growing consumer markets.

Labor-management relations. Good labor-management relations are essential to good incomes for wage earners and rising output from our factories. We believe that to the widest possible extent consistent with the public interest, management and labor should determine wage rates and conditions of employment through free collective bargaining.

Taft-Hartley Act. We strongly advocate the repeal of the Taft-Hartley Act.

The Taft-Hartley Act has been proved to be inadequate, unworkable, and unfair. It interferes in an arbitrary manner with collective bargaining, tipping the scales in favor of management against labor.

The Taft-Hartley Act has revived the injunction as a weapon against labor in industrial relations. The act has arbitrarily forbidden traditional hiring practices which are desired by both management and labor in many industries. The act has forced workers to act as strikebreakers against their fellow unionists. The act has served to interfere with one of the most fundamental rights of American workers—the right to organize in unions of their own choosing.

We deplore the fact that the Taft-Hartley Act provides an inadequate and unfair means of meeting with national emergency situations. We advocate legislation that will enable the President to deal fairly and effectively with cases where a breakdown in collective bargaining seriously threatens the national safety or welfare.

In keeping with the progress of the times, and based on past experience, a new legislative approach toward the entire labor-management problem should be explored.

Fair labor standards. We pledge to continue our efforts so that government programs designed to establish improved fair labor standards shall prove a means of assuring minimum wages, hours, and protection to workers, consistent with present-day progress.

Equal pay for equal work. We believe in equal pay for equal work, regardless of sex,

and we urge legislation to make that principle effective.

The physically handicapped. We promise to further the program to afford employment opportunities both in government and in private industry for physically handicapped persons.

Migratory workers. We advocate prompt improvement of employment conditions of migratory workers and increased protection of their safety and health.

Strengthening free enterprise

The free enterprise system has flourished and prospered in America during these last twenty years as never before. This has been made possible by the purchasing power of all our people and we are determined that the broad base of our prosperity shall be maintained.

Small and independent business. Small and independent business is the backbone of American free enterprise. Upon its health depends the growth of the economic system whose competitive spirit has built this nation's industrial strength and provided its workers and consumers with an incomparably high standard of living.

Independent business is the best offset to monopoly practices. The government's role is to insure that independent business receives equally fair treatment with its competitors.

Congress has established the Permanent Small Business Committee of the Senate and the Special Small Business Committee of the House, which have continued to render great service to this important segment of our economy. We favor continuance of both these committees with all the powers to investigate and report conditions, correct discriminations, and propose needed legislation.

We pledge ourselves to increased efforts to assure that small business be given equal opportunity to participate in government contracts, and that a suitable proportion of the dollar volume of defense contracts be channeled into independent small business. The Small Defense Plants Administration, which our party caused to be established, should retain its independent status and be made a continuing agency, equipped with sufficient lending powers to assist qualified small business in securing defense contracts.

We urge the enactment of such laws as will provide favorable incentives to the establishment and survival of independent businesses, especially in the provision of tax incentives and access to equity or risk capital.

Enforcement of antitrust laws. Free competitive enterprise must remain free and competitive if the productive forces of this nation are to remain strong. We are alarmed over the increasing concentration of economic power in the hands of a few.

We reaffirm our belief in the necessity of vigorous enforcement of the laws against trusts, combinations, and restraints of trade, which laws are vital to the safeguarding of the public interest and of small competitive business men against predatory monopolies. We will seek adequate appropriations for the Department of Justice and the Federal Trade Commission for vigorous investigation and for enforcement of the antitrust laws. We support the right of all persons to work together in cooperatives and other democratic associations for the purpose of carrying out any proper business operations free from any arbitrary and discriminatory restrictions.

Protection of investors and consumers. We must avoid unnecessary business controls. But we cannot close our eyes to the special problems which require government surveillance. The government must continue its efforts to stop unfair selling practices which deceive investors, and unfair trade practices which deceive consumers.

Transportation. In the furtherance of national defense and commerce, we pledge continued government support, on a sound financial basis, for further development of the nation's transportation systems, land, sea and air. We endorse a policy of fostering the safest and most reliable air transportation system of the world. We favor fair, nondiscriminatory freight rates to encourage economic growth in all parts of the country.

Highways. In co-operation with state and local governmental units, we will continue to plan, co-ordinate, finance, and encourage the expansion of our road and highway network, including access roads, for the dual purposes of national defense and efficient motor transportation. We support expansion of farm-to-market roads.

Rivers and harbors. We pledge continued development of our harbors and waterways.

Merchant Marine. We will continue to encourage and support an adequate Merchant Marine.

Our natural resources

The United States has been blessed with the richest natural resources of any nation on earth.

Yet, unless we redouble our conservation efforts we will become a "have-not" nation in some of the most important raw materials upon which depend our industries, agriculture, employment and high standard of living. This can be prevented by a well-rounded and nation-wide conservation effort.

Land and water resources. We favor sound, progressive development of the nation's land and water resources for flood control, navigation, irrigation, power, drainage, soil conservation and creation of new, small family-sized farms, with immediate action in critical areas.

We favor the acceleration of all such projects, including construction of transmission facilities to load centers for wider and more equitable distribution of electric energy at the lowest cost to the consumer with continuing preference to public agencies and REA co-operatives.

The Democratic party denounces all obstructionist devices designed to prevent or retard utilization of the nation's power and water resources for the benefit of the people, their enterprises and interests.

The wise policy of the Democratic party in encouraging multipurpose projects throughout the country is responsible for America's productive superiority over any nation in the world and is one of the greatest single factors leading toward the accomplishment of world peace. Without these projects our atomic weapons program could never have been achieved, and without additional such projects it cannot be expanded.

The Democratic party is dedicated to a continuation of the natural resources development policy inaugurated and carried out under the administrations of Presidents Roosevelt and Truman, and to the extension of that policy to all parts of the nation, North, South, East, Midwest, West and the territories to the end that the nation and its people receive maximum benefits from these resources to which they have an inherent right.

The Democratic party further pledges itself to protect these resources from destructive monopoly and exploitation.

River basin development. We pledge the continued full and unified regional development of the water, mineral, and other natural resources of the nation, recognizing that the progress already achieved under the initiative of the Democratic party in the arid and semiarid states of the West, as well as in the Tennessee Valley, is only an indication of still greater results which can be accomplished.

Fertilizer development. Great farming areas, particularly of the Midwest and West, are in acute need of low-cost commercial fertilizers. To meet this demand, we favor the opening of the nation's phosphate rock deposits in the West, through prompt provision of sufficient low-cost hydroelectric power to develop this great resource.

Forests and public lands. We seek to establish and demonstrate such successful policies of forest and land management on federal property as will materially assist state and private owners in their conservation efforts. Conservation of forest and range lands is vital to the strength and welfare of the nation. Our forest and range lands must be protected and used wisely in order to produce a continuing supply of basic raw materials for industry; to reduce damaging floods; and to preserve the sources of priceless water. With adequate appropriations to carry out feasible projects, we pledge a program of forest protection, reforestation projects and sound practices of production and harvesting which will promote sustained yields of forest crops.

We propose to increase forest access roads in order to improve cutting practices on both public and private lands.

On the public land ranges we pledge con-

tinuance of effective conservation and use programs, including the extension of water pond construction and restoration of forage cover.

Arid areas. In many areas of the nation assistance is needed to provide water for irrigation, domestic and industrial purposes. We pledge that in working out programs for rational distribution of water from federal sources we will aid in delivering this essential of life cheaply and abundantly.

Minerals and fuels. The nation's minerals and fuels are essential to the national defense and development of our country. We pledge the adoption of policies which will further encourage the exploration and development of additional reserves of our mineral resources. We subscribe to the principles of the Stockpiling Act and will lend our efforts to strengthening and expanding its provisions and those of the Defense Production Act to meet our military and civilian needs. Additional access roads should be constructed with government aid. Our synthetic fuels including monetary metals research program should go forward. Laws to aid and assist these objectives will be advocated.

Domestic fisheries. We favor increased research and exploration for conserving and better utilizing fishery resources; expanded research and education to promote new fishery products and uses and new markets; promotion of world trade in fish products; a public works and water policy providing adequate protection for domestic fishery resources; and treaties with other nations for conservation and better utilization of international fisheries.

Wildlife recreation. In our highly complex civilization, outdoor recreation has become essential to the health and happiness of our people.

The Democratic party has devoted its efforts to the preservation, restoration and increase of the bird, animal and fish life which abound in this nation. State, local and private agencies have co-operated in this worthy endeavor. We have extended and vastly improved the parks, forests, beaches, streams, preserves and wilderness areas across the land.

To the 28,000,000 of our citizens who annually purchase fishing and hunting licenses, we pledge continued efforts to improve all recreational areas.

Atomic energy

In the field of atomic energy, we pledge ourselves

1. To maintain vigorous and nonpartisan civilian administrations, with adequate security safeguards;

2. To promote the development of nuclear energy for peaceful purposes in the interests of America and mankind;

3. To build all the atomic and hydrogen firepower needed to defend our country, deter aggression, and promote world peace;

4. To exert every effort to bring about bona fide international control and inspection of all atomic weapons.

Social security

Our national system of social security, conceived and developed by the Democratic party, needs to be extended and improved.

Old-age and survivors insurance. We favor further strengthening of old-age and survivors insurance, through such improvements as increasing benefits, extending them to more people and lowering the retirement age for women.

We favor the complete elimination of the work clause for the reason that those contributing to the social security program should be permitted to draw benefits upon reaching the age of eligibility and still continue to work.

Unemployment insurance. We favor a stronger system of unemployment insurance, with broader coverage and substantially increased benefits including an allowance for dependents.

Public assistance. We favor further improvements in public assistance programs for the blind, the disabled, the aged and children in order to help our less fortunate citizens meet the needs of daily living.

Private plans. We favor and encourage the private endeavors of social agencies, mutual associations, insurance companies, industry-labor groups, and co-operative societies to provide against the basic hazards of life through mutually agreed-upon benefit plans designed to complement our present social security program.

Needs of our aging citizens

Our older citizens constitute an immense reservoir of skilled, mature judgment and ripened experience. We pledge ourselves to give full recognition to the right of our older citizens to lead a proud, productive and independent life throughout their years.

In addition to the fundamental improvements in old-age and survivors insurance, which are outlined above, we pledge ourselves in co-operation with the states and private industry to encourage the employment of older workers. We commend the Eighty-second Congress for eliminating the age restriction on employment in the Federal Government.

Health

We will continue to work for better health for every American, especially our children. We pledge continued and wholehearted support for the campaign that modern medicine is waging against mental illness, cancer, heart disease and other diseases.

Research. We favor continued and vigorous support, from private and public sources, of research into the causes, prevention and cure of disease.

Medical education. We advocate federal aid for medical education to help overcome the growing shortages of doctors, nurses, and other trained health personnel.

Hospitals and health centers. We pledge continued support for federal aid to hospital construction. We pledge increased federal aid to promote public health through preventive programs and health services, especially in rural areas.

Cost of medical care. We also advocate a resolute attack on the heavy financial hazard of serious illness. We recognize that the costs of modern medical care have grown to be prohibitive for many millions of people. We commend President Truman for establishing the nonpartisan Commission on the Health Needs of the Nation to seek an acceptable solution of this urgent problem.

Housing

We pledge ourselves to the fulfillment of the programs of private housing, public low-rent housing, slum clearance, urban redevelopment, farm housing and housing research as authorized by the Housing Act of 1949.

We deplore the efforts of special interests groups, which themselves have prospered through government guarantees of housing mortgages, to destroy those programs adopted to assist families of low income.

Additional legislation. We pledge ourselves to enact additional legislation to promote housing required for defense workers, middle-income families, aged persons and migratory farm laborers.

Veterans' housing. We pledge ourselves to provide special housing aids to veterans and their families.

Education

Every American child, irrespective of color, national origin, economic status or place of residence, should have every educational opportunity to develop his potentialities.

Local, state and federal government have shared responsibility to contribute appropriately to the pressing needs of our educational system. We urge that federal contributions be made available to state and local units which adhere to basic minimum standards.

The Federal Government should not dictate or control educational policy.

We pledge immediate consideration for those school systems which need further legislation to provide federal aid for new school construction, teachers' salaries and school maintenance and repair.

We urge the adoption by appropriate legislative action of the proposals advocated by the President's Commission on Higher Education, including federal scholarships.

We will continue to encourage the further development of vocational training which helps people acquire skills and technical knowledge so essential to production techniques.

Child welfare

The future of America depends on adequate provision by government for the needs of those of our children who cannot

be cared for by their parents or private social agencies.

Maternity, child health and welfare services. The established national policy of aiding states and localities, through the Children's Bureau and other agencies, to insure needed maternity, child health and welfare services should be maintained and extended. Especially important are the detection and treatment of physical defects and diseases which, if untreated, are reflected in adult life in draft rejections and as handicapped workers. The nation as a whole should provide maternity and health care for the wives, babies and preschool children of those who serve in our armed forces.

School lunches. We will enlarge the school lunch program which has done so much for millions of American school children and charitable institutions while at the same time benefiting producers.

Day care facilities. Since several million mothers must now be away from their children during the day because they are engaged in defense work, facilities for adequate day care of these children should be provided and adequately financed.

Children of migratory workers. The nation as a whole has a responsibility to support health, educational and welfare services for the children of agricultural migratory workers who are now almost entirely without such services while their parents are engaged in producing essential crops.

Veterans

The Democratic party is determined to advance the welfare of all the men and women who have seen service in the armed forces. We pledge ourselves to continue and improve our national program of benefits for veterans and their families, to provide the best possible medical care and hospitalization for the disabled veteran, and to help provide every veteran an opportunity to be a productive and responsible citizen with an assured place in the civilian community.

Strengthening democratic government

Streamlining the Federal Government. The public welfare demands that our government be efficiently and economically operated and that it be reorganized to meet changing needs. During the present Democratic Administration, more reorganization has been accomplished than by all its predecessors. We pledge our support to continuing reorganization wherever improvements can be made. Only constant effort by the Executive, the Congress, and the public will enable our government to render the splendid service to which our citizens are entitled.

Improving the Postal Service. We pledge a continuing increase in the services of the United States Postal Service. Through efficient handling of mail, improved working conditions for postal employees, and more frequent services, the Democratic party promises its efforts to provide the greatest communication system in the world for the American people.

Strengthening the civil service. Good government requires a civil service high in quality and prestige. We deplore and condemn smear attacks upon the character and reputations of our federal workers. We will continue our fight against partisan political efforts to discredit the federal service and undermine American principles of justice and fair play.

Under President Truman's leadership, the federal civil service has been extended to include a greater proportion of positions than ever before. He has promoted a record number of career appointees to top-level policy positions. We will continue to be guided by these enlightened policies, and we will continue our efforts to provide federal service with adequate pay, sound retirement provisions, good working conditions, and an opportunity for advancement.

We will use every proper means to eliminate pressure by private interests seeking undeserved favors from the government. We advocate the strongest penalties against those who try to exert improper influence, and against any who may yield to it.

Democracy in federal elections. We advocate new legislation to provide effective regulation and full disclosure of campaign expenditures in elections to federal office, including political advertising from any source.

We recommend that Congress provide for a nonpartisan study of possible improvements in the methods of nominating and electing Presidents and in the laws relating to Presidential succession. Special attention should be given to the problem of assuring the widest possible public participation in Presidential nominations.

Strengthening basic freedoms. We will continue to press strongly for world-wide freedom in the gathering and dissemination of news and for support to the work of the United Nations Commission on Human Rights in furthering this and other freedoms.

Equal Rights Amendment. We recommend and endorse for submission to the Congress a constitutional amendment providing equal rights for women.

Puerto Rico. Under Democratic party leadership, a new status has been developed for Puerto Rico. This new status is based on mutual consent and common devotion to the United States, formalized in a new Puerto Rican Constitution. We welcome the dignity of the new Puerto Rican Commonwealth and pledge our support of the Commonwealth, its continued development and growth.

Alaska and Hawaii. By virtue of their strategic geographical locations, Alaska and Hawaii are vital bastions in the Pacific. These two territories have contributed greatly to the welfare and economic development of our country and have become integrated into our economic and social life. We therefore urge immediate statehood for these two territories.

Other territories and possessions. We favor increased self-government for the Virgin Islands and other outlying territories and the Trust Territory of the Pacific.

District of Columbia. We favor immediate home rule and ultimate national representation for the District of Columbia.

American Indians. We shall continue to use the powers of the Federal Government to advance the health, education and economic well-being of our American Indian citizens, without impairing their cultural traditions. We pledge our support to the cause of fair and equitable treatment in all matters essential to and desirable for their individual and tribal welfare.

The American Indian should be completely integrated into the social, economic and political life of the nation. To that end we shall move to secure the prompt final settlement of Indian claims and to remove restrictions on the rights of Indians individually and through their tribal councils to handle their own fiscal affairs.

We favor the repeal of all acts or regulations that deny to Indians rights or privileges held by citizens generally.

Constitutional government. The Democratic party has demonstrated its belief in the Constitution as a charter of individual freedom and an effective instrument for human progress. Democratic administrations have placed upon the statute books during the last twenty years a multitude of measures which testify to our belief in the Jeffersonian principle of local control, even in general legislation involving nation-wide programs. Selective service, social security, agricultural adjustment, low-rent housing, hospital, and many other legislative programs have placed major responsibilities in states and counties and provide fine examples of how benefits can be extended through federal-state co-operation.

In the present world crisis with new requirements of federal action for national security, and accompanying provision for public services and individual rights related to defense, constitutional principles must and will be closely followed. Our record and our clear commitments in this platform measure our strong faith in the ability of constitutional government to meet the needs of our times.

Improving congressional procedures. In order that the will of the American people may be expressed upon all legislative proposals, we urge that action be taken at the beginning of the Eighty-third Congress to improve congressional procedures so that majority rule prevails and decisions can be made after reasonable debate without being blocked by a minority in either House.

Civil rights

The Democratic party is committed to support and advance the individual rights and liberties of all Americans.

Our country is founded on the proposition that all men are created equal. This

means that all citizens are equal before the law and should enjoy equal political rights. They should have equal opportunities for education, for economic advancement, and for decent living conditions.

We will continue our efforts to eradicate discrimination based on race, religion or national origin.

We know this task requires action, not just in one section of the nation, but in all sections. It requires the co-operative efforts of individual citizens and action by state and local governments. It also requires federal action. The Federal Government must live up to the ideals of the Declaration of Independence and must exercise the powers vested in it by the Constitution.

We are proud of the progress that has been made in securing equality of treatment and opportunity in the nation's armed forces and the civil service and all areas under federal jurisdiction. The Department of Justice has taken an important part in successfully arguing in the courts for the elimination of many illegal discriminations, including those involving rights to own and use real property, to engage in gainful occupations and to enroll in publicly supported higher educational institutions. We are determined that the Federal Government shall continue such policies.

At the same time, we favor federal legislation effectively to secure these rights to everyone: (1) the right to equal opportunity for employment; (2) the right to security of persons; (3) the right to full and equal participation in the nation's political life, free from arbitrary restraints. We also favor legislation to perfect existing federal civil rights statutes and to strengthen the administrative machinery for the protection of civil rights.

CONCLUSION

Under the guidance, protection, and help of Almighty God we shall succeed in bringing to the people of this nation a better and more rewarding life and to the peoples of the entire world, new hope and a lasting, honorable peace.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

HILL, NORMAN. *International Organization.* Pp. 627. New York: Harper & Brothers, 1952. $5.00.

Professor Hill, well-known scholar of international relations and administration, has added this general text and collection of documents to the now rapidly growing body of postwar treatises on international organization. He offers a sound, if conventional, description of the major agencies of international co-operation, including both regional and global institutions. Emphasis is placed on procedures of consultation and conference, with particular reference to the handling of international disputes.

This book lacks the broad legal and sociological perspective of Eagleton's *International Government;* and it does not bring the student as intimately into the operational dynamics of international organizations as L. Larry Leonard's recent volume. Nevertheless, it gives a lucid, well-expressed survey of the historical development, constitutional features, and methods of action of the League of Nations, the United Nations, the Organization of American States, the Council of Europe, and, briefly, of diplomatic and technical international conferences. A full chapter is devoted to the International Court of Justice.

Professor Hill realistically interprets the powers and functions of these agencies as essentially nongovernmental, recognizing that most national governments still insist, in the name of "sovereignty," on retaining the actual power of decision over their international relations. The author consequently questons whether a reliable system of collective security can be constructed, based on compulsive international sanctions. He properly envisages the primary political task of international organizations as the promotion of peaceful settlement of controversies by methods dependent on the voluntary consent of the disputing states.

The serious shortcoming of the book is its neglect of the vast range of international activities devoted to the improvement of economic and social welfare, the development of international commerce and communications, and the protection of human rights—the whole field of "functional" international co-operation. The most notable achievements of international organizations to date have occurred along these lines; and so long as powerful states continue to rely on Machiavellian precepts in their political relations, effective collaboration among them will probably be limited to mutual interests which nations are willing to consider "non-political."

It is unclear why Professor Hill avoided careful consideration of these aspects of international organization, for in previous works he has demonstrated great interest in them. Perhaps he now questions whether the functional and the political can be sufficiently separated in the conduct of international relations to permit the growth of international organization along one line, while it is largely frustrated along the other. But in the immediate future, the implementation of *common* national interests, rather than the manipulation of outright conflicts of interests, is more likely to be the crucial significance of international organization in the struggles to establish a peaceful world order.

PHILIP E. JACOB
University of Pennsylvania

STONE, I. F. *The Hidden History of the Korean War*. Pp. xviii, 364. New York: Monthly Review Press (distributed by The Citadel Press), 1952. $5.00.

For the most part, Mr. Stone's book consists of heavily belabored "evidence" naming the United States as the aggressor in the Korean War and alleging a deep-dyed plot on the part of Messrs. MacArthur, Dulles, and others to bring about World War III.

This reviewer does not feel that the Western powers are necessarily all angels, with the Soviet bloc all devils. However it is difficult to view soberly the author's contention that a peace-minded Kremlin "was more surprised than Washington by the outbreak of the war" and that "there is also reason to believe that the North Koreans were taken by surprise." Nor can this reviewer consider as more than pure calculated rubbish Mr. Stone's evaluation of the purposes of American policy: "The Soviet bloc was to be treated with hostility, subjected to political boycott and economic blockade, and forced to divert its energies from reconstruction into an ever greater arms race, in the hope that the pressure would cause the Soviet regime to collapse from within . . . or to sue for peace on any terms. . . . The settlement of the Korean question by peaceful means would inevitably create a burst of good feeling Washington wished desperately to avoid."

We are told by Mr. Stone that the South Koreans were actually the aggressors in the current war. The circumstance that it was the North Koreans who invaded the South is explained on the thesis that the gullible Reds "were deliberately provoked by Syngman Rhee in the hope that they would retaliate by crossing the Parallel. . . . The Northerners for their part, fell neatly into the the trap."

This is a tiresome and tedious book, in which statements of evidence are continually pulled out of context, and their meanings warped and distorted. But like all fantasy it contains certain grains of truth, though in ways apparently unsuspected by the author. The United Nations command, for example, is seen as a papier-maché instrument which bears little relation to any organically constituted authority. Neither is it "obligated to consult the United Nations, [nor] to report to it regularly or otherwise." Thus the conclusion is irresistible that the United States became party to a procedure of pretense and diplomatic mumbo-jumbo which in the end would see her compelled to wage the war in Korea virtually alone.

It seems to this observer at least that Mr. Stone's manuscript takes little away from the argument that General MacArthur's analysis was the correct one, and that the war in Eastern Asia could have been ended expeditiously had the Chinese ports been immediately blockaded and had China's vital communications, airfields, and marshaling grounds been destroyed while the overwhelming preponderance of attack power was still in our hands.

WILLIAM B. ZIFF
New York City

MANNING, CLARENCE A. *The Siberian Fiasco*. Pp. 210. New York: Library Publishers, 1952. $3.75.

In view of the continuing inability of Western diplomacy, American in particular, to grapple with Oriental problems, notably Russian, Chinese and Japanese, there is a melancholy timeliness, not to say timelessness, in the study of an early and conspicuous failure in the relations of West with East. The Siberian venture, 1918–1920, is, in fact, peculiarly instructive, though it is doubtful that a government which could accept as guides in Far Eastern affairs the men who progressively lost all of East Asia to the Reds, and which still harbors some of them in most exalted stations, would pay much heed, even were Professor Manning to speak with the tongues of men and of angels, and to sound his warning on "an instrument of ten strings."

This small book is so compact with information that its lesson can be only sketchily conveyed. Throughout, one notes the hamstringing effect of a sort of schizophrenia between War and State Departments in the United States government. Their refusal to co-operate intelligently left General William S. Graves, commander of the Siberian expedition, even more confused than he need have been from his original instructions, conveyed as an *aide-mémoire* by the Department of State, but drafted obviously by Woodrow Wilson in his most mystifying style of transcendental idealism, remote from the ordinary facts of life and peculiarly devoid of any understanding of Oriental barbarism.

Nevertheless, a competent general and some 8,000 good soldiers did accomplish something. They were of undoubted assistance to the Czechoslovak forces in their escape from Russia, they guarded a considerable segment of the Trans-Siberian Railway, and, negatively but most importantly, they averted a major war in the Far East which would have cost the West even greater loss of prestige than actually occurred.

From the vantage of experience, the author suggests that a basic error in the entire Western concept was the endeavor to prop up the Russian Empire (not, of course, the Czarist) as a whole. Its dismemberment should have been a prime objective. Even Winston Churchill, a quarter century later, preoccupied with Germany, missed this lesson as completely as did F. D. Roosevelt (pp. 190–191).

But gloomy as is the picture he presents, the author closes on a hopeful note. He calls the Siberian adventure a mistake but not a crime, and he trusts that even yet it may teach the West a lesson.

LOUIS MARTIN SEARS
Purdue University

FFRENCH, YVONNE (Ed.). *Transatlantic Exchanges: Cross-Currents of Anglo-American Opinion in the Nineteenth Century*. Pp. 255. New York: Library Publishers, 1952. $3.75.

In compiling a book of extracts of American writers on England and of English writers on America, Yvonne ffrench is, it must be admitted, plowing a well tilled field. Most of the authors cited are well known for their opinions about the other shore of the Atlantic; the comments of Sydney Smith ("Who reads an American book?"), of Mrs. Trollope, of Charles Dickens, of Matthew Arnold, of Oscar Wilde, on the one hand, and of Washington Irving, Emerson, and Hawthorne, on the other, are familiar to many. Even the idea of such an anthology is not new, as witness Allan Nevins' *American Social History as Recorded by British Travellers and R. B. Mowat's Americans in England*.

Even so, the book is welcome. The extracts are brief, interesting, and arranged in the form of a transatlantic debate in chronological sequence from Tom Paine and William Cobbett to Henry James and Bernard Shaw. For every insult from either side there is a "countercheck quarrelsome" from the other; for every compliment (much rarer), a return bouquet. The editor's introduction, though not so analytical as Nevins', is well balanced and good tempered. If any complaint must be made, it is that the range of authors cited is too narrow. For example, there are a score of passages cited from Frances Trollope, but not one from Anthony Trollope, who also wrote copiously on the American scene, and much more fairly. One may also venture to hope that some day a companion volume will appear on Anglo-American exchanges in the twentieth century, surely as numerous and as significant as those of the nineteenth.

PRESTON SLOSSON
Ann Arbor, Michigan

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

DOUGLAS, PAUL H. *Economy in the National Government.* Pp. vii, 277. Chicago: University of Chicago Press, 1952. $3.75.

Anyone who looks on the government as an efficient and economical spender of the taxpayer's dollar will find this a disheartening book. Of course, not many such persons exist. But even those who believe government expenditures are made in a passably honest, competent, and coordinated manner will be discouraged.

In effect, this is a sort of handbook, based on Senator Douglas' personal research and effort, of federal financial inefficiency. An enormous range of material is touched on, as must be the case, since the federal budget is only one of the matters covered. Examples of waste, graft, ineptitude, and corruption range all the way from procedures in budget-making to the government's method of granting civil servants vacations with pay, the 5 percenters, and the Navy's 11,000 dozen oyster forks. It is an impressive indictment. Yet several issues fundamental to this whole range of topics are not dealt with, such as the government's (almost) unbelievable accounting *system* and the fact that the sum total of government appropriations is not, in the process of budget-making, compared with the estimated sum total of revenues.

Issues deeper, however, than the financial defects of the federal government are involved in this volume. One is the fact that the legislative branch of the government has very nearly lost control of the purse—a cause of more than one revolution. While the Senator hints at this here and there, he never quite faces up to the situation. Another is the moral difference, if any, between a dollar wasted in a depression (which creates purchasing power) and one wasted in a boom (which creates inflation). A third is whether the results of the government's financial activities are better, or worse, than can normally be expected from any type of large-scale bureaucratic government operation. So far as this reviewer is concerned the types of criticism directed at federal taxing, budget-making, and spending could be directed almost equally well at any facet of the government's activities and at big government or socialism in any form. For basically the volume is an arraignment of bureaucracy, big government, and the whole governmental process, not merely an account of the obstacles in the way of economy. And finally, it is an indictment of the morals and the sense of responsibility of the American people—since it is their government, and they tolerate it.

CHARLES C. ABBOTT
Harvard University Graduate School of Business Administration

LUBELL, SAMUEL. *The Future of American Politics.* Pp. viii, 285. New York: Harper & Brothers, 1951. $3.50.

This is perhaps the most penetrating and most readable analysis of recent and current American politics that has appeared for some time. It is replete with pungent and quotable passages, yet manages to achieve a commendable degree of balance, restraint, and objectivity.

Mr. Lubell describes the growing economic and political importance of recent immigrant groups, the movement of both Negroes and whites from the South to northern industrial centers, the industrialization and urbanization of the South, and the mechanization of agriculture in the South and in the West. This, he finds, has forced a political realignment, has transformed a normal Republican *majority* into a normal Democratic majority, has changed the race problem from a purely sectional one to a truly national one, and has revived the struggle for the establishment of a two-party system in the South. He notes that our current political controversies are expressed in terms of civil rights versus state rights, big government versus little government, the welfare state versus free enterprise, and internationalism versus isolationism—as talking points if not always as genuine issues.

He points out, however, that both major parties are coalitions of diverse interests and are usually unable to take a clear-cut stand on these questions. This has resulted in "border state politics"—a state of mind as well as an expression of geography—encouraging, if not forcing upon us a policy of compromise and stalemate. Despite the dissension growing out of our economic, sectional, ethnic, and religious rivalries, he finds the American government to be the most stable in the world. He feels, however, that we must somehow resolve our underlying struggle for national unity, achieve a better integration of the diverse elements in our population, and develop political parties and leaders that are capable of more decisive action, since stalemate cannot continue indefinitely.

The meticulous reader may criticize Mr. Lubell's reference to Frances Perkins, former Secretary of Labor, as "Mrs. Perkins." Hopeful Southerners may question his assertion that the political and economic revolution in the South has made the South more conservative (instead of merely bringing conservatism into sharper focus by challenging it). Those who fear the drift toward big government may object to the statement that "The real need is to strengthen government—not to protect either business-as-usual or social-gains-as-usual, but to discipline both to the national interest." None, however, can question the timeliness of this book or the contribution which it makes to an understanding of our political dynamics.

ROGER V. SHUMATE
University of Nebraska

STROMBERG, ROLAND N. *Republicanism Reappraised.* Pp. 93. Washington, D.C.: The Public Affairs Press, 1952. $2.00.

This book is a vigorous essay on the recent history of the Republican party with an analysis of its current prospects, "from a viewpoint," says its author, "sympathetic to the Republicans." If Republican politicians should ever read the book they would conclude that sympathy is much harder to find in its pages than many cutting criticisms, such as "The Republicans in the Senate with only a few exceptions hated Wilson primarily, and not the League; and they hated Wilson not primarily because he was Wilson, but because he was a successful Democratic President. They were encouraged in their long, dogged fight to defeat the Treaty and the League because at the end of the trail lay political gold. So the Republican party began its post-war career under a cloud, with a victory tainted by the bad odor of demagoguery and abandonment of principle."

On domestic issues, with the election of Harding the party turned conservative, and, writes the author, "A conservative, defensive party produces no great leaders, and no ideas." Such a generalization seems to this reviewer too broad, but for the period of the twenties we may agree that "while Republicans proclaimed the economics of pure competition, their deeds encouraged an ever-growing rigidity in the economic system, cartels and quasi-monopolies in big industry." The debacle came when "A complicated but decidedly not self-steering economic machine shot off the tracks at better than 80 per, while engineers and switchman were fast asleep, dreaming of a world where trains run themselves." Professor Stromberg feels, however, that the Republicans have still not learned their lesson: "Not long ago a decrepit Southern Democrat raised a voice against 'statism' and hordes of Republicans staggered to their feet, hoarsely cheering."

The only hope for the Republican party in domestic affairs, the author believes, is a return to Theodore Roosevelt's New Nationalism, which was "authentically Republican." This reviewer is inclined to believe that too much water has gone down the Potomac since 1932 for such a program, even if revived, to suffice to win. Too many liberal and independent voters have advanced too far beyond Roosevelt's position. Even if this were not the situation it is unlikely that the Republican party would go liberal, for, in our author's words, "Reactionary and/or confused the Republican party has been most of the time since 1932."

For the Republican position on foreign affairs Professor Stromberg uses such phrases as "irresponsible," "lack of intelligence," and "confused." He regrets the Republican attacks upon General Marshall and Secretary Acheson and the

McCarthyism that pervades their foreign policy speeches.

The great difficulty for the Republican party in 1952 is that there are too many Democrats. In seeking to wean some of them away, the Republicans are in the same dilemma they have been in since 1932: neither me-tooism nor conservatism can win. The party must have a program, as the author says, "both new and *different.*" If it fails to develop one, it is likely to pass "quietly away into whatever Valhalla is reserved for the ghosts of defunct political organisms." Such a program is not offered in this book, but nonetheless any one who follows American politics will find the discussion extremely interesting. There is no index.

DAYTON D. MCKEAN
University of Colorado

BALDWIN, RAYMOND E. *Let's Go into Politics.* Pp. 179. New York: The Macmillan Company, 1952. $2.75.

This volume is largely a political autobiography—and it is indeed fitting that its author, distinguished in the field of practical politics, should draw on his own rich experiences for the background of a book whose main purpose is to encourage wider participation in politics. Few men in public life today have had a more varied political career than our author, who began on the local level and continued on the state level, with further experiences on the national level. He has served in the lower house of the Connecticut legislature and later as a member of the United States Senate. He has had executive experience as a three-term governor and is now gaining judicial experience as a member of the supreme court of his state. In spite of this enviable record he speaks frankly of the frustrations that came with political defeat —first in local politics as described in his early chapters, and later by his failure to be re-elected after his first term as governor (followed, however, by two later elections).

Although this book is truly a success story, it is nevertheless written with a candor that admits mistakes, and with a spirit of fairness toward supporters and opponents alike. All this adds to its effectiveness as a document aiming to stimulate the recruiting of citizens into the ranks of active politicians.

The author does not hesitate to become rather elementary on occasion, as, for example, in his description of the mechanics of passing a bill, but such occasions are rare, and even these add to the realism which the volume portrays.

One of the best chapters in this very readable book is that which deals with campaigning for office. His comments on such things as campaign promises, handshaking, mud-slinging, and putting on airs reveal the genuineness of the author. One intimate paragraph describes the reactions of the members of the author's immediate family at the time of his only significant defeat (in the gubernatorial race in 1940). Another very interesting chapter tells, in an intimate fashion, about the reactions of members of the U. S. Senate to various pressures, including letters and telegrams.

Perhaps the most dramatic parts of the book are those which deal with the national nominating conventions. Judge Baldwin pictures the interesting details of a conference with Wendell Willkie during the 1940 convention in which it appears that Willkie looked with great favor upon Baldwin as a running mate. Equally fascinating to any one interested in the "inside" workings of a convention are the comments on the maneuvers which took place within, and in connection with, the Connecticut delegation immediately previous to the nomination of Dewey as the presidential candidate in 1948.

Repeatedly the author stresses the need of compromises in politics—not compromises between right and wrong but rather compromises between differing or opposing views. His breadth of view and his stature are shown by his pertinent and illuminating comments on such topics as lobbying, filibustering, seniority, and patronage. Very objectively he makes well-balanced statements comparing the divergent views held by public men on these matters.

His closing chapter Judge Baldwin devotes to the duties and obligations of the citizen rather than to his rights. Among other things the author warns against the careless use of labels. He shows great discrimination at this point. One is surprised, however, to find the statement that we do *not* live in a democracy, but in a republic. The author points out, with accuracy, that we do not live in a pure democracy, but overlooks the fact that a republic is one kind of democracy—indirect and representative.

As one who, for many years, has urged college-trained men and women to enter politics as *part-time* workers, this reviewer wishes that this stimulating volume had included some pointed and direct suggestions for *part-time* participation for those not interested in a full-time political career.

Judge Baldwin has made an important contribution to the literature in the field of practical politics. It is reasonable to hope that many other public-spirited citizens, influenced by his example and by his precepts, will take his suggestion seriously when he says *Let's Go into Politics.* It would be a great thing for America to have many more Raymond E. Baldwin's in public life.

Ohio Wesleyan University

HEARD, ALEXANDER. *A Two-Party South?* Pp. xviii, 334. Chapel Hill: University of North Carolina Press, 1952. $4.75.

This volume, good in style and accurate in fact, addresses itself to a problem which appears to worry students of politics continually—can the South break away from its thick-and-thin, for better-for worse devotion to the Democratic party. Heard appears to think it can and will, although most of his book is given over to an analysis of the formidable obstacles in the way of Republican party growth in the South.

This book is an outgrowth of the project at the University of Alabama through which V. O. Key, with Heard's assistance, produced *Southern Politics.* It is divided into sections which consider the background (the One Party South, the Dixiecrats), the case of the Southern Republicans, the revolution which is gradually changing the South, the new politics of the Negro, and a final chapter on the future. The outlines of the material presented here are generally familiar to students of Southern politics, but, by statistical summaries, investigations of Negro pressure groups, and brief excursions into local politics, Heard has added a realistic documentation. Generally, the scene is still one of devotion to traditional alliances springing from the middle of the last century. Heard thinks this traditional alignment may be modified by the growth of cities, a possible change in the method of electing the President, the need of the conservatives to move out of the Republican horde (I had thought of saying "phalanx," but "horde" seems a more appropriate term than one which implies a closely knit military unit), and the rise of labor. Yet, if a two-party politics is to become serious in the South (Heard shows very well that Republicans *do* exist), some really stiff hindrances must be overcome—the corruption and internal division of the Negroes and the inertia, hopelessness, and contentment of the existing Republicans, many of whom like the status of "big fish in little ponds," not to mention the legal mechanics which contrive to make a mockery of theory of majority rule. Indeed, if anything could be questioned in this volume, it would be the two-party hopefulness of the last chapter in view of the thorough probing of the obstacles to which most of the book is devoted.

The author writes and thinks very well. His book deserves the wide reading which it will undoubtedly receive.

DILLON, MARY EARHART. *Wendell Willkie, 1892–1944.* Pp. 378. Philadelphia: J. B. Lippincott Company, 1952. $4.00.

In this year of the resurgency of the amateur in politics, Mary Earhart Dillon of Queens College has brought forth a highly readable biography of the outstanding amateur of the present era, Wendell L. Willkie. In this story of the 1940 nominee, from his Elwood childhood through his struggles against the Tennessee Valley Authority and both political parties to his final demise as titular head of the G.O.P., Willkie's paradoxical personality and in-

consistencies, as well as his tremendous energy and devotion to any cause at hand, are treated with understanding and objectivity.

On the related topic of the struggle by the private utilities against the Tennessee Valley project, however, Miss Dillon in *1952* stands four-square with the Wendell Willkie of 1935 devoted to the "cause of utilities privately owned." Against "the bright young men of the federal government who essayed to reform the country but created chaos," the author presents a one-sided case in that she fails to record the many questionable tactics by which the privately owned companies sought to undermine the co-operative and municipal power facilities.

In picturing the rise of Willkie, the potential nominee, Dr. Dillon's work bears the fruit of more impartial political insight and extensive research. The behind-the-scenes conversations and actions which resulted in the spectacular Willkie build-up are important contributions to the literature on the making of Presidential candidates. Of additional interest is the evidence she presents for the need of co-operation between the candidate and the party professionals, though some students of politics may disagree with her conclusion that Willkie's "detachment from the party was a fatal blunder." Willkie, to be sure, erred in utilizing career politicians as infrequently as he did, but the fact that he received more votes than any Republican candidate to this day would indicate that he did obtain the regular Republican votes while attracting legions of new voters to the polls. Many will agree with those observers who asserted that Willkie lost in 1940, not because he did not have the support of the traditional Republicans, but because he was unable to convince enough liberals and independents that he would be a superior substitute for President Roosevelt.

After the election, Willkie made his impact on history, and Miss Dillon pays vivid tribute to Willkie's role in the making of the bipartisan foreign policy. Her description of his "One World" flight is illuminating both for its study of the Willkie character and its evaluation of his contribution to international understanding. The final chapter is devoted, with little comment, to Willkie's political position as illustrated by his writing after the 1944 Wisconsin primary—a position somewhat removed from that of his utility days in regard to social security, labor relations, and monopolies. Miss Dillon has done a thorough job in her timely presentation to the American public of the fascinating and controversial individual who indeed "contributed to saving freedom at a moment of great peril."

DONALD BRUCE JOHNSON
State University of Iowa

BURNS, JAMES M., and JACK W. PELTASON. *Government by the People: The Dynamics of American National Government.* Pp. xvii, 946. New York: Prentice-Hall, 1952. $5.50.

This is a college textbook which earnestly tries to get away from dry exposition of structures and powers in order to "picture American government as an alive and dynamic thing." In this regard it succeeds at least as well as any and far better than most. Though the authors avoid minutiae they nevertheless employ abundent homely and concrete examples and illustrations. The student ought to feel at home both with the style and with the attitudes expressed.

The method of the book is to play up problems and areas of controversy in the functions of the federal government. The defenses for methods and practices are clear and fulsome, and the questions of critics are amply represented. The authors for the most part maintain a properly objective attitude, though their tone is "liberal." Only in the case of civil rights do they adopt a positive position—supporting federal legislative programs.

The book is very long, offering enough material for the basic reading in a year course, and there do not appear to be any significant omissions. It is directed to the average student, so that inevitably some of the better students will become impatient with repetition and overelaboration. This may well be the defect of a virtue, however. In brief, Professors Burns and Peltason have done well what they set out to do and have made an important contribution to the undergraduate teaching materials.

This reviewer would like to add, for what it is worth, that students will never be led by this book to reach down for the roots of the problem of the relation between liberty and security. The tacit assumption throughout is that big government and big power, as means for the advancement of the general welfare, are inevitable and that administrative process is the characteristic development of modern democracy. In this sense *Government by the People* moves in the main current of liberal thought prevalent during the past twenty years. Whether liberals may not before long have to reconsider this current in the light of encroachment on citizen liberties and prerogatives is an important question here left almost untouched.

STUART GERRY BROWN
Syracuse University

LEEK, JOHN H. *Government and Labor in the United States.* Pp. ix, 336. "American Government in Action Series." New York: Rinehart & Company, 1952. $3.00.

The writer on government and labor can adopt various approaches. He may assume the role of historian and tell from the best manuscript and related sources the story of organized labor's relationship with selected governmental units over a given period of years. On the other hand, he may try to analyze legislation and court decisions and present material descriptive of administrative procedures. The present author, professor of government at the University of Oklahoma, has chosen the latter course.

The heart of Professor Leek's book rests in its capable analyses of laws and cases on collective bargaining, wages and hours, the injunction, immigration, working conditions, social security, and arbitration. A good chapter summarizes recent anti-union legislation by the states. Three introductory chapters trace the historical background to the New Deal era, however, in a general and colorless fashion. Two final chapters discuss government as an employer and comment lamely on labor in politics. A well selected bibliographical list for student use shows the mature teacher at work.

This book lies in the field occupied in part by the detailed but often subjectively defensive account of Millis and Brown, the learned and readable legal survey of C. O. Gregory, the serious policy analysis of Harold W. Metz, the propagandistic and influential pioneer contribution of Frankfurter and Greene, and the textbook of Glenn W. Miller. The author profited from these and numerous other studies. His own intention was to provide students in government and economics courses with a survey volume for out of class reading. He has succeeded in his declared object, aided by the publisher's wise decision to forego a cloth binding and glossy paper in favor of a reasonable price.

A calculated effort was made in this book "to shift the emphasis from economics to political science" and thereby invade the domain of the labor economists. Analysis remained the basic tool, however, and this reviewer failed to observe any striking improvement in the result. Analysis is not enough. Labor history, regardless of the disciplinary framework within which it may be created, is still part of the stream of *human* history. Those who write about twentieth century labor legislation, court decisions, and politics are obligated to demonstrate in their prose that living people once participated in the events they describe. No labor leaders, employers, politicians, or judges live again in the pages of this book. The author's research method largely excluded such sources as manuscript correspondence, newspaper editorials, interviews with surviving participants, nearly all union journals, and both trade papers and the radical press. Without liberal doses of the spoken and written word in direct quotes historical writing can be somewhat soporific stuff.

Government and Labor in the United States belongs on appropriate collateral reading lists, nevertheless, because it provides on the whole a reliable introduction to its subject.

VAUGHN D. BORNET

Stanford University

ANDERSON, EUGENE N. *Process Versus Power: Studies in Modern Culture.* Pp. vii, 137. Lincoln: University of Nebraska Press, 1952. No price.

This study synthesizes evidence from all the social sciences in dealing with certain basic issues of our time. Primarily it is a comparison of societies identified, respectively, with industrialism, the Old Regime, communism, and nationalism (fascism). The first of these are societies of process, the others, societies stressing the concentration of power.

The author argues that process has been carried farther in this country than elsewhere. Indeed, except for minor flaws and qualifications, our culture is about as perfect as a changing process will allow. Everybody participates actively in the formulation of policies in various fields; we and others like us are far ahead of power-ridden countries in the capacity to conduct war; in the United States at least people can develop well-rounded personalities.

All this is interdependent with freedom, equality, and fraternity, which are more advanced here than elsewhere. Even the corporations are conducted democratically, being governed by their stockholders (page Berle and Means). Freedom of the consumer implements freedom in other fields. No mention is made of consumers themselves being conditioned to want what private enterprises can sell them at a profit. In line with these views, the author is dubious about federal bureaucracy, and about public ownership except as it aids private enterprise to develop.

Much of this I do not believe. But you should see the author take out after the societies of power and rigidity—the communistic, fascist, and pre-industrial. He scarcely has a good word to say for them. He says, for instance, that science along with the arts is stifled in Russia. But a recent report rates Russia as the third highest nation in scientific achievement, with our country coming first, and Britain second. I fear Dr. Anderson trusts our newspapers too much. Well, I feel about the same way regarding communism, fascism, and other totalitarian systems. We are inevitably ethnocentric in such matters. Still, we should try to give the devil his due.

Many will not share my criticisms, and the study challenges the views of those who do, which is a good thing. The little paper-covered volume will thus be found stimulating by many, and will lead some of them at least to re-examine their positions.

There is no index.

SEBA ELDRIDGE
University of Kansas

Hoover Institute Studies, Series C: "Symbols," Nos. 1–4. Stanford, Calif.: Stanford University Press. No price.

No. 1. LASSWELL, HAROLD D., DANIEL LERNER, and ITHIEL DE SOLA POOL. *The Comparative Study of Symbols: An Introduction.* Pp. v, 87. 1952.

No. 2. DE SOLA POOL, ITHIEL, with the collaboration of HAROLD D. LASSWELL, DANIEL LERNER, and others. *The "Prestige Papers"—A Survey of Their Editorials.* Pp. vii, 146. 1952.

No. 3. DE SOLA POOL, ITHIEL, with the collaboration of HAROLD D. LASSWELL, DANIEL LERNER, and others. *Symbols of Internationalism.* Pp. 73. 1951.

No. 4. DE SOLA POOL, ITHIEL, with the collaboration of HAROLD D. LASSWELL, DANIEL LERNER, and others. *Symbols of Democracy.* Pp. xi, 80. 1952.

The first four numbers in this Hoover Institute series provide a theoretical introduction and three comparative analyses of symbols. The series "undertakes to describe the world revolution of our time and its consequences for world politics and national policy." The Hoover Institute and Library on War, Revolution, and Peace conducted these studies as part of its research project on Revolution and the Development of International Relations (RADIR Project).

In the first monograph, one of the most significant points made by the authors is that statistical content analysis "should begin where traditional modes of research end. The man who wishes to use content analysis for a study of the propaganda of some political party, for example, should steep himself in that propaganda." He should first learn the propaganda's characteristic mechanisms and devices, its vocabulary and format, the party's organization and personnel, and its social and historical roles. This is such a large order and leaves such a minor role for the symbol counters that one is not surprised to find these investigators short on public affairs analysis, especially on the analysis of the struggles in which their symbols have parts.

The "Prestige Papers" reports a content survey of editorials in a few leading newspapers in Great Britain (*The Times*), Russia (*Novoe Vremia, Izvestia*), United States (New York *Times*), France (*Le Temps, Le Monde*), and Germany (*Norddeutsche allgemeine Zeitung, Frankfurter Zeitung, Völkischer Beobachter*), for periods of various lengths between 1890 and 1949. The third and fourth monographs deal with the symbols of internationalism and democracy in part of the same "prestige" newspapers in these five major countries.

As far as symbol analysis can take us on this high level of ritualistic expression, the monographs present careful and useful summaries of trends in symbol usage. As Bernard Berelson notes in the introduction to the second publication, "The temptation is always to interpret the content data, even from a sample as restricted as the 'prestige papers,' into application to 'people's attitudes' or 'the ideology of the times' or something similar." This common error of historians and other students of literary materials is, by and large, carefully avoided in this series. The more precise assignment of significance to the use of symbols in "prestige paper" editorials awaits, however, more detailed and sharp historical and contemporary affairs analysis than is now available, but the present studies aid in the process.

Statements on the fourth study's first page are arresting: "The heyday of the symbol DEMOCRACY has been a short one. A century ago democracy was a favored symbol for small extremist plebeian groups only. But since 1870 this term . . . has become respectable and comfortable." Sweeping statements about a symbol are dangerous. Democracy's "heyday" in the eighteenth century was different from its "heyday" in the nineteenth or twentieth. The symbol had and still has many contents, each a function of an interest group with a more or less developed ideology. To dismiss the successful eighteenth-century revolutionists in the United States and France as "small extremist plebeian groups" is not accurate. This fourth monograph in particular seems to suffer from being a patchwork of committee-member ideas. The "increasing concern with the notion of democracy," noted by the ten collaborators, is symptomatic of the active use of the democratic aegis by leaders of underrepresented popular groups, not of a decline either in the acceptance of the symbol or in whatever might fairly be so labeled.

City of New York

BERELSON, BERNARD. *Content Analysis in Communication Research.* Pp. 220. Glencoe, Ill.: The Free Press, 1952. $3.50.

A dozen years ago, in writing a book on public opinion, I became aware of the need for a monograph summarizing the studies and methods of content analysis. I referred to a number of the studies which had been done up to that time, most of them unsubtle and crudely quantitative in counting units of questionable validity. The need for such a monograph has continued increasingly through the years, as I would estimate that three-fourths of the content studies have been done in the last decade.

Now Bernard Berelson has very ably covered the field and performed a valuable service not only for all of us in communication research, but also for social science; for political scientists, historians, and literary analysts might well engage in many

kinds of content analysis in translating their craft from impressionistic accounts to social science. On the other hand, one may expect to see in the immediate future an enormous waste of energy in poorly selected, maldirected, undefined projects in this field, carried on with ill-defined units. But not when directed by social scientists such as Berelson or his mentor, Lazarsfeld.

This volume has chapters on the uses of content analysis, qualitative content analysis, the units of content analysis, the categories of content analysis, and a summary of technical problems. The assumptions are that: (1) content analysis assumes that inferences about the relationship between interest and content or between content and effect can validly be made; (2) that the content analyst assumes that the "meanings" which he ascribes to the content, by assigning it to certain categories, correspond to the "meanings" intended by the communicator and understood by the audience; and (3) that content analysis assumes that quantitative description of communication content is meaningful. Content analysis began with newspaper content studies, was stimulated by Lasswell and others in the 1930's, and was greatly broadened in the areas of its use in the activities of the war agencies and in the period from the war to the present.

A brief review does not permit of even a summary of Berelson's able organization of studies of content form, content effects (which I believe to be a related but different field), qualitative content analysis, and the central problem of categories and units. This is a book for research men, classes on social science method, and the large body of those labeled social scientists who are skeptical of social science methodology.

The book concludes with an extensive bibliography of the studies in this area, a bibliography so useful to me that I should have purchased the book for that content alone. This monograph is an excellently organized, critically incisive, and very useful social science contribution.

WILLIAM ALBIG
University of Illinois

BERNAYS, EDWARD L. *Public Relations.* Pp. x, 374. Norman: University of Oklahoma Press, 1952. $5.00.

The first part of this volume (13 chapters) deals with the growth of public relations, interpreted very broadly to include the story of propaganda, promotion, and press agentry from earliest times. The influence of Mr. Bernays himself upon the evolution of public relations during the last forty years is clearly shown. The second part of the book (chapters 14 to 33) is designed to show how Mr. Bernays deals with specific public relations problems, and consists mainly of speeches and articles he has prepared for various organizations such as the National Society for Crippled Children, the American Nurses Association, the House Magazine Institute, the League of New York Theatres, the Mail Advertising Service Association of New York, and the Territory of Hawaii.

Mr. Bernays' position in the public relations field remains intact. He has had many imitators, but few peers. Public relations for him is something far more profound and challenging than mere press agentry. It means using "overt acts" to dramatize appeals, using opinion leaders, creating "institutes, talking about the public interest, using public opinion surveys, and rationalizing client objectives in scientific terms. No one has been more zealous than Mr. Bernays in trying to raise the social status and academic prestige of this ubiquitous activity. And one lays his book aside with some answers as to why the task has been so difficult. One reason is that only a minority of public relations counselors seem to grasp the full public service opportunities and responsibilities of their work. Moreover, in serving many and varied causes the public relations counselor tends to lose his own ideological identity, his own place in the value system of the community. And finally, in acquiring a widespread reputation for cleverness in the arts of public opinion management, the expert in public relations somehow succeeds in bringing upon himself a considerable amount of resentment and suspicion from the great masses of humble, inferior, and unslick. Public relations still has a big job of public relations to do for itself.

HARWOOD L. CHILDS
Princeton University

WISH, HARVEY. *Society and Thought in Modern America: A Social and Intellectual History of the American People from 1865.* Pp. xii, 618. New York: Longmans, Green and Company, 1952. $6.50.

This is the second of two volumes in which Professor Wish traces the character and development of society and thought in America from colonial times to the present. The first volume carried this task through the year 1865, and the second one completes it by covering the period from 1865 to 1950. It is a work that is both reliable and readable. Beginning with the Reconstruction period, it gives an illuminating account of the efforts of the Southern Bourbons to regain power, and charts the appearance of the New South. The author has some interesting things to say about Woodrow Wilson as a product of the New Southern Liberalism. Succeeding chapters provide balanced and well-documented discussions of the growth and impact on American society of urbanism, industrialism, the labor movement, immigration, and inventions between the years 1865 and 1917.

Wish has a flair for portraying the influence of new ideas on the intellectual climate of a particular time. This is evident in his treatment of American reactions to Darwinism, pragmatism, and scientific determinism. In addition, he gives the reader a most useful account of the growth of realism in American literature and of the beginnings of modernism in our national architecture. The author is very skillful in showing the meaningful relationships between artistic and intellectual currents and relevant economic and political circumstances. His wide range of interests includes also a brief, but absorbing, discussion of the influence of Mahan's conceptions of naval strategy on both American and European conceptions of foreign policy.

Concluding chapters discuss with discernment the Business Civilization of the roaring twenties and the place of the Lost Generation in the literary life of this period. However, as the author approaches the contemporary present, he manifests less inclination to interpret events and falls into the role of one who simply records and recounts. This is not surprising because the objective historian requires the screen of time to discern interrelations and significance in the march of events. Those steeped in doctrinaire philosophies of history are immediately willing to assign causal significance to events, ideas, and human activities, but, fortunately, Professor Wish is not one of these.

JAMES H. BARNETT
University of Connecticut

NIEBUHR, REINHOLD. *The Irony of American History.* Pp. ix, 174. New York: Charles Scribner's Sons, 1952. No price.

This small volume of philosophical essays has grown out of two series of lectures, one given at Westminster College, Fulton, Missouri, and the other at Northwestern University under the Shaffer Lectureship. "Both lectureships," the author says in his preface, "dealt with the position of our nation in the present world situation, as interpreted from the standpoint of the Christian faith." And they do, indeed, pass moral judgment upon the politics and the economics of both the United States and Russia. He juxtaposes the two nations and seeks to discern the valid criticisms that each makes of the other. Although he is harsh in his moral judgments against the bourgeois Philistine qualities of the contemporary American business society, he is devastating in his attack upon the pretensions of Russia, for "communism changes only partly dangerous sentimentalities and inconsistencies in the bourgeois ethos into consistent and totally harmful ones" (p. 15). It is clear from such criticism that Mr. Niebuhr has taken upon himself the mantle of Elijah in order to warn against, and anathematize, the Ahabs of the present. He is so eager to pronounce his moral aphorisms that he rarely descends from his pulpit to the academic

level of careful definition of terms and the exposition of a theme.

In two of his essays the author strives toward a Christian interpretation of history; for him the key that unlocks the storehouse of mysteries is irony. He says "irony consists of apparently fortuitious incongruities which are discovered, upon closer examination, to be not merely fortuitious" (p. vii). He finds a comic situation to be ironic "if a hidden relationship is discovered in the incongruity. If virtue becomes vice through some hidden defect in virtue . . ." (p. viii). This view of history suits his mental processes very well for he is on an unending quest after paradoxes and contradictions. This quest results in a dialectic which baffles as well as provokes thought. His ceaseless movement from thesis to antithesis is a type of reasoning which may revivify old patterns of thought; it also confuses simple patterns.

Mr. Niebuhr's methodology will not bear the scrutiny of a critical historian. He has read widely and discriminatingly from the works of such authors as James Bryce and De Toqueville, and he has selected from the *smörgåsbord* of his reading those morsels that satisfy his appetite for moralizing. He too readily extracts historical generalizations from their context and transforms them into absolutes; for example, he treats social classes almost as rigidly as do the Marxians. He also attributes personality, and even a conscience, to the nation. This social Darwinism does not enhance a book that has many penetrating observations. In spite of its faulty methodology, it has the great merit of passing moral judgment upon wrongs and pretentions which cause hate and lead to war. Mr. Niebuhr is fully cognizant of the tradition of Christian morals; and he uses this plumb line to measure the crooked walls and shallow wells of our society. For this reason his book deserves many readers.

R. G. COWHERD

Lehigh University

WITTKE, CARL. *Refugees of Revolution: The German Forty-Eighters in America.* Pp. ix, 384. Philadelphia: University of Pennsylvania Press, 1952. $6.00.

Occasionally a book comes from the press which not only adds to the knowledge of the reader but leaves him with a comprehensive sense of understanding a certain period of history. Carl Wittke's book *Refugees of Revolution* describing the German Forty-Eighters in America has added greatly to our knowledge of this interesting period in American life and has made various phases of the turbulent nineteenth century more distinct and clear.

There is no question about the intellectual vigor and force which refugees of the various revolutions in Europe brought to this country. There has been considerable debate as to the value of their ideas and as to their effective accomplishment in the American scene. Carl Wittke deals with these men very objectively. He points out the shortcomings of such men as Karl Heinzen who could never conform to the new environment and spent his life in bitter writings. On the other hand, he credits Carl Schurz, Frederick Hecker, and a large group of vigorous men who found a new destiny in a new world. He credits the stimulation of thought and the devotion to principle that was characteristic of the sixth decade of the nineteenth century culminating in the Civil War, after which there was little evidence of any particular contribution from the refugees of revolution.

One of the saddest chapters is devoted to the failures. Men who fought with devotion and sometimes with distinction in Europe met a tragic fate in America. Occasionally this was due to an inability to apply talents to useful ways in the new world, often it was due to the unsatisfactory adaptation of intellectuals trying to wrench a life as Latin farmers from the land, and again it was due to luckless chance.

The divisive effect of European freethinkers is laid bare in Dr. Wittke's book. The rift between the "Grays" and the "Greens" and particularly the drive of the free-thinkers against American sabbatarianism and the Catholic Church led to neighborhood clashes and to the antagonism of entrenched religion.

Many "fighters of the barracks" were content to dream of the battles of the past rather than to share the pulsing life of America. Similarly many migrants at the turn of the century always thought of Germany as the land of Bismarck, a country of flower-boxes and captivating music. In strange ways the freedom of America dampened the fires of revolution. Dr. Wittke has written a resource book crediting the valuable contributions of an interesting generation and listing those debits which made subsequent history more understandable. His work carries the mark of thorough scholarship.

HOWARD W. ELKINTON

Philadelphia, Pa.

HAND, LEARNED. *The Spirit of Liberty: Papers and Addresses of Learned Hand.* Collected, and with an introduction and notes, by Irving Dilliard. Pp. xxx, 262. New York: Alfred A. Knopf, 1952. $3.50.

Irving Dilliard has performed a valuable service in bringing together these 34 nontechnical papers from the pen of Learned Hand; for Judge Hand, like all great judges, is far more than a legal scholar and technician. The breadth of his learning, the urbanity of his thought, and the felicity of his style combine to make even his brief occasional pieces both charming and instructive.

Hand resembles Holmes, whom he so much admired, both in the form and the substance of his writing. The loving and proficient care of the linguistic artist is evident in every sentence. Even more reminiscent of Holmes is Hand's philosophy. His insistence that ultimate values cannot be proved in no way qualifies his faith in liberal principles. His recognition of the wide gap between ideal and reality leads him neither to discouragement nor cynicism. "In a world where the stronger have always had their way, I am glad if I can keep them from having it without stint. It seems to me, with all its defects, our system does just that" (p. 98).

Although the title essay occupies but two pages, its subject continually recurs throughout the volume. A careful definition of liberty Judge Hand wisely eschews; but no one can read these pages without directly absorbing much of its essence. Liberty is based on the spirit of tolerance and of modesty. It must find its ultimate support in forebearance; for, as Hand, the Holmesian realist, insists, "liberty is so much latitude as the powerful choose to accord the weak" (p. 71). In the final analysis, he declares, "it is man's inherent willfulness that I would preserve, and in which I wish to set the stronghold of that Liberty I prize" (p. 151).

This concept of liberty provides the key to his attitude toward the role of the courts. The institution of judicial review as it relates to the separation and distribution of powers he considers implicit in the nature of constitutionalism. But liberty can not be preserved by laws and courts. It must be enshrined in the hearts of the people. Without that, courts will be of no avail; with it, legislatures may be trusted and courts may confine themselves to the interpretation and application of the laws as enacted.

Mr. Dilliard has performed his editorial functions carefully and skillfully. One can only wish that he might have felt free to expand his introduction beyond its modest limits.

J. ROLAND PENNOCK

Swarthmore College

SEAGLE, WILLIAM. *Law: The Science of Inefficiency.* Pp. x, 177. New York: The Macmillan Company, 1952. $3.50.

Three long centuries ago complaint of "the law's delays" was voiced by the greatest of the Elizabethans. Legal delay, and its consort, inefficiency, are familiar to every tutored person and have become a staple of criticism. Charles Dickens, whose study of *Jarndyce v. Jarndyce* in *Bleak House* constitutes the literary classic on the subject, was moved to remark: "The one great principle of the English law is, to make business for itself." The most distinguished living American judge, surveying the contemporary legal scene, recently confessed that "as a litigant I should dread a lawsuit beyond almost anything else short of sickness and death."

This book is a popular and well mounted exposition of legal inefficiency. It de-

scribes, analyzes, and pursues the details of the subject in a series of chapters devoted respectively to particular provinces of the law: The Dictionary Theory of Justice, or the problem of interpretation; The League of Timid Men, or the lawsuit as a judicial duel with the judge in the negative role of umpire; The Ordeal of Procedure, or the complexities of pleading and procedure in litigation; The Bogus War on Crime, or the difficulties in the administration of criminal justice; and so forth.

The presentation is provocative; the style, crisp and clear. Mr. Seagle's pen turns out epigram and paradox like an untiring lathe. These pages are, indeed, a small thesaurus of quoted and quotable material. The items quoted range from the literary mockery of Rabelais to the august pronouncements of eminent jurists. Among Mr. Seagle's verbal impertinences are the following: The judicial machine "will always remain a tinkered and painted jalopy," and "law and politics are fuller of double talk than baseball is of double plays." That cherished predilection of the law, impartiality, he dispatches with Anatole France's celebrated dictum: The law is magnificent in its impartiality, for it forbids the rich and poor alike to steal a loaf of bread or to sleep under the bridges.

It is the author's thesis that law is doomed to inefficiency by its very nature and structure. This observation may be made of all legal "systems" alike. The code system of the Civil Law fares no better and no worse, in this connection, than the Anglo-American system of common law. A code requires judicial implementation and, in the last analysis, is "no more a body of laws than a skeleton is a man." The pages of Gibbon remind us that even the Roman law under Justinian, for all the encomiums it has received, was "a mysterious science and a profitable trade."

Furthermore, in democratic societies legal inefficiency is maintained and preserved "with painstaking deliberation," for it "actually serves a useful social purpose." The paradox means that inefficiency in law, like that in government, is one of the prices which must be paid for the democratic order and constitutional liberty thereunder. This is especially apparent in certain legal areas, such as the administration of the criminal law. The Star Chamber, dread tribunal and "curious eye" of the Tudor state, is cited as an example of a legal institution which had to be abolished because it became a model of efficiency.

As a natural corollary of this thesis, the author regards with little patience attempts at "law reform." He considers such attempts destined to be fruitless and refers contemptuously to "the process of tinkering known as law reform."

Some members of the legal fraternity will find in this small volume matter for offense; others will find in it ample room for disagreement; but surely no reader will find it dull.

ECONOMICS AND INDUSTRY

HATT, PAUL K. (Ed.) *World Population and Future Resources.* The Proceedings of the Second Centennial Academic Conference of Northwestern University, Evanston, Illinois, March 1951. Pp. xviii, 262. New York: American Book Company, 1952. $3.50.

The problem posed to the Northwestern symposium was "the relation of the potential growth of world population to resources for human sustenance."

Like so many previous efforts in this field this book does not in fact come to close grips with the problem of the *relation between* population and resources. It is a symposium of twenty contributions from experts in the fields of demography and the physical sciences, each an authority in his own field. A first section, by leading demographers, discusses "The Population Factor," especially possible future trends in population growth. Three other parts deal with "Food Resources," "Material Resources of Industry," and "Energy Resources."

The demographers are pessimistic. They correctly point out that the present and prospective rates of increase, carried on long enough, will ultimately outdistance any conceivable resource development and that a doubling or tripling of human numbers will not only call for a grandiose application of science but also for much more effective social organization than we now have for achieving long-run economic goals.

The experts on resources are generally hopeful. In the few cases in which they relate their findings to population growth they evince a faith that a proper application of inventiveness and technology can keep ahead of the needs of a growing population. Dennis Fitzgerald, for example, states "a deep conviction that for years to come, physically and technically, agricultural production can be increased twice as rapidly as any foreseeable increase in population" (p. 136).

Similar optimism is promoted by the somewhat parochial focus of several contributors who deal only with the resource problems of the United States rather than with the much more serious problems of other parts of the world or the world as a whole.

At best the contributors had difficulty in attaining the world view originally planned for the symposium. The problem posed is too broad for careful analysis. The world can scarcely be considered in significant terms as an economic unit. The realistic question is not "Can the world support its future population?" but, rather, can economic development outstrip prospective population growth in India, in Japan, and in other specific areas of population pressure.

While the book did not achieve what it set out to do, it should serve a useful purpose in bringing together in a small volume authoritative statements on a wide range of resource problems. In general the contributions are brief, interesting, and nontechnical.

Washington, D.C.

HARRIS, SEYMOUR E. *The Economics of New England: Case Study of an Older Area.* Pp. xvii, 317. Cambridge, Mass.: Harvard University Press, 1952. $4.75.

The major question posed in this volume is whether New England is destined to occupy an increasingly unimportant place in the national economy. The thesis of the author is that while the region may continue to fall behind relative to certain other areas in the United States, there are no insurmountable obstacles to keep New England from enjoying a healthy economic growth in absolute terms. In developing this thesis Professor Harris has analyzed the major factors that have affected the New England economy.

To the consternation, no doubt, of numerous local chambers of commerce, he has frankly listed the region's present limitations: unfavorable labor conditions compared to the South, a paucity of raw materials, a social climate unfavorably oriented to business, backward management and investment policies, and unsatisfactory relations with the federal government. While little can be done to remedy a lack of raw materials or to change New England's geographic position vis-à-vis the rest of the nation, the others on the list are amenable to change and improvement. To implement a program of reform, it will be necessary to obtain the co-operation of management, labor, investors, and public officials; it will involve an abandonment of New England's traditional protectionist point of view, a re-examination of the circumstances affecting labor productivity, a more alert management, and a new attitude toward federal expenditures in the region. This last point is especially noteworthy. New England's contributions to the federal budget have long exceeded the sums spent in the area by the government. Professor Harris suggests the possibility of a more equitable distribution of federal funds which would serve to lessen the disadvantage of New England relative to other parts of the country.

While this book is concerned with New England, the problems raised and the proposed remedies are relevant to any region that has suffered from or may be faced with a decline in its relative economic position. For this reason, the volume represents a welcome addition to a general subject that still needs many more such studies.

HAROLD F. WILLIAMSON
Northwestern University

STUDENSKI, PAUL, and HERMAN E. KROOSS. *Financial History of the United States: Fiscal, Monetary, Banking, and Tariff, including Financial Administration and Local Finance*. Pp. x, 528. New York: McGraw-Hill Book Company, 1952. $6.50.

This is the second altogether new general textbook on the history of American finance since the first of the numerous editions of Davis R. Dewey's *Financial History of the United States*, which appeared fifty years ago. The other is William J. Shultz and M. R. Gaine, *Financial Development of the United States*, published in 1937, or three years after the last edition of Dewey. The three volumes by Albert S. Bolles (1879, 1885, 1886) covered only the years 1774–1885 and are too outdated for comparison. Alexander D. Noyes, *Forty Years of American Finance, 1865–1907* (1909) could be compared only to the third volume by Bolles. Thus, the book under review is the only one even comparatively up to date covering the maze of financial involvements of the past fifteen years.

The authors acknowledge their heavy debt to Dewey, which, they declare, "will continue to be a classic in the field." The greatest difference between Dewey and the Studenski-Krooss book is in the much heavier stress of the present authors on finances of a nonfederal nature and in the abbreviation of the earlier period of American history, thus giving far more space to the later periods. A full half of the book is devoted to the first half of the twentieth century and well over a quarter to the years since 1929.

The authors properly assume that the readers should learn the general facts of economic and political history elsewhere, but here and there a few additional words of explanation would be most useful. For example, it is somewhat puzzling to read on page 250 that by 1902 "The agrarian groups which had been whole-heartedly opposed to soft money disappeared." Also, the cryptic reference to Eugene V. Debs on page 223 needs a little explanation. Again, who will believe the assumption on page 436 that there was no curtailing of civilian consumption during the war years of 1941–1945?

In other instances the authors seem to have mislaid their own knowledge of general American history. To take a very early instance, any student of the life of Patrick Henry, of the background of the American Revolution, and of the celebrated Parson's Cause of 1763 will be utterly mystified by these authors' statement on page 14 that by 1700 the use of commodity money "was confined almost wholly to the frontier."

Probably the most mysterious statement in the whole book appears on page 179: "But even over short periods, national-bank currency did not expand and contract with the needs of business." So far, so good, but this follows. "In periods of prosperity, when the business community wanted more money, national-bank circulation invariably declined. . . . In periods of recession, the situation was reversed, and currency expanded even though the demand for it was lacking." This is peculiar economics, queer logic, and such poor history that the authors have to refute it twice in the next ten pages, particularly in the table on page 189.

While the authors are eliminating the puzzles in a later edition, they should also correct the numerous liberties they took in alterations of people's names.

FRED A. SHANNON
University of Illinois

PATTERSON, JOHN C. *Association Management, with Special Reference to Trade Associations*. Pp. xiv, 230. New York: Harper & Brothers, 1952. $3.00.

The author is a professional public relations counsel and formerly was assistant director of public information, National Association of Manufacturers. The book is a combination manual and social analysis, aproximately one-half being devoted to technical problems of trade association management and the other half to the role of trade associations in the modern economy. This review is concerned solely with the latter subject.

In 1900 there were about 100 national trade associations; today the number exceeds 12,000. There have been two great boom periods in the formation of trade associations: the 1920's and the 1930's following the passage of the National Industrial Recovery Act in 1933. The author regards NRA as "the greatest stimulant to organization that industry has ever had" (p. 4). These 12,000 associations have as members more than a million business firms; they employ over 16,000 executives and clerical workers; their aggregate budgets exceed $100 million annually.

The trade association is "an instrument of social and economic action" (p. 2). It wields significant, though not decisive, power through its influence on public opinion, legislation, and administration. No association, or group of associations, can ever make "a bid for total power" because "no single interest can be pursued very far in group activity until it is curbed by conflict with other interests within the membership itself" (p. 14). Beyond this internal check, there are three external restraints on the possible abuse of power: public opinion, rival business groups, and government. The author lacks confidence in the ultimate efficacy of "natural" checks and warns association management against seeking to "get away with all it can" lest it invite governmental control.

Mr. Patterson's general theory is that a trade association is a "quasi-public" activity. Though organized to promite private interest its "responsibility to society as a whole transcends the self-interest of the group" (p. xiii). "Service to mankind" takes precedence over financial gain (p. 16). He visualizes the trade association executive as a professional broker operating as a middle-man between the frequently hostile forces of government and business; his function is to induce better understanding between them and co-operation for the common good. The ultimate objective is always the public interest.

This argument is plausible but unrealistic. The voluminous public record of the past thirty years—which Mr. Paterson ignores—fails to establish any identity between trade association activity and the public interest. On the contrary, it is replete with evidence of restraint of trade, dissemination of propaganda, attempts to influence legislators and administrators, clamor for special privilege, anti-labor activity, and opposition to progressive social legislation. Such activities are scarcely consonant with public interest. The author deplores these manifestations of private selfishness and seeks to persuade the business community to a more socially responsible way of life, but he fails to reckon with the realities of organized power inherent in trade associations.

HORACE M. GRAY
University of Illinois

BEHRENS, CARL F. *Commercial Bank Activities in Urban Mortgage Financing*. Pp. xix, 131. New York: National Bureau of Economic Research, 1952. $2.50.

This study is one of a series sponsored by the Urban Real Estate Finance Project of the National Bureau's Financial Research Program. It is a painstaking effort and one which, because of the nature of the data it sought, encountered numerous stumbling blocks. The author and the Bureau deserve much praise for their perseverance and ingenuity in utilizing many avenues of approach to their goal.

An outline of the legal framework of urban mortgage financing by commercial banks prefaces the statistical analysis which forms the core of the book. The law, of course, is an important consideration in the interpretation of the statistics, and it is referred to repeatedly. This outline is followed by a description of the scope of commercial bank real estate financing. Federal Deposit Insurance Corporation data and other government agency statistics are presented to illustrate the kinds of loans held by various types of banks, the relative importance of mortgage financing to the different classes of institutions, and the importance of banks in the mortgage market over the last twenty years.

The main portion of the study deals with the characteristics of bank mortgage loans and the degree to which they are related to loan experience. The author does not state it, but the basis of the analysis appears to be an attempt to describe and rationalize the mortgage lending

policies of commercial banks as well as to shed additional light on the composition of banks' mortgage portfolios. The limitations of his study did not permit Mr. Behrens to discuss the implications of his findings for the banks themselves and for public policy; but much relevant material is here and in such form that useful inferences may be drawn readily by the reader. Loan-to-value ratios, amortization practices, amounts of loans by types of properties, interest rates—all these and more are carefully reviewed over a period of years, related, and sometimes classified by region. Data on the cost of lending operations, while based on few cases, are nevertheless interesting.

The source of the data on loan characteristics and lending operations was a sample survey. An illustration of the author's difficulties is the fact that of 496 banks selected to give a cross section of commercial bank mortgage loans, only 170 returned usable loan samples, and some of these were not completely satisfactory. Independent checks on certain of the data are favorable, however, and, while some of the detailed information must be used with caution, there is little chance that the important results can be seriously misleading.

Since this study was completed, additional statistical material on bank mortgage lending has become available through the June 1950 call report, the Census Bureau's Survey of Residential Financing, and the Federal Reserve's Regulation X registration statement. In unfinished form, Behrens' works and the new questions it raised contributed to the formulation of these later studies.

This is a work for the specialist in real estate financing. In its proper place among the other studies in the field which the National Bureau has sponsored, it must be considered a thoroughly worth-while contribution.

DAVID C. MELNICOFF
Federal Reserve Bank of Philadelphia

ABRUZZI, ADAM. *Work Measurement: New Principles and Procedures.* Pp. xviii, 290. New York: Columbia University Press, 1952. $6.00.

The author of this interesting book begins his text with the sweeping statement that "Most of the procedures now used for work measurement do not perform their intended functions yet nothing of any consequence has been done to correct the situation." He reviews the work of many well-known workers in this field, discusses the old problem as to whether work measurement can be considered scientific or not and proposes some new methods. He believes that work measurement should be conducted entirely apart from the problem of compensation with which it is so often connected.

His experiments were conducted largely in factories manufacturing ladies' garments and in which the operations are controlled largely by the worker as contrasted with industries where the machine dominates the operations. In such factories also, it is more difficult to obtain accurate time measurements for the reason that the worker can set his own pace without the timing of a machine. Dr. Abruzzi introduces a new term, namely "statistical stability" instead of "statistical control," and reclassifies the term as "local stability" and "grand stability." "In the case of local stability the production rates involved represent a *continuous* series of items produced during a period of several hours. In the case of grand stability the production rates represent items produced over a protracted period."

In chapters 4, 5, 6, and 7 he demonstrates his methods of securing these results, using Shewhart diagrams and mathematical formulas. The remaining chapters are devoted to such topics as Developing Standard Data, Comparing Work Methods, Measurements and Estimates, Delay Factors, and Fatigue. The text is illustrated with 25 figures and 55 tables, and there is a very good bibliography. The book is scholarly and is not particularly easy reading. Whether the author's claims that most of the work done in work measurement to date is faulty if not inaccurate and that he presents the only accurate method remains to be seen. To the reviewer at least it does not seem possible that the vast amount of work done in this field can be wasted energy.

SOCIOLOGY AND EDUCATION

COATES, ADRIAN. *Prelude to History: A Study of Human Origins and Paleolithic Savagery.* Pp. xviii, 289. New York: Philosophical Library, 1952. $4.75.

One of the most significant features of Coates's digest of prehistory is its parallel attention to human and cultural development in the early centuries of time. This will be a boon for readers who have wanted to see both aspects of man's growth treated in co-ordinated fashion between a single pair of covers.

Prelude to History is not a popularization of prehistory, nor is it for the advanced student. With admirable thoroughness the author, who is not a professional archeologist, has studied a mass of materials describing paleolithic finds in their geological setting. Without offering the reader humorous bribes he sets data out carefully and assesses the reasonableness of the hypotheses which seek to explain the facts. On debatable issues Coates generally takes a point of view shared by the majority of anthropologists as, for example, in postulating a late and tangential status for the Australopithecoids. He defends his position with careful reasoning.

Unfortunately, logical impeccability need not accord with empirical truth. In the last sixty pages the author moves away from skeletal or lithic data and tries to reconstruct "primitive mind" or "primitive society." His method is one of analogy. Fear predominates in the rites of contemporary primitives; hence, early man was dominated by fear. What evidence is there for saying that this pattern existed with paleolithic artifacts? The method of analogy has given way to functional interpretation in contemporary prehistory. Coates apparently never studied this aspect of V. Gordon Childe's work and does not know Julian Steward's painstaking attempt to find *predictable* associations between, for example, a type of food production and a pattern of social structure. Only if specific connections hold in a series of contemporary world cultures can they safely be postulated to have existed in remote times.

JOHN J. HONIGMANN
University of North Carolina

MARDEN, CHARLES F. *Minorities in American Society.* Pp. xiv, 493. New York: American Book Company, 1952. $4.50.

This textbook deals with the relationships between minority peoples in the United States and the norm-setting "native" group with which they interact. The interactional process is conceived as one between subordinate and superordinate groups occupying inferior and superior statuses in the larger, total society by virtue of the differential degrees of power that each commands. The development of the process is through various stages toward assimilation, and the method of treatment is therefore historical. In the case of each minority discussed, special attention is paid to the role of the superordinate or "native" group (which Marden felicitously calls the *dominant*) in the intergroup situation under consideration.

While the avowed aim of the book is to present minority-dominant relationships objectively and to provide an accurate description of relevant group interactions, it is also recognized that the processes involved constitute one of America's most acute social problems. When such problems are considered, it is virtually impossible to avoid the intrusion of a value system. Marden faces this fact frankly and quite properly declares that it is desirable to make one's valuational point of view explicit. His is that of Myrdal's American Creed, holding that all Americans, regardless of race, religious affiliation, or national origins, hold equal rights of justice, freedom, and opportunity. The discussions of minority-dominant interactions taken as social problems are therefore strongly colored by this set of value concepts; and it is greatly to their credit that these pages are both so lively and yet so free from the earmarks of the doctrinaire. If there is no temporizing with these basic tenets of democratic values, neither is there any blindness to the difficulties that must be dealt with if such ideals are to be instrumented.

And the problem of instrumentation brings us back to the descriptive and objectively interpretive bulk of the book. One of the major requisites for translating ideals into reality is well grounded under-

standing. Understanding is arrived at, by and large, through sensitive, perceptive observation and trenchant, hard-headed analysis. On the observational side, *Minorities in American Society* stands up well. The coverage is broad, the amount of information pertaining to each group is extensive, and the sources examined seem impressive in their variety and authoritativeness.

On the analytic or theoretical side, however, one is inclined to wonder if more steps could not have been taken toward furnishing students with a conceptual framework that would allow for a more useful organization of the facts of intergroup relations. One searches in vain for statements relating the phenomena of prejudice, for example, to the theory of the authoritarian personality. One finds virtually nothing on the development of prejudicial attitudes through childhood or on the importance of frustration and displaced aggression as an important set of factors determining the course of minority-dominant relations. One is hard put to account for the *maintenance* (not the existence) of stereotypes as they affect intergroup situations. In short, one regrets that so little attention has been given to the theoretical contributions that psychology might have made to the theoretical aspects of this ambitious and otherwise well-executed volume.

But a criticism of this kind reflects more the general problem in social science of developing more adequate cross-disciplinary communication. Until a more unified method of social science inquiry has come into being, *Minorities in American Society* must be judged a useful and lucid text, the democratic direction of which is always supported by close attention to facts and a genuine effort at conceptual comprehensiveness. EDWARD JOSEPH SHOBEN, JR.
Columbia University

GRUENBERG, SIDONIE M., and HILDA SIDNEY KRECH. *The Many Lives of Modern Woman: A Guide to Happiness in Her Complex Role.* Pp. 255. Garden City, N. Y.: Doubleday & Company, 1952. $3.00.

The American woman is not what she used to be; we are all sure of that. Just what she is, and why, has been the object of much discussion in recent years. Philip Wylie dipped his pen in her blood and dashed off a caricature of modern woman in his *Generation of Vipers* a decade or so ago. Then, Dr. Strecker blamed her again for the infantilism of her children in his *Their Mothers' Sons.* President White joined the chorus in a minor key a few years later with his *Educating Our Daughters.* None of these was of much help to the girl or woman caught in the web of confusing choices of what she wants to be and do. It has remained for a couple of women themselves to come out with a clear-headed analysis of the problem with positive suggestions for its solution.

As Director of the Child Study Association of America for many years, Mrs. Gruenberg has worked closely with women and the experts who know them best. Her writings addressed to women as mothers have contributed to the literature of parent education. In this book, her daughter Hilda, married and a mother herself, joins her effectively as collaborator.

The contribution of the book is in its realistic acceptance of women as persons, as marriage partners, as mothers, and as citizens in a changing world. The variety of women's roles is traced without an effort to blame or to pass judgment. Some of the fruitful ways in which real women are working out their lives are described. The point of view is positive and hopeful. The approach is realistic and courageous. The plea is for marriage as a growing partnership of man and woman coming to terms with their potentialities within the world as it is and may become. As the authors say in conclusion,

"The good life, the rich, full life—it is different for each of us. Yet certain aspects, certain values are universally cherished. It seems to us that a happy marriage and having children are such values. . . . we would like to see more husbands and wives develop their comradeship and spirit of sharing, so that the life of the couple becomes far richer, more meaningful, and more satisfying than the life of either individual alone could ever be."

EVELYN MILLIS DUVALL
Chicago, Illinois

SMITH, M. B. *The Single Woman of Today.* Pp. xiv, 130. New York: Philosophical Library, 1952. $2.75.

In her introduction Miss Smith points out that the title of her book is "misleading in its suggestion of comprehensiveness." Nevertheless in its 127 pages she treats at least briefly some 39 major aspects of the single woman's problem and adjustment. She has dug deeply into psychology, and possibly somewhat less deeply into sociology and philosophy in her attempt to analyze the problem and to offer some possible adjustments. For illustrations and evidence of attitudes of and toward the single woman she has drawn upon literature (as far back as Herodotus) as well as upon real life situations. One cannot doubt the wealth of material and the seriousness of purpose that Miss Smith has brought to this report. The difficulties, however, of selection and elimination are apparent, and sometimes the text is less logical and coherent than one might wish. Nevertheless it is full of food for thought—and the careful reader can supply transitions and make connections that are not always clear.

The thesis of the book is that there is definitely a husband shortage in Great Britain, in Europe, and—to a lesser degree—in the United States of America. Simple statistics prove this. In European countries women exceed men numerically "on an average of 7.5 per cent." The plight of the United States, she points out, is somewhat less acute, but, even here, in 1940 we had a "surplus of a half-million females [21 and over] whereas ten years before there had been a surplus of 100,000 males instead." The question Miss Smith raises is, "what are we going to do about it?" She discusses the biological and psychological effects on the single woman and the sociological aspects of the problem which concern (or should concern) everyone. She admits that the unbalance has been much greater in other epochs. In Europe of the Middle Ages, for example, the "numerical superiority of women varied from 10 to 25 per cent." But the problem of today is different because the world is different. In the Middle Ages many women banded together partly for protection, partly to do "good works." The growth of convents was rapid. These women pledged to celibacy were believed by their society to have chosen a role vastly superior to marriage —each became the "spouse of Christ." Others were welcomed into homes of friends or relatives because household tasks, making of clothes, and other chores, without benefit of machinery, could keep many women usefully occupied in every home.

Industrialization changed all that. The modern home has, as a rule, no room or use for grandmother—not to mention the maiden aunt. This, Miss Smith believes, is as it should be; the family should consist of father, mother, and minor children. The maiden aunt or adult daughter should have a home of her own. But this presents problems, partly because of the individual's loneliness and partly because of social attitudes. Our society accepts wholeheartedly the idea that women are for marrying. A girl's whole thinking is directed toward marriage as the goal in life. Even the woman who has made an unsuccessful marriage and is divorced feels superior—and is generally regarded as superior—to the spinster.

Miss Smith offers a number of possible solutions for the single woman of today, most of which, she admits, are unsatisfactory. One—and we believe the most important one—is the *solution of maturity.* "Maturity," she says, "implies an ability to walk alone and be unaffected by it." She states her belief that "a single woman may often be immature emotionally." We could not refrain from a marginal note there: "What about the married woman? Does marriage insure maturity?" Frequently it fosters immaturity and dependence. As a matter of fact, it seems to us that Miss Smith is a bit idealistic about marriage. The ordinary marriage does not guarantee biological, psychological, and spiritual fulfillment. In fact, even the companionship which she stresses is frequently lacking. Many a married woman must "go it alone."

The one place in the book where one senses a sharp and slightly critical note of the human male is in her discussion of the "inferior" type of woman he allows to lure him into matrimony. She suggests that

the "eugenically superior" are frequently among "the surplus women." In this connection she discusses "marriage by arrangement" and concludes, "There should be some sort of compromise between Chance and the Marriage Bureau." This critical attitude would not stand out so sharply were it not for her dedication:

"The frequency with which the desirable woman is committed to the ranks of the surplus, whilst the less worthy is chosen in marriage, is one of the social injustices of our time.

"To these desirable women this book is sympathetically dedicated."

That statement and discussion later in the book seem to us to detract from what is otherwise a pretty scientific and objective study.

There is a very fine three-page bibliography for people who would like to pursue the subject further.

JEAN AND JESS OGDEN
University of Virginia

HAVEMANN, ERNEST, and PATRICIA SALTER WEST. *They Went to College.* Pp. x, 277. New York: Harcourt, Brace and Company, 1952. $4.00.

This well-publicized, widely distributed, best selling book makes some distinctive contributions to our knowledge about the impact of higher education on the approximately 6 million college graduates in the United States. Begun as a doctoral dissertation at Columbia University, the study probes the reactions to their college days of a representative sample consisting of 9,064 graduates from almost all of the degree-granting institutions that existed in 1947, when the study was made. The data, processed in Columbia's Bureau of Applied Social Research, have been cast into highly readable form by a news magazine editor. Fifty-two excellent charts, appropriately distributed throughout the text, highlight significant facts and trends.

Following a note on what the book is about, the story of the United States college graduate is told in six parts. The "Portrait of the Old Grad (Masculine Division)" reveals that, whatever else he may be, he is financially well off. In fact, on all counts except the production of large families, male graduates over 40 are doing very well, indeed. The "Portrait of the Ex-Coed" is less cheerful in some respects. For example, for 31 coeds out of 100, college was an education for spinsterhood, the incidence of which fell most heavily on Catholic girls, 48 per cent of whom have never married.

"The Group Portrait" reflects predominant political conservatism. A detailed discussion of the graduates' beliefs regarding religion, civil rights, internationalism, and party politics makes rewarding reading. The group looks back on its collective college experience with a purr of contentment, although some provocative comments about curriculum, teaching, guidance, and education for citizenship add spice to the analysis.

The section called "College as the Road to Success" focuses attention on the Greasy Grind, the All-Around Student, the Big Man and Woman on Campus, and the Student Who Just Sat There; the generalist and the specialist; the rich man's son and the boy who worked his way; the student who attended distinguished Ivy University and the one who went to East Widespot College. Although the statistics only hint at why who is successful, vigorous opinions are not lacking when "The Ex-Student Speaks to the Student" and offers "Some Advice to the Colleges" in the concluding sections of the book.

Anyone who is interested in what college education does to people should enjoy this book. But the authors are the first to admit that while they have answered some questions, they have raised many others. So educational researchers should note this study well, also.

CLAUDE E. HAWLEY
Washington, D. C.

BLOCH, HERBERT A. *Disorganization: Personal and Social.* Pp. xv, 608, x. New York: Alfred A. Knopf, 1952. $5.00 text.

Through a frame of reference the author makes personal and social disorganization primarily a matter of social change and places the person or group in a crisis partly because of latencies. These latencies are individual or social organizations that tend to maintain the status quo. This maintenance of status quo may result in a crisis which may be met in five different ways (p. 125).

Instead of starting at once to deal with social problems in this framework the author digresses to review "the basic materials in sociology ordinarily offered in the introductory course." If the student does not already have a good foundation in the principles of sociology it would take a full semester to explain all the points introduced by the author in this connection.

The framework in this text is designed to consider: "(a) the conditions of social change, (b) the reciprocal relations between individual and social change, and (c) the way in which personality develops in the changing social structure." This makes personal and social disorganization a matter of social change.

Is this a genuine frame of reference—something that will be found in every instance of personal and social organization? There is a great deal of disorganization without social change or latencies being involved. Some types of social disorganization are cultural patterns, a part of the American way of life. Criminality, for example, is an ancient cultural pattern as well established in society as education or any other socially approved cultural pattern.

Law-abiding behavior is related to social change in the same sense that criminality is related to social change. Both mental health and mental ill-health are achieved during social change. Sex pathologies and sex normalities have a common origin in social change. This is true of all personal and social disorganization. As a matter of fact, social disorganization is a type of social organization. Personal disorganization is a type of personal organization.

Instead of placing criminality as a universal cultural pattern in the frame of reference, the author reviews the whole field of criminology and penology. If all of this is to be understood by the student there would be no need for courses in criminology. In a basic text in social disorganization, criminality should be placed in a universal frame of reference merely as a type of disorganization.

The last chapter, "Prospectus and Conclusions," does not deal with conclusions about the proposed frame of reference but considers such topics as "Family Disorganization" and "Can Science Save Us?"

There is a Glossary but no bibliography. Appendixes follow Chapters V and VI. Chapter X is the analysis of a case document. The author has not included lesson assignments, thus showing his respect for the maturity of those who will use this text.

University of Rhode Island

REDL, FRITZ, and DAVID WINEMAN. *Controls from Within: Techniques for Treatment of the Aggressive Child.* Pp. 332. Glencoe, Ill.: The Free Press, 1952. $4.50.

This account of the treatment of five aggressive boys who were residents (15–19 months) of Pioneer House, a residential treatment center for severely disturbed adolescents, is a sequel to *Children Who Hate,* which describes the boys and their clinical background. It seeks to show how internalized behavior controls were substituted for controls from without.

The general plan is revealed by the chapter titles: "Structure and Strategy of a Treatment Home," "Programming for Ego Support," "Techniques for the Antiseptic Manipulation of Surface Behavior," "Techniques for the Clinical Exploitation of Life Events." Examples of a few section titles such as "Routines which relax," "Leeway for regression and escape," "Group psychological hygiene," "The cultivation of interest-contagion," "Tension decontamination through humor," "Promises and rewards," illustrate the approach used.

Verbatim materials from recordings of interviews and observations are used to illustrate the extensive and verbose interpretations of the authors. Many generalizations are made. Some are obvious platitudes in very fancy language. Some are presented as scientific principles without supporting evidence other than observation. There is no quantitative evidence, no control group, no check. The authors who use many scientific terms loosely, fail to present a design or to give precise tests of their hypotheses.

The result is a detailed description of treatment procedures in a psychoanalytic frame of reference. A scientist hesitates to wade through pages and pages which describe procedures in minute detail in order to secure small amounts of questionable generalization. A practical worker may find in such reading suggestions on procedures to be used with disturbed children. A skillful writer selects detail in terms of its relevance to a major theme. These authors seem to be interested in detail as detail.

The epilogue which gives the therapeutic gains following the closing of Pioneer House is quite unsatisfactory when examined for specific evidence that the treatment procedures permanently improved the relations of the children to their environment. The way out for the authors is "Thus our *children who hate* went back into the limbo of *children that nobody wants*"—that is, to their old environment. One would expect that such intensive handling of children over many months, with a staff of two skilled adults per child, would produce some reorganization of children's adjustment that would manifest itself later, even in their old environments. At least one or two of the five children should have shown persisting improvement. But the outcomes were negative. If, after such long and expensive treatment, a child cannot maintain a better balance in the face of a hostile world, the outlook with regard to the practical use of the procedures described in this book seems quite hopeless.

SCHEIDLINGER, SAUL. *Psychoanalysis and Group Behavior: A Study of Freudian Group Psychology.* Pp. xviii, 245. New York: W. W. Norton & Company, 1952. $4.00.

Psychoanalysis and Group Behavior is not completely without merit. It is an earnest effort to bring out the concern of Freud and his followers with the phenomena of group behavior as an extension of their interest in individual behavior. The book has two sections, one entitled "The Freudian Concepts of Group Relations" and the other "Implications and Applications."

Section One spells out in some detail the processes operating within individuals and among individuals in groups as first postulated by Freud. Here the author leans heavily on Freud's major work in this area *Group Psychology and the Analysis of the Ego,* although he draws upon a number of people who would come under the heading of psychologists, psychoanalysts, sociologists, and other "ologists" in the social sciences. He discusses some of the dynamics involved in the role of the leader and of group conflicts.

Section Two explains how the above are perceived, or applied, or misapplied in other fields of group study and suggests some of the implications for educational practice and group psychotherapy. This section has a number of real incidents which enliven and point up the moral of the text. They might conceivably provide teachers a meaningful framework within which to see the children of their classrooms as both individuals and group members.

The book as a whole was disappointing to this reviewer. Although replete with quotations, many of them trivial, footnotes, and all the academic trappings of a dissertation, it does not satisfy the demands of intellectual rigor nor linguistic precision that such a structure implies. For the social scientist familiar with Freud's work nothing new has been added. There would appear to be neither new facts nor a new synthesis of the old. The laymen unfamiliar with the vocabulary and with higher literary standards than the social scientist would have very hard going indeed.

DOUGLAS COURTNEY
Institute for Research in
Human Relations
Washington, D. C.

HURWITZ, STEPHAN. *Criminology.* Pp. 442. London: George Allen & Unwin, 1952. 50 shillings.

According to its preface, this book, which was first published in Danish in 1947, the second edition appearing in 1951, is being used in the Universities of Copenhagen and Aarhus and in other Scandinavian Universities. Its author, Stephan Hurwitz, is Professor of Penal Law and Criminology at the University of Copenhagen. In the foreword of this English edition, Professor Thorsten Sellin explains that although the teaching of criminological subjects has been going on in some European universities for several decades, usually in "institutes" attached to law schools and "set up to offer instruction to prospective officials in the public services, police, prosecutors, judges, prison administrators, etc.," few general textbooks on criminology have been available. Professor Sellin informs us, however, that a few European texts have appeared during the last fifteen years, and that among these, in his opinion, this book by Professor Hurwitz "occupies a front-rank position."

In accordance with European tradition, the author regards criminology as "*the part of criminal science illustrating the factors of criminality through empirical research,* i.e., the individual and social factors underlying criminal behavior" (p. 13). His book, therefore, represents an attempt to provide a critical analysis of our knowledge of the causes of crime.

Professor Hurwitz, in carefully summarizing and critically analyzing a great deal of material drawn from both European and American sources, manifests not only an impressive familiarity with the many complex aspects of his controversial subject, but also an admirable balance, restraint, and objectivity in the treatment and presentation of his facts. Furthermore, by making his textbook available in English, he has placed the findings of much European, and especially Scandinavian, research within the reach of many students of criminology who otherwise might not have had access to them. Finally, it should be pointed out that his book forcefully reminds the reader that criminal behavior can be successfully studied only through the co-operation of many disciplines, each using its own concepts and specialized techniques. This, unfortunately, seems to have escaped the understanding of some American sociologists who have come to look upon criminology as exclusively within their province of teaching and research.

Since Professor Hurwitz's book confines itself primarily to the causation of crime, it will probably not be adopted as a textbook for undergraduate courses in American colleges and universities. However, it will provide American criminologists, and all others who are interested in the field, with an excellent reference book in the etiology of criminal behavior.

ROBERT G. CALDWELL
State University of Iowa

STRAUS, NATHAN. *Two Thirds of a Nation: A Housing Program.* Pp. xiii, 291, xvii. New York: Alfred A. Knopf, 1952. No price.

This little book ought to be widely adopted by colleges and adult education groups throughout the country as the most readable introduction to the problem of housing. The author is the first Administrator of the United States Housing Authority—long before its establishment in 1937 and ever since one of America's most earnest and well informed housing experts. Ten chapters he has written himself; four are by other leaders.

Mr. Straus's book is not only a plea for the effectuation of the excellent federal housing law of 1949; it is also a criticism of administration and a call to the states and larger cities to do their part. The FHA (Federal Housing Administration) comes in for the most severe criticism directed at the administration of its mortgage insurance, though Mr. Straus begins this chapter with the highest praise for its solid achievements. His main point is that the agency serves the speculators (land developers, mortgage bankers, and builders) more faithfully than it does the home user and buyer. He is convinced that, if certain FHA practices were moderated or dropped, housing could be made available at considerably lower cost. Charles Abrams (Chapter XII) places a heavy burden of blame on FHA for its long-time practice, officially abandoned in 1950, of encouraging racial segregation through restrictive covenants. But Abrams is today more alarmed about the racial segregation that urban redevelopment under Title I of the Housing Act of 1949 in his opinion bids fair to produce, holding that redevelop-

ment ought to be abandoned unless it can be "brought under the fold of the constitution."

As may be gathered from these illustrations of criticism, *Two Thirds of a Nation* is a book of positive opinion. There is no soft-pedaling of the basic issues. Controversial aspects of housing, such as public housing, are forthrightly discussed; and some practices generally considered beyond argument are presented in a new and controversial light. But neither Mr. Straus nor his collaborators seem to be careless of the facts. The book is intended to be not only informative, which it is, but to be provocative—on the theory, no doubt, that discussion of pros and cons increases the public intelligence. Mr. Straus's own chapters are distinguished by a challenging brevity and conciseness of style that should arouse much interest and argument.

BRYN J. HOVDE
Pittsburgh Housing Authority

THAYER, V. T. *The Attack upon the American Secular School.* Pp. x, 257. Boston: The Beacon Press, 1951. $3.00.

That the problem of Dr. Thayer's book is becoming chronically alarming is exemplified by the fact that, even in the brief time since its publication, organized religion has won another important victory over the autonomy of public education. The recent decision of the United States Supreme Court in finding that the released time program in New York does not violate the First Amendment to the Constitution virtually negates its earlier decision in the famous McCollum case which ruled that religious instruction may not take place upon school premises. If the learned Justices had read Dr. Thayer's careful analysis of the released time issue, their decision might have been otherwise. As the law now stands, religious groups are free to widen their operations. They will undoubtedly do so.

For, if this book proves anything, it proves that the attack upon the secular school is becoming increasingly organized, increasingly obtuse, increasingly set upon its objective of breaking down the traditional wall of separation between church and state in America. Dr. Thayer, whose earlier book *Religion in Public Education* prepared the ground for his present one, has gathered systematically the most substantial evidence available in support of his thesis. Beginning with an historic survey which indicates that the problem has seldom if ever been wholly quiescent in American history, he covers such topics as "practices that undermine," "opposition to the secular idea in education," and the effort—especially of the Roman Catholic Church—to block federal aid to education unless portions are earmarked for parochial schools.

The author's positive views follow those characteristic of liberal, progressive educators. He sees no objection to public financial support of health measures for parochial children provided that it is administered by public agencies, and he finds no serious difficulty in similar support of transportation facilities so long as these are not provided for the exclusive convenience of such children. As for religious instruction, however, he reiterates the suggestion of his earlier book that the most the public school can safely allow is teaching "about" religion in a strictly "objective" fashion, and then only in the upper grades or secondary school. Study of comparative religion should be delayed for the most part until college. His chief emphasis is upon "moral and spiritual values" as these permeate the entire learning process of young people—values that emerge from their own experience as well as from living cultures of the past and present.

Dr. Thayer applies Dr. T. V. Smith's apt phrase, "strategic obfuscation," to the religious question by noting that a majority of critics of secular education are really concerned, behind the façade of their frequently professed devotion to the public school, to force their own predetermined religious faiths down the throats of children. It is for this reason, more than all others, that Dr. Thayer opposes any effort to bring sectarian teaching into the curriculum.

It is one thing, however, to recognize such an intent among most sectarians and another to offer no better solution than Dr. Thayer gives us. Granting his sound empirical approach to moral and spiritual values as the ideal, one may still inquire whether he himself does not obfuscate strategically in proposing further an "objective" teaching "about" religion—a proposal that contradicts a crucial principle in his own theory of learning. For, according to progressivist psychology, even teachers are human beings with feelings, habits, and beliefs; hence, good teaching is not the kind that tries at the cost of suppression or hypocrisy to conceal these characteristics, but rather is the kind that encourages teachers to reveal themselves as they genuinely are even to the point of their political, moral, *and* religious preferences.

What is needed, if the contradiction is to be removed, is a fresh approach that, on the one hand, enables teachers to be completely honest and frank with themselves and with their students, and, on the other hand, safeguards the classroom from indoctrination of every preconceived bias or dogma. The way to accomplish this in religious education is through carefully planned projects, conducted by co-operating panels of teachers holding a variety of beliefs (including, of course, humanists and atheists as well as theists and deists). Such projects should probably be attempted, certainly at first, in the upper levels of the secondary school. They should draw freely upon outside experts, include frequent visits to religious institutions of every possible type, and encourage utmost discussion and criticism by all participants of every belief or practice. Toward their close, group consensuses should be sought inductively as to any similarities and differences that are found among the several religions studied, as well as to any preferences that a majority of students might agree upon with due respect always for every dissenter.

Admittedly this proposal could not be attempted immediately in many communities. Nor could it succeed without in-service training on the part of the teacher panels, or without parental support. But these are by no means insurmountable obstacles. Once the proposal began to take hold, moreover, we can be quite sure that many sectarians who were originally hostile would find reasons to reconcile themselves rather than be left outside. Most important, the proposal has the virtue of meeting the attack upon secular schools, not by building a fence around one of the most vital areas of life, nor by an "objectivity" made no less spurious by calling it "benevolent neutrality," but by a method of social learning that is genuinely public, free, and uncoerced while recognizing the legitimacy of conviction. Dr. Thayer's great contribution toward clarifying the issue of religion and education would be enhanced still further were he to give such a plan serious consideration, and to share in its implementation as an experimental venture.

THEODORE BRAMELD
New York University

JARMAN, T. L. *Landmarks in the History of Education: English Education as Part of the European Tradition.* Pp. viii, 323. New York: The Philosophical Library, 1952. $4.75.

The professional study of education is replete with a literature which concerns itself primarily with recounting the educational thinking of great teachers and assaying their significance to educational growth. The contributions to education of historical periods in Western civilization are rehearsed in varying degrees of competence and depth. It is possible that a fully adequate history of education can never be written by one author for the reason that one man's knowledge is hardly adequate to so gigantic a task. The history of Western education is, of course, the history of Western man. Perhaps from the standpoint of students of education, close and intimate contact with the great wellsprings of our educational heritage is of far more worth than the study of commentaries and histories. In other words reading Plato sheds far more light on the flow and ebb of Greek educational thinking than a score of commentaries and descriptions compiled by pedagogues. The vitality and freshness of a profound thinker transmits in his struggle with ideas something more valuable than a diluted, chronological narration can possibly convey. The tendency, widespread among teachers, to read about the thinking of education's keenest minds and

to avoid coming to grips with these men through their own writings is to be deplored. Easy recourse to a history of education is not enough.

However, a useful service is performed by histories of education if they lead the student to the stimulation and growth which comes from the study *of* (not about) creative, productive thinkers. It is in this light that T. L. Jarman's *Landmarks in the History of Education* is to be viewed. There is much merit in Jarman's book. His task in selecting significant *landmarks* for inclusion was not easy. In the main he has discharged this responsibility satisfactorily. The author endeavors to trace the historical development of European education from ancient Greece to contemporary British policy and practice.

Jarman's treatment has the earmarks of an eclectic, scissors and paste-pot, arrangement of data, and is at times weak in a critical appraisal of materials. Excellent and readily available references are an encouragement to further study of topics and issues raised by Jarman's book. *Landmarks in the History of Education* is not to be regarded as a substitute for careful and penetrating study of the roots of Western educational tradition; nor for that matter is any other history of education.

FREDERICK E. ELLIS
Tufts College

PHILOSOPHY AND RELIGION

MCKEON, RICHARD. *Freedom and History.* Pp. 95. New York: The Noonday Press, 1952. $2.50.

At a time when "current fashions of thought" are so diverse and conflicting, it is a real achievement and contribution to clarify so much of the current confusion in philosophy by this brilliant essay on historical semantics. For this is semantics at its best and philosophical analysis at its best.

The purpose of the essay is to study the varying interrelationships between the concepts of freedom and history by examining and explicating their basic presuppositions in philosophy. In part this is most ereditely illustrated in the first chapter where we are treated to a sketch of the "history of the fashions of philosophizing." Out of this flux of thought McKeon discerns three basic methods: the dialectical, the logistic, and the problematic or method of *inquiry*. These are also designated as "epochal" or universal history, "causal" history, and "disciplinary" history.

Before proceeding to an elaboration of these three basic analyses, the author points up certain distinctions and oppositions within semantic anlaysis and notes its limitations and its values. After a masterly general review of the interrelationships of the three basic analyses of history with freedom, McKeon devotes successive chapters to a more detailed anaysis of each. Brief but excellent analyses of the Hegelian and Marxian dialectic are given. Also included in the chapter on dialectic analysis are such philosophers as St. Augustine, Plato, Rousseau, Kant, Spinoza, and the Stoics. This may seem to be a somewhat questionable inclusion but it is partially dispelled by the very incisive analysis of the place of freedom with the philosophy of each of these men.

The explications of the logistic and the problematic analyses of history and freedom do not compare in my opinion to the dialectical analysis. There is a fine account of Hume in the chapter on logistic analysis, but Cournot is dealt with inadequately, and the revival of Buckle is questionable. There are excellent studies of the problem of freedom in Aristotle, Mill, and Dewey in the chapter on problematic analysis, although I wonder if there is not an inadequate specification of this problem to the interrelating concept of history.

On the whole I found this a highly stimulating and provocative essay, but I remain somewhat haunted by the thought that the semantic analysis has superimposed upon it the pattern if not the substance of the dialectical method. There is a tendency to proliferate "triads" which often represent keen insights and fine illustrations, but occasionally seem to falter dialectically as in the concept of "fraternity." Curiously Comte is omitted entirely. None of these minor criticisms should detract, however, from the very real contribution of the author to the advancement of philosophical understanding both in thought and in action.

JOHN A. MOURANT
Pennsylvania State College

BAINTON, ROLAND H. *The Reformation of the Sixteenth Century.* Pp. xi, 276. Boston: The Beacon Press, 1952. $3.75.

Years ago James Harvey Robinson, one of the most distinguished of American historians, made a plea for the "humanizing of knowledge." He exhorted his fellow historians to desert the copying and verification of references for a period and write, not just for one another, but for the rank and file of intelligent people.

This volume by an outstanding authority on the Reformation reads like an endeavor to answer Robinson's plea. It has plenty of scholarship behind it, but it is designed specifically "for the general educated reader." Here are great figures of the Reformation: Luther, Zwingli, Calvin, Knox, and Cranmer. Here are great events: the Diet of Worms, the institution of the Holy Commonwealth of Geneva, Henry VIII's break with Rome, William the Silent's struggle for Dutch independence. Here are great doctrines that created or grew out of the Protestant revolt: justification by faith, predestination, the priesthood of all believers, the authority of the Scriptures as against that of ecclesiastical decrees, freedom of conscience, and the separation of church and state. But nothing is left in isolation. Figures, events, and doctrines are made part of an absorbing story of what was a powerful movement that flowed in the sixteenth century from primary centers in Germany and Switzerland out across northern and western Europe.

Some of the impressions left by this story of the Reformation have contemporary relevance. For instance, the Reformation began in religious experience. But it could never have come to triumph—where it did triumph—without the cooperation of many other factors—political, economic, and social. As an illustration, one may speculate on what might have happened if the Emperor Charles V, when he had Luther on his hands, had not been at odds with the Pope, and if the balance of power in Europe had not made Catholic monarchs as well as Protestant princes jealous of Charles. Here is Bainton's description of the Emperor's predicament: "Charles for twenty-five years was not in a position to throw full weight into the struggle for the extermination of heresy in Germany. . . . During the long period of vacillation Lutheranism gained such a footing that in the end conciliation was the only live alternative." The reader may make such applications to our own day as he chooses.

Would that we had more history like this, so well-proportioned in its emphasis, and so pertinent to the understanding of history now in the making.

JUSTIN WROE NIXON
The Colgate-Rochester Divinity School

HERSHBERGER, GUY FRANKLIN. *The Mennonite Church in the Second World War.* Pp. xii, 308. Scottdale, Pa.: Mennonite Publishing House, 1951. $3.50.

The Mennonite Church, like the Quakers and the Church of the Brethren, has for centuries been pacifist and nonresistant in attitude and program. Like all religious groups, it was sorely tried during the two world wars. Mr. Hershberger, professor of history and sociology at Goshen College, and others have detailed elsewhere Mennonite experiences before 1940. In this volume, Mr. Hershberger covers only the period of the Second World War.

Throughout the book the author is disturbed over the impact made by modern life, and particularly war, upon members of the Church. Forty per cent of their men of draft age entered military service; some of their members bought war bonds; some of their children purchased war savings stamps; some of their members participated in tin and scrap metal drives; "too many" Mennonites worked in war industries; and Mennonite businessmen often succumbed to temptations "to violate the principal of nonresistance."

On the other hand, church leadership held firm to historic principles. The greatest weakness was at the point of "home training, ministerial teaching, and the pas-

toral care of the congregation." The war brought shortcomings to light, deepened determination to live by Christian principles, and opened up new avenues for service.

A large proportion of the book deals with Mennonite administration of civilian public service camps for drafted conscientious objectors. The author accurately records the experience and points up the difficulties. His survey indicates that Mennonite administration was reasonably satisfactory, at least until the last year. He also concludes that camp administration for the Mennonites was less difficult than it was for the Quakers and Brethren. So far as the campers themselves are concerned, his postwar poll reveals that the great majority of the nearly 5,000 men entering Mennonite-sponsored camps and projects thought the church had not made an unwise decision in undertaking administration under Selective Service. Equally large majorities thought their experiences had given them new religious insights and deepened their devotion to nonresistance principles. The author is certain objectors were more humanely and wisely handled than during the First World War, and he suggests a program for the future designed to make conscription even less rigorous.

Throughout the book the author goes into much detail mentioning names, pieces of literature, dates, figures, and the like. The detail is likely to bore non-Mennonite readers, but those who want a full and careful record and appraisal will find it here.

JOHN H. FERGUSON
Pennsylvania State College

COMMONWEALTH OF NATIONS

SIEBERT, FREDRICK SEATON. ***Freedom of the Press in England, 1476–1776: The Rise and Decline of Government Controls.*** Pp. xiv, 411. Urbana: University of Illinois Press, 1952. $7.50.

As a contribution to social, legal, and journalistic history, Professor Siebert's detailed study of the evolution of press freedom in England is of exceptional value. Through an exhaustive investigation of court cases, Parliamentary discussions, and official papers of such agencies as the Stationer's Company, the author has put together a step-by-step history of the rise and decline of the concept of governmental control over the circulation of ideas. The period covers English practice from the time when the printing press first came into general use in the country until the outbreak of the American Revolution. Since the Revolution expressed as it did the antipathy toward authoritarian government which was growing on both sides of the Atlantic, the period after 1776 in both England and the New World witnessed a rapid decline of press controls until these reached the vanishing point.

The study of English jurisprudence and political philosophy bearing upon the freedom of the press, therefore, is an important addition to our knowledge of the Anglo-American idea of practical democracy in general. Professor Siebert's research, in fact, suggests to him two propositions as relevant to modern political science as to the three centuries covered in his book: first, that "the extent of government control depends on the nature of the relationship of the government to those subject to the government"; and second, that "the area of freedom contracts and the enforcement of restraints increases as the stresses on the stability of the government and of the structure of society increase." With the progressive rise of a middle class democracy in England from the absolutism of Henry VIII to the predominance of Parliament in the last of the eighteenth century, the relationship of government to citizenry became expressed in the principle of reserved or delegated power while the right of the government to exercise greater authority in times of emergency has been limited in practice by the Jeffersonian ideal of absolute individual freedom.

The press has figured in both the cause and effect of this Anglo-American political development. As a medium for the exchange of basic political ideas among the people, the press has been a prime mover whose importance has been recognized from Edmund Burke to Chief Justice Charles Evans Hughes. Conversely, as popular liberty increased, the press has been a direct beneficiary. In English history the turning point in the struggle for freedom, Professor Siebert concludes, was in the seventeenth and early eighteenth centuries, as the fight for religious liberty was transformed into a fight for economic liberty. John Milton and his immediate predecessors demanded unrestricted press freedom in the conviction that "there was a definite, discernible and discoverable truth in religious doctrine, the presentation of which could not fail to convince the unbeliever." Those who followed Milton—and the Cromwellian Revolution—were more concerned with the wide circulation of the new theories of political independence.

Licensing, copyright, censorship (under the Commonwealth), prosecution for criminal or seditious libel, taxation, and subsidy were the successive barriers to press freedom which the English press surmounted in the course of three centuries. Through an exhaustive analysis of contemporary materials Professor Siebert has documented the course of governmental control. The result is a thoroughgoing study of the evolution of the idea of free expression which has been a peculiarity of Western political conviction.

WILLIAM F. SWINDLER
University of Nebraska

CHESSER, EUSTACE. ***Cruelty to Children.*** Pp. 159. New York: The Philosophical Library, 1952. $3.75.

The author of this book gives us an impressive account of cruelty to children in England. He bases his discussions largely on case reports taken from the files of the National Society for the Prevention of Cruelty to Children, and on analysis of 600 cases brought before the English courts. Some of the forms of cruelty perpetrated are unbelievably atrocious and fantastic such as partially suspending a boy from a clothes wringer with his toes securely wedged between the rolls. Although the writer says human nature is derived from animal nature, in many cases the arrival never was achieved!

Cruelty to children is regarded as a disease of industrial and urban civilization and is rarely found among the so-called "backward nations"—a sad commentary on the quality of Anglo-Saxon enlightenment.

More than 40,000 cases involving almost 100,000 children have been reported in a single year. During the period of childhood approximately one child out of sixteen becomes the victim of cruelty or neglect. The unwanted child, representing 37 per cent of the court cases, is the most frequent victim. Oversized families, illegitimacy, inadequate housing, parental instability, and infidelity develop attitudes of antagonism and under-love that make children their unfortunate victims.

Low intelligence also produces similar results. Unfavorable economic and social conditions over many years of time, plus inbreeding, are considered chief causes of parental inhumanity. Mental unbalance and emotional stability likewise cause parents to wreak their spleen on helpless children.

The author emphasizes the need of removing the obstacles to wholesome family life and recommends both public programs and voluntary measures.

One woman who achieved the awesome distinction of procuring 20 abortions represents the need of knowledge of planned parenthood, training in mothercraft, and higher family incomes. Smoking, drinking, and gambling cost more than the outlay for food in the household budget. Life in our modern cities is tame unless "thrills" are provided or manufactured. Better leisure and recreational facilities and a higher quality of commercial entertainment would give people an opportunity to make substitutions for these excessive costs.

Ignorance in respect to human nature in man, woman, and child should be overcome and an enlarged program for what we in the United States call "sex education" adopted. A children's charter is needed, and a Ministry for children should be established. Efforts to reach borderline cases can then be made and neglect in part prevented.

The frequent references to living in "one or two tiny rooms" reveal a story of

cramping that must be overcome. Instruction in the art of homemaking and child care would greatly reduce unjust punishments. The author believes that many of the artificialities in our neurotic civilization can be eliminated. The book should be helpful in producing these results.

GEORGE B. MANGOLD
University of Southern California

MOUNTFORD, CHARLES P. *Brown Men and Red Sand: Journeyings in Wild Australia.* Pp. xvi, 184. New York: Frederick A. Praeger, 1951. $4.50.

It is fortunate that Mr. Mountford is an excellent photographer, for this book contains some of the most striking pictures on film ever to come out of Central Australia. The word pictures, on the other hand, in the opinion of this reviewer are somewhat less distinguished.

The presentation is in the form of a narrative of travel mainly in the region of the Mann and Musgrave Ranges along the border between South Australia and the Northern Territory. Although there are some purple passages about the beauty of the scenery, there is little of that incisive characterization of members of the party which holds the interest of the reader in a true story of adventure. The author sets forth many observations on the "aborigines" and provides interesting material on folklore, native art, and ceremonies. Some of these data are original contributions to knowledge. But they are not treated systematically within the context of the known ethnography of the region. Furthermore, although the author was in personal contact with the "natives" at mission stations, cattle camps, and the like, it is obvious that he spent no extended period living *with* the aboriginal people and getting to know their ways "from the inside." For these reasons the book is not entirely satisfying to the student of ethnography or social anthropology.

Nevertheless, the work is sympathetic to the native culture, it gives one a certain feeling for the wide open, nearly empty spaces of Central Australia, and it is excellently illustrated. JOHN GILLIN
University of North Carolina

SLAVIC COUNTRIES

MACKIEWICZ, JOSEPH. *The Katyn Wood Murders.* Pp. viii, 252. London: Hollis & Carter (distributed in the U. S. by The British Book Centre), 1952. $3.00.

The mysterious Katyn forest massacre of Polish war prisoners has become one of the most controversial questions of World War II. It is the most cruel crime in history involving the killing of war prisoners.

The basic facts are well known: As a result of the Ribbentrop-Molotov pact the Soviet army invaded Poland in September 1939 and captured about 11,000 Polish officers. When, after the German attack on Russia in 1941, a new Polish army was organized in the Soviet Union, these officers could not be found, and Soviet officials, including Stalin himself, could not produce a satisfactory explanation of their disappearance. The matter considerably clouded Polish-Soviet relations in 1942–1943.

Then, in April 1943, the Germans discovered in the Katyn forest nearly 5,000 corpses of Polish officers who were identified as those who had disappeared in Russia. The remaining 6,000 have not been accounted for up to now. The Germans accused the Russians of this crime and the Russians replied promptly with an accusation of the Germans. The Russian explanation: The Poles were in labor camps near Smolensk and after the German attack in June 1941 had to be abandoned to the advancing German army. A Polish demand for an investigation by the International Red Cross met with a definite refusal on the part of the Russians. Thus the case was handled by a Commission of internationally known experts in criminal medicine and by the Polish Red Cross.

On the basis of these facts, Joseph Mackiewicz has written a documentary account which was published in London as a somewhat abridged translation of an earlier Swiss edition in the German language. (Joseph Mackiewicz, *Katyn—ungesühntes Verbrechen.* Zurich: Thomas Verlag, 1949.) It is a transcript of a huge amount of documents into an easily readable journalistic report on the whole affair. The author had the advantage of having witnessed the exhumations in Katyn and of having interviewed the local populace. Combining his own observations with the vast documentary material, German, Russian, and Polish alike, Mr. Mackiewicz has put together all the pieces of evidence and information into a complete presentation of the Katyn crime. With the skill of a crime reporter, the author has tried to find an answer to the crucial question: *When* was the crime committed? He presents overwhelming evidence indicating that the officers were murdered in March–April 1940. By having the time of the crime established, the criminal becomes obvious —the Soviet NKVD.

The book will be useful to anyone who intends to study the complicated Katyn affair. It indicates and discusses additional details which are not in the documents but which make the documents better understandable.

According to the author's statement (*Der Monat,* March 1952), the English publisher eliminated from the Zurich edition the essential material concerning the treatment of the Katyn matter by the International War Crimes Tribunal in Nuremberg. This was a mistake because precisely these strange machinations in Nuremberg precipitated the inquiry recently undertaken by a special Committee of Congress. The publisher should have known that censorship never remedies political errors. W. S. SWORAKOWSKI

ROUNAULT, JEAN. *Nightmare.* Translated from the French by Vera Traill. Pp. xvii, 267. New York: Thomas Y. Crowell Company, 1952. $3.50.

It seems extraordinary that it should be necessary for an intelligent man to go through the frightful experiences recorded in this book in order to arrive at any conception of Soviet forced labor in particular and of the Soviet economic and social system in general. Yet, the sad fact is that the great mass of intelligent and well-informed persons in the Western World are quite incapable of forming any idea of what is going on behind the iron curtain. In order to do so they have had to divest themselves of preconceived ideas and moral standards which are a part of Western civilization and return to primitive concepts which find no place in the modern age. Perhaps the simplest analogy to this would be a return to the age when barbarian peoples swarmed into Western Europe and destroyed much of ancient civilization.

The author of this book is of French origin, having been born, as he tells us, in Transylvania in the old Austria-Hungary, and sent to France for his education. He served in the French army during the unfortunate campaign of 1940 and, after the defeat of the French, left France for Rumania and a post in the *Institut Français des Hautes Etudes* in Rumania. When the latter country was overrun in 1945 by the Soviet armies he was caught up in a vast deportation of foreigners into the Soviet Union and transported to the Donbas. Here he served in labor gangs in connection with the coal mines till 1949 when he was released and returned to Paris.

His account of his experience is written with complete detachment yet with sympathy. The characters that emerge in the course of his story are well sketched; their thoughts and actions mirror the traditions and feelings of the multitude of social groups which were submerged in the cataclysm of war and later in the unprecedented mass deportations which have made the history of Eastern Europe since 1945 an almost unparalleled human tragedy.

Mr. Rounault was a careful observer and thoughtful interpreter, and many of his conclusions are valuable. One feels, however, some doubt that even he has grasped the full significance of what he has recorded—that is, the transformation of the countries behind the iron curtain into a vast prison, the life of whose inmates is devoted exclusively to one end—the accumulation of an overwhelming potential of war with its diverse weapons, propaganda, terror, and military might calculated to overawe and subdue the free world. The plan is on so vast a scale and so complex that it almost transcends the power of imagination, and thoughtful per-

sons would do well to ponder the full meaning of what they see here described.

University of Oklahoma

DEWAR, HUGO. *Assassins at Large.* Being a fully documented and hitherto unpublished account of the executions outside Russia ordered by the GPU. Pp. x, 203. Boston: The Beacon Press, 1952. $3.00.

This book sounds, in parts, like a collection of detective and mystery stories. Actually it is a well-documented, though far from complete, report on political murder and kidnapping cases perpetrated by Soviet secret agents all over the world that have become known during the last fifteen years. Some of them, like the murder of Leon Trotsky in Mexico City, or the mysterious suicide in Washington of Walter Krivitsky, ex-leader of Soviet intelligence in Western Europe, are known in this country. But many others, that took place on the other side of the Atlantic, are hardly known here, and combined in one book they represent highly instructive and fascinating reading.

With one exception, "the case of a missing General," that caused a great deal of noise and scandal in France in 1937, and where an object of the Soviet kidnapping had been a White Russian General Miller actively engaged in anti-Communist struggle, this book deals with the Stalinist defectors, regardless of their nationality. Most of them were convinced Communists who for various reasons did not like Stalin's brand of communism; some of them were highly secret Soviet officials abroad who tried to run away from the Kremlin's rule and later were caught and liquidated. The author, quite justly, brushes off the argument that "a Russian citizen, himself a part of the Soviet Military Intelligence . . . is a traitor of his country . . . and that his death therefore is really an internal affair of the Soviet Union" even if a man is killed in the territory of another sovereign state—the argument that might be used by some people who might like to see the Communists of various brands kill each other.

The author's concern, however, is "to show that political assassination is resorted to by Russian secret police agents abroad, and that these agents are aided and abetted by the Communist Party." The author, who apparently has been close to the Communists in the past and thus is well informed, proves his point in a very convincing way. As testified by Walter Krivitsky before the Dies Committee on October 11, 1939, "Soviet Military Intelligence has approximately the same functions as the same services of other countries. Its most unique feature is that it can enlist and recruit members of the Communist Parties in countries in which it operates . . . who consider it their duty to aid Soviet Military Intelligence in their work." And this work is not limited, as the book shows, to gathering of secret information; it includes also the physical liquidation of the most dangerous, in Stalin's opinion, enemies of his totalitarian empire. Thus reading the book one can find some interesting indications as to whom the Soviet government fears the most. Mr. Dewar furnishes some proof that the main concern of the Kremlin gang has been not so much the "capitalist imperialists" as the Communist deviators and oppositioners who dared to stand up against Stalin's rule.

Probably, the chief conviction one might get after reading *Assassins at Large* is that there is no law, national or international, that a devoted foreign Communist would not readily break on the first order from his superiors in Moscow.

VLADIMIR PETROV

Yale University

BAUER, RAYMOND A. *The New Man in Soviet Psychology.* Pp. xxiii, 229. Cambridge, Mass.: Harvard University Press, 1952. $4.00.

Were this book simply a history of Soviet psychology, illustrative of the rather high correlation between changing theory and the changing "party-line," it would have filled an important gap in our knowledge and would have been of interest to most psychologists. But it is much more than this. As Jerome Bruner states in his enthusiastic foreword, "The book is at once an essay in psychological history and a study in political control." It most pertinently raises the question: should social science in its positive findings determine the nature of the social-political order, or should the social-political order determine the nature of social science?

Everyone knows that the Soviet Union was supposedly founded on the first premise, namely, "The first truly scientific society based on the Marx-Leninist Science of Society." But as Bauer shows, the second premise began to take over in the early 1930's. The author is both realistic and remarkably objective considering the current world political climate. Specifically and through inference he points out that our own social science is caught on the horns of the same dilemma, albeit with us these are currently not so sharp. The book should be a *must* for everyone interested in the broader aspects of social and political psychology. Further it is lucidly written and well documented not only from the literature but from the author's own field observations.

It seems to me that the chief positive findings of modern social science may be subsumed in the following slogan: *Our traditional belief that normally man's rational mind controls his animal body and determines the nature of the culture in which he lives, must be replaced by the belief that to some extent the nature of man's rational mind is determined by his animal body on one hand and by his culture on the other hand.* This slogan is undoubtedly valid, but the rub arises in connection with the words "to some extent." How much is "some"?

To begin with, the Soviets defined "some" practically as "everything" regarding the environmental-cultural factors, and these were emphasized to the exclusion of all others. Interestingly enough the Freudians originally took an almost diametrically opposed position, using our slogan but greatly over-emphasizing the unconscious id forces in psychology. Bauer points out clearly how the practical failure of naïve environmentalism and the survival needs of the Politburo both dictated the need for a changed picture of human nature. The emergent "New Man" is dialectically the almost complete antithesis of the "Old Man." He is "responsible, rational, individualistic." Current Soviet theorists almost go back to the traditional rational mind, controlling the animal body in a culture which to be sure is rational and "rationalized." Interestingly enough this "New Man" differs chiefly in his lack of an unconscious from the "Ego-Strong Man" of the contemporary Freudian psychoanalists. The Soviet psychologists' complete rejection of the psychodynamics of the unconscious places them, I believe, at a decided disadvantage. Bauer's history of the return to "rationalism" is an important and fascinating story. I recommend it without reservation to all students of the social sciences.

One final point: Bauer's trenchant comparison of contemporary Soviet psychology with Nazi psychology should do much to dissipate the increasingly widely held opinion that "Soviet Communism is nothing more than Red Fascism." This prevalent opinion seems to me is not only erroneous but scientifically and politically dangerous.

Hollywood, California

PUTNAM, PETER (Ed.). *Seven Britons in Imperial Russia, 1698–1812.* Pp. xxxiv, 424. Princeton: Princeton University Press, 1952. $7.50.

A unique profile of Russia in the eighteenth century is presented in this anthology of the writings of seven British travelers. Chosen because of their representative character or their special interest from the writings of some twenty-six British observers in this period, these carefully edited selections permit one to see the Russians through the eyes of the Western peoples with whom they were at this time most closely associated.

Mr. Putnam points out in his introduction that between the reigns of Peter the Great and Alexander I Russia developed from a backwater of Western civilization to a mainstay of the European political system, and this change is clearly reflected in these various writings. Even in the relatively brief period between the visits of the hydraulic engineer John Perry, 1698–1712, and of the merchant Jonas Hanway, 1743–50, a significant transformation in the status of Russia is evident.

Where Perry complains of the difficulties of living in St. Petersburg and criticizes the ignorance of the Russian people and the oppressiveness of their institutions, Hanway refers to the capital as "an elegant and superb city" and praises Russia for the "great strides in the improvement of her commerce." Even after allowing for the prejudices of a disappointed engineer and a successful merchant, the development of Russia is clearly enough reflected.

The purpose of this volume is less to illustrate the transformation of Russia than to illuminate the development of Anglo-Russian relations in all their aspects, however, and this it accomplishes with great skill. Whether in the extracts from the *Anecdotes of the Russian Empire* (1784) of William Richardson, who observed Russia as secretary to the British ambassador, 1768–1772, from the dispatches of Sir James Harris, who served as ambassador from 1777 to 1783, or from the *Travels* of William Coxe, scholar and tutor who toured Russia in 1778–1779, the achievements and shortcomings of Russia in the age of Catherine II stand out clearly. The final emergence of Russia under Alexander I as a leader among European states is likewise vividly depicted in selections from the writings of Robert Ker Porter, court painter in 1805–1807, and from the *Private Diary* of Sir Robert Thomas Wilson, who as brigadier general served with Kutusov's army against Napoleon in 1812.

While the extracts from these various writings form the heart of this anthology, their value is greatly enhanced by the interesting introductory essays of the editor. Incidentally, this volume also deserves special mention as an example of fine publishing.

C. E. BLACK

Princeton University

HARCAVE, SIDNEY. *Russia: A History.* Pp. xiii, 665, xxxiv. Philadelphia: J. B. Lippincott Company, 1952. $6.00.

As most teachers of Russian history are sadly aware, the existing texts in the field by Pares, Sumner, Vernadsky, and others are unsatisfactory from various and several points of view. Pares put us off by a great prolixity of style (among other faults); Sumner organizes his material in a way that is above the heads of beginners; and Vernadsky's treatment of the early centuries of Russian history is, paradoxically enough, too sketchy.

Now Professor Harcave of Champlain College, New York, has attempted another "concise presentation of Russian history." Unlike the product of the writers cited above, his work makes no claim to any great originality of concept or scholarship. The author has, however, enriched his understanding of the Union of Soviet Socialist Republics as a result of participation in interviews with displaced Russians in Germany, a project sponsored by the Russian Research Center at Harvard.

The book is divided into five main sections of unequal length and merit. Less than 10 per cent of the content is devoted to pre-Petrine Russia; about 15 per cent to the period from Peter's time through the end of the reign of Paul I; and about 30 per cent to the decades subsequent to the Bolshevik Revolution. In other words, the work is heavily weighted on the side of the nineteenth and twentieth centuries.

No discernible underlying theme or point of view exists within these pages. On the contrary, an essential eclecticism, a certain "conventionality" of thought, pervades the work. However, the writing is clear, with helpful chronological charts and maps, pertinent illustrations, a good bibliography, and a serviceable index.

As has been made evident, the most substantial part of Professor Harcave's book deals with "modern Russian history." In general, the threads of political, diplomatic, economic, and intellectual development within imperial Russia are carefully presented. The treatment of the late nineteenth and early twentieth century revolutionary, nationalist, and liberal movements in Russia is first-rate.

All in all, Mr. Harcave's book should be welcomed by students as a more than competent effort to produce a usable one-volume text. It will, however, have to be used with caution, principally because of its skimping on the earliest times in Russian history. Hence, Vernadsky's text still probably remains our best standby.

DAVID HECHT

New York City

CARR, EDWARD HALLETT. *The Bolshevik Revolution. 1917–1923.* Pp. vii, 400. New York: The Macmillan Company, 1952. $6.00.

Professor Edward Hallett Carr of England has done it again. The second volume of his "A History of Soviet Russia" series on *The Bolshevik Revolution, 1917–1923* is impartial, scholarly, carefully documented, and brilliant. He has divided the treatment into three periods: that of the Revolution, of war Communism, and of the first stage of NEP. Within each of these periods he has discussed: (a) agriculture, (b) industry, (c) labor and trade unions, (d) trade and distribution, and (e) finance.

Anyone who reads the book will note the great contrast between this factual treatment and the hysteria and fear of Russia broadcast by our press, radio, and television. Reading this scientific analysis one can see that given the cultural and international forces of the period, the rise of Bolshevism was inevitable.

The book shows that Russian policies have not been the strict result of ideological theory but have rather been the product of trial and error. Whenever dogma interfered with concrete results it was reinterpreted! Socialists had not in their theoretical writings, prior to the Revolution, envisaged a direct transition from capitalism to communism and when they found themselves in power had to discover the precise pathway by experimentation.

This book shows quite clearly that the actions of foreign governments helped forward the complete nationalization of the basic means of production and distribution. War is shown to be the pathway to communism even when it is used by the United States or any other country ostensibly to destroy communism.

The author might have made a little clearer his references to political events. Nowhere does he refer to Lenin's offer to continue the war against Germany if the Allies would give assistance and to the effect of this refusal on the economy. Again in mentioning the outlawing of the Left Social Revolutionists he mentions Mirbach's murder but fails to refer to the fact that the Social Revolutionists attempted to seize the entire government by force. But these are minor omissions.

These two volumes should be compulsory reading for all officials of the State Department who want to understand the realities of the Russian Revolution. If we could have similar scientific volumes analyzing Russian actions down to 1952, we would then no doubt realize the extent to which Allied foreign policy has failed to take into account the causative factors making inevitable the Russian reactions of our time.

JEROME DAVIS

West Haven, Connecticut

CONDOIDE, MIKHAIL V. *The Soviet Financial System: Its Development and Relations with the Western World.* Pp. xiii, 230. Columbus: The Bureau of Business Research, College of Commerce and Administration, Ohio State University, 1951. $4.00.

JASNY, NAUM. *The Soviet Price System.* Pp. 179. Stanford, Calif.: Stanford University Press, 1951. $2.00.

Jasny's book is one which I would not recommend either to a layman or to a specialist in the Soviet economy. For the layman, it would be extremely tedious to read, since the technical-statistical material (material of which non-specialists will be unable to form any independent judgment), is presented in a scattered, unsystematic way. For this type of reader it will be sufficient to read the introduction in which he will be assured that "It is not an exaggeration to say that the Soviet price system was in a chaotic state through the whole Plan era" (p. 8), that "the club law of administrators who know Stalin's speeches by heart and are less familiar with economic planning appears in Soviet prices with the greatest clarity" (p. 10), and that "certain enthusiasts for planning, and specifically for Soviet planning, in this and other non-Soviet countries, seem not to realize two things: that good planning in the U.S.S.R. might spell peril to the world,

and that good planning is fortunately incompatible with dictatorship. It is a blessing that while Soviet conditions greatly facilitate planning they make possible only very poor planning" (p. 12).

The whole book is in the main devoted to the task of proving these statements, but after pursuing these "proofs" the layman will find himself even less informed about the real Soviet price system than before. This book is not written by an academically trained economist but by a crusader against the Soviet Union, whose task is not to describe and analyze the Soviet price system, but to condemn everything that is being done by the Soviet government in the economic field—every aspect of economic policy and economic development. A few quotations will suffice to illustrate this attitude.

"The habit of getting something for almost nothing seems to have become firmly fixed in the Soviet Government" (p. 59); "fake official figures," "even moderately experienced planners are very scarce in the U.S.S.R." (p. 16); the U.S.S.R. is "a country where around half of the national income is confiscated by the State for new investment and aggression" (p. 78). Every statement of facts well-known to specialists in the Soviet economy is accompanied by the refrain—Look what bad things they are doing. This tedious refrain and his biased interpretations may prevent the objective reader from doing justice to the painstaking collection of some factual statistical material which would otherwise be useful for reference. The author's extreme bias may arouse the suspicion that even this factual material is not an objective collection of facts, but manipulated evidence produced in order to prove the author's thesis that everything is evil that comes from the Soviets—especially as Mr. Jasny is very unscrupulous in his method of selecting quotations when he wants to discredit authors who differ from him in their interpretations of statistical material or of government measures.

For the specialist in Soviet economics this book is very disappointing reading. He will not find in it anything that is not know to him—with the exception of some scattered information on the prices of certain goods—while nearly all the author's main interpretations and "findings" are not only questionable, but very often cause astonishment (to put it mildly) at the methods used by Mr. Jasny in his "analysis" and polemics.

Mr. Condoide's book is not a scholarly work, but a very general compilation of material assembled from more competent studies of the same subject, which are only very superficially sketched by him. In this book Mr. Condoide repeats the mistake which he made in his book on Russian-American trade, in which he tried to cover too large a field in a very short study. He again starts with a description of "Soviet Economic Organization," dealing with it in 20 pages, 9 pages more than he devoted to "the Soviet Economic System" in his previous book. To the analysis of "The Soviet Banking and Credit System" he allocates another 24 pages, and the same space is devoted to "Soviet Foreign Economic Policies 1941–50," a subject which it would have been more advisable not to include in this study. The rest of his text (a total of eighty-six pages) is devoted to the description of "Soviet Money," "The National Budget," and "Soviet Financial Relations with the World and Foreign Trade," no more and no less!

The result of this attempt to discuss everything in such a condensed way is a very superficial compilation, full of generalities, with quite a number of inaccuracies of description. In the chapter "Summary and Conclusions" we are, for example, enlightened by the following statements: "The State owns the means of production and distribution. It finances the expansion of industry and the distribution of goods"; "The Soviet currency is an internal currency only and is not available abroad. In settling foreign accounts the Soviets use foreign exchange or gold"; "In April 1918, the Soviet Government took over foreign trade and since that time the foreign trade of the Soviet Union has been operated by the State"; "During World War II the Soviet Union received substantial assistance from the U.S. under Lend-Lease"; and "Barring far-reaching changes in international relations, the U.S.S.R. will continue to control, both politically and economically Bulgaria, Czechoslovakia, Hungary, Poland and Rumania" (pp. 158–164).

If the reader is innocent of any knowledge of the Soviet financial system, he might read Mr. Condoide's book with some profit to his general education. But to the serious student of the Soviet financial system this book has nothing to offer.

ALEXANDER BAYKOV

The University
Birmingham, England

GLUCKSTEIN, YGAEL. *Stalin's Satellites in Europe*. Pp. 333. Boston: The Beacon Press. 1952. $4.50.

Gluckstein's book gives a realistic picture of the economic and social changes that have taken place in the shadow of the Red Star since the second world war. It contains a wealth of useful although not quite integrated and not always evaluated material. The author is an economist, and the first part of the book dealing with the methods of Soviet economic conquest is far superior to the second and third parts commenting on political developments and on the problems of Titoism.

Comprehensive material on the agrarian reforms, changes in property relations, and the various means of direct and indirect Soviet exploitations are well presented. The author shows how the chief means of production and exchange were concentrated in the hands of the state. Several chapters include selected illustrations of corresponding developments in Soviet Russia and in some cases in Nazi Germany. In these cases of state capitalistic systems the various means of economic exploitation, such as recourse to extreme piece-work wage policies, aim at the establishment of a strict control over the individual in all facets of human relations. The author correctly pointed out that the primary goal of social and economic reforms in the satellites was to subordinate the individual to the state and to subordinate the state to Moscow. Soviet Russia intervened actively to implement changes, but the Communist recipe was a changing pattern. For example, in the difficult postwar period capitalist production was encouraged and nationalization came only later. Today the Russian and joint companies are the only capitalistic enterprises in the satellites. Through these the Soviet Union has been draining satellite economy. For similar reasons the Soviet Union has been opposing nationalization in Austria and Finland.

The second part of the book describes how the totalitarian police regimes were established, the methods of direct Russian action, the liquidation of actual or potential opposition, and Soviet manipulation of the various conflicting national aspirations. The long report on Czech atrocities committed against the Sudeten Germans (pp. 195–200) does not fit into the general framework of the book, and the presentation of antichurch measures reveals some lack of knowledge of facts and understanding of the Eastern European situation. There are some gratuitous statements, like the remark that Cardinal Mindszenty "had welcomed the extermination of millions of Jews by the Nazis" (p. 217). On the fate of the Hungarian Jews and on the attitude of the Catholic hierarchy in Hungary, there are Jewish publications in English from which the author could have ascertained the facts before passing judgment.

The third and least integrated part examines the Tito-Stalin conflict and the epidemic of Titoism in Eastern Europe. The author ends with the optimistic conclusion that Stalin's empire has no future. He supports this thesis with the internal contradictions of Stalin's empire and especially with the latent antagonism existing between the satellite Communist parties and the Kremlin. In the light of various historical examples, the author considers the mass terror and the extremely exaggerated leader cult as symptoms of decline of a reactionary doomed society. His examples, however, do not support his conclusions in view of contemporary world conditions. Modern technology enables a totalitarian dictator with a relatively small group of well rewarded collaborators to terrorize and control millions of people. The era of popular uprisings is over, and only a clash between the various ruling groups—such as party, police, or army factions—or external intervention may expedite the dictator's fall.

All in all Gluckstein's work is a useful

contribution to the literature dealing with Stalin's captive states.

STEPHEN D. KERTESZ
University of Notre Dame

WESTERN CONTINENTAL EUROPE

TAYLOR, O. R. *The Fourth Republic of France: Constitution and Political Parties.* Pp. ix, 221. London and New York: Royal Institute of International Affairs, 1951. $3.00.

This little volume provides a useful guide through the labyrinth of French politics since the advent of the Fourth Republic. The antecedents and significant provisions of the Constitution of 1946 are first briefly and clearly explained. Next comes a survey of the organization, strength, and programs of national party groups—a score in number—which have appeared on the political stage in recent years. A third section of the book summarizes the composition and policies of the nine successive cabinets which held office from 1947 to the spring of 1951.

For the student of French politics, the most striking impression conveyed by this account is the extent to which traditional habits and practices have reasserted themselves within the context of a Constitution which, like its predecessor of 1875, satisfies nobody: Unstable, short-lived governments are still the captives of an all-powerful legislature; the right of dissolution is on the way to becoming a dead letter; the new Council of the Republic, shorn of the powers possessed by the former Senate, shows signs of acquiring substantial influence in the policy-making process; the system of *décrets-lois,* though now constitutionally barred, seems to be "creeping back under the new name of *pouvoir réglementaire";* and so on. Except for the rigidly disciplined Communists, political groups continue to shift their bases, to splinter, to coalesce, and to realign themselves much as before.

There is, however, one new and disturbing feature. This is the very much greater difficulty of forming effective governing majorities loyal to democracy. French cabinets, whether of the Third or Fourth Force, have since 1947 fallen less because of adverse votes in the National Assembly than because their own members have been unable to agree among themselves on major policy questions—at least in the domestic if not in the foreign field. Only the grave threat of Communism from the Left, and, until recently at any rate, the pressure of Gaullism from the Right, have held together the moderate but heterogeneous coalitions sufficiently to deal on a makeshift basis with one crisis after another. Whether the current swing toward the Right, which has occurred since Mr. Taylor's volume appeared, will usher in a little more stability remains to be seen; but the odds are against it.

The mass of detail presented by the author does not make for exciting reading: an interpretation of political trends with a broader sweep of the brush would have made the book a more interesting contribution. Nor are the English translations of French terms always well chosen. Even so, the study will remain for some time a valuable handbook of reference for those concerned with the beginnings of the latest attempt of France to function as a national democracy.

WALTER R. SHARP
Yale University

JORDAN, Z. *Oder-Neisse Line: A Study of the Political, Economic and European Significance of Poland's Western Frontier.* Pp. 133. London: The Polish Freedom Movement, "Independence and Democracy," 1952. No price.

In 1950 the Polish Freedom Movement formed a study group to examine the significance of the Oder-Neisse frontier for Europe as a whole. Dr. Zbigniew Jordan has sumarized the work of this group around three main arguments: (1) the disputed territories are far more important for Poland than for Germany; (2) these territories are essential as an industrial base for East-Central Europe; and (3) a strong East-Central Europe is necessary "in the building of a peaceful integration of Europe as a whole."

As a preliminary part of his study Jordan discusses the international agreements which led to the establishment of the Oder-Neisse line. He shows conclusively that these go back to the Teheran Conference of 1943 although they were not formalized until the Potsdam Conference of 1945. Likewise Great Britain, the United States, and Russia had long before Potsdam accepted the expulsion of the German population from these territories. There was, of course, always the formal stipulation that final determination of boundaries must be reserved for the peace treaties. As occupation problems developed and relations between the Western Powers and the Union of Soviet Socialist Republics grew less friendly voices were raised for a revision of this frontier. Secretary Byrnes led off in his Stuttgart speech on September 6, 1946, soon to be followed by Mr. Bevin, and now constantly by the statesmen of Western Germany. To counter this "revisionism" the book under review was written.

The argument is advanced that Germany does not need this arable land, since in normal times it produced a negligible agricultural surplus and fed little more than its own population. The increased density of population in Western Germany because of population transfers is held to be little more than would have occurred if the natural growth 1934–49 had continued (p. 59). Two pages later the author cites figures for 1921–33 to show that "the population in Germany was not replacing itself" and argues that Germany has no surplus population to repopulate her former Eastern provinces. Here as in other places the statistics presented do not inspire confidence.

The main thesis of the book, however, is that the present fear of communism should not cause us to forget "the German menace." The only way to curb Germany is to establish equally strong economic areas outside her borders. The Saar Basin must therefore be attached to France and the Silesian industrial area, with its outlet at Stettin, united to give a strong economic basis for Poland, Czechoslovakia, and Hungary. Such an industrialized East-Central Europe, when finally freed from Russian domination, is necessary for an integrated Europe. The author's assurance that the development of the Silesian-Oder region (an Eastern Ruhr) will unite Poland, Czechoslovakia, and Hungary, even after the unifying coercion of Moscow is removed, seems somewhat optimistic in view of past history. Perhaps this is the correct vision of the future, but Jordan seems on firmer ground for the present when he reiterates that to support Germany's claim for territorial revision in the East will only increasingly alienate the Poles and the Czechs from the West.

Bowdoin College

ROBERTSON, PRISCILLA. *Revolutions of 1848: A Social History.* Pp. xi, 464. Princeton: Princeton University Press, 1952. $6.00.

This delightfully brilliant work by Priscilla Robertson, daughter of Preserved Smith, is in its keen analysis of the social conditions of the 1848 revolutionary era well worthy of the distinguished father to whom it is dedicated. The book presents not only a penetrating interpretation pithily expressed, but vividly portrays the experiences and thoughts of the people of those troubled times, derived to a large extent from the memoirs not only of participants but of disinterested observers—especially American envoys. The author likewise regards the Russian, Alexander Herzen, as "the greatest commentator" of all. "His memoirs," she says, "read as if a twentieth century intelligence had somehow been sent back to record for us the meaning of those struggles that seem in so many ways the birth pangs of our modern era" (p. 8). Her book deals with the 1848 revolutionary movements in France, Germany, the Austrian Empire, and Italy.

The Revolution of 1848 was feared, she says, "because sixty years of the swiftest industrial progress the world had ever known" had created a violently explosive element, a proletariat whose miseries presented an unsolved problem. Should the "strait-jacket" in which the Treaty of Vienna had placed Europe be broken to allow this new class a vote, or would they use this franchise for immediate overthrow of the industrial system which had given them their livelihoods, or would they tamely obey the wishes of their employers?

Or was the problem rather a need for guarantee of food and steady employment?

Businessmen likewise "resented the eighteenth century restrictions which limited their nineteenth century opportunities" (p. 4).

Intellectuals failed to realize that the workers would not be far-seeing and generous about social reorganization, believed that all classes would benefit together. "Only after the liberals won power did they discover that they were afraid of the workers; when the workers found this out they turned to the Marxian gospels" (p. 6).

As for nationalism, it "could give character and mission to every people." "Internationalism was made to seem materialistic and selfish, while the petty jealousies of Balkan nationalities, which have caused so much strife in a century, were made to seem like holy wars" (p. 6).

The chapters of this book teem with interesting comments on the classes, the personages, the ideas, and the places associated with the revolutionary movements of the time. In the chapter entitled "A Crown From the Gutter," the vain efforts of the Frankfurt Parliament to form a truly united liberal empire for the German states are vividly recounted.

Of rather unique interest in this are the businessmen's concern after having attained the Zollverein and 3,000 miles of railway, to abolish the "oldfangled confederation" with its confused jumble of "weights, money and commercial law." The Frankfurt Parliament's sessions, held in St. Paul's Church and reported by German, English, and French journalists, were long and arduous. Not only were political questions discussed, but also the creation of a national army and a navy, for which one ship was contracted for at the Brooklyn navy yard.

It was not only fear of Prussia's power that led some to favor an Austrian as emperor of the new nation, but also desire to provide through Austria a path for German expansion towards the Black Sea as well as to Venice and the Adriatic. However, King Frederick William IV was chosen for the post, which choice as well as the constitution itself was approved by most parliaments and rulers throughout Germany. Afflicted with autocratic ideas, though acknowledging that his great ancestor Frederick the Great would doubtless have condescended to a crown at the hands of parliament, Freedrick William utterly rejected it as plebeian, terming it "a dog's collar," "a pig's crown," "a fictitious coronet baked of mire and clay" (p. 163).

"In the end Bismarck took over some of the 1848 Assembly's ideas without its idealism, either for liberalism or for Pan-Germanism and without its weakness" (p. 166).

Both the chapters dealing with France and with Austria, "The China of Europe," are filled with intensely interesting comments and characterizations.

EUCKEN, WALTER. *Grundsätze der Wirtschaftspolitik* (Principles of Economic Policy). Pp. xix, 396. Tübingen: J. C. B. Mohr (Paul Siebeck), 1952. DM 21.—.

As Friedrich Lutz points out in his foreword to this magnum opus of the late Walter Eucken, the study of economics in Germany has long suffered from certain basic deficiencies: for one, the prevalence of a historic-contemplative approach has often favored a neglect of the analytical processes known to the liberal mind; for another, significant methodological shortcomings stem from traditional fixed concepts of vested authority which seem to represent the inevitable dogma of German economic rationale. As in other Continental schools of thought, this latter tendency has, in turn, forced German theorists into extremes of either economic interventionism or laissez-faire which appear archaic to the present-day observer. The inability of the German academicians to explain, let alone cope with, the hyperinflation after World War I gave rise to a degree of reorientation which might, in time, have bridged the gap between German and other, more advanced economists; but the intellectual vacuum of the totalitarian thirties and the war made this impossible to the point where, after World War II, isolation had become complete.

Thus, many German economists who had been able to cull from Keynes's work only that which seemed to fit the Nazi program for pump priming through military preparedness began to appreciate the true significance of his work only after his death. By that time, however, large parts of Europe, including areas directly contiguous to Germany, had turned into regimented economies and, in the case of those situated to Germany's East, had lost their political freedom as well. It is against this historic background that Eucken propounded his neoclassical theories, first in his *Principles of Economics*, published in 1940, and now in the present volume edited posthumously by his widow and K. Paul Hensel.

To the American reader, the book's principal significance lies in its frank and cogently advanced advocacy of a liberal economy, free of centralized planning and controls and based on a functioning price mechanism similar to the one which has prevailed in Germany since currency reform. In this, Eucken follows Roepke and von Mises while, at the same time, making full use, in what might be termed a generalized European version of macroeconomics, of marginalism, aggregates, and similar tools developed by Anglo-Saxon scholars. However, Eucken posits a more typically continental concept of an economic "order" which links the criteria of general equilibrium to certain of the political and social postulates found in Schumpeter and which is not always free of dogmatism. Used in German universities, this book should do much to advance the discipline past the narrow bounds of tradition, despite some relatively minor misinterpretations and errors (it could hardly be maintained that New Deal economics derive from Fascist economic concepts (p. 56)); the United States abandoned the gold standard in 1933 (p. 176).

KRUSE, VINDING. *The Community of the Future*. Pp. 828. New York: Philosophical Library, 1952. $12.00.

The Community of the Future, as seen by F. V. Kruse, Professor of Jurisprudence at the University of Copenhagen, is a blueprint for an ideal society consisting of men of a new type and built up in accordance with the author's attempt "to place morality and justice on a scientific basis." This attempt depends on the classification of sciences in "descriptive" (including the theoretical) or "experimental" (applied). Ethics, individual and social, belong to the second of these classes; but the term as used by Professor Kruse connotes not so much experiment, as the trial-and-error procedure. After a rather lengthy discussion of various theories about the ultimate good, the author decides in favor of utilitarian ethics, style Bentham and J. S. Mill. He hopes however that the men of a new type will reach such a state of social unselfishness that all the regulating and leading positions in the community will be fitted by those who are best fitted for them in abilities and other qualities.

There follows a study of the nature and purpose of the law through which the new community is to be engendered. Here he stands on the solid ground of "the general theory of law" as taught in continental Europe prior to Kelsen. He who is familiar, say, with Korkunoff's work (available in English translation) will find little new. This study serves as a starting point for the discussion of personal rights and property rights which, in the author's new community, will have approximately the same shape as they have now. But, in his opinion, a new division of law must emerge to take care of "the right to earn." He dislikes both the liberal and the socialist solutions of the problems of industrial relations and offers a third way which, surprisingly, has nothing in common with the middle way of the Scandinavians based on co-operative societies. What he suggests is the institution of "courts of industry" to fix wages and prices and to solve industrial conflicts. Strikes, lockouts, and boycotts would be forbidden.

The whole edifice is to be crowned by a new constitution. The author rejects both autocracy and democracy since they result in the rule of incompetent persons. He

suggests the institution of a parliament elected by persons holding positions in the local administration, professional men (particularly university professors), and delegates of national leagues of agriculture, industry, handicraft, shipping and banking. This parliament would share power with a president (or a prime minister) elected by persons possessing higher professional training and by farmers, clerks, and skilled workers with at least ten years of experience. No name is given to the system; but this is obviously a new variety of technocracy.

Professor Kruse seems to ascribe to his plan universal validity. Though Scandinavian institutions and developments are in the forefront, long chapters are devoted to English, German, and American affairs. In the present reviewer's opinion, the author's conclusions express merely his personal predilections justified ex post facto by a vague and by no means original system of ethics.

WALEY, DANIEL. *Mediaeval Orvieto: The Political History of an Italian City-State, 1157–1334.* Pp. xxv, 170. New York: Cambridge University Press, 1952. $4.00.

The political histories of such great Italian city-states as Florence, Venice, and Genoa are comparatively well known for the late medieval and Renaissance periods. Often such independent cities, with their fierce rivalries within and without, serve as illustrations for the whole Italian scene. There was, however, another group of cities, small in comparative population but with as involved civic politics, which was faced with the additional problem of integration within the States of the Church. Such cities had their own peculiar set of foreign relations as well as the development of party politics.

Mr. Waley has made a minute analysis of such a town in medieval Orvieto. While his main objective has been to trace the political emergence of a small commune of tradesmen, craftsmen, and farmers, he has been led inevitably to consider Orvieto's position as an indication of fluctuating papal temporal power. He has made an admirable study of the commune, tracing its internal development with the growth of factions designated as Guelf or Ghibelline, factions ever ready to forget the quasi-national political platforms in favor of local power and issues, much as modern political parties often find their local units with aims bearing little resemblance to those of the national organizations with which they are affiliated.

Orvieto, recognized as a self-governing commune in the middle of the twelfth century by the papacy, found its principal internal problems to be the rivalry between two powerful families and the effort to extend and strengthen her control over the surrounding countryside and villages. Such problems were more or less indigenous to every commune, large or small, of the time. The author carefully traces the effects of each on Orvieto's foreign policy, on her relations with her papal overloads, and on the rise and decline of her internal independence. Of particular interest is the commune's part in the great Guelf-Ghibelline struggle during the thirteenth and early fourteenth centuries, in which her position in the Papal States was basic. Here we get a glimpse of the efforts of the popes to maintain in miniature the temporal power they sought to acquire over the wider domain of the continent. Orvieto's ability to act independently was, as with other communes within the Patrimony, circumscribed by strong popes and almost unfettered by weak ones. This phase is well done, including thorough documentation on the economic and external as well as on internal affairs.

The author is to be congratulated on his treatment of the development of Orvieto as a small commune whose political life was, perhaps, more representative of the general run of communes in Italy than were the great cities. The book has several appendixes containing material which could, except for the genealogical detail, be more properly incorporated in the text. There is an exhaustive bibliography and a usable index.

OTHERS

KEMÉNY, GEORGE. *Economic Planning in Hungary 1947–9.* Pp. x, 146. New York: Royal Institute of International Affairs, 1952. $2.50.

The author's experience as instructor in economics at the University of Budapest and on the editorial staff of the *Pester Lloyd,* as well as his position as Under-Secretary for Finance in the Hungarian Coalition Government, 1945–1948, makes him eminently qualified to survey and examine recent economic developments in Hungary. The work is a concise and authoritative study of the Hungarian Three-Year Plan, 1947–1949, based on extensive statistical data. It opens with a brief statement on the economic and social background in Hungary, and then launches into the examination of the antecedents of planning and industrialization and economic nationalism. It also deals with the change in economic and financial structure, planning, and policy, and treats administration of the Plan.

The Three-Year-Plan constituted a period of transition, "shaping economic life towards a full use of productive resources," an objective to be attained through the second Plan inaugurated in January, 1950. It entailed full nationalization of the manufacturing industry and wholesale trading. Capital programs were subject to licensing and were for the most part "centrally directed." The aim of the Plan was to reconstruct and re-equip the Hungarian economy, and to raise the standard of living. The first objective was achieved. Reconstruction in industry and transport was accomplished. Industrial capacity in important sectors was enlarged. In the village too, despite much tension, progress was made. But in regard to the second aim there is a question whether the increase in well-being was proportionate to the efforts made. The improvements in the standard of living were conspicuous if the comparison is made with the low level of 1946–47. It must be remembered, however, that these improvements were results not only of the increasing supply of consumer goods but also, to a certain extent, of the redistribution of incomes. Furthermore, the raising of the social and economic status of the workers had its counterpart in the deterioration of that of the middle classes.

The author wonders about the soundness of the economic policy underlying the Plan. The government set out to increase production at all costs. It failed to realize reduction in costs of production but found a new way toward higher production through availability of cheap labor. This accounted for lack of balance in the execution of the Plan. While production programs were reached or slightly exceeded, the improvement in the productivity of labor fell short of the estimates. The investments moreover went beyond the requirements for the planned level of production and were not accompanied by a commensurate rise in production (pp. 125–126).

The reviewer was especially struck by the statement that the Three-Year Plan was formulated as a "national plan," and that, while economic co-operation with the Eastern countries was encouraged, it was done by promoting closer trade relations and not by attempts "to co-ordinate planning." Indeed the author writes that the Supreme Council for Mutual Aid, established in Moscow in the beginning of 1949, was not, as some believed, a nucleus for supernational planning. A possible exception to central conception might have been the rapid development of heavy industry. Within the Three-Year Plan some 8 per cent of industrial (or 25 per cent of total) investment served the expansion of the capital-goods industries—the Soviet Union supplying much of the iron ore and coke. The author says the second Hungarian Plan is also a national plan. This interpretation seems inconsistent with much evidence readily available in Soviet publications. The fact that the Hungarian planning has a national character does not necessarily imply that it was not co-ordinated with the over-all Eastern planning.

Needless to say, this work is a useful compendium not only because it offers an expert analysis of the Hungarian Three-

Year Plan, but also because it is a competent study of economic planning in a "People's Democracy."

WAYNE S. VUCINICH
Stanford University

BROCK, RAY. *Blood, Oil & Sand.* Pp. 256. Cleveland: The World Publishing Company, 1952. $3.50.

This up-to-the-last-minute book undertakes, on the basis of wars past and problems present, to show the shape of things to come in the Middle East. It is in this area, the author is convinced, that the world struggle of Communist Russia and the non-Communist powers for a variety of reasons is most likely to break out into uncontrolled war. The reader gathers on the run, while trying to keep up with the breathless pace of the book, that these reasons are, mainly, the strategic position occupied by the Middle East countries in the global struggle, the importance of Middle East oil both to the Western Allies and to "desperately oil-hungry" Russia, the legacies of World Wars I and II in terms of unsolved problems, with particular emphasis on the rise of Israel, and incredible bungling in very recent years on the part of Great Britain and the United States.

These points are brought out in the course of twenty-five untitled chapters which describe the contemporary Middle East scene in its Balkan, North African, Mediterranean, Pakistani, and Indian setting. The author, a veteran observer of international double-dealing in these areas, regards the relations between most of the Middle East states and the West as steadily deteriorating. He is concerned with the depth of Communist penetration in Iran, Egypt, Iraq, Syria, and Lebanon, where Communist elements have insinuated themselves into nationalist activities on a large scale. Iran and Egypt he sees as the present danger areas and 1952 as the year of decision on the part of the Soviet Union with respect to a military move in the Middle East. He envisages no firm barrier to a sudden thrust from Russia other than a not overly strong Turkey. In this area, which is characterized on the whole by weakness and ineffectuality, he entertains a high regard for the Turks both as fighters and as diplomatists.

Most of the historical snatches used as background are familar enough, as is the title of the book itself which, with a slight change in word order, was employed by Robert L. Baker a decade ago in dealing much more sedately with approximately the same area. Nevertheless, if the reader is able to take Brock's sensational style of presentation with enough salt, he is likely to find *Blood, Oil & Sand* usefully thought provoking.

HALFORD L. HOSKINS
Library of Congress
Washington, D. C.

COUGHLIN, WILLIAM J. *Conquered Press: The MacArthur Era in Japanese Journalism.* Pp. 165. Palo Alto, Calif.: Pacific Books, 1952. $3.00.

Mr. Coughlin, a professional journalist, writes of the system of public communication in Japan before and after the MacArthur conquest. He pictures the Japanese journalist, in phase one, as the pawn of the militaristic clique which used the press to create a false world in which lived the Japanese masses largely ignorant of the brutal and aggressive military adventure in China and the suicidal war with the United States.

In phase two, the Japanese journalist is being waited upon by his military captors who expect him, overnight, to recognize the errors of the Tojo government and Japanese militaristic society and to turn upon them in wrath and vengeance. To facilitate the quick change of mind, the captor introduces a system of press supervision, curiously misnamed freedom of the press, in which the journalist is encouraged to denounce his old rulers and is protected against reprisal either by the Japanese government or by the stockholders of publishing houses.

In phase three, the journalist has quaffed so deeply of the new wine of freedom and protection from reprisal that he is dangerously friendly with communism. The American GHQ is saved from using its bayonets by the emergent conservatism of the journalists and the leadership of the staff of *Asahi*. The journalism of Japan is then allowed to settle down and combat severe economic handicaps and a post-publication supervision which keeps radicalism under control.

The American journalist in Japan writing for the home audience had his difficulties with postpublication supervision, and Mr. Coughlin outlines a system of rewards and punishments which he says General MacArthur's staff used to stifle criticism of the occupation.

Mr. Coughlin's narrative is packed with color and interest and moves rapidly and effectively. There is some tendency to preoccupation with incidents at the expense of broad and intensive investigation which would afford a solid basis for judgment. Thus Mr. Coughlin attributes the decision to drop the atomic bomb and intensify the war against Japan to the single circumstance of the mistranslation of a Japanese word used in an English language broadcast describing the attitude of the Japanese government toward the Potsdam declaration. The book is a personal narrative based primarily upon observation and experience and is valuable to the social scientist in search of insight into the MacArthur GHQ.

J. EDWARD GERALD
University of Minnesota

BERGER, ELMER. *A Partisan History of Judaism.* Foreword by Paul Hutchinson. Pp. xvi, 142. New York: The Devin-Adair Company, 1951. $3.00.

Rabbi Berger is Executive Director of the leading American Jewish group opposed to Zionism. He supplements his *The Jewish Dilemma* (1945) with this series of lectures which further documents his views with an interpretation of Jewish history and an evaluation of the worth of various aspects of the European Jews' religio-cultural heritage. He urges that Jews who value the advances of modern democracy should retain only the ideology and ethics of the pre-Christian Prophets. He fails to discuss or dismisses as valueless almost all other Jewish religio-cultural traits developed later in Europe, and he undertakes no consideration of the religio-cultural heritages of Sephardic and non-European groups of Jews. The motivation for writing the book is to polemicize against the central and northern European Jewish tribalists, ghettoists, and Zionist nationalists.

Whatever the book's worth may be for the purposes of advocates of the anti-Zionist cause who need historical support for their stand, it is an interesting psychological document. It evidences the kind and intensity of feeling, as well as the rationalizations, that characterize many Jewish liberals in their opposition to their Zionist coreligionists. There may be regret that Berger is not better versed in dynamic social psychology, because he could have then penned a more effective polemic. He could have pointed to psychological and historical processes that account for the emotional needs and the personalities of tribalists. He could have shown why his preference for individualistic self-realization and surrender of tribal affiliation is also the desirable choice for modern-minded Jews. His group needs a writer who can phrase the way such Jews may attain maximal personal freedom with a minimum of emotional hostility to Zionists.

In short, the case is weakly stated because of overemotionality and lack of psychological insight. Presumably few synagogues and Hillel foundations on college campuses will therefore encourage serious consideration of Berger's currently unpopular ideas. Berger quite rightly suggests that during the past two decades many antitribalistic liberals among American Jews have been almost terrorized into inaction or pressured into support of the Zionists' efforts to maintain a post-Prophetic north-European Jewish religio-cultural heritage. But I doubt that Berger's arguments will now do much to lessen his opponents' prestige and power among Jews, because his social psychology is so feeble that he cannot reveal to Jews why the tribalists feel and think as they do, nor is he able to phrase to any notable extent the means by which Jews may attain dignity and self-fulfillment by rational adherence to an antitribalist position. So worthy a cause ought to recruit a more effective active protagonist.

MELVILLE JACOBS
University of Washington

COLBERT, EVELYN S. *The Left Wing in Japanese Politics.* Pp. xii, 353. New York: Institute of Pacific Relations, 1952. $4.50.

Serious students of Japanese government are indebted to Mrs. Colbert for this painstaking, albeit overly annalistic, narrative of the rise and experience of the Socialist, Communist, and certain other parties, and of labor unions and federations which have, in greater or lesser degree, supported one or another of these parties or sought similar objectives through parallel action. The major portion of the book is devoted to the occupation years up to October 1948, but this period is introduced by a brief historical survey and followed by a sketch of developments to June 1950. Not the least valuable section is an appendix containing biographical notes on 126 leaders; a second useful appendix contains lists of party officers.

The author eschews any general thesis or expression of her own judgment upon acts or motives of parties or unions or upon their relationships with one another. Limiting her sources almost entirely, for the occupation years, to Japanese news releases, she makes a highly creditable effort to write a dependable factual account of events, party structure, and political issues. Had she chosen to make use of articles of opinion from Japanese reviews and to give more intimate vignettes of personalities, her book would have gained in interest without loss of reliability. One is inclined also to look for much greater attention to the effects of the Supreme Commander for the Allied Powers (SCAP) upon party shifts and pronouncements. Mrs. Colbert has given us a considerable amount of sifted data. Why, one asks, has she not done more about interpretation? No quarry is more elusive than the nature of a Japanese party—the qualities that distinguish one party from another and one faction from another within a party. Possibly Mrs. Colbert will pass to this endeavor in another volume.

The relevance of a descriptive term that is broad enough to comprehend Tokuda Kyuichi and Isoo Abe may well be questioned. If Abe was a "leftist," Tokuda may well be something else. There may be grave danger of doing injustice to individuals so widely divided in their views by calling them both "leftists" or "radicals." When does a leftist become an extreme leftist; when is a leftist a rightist? Faced by the plethora of organizations, which spring up in Japan with no regard for the analyst's problem of classification, an author is forced to use popular categories in an effort to simplify problems that may not be subject to simplification. This reviewer mentions this problem without disparagement of a book which is the product of very serious, mature, and conscientious research.

HAROLD S. QUIGLEY
University of Minnesota

LAKDAWALA, D. T. *International Aspects of Indian Economic Development.* University of Bombay Publications, Economics Series No. 5. Pp. vii, 191. New York: Oxford University Press, 1952. $2.50.

Dr. Lakdawala's scholarly study of India's economic needs is most interesting and most important in the light of what it reveals about changing attitudes in India. The precise figures at which he arrives by a series of mathematical computations are less significant than his considered judgment that there has been a considerable reappraisal of India's position in India itself.

Immediately after India became independent, he notes, there was a deep mistrust of foreign investment. Nationalism was highly self-conscious, and it was feared that foreign capital, either of the loan or the risk variety, might somehow involve an impairment of Indian sovereignty. This attitude is not singular; it has been seen repeatedly in new or emerging nationalisms. In India's case it reached perhaps its climax, at least officially, in the response to the United Nations canvass of dollar needs in "underdeveloped" countries.

"It is interesting to recall," Dr. Lakdawala writes, "that when in an inquiry, the United Nations Secretariat asked the Government of India to state her dollar needs, along with other Governments, no answer was given on the ground that she had no such needs. This policy is slowly changing under the impact of events."

The word "slowly" could now be taken from the economist's cautious statement, made more than a year ago. India is now making a definite effort to enlist and attract foreign economic assistance, and the degree of her progress in the next few years will be largely dependent upon the success of this effort.

Of the several billion dollars that will be required in the immediate future to keep pace in industrial development and improved food production with the increase in population, Dr. Lakdawala believes that about 60 per cent can and should come from loans either on a government-to-government basis or from recognized international agencies. The other 40 per cent, he holds, should be supplied by private venture capital.

In the first category, he believes, there should be no great difficulty since India's credit position is and has been sound. In the second it will be necessary for India to adopt and follow policies that inspire confidence. India must, he says, "make all efforts to create the proper environment" for this needed development.

While this book has thus a strong political implication it is not a political book. It is a technical work, thoroughly documented, and is written for technicians. The cause of better international understanding will be served if the same materials can be presented, also, in a popular form and gain a wide readership.

ROBERT AURA SMITH
The New York Times

DAVIS, S. *Race-Relations in Ancient Egypt: Greek, Egyptian, Hebrew, Roman.* Pp. xiii, 176. New York: Philosophical Library, 1952. $4.50.

This little volume addresses itself to a big subject, at least in so far as its title is concerned. Actually, however, the subject of the book is limited to the period stated in the subtitle, namely, the Hellenistic-Roman age. By that time the career of Ancient Egypt had come to an end, after nearly three thousand years of highly individual history. What followed was no longer Egypt proper but a curious cultural blend in which outside elements predominated. Yet the native forces, while by no means dynamic, remained unassimilated nevertheless, except on the surface. The Hellenistic veneer proved relatively thin. In the end, native tradition triumphed in more than one significant instance over the foreign importations.

Against such a background the social scientist finds himself at a great disadvantage. He operates on a two-dimensional plane whereas the subject calls for a three-dimensional investigation. The author covers the Greek and Roman periods in Egypt with admirable thoroughness. But that juncture was merely an epilogue to the story of Egypt proper. This is not to say that the period in which Mr. Davis is interested lacks importance in its own right. But it cannot be fully understood and interpreted without an intimate knowledge of the normative past. The author's attempts to reach back, which he is often compelled to do, are on the whole unsuccessful. The usefulness of the book is thus distinctly limited. Within its limits, however, the volume constitutes a welcome contribution.

The results of the study, which is richly documented, may be summed up as follows: The Egypt of the Graeco-Roman period provides a fascinating illustration of the interaction of culture and politics. Political expediency may seize upon the racial factor in a multicultural society and raise it to undue prominence. But claims of racial superiority on the part of one group cannot in themselves affect the cultural balance or persuade older groups that they are inferior. This is false anthropology, unconvincing theology, and in the end ineffectual political theory. Hellenistic Egypt accommodated several distinctive societies; but racist explanations could not then, and cannot now, account for the underlying differences.

It is perhaps not without interest these days that the author of this work is a member of the faculty of the University of Witwatersrand, Johannesburg, and that the publication was made possible by a grant from that University.

E. A. SPEISER
University of Pennsylvania

LETTERS TO THE EDITOR

Dear Sir:

Joseph Mayer's review of my book *American Imperialism* omits the central theoretical approach of the book. This is that imperialism is a definite stage of capitalism, when large monopolies dominate economic life; when they concentrate on the export of capital to find further sources of profits, when they divide up the world through cartels and other devices, and involve their governments in wars for redivision of the world. United States monopoly capital, having attained the greatest development long ago, has now obtained the greatest degree of control over other peoples. The approach is supported by reference to Lenin and to the British liberal economist Hobson.

According to Mayer, my central theme is that "Wall Street imperialist masters" have pursued a consistent and set plan to dominate the world ever since the War for Independence. This is a gross distortion. While internal capitalist expansion during the nineteenth century is briefly noted, the book definitely dates the period of expansion abroad from the end of that century (p. 10). The goal of world domination is set as developing only during World War II (p. 126). It has been operative less than 10 years, instead of 175 years. The phrases "Wall Street imperialist masters" and "tool of Wall Street," carried in quotations in Mayer's review, do not appear in my book. Use of these phrases in quotations helps Mayer's attempt to portray the book as a collection of clichés, but it is hardly honest criticism.

Four of the eleven chapters are devoted to a detailed accounting of the methods of rule and the amount and forms of profits derived by large United States corporations from various parts of the globe, and from the Negro people in the United States (Chs. II–V). Mayer ignores this entire section. He does indicate the central conclusions of another group of chapters (Chs. VII–X), which detail the post-World War II expansion of U. S. economic and military interests, principally in Europe. However, Mayer discards the conclusions as a travesty without rebutting a single one of the voluminous details cited in evidence, or any of the analysis and argument.

Mayer pictures my book as an attack on the United States. Such an attack is explicitly denied at the outset:

"The American people are not imperialists. The imperialists are only the tiny group of those who own and control America. . . . They are not only different from, but they are the bitterest enemies of, the people of the United States. . . . Thus it is essential to bear in mind throughout this book that the exposures of United States imperialism or imperialists are not attacks on the United States as a nation, or on its people" (p. 8).

It is a sad sign of our times when a reviewer for a scholarly magazine can denounce attacks on monopolies and imperialism as foreign propaganda. Have professors forgotten the grass-roots antimonopoly movements which played such a prominent part in American political life since the 1880's, or the powerful Anti-Imperialist League which sprang up after the War of 1898, or the classic exposés of monopoly and of U. S. imperialism abroad which enrich our literature?

Mayer makes only passing—and sneering—references to the book's documentation. He expresses his opinion about my research methods in the following sentence:

"Is it too much to assume that the Kremlin is systematically culling, from newspapers, periodicals, and books, every derogatory remark that has ever been made about the United States, classifying these tidbits, and making them available to its agents of slander, double-talk, and intimidation for most effective propaganda use, whether behind the iron curtain or on this side of it?"

I did every bit of research for this book personally from the cited sources, with the single exception of certain facts about Brazilian coffee supplied me by an American university student who did research in this field under my guidance. Mayer's description of the documentation as consisting of derogatory remarks and tidbits is inaccurate, since its central content is detailed official and financial statistics and policy statements. References cited in the notes to my book fall into the following classifications: U. S. government documents, 111; international agency and foreign capitalist government documents, 50; speeches, articles, of U. S. government officials and prominent business men, 35; corporation and trade association reports and business magazines, 45; books and scholarly periodicals (not left-wing), 34; general circulation newspapers and periodicals (not left-wing), 52; labor and left-wing United States sources, 17; left-wing foreign sources, 15; total 359.

The purpose of my book is to expose the forces leading this country to a disastrous war, and I conclude with a favorable discussion of those forces in the United States working for progress and for the peaceful coexistence of the two systems, socialism and capitalism (pp. 242–243). Mayer concludes his review with the remark that my book is the kind of caricature "the Kremlin will continue to dish up for us until its evil power is finally destroyed." He thereby implies his partisanship with the war camp, from which a writer on behalf of peace can hardly expect an honest review.

Yours sincerely,

VICTOR PERLO

Dear Sir:

Two rather significant background factors are omitted from Mr. Perlo's letter: one, his identification by confessed Soviet agents as the leader of a Russian espionage ring in the United States; and the other, his persistent portrayal throughout his book of Russia as lily white and the United States as sordidly black.

In my review I quote from his book (p. 15):

"Imperialism is military, political, and economic domination of subject nations. The forms of domination include incorporation into the home territory of the conqueror, establishment of colonies, and establishment in the subject country of nominally independent governments actually controlled by the imperialist power."

To any objective observer, these words from Perlo's book certainly characterize Stalinist Russia today. But naturally, to a Stalin lover and a follower of the "central theoretical approach" of Lenin (and Marx), it is rank heresy to have Russia placed in such a position. For Perlo expostulates elsewhere (p. 204) that Soviet imperialism is a "myth"—in fact, "a logical absurdity"!

To what he really objects, in his second, third, and fourth paragraphs, it is hard to see. In the book he mentions Wall Street scores of times. Chapter II is entitled "Wall Street's Empire"; and Chapter IV "The Stake of Wall Street in the Jim Crow System." One of the sections (p. 164) is headed "Turning European Industry over to Wall Street." American imperialism, United States imperialism, capitalist imperialism, moribund imperialism, the American empire, and Wall Street imperialism are used synonymously. "The tiny group . . . who own and control America" (*sic*, p. 8) are the Wall Street imperialist masters. All our leaders and government officials (including Senator Taft, p. 214, and General Eisenhower, p. 238) are either imperialists of their stooges, engaged in superexploitation and the gathering of "tribute," "loot," and "booty" for their masters. All are spoken of in highly derogatory terms.

The book and its hocus-pocus might well have been dubbed "Wall Street Imperialism." Its central theme may be gleaned from the following excerpts out of the book starting with the "tiny group" of imperialist masters who allegedly "own and control America":

"Bureaucrats carry out their orders" (p. 8). "The United States government set out to build an empire" (p. 11). "It launched an imperialist war for redivision of the world in 1898" (p. 12). "British or Spanish exploiters were replaced by Wall Street exploiters" (p. 13).

"The new masters engaged in wars of conquest" (p. 13). "Such is the pattern of superexploitation and repression carried out by the U. S. Army, acting as the front for the finance capitalists" (p. 81).

"The South was converted virtually into a semicolony of Wall Street" (p. 83). "This led to superexploitation of the Negro people" (p. 84). "Wall Street set its terms. . . . President Franklin Roosevelt . . . was the head of a Wall Street state apparatus . . . controlled by finance capital" (p. 122).

"Into the mouth of the flat-voiced politician from Missouri are placed the noblest sentiments. . . . The monopolists put this unctuous wrapping of God and the Bill of Rights around the President's speeches . . . all for the purpose of whipping up chauvinist and aggressive moods" (p. 128). "A procession of Wall Street leaders took the decisive Washington posts" (p. 132). "Wall Street dominates" (p. 168). "The new masters" (p. 170). "The Pentagon-Wall Street Group" (p. 203).

"But this strategy of world domination is bankrupt" (p. 214). "Lined up in opposition are 800 million people of the U.S.S.R., the People's Democracies [*sic*], and China, with their first-rate armies" (p. 216). "American imperialism, under the false slogan of 'American leadership,' tries to establish swiftly a world empire, the goal of all imperialists. Can Wall Street succeed where others failed?" (p. 241).

As for "partisanship with the war camp," Perlo simply drew the wrong conclusion. The evil power of the Kremlin could of course be destroyed, not from without, but from within—from its fifteen to twenty million slaves rising up and striking off their chains. They indeed "have nothing else to lose."

Yours sincerely,

JOSEPH MAYER

FOREWORD

THE American Law Institute has recently undertaken the task of preparing a model penal code. In discussing the many issues that demand consideration by the drafters, Professor Herbert Wechsler wrote a few months ago:

> Should the death penalty be retained as the highest sanction? Viewed nationally there have been in recent years between 100 and 150 executions annually. Can the dispatching of these individuals, their selection determined by incalculable chances, make sufficient contribution to prevention to outweigh the brutalizing and sensational factors involved in taking life? Is it meaningful upon the issue of prevention that Rhode Island is an abolition state without its homicide rate comparing unfavorably with that of Massachusetts or that Michigan's does not suffer by contrast with that of Illinois? This is an issue that merits a larger hold upon the mind and conscience of the country than it has received in recent years. [Herbert Wechsler, "The Challenge of a Modern Penal Code," 65 *Harvard Law Review* (May 1952), pp. 1097–1133, at p. 1124.]

There is something unique about the death penalty. No one today seriously objects to fines or to imprisonment as punishments, even though there are differences of opinion concerning the manner in which they are executed or concerning the classes of offenses or offenders to which they are to be applied. But when the death penalty is discussed, many persons object to its very existence, claiming that it is improper and should therefore be removed from our list of punishments. The debate has been going on for at least two centuries—at least since the young Italian jurist Beccaria challenged the validity of capital punishment in the middle of the eighteenth century. Since then many countries have abolished it. A number of the states of the Union have also done so, some of them only temporarily.

There is a considerable literature on the death penalty in the United States, but nevertheless Justice Felix Frankfurter, in his testimony before the Royal Commission on Capital Punishment in 1950, decried the fact that so little factual information about it and its effectiveness had been assembled. This issue of THE ANNALS attempts to meet this deficiency in a small degree. The reader will determine for himself whether or not the authors have succeeded in presenting their data in an objective manner, thus contributing to our knowledge of the question. There are no doubt many aspects which have not received adequate treatment, for lack of space. Some important gaps will also be noted, especially the absence of an article which clearly shows what crimes are made capital in the various states and in federal law. Such an article had been promised but was not delivered to us.

THORSTEN SELLIN

Extent and Trend of Capital Crimes in the United States

By George B. Vold

THE problem suggested by the title is a *difficult one, both* from the standpoint of terminology and from that of basic data. Capital crimes are presumably those offenses the commission of which calls for the death penalty. But with few exceptions, there are no consistent definitions as to what kind of offenses call for the death penalty.

The exceptions are negative; that is, some states specify that no offense calls for the death penalty. At the present time, six states do not permit the death penalty, namely: Maine, Michigan, Minnesota, North Dakota, Rhode Island, and Wisconsin. Several other states have at one time or another abolished the death penalty and then reinstated it.

On the other hand, until very recently five states have specified death as the mandatory penalty for first degree murder, *namely:* Connecticut, Massachusetts, New Mexico, North Carolina, and Vermont.* In the rest of the states the penalty for first degree murder may be either death or life imprisonment. In practice, obviously, this choice of penalty leads to the familiar procedure of charging something less than first degree murder in order to avoid the death penalty, and sometimes to avoid a sentence to life imprisonment as well.

These widely divergent legal practices and penalties operating for the control of the same crime—namely first degree murder—simply reflect the fact of inconsistent and confused notions as to the real nature of capital crime.

Statistics Not Clear

Criminal statistics also reflect this confusion of attitude and practice. There are no general statistics available as to the number of offenses committed per year for which death is the required penalty, or even as to the number of persons convicted per year of first degree murder.

Some statistics are available on "offenses known to the police" in the *Uniform Crime Reports*, published by the Federal Bureau of Investigation, Department of Justice, Washington. But the uniform crime classification gives no breakdown of the general category "murder and non-negligent manslaughter" from which may be deduced the probable number of first degree murder offenses included under the more general category.

The same general difficulty obtains in connection with the now discontinued series on *Judicial Criminal Statistics* (formerly published by the Bureau of the Census), which reported on the activity of the criminal courts and the disposition of criminal cases before these courts. The classification used for offenses makes it impossible to separate the number of cases of deliberate, premeditated killing from other types of murder.

Another source is the records of the National Office of Vital Statistics, United States Public Health Service, Federal Security Agency, in which homicide is included as one of the

* In four of these states the laws were changed to a permissive death penalty in 1950 and 1951, leaving only Vermont with a mandatory death penalty at the present time.

recognized standard causes of death. The homicide classification, however, is not the same as the police designation of "murder and non-negligent manslaughter." It includes justifiable homicide (for instance, the killing of a felon by the police in line of duty, and some other types of killing in self-defense) and incendiarism, but does not include legal executions. Practically speaking, it means any violent death that is neither a suicide nor an accident. Homicide rates, therefore, offer only an approximate index of the amount of murder, depending upon the constancy of such elements as the proportion of justifiable and nonculpable homicides in the total number reported.

None of these statistical sources throw any direct light on the number of capital crimes as such. Some scattered information is available on the distribution of murder charges as between those designated first degree and the several possible lesser charges. There are also available reports on the annual number of executions, by states. These fragments may be taken, perhaps, as straws in the wind giving some basis for estimating the probable number of capital crimes included in the available indexes for any given year. But such approximations are hardly of sufficient accuracy to warrant attempting to assemble a trends table for capital crimes.

SPECIFIC COMPARISONS

Before attempting any estimation of probable numbers of capital crimes for any given year, it will be helpful in the understanding of the whole problem of murder and capital crime to examine some of the sources in some detail and from the standpoint of several different kinds of problems.

Trends in murder and homicide rates. Full coverage of the United States in death registration was not obtained until 1933. By that time the *Uniform Crime Reports* had also obtained a reasonably extended national coverage, though the southern cities were still underrepresented. Table 1 presents a comparison of these two principal indexes of murder and killing for the time span of 1933–51. The *Uniform Crime Reports* for 1933 included 1,264 cities with a total population of 49,471,000; in 1951 there were 2,421 cities reporting, with a total population of 69,980,000. This increase in the number of cities participating—which means also a considerable increase in the number and proportion of southern cities and towns reporting—may be the principal factor accounting for the relatively close approximation of these two indexes during the last decade.

TABLE 1—COMPARATIVE TRENDS IN MURDER AND HOMICIDE RATES, 1933–51

(Rates per 100,000 general population)

Year	Murder	Homicide
1933	7.1	9.7
1934	6.7	9.5
1935	6.0	8.3
1936	6.2	8.0
1937	6.1	7.6
1938	5.3	6.8
1939	5.4	6.4
1940	5.4	6.2
1941	5.4	6.0
1942	5.5	5.8
1943	4.7	5.0
1944	4.9	4.9
1945	5.5	5.6
1946	6.4	6.3
1947	6.1	6.0
1948	5.9	5.8
1949	5.7	5.4
1950	5.1	4.6
1951	4.9	4.5

Sources: Murder and non-negligent manslaughter rates from *Uniform Crime Reports* for respective years; homicide rates from *Vital Statistics Rates in the United States, 1900–1940* and other *Special Reports* of the Office of Vital Statistics, U. S. Public Health Service, Federal Security Agency.

The general tendency to a downward trend during this period of uniform reporting is unmistakable. There was a brief upturn in both indexes in 1945 and 1946, with continuous decreases since that time. The rates for 1951 are again at the all-time low levels.

Regional differences in murder rates. A general murder rate for the United States as a whole has no very close relation to the actual rate of any specific area or section. The rates for individual states are widely divergent. Thus, in 1951 *Uniform Crime Reports* shows a rate of .41 per 100,000 general population for New Hampshire as compared with one of 18.23 for Georgia; Minnesota had a rate of .80 per 100,000, Alabama one of 15.27; and so on. These extreme differences between states

[a] Death penalty abolished.
[b] Death penalty optional or permissive for first degree murder.
[c] Death penalty mandatory for first degree murder during period given; law changed in 1951.
Source: *Uniform Crime Reports* for years indicated.

are relatively consistent, and states in the same area have generally similar magnitudes in murder rates. Moreover, these regional differences have been strikingly consistent for many years. These general relations are clearly indicated in Table 2.

States that have and have not abolished the death penalty. In the long years of debate about the effectiveness of the death penalty in controlling or reducing the crime of murder, comparisons have often been made between some of the states that have and some that do not have the extreme penalty. Unless the states involved are in the same area or region, such comparisons are likely to be meaningless. As a matter of fact, it seems clear that the presence or absence of the death penalty makes no particular difference in the amount of murder in any given state. Its murder rate will be closely parallel to that of adjoining states, where conditions of life and social-cultural attitudes are similar. This general point of view was elaborated by the present writer in an earlier study,[1] and the same basic fact is even more strikingly evident in the trends data presented in Table 3.

[1] G. B. Vold, "Can the Death Penalty Prevent Crime?" *Prison Journal*, October 1932, pp. 3–8. (Published by the Pennsylvania Prison Society, 311 South Juniper Street, Philadelphia, Pa.)

The important fact in this is the persistence of the differences between sections and regions, regardless of whether the states have abolished or retained the death penalty.

Racial differences in homicide rates. The uneven distribution of various racial groups other than white often bedevils and complicates comparisons of rates on a regional or sectional basis. The much higher homicide rates of racial groups other than white, in the United States, mean that differences in regional figures inevitably reflect in part the relative presence or absence of such groups in any particular region.

Table 4 has been assembled to illustrate some of these problems. The New England States have low homicide rates, generally speaking, while the states listed from the South Atlantic and East South Central region have uniformly some of the highest rates in the United States. The high rates in this section are obviously due in part to the extremely high homicide rates of racial groups other than white which are present in large numbers in these states. The homicide rate for such groups in Maine, for example, is also extremely high; but since their numbers there are insignificant, the effect of such high rates on the rate for the state as a whole is very slight.

TABLE 4—RACIAL DIFFERENCES IN HOMICIDE RATES, 1940
(Rates per 100,000 population of same race group)

	All Races	White	All Other Races
New England			
Maine	1.5	1.4	37.3
New Hampshire	1.4	1.4	0.0
Vermont	0.8	0.8	0.0
Massachusetts	1.5	1.4	11.8
Connecticut	1.8	1.7	8.9
Rhode Island	1.4	1.4	0.0
South Atlantic and East South Central			
Georgia	20.0	5.6	47.1
North Carolina	10.8	4.0	28.3
South Carolina	13.2	5.0	24.0
Virginia	10.5	5.0	27.2
Alabama	16.4	6.9	34.4
Kentucky	14.3	10.4	61.6
Tennessee	16.6	7.1	61.5

Source: *Vital Statistics Rates in the United States, 1900–1940*, Table 20, pp. 366–401. (National Office of Vital Statistics, U. S. Public Health Service, Federal Security Agency, 1947.)

Lest anyone conclude from the above that regional differences in homicide rates are equivalent to, or due only to, differences in the proportions of the total population classed as other than white, attention is invited to the similar consistent and large differences in the rates as between regions for the white group alone.

When comparisons are made between the states of Massachusetts and Georgia, the following will be found to obtain: The homicide rate of the white group in Georgia (5.6) is almost exactly four times as high as that of the white group in Massachusetts (1.4); the Georgia "other than white" rate (47.1) is likewise almost exactly four times the "other than white" rate (11.8) for Massachusetts. This basic regional or sectional difference must be recognized and taken account of independent of and in spite of the obviously important differences between the several major racial groups. Thus, the rate for Massachusetts "other than white" groups (11.8) is more than eight times as high as for the white group (1.4); similarly, the rate for the "other than white" groups of Georgia (47.1) is more than eight times that of the white group of that state (5.6). When comparisons are made across both racial and regional lines, the differences are intensified, of

course. Thus as between the two states, the rate of the Georgia "other than white" group (47.1) is approximately thirty-four times that of the white group in Massachusetts (1.4).

Illustrations from other states and regions could be taken, but the general import of the above analysis would nevertheless be sustained. Presumably factors of these various kinds will operate in a similar manner in connection with the more specific problem of differences in frequencies of first degree murder in different states; or in capital crimes, if information could be had directly on such offenses.

FRAGMENTARY GUIDES

It was said earlier that there were various fragments of information at hand that might be used as a basis for estimating the number of capital crimes, as opposed to murder and homicide as general categories. A few of these straws in the wind should be noted in a little more detail. Thus, VanVechten reported results of a study of procedural outcome and criminal case mortality for 1939.[2] With his best data from the District of Columbia and Minnesota, he found in both of these jurisdictions, for the offense "murder and non-negligent manslaughter," a surprisingly similar relation between the number of offenses known to the police (as shown in *Uniform Crime Reports*) and imprisonment for murder. For the District of Columbia the number imprisoned was 9.2 per cent of the offenses known to the police; for Minnesota it was 12.3 per cent.

In a somewhat different connection, Professor Sutherland considered various aspects of this general problem and concluded that "perhaps not more than one-tenth of the persons committed to prisons for homicide have been found guilty of premeditated murder."[3]

A quarter of a century ago, Hall concluded that "less than 10 per cent of the known murders result in executions in England."[4]

The criminal statistics of Canada for the ten-year period 1940–49 show 450 cases charged with murder; 177 death sentences; and 91 executions. In other words, the number of death sentences was about 40 per cent of the number charged, and those executed were about 20 per cent of those charged.[5]

In the United States for the period 1930–50, there were 3,029 executions, of which 87.3 per cent were for murder, 11.1 per cent were for the offense of rape, and 1.6 per cent were for other offenses. For the year 1949 there were 119 executions; for 1950, only 82.[6]

During the past several years, the prisons and reformatories of the United States have received from the courts approximately 1200–1300 prisoners per year sentenced to life imprisonment. Somewhat more than half of these represent life sentences as an indeterminate maximum. It seems clear that many of these life sentences cannot be taken as representing capital offenses. During these same years the prisons have received from the courts approximately 1600–1800 persons per year sentenced for the crime of murder.[7]

With these fragments as a guide, some

approximations and guesses may be made as to the probable number of capital crimes in the United States in 1951. Following VanVechten's findings with an estimated total of offenses known to the police in the classification of "murder and non-negligent manslaughter" of 6,820 for the year 1951,[8] one would expect that there would be approximately 1,658 persons sentenced and entering the prisons from the courts for the crime of murder. Of these, perhaps 179–200 represent the most extreme first degree murder, premeditated and deliberate; another 750–800 should be considered to be capital crimes, though somewhat less positively so.

No such figures can be verified at this time for the year 1951. They are merely this writer's best guess as to the present. The figures seem consistent with what is known about relations between offenses and capital crimes in other years.

George B. Vold, Ph.D., Minneapolis, Minnesota, is professor of sociology at the University of Minnesota. He has served variously as technical adviser to the Minnesota Crime Commission, as chairman of a Governor's Committee on Sex Criminals (Minnesota), as chief analyst and statistician for the Public Safety Division, United States Occupation Forces in Japan, and as chairman of a Governor's Special Committee on Prison Conditions in Minnesota. He is author of Prediction Methods and Parole (1931); co-author of Report of Minnesota Crime Commission (1935), Survey of Police Training (1937), and Report on Prison Conditions (1951); and contributor to professional journals.

Trends in the Use of Capital Punishment

By Frank E. Hartung

TRENDS in the use of the death penalty cannot be separated from trends in the use of punishment as a whole. The trend in punishment for about the past 275 years is from the corporal, bloody, and severe sanctions developed through the medieval period to the predominantly nonphysical forms of today. The movement has been to abandon the gallows and the stake, the butcher knife, the branding iron, and the whip, and to adopt some form and degree of fines and imprisonment.

Perhaps the most important single influence behind this movement is the secularization of thought which became evident with the development of modern science at the opening of the seventeenth century. If one accepts the position that the criminal must be made to suffer for and to expiate his offense, then the forms of punishment which held almost undisputed sway in Occidental and other countries for centuries prior to 1682 will perhaps seem necessary. If, however, one accepts the position that crime is as natural as any other form of cultural behavior, it will seem reasonable to attempt to control it through a program based on an understanding of the sociocultural processes leading to criminality.

The inroads of science upon the theological notion of expiation and retribution are so great that the advocates of capital punishment have been on the defensive for about two centuries. The argument on the death penalty has changed from an axiomatic acceptance and justification on the part of those who support it to a search for factual evidence that will demonstrate its efficacy in controlling those few offenses to which it is now sometimes applied. It is a search which opponents of capital punishment hold, on the basis of available evidence, is fruitless.

There are seven trends in the use of capital punishment which support the widespread acceptance of the conclusion that it is not an efficient means of dealing with the few capital offenses of today, and that it certainly was not adequate to deal with the many crimes that once were capital but are no longer so.[1] These trends indicate a prolonged secular and international movement toward abandoning the concept of the capital offense in peacetime law. The present discussion will deal only with the death penalty as an instrument of civil law (as contrasted to military law). It does not, therefore, deal with treason or with the temporary resort to capital punishment in dealing with collaborators, which occurred after World War II in some countries, such as Belgium, the Netherlands, and Finland, which had otherwise abolished the death penalty.

Abolition of Capital Punishment

One trend of the past century, and more, away from capital punishment is the tendency to abolish it completely. In some thirty countries the death penalty has been abolished completely by law or tradition.

There is a fairly common belief that a revival of capital punishment follows a war. This notion was popularized by Clarence Darrow and Lewis E. Lawes in their campaigns against this penalty.

[1] Frank E. Hartung, "On Capital Punishment," Detroit: Wayne University Mimeographing Dept., 1951.

The postwar survey made by Deets in 1948 [2] and a similar one made by Viscount Templewood in 1951,[3] however, indicate just the opposite. The restoration of capital punishment in Italy, Austria, and Rumania was a fascist measure which remains on the statute books only in Austria. Switzerland extended the abrogation of the death penalty from fifteen cantons (1874) to the entire country in 1942. Iceland eliminated capital punishment in 1930 and confirmed this upon achieving independence in 1944. Brazil liberalized its law in 1946 by limiting the death penalty to wartime military offenses. England began a trial period of no executions in 1949.

Deets's study showed that more jurisdictions had abandoned the death penalty for murder and other heinous civil offenses in 1948 than was the case in 1939. England and France are the only democratic European countries outside the Iron Curtain sphere that still have capital punishment for a few peacetime crimes.

Fluctuations among states

The example of those states in this country which have restored capital punishment after abolishing it is sometimes cited as evidence that capital punishment is enjoying a revival. The preceding discussion indicates that just the opposite is revealed by an international survey. As to this country, it appears that there is a fluctuating tendency to abolish it. Michigan was the first state to do so, in 1847. Four other states prohibited it in 1907 and 1911, and seven more between 1913 and 1918. Five of these restored it after an average period of about three years. Maine abolished it in 1876, reinstated it in 1883, and abolished it again in 1887. South Dakota restored it in 1939, with no discernible effect upon its homicide rate. Only one man was executed in that state (in 1947) from 1939 through 1951. The state of Michigan has executed no one since 1830.

There are periodic attempts to restore the death penalty in those states that have abolished it, and to abolish it in those retaining it. In Michigan, for instance, capital punishment has been an issue before the legislature no fewer than twenty-five times since 1885. It was defeated twenty-three times, vetoed once, and rejected by the people once. There has been a systematic attempt in Ohio to abolish it for persons less than 21 years of age. The Connecticut legislature in 1951 considered a bill to abolish it, the Connecticut Legislative Council having approved such a bill in 1950. There have been attempts to abolish it in Pennsylvania, with some newspaper support. The Philadelphia Bar Association Committee on Criminal Justice issued a report in 1951 in favor of abolition.

Reduction in the Number of Capital Offenses

The second long-term trend away from the death penalty is the reduction in the number of capital offenses.* It began much earlier than the complete abolition of the death sentence, and dates from the Great Law of the colony of Pennsylvania adopted in 1682. In this code, capital punishment was retained only for first degree murder. At that time the principal methods of punishment were death, mayhem, branding, flogging, transportation, and public humiliation. This code was undoubtedly the most important single innovation in centuries in the treatment of convicted criminals. Since its promulgation prac-

[2] Lee Emerson Deets, "Changes in Capital Punishment Policy Since 1939," *Journal of Criminal Law and Criminology*, Vol. 38, No. 6 (March–April 1948), pp. 584–94.

[3] Viscount Templewood (Samuel J. G. Hoare), *Shadows of the Gallows*, London: Victor Gollancz, Ltd., 1951.

tically every country in the world has followed its example in great degree. It set the pattern for the use of fines and imprisonment with labor, the predominant means of punishment today.

The English penal code was instated in Pennsylvania the day after Penn's death, May 30, 1718. This restored not only religious offenses, from which Penn's code was happily free, but also the death penalty for fourteen offenses. The English colonies in this country had from ten to eighteen capital offenses. After independence, Pennsylvania again took the lead in reducing the number of capital crimes, with the state constitution of September 28, 1776 directing the legislature to effect a speedy reform of the penal code. The death penalty was abolished for witchcraft in 1791, and for all offenses save first degree murder in 1794.

The other states have followed Pennsylvania to a great degree in this respect. There are in the forty-eight states only seven capital crimes, excluding treason (for which no one has ever been prosecuted, let alone executed). No one state has all these seven offenses on its statute books. The distribution of capital offenses in the states is as follows: 6 states have no capital crimes; 14 states have 1; 8 have 2; 9 have 3; 6 have 4; 3 have 5; 2 have 6.

The seven capital offenses for the various states are first degree murder, kidnaping, rape, armed robbery, burglary, arson, and train wrecking. It is not possible to give the legal definitions of these crimes here, but it should be understood that some degree of physical assault or personal injury is required in these offenses in order to make them capital. It is a safe generalization to say that the trend away from capital punishment has eliminated this penalty for offenses directed against property only.

TABLE 1—CIVIL EXECUTIONS IN THE UNITED STATES, BY OFFENSES: 1930–50

	Number	Per Cent
All offenses	*3,029*	*100*
Murder	2,645	87.3
Rape	335	11.1
Armed robbery	17	
Kidnaping	12	
Burglary	10	1.6
Espionage (all in 1942)	6	
Aggravated assault	3	
Not reported	1	

Source: *National Prisoner Statistics*, No. 5, April 1952, Federal Bureau of Prisons, Washington, D. C.

Kidnaping is the most recently adopted of the capital crimes. There are six states with train wrecking carrying the death penalty, but as far as this writer has been able to ascertain, there have been no executions for this crime in these states, as far back as there are available records.

If train wrecking be excluded, there are sixteen states with only first degree murder as a capital crime. Ohio and New Mexico are the two states with only first degree murder and train wrecking carrying the death penalty. Rape ranks second to first degree murder as leading to execution. This is a penalty directed primarily against Negroes in southern states, as will be seen in the discussion of the selective enforcement of the death penalty.

National figures on executions show that *in practice*, the only capital crime is first degree murder, except in the southern states which also execute Negroes for rape. Table 1 shows executions in this country for the period 1930–50. More than 87 per cent of the 3,029 executions in this 21-year period were for murder, only 11.1 per cent for rape, and 1.6 per cent for other offenses.

England's course

England furnishes perhaps the best example of the long-term trend away from capital punishment through the abolition of the death penalty for crimes. England's course in this respect has been dramatic—from 1780 with about 350 capital crimes, the penalty being ruthlessly enforced on minors as well as men and women, to 1948 with murder as the only capital offense, with adult males sometimes being executed for the crime. This story has been told several times, and as engrossing as it is, it can be stated here only in its barest factual outline.

England had 17 capital crimes in the early part of the fifteenth century. This number was rapidly increased about the first quarter of the seventeenth century, reaching a peak, according to Radzinowicz, of some 350 capital crimes by 1780! Practically all the capital crimes added after 1500 were offenses against property, most of these crimes being trivial. This number was drastically reduced in the nineteenth century: to about 220 by 1825, to about 17 in 1839, and to 4 in 1861. This number was further reduced by the time capital punishment was suspended by the Parliament in 1948.

The English revolt against capital punishment began in the second quarter of the eighteenth century. Juries either acquitted the accused or found them guilty of stealing 39 shillings (the theft of 40 shillings was capital) regardless of the sum they confessed to stealing or were proved to have stolen. Banks appealed (in vain) to the government to abolish the death sentence for forgery, as the law against it became practically inoperative. Victims refused to prosecute, witnesses to testify, and juries to convict.

Murder is the one crime in England today for which, *in practice*, capital punishment is put into operation. The death penalty is on the books also for treason, piracy with violence, and setting fire to arsenals and dockyards. But even the law on murder is very restricted in its application. A series of laws beginning with the Children Act, 1908, abolished the death penalty in all cases in which the murderer was less than 18 at the time of committing the murder. Much the same is true of women, so there is a wide field of homicide open to women, free from the death penalty. During the period 1900–48, there were 935 women committed for trial on the charge of murder. Of these, 126 were sentenced to death, but only 11 were executed. In the decade 1939–48, of 140 women committed for trial on murder charges, only 18 were sentenced to death, with but one of these being executed.

Only the passing of the Roman Inquisition, the greatest single source of executions for heresy and witchcraft and other religious offenses in western civilization, can compare with the English development in dramatically demonstrating the trend toward the progressive reduction in the number of crimes carrying the death penalty.

In 1949 a Royal Commission on Capital Punishment was appointed, with the following terms of reference:

> To consider and report whether liability under the criminal law in Great Britain to suffer capital punishment for murder should be limited or modified, and if so, to what extent and by what means, for how long and under what conditions persons who would otherwise have been liable to suffer capital punishment should be detained, and what changes in the existing law and prison system would be required; and to inquire into and take account of the practice in those countries whose experience and practice may throw light on these questions.

It will be noted that these terms of reference preclude the Commission from recommending the abolition of capital punishment. They do, however, empower it to propose any reduction it

may think fit in the scope of this punishment.

DEATH SENTENCE PERMISSIVE RATHER THAN MANDATORY

There is a third trend which is of importance as leading to the actual abolition of capital punishment. This is the increasingly adopted practice of giving the jury or the court, or both, the power of deciding whether the convicted person must be executed or whether he may be given a lesser sentence than death. This is done partly by establishing different degrees of homicide, and partly by prohibiting a mandatory death sentence and making the death sentence permissive. In 1918 the death penalty was mandatory upon conviction of a capital crime in twelve states. By 1930 there remained only five states with a mandatory death law. In 1951 Vermont was the only state with such a law, Massachusetts having passed its "Alternative Bill" in that year.

It required seventy years for the Massachusetts mandatory law to be modified, the first attempt having been made in 1881! Juries may now recommend life imprisonment rather than death in first degree murder cases, with their recommendation binding the court. One of the persons effective in achieving this permissive clause writes in a personal communication:

> Because of the bitterness engendered in Massachusetts by criticism of the Sacco-Vanzetti case this Bill was fought as bitterly as if it were one completely to abolish capital punishment. It is a slight change in the law. In almost any other state it would have gone almost unnoticed. However, I think it marks an important direction in Massachusetts penology.

There is no doubt that the permissive provision has tended to reduce the number of death sentences and actual executions. Of the 42 states with capital punishment, an average of 14 states each year have no executions, even though they report their usual number of annual homicides in *Uniform Crime Reports*. One can thus say that every year 14 states with capital punishment take advantage of the permissive clause so as to avoid execution. In 1949 and 1950 (the last years for which figures are reported at the time of this writing), 18 states and 21 states, respectively, failed to perform any executions! This provision therefore appears to be a method of abolishing capital punishment in fact while retaining it on the statute books in theory.

It also appears that the alternative of life imprisonment to death has increased the proportion of convictions of those charged with murder. This seems to be because juries appear to be more likely to convict when life imprisonment is involved, but more likely to acquit when execution is involved. This, however, is a point which needs additional investigation before more than tentative conclusions concerning it can be drawn. There is no doubt whatever about its validity as far as the death penalty in relation to offenses against property is concerned. English juries for about 150 years prior to 1861 were refusing to convict, and deliberately disregarding incontrovertible evidence, when conviction for burglary, robbery, forgery, or counterfeiting made a death sentence mandatory.

NUMBER OF EXECUTIONS REDUCED

The fourth trend away from the use of capital punishment is the reduction in the annual number of executions. This trend has been clearly evident for about 150 years. The practice in England in this respect has already been mentioned. Persons charged with capital offenses were arbitrarily found guilty of other and lesser charges by juries. An incomplete and impressionistic survey shows that to some extent a similar situation obtained in continental countries. No data are available in tabular form for executions performed by the federal government, but a partial survey shows that no one was executed for decades prior to 1892 for most of the 17 capital offenses which in that year were reduced to 3 in number.[4] There was one federal execution in 1945. However, in 1945 federal courts sentenced 130 men to federal prisons for murder; in 1946 there were 220 men and one woman so sentenced. Of these, 168 received life sentences, 28 received sentences of 20 to 99 years, and the remaining 24 received sentences of 19 years or less.

The number of executions varies annually among the 42 states having the death penalty. An average of 14 states fail each year to hold an execution, although their prisons receive persons convicted of murder. It is, unfortunately, often not possible to distinguish between those sentenced for first degree murder and those committed for less than first degree.

The late Edwin H. Sutherland studied the trend in Ohio for the period 1896–1930. He found that the proportion of death sentences to commitments for first degree murder decreased very greatly during the period. In 1896–1900, of those committed for first degree murder, 58 per cent entered under the death sentence. By 1926–30 this proportion had steadily dropped to 26 per cent, although the absolute number of admissions for first degree murder had increased several fold. In addition, not all of those sentenced to death were executed. The percentage of death sentences fulfilled varied from 45 to 82, with an over-all percentage of about 60.[5]

Sources: 1921–29: Harry Elmer Barnes and Negley K. Teeters, *New Horizons in Criminology*, First edition (1942); 1930–50: *National Prisoner Statistics*, No. 5 (April 1952), Federal Bureau of Prisons, Washington, D. C.

Additional evidence of the trend away from capital punishment in those states having the death penalty is seen in the annual number of executions for the country as a whole. Table 2 shows the figures, including those of the federal government, for the period 1921–50.

The average annual number of executions for the thirty-year period is about 135. The number increased during the depression years, and began to drop drastically in 1939. Only two years in the 1940 decade exceeded the average, and the decrease has continued into the 1950 decade.

In the twenty-one-year period 1930–50, there were 3,029 executions. Idaho conducted no executions; New Hampshire and South Dakota (1939–50) had one each; Vermont and Nebraska had 2 each; New Mexico had 4; and Kansas, Montana, and Wyoming had 6 each. The eight states at the other extreme of this period, however, performed 52.5 per cent of the 3,029 executions. They are, in the order of their executions, Georgia (280), New York (270), North Carolina (248), Texas (207), California (195), South Carolina (129), and Pennsylvania (124).

Lewis E. Lawes, warden of Sing Sing for many years, showed some twenty years ago that capital punishment was practically abolished in this country through indifferent enforcement:

> Not more than two per cent of the murderers ever reach the death chamber. The ratio of convictions in prosecutions for murder throughout the country is less than 17 per cent. In the eight states of the Union where capital punishment has been abolished [in 1932] there have been no excessive murders. . . .
>
> Capital punishment in the United States may be regarded as practically abolished through indifferent enforcement. But, by retaining the death penalty in its penal codes, it necessarily goes through the theatricals of the threat of enforcement. These very theatricals lend glamor to the accused fighting for his life. The offense, no matter how heinous, is frequently disregarded in the new drama portrayed in the courtroom where prosecutors demand death for the prisoners and counsel pleads for mercy. These theatricals reach out beyond the courtroom and weaken law enforcement all along the line.[6]

SELECTIVE ENFORCEMENT

The selective fashion in which the death penalty is enforced is a point usually cited by its opponents and usually ignored by its proponents. This trend can be very briefly summarized: the death penalty is in this country predominantly and disproportionately imposed upon Negroes, the poor and the less educated, and men. Lawes commented upon the 151 executions he had supervised from 1920 through 1931:

> In the twelve years of my wardenship I have escorted 150 men and one woman to the death chamber and the electric chair. In ages they ranged from seventeen to sixty-three. They came from all kinds of homes and environments. In one respect they were all alike. All were poor, and most of them friendless. To what end or purpose were these victims sent to their premature deaths? Ordinarily the answer would be simple. They killed, therefore they had to die. A logical point of view, indeed, if it were applied equally to all who committed unjustifiable homicide.[7]

Lawes has explained what he means by the last sentence quoted. He says that the death penalty is inherently selective:

> Not only does capital punishment fail in its justification, but no punishment could be invented with so many inherent defects. It is an unequal punishment in the way it is applied to the rich and to the poor. The defendant of wealth and position never goes to the electric chair or to the gallows. Juries do not intentionally favour the rich, the law is theoretically impartial, but the defendant with ample means is able to have his case presented with every favourable aspect, while the poor defendant often has a lawyer assigned by the court. Sometimes such assignment is considered part of political patronage; usually the lawyer assigned has had no experience whatever in a capital case. Even after death, distinction prevails. Where there are relatives who can afford to do so, the body may be claimed and taken away. The law states that the unclaimed body shall be buried on prison ground and in quicklime.
>
> . . . Thus it is seldom that it happens that a person who is able to have eminent defense attorneys is convicted of murder in the first degree, and very rare indeed that such a person is executed. Incidentally, a large number of those who are executed were too poor to hire a lawyer, counsel being appointed for them by the state.[8]

Source: *National Prisoner Statistics*, No. 5, April 1952, Federal Bureau of Prisons, Washington, D. C.

Data relating to death sentences actually executed confirm Lawes's assertion concerning its selectivity. Sellin made a study of homicides occurring in 1930, and found that most of those executed were Negroes and immigrants:

> How many of [the homicides in 1930] were capital crimes it is impossible to say, but in that year there were 1,011 persons committed for life to state and federal prisons and reformatories in 45 states on the charge of homicide, most of them undoubtedly for capital offenses, at least in the 37 of these states in which the death penalty exists. In that same year there were 155 executions. . . . Ten states with the death penalty did not execute a single prisoner. Sixty-nine of the executions were in six states: New York, Pennsylvania, New Jersey, California, Arkansas, and North Carolina. Little is known of those executed. They were mostly Negroes and immigrants.[9]

Supporting figures

North Carolina published a study of the executions in that state during the years 1910–28.[10] In this period 199 men and one woman were committed to the North Carolina state prison after conviction of capital crimes. Of these, 149 were Negro and 51 were white. Of the 200, there were 94 electrocuted: 71 for murder, 21 for rape, and 2 for "burglary in the first degree." Of the 94 executed, 81 were Negroes and 13 were whites. Thus, 86 per cent of the persons executed by the state of North Carolina in approximately twenty years were Negroes. The proportion of convicted Negroes executed was more than twice as great as the proportion of whites: 54.4 per cent of the Negroes and 25.5 per cent of the whites. Of the total 200 sentenced to death, 142 were wholly illiterate. Of the 51 condemned whites, 22 were illiterate.

National figures on execution for the period 1930–50, by race, show that of the 3,029 executed, 1,356, or 44.8 per cent, were white; 1,636, or 54.0 per cent, were Negro; and 37, or 1.2 per cent, were "other." Considering their proportion in the total population, this means that Negroes are overrepresented among the executed by about 550 per cent.

This is the same figure as found in the period 1937–50, the period for which

[8] Lewis E. Lawes, *Life and Death in Sing Sing* (1928), pp. 155–56, 160.

[9] Thorsten Sellin, "Common Sense and the Death Penalty," *Prison Journal*, October 1932.

[10] North Carolina Board of Charities and Public Welfare, *Capital Punishment in North Carolina*, Special Bulletin No. 10, Raleigh, N. C., 1929.

national figures are available by both offense and race for the individual states. Table 3 presents the data for the 1,861 persons executed during these fourteen years. Of this total figure, 41.6 per cent were white, 57.2 per cent were Negro, and 1.1 per cent were "other."

All the executions for rape occurred in the South with the exception of 3 in Missouri. Nevada and the federal jurisdiction, in which rape is also capital, had no executions for such a conviction during this period.

There were 13 women executed during the period 1937–50. Of these, 4 were white and 9 were Negro. For the period 1930–50 there were 21 women executed in a total of 3,029. It thus appears that, although Negro women are executed about twice as often as white women, the disproportion in favor of women as a whole is overwhelming. It seems that in this country, capital punishment has simply fallen into disuse for women. This appears also to be the case for all the American and European countries, and for others too numerous to list.

The selectivity of the death penalty on a racial basis is shown again in the matter of minors executed. During the seven years 1940–46 there was a total of 81 persons executed shown as "less than 20 years old." Of these, 20 were white and 61 were Negro. In March 1951, when the present writer visited the Florida State Prison at Raiford, there were 2 white and 9 Negroes in the death house awaiting execution. In April 1951 the United States Supreme Court ordered a retrial of two of the Negro youths. One of these was shot to death and the other seriously wounded, by the sheriff, as he was transporting them from the State Prison to jail for retrial.

States charged with racial penalty

The executions on convictions of rape have led to the charge that this is a racial penalty directed against Negroes. A recent notorious case which occasioned this charge was that of the "Martinsville Seven," or "Martinsville Rape Cases." Seven Negro youths were found guilty in 1950 of raping a white woman in Martinsville, Virginia. They were sentenced to be electrocuted in February 1951. The National Association for the Advancement of Colored People conducted the defense. It filed a brief in the Supreme Court of Virginia and in the Supreme Court of the United States, in which it argued that execution for rape is a racial penalty in Virginia directed against Negroes.

The association's figures were never questioned. These figures showed that no white man had ever been executed in Virginia for rape, although 809 white men had been convicted of rape since 1909. One of these men received the death sentence, but this was commuted to a life sentence by the governor; he was later pardoned. During the period 1909–49 Virginia executed 52 Negroes on conviction of rape, not including the "Martinsville Seven," who were executed in 1951 after an adverse decision by the United States Supreme Court.

A similar charge has been made against the state of Louisiana on the basis of its selective enforcement of the death penalty for rape. Negroes are prosecuted on a charge of "aggravated rape," which carries the death penalty. Whites are charged with "simple rape," or "carnal knowledge," which can carry a sentence as short as one year. During the period 1900–50 there were 40 Negroes and 2 white men executed in Louisiana for rape, with no execution of whites on this charge since 1907, and no death sentences imposed upon whites for this offense, to be commuted, since 1918.[11] These comparative figures have led to the claim that Louisiana operates under a concealed "Black Code."[12]

The District of Columbia

The discussion of the tendency to the selective enforcement of the death penalty can best be summarized by a quotation from the House Committee on the District of Columbia, which reported favorably on a bill to abolish the death penalty in the District:

> As it is now applied the death penalty is nothing but an arbitrary discrimination against an occasional victim. It cannot even be said that it is reserved as a weapon of retributive justice for the most atrocious criminals. For it is not necessarily the most guilty who suffer it. Almost any criminal with wealth or influence can escape it, but the poor and friendless convict, without means or power to fight his case from court to court or to exert pressure upon the pardoning executive, is the one singled out as a sacrifice to what is little more than a tradition.[13]

PRIVATE EXECUTIONS

The sixth trend away from capital punishment is the exclusion of the public from executions. Executions were public spectacles until 1862 in England, and until the 1930's in several American states. The crowds often assumed the characteristics of a mob, and often indulged in the wildest and most unrestrained orgies. These exhibitions have often been described.[14] Long before executions were made private, it had become abundantly clear that public executions had completely failed in their avowed purpose, which was simply to deter others from the commission of murder and other capital crimes.

In this country, the state of New York was the first to discontinue public hangings, in 1835. One by one all the states have followed this example. Kentucky appears to be the last state to have taken this move. Federal executions are not public; it is not clear when this policy was adopted, but it was some decades ago. The Parliament abolished public hanging in England in 1868. Executions in France are technically public. The spectators, however, are kept at such a distance from the scaffold by a police cordon that but little of the proceeding can be seen.

In the various jurisdictions of this country, in Canada, Great Britain, and many other countries, the number and the type of witnesses to executions are highly restricted, according to the provisions of the statutes establishing the various crimes.

A few years ago the executioner of the states of New York and Pennsylvania urged that the prosecutors and judges involved in death sentences be obliged to attend the execution of those sentenced through their efforts and in their courts. His opinion was that

[11] Oakley C. Johnson, *Is the Punishment of Rape Equally Administered to Whites and Negroes in the State of Louisiana?* New Orleans, mimeographed, no date; probably 1950.

[12] There were 335 recorded lynchings in Louisiana during the period 1882–1948. About one-quarter of these involved allegations of rape. Lynching cannot, of course, under any circumstances be equated with a legal execution, but there are these figures available: there are about 84 illegal killings of Negroes with an allegation of rape, and 40 executions of Negroes upon conviction of rape, in contrast to 2 executions of whites on this charge, with no execution since 1907. It may be significant that one of these two white men was a foreigner to the United States, and the other a "foreigner" to Louisiana.

[13] House of Representatives, 69th Cong., first sess., *Report No. 876* (April 14, 1926. To accompany H. R. 4498).

[14] See, for example, William M. Thackeray, "Going to See a Man Hanged," *Fraser's Magazine*, Vol. XXII, August 1840; George Ryley Scott, *The History of Capital Punishment*, London: Torchstream Books, 1951.

even fewer than at present would be given the death sentence. Perhaps the legislators who enact the laws should also be required to attend the executions resulting from their legislative activities. On this point, Lawes says:

> Strange to say, I have never received a request from a district attorney to witness the execution of the man whom he prosecuted, or from a judge to attend the execution of the man whom he sentenced. Under the law, invitations must be sent to the judge and the [New York] Supreme Court of the district from which the condemned man was sentenced, also to the district attorney who prosecuted, as well as the sheriff of the county. It is not, however, obligatory for them to attend. As a rule, they do not.[15]

If capital punishment is to have the deterrent effect it is alleged to have, it is surely illogical to kill the convicted person in private, witnessed only by persons who are in the least need of seeing such a spectacle in order to deter them from murder or from the other capital offenses:

> . . . is it necessary as an example to others to kill the murderer? If it is, why surround the act with so much secrecy? It is surely not a deterrent example to perform an act furtively. If the state really believes that execution is necessary to deter others, it should execute openly and unashamed. Does not this furtiveness carry the suggestive thought that the spectacle of legalized killing by the state breeds on the part of the unthinking masses a hardened outlook toward murder which is harmful rather than effective as a deterrent? [16]

SWIFT AND PAINLESS EXECUTION

The seventh pronounced trend in the use of capital punishment is the adoption of relatively swift and painless methods of execution in place of prolonged torture. Of the 44 jurisdictions in this country which authorize the death penalty,[17] the following means are used: electrocution 25; hanging 9; lethal gas 8; choice (shooting or hanging) 1; Federal, means adopted by state in which execution occurs, 1.

It is unnecessary here to picture again in any detail the often-described, revolting, and sadistic methods of execution which man has used during his history. It can be credited to democracy that its development in the past two to three centuries has resulted in the complete discard of these bloody means of execution. In many cases the old laws remained on the books for decades, dead statutes whose enforcement was resolutely refused by the courts.

Such, for example, was the case in England prior to the revision of its penal code in 1835. Samuel Romilly vainly tried to persuade Parliament in 1814 to adopt simple hanging as the cost of treason in place of the then penalty of hanging, cutting down alive, disemboweling, decapitation, and quartering the body. This penalty had not been imposed for more than a century prior to 1814, but Parliament refused to legalise the change, because its members feared that treason would increase if the law were formally modified.

Today, a hanging is completed within a half-hour. Formerly, hanging was not limited to the period necessary to produce death. The custom was to hang the corpse in irons, to allow it to decay and be eaten by birds. Sometimes the corpse was dipped in tar prior to hanging it, so as to preserve it from the elements. In such cases parts of the skeleton would hang in chains for years. Hanging corpses were so common that they were part of the scenery, and landscape painters often included them in the background in their paintings. The prolonged hanging of corpses was formally abolished in England in 1835.

A partial inventory of methods of capital punishment includes burning at the stake, boiling in oil, boiling in water, the iron coffin, burying alive, breaking on the wheel, drawing and quartering, decapitation, impaling, hanging, crushing, flaying, shooting, exposure to insects, poisoning, throwing to animals, stoning, drowning, torturing, electrocution, asphyxiation. All of these methods were ingeniously varied. Mayhem, such as the amputation of one or both legs, was often a means of capital punishment.

Electrocution

In contrast to the prolonged agony of the older methods, electrocution is completed in five minutes. Here is Warden Lewis E. Lawes's description:

> It takes but a matter of a minute for the executioner to apply one electrode to the calf of the right leg and another to the crown of the head, while three prison keepers fasten the straps pinioning the arms, legs and torso. The final strap adjusted, the executioner—who has now taken his place in the alcove—throws the switch which sends a killing current of man-made lightning hurtling through the prisoner's body.
>
> As the switch is thrown into its socket there is a sputtering drone, and the body leaps as if to break the strong leather straps that hold it. Sometimes a thin grey wisp of smoke pushes itself out from under the helmet that holds the head electrode, followed by the faint odour of burning flesh. The hands turn red, then white, and the cords of the neck stand out like steel bands. After what seems an age but is, in fact, only two minutes, during which time the initial voltage of 2,000 to 2,200 and amperage of 7 to 12 are lowered and reapplied at various intervals, the switch is pulled and the body sags back and relaxes, somewhat as a very tired man would do. As a rule, the switch is thrown only once, but sometimes a second shock is given if the attending doctors think it advisable.
>
> Thus I have seen the tragedy enacted that has taken the lives of 114 men and one woman. There is a difference of less than five minutes in the time between the first step down the death corridor to the pulling of the switch, but it is enough to snuff out the God-given spark of life, without which what was a sentient human being is no more than a mere mass of clay.[18]

It seems that whatever deterrent effect the death penalty might have is largely lost because of the modern means of execution. The painless, rapid, solemn, and occasional execution of a murderer in the privacy of the death house is hardly designed to keep alive the terrors of death in those against whom the death penalty is theoretically directed.

SUMMARY

The trends in the use of the death penalty are solidly established in history. A study of them during the past 250 years can be summarized briefly: the over-all, international trend is toward the progressive abolition of capital punishment.

Murder as a Sociological Phenomenon

By John L. Gillin

HISTORICALLY among most peoples the murderer has been looked upon as perhaps the most dangerous member of society, certainly not rivaled by any other offender unless it be the traitor. As discussed by most criminologists, the murderer is one who kills a fellow member of his society not by accident or negligence but with purpose or to defend himself in connection with an attempt to commit another crime, such as robbery, or to shield himself from accusation by a person whom he has offended or abused. Therefore the term "murder" is more restricted than the term "homicide." That is the sense in which the term is used in this paper.

Did the limits of this paper permit, it would be worth while to trace in some detail the attempts of the various schools of criminology to explain the murderer. That survey, however, will have to be forgone.[1]

My own study of murderers was part of a larger project—a study of a sample of 486 out of about 1,700 prisoners in the Wisconsin State Prison at Waupun.[2] This study of ninety-two murderers, begun in 1930, included all the lifers in that institution save some who were discharged before the entire group was interviewed, a few who were in Central State Hospital, the institution for the criminal insane, and a few who were unable to be interviewed without an interpreter.

[1] For a brief survey of these theories see John L. Gillin, *Criminology and Penology*, 3rd ed. (New York: D. Appleton-Century Co., 1945), Chaps. XIII–XV.

[2] The complete analysis of the data gathered is to be found in my book, *The Wisconsin Prisoner*, Madison: University of Wisconsin Press, 1946.

This study of the murderers was, in a sense, a pilot enterprise, in that I had few precedents to guide me, and these were single case histories with little or no explanation as to the methods used in securing the data. Until I had tried, I did not know whether the prisoners would co-operate, or, if they did, whether I could rely on what they told me, whether I could check adequately on their statements from other informants, or just what items to look for.

Comparison showed that the murderers differed from their brothers in the following eight particulars: (1) The murderers left school earlier. (2) They had a full-time job before the age of fourteen in significantly greater numbers. (3) Fewer remained on a job for more than a year. (4) Significantly more of them (43 versus 12 per cent) felt that they were favorites of someone (mother, father, or someone else). (5) More of the married murderers and their wives lived disharmoniously than their married brothers and their wives. (6) A significantly greater percentage of the married murderers than of their married brothers had wives with more education than themselves. (7) They showed greater appreciation of their mothers than did their brothers. (8) Fewer of the murderers were farmers.

Family Background

Here is a brief listing of the most distinguishing features of the ninety-two murderers in my study.

The murderer's home was a farm home in 56 per cent of the cases. The family participated in church activities as a whole in 72 per cent of the cases, and in recreation as a whole in 53 per cent.

In seven cases out of ten he came from a family in which there were unfavorable conditions. For example, his mother worked outside the home in almost twice as many cases as the average for all the mothers in the United States during the time of his boyhood. He was thirty-four times as likely to be born a Negro, and eleven times as likely to be born an Indian, as to be born a white. Moreover, taking into account the relative proportions of these three races in the population, as compared with the other men of his age in the population of the state, he stood one and a half chances to one of being born in a home of foreign-born parents.

The murderer contributed to the family budget early. The chances were three in five that he and his brothers and sisters contributed to the family's support before they were fourteen years of age, and over four in five that they contributed before they were of age. The prisoner himself contributed in wages to family support before fourteen years of age in seven-tenths of the cases, and before he was of age in over nine-tenths of the cases. In other words, he came from a home in which the children were early shouldered with economic responsibility. This situation led him to drop out of school for economic reasons much earlier than other children.

The murderer stood not more than one chance in two of feeling that his parents were affectionate towards him. In at least one case in five he felt that his parents were cruel, fault-finding, moody, domineering, or indifferent.

There was more than one chance in three that in his family there was a history of intemperance. There was at least one chance in six that in his ancestry he knew of a history of insanity, epilepsy, mental defect, or queerness. This is about the same as the proportion found by Glueck in his study of reformatory cases in Massachusetts (17.4 per cent). He had almost one chance in four that in his family history there was some type of pathological condition.

Personal History

So much for the murderer's family background. Let us look at his own history.

He was sentenced to the state prison for life at the age of 32, an age slightly higher than that of other prisoners at Waupun. While his economic status was low, it was not lower than that of other Wisconsin prisoners. His education was about the same as that of all prisoners in the United States committed for grave homicide, but less than that of males committed for all crimes. While the Wisconsin lifer was born a farmer to a greater degree than the statistical average of all people in the state, he had less than one chance in seven of being a farmer at the time he committed the crime. In fact, in over seven cases out of ten he was either a skilled or unskilled laborer.

The Wisconsin lifer was not a professional criminal. In two cases out of three he had never had an institutional experience, not even that of an orphanage. In only two cases in twenty-two had he been in a workhouse or jail before being sentenced for murder; in only one in forty-six had he been in a prison, or in an industrial school and a reformatory; in only one in thirty-one had he been in both a reformatory and a workhouse; and in only two cases in twenty-three had he been in both a workhouse and a prison. But there was a little less than one chance in two that he had been in court for some offense, or had been arrested before. However, there was about one chance in four that he had been arrested more than twice before.

There was one chance in three that the Wisconsin lifer was single; not quite

one in two that he was married; about one in eight that he was divorced; and one in fourteen that he was widowed. Significant of the domestic situation is the fact that of the forty-two married lifers, eighteen had killed their own wives.

If married, there were almost two chances in five that the Wisconsin lifer had no children; one in eight that he had one; one in seven that he had two; the same chance that he had three; one in nine that he had five; and little more than one in twenty-five that he had either four or eight children.

In two cases out of five this Wisconsin lifer committed murder as an incident in connection with some other crime; in more than one in five, as the result of an immediate quarrel; and in almost two in five, as a result of long-standing marital difficulties or of a long-time grudge. Hence, the Wisconsin murderer is largely a criminal by passion.

Abnormal mental conditions characterize the Wisconsin lifer to a much greater degree than the other people of the state or even the other inmates of the prison. In over one case in four he was committed as insane or became insane after incarceration. Moreover, there was not quite one chance in three that his intelligence quotient was over 70.

There was more than one chance in four that he was drunk at the time he committed the crime.

CASE HISTORIES

A brief summary of a few case histories may aid in seeing the flow of events in individual lives leading up to murder in a crisis.

Loss of status

The first is the story of a young man who had come to consider himself outside the pale of society. The members of his family were the only persons he could meet as equals. All others were above him. The standards of conduct and the reaction patterns inculcated in this individual in his childhood were of such a nature as made it impossible for him to adjust himself to life outside the family group. He always carried with him an attitude of rebellion against authority. At the same time he submitted to what he considered the inevitable, not of justice but *of retaliation*. He had come to conceive of society as his natural enemy. He had no sense of a heritage in our social institutions. Revenge and the commission of antisocial acts were his method of asserting the self and realizing his dream of a complete personality.

This young man's father finally refused to have anything more to do with him. This led to the severing of a tie which hitherto had given him a sense of belonging to a family. After that he felt that the group in which alone he had status had disowned him. As a consequence, from that time on his antisocial acts grew in number and seriousness. These acts were methods he employed of compensating for the feeling of losing status.

Economic insecurity

The next case illustrates the effect of the loss of economic security. This man's parents had been well-to-do farmers in a neighboring state. They were thrifty, church members of good standing, and well thought of in their community. The son inherited the farm when he was twenty-two years of age. Through mismanagement he got into debt and a few years later lost the farm. By that time he had a wife and two children to support. After losing his position as assistant foreman in an industrial plant in southern Wisconsin he did odd jobs, earning from $10 to $15 a week.

Under the economic pressure and the lure of two acquaintances, this man assisted in the holdup of a small-town store. He sat at the wheel of the car while his two companions entered the store. The storekeeper resisted, and one of the two shot and killed him. The prisoner probably did not intend to engage in what turned out to be murder, but with the other two he was sentenced to prison for life.

The two other men had a different history. They likewise were business failures, and had been engaged in holdups for some time. One of them was an ex-convict, and the other had drifted into what he considered an easy way of making a living.

Immigrant culture conflict

In two cases we see the influence of the conflict of cultures in the case of the immigrant. One of these had a dependency record for his family for seven years before the crime occurred. He was slowly losing economic status chiefly because of a growing family and low wages. Furthermore, according to the standards of the immigrant group to which he belonged, the crimes of which he had been guilty before, like bootlegging, were not looked upon as crimes. He had lost his self-respect through a continued hand-to-mouth existence, had become dependent upon social agencies, and had become quite negative and resistant to the efforts of the social agencies to solve his problem. Crime was the means he employed to regain the respect of his small social group of nationals. Here is the conflict between the standards of a group within society and those of the larger society.

Bad temper and marital conflict

The following case throws light upon the early development of one of the lifers. In this case the home was economically good. This boy lived on a farm, in a family which enjoyed a good reputation. The home was more cultured than that of most others in the community. The record shows that because he dressed better than other boys in the community he was teased a good deal. The mother especially was an unusually cultured woman for the neighborhood. She was a university graduate.

This boy's early recreational interests were wholesome, chiefly of the out-of-doors sort. In his later boyhood his father and mother did not get on very well, and the boy was very much closer to his mother than to his father.

When the United States entered the war this young man enlisted in the Navy. This gave him a broad experience and introduced him to women of his own age. He did not bear the discipline of the Navy well, and got into trouble a number of times while in the service. He had always had a quick temper and was often in personal difficulty with his associates.

After discharge from the Navy the subject married a widow, with whom he had constant difficulties. His wife became pregnant, and, not wanting a child, induced him to secure a doctor for abortion. This caused a great emotional upset in the husband. Other serious quarrels occurred and separation took place for a time, but he returned later to live with his wife.

The wife's sister seems to have interfered in the situation, and was partly responsible for the outburst which led to the crime. The man was served with a notice by the deputy sheriff to vacate his wife's apartment, and was so angry that he took a gun which was in the house, intending to shoot his wife and then himself. He shot at his wife but the bullet struck and killed the little son of the wife's sister and seriously wounded his wife.

The violent temper which this man had shown all his life, the incompatibility between his wife and himself, due to the different way in which each had been raised, the clash between their respective religious and emotional backgrounds, his contempt for education and her desire for it, their differences with respect to the matter of children, all brought to a crisis in the attempt to oust him from the apartment, led to the crime. To all intents and purposes this man was a wife murderer. His emotional involvement with his mother, his erratic temper, and the provoking circumstances of his married life formed a combination which inevitably led to the crime.

Degeneracy

In the next case also, murder grew out of a sexual situation. However, the background was entirely different. This man was of very low grade intellectually and was physically a very unattractive person. He grew up in a home environment economically poor and without many of the cultural advantages. His father did not believe in education, and the boy attended school only a part of the winter for three or four years. His father was a strict disciplinarian and seems to have been rather savage in his punishment of the children. The father was a drinking man and seems not to have been of much higher intellectual capacity than his son. There is no question that this boy with an I.Q. of 55 was handicapped for proper social adjustment.

Because of his poor physical appearance and his lack of intelligence this youth was an easy prey of loose and designing women in his community. The evidence shows that he lived for a time with a degenerate woman in the neighborhood who used him as a kind of servant. After leaving her he formed an attachment with a widow who had a grown son and a brother who owned some property. There is evidence that this woman used this feeble-minded man to kill her brother in order that she might get the latter's property. Not only was this man feeble-minded, but he was subject to light epileptic seizures. His confession, however, shows that he killed the woman's brother partly because he did not like him, but more especially because the woman told him to do it. Clearly this is a case of feeble intellect and physical unattractiveness—both preventing normal family life—irregular sexual relationships, drink, and suggestion by another.

Social inadequacy

A final case is that of an individual somewhat mentally deficient. He was born in Germany and at the age of four years came to this country with his parents. When he was five years old his father was killed, leaving three small children for his mother to care for. Two years later she remarried. Her second husband was a man with two children. This boy did not get on well with his stepfather, who worked the children long hours and denied them many of the pleasures and advantages that other children in the community enjoyed. He objected to their going to school, and when they got old enough he was constantly trying to dissuade them from going to dances, parties, and other amusements in the neighborhood.

At the age of about thirteen or fourteen this boy left his home and went to work for a nearby farmer. Thereafter he was home only occasionally, simply for visits. After working for farmers in the neighborhood for some time he went to work in a sawmill and then proceeded to deal in real estate, buying land, improving it, and then selling it. He was a hard worker, and since he was unmarried, he kept house for himself. At the time of his trouble he had cleared $5,000 through his real estate operations.

In the communities in which he lived and worked, this youth had always been regarded as queer. He got along, however, better with children than with older people. He was unattractive physically, and his low mental development probably led to his remaining single. However, in compensation for his inability to attract the attention of young women, he developed an interest in young girls. He drank a good deal, usually brewing his own beer. He pleaded guilty to a charge of killing his sister-in-law, although he claims that he was drunk at the time and does not remember anything about it.

This case illustrates a murder growing out of the reactions of a boy with an I.Q. of only 60 to a social situation which his feeble mind prevented him from analyzing carefully. It also prevented him from foreseeing the consequences of his acts. In addition to that biological deficiency, the home conditions were unfavorable to the development of wholesome reactions. Led to feel that he did not belong to any family and that somehow he lacked something which would make him attractive to the opposite sex, he found an outlet for his sexual nature in attentions to young girls, which attentions were resented by his brother's wife. With that combination of unpromising conditions there was linked an addiction to alcohol which precipitated the attack upon the woman who interfered with the fulfillment of his fundamental wishes.

John L. Gillin, Ph.D., LL.D., Madison, Wisconsin, is professor emeritus and chairman of the Department of Sociology and Anthropology at the University of Wisconsin. He was formerly president of Ashland (Ohio) College and professor of political economy and sociology at the State University of Iowa. He is author or co-author of numerous works, among which are Criminology and Penology (1925, 1946), Taming the Criminal (1931), Introduction to Sociology (1942), The Wisconsin Prisoner (1946), and Cultural Sociology (1948).

Study in Murder

By Ralph S. Banay

EVER since Cain earned "the primal, eldest curse," society has grappled ineffectively with the perennial problem of murder. Felonious murders or other types of homicide occur in the United States at the rate of at least one every forty-five minutes. In spite of the threat of capital punishment or long imprisonment, the toll of homicide continues to grow.

Public Is Conditioned to Murder

Indeed, it is no exaggeration to say that, except for maintaining the traditional legal penalty for taking another's life, the society we live in almost reaches out to encourage murder. What is the commonest topic in the so-called comic books which children read? What is the focal event in the mystery stories sold by tens of millions annually? What is the very stock in trade of television and radio drama and, to a less extent, of film and stage "thrillers"? The gun is perhaps the commonest toy; a travesty of killing, the most popular form of play. "This will kill you" is a polite conversational cliché. "Drop dead!" is a devout injunction heard constantly. A psychologist studying our culture might fairly deduce that we are obsessed with the idea of sudden, violent, and retributive death.

Murder, of course, is the very essence of drama; book and play have always found dalliance with death a sure formula for profitable popularity. But no generation prior to ours has taken so intimate or universal a role in foreshortening doom, in fact or by fantasy. It would seem that the decreasing percentage of the population that is not actively engaged in killing is occupied a good part of the time in musing upon the murder theme. The mind being the delicately suggestible mechanism it is, can we wonder that people so often carry into effect the violent action pattern that is so persistently entertained in thought?

Cultural Classification

Classifications of murder lend themselves to such variety that the nature of homicide and the motives for killing can be assigned to an infinity of divisions. However, it is helpful to approach the questions of motivation and explanation first by considering that violent actions, like murder, are carried out on one of three levels—subcultural, cultural, or supercultural.

By subcultural one means that level of feeling, thought, and action in which the individual is accustomed to, and perhaps is incapable of adjusting to, the criteria of our culture. He has the mental equipment to gauge his situation accurately, but the ethical perception is dulled or remains undeveloped because of his family or community setting, which entered into the formulation of his personality. A person in this subcultural group is perhaps more likely to get into situations where violence may occur, and has less innate equipment for keeping his violent tendencies in check, than most of us.

The cultural level is that of people whom we euphemistically and empirically consider to be normal: persons with a fair endowment of physical and mental attributes and sufficiently fortunate to have good home breeding and a fair education. These are the people who might rationally be expected to be law-abiding and to live according to high ethical standards, since they presumably are accustomed to the cultural restraints and codified inhibitions of an intelligent society. Yet this is precisely the group that is being conditioned, from childhood onward, to accept murder as an amusing, intriguing, or challenging topic and to palliate the prohibitions and punishments set up against it. On the cultural level, therefore, the restraint on spontaneous violent impulses becomes less effective and the indulgence of explosive behavior tends to become more common.

The supercultural group is made up of those persons whose natural endowment and social and educational privileges put them above the crowd; they are men and women of achievement and superior intellect, members of professions, business executives, successful artists and artisans, and the people attached to their set.

Here again, social station is no proof against explosive behavior. In many of these persons the plexus of inhibitions by which their lives are regulated is so rigidly maintained that little or no outlet is left for the natural impulses of aggression. The time may, and often does, come when these pent-up forces are suddenly liberated by accidental circumstances, resulting in a violent act or train of conduct quite inconsistent with the person's ordinary nature. Among these people, too, an attitude toward murder of objective detachment, amounting almost to callousness or indifference, may tend to facilitate a lowering of the threshold of effective inhibition.

A Subcultural Case

First let us see a few pages of the analysis of a man of the subcultural group. He was serving a prison sentence for homicide when he came to the psychiatrist for aid:

I am in terrible distress concerning my family and I hope to God that you will be able to help me. My mother and father died when I was a small boy and all of my life I wanted to love someone and someone to love me and have something to live for. As sinful as it may be, through my common-law wife God has granted me that opportunity. When I was outside I suffered and sacrificed and my heart and soul was crushed more than once to hold it. My wife has fallen back into her sinful life again through her wicked mother. When I tried to correct her, the best I could from here, she stopped writing me, and I wrote her three letters begging her to please write me about my kids, and if she didn't want to write me any more, to go by my friend and tell him to write me about my kids. But she wouldn't even do that.

My mother-in-law was a prostitute from the old school which her police record will show. She wants her daughters to be the same. She has two. One was successful, which her record will show. She sent my wife to me for that purpose, but as I could see she was a nice girl and didn't belong in that racket, I explained to her what she was and what her mother was doing to her. She cried and thanked me and told me she would never do that again, and she didn't as long as I could keep her from her mother.

I asked her to marry me before our baby was born. She told me yes, but when she told her mother about it, her mother asked me out of the house. I asked her to come with me, because I loved her and wanted to marry her. She wanted to come, but her mother started crying and she stayed. Unknown to us all, she was with child. She sent for me and I went to her house to see her. She was four months, and her mother told me she wanted me to destroy that baby. If I didn't I would be sorry as long as she lived. I told my wife I still loved her and wanted my baby. Her mother cursed her with some awful name but she left with me, and never wanted to see her mother again. I talked her out of that to my sorrow.

Her mother hated me from that day and never ceased to do me harm, by making my wife do wrong and by teaching her never to trust a man. She even made my wife forsake my kids once to meet a man and while she was gone the house caught

fire and no one was with the kids. Some people that knew me told the firemen about my kids and after two of them got hurt, they saved them. I came home from work once and she was in an empty apartment with the janitor laying on the floor. Her mother had told her his sister wanted to see her down there. Her mother told her about a fellow once next door who wanted to meet her and had plenty money. She met him in his kitchen on his washtub.

So after her mother left my house we were very happy until I got into this trouble and she had to go live with her again. When I last saw her she promised me that she would stay nice and leave her mother's house as soon as she could. She is very weak and will do good as well as bad when she is asked. She hasn't any power at all over her mind or body and is a very pitiful person. She has broken her promise to me and is running around with people that she did wrong with before. Because they come to her mother's house to drink whiskey and have a good time. One Sunday I was supposed to meet her at church at 3 o'clock in the afternoon. I waited for her until 9 o'clock. She didn't come, so I went past her mother's house. She was drunk. All of her family was drunk, and she was in the room with my kids with someone else.

She is one of the strangest persons in the world. I believe there is nothing in the world that she wouldn't do if you would ask her, even commit murder. But if you spoke harshly to her it almost killed her, even when she had done wrong. As long as a man gives her a few pennies to play "numbers" with, he can do anything in that house to anybody, even my kids.

Analysis

This man, although belonging to the inferior cultural group which his style of life testifies, was physically and mentally sound. He was credited with average intelligence and made a good economic adjustment by working as a laborer, porter, and longshoreman. He was highly sensitive from early age. This condition probably arose from the fact that he lost his parents when he was very young, and that his schoolmates passed remarks regarding his long head and also his stuttering. He tearfully remarked that he was chided with a well-known sadistic rhyme, "Kelly, Kelly, big head and no belly." This also explains the fact that he was touchy and easily provoked. He had definite inferiority feelings which he sublimated in two directions—the normal one, which is shown by his great sense to do justice and reform others, and the abnormal one, which was expressed through his assault when provoked.

The circumstances of the homicide were subconsciously related to his problem with his common-law wife, his efforts to reform her, and his frustration. He was working on the docks, and coming home from work one night he was approached on the street near his home by a woman who asked for a cigarette. After he gave her the cigarette she tried to solicit him. He called a policeman. The next evening, coming home from work, he saw the same woman with a male friend apparently waiting for him. The male friend jumped on him and struck him. Our man, in fury, stabbed his assailant to death with a knife.

The incident that led to homicide released a displaced anger about his prostitute common-law wife, whom the other prostitute symbolized, and he saw the male protector in the role of the protective mother-in-law, whom he subconsciously wanted to kill.

SUBCULTURAL CHARACTERISTICS

In the subcultural group fall most of the acquisitive or felonious murders where killing is done for purposes of robbery or gain—murder committed in the course of robbery or to forestall detection of guilt, violent murders by organized criminal groups of rival gangsters, of offenders against the gangland code, of persons in a position to betray gangs or their members to the law, of others who may get in their way during the commission of crimes, and of victims for whose removal the gang or its members may be hired.

A significant finding in this group was that among twenty men convicted of murder in the first degree, eleven had mental ages of 9.6 to 11.5, the I.Q. ranging from 65 to 77; while the mental ages of nine were from 12.3 to 19.1, with I.Q. from 82 to 127. The percentage of borderline or less intelligence among all other criminals in the same prison was 25, while the group of first degree murderers in the prison produced 50 per cent borderline intelligence in the same group.

The other relevant finding was that ten of the twenty were excessive alcoholics, and sixteen of the twenty were unemployed at the time of the crime and none of them were skilled in any trade. All of them showed low educational levels, only two having progressed beyond the eighth grade of public school. Combined figures show that these individuals fall below the intellectual, occupational, and educational standards of the total prison population.

Even in this so generally accepted grouping of organized crimes and gang activities where murders are systematically carried out, even the executioners of the notorious Murder, Inc., as shown by psychiatric studies, had their individual determinants which predestined them, within their cultural setting, for the specific function they performed.

THE SECOND LEVEL

Murder committed by the average man in the street—a product of our culture—belongs to the second level. It is usually a result of an emotional smoldering which suddenly flares up into a violent explosion. There is an accumulation of hostility to the saturation point on the conscious level. The superego, which censures the action of the ego, is weak as a result of the lacking or rejected authority symbol. In this case the road is wide open to the primitive forces of the subconscious, which enhance the aggressive ego drives and effect a violent act.

A salesman, described as a happy-go-lucky type and so competent that his employer was able to dispense with the services of several other employees, one day killed five of his in-laws and wounded four others in a bloody attempt to wipe out his wife's family. At the trial, the counsel for the defense told the jury in his summation that he had called no psychiatrist to the stand because he agreed with the prosecution that "the offender was sane."

The psychiatric study of this case, however, found a foreboding chain of events in the personality, practically from birth to the commission of the act, indicating the psychodynamic development of this eventual massacre. The case may appear unusual or uncommon only because the focal points are in such dramatic relief. However, these elements—the long-standing frustration, anxiety, and building up of the aggression—are common characteristics of homicide in this group.

Preschool and school life

A series of unforgettable impressions entered this man's character formation. He was told that at birth, while his mother hovered between life and death, he had been given up as dead. He had been revived from asphyxia and his mother had recovered, but the story of his birth became an unforgettable memory.

Home surroundings increased the intensity of the horror aspects of this birth story. The lower part of the

house in which the family lived was used by the boy's father as an undertaking establishment, where as a child of four or five he watched, horror-stricken, as his father and uncle embalmed the dead. The impression of lifeless bodies, the tears and wailing of mourners, the foreboding atmosphere of the mortuary, conditioned his mind to the presence of death long before he was able to learn the alphabet, let alone understand death.

Other aspects of the home situation set the boy apart, in his own mind, from his brother and sister. His brother, subject to frequent illness, was favored by the mother, while his older sister was his father's pet. As a result, he felt forlorn and rejected. This feeling was intensified when, as he grew older, his father beat him for the slightest infraction. By the time he was ten he struggled to free himself from unhappy home surroundings and father authority by running away. At the age of twelve he was picked up in a New York railroad station—miles from his home—asleep, penniless, hungry, and cold.

The preschool childhood unhappiness was greatly increased by the lad's early school experiences. Try as he would with his studies, he could not keep up with other boys. Although he was their equal in mathematics, he could not learn to read and write as well as they did. This failure became more acutely tormenting when his teacher, unaware of the reaction it created in his mind and emotions, called upon him to read aloud to the class. When he faltered, the class laughed. This embittered and humiliated him to such a degree that he often burst into tears and ran out of the classroom and home to the comfort and sympathy of his mother.

In school the unhappy boy's defensive steps to avoid the sneers and laughter of classmates turned to truancy. Sent to a disciplinary school for punishment, he was eventually returned to his own school, bearing the new stigma of having been sent away. Friendless and rejected by his social group, he tried to compensate himself in illegal and aggressive actions. Having gone through a great deal of abuse and humiliation from his classmates, he learned that the only way he could defend himself was to beat them to the punch. He developed a provocative and pugnacious attitude, taking pride in his physical power. In one fight his nose was broken, and in another he fractured the metacarpal bones of his right hand in striking a blow to the head of an opponent. He said: "I used to go to school and never bother anyone. A lot of the people thought I was a sissy and picked on me. I didn't like to fight. I was afraid I'd hurt somebody."

Marriage and army life

The feeling of rejection persisted. At the age of seventeen (he falsified his age to get the license), in his blind search for love, home, and recognition, this youth married a sixteen-year-old girl. This immature, impulsive act brought, in time, serious results.

When he was inducted into the Army at the age of eighteen he established a pattern of aggression and belligerence. He could not accept the rigor, discipline, and hardship of army life. Two months after his induction he went AWOL, returned home, but gave himself up almost immediately. On his return to army life he became involved in even more serious infractions of regulations. More and more he felt that he was surrounded by a hostile world in which people took advantage of him unless he stood up and fought for his rights—"beat them to the punch." With confidence in his physical power, he was unable to restrain himself when authority demanded that he live in a highly disciplined environment. On the slightest provocation he went into a rage; everything went black before his eyes, and before he realized what he was doing, he was involved in assaults upon his superiors.

His immature and impulsive marriage became his dominant irritation, increasing his feeling of rejection and failure. His wife had given birth to a child some time after his induction, and he learned that she had gone to live with another man. He began to wonder about the paternity of his child, and the doubt became more acute after his wife divorced him.

Second marriage

Shortly after his release from service, while working on the house of his future father-in-law, he became acquainted with his future second wife, a girl for whom he felt a very deep affection. At the invitation of the girl's mother, he began working on their farm, receiving only a nominal salary. After working there several months he married the girl, but, at his mother-in-law's insistence, remained in the in-law's home, where he continued to work. But now the $15 salary he had received was stopped to pay for his and his wife's lodging and food. He was forced to ask for every dollar he got. It was given only after belittling remarks, grumbling, and dissatisfaction. "If I'd wanted $1.50 I'd have to go ask for it. If I'd go ask her, she raised hell. She said I didn't do anything but smoke, but I used to work."

He was unable to adjust himself to the closely knit and ruled home of a matriarchal mother-in-law. The authority was so complete that after his marriage the mother-in-law went along with him and his wife to Atlantic City to select the room in which they were to spend their honeymoon.

Two children were born of this union, and as they came along he felt more and more trapped. When he expressed a desire to get away and establish a home for his wife and children, his mother-in-law would say: "You can go, but my daughter and the children will stay." Dissatisfaction grew into an open break when he obtained a job in an electrical outlet store and moved away. He tried to rent a place for his family and entice his wife and children to come and live with him. All his efforts failed, however, and instead he was ordered not to visit either wife or children. He appealed to his father-in-law, but was warned: "If you come home I'll blow your head off." His wife, as an obedient daughter, followed her parents' instructions and rejected him.

He turned to his relatives and asked them to keep him company in the store, but even this afforded no relief. He brooded more and more. Eventually he was unable to eat, and sustained himself on coffee alone. At times even that would not stay down. He began to tell his employer that he wanted to quit his job. Then one morning he stayed home from work and sat on his bed or walked up and down in his room, brooding. He was afraid that if he did not see his children they would forget him. All the emissaries he had sent to intervene in his behalf had failed; four attorneys he had consulted could do nothing. Everything had failed.

The climax

Suddenly on this day, as he paced the floor or sat brooding on his bed, an upsurge of hostility and frustration told him to take matters into his own hands. If he could not see his children he would at least frighten his in-laws. He put three revolvers in his pockets, threw an army carbine into his car, and drove to the house where his family lived. There was a short conversation with his father-in-law. "No," he could not see the children. "Throw him out," urged the

mother-in-law. Then his wife appeared and he pleaded: "Do you love me?" "You are crazy," she answered.

That was the fatal moment. He pulled his guns and shot several people in the house; chased his mother-in-law to another house, shooting at anyone who came between them, and shot her. Then he drove to other relatives of his wife and shot them. The love that he claimed he had for his wife turned to hate, and its volcanic explosion engulfed her whole family in a mass murder.

Psychiatrically this catastrophic occurrence is no different from the murder in hot blood of one person who was loved; but instead of one fatal wound, thirty or forty are inflicted in an upsurge of fury. In this case, the homicidal fury was spread from the beloved to the beloved's whole family. They were one.

THE SUPERCULTURAL LEVEL

In the supercultural group, when murder is committed, it is done in a triggerlike action as though short-circuiting the higher cerebral centers. The impulse strikes without warning, with lightning speed, and against a person one would least expect. In contradistinction to the earlier group, there is no conscious building up of hostility to the point of saturation. The drama is enacted within the depths of the personality, where inhibitions have been universally repressed; so when liberation occurs, it does so with the force and destruction of an earthquake.

When the drama of the act and the subsequent trial dies down, a psychiatric study can painstakingly reconstruct the forces that were responsible for the act and can bring into focus the proper relationship of cause and effect.

How can one understand a murder so puzzling as the case of the 53-year-old president of a great industrial firm who shot and killed his friend and partner whom he had known from boyhood and with whom he had been associated practically throughout their lifetime? They and their families maintained a most amiable and cordial business and social relationship. He himself could not account for the act, except that the partners had had some discussion concerning the settlement of a compensation award granted to one of their employees. The president felt that his partner had not represented him potently enough at the compensation hearing.

The discussion took place in the inner office of the president, in the presence of two other partners, who testified that neither the nature nor the vehemence of the discussion had been excessive. At one point the president left the room, went to an adjoining office, and asked for a revolver which was kept in the safe as a precaution against payroll robbery. When it was handed to him, he fired a shot in the outer office, then returned to his room, shouting that he was "going to show" his partners. With that he fired three bullets into his friends, who succumbed immediately. He walked out and went to a neighborhood bar, had several drinks, and returned to his home. The next day he surrendered to the police.

This man came from a highly respected middle-class family, received a good preparatory and college education, went into business for himself, and became very successful, attaining both social and business prestige. At the age of 23 he married, and he was described as having been particularly devoted to his wife until her death a few years prior to the offense. This loss shook him emotionally so much that his relatives and friends became concerned about his outlook. He turned to extreme religious devotion for solace.

In this state he received another blow when his son developed schizophrenia and was committed to a mental hospital. He became morose and despondent and began to drink to occasional excess. He was, however, able to attend to his business, but his income dropped considerably in comparison with his earnings of the preceding years.

A detailed psychiatric study of the case traced down his psychological failure. Shortly after the death of his wife, on whom he had been very dependent, the commitment of his son to a state hospital further shook his confidence and outlook. His sexual life had been at a standstill for a number of years, and he began to feel a physical decline. His generous and openhearted attitude began to change to a more scrupulous one, and he became overconcerned with finances. His shrinking income symbolized the waning of his power, influence, and potency. He began to transfer his dependence from his wife to his friend and partner. The feeling of impoverishment and infidelity, which so often is part of the involutional state, began to be projected on his partner. Therefore, a relatively small incident acted as a fuse for the underground explosion. The fear, resentment, and feeling of being betrayed by the beloved, accompanied by his unreleased sexual aggression, propelled him to reach for the gun in the performance of a symbolical assault and defense against the psychological problems that were closing in on him and were dramatized in the attitude of his partner.

PSYCHIATRY NECESSARY TO UNDERSTANDING OF MOTIVATION

The true nature of the psychological phenomena of violence which cause one human being to inflict death upon another will remain shrouded in mystery unless a detailed psychiatric study traces down the inner motivations.

The legalistic thinking expressed in the criminal law gives extensive definition and classification. Murder, homicide, manslaughter, with their subdivisions, denote the quality and the consequences of the act from the viewpoint of responsibility and culpability. Determination is based primarily on the discovery of the motive or motives, the method, the circumstances, the attitude before and after the act, and the relationship of the individual to the victim, whether the person was an outsider, a friend or relative, an enemy or an innocent victim, and whether the removal of the person was an advantage or a disadvantage to the individual. By the establishment of a motive, an understanding of the crime, at least in the legal sense, is achieved, and no more official effort is extended from or charged to the authorities to go beyond and find a deeper insight into the true motivation of the mind of the man who kills.

Acceptance in legal procedures of the motive at large is based on the presumption that, unless it is proved otherwise through the intricacies and formalities of the court trial, the individual is like any other person, who could exercise at pleasure any function he chose. There is no recognition of the fact that if he had been in possession of such perfect powers of reasoning and such ideal forces of will, he could have prevented the occurrence of the fatal act. In reality, he is in his predicament for the very reason that he was incapable of behaving like a complete man, the master of himself. However, people in general refuse to look upon him as an invalid, and find considerable gratification in obtaining for society a maximum security and protection by imposing a maximum retribution.

It is understandable that, for the protection of the community and the individual, stringent defensive measures should be applied against danger that might come from another individual or individuals. But the best defense is a more profound understanding of the in-

dividual, which can lead to adequate preventive measures against the occurrence and recurrence of threats and violence to individual life and public safety.

A scientific evaluation and classification of violent destruction of one human being by another can be made in broad lines, but beyond that diffuse grouping a true understanding of a perpetrator of a violent act against life can be achieved only in individual terms and reactions. The psychological profile of the individual murderer varies as greatly as the physical profile, and the forces that operate the personality are so varied and variable that a complete understanding of the action can be evaluated only by the study of the individual in his total functioning. It is little appreciated that the functioning of the mind, through an aggregation of perceptive and reactive tendencies, produces a multitude of combinations of sensations and movements, to a different extent and quality in different cases, and creates a diversity of psychological phenomena not measurable with other individual reactions.

Ralph S. Banay, M.D., New York City, is psychiatric consultant to the New York City Police Department. He has served variously as lecturer on criminal psychopathology at New York University, director of research on social deviations at Columbia University, and director of the psychiatric clinic at Sing Sing Prison. He is author of Youth in Despair (1948) and articles on criminogenesis.

The Murderer in the Mental Institution

By BERNARD A. CRUVANT and FRANCIS N. WALDROP

THE popular conception of the primary role of the psychiatrist in medicolegal questions is his appearance in court as an expert witness when insanity has been raised as a defense against a charge of first degree murder. Actually, this is an infrequent part of the psychiatrist's contribution to legal processes, but such instances predominate in public awareness because of the attendant notoriety and because in occasional cases rather brutal crimes have attracted a great deal of public attention and resentment. Despite our awareness of this popular fallacy, we must have been in part influenced and misled by it, for we were surprised, on surveying the literature, to discover nothing dealing with the specific question, What happens to the murderer who is sent to a mental hospital?

This essay is intended as a statistical and descriptive study of the fate of all of the individuals committed to Saint Elizabeths Hospital [1] while under charges or conviction of homicide in any degree during the period July 1, 1925 to July 1, 1951. As can be seen from Figure 1, less than 3 out of each 1,000 admissions had been accused of some variety of homicide. Chance played some role in these figures; a number of our patients had committed serious assaults, and only the inefficiency of the aggressor or the hardihood of the victim prevented a fatal outcome.

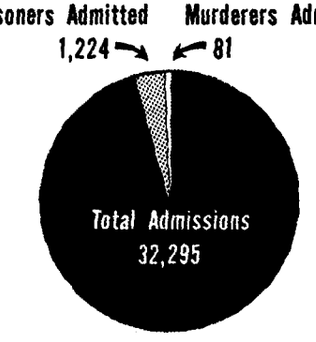

FIG. 1.—Admissions to Saint Elizabeths Hospital, July 1, 1925–July 1, 1951.

To avoid infringing on other discussants in this symposium on capital crimes and the death penalty, we shall confine ourselves, insofar as possible, to a statement and discussion of our statistical findings, including a few representative cases to illustrate certain points.

The selection of data to be memorialized by tabulation is ever subject to inherent error on the basis of bias, interest, or accessibility of the facts to be tabulated. We attempted to select such material as could be reasonably objec-

[1] Saint Elizabeths Hospital is a mental institution of more than 7,000 beds, now a bureau in the Federal Security Agency. It was established by Act of Congress in 1855 under the name of The Government Hospital for the Insane. The name was changed to Saint Elizabeths Hospital by Congress in 1916. Its purpose, in the words of Dorothea Lynde Dix, who wrote the bill, was to provide "the most humane care and enlightened curative treatment of the insane of the Army and Navy of the United States and of the District of Columbia." Primarily, the hospital provides services for the District of Columbia in lieu of a "state" mental hospital. In addition, during the period of this study, patients were admitted from the entire United States and its territories, and included insane nationals abroad, insane Indian wards of the federal government, persons from the armed services, the Merchant Marine, federal prisons, and federal enclaves, and individuals accused of crimes on the high seas.

tive, avoiding clinical interpretations or speculative conjectures whenever possible. We shall present first the statistical data under the headings of the three types of homicide, and, because one can readily overextend the conclusions drawn from statistical particularization, in the commentary that follows we shall present only the most obvious conclusions to be drawn from the material.

FIRST DEGREE HOMICIDE

In the category of first degree homicide there were 57 patients, of whom 44 were sent to the hospital prior to trial. Fifty-three were males and four were females. Ages at time of the crime ranged from 21 to 50 years, with a modal age of 34. Our patients accused or convicted of first degree murder are about equally divided between white and Negro. It is difficult to draw generalizations from these findings, since, as indicated in footnote 1, during the period surveyed, Saint Elizabeths Hospital received patients from a variety of sources.

Educational attainment did not seem statistically significant, all levels of achievement being represented, ranging from no formal schooling to college graduation, with a concentration of individuals in upper elementary school level. The majority of our patients were single; and of the seven who were widowed, all had murdered the spouse. In only sixteen cases was there an unequivocal history of excessive use of alcohol for a number of years preceding the crime. A preponderant number had made only a marginal economic adjustment. Fourteen patients had had a definite history of previous mental hospitalization.

Although our information in most of these cases is quite meager, we feel justified in stating that in extremely few cases was there anything that would enable the psychiatrist to predict accurately the subsequent capital offense. It is our opinion that the discipline of psychiatry has not yet developed valid criteria of sufficient degree of predictive reliability to justify hard and fast distinction *before* the act between the individual who is likely to commit a crime of violence, such as rape or homicide, and the one who will not ever translate his emotional conflicts into aggressive, destructive behavior. In this area psychiatric opinion represents only an informed and educated guess, but nevertheless constitutes the most reliable index presently available. It has been our experience that in no other field has the disclaimer of infallibility been met by others with so much enthusiastic approval or irritable resentment. Thus, 31 of these patients had no record of antisocial behavior, and in 17 cases there was a record of only minor offenses prior to the homicide. In just nine cases was there a record of a major offense such as a felony involving even a mild to moderate degree of aggression.

Shooting was the most popular method of causing death, possibly for a number of deeply buried psychopathological reasons, but more likely because it is simple, easy, and frequently accomplished by a weapon purchased in advance, often for protection in response to insane delusions. Next most frequent was stabbing, followed closely by bludgeoning. Strangulation and poisoning were rare.

The classification by diagnosis of patients in this group not unexpectedly shows that slightly more than half were afflicted with schizophrenia. The established diagnoses ran the gamut of psychotic and psychoneurotic conditions, but showed predominantly functional as contrasted to organic disorders.

Half of this group were equally Baptist or Catholic, the remainder belonging to various Protestant denominations or claiming no religious affiliation. There were no individuals in the entire group of patients known to be Jewish.

Disposition

At the time of this writing, 21 of this group remain in Saint Elizabeths Hospital, 7 have died while hospitalized, and 7 were returned to prison to continue serving a sentence. Eleven were returned for trial, of whom 4 were exculpated, 5 received sentences for a lesser included offense, and in 2 cases the final outcome is unknown. Six patients were transferred to other psychiatric institutions, and in 5 instances the patient was discharged from the hospital subsequent to dismissal of the charges and improvement or recovery from his illness.

The decision as to disposition of the accused or convicted murderer who is committed to a mental hospital as insane is obviously complex and difficult. The psychiatrist may be understandably reluctant to return to possible enlargement in the community an individual who has demonstrated his capacity for aggressively destructive behavior by the commission of a crime so serious as first degree murder. Thus it may have been, perhaps, that most of these individuals either remained in our hospital or were returned to prison to continue a sentence, particularly in instances where the sentence was for life or a protracted period of years.

While such conservatism as to disposition might appear justified on a common-sense basis, we have discovered no scientific validation for arbitrary rigidity. Of the limited number who were returned to jail following recovery and were subsequently acquitted or had charges dismissed and who returned to the community, there is no record of their having subsequently committed any serious crime.

Historically, there has been a change in emphasis in hospital policy toward individuals accused or convicted of murder and sent to the hospital for treatment. During the first twenty years of the twenty-six-year period under consideration, the dictates of the ancient talionic law were followed. A person accused of murder was considered to have forfeited his liberty, and, once having been found mentally incompetent and committed to the hospital, he was continued in the hospital virtually without regard to any subsequent changes in his mental condition. With the institution of a program of intensive therapy in the maximum security division of Saint Elizabeths Hospital in 1946, a considerably increased liberality with relaxation of previous rigid standards occurred. Thus, practically all the patients who were listed as returned to prison to continue sentence or returned to jail to await trial represent cases on which such disposition was made in the past six years. In no case was a hospitalized patient accused of murder returned directly to society from the hospital prior to the past five years.

In our review of the records of this group we considered that there was definite or highly suggestive evidence that the patient was of unsound mind at the time of the crime in 42 instances. This is comparable—but not identical—with the finding that 44 of these patients were sent to the hospital prior to trial. Of the 13 who were hospitalized while serving a sentence in prison, 2 became recognizably ill during the first six months of confinement, 5 between one and three years, and 6 after three years of confinement.

SECOND DEGREE MURDER

In the classification of second degree murderers there were 12 patients (10 males and 2 females), ranging in age at time of the crime from 18 to 45 years,

with a modal age of 25.5 years. Eighty per cent were in the third decade of life. All patients had had at least four years of formal education and nearly a half had finished high school or attended college. Four were married, the remainder were single or widowed; again, the three widowed patients had killed the spouse.

Less than half of this group had a definite history of excessive use of alcohol. In none of these cases were we able to establish any connection between a state of intoxication and commission of the crime. This is considered significant in that intoxication is often an element in reducing an accusation of first degree murder to a lesser included offense.

None of the patients in this group had a record of previous mental hospitalization. Six had no known previous antisocial record, two had a record of minor offenses, and four had a record of felonies. Few had an antisocial record which would have occasioned premonition as to the subsequent homicidal behavior.

Two-thirds of the cases were diagnosed as schizophrenic; the others had functional psychoses or were considered sane.

Again, as in the previous group, half of the patients claimed either Catholic or Baptist religious affiliation, and the remainder were listed under various Protestant denominations or professed no religious connections.

In this group shooting and stabbing were equally popular techniques of committing the homicide. There was one instance of bludgeoning and one of murder by strangulation.

Regarding disposition, three patients in this group remain in the hospital, one has died, and three were returned to prison to continue a sentence. Two were returned for trial, one of whom was found guilty and one acquitted. Charges were dismissed on two patients who were subsequently discharged from the hospital into their own custody as recovered from their mental illness. To our knowledge, they are adjusting satisfactorily.

In contrast to the previous group, only half in this category were sent to the hospital prior to trial. In our study of the case records, however, we considered that only a third had shown definite or highly suggestive evidences of mental unsoundness at the time of the crime. Of those who were convicted and sent to prison and then developed mental illness, in only one instance was the illness apparent during the first few years of imprisonment, and five cases in this category had been imprisoned more than three years before the illness developed.

MANSLAUGHTER

The manslaughter group included 10 patients (8 males and 2 females), ranging in age from 19 to 65 years at the time of the crime, with a modal age of 41. Significantly, the modal age here was seven years higher than for the first degree murder group and sixteen years higher than for the second degree murder group.

Educational attainment in this category was somewhat lower; three had no schooling, but four had completed elementary school, and one had finished high school. Half were married, and again the widower had killed the spouse.

In only two cases was there a history of excessive use of alcohol, and in no case was inebriation approximate to the crime.

Ninety per cent of the cases had no record of prior mental hospitalization, and half had no known previous record of antisocial behavior. In contrast, however, the five with previous antisocial records had committed offenses of a nature indicating possibly an increased proclivity toward violent behavior.

Diagnostic groupings showed a marked contrast to preceding categories in that the preponderant number were afflicted with organic brain disease, such as syphilis, cerebral arteriosclerosis, and mental deficiency. This accords well with the higher modal age.

In religious affiliation there were four Baptists and one Catholic, the remainder belonging to various Protestant denominations.

Once more, shooting was the most frequent technique of accomplishing the crime, but there was one homicide by poisoning and one by use of an automobile.

Only half of these patients were sent to the hospital before trial, but in our review of the records we believe that 80 per cent had shown almost unequivocal evidences of mental unsoundness at the time of the crime. This is suggestively validated by the fact that of the five convicted and sent to prison, three were committed to the hospital as insane in less than a year after the trial, and only two remained in prison for three years or longer before hospitalization.

Of this group only one remains in the hospital. One has died, three were returned to prison to continue sentence, two were returned for trial, and three were discharged from the hospital into their own custody after dismissal of the charges and improvement in their mental condition. None of those discharged has been readmitted to date.

DISCUSSION

What we suspect to be the popular conception of the "insane murderer" as a person who suddenly runs amuck and strikes down an unknown and unprovocative bystander is not supported by our study. It is frequently noted in the literature that the murderer's victim is seldom an "innocent participant" in his own demise. This observation seems to us to be as valid for our group, in which the murderer was adjudicated of unsound mind, as it is for the instances where the murderer was not considered insane. Thus, in our 57 cases charged with first degree homicide, the victim was previously known to the patient in 39 cases; in 12 cases accused of second degree murder, the victim was known to the patient in 9 cases; and in 10 cases accused of manslaughter, the victim was previously known in 7 cases. Even in many situations where the victim was previously unknown, his death occurred by ill chance, as, for example, the circumstance of a husband returning home, finding his wife in bed with a stranger, and killing both.

Parenthetically, none of these cases illustrates the conception of the "homicidal sex maniac." We readily concede that there are instances of "berserk insane murderers" and "insane sex killers," but these cases are extremely rare exceptions in our experience.

In connection with another popular conception, there was little evidence in our entire group that alcoholic inebriation directly precipitated the crime of homicide. In fact, the percentage of those even with a history of excessive use of alcohol, though fairly high, is not significantly different from that of the general hospital population.

Preponderantly, the patients under study had made only a marginal or dependent economic adjustment. This is in contrast to some reports about murderers in general.

Among our 81 patients, there were two who did not fit into any category, inasmuch as they had killed a nurse or physician in another mental hospital and were transferred to Saint Elizabeths Hospital without charges.

Approximately 70 per cent of the victims were of the same sex as their murderer. Therefore, males were predominantly the murderers and the victims.

Again in contrast to what we believe to be the popular notion, the "insane murderer" does not execute his crime with a more conspicuous lack of planning, motivation, or rationale than the murderer whose mental faculties are not in question. For example:

CASE 1

A 38-year-old colored male was described as timid, shy, and seclusive. His behavior was always exemplary and he had never been arrested except for a traffic violation. Drafted into the Army in 1941, he became tense and emotionally upset while in England in 1943 and was discharged for disability. Hospitalized in a Veterans Administration Hospital, he was signed out by his mother against advice.

For some time prior to admission he was noted to be increasingly sullen and suspicious, seemed unable to hold a job, and complained about the "delicacy" of his health. Following his mother's death he began to brood and expressed feelings of hopelessness. He moved into the home of his sister and brother-in-law, but lived on very poor terms with them. On one occasion the brother-in-law came home drunk and consumed some food the patient had placed in the icebox. An argument ensued, during which the brother-in-law behaved in a threatening fashion. The patient seized a .22 rifle and shot the brother-in-law five times, with fatal consequences. Immediately the patient became tense and agitated, repeating over and over "What have I done?" and proceeded to call the police and an ambulance.

In the hospital he initially made a fairly good adjustment but gradually showed more severe impairment, with the development of marked aggressiveness, alternating with states of seclusiveness and untidiness. After a few years he began to dress consistently in a bizarre fashion and kept his ears constantly stuffed with paper in an effort to prevent auditory hallucinations which had not been obviously manifest on admission.

Even in instances of what were apparently completely "senseless, insane crimes," there was often more than a thread of emotional continuity. For example:

CASE 2

A 32-year-old white male seemed to become progressively upset in anticipation of his appearance before his draft board. Three months prior to the crime he began to exhibit "antiwar religious fanatacism." On the day before he was scheduled to report before his draft board he was noted by his sister to be praying, reiterating constantly "Thou shalt not kill!"

While his sister was writing a letter she looked up suddenly and noticed that the patient had a knife poised above her head. She screamed and jumped up with such force that she tore the arm from the chair, and the patient was shoved backward. The noise awakened her husband, who grappled with the patient. After inflicting several wounds on the brother-in-law, the patient broke away, chased one of the children, who managed to elude him, and then dashed out into the street and fatally stabbed an innocent passerby. He was chopping senselessly at the top of an auto with his knife when he was finally subdued with great difficulty by an auxiliary policeman.

In the hospital he was resistive, negativistic, inaccessible, incontinent in his habits, and made repeated attempts to choke other patients. There has been a progressive increase in severity of his illness to the point of complete disorganization of behavior and mentation.

There were only five patients who had committed apparently senseless crimes. Much more common was the following:

CASE 3

A 34-year-old white male college graduate of comfortable economic status was accused of the murder of his four-year-old daughter. For some months prior to the tragedy he had been depressed and contemplating suicide. With increase in severity of his illness, he became hopeless about the future and began to worry that his illness had "contaminated" his wife and daughter.

Despite his complete obsession with this delusional belief, he evidenced careful planning in inviting them for a drive through scenic mountain country with intention of killing them and himself. When he stopped the car to permit his family to enjoy the view, he came up behind his wife and daughter with a hammer, beating them with it until the handle broke, and then struck them repeatedly with a car jack handle. When they were both unconscious, he dragged them back into the car, got in and drove off the cliff. When he regained consciousness in the wreck, he realized he had not been killed, kicked a window out of the car, took a piece of glass and cut his throat and wrist and the throats of his wife and child. When he still survived, he found a broken bottle which he also used to cut himself. When found by policemen from a state patrol car, he was attempting to set fire to the upholstery with a cigarette. Amazingly, he and his wife survived.

In the hospital he was at first quite depressed and retarded, but under treatment improved considerably and remained in good contact at all times.

In second degree murder one would, by definition, commonly expect the exhibition of marked impulsivity with evidence of great emotional turmoil and obvious mental distress as factors mitigating the degree of the crime. Yet only half of the cases in this group were considered a priori as mentally ill and sent to the hospital before trial, as compared to approximately 75 per cent in the group accused of first degree murder, the prototype of a crime involving *mens rea*. Further, although we believe that there was fairly clear clinical evidence of mental unsoundness at the time of the crime in 80 per cent of the patients accused of first degree murder, we found such evidence in only a third of the records of patients sent to the hospital in the category of second degree murder. However, where mental illness was present in this group, the crime tended to be more obviously bizarre or irrational than homicides in the other groups. For example:

CASE 4

A 25-year-old Catholic female with a sixth-grade education was accused of killing her year-old daughter. Following the birth of her second child, she had become nervous and easily upset by the infant's crying. On the day of the homicide, she impulsively seized the infant, took her into the bathroom, and there repeatedly cut her throat with a knife. Upon psychiatric examination she was confused, depressed, and disoriented. The patient had had no record of any previous mental illness or any antisocial behavior.

An even more bizarre crime was the following:

CASE 5

A 25-year-old Negro male was riding in a streetcar when one of the passengers stepped on his foot. An altercation ensued which was terminated when the patient pulled a pistol out of a small bag that he was carrying, and shot and killed the other passenger. He then calmly left the streetcar, and was not arrested until a month later. He was released on bond, and, without knowledge of the authorities, went to a Veterans Hospital in another jurisdiction, where he received electric shock therapy. He was eventually identified and sent to Saint Elizabeths Hospital.

In the group of patients accused of manslaughter, a substantially larger number were obviously of unsound mind at the time of the crime. This is consonant with the statistical finding of higher modal age and the preponderance of organic brain disease. In most instances the homicide was the result of mental confusion or defects in judgment. For example:

CASE 6

A 42-year-old white male became confused while driving his car, and, in attempting to pass a streetcar on the wrong side, he ran down and killed a prominent

banker. Upon examination he was discovered to have syphilis of the nervous system. Previous to the crime there was no record of hospitalization or antisocial behavior. The charges against him were dismissed. After intensive treatment for his syphilitic infection, he improved greatly and was discharged as a social recovery.

CASE 7

A 65-year-old white male, who had been making a marginal adjustment as a street vendor, was employed by a housewife to install a gas pipe. He was not aware of a defect in the pipe or a regulation requiring such installation to be made by the gas company. With the leakage of gas, the woman died of asphyxiation and her husband was rendered unconscious. On examination the patient was found to be suffering from marked confusion and clouding of consciousness, the result of advanced cerebral arteriosclerosis.

It is our clinical impression that mentally ill people who have committed violent and serious offenses against society are not a group apart from other mentally ill persons who have not translated their emotional conflicts into overt assaults upon others. The psychotic patients who have committed a homicide run the gamut of psychiatric disorders, and as a continuum are not clinically distinct from psychiatric patients in general. Some mentally ill patients who exhibit the most acutely disturbed and destructive behavior have never demonstrated sufficiently directed and organized aggression to kill another, while others who are quite meek and inoffensive have on occasion killed suddenly.

Further, it is our experience that the psychotic murderer responds to the same methods of care and treatment as other mental hospital patients. Maximum security and other extraordinary precautions need to be determined for each patient individually, and not on the arbitrary basis that he has been accused of a crime. One of us in a pilot study of several years' duration [2] has demonstrated that many of the security measures previously deemed so necessary for patients of this category have been based largely on preconceptions of physicians and hospital staff rather than on actual experiences with patients.

CONCLUSIONS

1. In the period July 1, 1925 to July 1, 1951, there were 32,295 persons admitted to Saint Elizabeths Hospital, of whom only 81 had been accused of some variety of homicide. These latter cases were studied on a statistical and descriptive level.

2. Homicide is an infrequent consequence of mental disorder. However, many mentally ill people may commit serious assaults and fail to kill only by chance or through inadequate design, itself also the result of the mental illness.

3. Because of the limited number of cases, few sweeping conclusions can be drawn as to the importance of such factors as educational attainment or economic or marital status. Interestingly, however, all those who were widowed achieved this status by their own hand.

4. Only 15 patients had a history of previous hospitalization for mental illness. Careful study of these case records indicated little that would have been useful, in the present status of our knowledge, for accurate prediction of the subsequent homicide, when they were compared with the unselected records of thousands of other mentally ill patients, except by *post hoc* reasoning. Similarly, the record of antisocial behavior was not considered of substantial value in predicting the specific crime. None of the patients had committed a previous murder, and only a small number had records of major offenses.

5. Alcoholic inebriation was not indicated as an immediate precipitant of the crime in any instance, and the frequency of a history of excessive intake of alcohol was not significantly different in these patients from that found in other mental patients or in the general population.

6. Most of the patients accused of first and second degree homicide were afflicted with one of the functional mental disorders, predominantly schizophrenia. In contrast, most of the patients accused of manslaughter were afflicted with an organic type of psychosis, and were, by and large, much older at the time of the crime than were the other patients.

7. Statistics as to the disposition of the mentally ill patient accused of homicide can be better understood from a study of the attitudes of the psychiatrist, or the community in which he lives, than from an objective evaluation of the patient distinguished as a distinct clinical psychiatric entity primarily on the basis of his having committed a homicide.

8. If there exists a popular conception of the "insane" murderer as a person who suddenly runs amuck and strikes down a perfect stranger, it is not confirmed by our studies. Such cases do occur, but they are extremely rare, as is also the frequency of the "maniacal sex killer" as conceived in the popular press.

9. Mentally ill people who commit a homicide do not constitute a psychiatric entity as distinct from other mentally disordered patients, and they respond in the same way and in the same degree to the identical methods of care found useful with mentally ill patients in general. Special precautions as to security and management, when indicated, must be individually prescribed for each mentally ill person, and cannot be arbitrarily decided on the basis of the previous occurrence of a homicidal transgression. That special precautions are frequently arbitrarily prescribed is, in our experience, more often than not the result of preconceptions entertained by the psychiatrist, or of social pressures, expressed, implied, or assumed.

Why Is the Death Penalty Retained?

By ROBERT G. CALDWELL

THE arguments for and against the death penalty have been analyzed, dissected, lacerated, mangled, and pulverized, in legislative halls, forums, churches, classrooms, newspapers, journals, and pamphlets, by lawmakers, orators, clergymen, lecturers, journalists, pamphleteers, and schoolboy debaters. It seems that everything that can be done to these arguments by all kinds of people in all kinds of places has already been done; and yet the controversy goes on, now and then bursting into flames as prison riots and heinous crimes deeply shock public opinion and provoke indignant protests and clamorous demands for action. In the face of this, we must conclude that the controversy has many more sides than it appears to have at first glance, and that many who have engaged in it have tended to give simple answers to problems that are very complex.

In our discussion of the death penalty it will be helpful to remember that both crime and punishment are functionally related to the culture in which they occur. That crime is so related and that it varies in kind and incidence from society to society is usually recognized; but that punishment likewise has such a relationship and that the efficacy of its methods is affected by what the people in a particular society feel, want, and believe is sometimes overlooked. We shall therefore seek to conduct this analysis with reference to the following important tendencies that exist in various degrees in many countries of Europe and the Western Hemisphere: (1) the spread of humanitarianism with its emphasis on the value of the individual, the protection of human life, and the reduction of human pain and suffering; (2) the increase of the impersonality of social relationships; and (3) the growth of the belief in the powers of science.

Capital punishment is a subject on which many people are likely to have very decided opinions, and both opponents and advocates are inclined to express their views in vigorous and emotional language. However, despite this, some arguments susceptible of analysis are used to defend capital punishment, and to these we shall now turn our attention.

THE ARGUMENT OF RETRIBUTION

An argument which is persistently advanced in support of the death penalty is that the criminal ought to die because he has committed a terrible crime and perhaps killed or seriously injured someone else. If this is not done, say those who employ this argument, friends and relatives of the victim, as well as the general public, who demand and expect satisfaction, may take the law into their own hands and try to lynch the criminal.

It is recognized that the desire to "get even" is a natural human tendency and that it exists in almost everyone, but we must inquire about the extent to which this feeling should influence our actions against the criminal. Should we be satisfied with a mere execution? Why not torture the criminal first—put out his eyes, cut out his tongue, beat him into insensibility and then revive him so that at last he will know the agony of being flayed alive and boiled in oil? If it is pain that is wanted,

why should we not make sure that we get as much as possible?

Now as a matter of fact, in harmony with the humanitarian movement, the tendency has been to make the method of execution as swift and painless as possible. Thus, in the United States by the beginning of 1951, the District of Columbia and twenty-four of the forty-two states which used the death penalty had adopted electrocution. Eight other states had provided for execution by lethal gas, and in one of the ten states where hanging was still used, the convicted person was permitted to choose shooting instead of hanging.[1] The trend away from hanging, which we see here, is due largely to evidence that it may cause a slow and painful death.

But, an advocate of the death penalty may insist, the punishment must be made to fit the crime. Well, if this be true, which crimes should be punishable with death? Should an offender who is convicted of armed robbery be so punished? Apparently only a few of the states in the United States believe so. Indeed, in 1950 only eighteen states prescribed the death penalty for so revolting a crime as rape, and only in the case of first degree murder do we find the death penalty prescribed by all states that have capital punishment. Furthermore, of the 42 states whose laws provide for the execution of criminals, 20 prescribe it for only one or two crimes, 29 for only one, two, or three crimes, and only 1 for as many as seven crimes.[2]

Thus, it can be seen that the argument for retribution in defense of the death penalty is not strongly supported in practice in the United States. In fact, it seems to be of declining influence not only in the United States but throughout western civilization.[3] However, this does not necessarily mean that public opinion no longer wants to keep the death penalty in the criminal code. On the contrary, the public strongly supports its retention in some countries. For example, this is apparently true in both Great Britain and the United States, where all but six states still use it.

Lynching and other considerations

But do the facts support the contention that if certain types of offenders are not executed, people will take the law into their own hands and lynchings will result? Although the experience of Colorado, where lynchings increased after the abolition of the death penalty and then decreased after it was restored, has been cited to substantiate this view, it is probable that the increase of lynchings there was a mere coincidence, and that the presence or absence of capital punishment had nothing to do with it. Certainly, none of the other states had a reign of lynch law after the death penalty was abolished,[4] and the number of lynchings actually decreased in Washington, Oregon, North Dakota, and Arizona after the death penalty was removed from their codes. Besides, in general, lynchings have been most frequent in the states which have continued to execute criminals.[5] It appears, therefore, that lynchings are correlated with factors other than the death penalty, and that, furthermore, since they now occur so seldom, they no longer constitute a serious problem. Thus, the possibility of lynchings need not be considered as an obstacle to the abolition of capital punishment.

Finally, it should be obvious that the demand for retribution cannot be permitted to control the policy of the state in its treatment of criminals, for this would tend to encourage and strengthen the very motives that might destroy all collective action. Of course, the injury to the victim of the crime and the interests and desires of the public must be considered, but so must the causes of criminality and the rehabilitation of prisoners; and since the abolition of the death penalty does not mean that the offender escapes all pain, any desire that the victim, or his friends and relatives, and the general public have for the suffering of the offender can be taken into consideration even if the criminal is not executed.

THE ARGUMENT OF SOCIAL SOLIDARITY

Another argument in favor of the death penalty is that an execution constitutes a spectacular exhibition of law and order which helps to unify society against crime and criminals. By providing a symbol around which law-abiding citizens can rally, the infliction of the death penalty, it is claimed, gives them renewed strength and courage to carry on the fight against crime and to furnish greater support to law enforcement officials.

Even if we grant, for the moment, that an execution does accomplish this, we may inquire whether there are not better methods of increasing social solidarity. War also helps to unify a people, but there are few who will advocate plunging a nation into war to achieve this purpose. Opponents of the death penalty may well ask, Wouldn't it be better to increase social and economic opportunities for all persons so that greater loyalty and respect might be fostered for the established standards? Furthermore, it can be seriously questioned whether executions unify society against crime and criminals. Executions are closed to the public, and no special effort is made to give them publicity. Then, too, since there is an increasing impersonality in western civilization, particularly in the United States, even serious crimes often attract little attention, and directly affect or injure only a few people. Under such circumstances, an execution can hardly be expected to exert a major influence in modern society.

And here another point may be raised. The humanitarian movement has made many conscious of the suffering of their fellow human beings and filled some with an earnest desire to reduce pain and suffering everywhere. Is it not possible, therefore, that among those who are aware that a criminal has been sentenced to death, there will be a tendency to reduce rather than solidify opinion against the condemned prisoner? May this not cause many, who would otherwise be strongly in favor of the criminal's punishment, to rush to his defense? Does an execution thus actually divide rather than unify the law-abiding members of society?

THE ARGUMENT OF ECONOMY

Some who favor the death penalty claim that it is cheaper than the cost of maintaining a prisoner for life, or for a long period of time, at the taxpayers' expense. Even though this can be shown to be true in some cases, the argument should be carefully examined. One may ask, for example, whether it is not more of an argument against the

poor management of our correctional institutions than against the abolition of the death penalty. Might it not be possible, at least in many cases, to modify our correctional policies in such a way that if a person were imprisoned instead of being executed, he could not only pay for his maintenance, but actually contribute to the support of his dependents and, if necessary, make payments to the victim of his crime or to the relatives of the victim?

Furthermore, how far should this argument be pressed? If it is valid in the case of those who now may be condemned to die, may it not also be applied to all prisoners—yes, even to all types of persons who are being maintained at public expense in our federal and state institutions? At the close of 1950 there were 167,173 in state and federal prisons and reformatories for adult offenders.[6] Thousands of these prisoners undoubtedly were not self-supporting, and therefore, on the basis of the economy argument, might have been selected for execution. Obviously, the possibility of such executions cannot be seriously considered. The humanitarian feelings of our country would be outraged, and public opinion would shrink in revulsion from the procedure.

Then, too, there is still another side of this argument that should be scrutinized. Is it really cheaper in most cases to execute the prisoner than to imprison him? In the first place, it must be recognized that although a prisoner may not be self-supporting, he can usually contribute something to his upkeep. And in the second place, it should not be assumed that the process in sending a man to his death is inexpensive. When the penalty may be death, the legal battle is often fierce and prolonged as each side struggles for an advantage. Much time and money may be spent in the selection of jurors acceptable to both sides, in the employment of experts and witnesses, and in the successive new trials and appeals that may ensue. Add to this the cost of constructing, maintaining, and staffing a suitable place of detention for those awaiting execution, and it can be seen that the cost of inflicting capital punishment may be very great—greater, in fact, than it may be to keep a person in prison "for the remainder of his natural life." [7]

Thus, an examination of the argument of economy causes much of its effectiveness to vanish, and one is left with the conviction that it cannot be given a great deal of weight in the controversy over the death penalty.

THE ARGUMENT OF PROTECTION

A fourth argument for the death penalty is that it protects society from dangerous criminals. This it accomplishes, according to those who reason in this way, by ensuring that they will never return to society to commit other crimes and to spread their undesirable hereditary traits. This is a complex argument and requires careful analysis. However, at the very beginning, we must admit that a state has the right to take the life of a criminal who threatens its security from within, just as it has the right to send its soldiers to their death in battle in order to defeat those who threaten its security from without. But we must also point to various reasons which compel us to ask whether the state should exercise this right to execute prisoners.

For example, it is clear that the possibility of releasing dangerous prisoners into the community could be reduced by improving the rehabilitative facilities of our correctional institutions and by strengthening our pardon and parole procedures. An execution, it is true, absolutely eliminates this possibility; but since it is to be prescribed as punishment for a crime, one can hardly maintain that in a given case it should be used not so much because a certain offense has been committed but because we are too lenient and inefficient in the operation of our correctional systems. To do so would appear to place one in the position of arguing that all persons who have recidivistic tendencies, regardless of the crimes that they have committed, should be executed. Such drastic action, of course, would not be tolerated by public opinion. Moreover, on the basis of our present knowledge, we cannot be sure that a person is incorrigible. Many persons who might have been executed for their crimes, but instead have been imprisoned, not only have caused little trouble while incarcerated, but have become law-abiding citizens after their release.

The late Warden Lawes, writing in opposition to the death penalty, stated:

> Murderers make the best prisoners. They are least troublesome to any warden, and often they accomplish a great deal behind bars. I know of none released during my wardenship at Sing Sing who reverted to crime. Furthermore, it is not true—at least in New York State—that a murderer whose death sentence is commuted to life imprisonment can easily obtain his freedom. The average period of incarceration among those who receive the second commutation is about twenty years. Granted that other states are too lenient, that would be an argument for a better administration of justice, not for putting people to death. Furthermore, if some murderers (the accidental types, particularly) gain their freedom, after competent officials are certain that they will never again menace the community, certainly that is far more sensible than keeping them behind bars.[8]

The eugenic aspect

Now let us look at the part of this argument which claims that capital punishment exerts a eugenic influence. Unquestionably, many of the criminals who commit capital crimes have mental or physical defects; but, it should be added, so have many prisoners who have been convicted of crimes that are not capital. Besides, it is one thing to say this, but quite another to say that such defects are the cause of criminal activities. Sometimes physical and mental defects do contribute to crime, but on the other hand, many persons who have them never come into conflict with the law at all. The fact is that crime is a very complex phenomenon, and is produced in the individual by the interaction of many factors as he seeks adjustment with his environment. Further complicating this situation is the fact that although heredity may cause a certain type of defect in one individual, environment may cause the same type of defect in another; and at the present time, science in many cases cannot determine which caused the defect.

Moreover, since many persons who are apparently normal may carry recessive defective genes, and consequently may have defective children, it is clear that even if all persons who have hereditary physical and mental defects could be identified and were killed, the next generation would produce a whole new group of defective individuals. And here we are assuming that public opinion would sanction the killing of all such defective persons, regardless of whether they have been convicted of capital crimes or not—indeed, regard-

less of whether they have been convicted of any crime or not. This, it is clear, public opinion is not prepared to do.

However, if a program of eugenic executions were instituted, the overwhelming complexity of the problem would provoke a public demand for nothing less than a very carefully planned and administered series of examinations based on the best knowledge that science can provide. And here one should not overlook the possibility of using sterilization as a substitute for execution in many cases, since sterilization would be just as effective as death in preventing procreation.

Our system does not protect

But it is obvious that we are not condemning prisoners to death on the basis of their hereditary traits. Our courts, of course, are neither designed nor equipped to do this. In fact, they are not condemning many prisoners of any kind to death. The available records indicate that in the United States we are executing only a small percentage of the persons who have committed capital crimes. For example, although it is estimated that in 1949 there were 6,990 cases of murder and non-negligent manslaughter and 16,380 cases of rape in the United States,[9] in that year we executed a total of only 119, of which 107 were for murder and 10 for rape, and in the following year a total of only 82, of which 68 were for murder and 13 for rape.[10] In view of this, we can hardly say that our system of criminal law is contributing in a significant way to the elimination of the "undesirable" or the "dangerous" from our society.

Furthermore, the death penalty may not be imposed equitably upon all offenders. The man of wealth, education, and position can secure able attorneys and use every legal device and technicality for delays and mitigation of penalties, while the poor, the illiterate, and the friendless can avail themselves of no such resources, and so suffer from greater exposure to the death penalty. Thus, factors other than those which make prisoners a threat to society may determine whether or not they are executed.

There is always present, also, the possibility that an innocent man may be sent to his death.[11] Mistaken identification, perjured testimony, fallibility of the senses, lapses of memory, errors in judgment, undiscovered evidence, public clamor for a conviction, inordinate zeal on the part of investigators and prosecutors—all these and many other factors contribute to the miscarrage of justice. And yet the death penalty is irrevocable. How can a life once taken be returned? How can the relatives of an innocent man be recompensed? How can the public's faith in justice be restored? Even though it can be shown that the execution of an innocent man rarely occurs, the very possibility, when measured by the humanitarian standards of western civilization, compels us to consider it in an evaluation of our use of the death penalty.

THE ARGUMENT OF DETERRENCE

The most frequently advanced and widely accepted argument in favor of the death penalty is that the threat of its infliction deters people from committing capital offenses. In analyzing this argument, we must admit at the outset that human behavior can be influenced through fear, and that since man tends to fear death, it is possible to use capital punishment as a deterrent. We must admit, also, that many who have had contact with convicted criminals have testified that almost all of them fear the death penalty. Virtually every trial involving a capital offense becomes a desperate struggle to avoid this punishment, and petitioners continually urge governors to reprieve condemned prisoners.

But the real question is whether individuals think of the death penalty *before* they act, and whether they are thereby deterred from committing crimes. If for the moment we assume that the death penalty does this to some extent, we must also grant that certain human traits limit its effectiveness as a deterrent. Man tends to be a creature of habit and emotion, and when he is handicapped by poverty, ignorance, and malnutrition, as criminals often are, he becomes notoriously shortsighted. Many violators of the law give little thought to the possibility of detection and apprehension, and often they do not even consider the penalty. As a matter of fact, it appears that most people do not regulate their lives in terms of the pleasure and pain that may result from their acts, and obviously, the mentally deranged, the mentally deficient, and those who commit crimes in the heat of passion are not in any significant way influenced by thoughts of the future.

Human nature, moreover, is very complex. A criminal may fear punishment, but he may fear the anger and contempt of his companions or his family even more, and the fear of economic insecurity or exclusion from the group whose respect he cherishes may drive him to commit the most daring crimes. Besides, fear is not the only emotion that motivates man. Love, loyalty, ambition, greed, lust, anger, and resentment may steel him to face even death in the perpetration of crime, and impel him to devise the most ingenious methods to get what he wants and to avoid detection.[12]

However, if the death penalty were surely, quickly, uniformly, publicly, and painfully inflicted, it undoubtedly would prevent many capital offenses that are being committed by those who do consider the punishment that they may receive for their crimes. But this is precisely the point. Certainly, the way in which the death penalty is being administered in the United States is not fitted to produce this result.

Factors hindering deterrence

In the first place, in addition to the uncertainty of detection and apprehension, long delays often occur in court procedures as each side, spurred on by the fact that a human life is at stake, furiously fights for victory. It is also true that when the penalty may be death, some juries are not inclined to convict, and some witnesses are not willing to testify. Furthermore, there has been a tendency to give the jury or the court, or both, the power to decide whether the prisoner should receive the death punishment or a lesser penalty. In fact, at present only one state—Vermont—makes the death penalty mandatory by law, and then only in the case of first degree murder.[13] Moreover, comparatively few criminals are exe-

[12] Robert G. Caldwell, *Red Hannah* (Philadelphia: University of Pennsylvania Press, 1947), p. 92.

[13] Until 1950 there were five states with a mandatory death penalty.

cuted each year in the United States. The greatest number of executions for any one year in the United States during the period 1930 to 1950 inclusive was 199, in 1935, and the smallest number was only 82, in 1950.[14]

Thus, it can be seen that today the infliction of the death penalty is not an important method of punishing criminals in our country. Besides, as we have already pointed out, the executions that do take place are closed to the public, and the tendency has been to make them as swift and painless as possible.[15]

And yet, if we know how to make the death penalty more effective as a deterrent, why do we not take the necessary steps to do this? Indeed, if this is all that is needed, why do we not increase the number of capital offenses? The reasons are to be found in the complexity of our society, which makes quick action in the detection, apprehension, and conviction of criminals impossible, and in the fact that our society is less inclined than ever before to support a program of severe punishment. Our impersonal social relationships do not demand such a program. Our scientific attitude cannot sanction it. Our humanitarianism will not tolerate it. In other words, as Professor Sellin has concluded: "*The death penalty probably can never be made a deterrent. Its very life seems to depend on its rarity and, therefore, on its ineffectiveness as a deterrent.*" [16]

But do the facts substantiate the line of reasoning that has led us to the conclusion that the death penalty as it is administered in the United States is not an effective deterrent? Although the results of the best statistical studies are not entirely conclusive, they do indicate that capital punishment in our country does not have any significant effect on the frequency of crimes punishable with death. Similar studies conducted throughout western civilization point to the same conclusion regarding other countries.[17] Since the problem of deterrence will be given special treatment elsewhere in this issue of THE ANNALS, an analysis of these studies will not be presented here.

CONCLUSION

Punishment is an art which involves a balancing of reformation, deterrence, and retribution in terms of not only the court and the offender, but also the values of the society in which it takes place; and in the balancing of reformation, deterrence, and retribution, first one and then another of these receives emphasis as the accompanying conditions change. It is clear, therefore, that a form of punishment which is suitable today may have been unsuitable in the past and may become unsuitable in the future. In the United States, with its humanitarianism, increasing impersonality in social relationships, and growing belief in the powers of science, the death penalty has become an unacceptable and ineffective method of punishment and has been largely replaced with imprisonment, in which the emphasis is being put more and more upon a scientific program of rehabilitation.

But more important than this, there is a growing recognition that it is the desire to find love, respect, and security among relatives, friends, and business associates, rather than the fear of legal penalties, that keeps the majority of persons from violating the law. This is the principal form of social control, and it will always exist, regardless of what methods are used in dealing with criminals.

The Deterrent Influence of the Death Penalty*

By Karl F. Schuessler

THIS article analyzes certain statistical material as it bears on the question of how much the death penalty deters people from committing murder. This material, consisting principally of United States homicide and execution data for the period 1925–49, has been organized around six topics expressed for the most part as questions: (1) the adequacy of United States statistics for purposes of measuring the deterrent influence of the death penalty; (2) the deterrence viewpoint as an explanation of murder and punishment trends in this country during the last twenty-five years; (3) whether fewer murders occur in places where murder is punishable by death than in places where it is not; (4) whether differences in the use of the death penalty correspond to differences in the relative occurrence of murder; (5) the consistency between the deterrence viewpoint and differentials in the murder rate by sex, race, and other population classifications; and (6) a general appraisal of the deterrent value of the death penalty.

This analysis in a sense represents a continuation of similar work done intermittently in this country during the last thirty-five years.[1] These previous studies have uniformly concluded that the death penalty is inconsequential as a deterrent and that the relative frequency of murder in a given population is a function of the cultural conditions under which the group lives. Deficiencies in United States data that handicapped earlier investigations of this kind have been remedied somewhat during the last twenty years, but many difficulties still face the analyst who wishes to generalize about murder and the death penalty. Before going to the data and their interpretation, the belief in the death penalty as a deterrent is briefly set forth.

The Deterrence Viewpoint

In brief, people are believed to refrain from crime because they fear punishment. Since people fear death more than anything else, the death penalty is the most effective deterrent, so runs the argument. It is further alleged that the effectiveness of the death penalty as a deterrent depends both on its certain application and on knowledge of this fact in the population; hence, the argument continues, regular use of the death penalty increases its deterrent value. It was largely on grounds of this sort that the death penalty was recently (1950) restored in New Zealand after a ten-

* This paper was aided immensely by Professor Thorsten Sellin who made available to the author his extensive *Memorandum on Capital Punishment* prepared in 1950 for the British Royal Commission on Capital Punishment. The author is also indebted to Professor Clifford Kirkpatrick who read this paper critically but who is, of course, in no way responsible for its contents, and also to Mrs. Vada Gary who assisted with the statistical work.

[1] See, for example, Raymond T. Bye, *Capital Punishment in the United States*, Philadelphia: Committee on Philanthropic Labor of Philadelphia Yearly Meeting of Friends, 1919; Edwin H. Sutherland, "Murder and the Death Penalty," *Journal of the American Institute of Criminal Law and Criminology*, Vol. 15, 1925, pp. 522–29; Clifford Kirkpatrick, *Capital Punishment*, Philadelphia: Committee on Philanthropic Labor of Philadelphia Yearly Meeting of Friends, 1925; George B. Vold, "Can the Death Penalty Prevent Crime?" *Prison Journal*, October 1932, pp. 3–8.

year period of abolition, demonstrating that the deterrence line of reasoning still has considerable practical force.

Involved in the deterrence argument is the assumption that men deliberately choose among rival courses of action in the light of foreseeable consequences, the criterion of choice being personal gratification. This psychological hedonism, needless to say, is not in accord with modern psychology and sociology, which see human behavior as largely unplanned and habitual, rather than calculated and voluntary. The belief in the deterrent value of the death penalty is thus seen not as a scientific proposition, but rather as a social conviction widely used to justify and reinforce existing ways of treatment that perhaps rest mainly on feelings of vengeance. Consequently, this study does not constitute a test of a carefully drawn sociological hypothesis that intends to explain differences in the prevalence of murder among human societies, but rather assembles factual evidence to test the validity of a popular belief. We now return to the topics posed in the introduction to this article.

United States Homicide and Execution Data

The homicide statistics collected by the United States Census Bureau [2] are ordinarily used as an index of murder, figures on murder being generally inaccessible as well as fragmentary. The use of homicide statistics for purposes of estimating the deterrent influence of the death penalty has been criticized on the grounds that (*a*) they include justifiable and excusable homicides and (*b*) they do not distinguish among differing degrees of murder. The reasoning behind this criticism is that the proportion of nonfelonious homicide and the relative amount of different kinds of murder may vary in time and space in such a way as to make unreliable regional comparisons and time trends.

Over against these reasonable objections is the fact that the homicide rate closely corresponds, both geographically and temporally, to the murder figures given in *Uniform Crime Reports*,[3] which exclude nonfelonious homicide, though they include non-negligent manslaughter. Also, the homicide rate is closely correlated, on both a geographic and a temporal basis, with murder conviction rates given in *Judicial Criminal Statistics*, and with murder commitment rates based on information in *Prisoners in State and Federal Prisons and Reformatories*.[4]

This consistency among four independent indexes of murder is probably due to the fact that the relative occurrence of different kinds of murder is similar among states and fairly constant during the last twenty-five years. If this interpretation is correct, then the homicide rate is a reliable index of murder in general and first degree murder in particular, during approximately the last twenty-five years.

National statistics on executions have been readily available in this country only since 1930, when they were reported in *Mortality Statistics* and also in *Prisoners in State and Federal Prisons and Reformatories*. From the standpoint of measuring the temporal relation between execution and murder, these figures are of limited value be-

[2] *Mortality Statistics*, Bureau of the Census, United States Department of Commerce, Washington, D. C. Also, *Special Reports*, National Office of Vital Statistics, Public Health Service, Federal Security Agency, Washington, D. C.

[3] *Uniform Crime Reports*, Federal Bureau of Investigation, United States Department of Justice, Washington, D. C.

[4] Both publications issued by the Bureau of the Census. The results of this correlational analysis are omitted because of lack of space, except to say that the correlation coefficients were uniformly high ($r \geqq .8$).

cause they cover such a short period of time. The fact that executions-by-offense were not published for the period 1931–36 adds to this difficulty, although for certain states it may be safely assumed that all executions during that period were for murder.

Some material on murder convictions and death sentences is available in *Federal Judicial Statistics*. But for purposes of relating conviction and punishment trends to concurrent trends in murder, this source is limited as follows: (*a*) this series covers only a thirteen-year period, 1933–45; (*b*) the largest number of states reporting in any single year was thirty; (*c*) only eighteen states (including the District of Columbia) reported each year during the entire period; and (*d*) except for the first few years, the number of persons convicted of murder is not given, but rather the number of murder indictments resulting in conviction.

In spite of the forenamed shortcomings in murder statistics for the period 1925–49, they are probably more adequate than data hitherto employed as a check on the alleged deterrent influence of the death penalty. In consequence, conclusions based on this study are less vulnerable to the objection that murder data are so unreliable as to make worthless generalizations about the death penalty as a deterrent.

UNITED STATES HOMICIDE AND CAPITAL PUNISHMENT TRENDS

The United States homicide rate moved steadily upward from 1900 until the middle of the thirties, dropped sharply during the next ten-year period, and then at the close of World War II started an upward swing. Although homicide statistics are not available for 1950 and 1951, national police statistics indicate that the upward trend was checked in 1951; in any case, the rate is still far below the high levels of the late 1920's and early thirties.

State trends in the period 1925–49 generally correspond to the national trend, although there are several exceptions, important from the standpoint of an explanation of murder. (1) Vermont exhibited an almost constant rate during this period. (2) By 1949, Virginia, North Carolina, and South Carolina had returned to or exceeded the high level of the depression years. (3) Michigan, Nevada, and Florida started their downward trend before 1930. (4) At least one state—Connecticut—continued to climb until 1940. The homicide rate continued to exhibit large regional differences, the highest rates persisting in the South, the lowest in New England.

Also, the homicide rate continued to display large differentials by sex, race, ecological area, and season, the effect of each classification being conditioned to a certain extent by its relation to the others. These differentials suggest at once that murder is a complex sociological event rather than a simple response controlled altogether by the deterrent influence of the death penalty.

Two somewhat contradictory capital punishment trends in the United States characterize the period 1925–49. On the one hand, a trend to extend capital punishment, starting just after World War I, continued with the restoration of the death penalty in Kansas (1935) and South Dakota (1939). The move to re-establish capital punishment in Michigan in 1951 exemplifies the persistence of this trend. On the other hand, a tendency to make the death penalty permissive rather than mandatory on conviction of first degree murder continued. By 1951 the death penalty was mandatory in only one state, in contrast with 1924 when it was mandatory in eight states.

The speculation has been advanced that nowadays a smaller proportion of persons sentenced to death for murder are executed than formerly, the tendency to administer clemency being in line with a general trend to moderate punishment. This was not borne out by an analysis of available judicial and penal statistics, although this evidence is very scanty. Of those sentenced to death for murder in the courts of 25 states during the period 1933–39, 80 per cent were executed; during the period 1940–45, 81 per cent were executed—practically no change. The idea of a downward trend in the use of the death penalty is also opposed, though indirectly, by the fact that the decline in executions from 1930–39 to 1940–49 was roughly proportional to the drop in homicides. The number of executions for murder dropped from 1,507 in the period 1930–39 to 1,063 in the following decade, a 29 per cent drop, while homicides dropped from 107,514 to 78,443, a 27 per cent drop.

By way of summary, capital punishment policy and practice in this country was fairly stable in the period 1925–49; consequently, the movement of the homicide rate and differentials in the homicide rate by various population classifications cannot be attributed to changes in the use of the death penalty. This suggests once again that differences in the homicide rate correspond to differences in social structure and culture setting, and that murder and the death penalty are unrelated except in the circular sense that more murder involves more death penalties.

COMPARISON OF DEATH PENALTY AND ABOLITION STATES

A comparison of states that provide the death penalty for murder with those that do not shows the homicide rate to be two to three times as large in the former states as in the latter (Table 1). Such a comparison is usually declared invalid because the two groupings are not uniform with respect to population composition, social structure, and culture pattern. This criticism, though methodologically sound, affirms indirectly that the relative occurrence of murder is the result of a combination of social circumstances of which punishment is only one, possibly an immaterial one.

TABLE 1—HOMICIDE RATES PER 100,000 POPULATION IN DEATH PENALTY STATES AND ABOLITION STATES[a] FOR FIVE SELECTED YEARS

Year	Abolition States	Death Penalty States
1928	4.2	8.8
1933	3.7	10.5
1938	2.2	7.6
1943	2.1	5.5
1949	2.2	6.0

[a] These two groupings include all states in the national registration area in any given year. All states were in the registration area after 1932.

To meet the foregoing objection, the usual practice is to compare the homicide rate in states that have abolished the death penalty with their neighbors where the death penalty is legal. This comparison is illustrated in Table 2, and it will be seen that Rhode Island, an abolition state since 1852, is very similar to Connecticut, where the death penalty has been retained. Maine also, though not shown in the table, has been abolition since 1887, and is quite similar to the New England states which have the death penalty. The homicide rate in Michigan, where the death penalty was abolished in 1847 (except for treason), closely resembles Indiana and Illinois homicide rates, while Wisconsin, an abolition state for practically a hundred years, has a rate significantly below Michigan, indicating that the homicide rate is indifferent to the presence or

TABLE 2—ANNUAL AVERAGE HOMICIDE RATES IN FIFTEEN STATES SELECTED ACCORDING TO CONTIGUITY

State	1931–35	1936–40	1941–46
Rhode Island [a]	1.8	1.5	1.0
Connecticut	2.4	2.0	1.9
Michigan [a]	5.0	3.6	3.4
Indiana	6.2	4.3	3.2
Wisconsin [a]	2.4	1.7	1.5
Illinois	9.6	5.7	4.4
Minnesota [a]	3.1	1.7	1.6
Iowa	2.6	1.7	1.3
Kansas [b]	6.2	3.6	3.0
Colorado	7.5	5.5	3.7

New Mexico	12.5	8.4	5.3

[a] Abolition state.
[b] Abolition between 1931 and 1935.

absence of capital punishment. Homicide rates in Minnesota, where the death penalty was abandoned in 1911, and in Iowa are very nearly alike with respect to both level and trend during the last twenty-five years. Similarly, homicide rates in Arizona and New Mexico, both death penalty states, have been practically identical both in level and movement during the period 1930–50, although Arizona executed 27 and New Mexico but 4 in this period.

Kansas and South Dakota are of special interest because they make possible a before-and-after comparison, though extremely limited in scope. Kansas abolished the death penalty in 1907 and re-established it in 1935. The annual average homicide rate in Kansas for the period 1931–35, as shown in Table 2, was considerably higher than the average rate for the following five-year period, giving plausibility to the deterrence argument. However, an identical trend characterized the states bordering on Kansas (Table 2), and these states had the death penalty throughout this period. The experience of Kansas, then, when viewed in context, merely emphasizes that homicide trends are the resultant of social conditions rather than the resultant of changes in death penalty policy.

This notion is borne out by a comparison of homicide trends in South Dakota, an abolition state between 1915 and 1939, and North Dakota, where the death penalty has not been in force since 1915. The annual average homicide rate in South Dakota dropped from 1.8 for the period 1930–39 to 1.5 for the following ten-year period, while in North Dakota the rate dropped from 1.8 to 1.1. If changes in the homicide rate were due solely to differences in capital punishment policy, then North Dakota's greater proportional drop in homicides must have been due to the fact that the death penalty was not restored.

EUROPEAN DATA

Since the middle of the last century there has been a sustained though uneven movement among European countries to abolish capital punishment by legal annulment or by allowing it to fall into disuse. Certain European statistics therefore bear on the question of whether the removal of the death penalty has a perceptible effect on the incidence of murder. Several examples [b] are cited primarily to illustrate the fact that the independence between the murder rate and the death penalty is not a peculiarity of American culture.

Sweden formally abolished the death penalty in 1921; but the last execution occurred in 1910, this being the only one since 1900. During the preceding period, 1869–1900, there were 12 executions, roughly averaging 4 per decade.

[b] Taken from Thorsten Sellin's *Memorandum on Capital Punishment*, London, 1951.

TABLE 3—ANNUAL AVERAGE HOMICIDE RATE PER 100,000 POPULATION OF SWEDEN FROM 1754 TO 1942

Period	Homicide Rate
1754–1763	.83
1775–1792	.66
1793–1806	.61
1809–1830	1.09[a]
1831–1845	1.47
1846–1860	1.24
1861–1877	1.12
1878–1898	.90

1920–1932	.52
1933–1938	.46
1939–1942	.47

[a] Exclusive of 1814 and 1818.

There is nothing in the Swedish homicide series (Table 3) to suggest that its movement has in any way been conditioned by the abandonment of the death penalty during the twentieth century.

The death penalty in the Netherlands was not used after 1860 and was formally abolished in 1870. Although there was an upward trend (Table 4) in the murder and attempted murder conviction rate in the twenty-year period immediately following abolition, during this period the rate never attained the level of 1860–70 when the death penalty was still legally in force. The rate reached its lowest level in the 1920's when the death penalty was, of course, not in effect. Moreover, the decade immediately following abolition, 1870–79, was the lowest but one in the approximately eight-decade period covered by this series.

TABLE 4—ANNUAL AVERAGE MURDER AND ATTEMPTED MURDER CONVICTION RATES PER MILLION INHABITANTS IN THE NETHERLANDS, 1850–1927

Period	Homicide Rate
1850–1859	.96
1860–1869	1.46
1871–1880	.83
1881–1890	1.17
1891–1900	1.41
1901–1910	1.25
1911–1920	1.32
1921–1927	.60

CERTAINTY AS A DETERRENT INFLUENCE

The point has often been made that it is not so much the legal existence of the death penalty that deters potential murderers, but rather the certainty of its being used. In fact, a common criticism of the death penalty is that juries do not convict readily if the punishment is death, thereby reducing the certainty of punishment, and, in consequence, its deterrent value. The problem as to whether differences in the use of the death penalty are in some way related to variations in the homicide rate may be approached by correlating execution and homicide data distributed geographically or temporally.

That the risk of execution is not uniform among the states that have a death penalty for murder is demonstrated by the lack of consistency between homicide and execution rates. The correlation coefficient of a homicide rate based on the period 1937–49 and an execution rate for the same period was .48 for 41 death penalty states.[6] The question therefore arises as to whether the relative occurrence of murder decreases regularly as the risk of execution increases, since, under deterrence theory, the value of the death penalty as a deterrent is thought to depend on its certain application.

To test this idea, though somewhat crudely, the risk of execution, opera-

[6] Includes states that had a death penalty for murder during the period 1937–49, except South Dakota where the death penalty was restored in 1939 and Idaho where no executions occurred during this period. The product-moment correlation method was used throughout this analysis, not because it necessarily gave the best fit in all cases, but rather because its limitations and signification are well known.

tionally defined as the number of executions-for-murder per 1,000 homicides for the period 1937–49, was statistically compared with the homicide rate in 41 death penalty states. The correlation between these two indices was −.26, indicating a slight tendency for the homicide rate to diminish as the probability of execution increases. Next, as a check on consistency in this trend, the ratio of the average execution rate to the average homicide rate was computed for four groupings of states according to size of the homicide rate, as shown in column 3 of Table 5. This

TABLE 5—AVERAGE HOMICIDE AND EXECUTION RATES IN 41 STATES GROUPED ACCORDING TO SIZE OF HOMICIDE RATE

Quartile by Homicide Rate	Average Homicide Rate (HR)	Average Execution Rate (ER)	$\frac{ER}{HR}$
Highest	15.4	.32	.21
Upper middle	7.8	.14	.18
Lower middle	4.2	.08	.19
Lowest	2.0	.05	.25

analysis shows that the homicide rate does not consistently fall as the risk of execution increases.

To illustrate: the average homicide rate for the ten states having the highest homicide rates is almost twice as large as the average homicide rate for the states in the next quartile, but the risk of execution is slightly greater in the former group of states than in the latter group. This evidence, included primarily because of its suggestiveness, must be classed as negative from the standpoint of deterrence theory, since (*a*) the homicide rate does not drop consistently as the certainty of the death penalty increases, and (*b*) the geographic correlation between the risk of execution and the homicide rate is not impressive, failing to reach the 5 per cent significance level and statistically accounting for only 7 per cent (r^2) of the variability in the homicide rate.

To investigate further how differences in the use of the death penalty affect the homicide rate, the relationship between homicide and execution data as time series was measured within certain death penalty states. States which displayed little variability in executions for murder from year to year were not included in this analysis; also, states not having execution-for-murder figures complete for the period 1930–49 were omitted. This left a total of eleven states. On the assumption, implicit in deterrence theory, that a large number of executions relative to the frequency of murder should be followed by a reduction in the murder rate, a one-year time lag was established, with the execution risk, defined as the number of executions-for-murder to 1,000 homicides per year, as the forerunner.

The most general finding is that the homicide rate and the execution risk as time series move independent of one another. None of the correlation coefficients reached .35, and the number of negative correlation coefficients, 4, was less than the number of positive coefficients, 7, but not significantly so. This evidence, like that just preceding, fails to substantiate the belief that the deterrent influence of the death penalty is enhanced by its frequent use, as changes in the homicide rate do not correspond in a systematic way to variations in the probability of its being used.

DIFFERENTIAL HOMICIDE RATES AND THE DEATH PENALTY

A final problem is whether the deterrence viewpoint is consistent with certain population classifications. First, the death penalty is hardly ever used with women in the United States, but women, in contrast with men, seldom commit murder. Very likely the conditions of life surrounding women in most human societies operate to develop and sustain lawful attitudes and habits. Lawfulness in the female population, specifically the fact that women generally refrain from committing murder, is probably due to these positive sociocultural influences rather than to fear of the death penalty.

Second, the number of Negro murderers is relatively larger than the number of white murderers; yet it is doubtful whether the death penalty is used less often with Negro murderers than with white murderers. Suggestive in this connection is the fact that white executions for murder, 166, were 1.1 per cent of all white homicides, 15,494, in the period 1946–49, while Negro executions for murder, 265, constituted 1.5 per cent of all Negro homicides, 18,327, during the same period. The environmental factors influencing Negroes are analogous but opposite to those influencing women. The circumstances of life surrounding large numbers of Negroes in the United States generate violence, assault, and murder,[7] and this kind of behavior, to a certain extent socially expected and socially sanctioned among Negroes, is indifferent to the use of the death penalty.

Finally, the homicide rate exhibits differentials by age, social class, ethnic background, community size, and season, but in no instance can these differences be ascribed to corresponding differences in the application of the death penalty.

DISCUSSION AND CONCLUSION

The results of the foregoing analysis are consistent with the results of previous investigations of this kind. The findings of this study, then, sustain the conclusion that the death penalty has little if anything to do with the relative occurrence of murder. Studies of this sort have been criticized on the ground that they do not *prove* that the death penalty is completely without deterrent value. Although logically sound in a very strict sense, this objection is unrealistic, since there is no way at present of contrasting personal and social situations so as to assure that all differences in murder behavior are due solely to differences in the use of the death penalty. As usual, inferences have to be based on evidence collected under conditions that most nearly approximate the methodological ideal. Moreover, the inference drawn from statistical data that the death penalty is inconsequential as a deterrent is borne out by case studies and expert opinion, material not surveyed in this paper but now briefly noted.

The alleged deterrent influence of the death penalty is contradicted by the following recurrent case study data, expressed as four rough generalizations: (1) In the events preceding murder, the murderer is usually preoccupied to the point that reflection over future consequences is virtually impossible. (2) The fear of death is relative to the situation; consequently, the death penalty may appear on reflection to be a necessary though unfortunate sequel to murder. (3) Certain cultural circumstances (underworld, marital, and others) often make murder imperative, thereby nullifying the supposed deterrent effect of the death penalty. (4) The relation between murderer and victim is usually primary, hence, one that is likely to be suffused with emotionality. This emotionality, probably heightened during a crisis, doubtless interferes with the objective assessment of future consequences. The indifference of the murderer to the death penalty is well illustrated by the following conversation between Lawes and a prisoner.

[7] Gunnar Myrdal, *The American Dilemma* (New York, 1944), pp. 558–60.

Before Morris Wasser's execution, when I told him that the governor had refused him a last-minute respite, he said bitterly: "All right, Warden. It doesn't make much difference what I say now about this here system of burning a guy, but I want to set you straight on something."

"What's that?" I asked.

"Well, this electrocution business is the bunk. It don't do no good, I tell you, and I know, because I never thought of the chair when I plugged that old guy. And I'd probably do it again if he had me on the wrong end of a rod."

"You mean," I said, "that you don't feel you've done wrong in taking another man's life?"

"No, Warden, it ain't that," he said impatiently. "I mean that you just don't think of the hot seat when you plug a guy. Somethin' inside you just makes you kill, 'cause you know if you don't shut him up it's curtains for you."

"I see. Then you never even thought of what would happen to you at the time."

"Hell, no! And lots of other guys in here, Harry and Brick and Luke, all says the same thing. I tell you the hot seat will never stop a guy from pullin' a trigger." That was Wasser's theory, and I've heard it echoed many times since.[8]

To summarize: statistical findings and case studies converge to disprove the claim that the death penalty has any special deterrent value. The belief in the death penalty as a deterrent is repudiated by statistical studies, since they consistently demonstrate that differences in homicide rates are in no way correlated with differences in the use of the death penalty. Case studies consistently reveal that the murderer seldom considers the possible consequences of his action, and, if he does, he evidently is not deterred by the death penalty. The fact that men continue to argue in favor of the death penalty on deterrence grounds may only demonstrate man's ability to confuse tradition with proof, and his related ability to justify his established way of behaving.

The Alternatives to the Death Penalty

By ARTHUR LEWIS WOOD

IN a study of the death sentence some space should legitimately be given to a discussion of its alternatives. At the outset, it is necessary to say that little is actually known on what happens to capital offenders who do not pay the final penalty. What kind of prisoners do they make? How frequently are they paroled? What is their behavior while on parole; after parole? What is their after-parole conduct? How frequently do they commit further capital offenses? Can "science" rehabilitate them? We lack conclusive evidence on most of these questions. It would be far easier to design research projects for their answer than to summarize and analyze the inconclusive facts at hand.

There appears to be some merit, however, in bringing together the knowledge we have of these alternatives and in assessing their relevance to the practical considerations of the administration of justice. The presentation here does not argue *for* an alternative to the death penalty. The facts can be stated and their relative significance can be assessed, but in final analysis the question, Should an alternative to the death penalty be used? is answered by individual morals and social values. On the other hand, we can indicate roughly to what extent alternatives *are* used, and the possible meaning that these facts have for social action.

SOCIETY AND PUNISHMENT

It is quite obvious that the forms of punishment for particular crimes in a society are related to the social conditions and institutions of that society.[1] For instance, where political or other ideologies are strongly held, flagrant acts against the dominant interests tend to call for the most severe penalties; death may become, from the social and social-psychological point of view, the only choice in terms of the politico-social ingredients of the situation. Even persons who otherwise espouse humanitarian ideals will support the death penalty when survival of the political community or beliefs is at stake. There are many historic and social conditions, which range from the well-institutionalized procedures which pronounce the death penalty to the conditions of mob violence where death or its equivalent by eradication from the community is the only possible choice.

On the other hand, in the case of murder, which is considered a capital offense in the penal codes of many of our states, the death penalty is not the only possible course from the point of view of the sociology of the situation. The fact that the pros and cons of capital punishment have been argued in public by the political and intellectual leaders of the nation for over a century is perhaps the best evidence for this statement. Alternatives to the death penalty are possible in the social climate of most of the Western world.

LIMITED USE OF DEATH PENALTY

Whether one be strongly for or against the death penalty, or whether one wishes to evaluate critically the effectiveness of its use as an instrument of justice in American penal procedure, it is conspicuous by its infrequent use as a form

[1] The most authoritative treatise on this subject is Georg Rusche and Otto Kirchheimer, *Punishment and the Social Structure*, New York: Columbia University Press, 1939.

of punishment. Granted that it becomes an important issue for those who under all circumstances deny the state the right to take a life, capital punishment plays an infinitesimally small role in criminal procedure. On frequent occasions it appears to be a penalty of last resort for those few who do not escape this judgment through the many avenues that both the law and those who administer the law provide.

There are undoubtedly well over 8,000 criminal homicides each year in this country. Not more than a fourth this number are ever convicted as originally charged, and only approximately 150 executions take place each year in the United States. Many states having capital punishment go for years without an execution; most of the executions are concentrated in a few states—New York, California, Pennsylvania, and the southern states.

In relation to the extent and the total cost of crime in this country, the use of the death penalty is certainly of minor importance. Though some believe that capital punishment must remain on the statute books for its deterrent effect (although its efficacy is seriously questioned—dealt with extensively elsewhere in this volume), such effect is all but negated by the infrequency of its use. In actuality, life imprisonment and long-term sentences are used as punishment for all but a few of the "hardened" and most serious offenders. Execution is practically never exacted except in cases of first degree murder.

Perhaps the most striking evidence of the limited use of the death penalty in the United States was shown in a study of criminal statistics made by Alfred Harries.[2] Taking those prisoners convicted of first degree murder, he tabulated the type of "release" from prison during a twelve-year period, 1926–38, in five states which had capital punishment.[3] Forty per cent were executed; 18 per cent died in prison; 38 per cent were pardoned, released on parole, or had their sentence commuted; and 4 per cent received a court order release, were transferred, or escaped.[4]

Social Significance of Death Penalty and Alternatives

Of what significance are these social facts? Extremists on one side would have it that this is a sign of our weakened, decadent society. Another view, that which probably appeals to a larger number of American intellectuals, is that the social fiber of American society is strong enough to afford a more humane treatment of its criminal element. Whatever the truth of this argument, we resort to long years of imprisonment for over half of our murderers. Possibly the long years of incarceration are not particularly humane, and surely they are not desired by those incarcerated. Our "weakness," if relative weakness it is, may lie more in the public indifference to ineffective agencies of law enforcement than in the punishment of our worst offenders.

Another "weakness," though one of a different order—one concerning instrumental policy rather than integration of the society—is the extent to which the processes of legal procedure allow potentially serious criminal offenders to go undetected until they perpetrate more heinous offenses against persons and the community.

Traditional criminal procedure is largely designed to govern the state's action *after* the crime has been committed, and for the purpose of revenge or deterrence. In the broadest sense of the "alternatives to the death penalty," a constructive approach would give considerable attention to the identification of potential murderers and other serious offenders with a view to treatment and/or long-time incarceration *prior* to their final commission of more serious acts. One authority who bases his comments on the detailed case histories of many murderers, Doctor Joseph Catton, believes that 40 per cent of our homicides could be predicted and prevented by proper treatment when the offender first comes into contact with the law.[5]

It is undoubtedly true that many psychotic and psychopathic persons, those who commit crimes of physical assault, and those who prey upon society armed with deadly weapons, are among tomorrow's murderers. Whether detection and treatment of these individuals would decrease the murder rate by 40 per cent is not known; but certainly the application of modern psychiatry and other means of diagnosis to such cases could diminish the "errors" in criminal justice which are now being made.

By comparison with the infrequently used death penalty, what is more commonly done with our most serious offenders is an important consideration. Rather than a deterrent to murder, the death penalty, as demonstrated in the records of criminal prosecution, has everywhere proved to be a hindrance to the administration of efficient justice. Court officials hesitate to participate in the procedure of finding a man guilty when the death penalty is mandatory. Substitutes for the death penalty tend to free court personnel from such considerations, and therefore allow the determination of guilt or innocence to be more readily decided on the evidence in the case. For such reasons, the alternatives to capital punishment become an important aspect of the administration of justice.

Substitutes for the Death Penalty

Alternatives to the death penalty are well-established procedures in many of the states. Capital punishment is completely abolished in six of them, and a sentence of life imprisonment is given.[6] In Washington the jury may decide between death or life imprisonment, and in several states the jury may recommend the punishment, or death is not a mandatory sentence. A death sentence may be commuted to life imprisonment in virtually all states, and in some at least (including Idaho, Illinois, Louisiana, New York, Oklahoma, and Texas), it can be directly commuted to less than life.[7] A life sentence usually can be recommuted to less than life.

Again from a legal standpoint, those serving life sentences which were commuted from death are eligible for parole in a majority of the states. In some states, however, this is specifically not possible, as in Colorado, Iowa, Louisiana, New Mexico, New York, and Ohio, unless the life sentence is recommuted to a term of years. In California a

[2] "How Long Is a Life Sentence for Murder?" *Proceedings* of the American Prison Association, 1939, pp. 513–24.

[3] Connecticut, New Jersey, California, Massachusetts, and Pennsylvania.

[4] These percentages are recomputed from the published data to exclude Michigan and Kansas, which were without capital punishment at that time. If the latter two are included, the proportion executed among the seven states is, of course, decreased, as follows: 29 per cent were executed; 20 per cent died in prison; and 41 per cent were pardoned, released on parole, or commuted.

[5] *Behind the Scenes of Murder*, New York: W. W. Norton & Co., Inc., 1940.

[6] Maine, Michigan, Minnesota, North Dakota, Rhode Island, and Wisconsin.

[7] Information on the commutation of death sentences and the subsequent parole of the offenders was obtained through a questionnaire sent to the attorneys general of the states. The author wishes to thank members of these offices and those of the offices of pardons and paroles who helped in this survey. Replies were received from thirty-five states.

distinction is made between commuted death sentences which allow parole and those under which the man is not eligible for parole. Where parole of lifers is possible, the minimum time which must be served (minimum sentence less good time) varies among the states from seven to about fifteen years.

In Michigan, Minnesota, Rhode Island, and Wisconsin, where the death penalty has been abolished, those serving life sentences may be paroled. Maine and North Dakota do not allow the parole of these prisoners, although the sentence presumably could be commuted to a term of years.

ADMINISTRATIVE ARRANGEMENT

The administration of these various procedures dealing with capital offenders and lifers has historically had its authority lodged with the highest office of the state. The governor retains the pardon power in most jurisdictions, and it is usual for the power of commutation to be formally held by this official.

Not infrequently the commutation of sentences or the parole of serious offenders such as murderers requires special procedures for approval not used for other offenders. In one extreme example of this from a southern state, the law provides that any person serving a life sentence may not be paroled unless the sentence is further commuted on recommendation from the warden of the state penitentiary and approved by the lieutenant governor, the attorney general, and the trial judge, or any two of them, and then approved by the governor. An example is found in Minnesota (without the death penalty) where the parole board must obtain the written permission of the members of the pardon board if they wish to parole a man convicted of first or second degree murder.

As pardon and parole boards are removed from direct political influence and made permanent professional agencies, there appears to be a trend toward placing in these boards some authority which was formerly exclusively a matter of executive clemency. The most frequent indication of this trend is seen in the extent to which actual decision in these clemency matters is made by such nonpolitical boards, while only nominal authority is exercised by the executive. Where lifers have been made under the law automatically eligible for parole, however, parole is granted such persons without the necessity of executive clemency.

The trend referred to above is more explicit in matters of commutation and where legislative enactments have changed the legal procedures. For instance, a Georgia act of 1942 removed the clemency power (including the power to commute sentences) from the office of the governor and placed it in the board of pardons and parole. During 1951 an act went into effect in the state of Washington which made it possible for the Board of Prison Terms and Paroles to parole those serving life sentences, thus making commutation of the sentence by the governor unnecessary for paroling such prisoners. And in Michigan (a state without capital punishment) the "lifer law" which permits the parole of all those sentenced to life terms, except prisoners convicted of first degree murder, has been in operation since 1942.

PUBLIC ATTITUDES TOWARD LIFERS

Casual observation would indicate that the public is generally apathetic to what happens to the average person receiving a death sentence who is pardoned or whose sentence is commuted to life. These events take place without more than incidental mention in the press. In fact, the parole of such persons, as with all parolees, is not reported to the press in many states, as a result of the policy of protecting the subject from unnecessary public attention.

Exceptions to this lack of interest now and then come from those who are particularly insistent on the necessity for rigorous crime prevention measures and who sometimes focus their attention on the extent to which dangerous criminals are being released from our prisons. Persons in high authority, and journalists who are uninformed about the total picture, have presented the public with misleading information in these matters.[8] Contrasted with this, an occasional Horatio Alger account appears which tells the true story of how a released murderer makes good.[9]

Detailed case histories of lifers whose sentences have been commuted from death are not available. Nevertheless, the evidence clearly indicates that neither of the extremes presented above accurately portrays what is happening through commutation of death sentences and the parole of lifers. Lifers are nowhere being indiscriminately released; and many lifers would certainly not become successful parolees. Generally speaking, procedures dealing with these offenders are still matters of executive clemency, and the facts show that these powers are infrequently exercised and then only in particularly meritorious cases.

The study by Alfred Harries to which reference has already been made did show that in five states having capital punishment, only 40 per cent of those convicted of first degree murder were actually executed. In only two of the states included, however, was a death sentence mandatory; therefore these data include many cases (probably a majority, although this fact is not available) where the original sentence was life imprisonment and not death. The 40 per cent does not reflect leniency on the part of pardon, commutation, and parole authorities as much as "leniency" (if it may be called such) on the part of prosecutors, juries, and judges, who probably more closely respond to the pressure of public opinion.

WHAT HAPPENS TO THE LIFER?

The survey conducted by the writer reveals to some extent what is happening to those who originally received a sentence of death. In replies from 28 states out of the 42 in which the death sentence is a legal possibility, the following results appeared.[10] During the ten years 1942–51, among all those who had previously and currently received an original sentence of death, only 5 persons were pardoned; 198 had the original sentence commuted to life imprisonment; only 3 were commuted to less than life imprisonment; [11] and 63 were paroled.

The above figures indicate roughly the relative frequency with which various procedures are used for the type of offender originally given a sentence of death. Pardon, which is almost completely a matter of executive action, is practically never used. If we recall that there are over 100 executions in the country each year, or from 1,000 to 1,500 in each ten-year period, we have some estimate of the infrequency with which such persons receive any form of special consideration. Although this comparison with the number of execu-

[8] See Alfred Harries, *op. cit.*

[9] "Portrait of an Ex-lifer," *American Mercury*, Vol. 69, No. 312 (Dec. 1949), pp. 727–36.

[10] These data are based on replies from the attorneys general and other officials in the following states: Alabama, Arizona, California, Colorado, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kentucky, Massachusetts, Mississippi, Nebraska, Nevada, New Hampshire, New Mexico, New York, Ohio, Oklahoma, Pennsylvania, South Dakota, Texas, Utah, Vermont, Washington, West Virginia, and Wyoming. For five of these states, the figures were estimates.

[11] Two of these 3 commuted to less than life were commuted to 99 years.

tions is not directly comparable, as it includes all 42 states in which capital punishment is possible, our figures do include the larger states of California, New York, and Pennsylvania, as well as most of the southern states in which clemency appears to be more often used because of the more numerous death sentences.

It is evident that the great majority of cases in which the death sentence is not carried out first receive consideration through executive clemency—commutation to life imprisonment. This procedure is conservative, while at the same time permitting ample opportunity for review of the case prior to further action. The study by Alfred Harries showed that the time served by the average lifer convicted of first degree murder was approximately thirteen years prior to release from prison, and of course many such prisoners serve a longer sentence. Sixty-three cases in our survey, or less than one-third the number whose sentences were commuted from death, were granted parole. The larger proportion of the remaining two-thirds undoubtedly die in prison before additional consideration, while some cases are granted further executive clemency or change in sentence by the original court of jurisdiction.

To summarize the available information, a large proportion of those sentenced to death are executed. Where natural death does not occur in prison, more than twenty persons have their death sentences commuted to life imprisonment each year, and about a third of these cases are paroled. What is the rationale of "leniency" for men sentenced to die? To what extent do these cases receive adequate study prior to parole, and how successful are these parolees? Is there a trend toward paroling a larger number of such cases? These and other questions cannot be given definitive answers, but there is sufficient evidence to outline some general considerations.

IMPRISONMENT AND TREATMENT OF SERIOUS OFFENDERS

There is some evidence that the trend is in the direction of using imprisonment as a substitute for death. Whether or not in the final analysis this is more desirable, is a matter of opinion. But wherever alternatives to death are used, it is of some merit to evaluate the meaning of these procedures.

The substitute procedures for capital punishment are pre-eminently congruous with the logic of modern penology. Here it is assumed that each individual criminal case is in some fashion unique and must be dealt with in terms of these individual factors. With respect to our concern here, the essential elements of this penology are the insistence that treatment or segregation rather than punishment for its own sake serves to protect society most adequately, and that the form of treatment must be designed to fit the individual case rather than predetermined and prejudged by rigid legislative acts which are intended for all those committing particular crimes.

Although the proportion of cases eligible for probation or short sentences among our most serious offenders is no doubt considerably limited, the logic of dealing with serious offenders in terms of their individual characteristics is the same. It is equally unreasonable to suppose that all those who commit certain offenses require forty years, life, or even death, as it is to assume that all those who pick pockets must be imprisoned one year. Not so much the social scientist, but the law itself and those who have administered it have been forced to grant that there are individual differences among serious offenders. This is evidenced by the laws which have voided the mandatory death penalty, and by the commutation of sentences and the parole of lifers discussed above.

No investigation has been made of the parolability of prisoners serving life terms, to say nothing of the lack of information on the potentialities for rehabilitation of those who were executed. It is known by anyone familiar with prison administration that most institutions have one or more lifers assigned to some of the most trusted duties. Many times the observation has been made that lifers are among the best-behaved prisoners. Although these observations certainly have a basis in fact, they say nothing concerning the extent to which lifers as a group possess these characteristics, and, realistically speaking, they say little about the actual parolability of such persons. Since these comments are usually made with reference to prisoners who have already served many years in prison, it seems likely that these characteristics may often be the result of the subduing effect which comes from such imprisonment. Although some of these prisoners may be capable of adjusting as law-abiding citizens to certain community situations, it certainly cannot be said that resignation to the confining authoritarian prison environment is necessarily an indication of parolability.

PAROLE OF LIFERS IN MICHIGAN

The two states of Michigan and Washington have adopted procedures for experimenting rather systematically with the release of long-term offenders. It appears to the writer that they constitute steps in the direction of dealing with the more serious offender on an individual and professional basis which may foreshadow a trend toward this type of procedure in other states.

Several states allow the parole of lifers without the necessity of executive clemency. The new legislation adopted by Michigan in 1942 was not, therefore, entirely new. Since Michigan is a state without the death penalty, this experiment is not, strictly speaking, an alternative to the death penalty for this state, and the legislation excluded those convicted of first degree murder. At the same time, the Michigan legislation represents a trend in the direction of individualizing the treatment of the more serious offenders. With a fourth-offender law, a large number of prisoners serving life terms had accumulated in the state's prisons. It seemed apparent to many that some of these prisoners, having been incarcerated for a long time, were as eligible for parole as short-term offenders, and their further imprisonment was not serving the state any useful purpose. The Michigan "lifer law" made it possible to parole these prisoners after serving a minimum of ten calendar years, with the approval of the sentencing judge (if still alive), and a public hearing held by the parole board with the attorney general's office representing the people.

The experience gained from the operation of this law supplies us with some information pertinent to our topic of discussion.[12] During the operation of the lifer law, the ten years from 1942 through 1951, 138 persons were paroled after serving an average time of seventeen years. In addition, 32 were discharged by court order, 25 died in prison, and 2 escaped. As a result of the operation of the lifer law, the number of annual discharges by court order is now on the decrease. With the new commitments to prison and the return of violators and escaped prisoners, the operation of the law reduced the "lifer

[12] Information on the Michigan lifer law was graciously supplied by Roy H. Nelson, Parole Board member and for five years the parole eligibility examiner handling lifer cases for the Parole Board; and Ayres R. Raymond, supervisor of research and statistics, Michigan Department of Corrections.

law prison population" by 78 (from 325 to 247) during the ten-year period.

Parole procedure

High standards of administration of the Michigan lifer law have been maintained. Each prisoner eligible for parole has his case reviewed each year. After an interview with a parole examiner, a detailed analysis of those cases considered by the board good parole risks is forwarded to the sentencing judge and prosecutor of the original court of jurisdiction and the attorney general. Meanwhile, a pre-parole investigation is made by the board. If no objections have been raised, a public hearing is held and parolability is determined. It is reported to the writer that only three or four judges have ever objected to the parole of a case recommended by the board. Most judges admit that they have only the vaguest recollection of the case after the lapse of years, and they are willing to accept the recommendation of the board.

Now that the best parole risks have been discharged, it is reported that the policy of the board will be to maintain the conservative standards. This means that in the future it is expected that a larger proportion of parole discharges will be cases which have recently become eligible by meeting the ten-year minimum requirement; and it is probable that fewer paroles will be granted each year.

There has been no substantial criticism of the actions of the board in the administration of the law. Adverse news articles and editorials have not been evident in the state. The board has successfully resisted private pressures for the parole of individual cases.

Experience with parolees

It has been reported to the writer that without exception, the parole officers of the state have found the lifer much easier to supervise and handle than the ordinary parolee. Of course this is in large part the result of careful screening practiced by the board, but also it probably reflects the subduing effect of long-time incarceration and the aging of the prisoners. In any case, the experience demonstrates that there is considerable individual variation in parolability among men who are serving life under statutory and court-imposed sentence.

Of the 138 lifers paroled, 8 have been returned for parole violation—6 received new sentences and 2 incurred technical violations; 5 died on parole; 5 were deported; 1 was discharged on a retrial; and 72 have been discharged from parole. In one case a new sentence was received after parole discharge. The remaining 46 are still on parole (as of July 1952).

Although a prisoner serving a sentence for first degree murder in Michigan is not eligible under the lifer law, this state's experience with these cases is specifically relevant to an evaluation of the alternatives to the death penalty. Some members of the Michigan Parole Board feel that their experience with the lifer law warrants the experimentation with similar legislation for first degree homicide cases after serving twenty years in prison. A bill providing for this procedure has been introduced in the legislature, although for the present the advocates of capital punishment have successfully staved off such a proposal. Nevertheless, since recent governors have been more willing to commute the sentences of these prisoners (who otherwise would not be eligible for parole), 49 were paroled during the ten-year period ending with 1951. In addition, 98 were discharged by court order and 67 died in prison.

With 2 cases commuted and discharged and 1 case pardoned, a total of 217 separations of first degree murder cases occurred during the ten years. This enabled the first degree murder prison population of 586 to be reduced to 566 in 1951. New commitments and return of parole violators numbered 197. The present tendency is toward the substitution of parole of first degree murderers for discharge by court order. These policies are expected to prevent an increase in the first degree murder prison population of the state, which now approaches the high figure of 600.

Since 1937, when the present Michigan Parole Board was organized, 68 first degree murder cases have been paroled after serving an average term of 22½ years. Of these only 2 became parole violators, by receiving sentences for burglary and indecent liberties. No known instance of homicidal assault occurred among these parolees. In spite of the fact that parole violation rates based on the information presented above are crude, it may be pointed out that the first degree murder parolees had a violation rate of less than half that of the lifer law cases—rates of 3 and 7 per cent, respectively.[13] These rates are substantially lower than the usual official parole violation rate of 15 per cent for ordinary offenders.

PAROLE OF LIFERS IN WASHINGTON

A similar experiment with the parole of lifers has been started in the state of Washington. As reported above, as recently as July 1951, a new law gave the Board of Prison Terms and Paroles the authority to consider lifers (including those sentenced to death for first degree murder whose sentences have been commuted to life) for parole after serving a minimum of 13 years and 4 months (20 years less good time). Like the situation in Michigan, Washington evidently had come to the position in which a relatively large number of lifers were serving time in the state prison.

In spite of the fact that the board followed a very conservative policy, about 30 lifers were paroled during the first year.[14] At least 2 of these men had been originally sentenced to death and the sentence had been commuted to life by the governor. These parolees have been subjected to rather searching investigations every three months, and during this time no case has got into sufficiently serious trouble to warrant a revocation of his parole.

SUMMARY AND CONCLUSIONS

Whatever ultimate value may be assumed to exist in the death penalty, the statutes, the administration of justice, and public opinion tend to limit its use to relatively few cases in the United States. The life sentence is, of course, the most commonly used alternative to the death sentence. This practice has caused an excessive accumulation of inmates in many of our state prisons. The pressure of this condition and perhaps the increasing acceptance of individualized treatment have encouraged, at least in some states, the more frequent use of the traditional powers of executive clemency and court discharge by selective release of these prisoners. In more recent years it is apparent, specifically in Michigan and Washington, that there is a trend toward the placement of this power in the parole authority of the state. From the point of view of administrative efficiency, this appears to be pre-eminently desirable. Except in the rare cases in which it ap-

[13] Based on 2 in 68 cases and 9 in 138 cases, respectively. In the latter instance of lifer cases the 2 technical violation cases and the 1 case which was resentenced after discharge have been included to give the 9 violations. Note that this is a conservative basis of computation for comparison with ordinary parolees.

[14] The writer is indebted to Dr. Norman S. Hayner, member of the Washington Board of Prison Terms and Paroles, for this information.

pears necessary to rectify a miscarriage of justice through executive pardon, a professional parole board is best qualified and specifically staffed to make investigations and decisions regarding alternatives to life imprisonment.

Available information would seem to bear out expectations based on the knowledge of psychology and the social sciences that not all prisoners who happen to have been sentenced under statutory laws which demand the death sentence or life imprisonment are equally incorrigible. It seems reasonable to expect, assuming continued and increasing support of the idea of individualized treatment and the existence of competent correctional authorities, that the future will see further use of selective forms of treatment for even the most serious offenders.

Although the life sentence is the only available alternative to death as a maximum "penalty" for the most serious offenders, there is a great deal of room for more permissive powers than exist at present. From one point of view, there are offenders from whom society would receive greater protection if a life sentence were legally possible. On the other hand, there are those persons originally sentenced to life imprisonment for whom even a term of ten years may be *unnecessarily long* for adequate protection of society. Ten years of penitentiary life can evidently induce significant changes in the social attitudes of some prisoners.

Knowledge of human behavior indicates that a minimum sentence of ten years is arbitrary. Arbitrary as it may be, however, ten years or more is perhaps understandable in light of the prevailing incompetence of correctional authorities in some of our states, and in light of the inability of even the most competent professional persons to predict human behavior accurately.

Considering the latter point, the alternative to parole from the penitentiary direct to community supervision is the diversified correction system in which gradual release and observation of conduct under conditions of increasing individual responsibility is the most adequate test of final parolability. Under these conditions genuine treatment programs can be substituted for more punitive incarceration in the more hopeful cases.

The Death Penalty and the Administration of Justice

By HERBERT B. EHRMANN

ARMCHAIR criminology is among the least reliable of the social sciences. It is, however, one of the most popular. To qualify as an expert on crime one needs only to be a legislator, a lawyer, a prosecutor, or a judge. Such persons may actually be authorities in the field. Generally, however, they have had no scholastic preparation and no special experience beyond a few sporadic episodes. All too often the opinions of individuals in such positions are accorded a factitious authority merely because of the office which they hold. Unfortunately, the public does not understand the meagerness of experience and inadequacy of data on which such views are so frequently based.

IRRATIONAL VIEWS

Discussions concerning the death penalty have been especially confused by the voices of unqualified "authorities." For nearly a century and a half change has been delayed and the acquisition of real knowledge hampered by sonorous pronouncements of the eminent, but uninformed. When in 1810 Sir Samuel Romilly introduced a bill in Parliament to abolish capital punishment for stealing five shillings or more from a shop, it was unsupported by a single judge or magistrate.[1] Speaking for the unanimous opposition to the bill by his judicial colleagues in the House of Lords, Lord Ellenborough, Chief Justice of the King's Bench, predicted that the repeal of this law would lead to abolition of the death penalty for stealing five shillings from a dwelling house, in which case no man could "trust himself for an hour without the most alarming apprehensions that, on his return, every vestige of his property will be swept away by the hardened robber." [2]

These and similar laws were eventually repealed without any increase in *the number of offenders in the particular class of crime.* In fact, the absolute number of such offenders diminished.[3] As lawyer and judge, Lord Ellenborough was no fool. Although inclined to be harsh in criminal cases, he did much to bring the civil law into harmony with mercantile practice. He was a profound legal scholar. He knew the value of evidence. Yet, when it came to the death penalty, he felt qualified to pronounce an authoritative judgment without the aid of any evidence whatsoever other than his own emotional reflexes. His contemporaries accorded his words the respect due his high position; but history has proved that the great Lord Ellenborough, in discussing capital punishment, was talking nonsense.

The efforts to remove or modify the death penalty for the crime of murder have run a similar course. Fortunately, there has now been enough experience with abolition and curtailment to establish as a fact that the repeal of capital punishment is not followed by an increase in the number of murders, nor does its restoration result in a diminution. Whatever other purpose the death penalty may serve, it is now obvious that, in a settled community, it is not needed to protect society from murderers.

[1] *Hansard*, May 1, 1810.

[2] *Ibid.*, May 30, 1810.

[3] Second Report on the Criminal Law by His Majesty's Commissioners, 1836, p. 21.

Nevertheless, even in this narrow area where data are abundant and easy to obtain, pronouncements of the Ellenborough variety continue to confuse the public. As late as 1950, the legislative halls of Massachusetts still rang with dire predictions that the passage of a bill to give juries a chance to designate life imprisonment as a penalty for murder in the first degree would result in loosing upon the people of the Commonwealth a horde of savage murderers. This was at a time when 38 other states and the federal government already had some form of the alternate penalty and 6 states had abolished capital punishment!

ALTERNATE AND MANDATORY AREAS COMPARED

A similar disregard of experience frequently marks discussion of the effect of the death penalty on the administration of justice. For instance, it was claimed that the giving of the power to impose the alternate penalty of life imprisonment would result in the complete disuse of capital punishment. Those making the claim seemed to think that this would be very bad indeed. In 1948 the then governor of Massachusetts vetoed the proposed bill granting juries the right to choose life imprisonment instead of death on conviction in murder cases, stating in his veto message that such a law would abolish capital punishment by "indirection"; that it pays "lip service to capital punishment" and then "effectively proceeds to destroy it."

Coming from the governor, the veto message was treated with respect;[4] but it was only another example of armchair criminology. For the ten years ending with 1946, Massachusetts, under a law making death a mandatory punishment for first degree murder, had 12 executions. For the same period, alternate-penalty states had the following record: New Jersey, with a slightly smaller population, 16 executions; Pennsylvania, with something more than twice the population, 50 executions; and New York, with about three times the population, 118 executions. For the same period, North Carolina, a mandatory state, had 118 executions, and its neighbor, Georgia, somewhat smaller in population, under the alternate penalty, had 102.

There are too many variables—such as homicide rates, population characteristics, police efficiency, prosecution standards, jury attitudes, executive clemency—for any quantitative comparison of states within these groups, but the figures indicate clearly that capital punishment continues to flourish in states which provide the alternate penalty.

On the other hand, the residents in certain areas have, in practice, virtually abolished capital punishment in both mandatory and alternative penalty jurisdictions. Vermont, a mandatory state, has had only 2 executions in 28 years; New Hampshire, an alternate state, has had only 1 execution in 28 years; South Dakota, an alternate state, has had only 1 in the 10 years since it restored the death penalty; Nebraska, an alternate state, has had only 2 in 28 years.[5] In Massachusetts during a period of 50 years under the mandatory penalty, Worcester County, with a half-million population, had only 2 executions; Bristol, a sizable county, only 1; Berkshire County, of moderate size, none; and some of the smaller counties, none. The failure to use the death penalty in certain counties of Massachusetts is dramatically shown in Table 1.

[4] Not, however, by the dean of the Harvard Law School, who commented on the fact that the message ignored available data.

[5] Data from *Memorandum on Capital Punishment*, prepared by Thorsten Sellin for the Royal Commission on Capital Punishment, 1951, pp. 657–60.

TABLE 1—CONVICTIONS ON MURDER INDICTMENTS, CERTAIN MASSACHUSETTS COUNTIES, 1925–41

County	Indictments for Murder	Convictions			Executions for Murder
		1st Degree	2nd Degree	Manslaughter	
Berkshire	11	0	5	1	0
Bristol	36	0	16	3	0
Essex	26	1	12	2	1
Hampden	27	1	12	9	1
Hampshire	8	1 (commuted)	1	4	0
Plymouth	21	0	10	4	0
Total	129	3	56	23	2

Data compiled from records in State Prison and reports of the Attorney General by Sara R. Ehrmann, executive secretary Massachusetts Council for the Abolition of the Death Penalty.

DEATH PENALTY AND ACQUITTALS

A closely related problem is presented by the claim that the mandatory sentence of death upon a finding of guilty of murder in the first degree results in more acquittals. Some of those who express this opinion are extremely well informed penologists.[6] The reason given is that the infliction of death is so repugnant to most people that juries tend to avoid a conviction if possible. Curiously enough, proponents of the death penalty seem to confirm this tendency in a backhanded sort of way. In arguing that the danger of a miscarriage of justice is slight in a capital case, they frequently urge that the evidence must be overwhelming before a jury would vote to consign a fellow being to his death.

Convincing data on this subject are not available. We may, however, accept the reasoning and observations that the reluctance of jurymen to convict, where death is the penalty, leads, in some cases, to acquittal. Nevertheless, one may well question the conclusion that the net over-all result is a larger percentage of acquittals. There are complicating factors working in the opposite direction. For instance, numbers of prospective jurors are frequently excused from serving in capital cases because of opposition to the death penalty. Sometimes the numbers are so great that the judges assail the veniremen for "jury dodging," and these denunciations reach the newspaper headlines.[7]

[6] For instance, Lewis E. Lawes, former warden of Sing Sing Prison, *Man's Judgment of Death* (New York: G. P. Putnam's Sons, 1925), p. 58; Austin H. MacCormick, formerly Commissioner of Corrections, New York City, then executive director of the Osborne Association, in *Boston Sunday Herald*, December 11, 1949.

[7] See for instance the quoted remarks of Chief Justice Higgins in the *Boston Daily Record*, November 5, 1942; those of Judge

This process of weeding out jurors who will not serve because of the death penalty tends to produce an unbalanced jury. Those most likely to lean emotionally toward the defendant are eliminated. No doubt the great majority of those who remain view the death penalty with considerable distaste, but their emotional attitude is likely to be negative. Inevitably, however, on some juries there will be those who favor the use of the death penalty. These people are occasionally forcefully articulate and capable of swaying jurors with less positive attitudes. They are not counterbalanced by those most reluctant to inflict death. Thus hostility toward the death penalty may actually, in some cases, produce juries which are most likely to convict the accused.

EMOTION AND PREJUDICE

There are other factors which work for conviction rather than acquittal in a capital case. Of all crimes, murder is most likely to produce a violent emotional public reaction, a demand for vengeance, a feeling that the perpetrator "deserves" to be put to death. Jurymen cannot help sharing this feeling. The idea that a jury "weighs" the evidence in a criminal case to decide whether the accused is guilty beyond a reasonable doubt, conveys a wrong picture of the process. In many cases it is merely a question of what evidence the jury chooses to believe. If the government's case rests largely on identification testimony and the defense is an alibi, the jury does not "weigh" one against the other. If it believes the identification testimony, the alibi is thrown out of the scales of justice entirely, and vice versa. Where there is conflict of testimony, people tend to believe that which they would like to believe. The emotional drive to punish someone for an atrocious murder frequently plays an important part in conditioning a jury for believing the evidence which proves the guilt of the accused.

In a recent Massachusetts case the only issue was the criminal responsibility of the defendant, who had killed his wife. According to the opinion of the Supreme Judicial Court, the evidence portrayed "the sudden destruction, while in apparent good health, of one member of a harmonious and cultured household by the only other member, in a series of acts paradoxically done, it is confessed, solely in kindness to benefit the victim, yet revoltingly achieved in the grossest barbarity with the crudest of weapons."[8] Two eminent psychiatrists testified that the defendant was not criminally responsible at the time of the killing. There was no medical testimony that he was responsible. Nevertheless, the jury returned a verdict of guilty. The conclusion that the accused was sane beyond a reasonable doubt can be explained only on the ground of emotion aroused by the sheer horror of the deed itself. Although there was no error of law, the Supreme Judicial Court ordered a new trial under a statute passed in 1939 for the review of capital cases.[9] The defendant was tried a second time, found insane, and committed to a mental institution.

When prejudice is added to the emotional reactions induced by a slaying, the jury finds even greater difficulty in believing evidence offered for the accused.[10] If the jury is composed of the dominant or "in-group" and the defendant and his witnesses belong to an "out-group"—as they frequently do—the defendant's evidence is often discounted to zero. The jury tends to believe that foreigners, Negroes, or members of any minority group will lie for one another and "stick together" under all circumstances.

The United States Supreme Court has recognized this human failing, in holding that the exclusion of Negroes from a jury trying a Negro is a denial of equal protection of the laws.[11] Massachusetts had a case where a Chinese, arrested and tried with others for a tong killing, was convicted of murder although no witness identified him or implicated him in the affair.[12] In Kentucky it used to be said that if a Negro killed a white man it was murder, if a white man killed a Negro it was unfortunate, but if a white man killed a white man it was self-defense, unless the affray was over a woman, in which case the cause of death was apoplexy.

PUBLIC HOSTILITY

If to a brutal killing and prejudice there is added the element of public hostility against the accused, the jury listens to the defendant's evidence with ears that are stone-deaf. This is the combination which produces most of our *causes célèbres* subsequently believed by many to be miscarriages of justice, such as the cases of Leo Frank, Tom Mooney, and Sacco and Vanzetti. In the last-named case, the jury, after thirty-five days of trial, received the case in the afternoon and returned a verdict of guilty in the evening. According to one of the jurymen, his colleagues were ready to vote a guilty verdict immediately at the close of the case, but he forced an hour's discussion because he thought such precipitate action was improper.

Regardless of the eventual verdict, the jury could not possibly have considered the mass of testimony in favor of the defendants or weighed the improbabilities in the government's case in so brief a time. Even without the benefit of the subsequent revelations which threw new doubt on the defendants' guilt, a relaxed and unprejudiced jury would have debated at great length the validity of the fleeting and even silly identifications and would not have lightly assumed that a large number of reputable Italian alibi witnesses were perjurers.

Strip the case of the then current antiradical hysteria, change the defendants into Massachusetts veterans of World War I, the identifying witnesses into Italians, and the alibi witnesses into native New Englanders, and it becomes inconceivable that the weaknesses of the prosecution and the massive evidence for the defense would have received such brief consideration by the jury.

DEATH PENALTY AND SECOND DEGREE CONVICTIONS

Whether or not the mandatory death penalty results in more acquittals, there seem to be some general data indicating that it produces a smaller proportion of convictions for first degree murder and a larger proportion for second degree murder.[13] Opponents of capital punish-

[13] Royal Commission on Capital Punishment, Minutes of Evidence taken before the Royal Commission on Capital Punishment,

ment claim that this is due to the fact that juries shy away from the infliction of death; proponents allege that the possibility of the extreme penalty produces more pleas of guilty to murder in the second degree, for which the sentence is imprisonment. Without further and more precise research, it is impossible to draw any general conclusions. People and conditions differ. Doubtless both theories are valid, but it is not known to what extent.

How difficult it is to generalize about these questions may be seen in the contrasting experience with the death penalty of the two most populous counties in Massachusetts—Suffolk and Middlesex. These two counties are contiguous, being separated, for the most part, only by the Charles River. During the test period they were approximately the same size in population [14] (Middlesex was actually about 5 per cent more populous). The criminal courts handling murder cases are presided over by judges who rotate their sittings in the various counties, so they are not indigenous to either Suffolk or Middlesex. Nevertheless, respective records of the two counties for disposing of murder cases are strangely different.

State Prison records for the years 1900 to 1949 inclusive show that 23 individuals were executed for murder in Middlesex, and only 10 for the crime in Suffolk. More detailed reports of the Attorney General for the years 1925 to 1941 inclusive indicate that of 113 indictments for murder in Middlesex, 19 were convicted of first degree (of whom 17 were executed), 23 of second degree, and 30 of manslaughter; of those not guilty, 18 were insane, 10 received a verdict of not guilty, and 13 were nol-prossed, meaning that the district attorney refused to prosecute. For the same period in Suffolk, 3 were convicted of first degree (of whom 2 were executed), 16 of second degree, and 24 of manslaughter; of those not guilty, 10 were insane, 22 received a verdict of not guilty, and 4 were nol-prossed. The approximate percentages are shown in Table 2.

TABLE 2—DISPOSITION OF CAPITAL CASES MIDDLESEX AND SUFFOLK COUNTIES, MASSACHUSETTS 1925–41

By Percentage of All Cases

MIDDLESEX COUNTY	
Convicted	
First degree	16.8
Executed	15.0
Second degree	20.4
Manslaughter	26.4
Total	64.0
Not convicted	
Not guilty	9.0
Nol-prossed	11.4
Not guilty and nol-prossed	20.4
Insane (not tried)	16.0
Total	36.0
SUFFOLK COUNTY	
Convicted	
First degree	3.9
Executed	2.55
Second degree	20.2
Manslaughter	30.4
Total	54.0
Not convicted	
Not guilty	27.8
Nol-prossed	5.0
Not guilty and nol-prossed	32.8
Insane (not tried)	12.65
Total	46.0

Compiled from data collected by Sara R. Ehrmann.

The period covered by Table 2—seventeen years—and the number of cases involved are sufficient to smooth out any substantial distortions due to unusual cases. From these figures it appears that one indicted for a capital offense in Middlesex stood nearly a 17 per cent chance of being convicted of first degree murder and a 15 per cent chance of being executed; whereas if the murder were committed in Suffolk, he would stand only a 4 per cent chance of being so convicted, and only a 2.5 per cent chance of being executed. Those guilty of second degree murder, whether by plea or after trial, were approximately the same in percentage in both counties, as were those guilty of manslaughter. The accused had three times the chance of being acquitted after trial in Suffolk that he would have had in Middlesex, but in the latter county the district attorneys may have nol-prossed weak cases more freely than their opposite numbers in Suffolk.

Explanations may be offered for these startling differences. Suffolk contains a larger percentage of more recent immigration; its racial, religious, and ethnic proportions of population vary substantially from those in Middlesex; its residents, on the whole, are on a lower economic level; they are less suburbanite; there is a tradition of "hanging" prosecutors in Middlesex. The very nature of these explanations, however, indicates the complexity of the problem. If citizens of the same state, living in adjoining counties, operating under the same administration of justice, differ so drastically in their attitude toward the death penalty, how is it possible to generalize for an entire state or nation?

DEATH PENALTY AND NUMBER OF TRIALS

Again, it is claimed that fewer trials are required in abolition states because obviously guilty defendants are more likely to plead guilty where they do not have to battle for their lives. There are, indeed, some instances where this appears to be the fact. On the other hand, there are those who claim that it is harder to secure pleas of guilty in abolition states because the prosecutor has less inducement to offer the guilty defendant. The answer necessarily depends upon the attitude of prosecutors in a death penalty state. If, for instance, the prosecutor insists on first degree with death as the penalty, the accused has nothing to lose by trial; if the prosecutor is willing to trade for a plea of guilty in the second degree, the defendant has much to gain by not risking a trial. How do we know, however, what prosecutors will do?

The application of armchair psychology to forecast the conduct of prosecutors—or any other public authority—is no easier than the Ellenborough method of predicting the reaction of criminals. For instance, as early as 1900, Hosea M. Knowlton, then attorney general of Massachusetts, recommended the commutation of the death sentence of a seventeen-year-old murderer whose crime was particularly vicious, on the ground that Massachusetts public sentiment would not tolerate the execution of so young a boy.

In 1942, after forty years' development in the field of handling juvenile delinquency, another Massachusetts prosecutor insisted on the death penalty for a seventeen-year-old offender despite the suggestion of the judge that the case was a proper one for a plea of guilty to murder in the second degree. The boy's previous record had been good, and there was a conflict of medical testimony as to whether the cause of the victim's death was the wound or a heart ailment, since the victim lived for seven weeks and his injuries had apparently healed. Nevertheless, the lad was allowed by the governor to be electrocuted, with the assent of the parole board acting in an advisory capacity.

A few years later, in another case involving a seventeen-year-old boy, another Massachusetts judge took the initiative and accepted a plea of guilty to second degree on the ground that no Massachusetts governor would ever al-

Thirtieth Day, Thursday, 1st February, 1951. Witness: Professor Thorsten Sellin. (Pp. 647–678) London: H. M. Stationery Office, 1951.

[14] The 1940 Census gave Middlesex, 958,855; Suffolk, 912,706.

low so youthful an offender to be electrocuted!

A very conscientious district attorney will sometimes secure a conviction which the facts require, in the belief that the governor will take care of mitigation. Such a case was *Commonwealth v. Desatnick*,[15] where the father of an illegitimate child, plagued by accusing parents and a religious sense of guilt, murdered the infant. Instead of commuting, however, the governor sent for clerics of the defendant's faith and asked them whether illegitimacy was a more serious offense than murder. On the basis of the obvious answer, the young man was electrocuted. Within a short time, however, another Massachusetts district attorney, regarded by many as more hard-boiled than the one who prosecuted Desatnick, nol-prossed the case of a mother who had abandoned her illegitimate child to die, on the ground that, although the crime would ordinarily be murder, "society needs no penalty for this, unfortunate as it is."

These instances are sufficient to indicate the futility of generalizing on insufficient data. Research alone, in a wide area and covering a period of years, could establish what prosecutors tend to do in the death penalty states by way of accepting pleas of guilty to second degree murder.

DEGREES OF MURDER

Degrees of murder present such a confusing problem that they create a further obstacle to predictability in the administration of criminal justice. In states where capital punishment has been abolished, the situation is not too serious. An intelligent parole board may ultimately adjust any gross errors in the jury's verdict or in the pleas. But where the penalty is death, a confused jury may eternalize its mistakes.

[15] 262 Mass. 408 (1928).

The principal variety of "first degree" murder is generally defined as including "malice aforethought," and involves "premeditation" and "deliberation." However, judicially defined "malice" does not necessarily involve malice against the victim in the ordinary dictionary sense. Moreover, the courts have explained "deliberation" and "premeditation" in such a way that these words also have lost their usual meaning. Under judicial definition, "premeditation" and "deliberation" can both occur within a few seconds of the killing itself. In the now rather celebrated case of *Fisher v. United States*,[16] a Negro of low-grade intelligence, suddenly feeling that he was insulted by his victim, struck her, and then killed her "to stop her from hollering." The jury by its verdict found deliberation and premeditation, essential to first degree murder.

Mr. Justice Frankfurter, in his dissenting opinion in the United States Supreme Court, referred to the judge's charge on the subject as the "dark emptiness of legal jargon." According to Mr. Justice Frankfurter, the insult "pulled the trigger of Fisher's emotions." We shall never know how many defendants have been hanged or electrocuted for a "deliberate" and "premeditated" killing where some unexpected incident "pulled the trigger" of the accused's emotions.

"Is it possible," asked Sir Ernest Gowers of Mr. Justice Frankfurter at hearings held by the Royal Commission on Capital Punishment in 1950, "to express premeditation clearly and logically without mumbo-jumbo entering into it?" Mr. Justice Frankfurter thought that it was possible, but conceded that "the charges given by trial judges in the United States are often not very helpful." The Royal Commission appeared

[16] 328 U. S. 463, 66 S. Ct. 1318, 90 L. Ed. 1382 (1946).

to think this observation to be an understatement.[17]

Another type of first degree murder is usually defined as a homicide occurring in the act of committing a serious felony. Here again the situation may be far from clear. If the jury believes that the accused, at the time of the killing, had given up all intention of committing the felony, and killed the victim because of fear for his own safety, the crime is not first degree murder. In a close case, how is the jury to read the defendant's mind in order to apply the instructions of the judge?

It would be unfair, however, to blame the judges for their inability to explain clearly the different degrees of murder. The fact that so many do not succeed suggests that the real blame rests with the rather fanciful distinctions between first degre and second degree murder. Mr. Justice Cardozo himself found it difficult, if not impossible, to draw a satisfactory line:

> I think the distinction is much too vague to be continued in our law. . . . The statute is framed along the lines of a defective and unreal psychology. . . . The present distinction is so obscure that no jury hearing it for the first time can fairly be expected to assimilate and understand it. I am not at all sure that I understand it myself after trying to apply it for many years and after diligent study of what has been written in the books. Upon the basis of this fine distinction with its mystifying psychology, scores of men have gone to their deaths.[18]

Degrees of murder were introduced into the law originally in order to give juries an opportunity to mitigate the harshness of the death penalty. No doubt in many cases they have accomplished their purpose. Some juries find second degree despite the facts and the judge's instructions; other juries, more conscientious than merciful, find first degree where warranted; still others muddle through the "mystifying psychology" to a bewildered finish. In conjunction with the death penalty, these degrees of murder have created a combination which tends to produce a most haphazard application of the criminal law in capital cases. Once the death penalty has been abolished, however, the criminal law may safely drop such metaphysical distinctions and relate the period of imprisonment to modern penology for the protection of society and the rehabilitation of the convicted.

[17] See Testimony of Mr. Justice Frankfurter before the Royal Commission on Capital Punishment, 1950, pp. 580–82.

[18] Benjamin N. Cardozo, *Law and Literature* (New York: Harcourt, Brace & Co., 1931), pp. 99–101.

MENTAL RESPONSIBILITY

Another cause for the haphazard application of the death penalty is the submission of the issue of mental responsibility to juries under legal definitions of insanity which are completely at variance with medical science. Most jurisdictions still apply the century-old rule in M'Naghten's case, namely: Did the defendant know that his act was morally and legally wrong? The rule has been somewhat qualified by such exceptions as the "irresistible impulse" test, but on the whole, M'Naghten still dominates judicial charges and decisions.

Under this definition of insanity, the lowest-grade morons and the most disturbed psychopaths are repeatedly convicted because they "knew the difference between right and wrong." It has also provided astute defense counsel with a handy means of getting guilty clients off without any penalty whatever, through a verdict of "not guilty by reason of insanity," and a subsequent speedy cure of a nonexistent mental disease.

In Massachusetts, under the Briggs law, the issue of insanity in capital

cases is now usually decided before trial by the report of two impartial psychiatrists. In most states, however, the juries must continue to choose between contending alienists who are paid for their opinions by the side which calls them to the stand. Since there can be no reconciliation between the legal test for insanity and a conscientious psychiatrist's ideas about mental disease, the expert testimony from the witness stand is given under conditions which often confuse rather than assist a jury in reaching a verdict.

If imprisonment or confinement were the result in any event, then a finding of either sanity or insanity would provide opportunity for further study and possible treatment. Under the present system, a mistaken finding of guilty or not guilty where insanity is pleaded may result in irrevocable error. It is the presence of the death penalty that hinders a new approach to the entire question of mental responsibility.

DEATH PENALTY AND COST OF TRIAL

Whether there is actually a larger proportion of pleas of guilty without trial where capital punishment has been abolished is also largely unexplored territory. The trial of murder cases is an expensive process. The ordinary murder trial may cost the county thousands of dollars, and some of the more bitterly contested cases may run high up in five figures. In Massachusetts, the trial of the Millen brothers and Abraham Faber in 1934 for murder in the commission of robberies ran for nearly eight weeks at very great cost to the county. These criminals and their lawyers knew that the government's case was overwhelmingly strong and that public feeling ran high against them. Slim as their chances were, however, they went to trial because no prosecutor in a mandatory death penalty state, on the facts of their outrageous crimes, would have accepted a plea of second degree. Under the same conditions in an abolition state, would the accused have pleaded guilty? [19]

California was put to a great expense in the trial of the sensational Hickman case involving the fiendish sex killing of a child. Would the defendant have pleaded guilty in an abolition state? Shortly after the Hickman trial, Michigan had a murder case almost exactly the same in its gruesome details, apparently induced by the lurid press treatment of the California crime. The accused, one Hoteling, promptly pleaded guilty, thereby sparing the state much expense and the public a recital of the macabre details.

The money spent on the trial of capital cases would pay the salaries of a substantial number of additional parole officers, badly needed in a constructive effort to reduce crime. It might repay any state to investigate the probability of saving the cost of these expensive murder trials through repeal of the death penalty.[20]

[19] Cf. *Boston Globe*, October 14, 1930. "Battle Creek, Michigan [an abolition state]. Only a little more than 12 hours following their capture after the killing of a state policeman and the robbery of a bank, Thomas Martin and James Gallagher were sentenced to life imprisonment in Jackson Prison." The Millen-Faber cases are notable for reasons other than great expense. At the time of the arrest of these criminals, two innocent men, Beret and Molway, were being tried for one of the murders committed by the Millen gang. The trial was nearing a conclusion, and eight reputable witnesses, with good opportunity to observe, had identified Beret and Molway as the robbers, when the real criminals were apprehended, bringing confessions and ballistic evidence to the rescue. No one familiar with the Beret-Molway trial has ever doubted that these men would have been convicted—and executed—but for this timely occurrence.

[20] Commenting on the execution of Irene Schroeder by the State of Pennsylvania in 1931, Dr. Harvey M. Watkins, of Reading, a social worker, is quoted in a bulletin issued by the American League to Abolish Capital Punishment as saying: "It cost the State of Pennsylvania $23,658 to prosecute, convict and electrocute Irene Schroeder at the Western Penitentiary. If one twentieth of this sum had been spent 10 years ago by any social workers on that 22-year-old girl, that electrocution would have been prevented."

Whether or not capital punishment increases the expense of administering justice by forcing to trial a greater number of murder cases, there can be no doubt that the cost of cases actually tried is greatly increased because of the reluctance of jurors to serve where they may feel compelled to decree death to the accused. This is a universally observed phenomenon. Where the cases are notorious, the delay in securing a jury may be fantastic. In the trial for the murder of "King" Solomon in Boston, only one of 90 veniremen failed to disqualify himself on the ground that he was opposed to capital punishment. After 160 had been interrogated, there still were not enough to make up a jury.[21] In the case of Sacco and Vanzetti, four days were consumed in impaneling a jury.[22] These instances may be extreme, but they underscore a fact which should properly be considered in any evaluation of the death penalty in the administration of justice.

DEATH PENALTY AND SENSATIONALISM

Expert observers also agree that the trial of murder cases where death may be the penalty tends to be more sensational than where imprisonment is the only punishment. The spectacle of a human being fighting for his life is stirring drama inside and outside of the courtroom. Frequently, in order to sway a jury toward the fatal verdict—and possibly to reassure his own conscience—a prosecutor will inflame the jurors against the accused by playing upon every prejudice and ghastly detail. It is generally recognized that some prosecutors, because of political ambition or simple vanity, are not above deliberately seeking the headlines.

Of course, noncapital cases may also tend toward sensationalism; but where this occurs, it is because of reasons other than the penalty involved. Generally speaking, the trial of cases where the penalty may be death is surcharged with an emotional tension not present in other prosecutions. Defense counsel, witnesses, judges, and even prosecutors have been visibly affected by the strain. This atmosphere, created by invoking the specter of death to destroy the life in the dock, is hardly a help to calm consideration of the evidence.

DEATH PENALTY DISTORTS ADMINISTRATION OF JUSTICE

Indeed, the one conclusion on which practically all criminologists agree is that the death penalty tends to distort the course of the criminal law. In the phrase of Professor Sheldon Glueck, it "bedevils the administration of justice." [23] Data may indicate that in some instances it may result in acquittals or findings not merited by the accused; in others, in convictions and executions not justified by an unemotional consideration of the evidence. In either case, the normal is deflected. The penalty is erratically inflicted at different times in different places. It retards progress in the criminal law by maintaining concepts which should have little to do with the process of ascertaining guilt, innocence, or responsibility.

Just as the death penalty is a para-

[21] *Boston Herald*, June 7, 1933.

[22] Record published by Henry Holt & Co., 1928.

[23] Minutes of Faculty Meeting on Capital Punishment, Twentieth Century Club, January 18, 1936.

doxical block in a modern system of penology, so does the fear of its finality hinder reform in the administration of criminal justice. Professor Sam Bass Warner, then on the faculty of the Harvard Law School, declared to the Joint Judiciary Committee of the Massachusetts Legislature in 1935 that "the existence of the death penalty for first degree murder is one of the principal reasons, if not the main reason, why it is extremely difficult to get judges and legislators to remove procedural barnacles from our law."

It may be said that all human processes are imperfect, and that those of justice are no different; but the fact of human fallibility is not a good reason for increasing it. If to err is human, then it becomes all the more important to reduce the probability of errors—especially fatal ones. On the massive evidence now available dealing with the use and disuse of the death penalty, there would seem to be no sufficient compensating advantage in retaining it. Its disappearance could only improve the administration of justice.

Herbert B. Ehrmann, Esq., Boston, Massachusetts, is a practicing lawyer and is chairman of a Joint Committee of the Boston Bar Association and the Suffolk District Medical Society dealing with mental responsibility in crime. He is a member of the Council of the Boston Bar Association and has been a member of the Judicial Council for Massachusetts and of the Massachusetts Civil Service Commission. He has also served as a trustee of the Training Schools of Massachusetts and as chairman of the Parole Committee of Shirley Industrial School. He is co-author (with Reginald Heber Smith) of Criminal Courts of Cleveland (1921) and author of The Untried Case (1933) which deals with the case of Sacco and Vanzetti, for whom he was of counsel.

The Paroling of Capital Offenders

By G. I. GIARDINI and R. G. FARROW

THIS survey was conducted by correspondence. A questionnaire was sent to each state, asking for information about commutation of death penalty and the procedure for subsequent parole of commuted capital offenders, and requesting statistics on this group. Forty-six states responded to the questionnaire. When the information was summarized, the resulting statements were submitted to the respective states for approval or correction.

Following is the current practice in the paroling of capital offenders in forty-six states as revealed by this survey.

ALABAMA. Prior to 1951, prisoners whose death sentence had been commuted by the Governor to life imprisonment were eligible for parole at discretion of the Board of Pardons and Paroles. Since 1951, the law requires that the commuted "lifer" must serve fifteen years before he is eligible for parole consideration by the Parole Board. Parole continues for life unless a pardon is granted by the Board of Pardons and Paroles. Parole may be revoked by action of a quorum of the board.

ARIZONA. Parole of prisoners with death sentences commuted to life imprisonment is granted by the Governor on recommendation of the Board of Pardons and Paroles. The board itself has power to terminate or revoke parole.

ARKANSAS. After death sentence has been commuted to life, further commutation to a specific term is required for parole purposes. A prisoner is eligible for parole consideration when he has served one-third of the specific term imposed. Expiration of the minimum sentence of the specific term ends parole. Parole is granted and may be revoked by the Board of Pardons, Paroles and Probation.

CALIFORNIA. Parole may be granted after the prisoner has served seven years of the life sentence commuted from the death penalty, unless the Governor's commutation order stipulates that parole shall not be granted. The Governor may remove this stipulation through further clemency. Parole on life sentences continues for life unless terminated by the Governor, or unless revoked by the Adult Authority for violation.

COLORADO. Capital sentence may be commuted to life by the Governor. The Parole Board has authority to parole a life prisoner only after the Governor establishes a minimum sentence and this sentence is served. Further clemency by the Governor is needed to terminate parole, but the Parole Board may revoke for violation.

CONNECTICUT. The Board of Pardons, prior to July 1, 1951, had power to commute death sentences to life and later to commute the life sentence or grant conditional pardon to lifers, subject to further action and conditions of the Board of Parole. Lifers were eligible for parole in twenty years if they had earned the time given for good behavior. Since 1951, juries are permitted to recommend mercy in cases of conviction for a capital offense. The judge *must* sentence the offender to life imprisonment. This sentence cannot be reduced, and the offender does not have the privilege of applying for commutation or parole. However, capital sentences will still be subject to commutation by the Board of Pardons, but the possibility of subsequent clemency from

a life sentence has not been determined.

DELAWARE. Capital offenders serving life sentences can be paroled by the Board of Parole after serving fifteen years in prison. Paroles can be terminated by commutation action of the Board of Pardons, or by revocation order of the Board of Parole after violation.

FLORIDA. Parole consideration may be given to lifers, including commuted capital offenders, after six months have been served on the sentence. The Parole Commission can release the parolee from supervision or return him for violation; but only the Pardon Board, on recommendation of the Parole Commission, can restore civil rights lost through conviction for felony.

GEORGIA. Since 1943, commutation from death penalty to life imprisonment is a power of the Board of Pardons and Paroles, rather than of the Governor. Prisoners serving life sentences are eligible for parole consideration after serving seven years. Parole on life sentences can be terminated after five years, through application for commutation and restoration of civil and political rights. The board may order return to prison of a parolee who violates.

IDAHO. The Board of Pardons may commute the death penalty to life in prison. In order to be eligible for parole, a life prisoner must serve ten years. Parole may then be ordered by the State Board of Correction, which, incidentally, has the same membership as the Board of Pardons. Parole may be terminated after one year by the Board of Correction, which may also order return for violation.

ILLINOIS. Commutation of death sentences to life imprisonment is effected by the Governor, acting upon recommendation of the Parole and Pardon Board. Parole of commuted capital offenders may be ordered by the Parole and Pardon Board. This same body may order the return of a parolee to the institution for violation, and may discharge a parolee from supervision after he has served honorably on parole for five years.

INDIANA. The Governor has authority to commute a sentence from death to life. He may then grant parole by executive order or may commute the life sentence to a minimum term of time-served. In the latter instance, the Parole Board may grant parole.

IOWA. Parole of capital offenders serving life sentences through commutation of the Governor appears to be a legal possibility, provided commutation of sentence to a definite term is later effected by the Governor. However, the reply from this state reports no known paroles in such cases in the past twenty years. Termination of parole would have to be through action of the Governor.

KANSAS. The Governor may commute death sentences to life imprisonment. Legally, the Governor could parole such cases or could commute the sentence to an indeterminate sentence, after which the Parole Board could take jurisdiction; but no paroles have been granted to date. Paroles on all sentences can be terminated only by the Board of Administration which grants them, except in cases of Governor's parole, which may be revoked by the Governor.

KENTUCKY. Commutation of the death penalty is a power of the Governor. Capital offenders may be paroled by the Division of Probation and Parole after serving eight years. Parole may be terminated only by pardon or by executive clemency restoring citizenship. A life parolee may be returned to prison as a parole violator, but if he is again released, the act is a reinstatement, not a reparole.

LOUISIANA. No reply received.

MAINE. The death penalty is not imposed in this state.

MARYLAND. The Governor may commute death to life sentences. Commuted capital offenders serving life sentences are eligible for parole consideration after serving fifteen years. The Parole Director automatically reviews each case at that time. He must make a favorable recommendation to the Governor before the Governor may grant or refuse parole. An unfavorable decision by the Director is final. Paroles on life sentences are not terminated short of life except by revocation by the Parole Director for violation of parole. The Governor may grant a conditional pardon, which also may be revoked for violation.

MASSACHUSETTS. The Governor, with consent of the Council, may commute the death penalty to life imprisonment. Parole may be effected through a Governor's conditional pardon or a subsequent commutation by the Governor with release power exercised by the Parole Board. Parole may be terminated by a complete pardon or by revocation order of the Governor and Council for conditional pardon cases, and by the Parole Board for commutation cases.

MICHIGAN. The death penalty may be imposed for treason only. There is no known case of its use.

MINNESOTA. There is no death penalty in Minnesota.

MISSISSIPPI. No reply received.

MISSOURI. Capital sentences may be commuted to life imprisonment by the Governor. After commutation, parole may be effected at any time by the State Board of Probation and Parole. Termination of parole requires further commutation by the Governor. Return to prison for violation may be ordered by the board.

MONTANA. The State Board of Pardons may commute death sentences to life imprisonment, upon recommendation of the Governor. A prisoner serving life may be paroled when he has served twenty-five years less possible "good time" of eleven years and three months. Parole must be approved by unanimous action, in writing, of the Board of Pardons. There is no provision for termination of parole, but the Board may order return for violation.

NEBRASKA. The Board of Pardons may commute death to life imprisonment. Parole may be granted by further commutation to a definite number of years. Parole may be terminated by the Board of Pardons after satisfactory completion of the required period —usually nine months. Revocation may also be effected by the board if the parolee violates.

NEVADA. Commutation of death to life sentences is effected by the Board of Pardons and Paroles, consisting of the Governor, three Supreme Court judges, and the Attorney General. A prisoner serving life is eligible to apply for parole after seven calendar years. Parole may be terminated or revoked at the discretion of the Board of Pardons and Paroles.

NEW HAMPSHIRE. The Governor and Council can commute the death sentence to life imprisonment. Parole may be effected by the Governor and Council's granting conditional pardon which may later be changed to complete pardon to terminate sentence. Return of the parolee to prison for violation may be ordered by the Governor and Council.

NEW JERSEY. Capital sentences may be commuted to life imprisonment by the Governor, who may extend further clemency in order to permit release on parole. Parole is ordered by

the State Parole Board and supervised by the Parole Division of the Department of Institutions and Agencies. No capital case has been released under the present system, which was adopted in 1947. Parole for capital offenders can be terminated only by further clemency by the Governor, but the State Parole Board may order return for violation.

NEW MEXICO. The Governor has power to commute death to life sentences. A life prisoner who is not a fourth offender, has not escaped or attempted to escape, and has not violated parole may be granted parole by the penitentiary warden. Such parole is terminated only by violation, with return ordered by the warden. However, capital parolees report for only one year and are then placed on probation for life without any requirement to report or be supervised.

NEW YORK. The Governor has commutation power in capital cases except for the offense of treason, which is subject to the State Legislature. In commuting the death sentence, the Governor may establish a life term or he may set a minimum and maximum term to the sentence. If the term is life, subsequent commutation to a shorter time is needed before parole may be considered by the Parole Board. Parole extends for life or for the duration of the sentence as set by the Governor. The Parole Board may order return for violation.

NORTH CAROLINA. The Governor may commute death sentences to life sentences. No further commutation is required before parole. However, it is customary to reduce life sentences to a definite term of years before parole is granted by the Governor. Paroles are terminated through further commutation order or through revocation by the Governor.

NORTH DAKOTA. There is no commutation of death sentences to life imprisonment and therefore no parole of capital offenders. The only capital offense is murder while serving a life sentence for murder.

OHIO. Prisoners serving life sentences after receiving commutation of the death sentence are not eligible for parole without extension of further clemency by the Governor to reduce the offense from first degree murder to a lesser offense, such as second degree murder. A prisoner serving life for second degree murder is eligible for parole consideration after serving ten years. Paroles of first degree murder cases reduced to second degree by executive clemency can be terminated only by action of the Governor. Return for violation may be ordered by the Parole Commsision.

OKLAHOMA. Capital offenders serving life sentences are in the same category as other prisoners with life terms and are eligible for parole consideration by the Pardon and Parole Board after serving fifteen years. The Criminal Court of Appeals has the power to modify sentences in cases on appeal. The Pardon and Parole Board has authority to recommend clemency to the Governor. Paroles may be revoked on application from the Pardon and Parole Officer to the Governor. The Governor has authority to grant pardons after same has been recommended by the Pardon and Parole Board.

OREGON. Capital sentences may be commuted to life imprisonment by the Governor. All persons serving life sentences are eligible for parole consideration by the Board of Parole and Probation after serving seven years. By law, any parolee is eligible for discharge after one year, but by rule of the Board of Parole and Probation this period is extended to ten years for life sentences. In the past twenty years, only two commutations from death to life have been granted. There have been no paroles granted to capital offenders.

PENNSYLVANIA. The Governor, on recommendation of the Board of Pardons, may commute death to life. Further commutation is required before the prisoner may be paroled by the Board of Parole. The life maximum stands unless reduced by commutation. The Board of Parole may revoke for violation.

RHODE ISLAND. This state has the death penalty for only one offense, murder committed by a person under sentence of imprisonment for life.

SOUTH CAROLINA. The Governor has power to commute death sentences to life terms, and to grant reprieves. The Probation, Parole and Pardon Board may parole capital offenders serving life sentences after ten years of imprisonment. The board may terminate parole for a capital offender by granting a complete pardon.

SOUTH DAKOTA. Death sentences may be commuted by the Governor to life imprisonment, but capital prisoners in this status are not subsequently paroled. The Governor has authority to parole and could terminate parole by revocation or by extending further clemency.

TENNESSEE. The Governor can commute the death penalty to life imprisonment. The commuted capital prisoner is eligible for parole by the Board of Pardons, Paroles and Probations after serving thirteen years and seven months. Parole cannot be terminated except by revocation by the board for violation.

TEXAS. The Board of Pardons and Paroles recommends various forms of executive clemency which the Governor may grant or refuse. Commutation from death to life is granted by the Governor on recommendation of the Board of Pardons and Paroles. All other executive clemency may be granted and terminated through the same procedure. Executive clemency may take the form of reprieve and stay of execution, conditional pardon, reprieve, emergency reprieve, commutation of sentence, or full pardon.

UTAH. The Board of Pardons may commute the death penalty to life imprisonment, and later commute the life sentence to a definite period of time at expiration of which parole may be granted by the board. Parole may be terminated by the Board of Pardons. No paroles were granted to commuted capital offenders from January 1920 to January 1952.

VERMONT. The Governor may commute a death penalty to life imprisonment. He may extend further clemency in the form of pardon or conditional pardon to release the prisoner. However, in the past twenty years the only prisoner whose capital sentence was commuted to life has not been paroled. During this same period there was one other capital conviction, which resulted in execution. If a conditional release is granted, the Governor has power to revoke or terminate it.

VIRGINIA. Death sentences can be commuted by the Governor to life imprisonment. The Governor may also grant a pardon or conditional pardon to prisoners serving life sentences. The conditions of the pardon may be set by the Governor and may be the conditions of parole, including supervision by a parole officer. Such conditional release can be terminated by a specification in the pardon designating a definite period at the end of which the conditions of the pardon will be satisfied, or by absolute pardon or revocation by the Governor. Parole supervision may be ended at the discretion of the Parole Board, usually after five years.

WASHINGTON. The Governor holds the power to commute death sentences to life imprisonment. Prior to 1951 a life prisoner could be released only by full pardon or conditional pardon. Since 1951 the Board of Prison Terms and Paroles has jurisdiction over life prisoners and may consider them for parole after they have served twenty years less earned good-time allowance. This cannot be less than thirteen years and four months. Parole on life sentences can be terminated only by full pardon or by final discharge and restoration of civil rights, both actions being solely in the Governor's power. The board, however, may, at its discretion, issue a conditional discharge from supervision, eliminating the reporting requirement of parole. Other conditions of parole remain in effect.

WASHINGTON, D. C. No reply received.

WEST VIRGINIA. Prisoners whose death sentences are commuted by the Governor are eligible for parole after serving ten years, unless they have had two prior felony convictions, in which case they must serve fifteen years. Release from parole can be effected only by clemency action of the Governor.

WISCONSIN. There is no death penalty in the state of Wisconsin.

WYOMING. There is no commutation of the death penalty to life imprisonment. Death sentence is mandatory for certain offenses unless the jury specifies "without capital punishment," in which event life term is imposed. These life sentences may later be commuted to an indeterminate term by the Governor on recommendation of the Board of Pardons, making parole possible on expiration of the minimum sentence. Parole may be terminated by expiration of maximum sentence less good-time allowances, and by further commutation action of the Board of Pardons.

STATISTICS ON PAROLING OF CAPITAL OFFENDERS

In Table 1 are presented the data received from twenty-two states on the paroling of capital cases. The table does not include five Pennsylvania cases whose life sentences, after commutation from the death penalty, were terminated by full pardon. Nor does it include several cases whose life terms were commuted to permit deportation to foreign countries. Statistics from five other states had to be excluded for various reasons.

The table shows that 197 capital cases were paroled in 22 states over periods ranging from 1 to 38 years. Eleven cases violated parole by the commission of new offenses, 7 violated by breach of rules, 11 died while on parole, 5 absconded from supervision, 129 are still on parole, and 34 were discharged from parole. Combining the three forms of violation of parole, we have 23 cases or 11.7 per cent of the total. This figure compares favorably with violation rates usually reported by parole agencies for all categories of offenders, but its reliability is to be seriously questioned. The small number of cases reported by each state and the wide differences between the states in the laws and policies governing the processing of these cases make any conclusions extremely hazardous.

Of the states that submitted statistics, Pennsylvania and Texas furnished data sufficiently comprehensive to warrant separate treatment. The period covered by the Pennsylvania statistics extended from June 1914 to March 31, 1952. In 1913 a law was passed providing for the abolition of hanging capital cases in the separate county seats and for the substitution of electrocution of all such cases in a newly built prison in the center of the state. Since that time an

TABLE 1—CAPITAL CASES PAROLED AND THEIR PRESENT STATUS

State	Years Covered	Capital Cases Paroled	Number of Violators			Died	Still on Parole	Completed Parole
			New Offense	Breach of Rules	Absconded			
Arizona	20	2	0	0	0	0	1	1
Colorado	22	1	0	0	0	0	1	0
Connecticut	25	3	0	0	0	0	3	0

Wyoming	20	3	0	0	0	0	1	2
Total		197	11	7	5	11	129	34

electrocution docket has been kept by the warden of the prison. This docket was the principal source of our data.

The Texas statistics cover the period from February 8, 1924 to March 31, 1952. It should be recalled that in Texas capital punishment applies to the crimes of murder, rape, and robbery with arms, whereas in Pennsylvania it applies only to murder in the first degree.

Table 2 shows the number of cases executed and the number commuted to life imprisonment for each of the three crimes for which capital punishment may be imposed. Of 269 cases sentenced to die for murder, 21 per cent were commuted to life. Only 7 per cent of those charged with rape, and five of eight cases of robbery, were commuted to life. Of the total of 350 cases sentenced to die, 19 per cent were commuted to life imprisonment.

In Table 3 we have presented the same cases segregated according to offense and race or nationality. For the sake of brevity we will use the term "race" loosely.

TABLE 2—EXECUTIONS AND COMMUTATIONS TO LIFE IMPRISONMENT IN TEXAS FROM FEBRUARY 8, 1924 TO MARCH 31, 1952

Offense	Executed		Commuted		Total Numbers
	Number	Per Cent	Number	Per Cent	
Murder	213	79	56	21	269
Rape	68	93	5	7	73
Robbery	3	37	5	63	8
Total	284	81	66	19	350

TABLE 3—CAPITAL CASES BY OFFENSE AND RACE—TEXAS

Offense	White		Negro		Mexican		Indian		Total
	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent	
Murder	88	32.7	147	54.6	33	12.3	1	0.4	269
Rape	12	16.4	56	76.7	5	6.9	0	0.0	73
Robbery	5	62.5	3	36.5	0	0.0	0	0.0	8
Total	105	30.0	206	58.9	38	10.8	1	0.3	350

In Table 4 we have the number of executions and commutations to life imprisonment for Pennsylvania and for Texas. During the period covered by the statistics, Pennsylvania executed an average of 8.6 capital cases a year as compared with Texas' average of 10.1 cases. If we consider only the murder cases for Texas, the average drops to 7.6 cases per year. If we consider only murder we find that Texas commutes 20 per cent of the cases as compared with Pennsylvania's 18 per cent. The difference is not significant.

TABLE 4—EXECUTIONS AND COMMUTATIONS TO LIFE IMPRISONMENT FOR PENNSYLVANIA AND TEXAS

State	Executed		Commuted		Total Number
	Number	Per Cent	Number	Per Cent	
Pennsylvania	327	82	72	18	399
Texas	284	81	66	19	350
Total	611	82	138	18	749

In Table 5 we note that of the 399 Pennsylvania capital cases, 64.2 per cent were white, 35.6 per cent were Negro. One was Mongolian. When all the Texas cases are considered, regardless of offense, we find that 30 per cent were white, 59 per cent Negro, and 11 per cent included 38 Mexicans and 1 Indian. If we consider only the Texas cases convicted of murder, we have 33 per cent white, 55 per cent Negro, and 12 per cent including 33 Mexicans and 1 Indian.

Table 6 shows the disposition of the

Discharged	0	2
Still in prison on March 31, 1952	12	28
Total	72	66

cases whose death sentence was commuted to life imprisonment, as far as it is known. Texas does not use the pardon in the fashion used in Pennsylvania. Of the two cases discharged in Texas, one was by order of court and the other by order of the Governor.

The 41 cases conditionally released in Pennsylvania include five that were released for deportation. Only one case was released for deportation in Texas.

Of the 41 Pennsylvania cases that were conditionally released, 31 were white and 10 Negro. Of the 22 Texas cases, 8 were white, 11 Negro, and 3 Mexican.

The question of what became of the capital cases conditionally released was answered in Table 1. Of the four cases that were returned for violation in Pennsylvania, two were reparoled. One of these was discharged from parole by commutation of maximum sentence; the other is still on parole. Thus 18 of those originally sentenced to die are still on parole.

One of the questions frequently asked about persons sentenced to serve life terms is how long they actually remain in prison before they are released. With the data at hand it was possible to give a tentative answer to this and other questions. For example, how much time usually elapses between the sentence of death and commutation to life? How long does the capital offender serve on parole before discharge? How long does he remain before he dies? These questions are tentatively answered in Table 7. We have included some data from Kentucky.

It is significant that there are 17 cases in Pennsylvania, 14 in Texas, and 9 in Kentucky that have been on parole

TABLE 7—TIME LAPSES BETWEEN DISPOSITION STAGES IN CAPITAL CASES

Time and Stages	Pennsylvania		Texas		Kentucky	
	Number of Cases	Average Time	Number of Cases	Average Time	Number of Cases	Average Time
Time served before death sentence was commuted to life	72	9.6 mos.	No data		12	15.2 mos.
Time served before release from prison	46	14.3 yrs.	22	11.4 yrs.	10	10.0 yrs.
Time served on parole before discharge	7	10.5 yrs.	3	8.2 yrs.	No data	
Time served on parole before death	7	4.0 yrs.	2	2.3 yrs.	No data	
Time served on parole as of March 31, 1952	17	8.1 yrs.	14	8.5 yrs.	9	6.8 yrs.
Time served by those in prison as of March 31, 1952	12	13.9 yrs.	28	7.3 yrs.	No data	

on an average of more than seven years without violating in a degree to warrant return to prison. On the basis of the statistics usually published by parole boards the likelihood of violation by these persons in the future is very remote, for it has been shown time and again that more than 95 per cent of violations occur within the first three years of parole.

The statistics we have presented point up the need for more thoroughgoing research in this relatively neglected area of criminology.

Giovanni I. Giardini, Ed.D., Harrisburg, Pennsylvania, has been superintendent of Parole Supervision, Pennsylvania Board of Parole, since 1942. He has also served as senior psychologist at the Western Penitentiary of Pennsylvania, lecturer in psychology of crime at the University of Pittsburgh, and instructor in psychology at Pennsylvania State College Centre.

Richard G. Farrow, M.S.W., Harrisburg, Pennsylvania, has been assistant superintendent of Parole Supervision, Pennsylvania Board of Parole, since 1946. He has also served as a case worker at the Pennsylvania Industrial School, the Pennsylvania Prison Society, and the Pennsylvania Board of Parole.

The Pardoning Power[1]

By AUSTIN W. SCOTT, JR.

THE substantive criminal law—concerning itself with the technical problem of what act combined with what mental state is necessary to constitute any of the various crimes in our criminal jurisprudence—has been aptly described as "an island of technicality in a sea of discretion."[2] Thus, before trial, the police have broad discretion as to whether to arrest, and the prosecutor as to whether to prosecute, and if so, for what crime. After conviction, the trial judge (or, less frequently, the trial jury) has discretion as to what sentence, within limits, to impose or whether to suspend sentence and place on probation; the parole board has discretion as to the duration of penal treatment; and the pardoning authorities have discretion as to the use of the pardon power.

The technical and inflexible nature of the problem of guilt or innocence of crime (inherited largely from the historical fact that in England, when the criminal law was being developed, so many crimes were punishable by death) makes desirable the placing of a good deal of discretion in the groups concerned with criminal law enforcement—police, prosecutors, judges, juries, parole boards, and pardon authorities. If this discretion is taken away from any one of these groups, the burden becomes correspondingly greater on the others to make wise use of their discretionary powers.

Thus in capital cases it has in the past been not uncommon to deprive judges or juries of their normal discretion as to sentence, by making the death sentence mandatory. The trend in recent years has been, if not to abolish capital punishment, at least to abolish the mandatory death sentence. Accompanying this movement has been something of a decline in the importance of the pardon power in capital cases. But as long as capital punishment continues, power to pardon in capital cases is bound to remain an important element in the administration of criminal justice.

The broad power vested in pardon officials to pardon, to commute sentences, and to grant reprieves, applies, of course, to many crimes other than capital crimes. In this article, however, we shall limit ourselves to a consideration of these powers in relation to capital cases where the death penalty has been imposed.

WHO MAY EXERCISE PARDON POWERS

All civilized countries make use of some form of the pardon power to give flexibility to the administration of justice in criminal cases. In England this power historically is vested in the Crown. But in the United States it is vested in the People, who can delegate

[1] Much of the material in this chapter on the *powers* of pardoning authorities in capital cases has been derived from the Attorney General's Survey of Release Procedures, Vol. 3 on *Pardon*, published by the Department of Justice, Washington, D. C., 1939. The material on the *policies* of pardoning authorities has been derived mainly from two sources: (1) the annual reports of the U. S. Department of Commerce, Bureau of the Census, on *Prisoners in State and Federal Prisons and Reformatories*, a series of reports which were discontinued in 1946; and (2) reports of various state pardoning authorities giving data and reasons for granting pardons, commutations, and reprieves.

[2] Livingston Hall and Sheldon Glueck, *Cases on Criminal Law and its Enforcement* (St. Paul, Minn., 1951), p. 3.

the power to whomever they please. As a matter of practice, the People have found it most convenient to give the power to the executive branch of the government. Thus, under the United States Constitution the pardon power in federal cases has been delegated to the President; and practically all the state constitutions have delegated this power in state criminal cases to the governor, either alone or in conjunction with advisers.

A large majority of state constitutions originally gave the power to pardon to the governor alone. The more recent trend has been toward putting more power in the hands of a board. Simplifying matters somewhat, we find that today there are in general three different arrangements among the states. First, in about one-quarter of the states, the executive pardon power is vested in the governor alone; some of these states, however, furnish a pardon attorney to aid the governor in these cases. Second, about half the states have provided for advisory boards whose function is to hold hearings on pardon applications and make recommendations to the governor, who alone may make the final decision; in practice, the governor usually adopts the recommendations of the board. Third, in about a quarter of the states there are boards which, instead of acting simply in an advisory capacity, have the final decision about pardons; in all these states, however, the governor is a member of the board.

TYPES OF PARDON IN CAPITAL CASES

In discussing the power to pardon in cases where the death penalty has been imposed, it will be well to consider separately three different types of executive clemency: (1) full pardon; (2) commutation of sentence to imprisonment for life or a term of years; and (3) reprieve, or stay of execution.

FULL PARDON

In only a rare case does one sentenced to death for crime receive a full pardon. Usually the best he can hope for is a commutation of his sentence to life imprisonment. But there is one type of case, fortunately quite rare in capital cases, where justice demands a full pardon—namely, where subsequent events prove that the convicted person is innocent.

There is some dispute as to how often innocent persons are convicted of serious crimes. Some enthusiasts assert that the many procedural safeguards which are afforded criminal defendants in this country—the right to a jury trial, to counsel, to be informed of the charge, to call witnesses, the privilege against self-incrimination, for instance—make it impossible to convict an innocent person. The District Attorney for New York County reports that only 3 out of 27,288 persons convicted in that county of felony during the years 1938–49 were later shown to be innocent.[3]

On the other hand, Professor Edwin M. Borchard, in his book, *Convicting the Innocent,*[4] has collected and discussed at length 65 cases of innocent persons convicted of crime, mostly in this country, of which 29 are murder cases. He says that these 65 were chosen from a much larger number.

Borchard's cases show that innocent persons are sometimes convicted of crime on mistaken identification by the victim, who is often emotionally disturbed by his experience; sometimes on erroneous inferences drawn from circumstantial evidence; sometimes on the basis of perjured testimony of hostile witnesses. Prosecutors, expected by the public to produce convictions, are seldom as impartial as they are ideally supposed to be, although they do not often stoop so low as intentionally to use perjured testimony against the defendant or to suppress evidence favorable to him. Public pressure for revenge sometimes leads juries to convict innocent persons. If the jury learns that an accused person has previously been convicted of an earlier crime, his chances of being convicted of this later crime are considerably enhanced, so much so that he often refuses to testify in his own behalf for fear the jury will learn of his former conviction.

Thus it is clear that for one reason or another an innocent defendant is sometimes convicted and sentenced to death, a fact which obviously constitutes one of the strongest reasons for abolishing capital punishment. In such a case it is only right that the defendant should be given a full pardon. It seems odd, but in most cases of innocence established some time after conviction, a pardon is the only effective way to rectify the wrong, since courts generally have no power to grant new trials because of newly discovered evidence after a relatively short period of time following conviction.

[3] Report of the District Attorney, County of New York, 1946–48, p. 143.

[4] New Haven, 1932.

COMMUTATION OF SENTENCE

Commutation is the substitution of a lighter for a heavier punishment. Unlike pardon, it does not mean forgiveness, and does not effect a restoration of civil rights. Most state constitutions specifically include in the pardoning power the power to grant commutations. In those states whose constitutions do not specifically so provide, it is held that such a power is included in the grant of the pardoning power, for the reason that the greater power (to pardon) necessarily includes the lesser power (to commute).

The power to commute sentences is exercised in a great many cases other than death cases, usually to make eligible for parole a prisoner whose term has not expired. Here we shall consider the power only as used to avoid the death sentence, an important but far less common use of commutation. In practice, the power is generally exercised by commuting death sentences to life imprisonment, although occasionally the sentence is reduced to imprisonment for a term of years.

To prevent the arbitrary or dishonest exercise of the pardoning power by pardon authorities, most of the states require regular annual or biennial reports to the legislature by pardon authorities concerning the granting of pardons, commutations, and reprieves. A study of these reports gives us some indication as to the reasons why commutations are granted in practice. Often the recommendation of the judge who tried the case, the district attorney who prosecuted it, or the state supreme court which reviewed it, is emphasized. Frequently the fact that, of several joint participants in the crime, only one received the death sentence (particularly if this one was not the moving spirit behind the commission of the crime) is given as a reason for commuting the sentence to life imprisonment.

Sometimes the evidence against the defendant, although sufficient to sustain a conviction, is conflicting or is based on circumstantial evidence alone, in which cases the pardon authorities may decide to commute the death sentence. Commutations (or even occasionally full pardons) are sometimes granted because of prior promises made by prosecutors, which the state feels bound to honor, of lighter punishment or immunity in return for turning state's evidence. Sometimes there are extenuating circumstances which do not

affect the technical legal question of guilt or innocence of a capital crime but which do call for the exercise of mercy, as for instance in the famous lifeboat cases which are so well known to law students.[5]

A variety of other reasons have been given as well, including such matters as the youth of the condemned person, the evil influence exercised over him by his stronger or older companions, his good prison record, or the fact that this was his first offense. At times the reasons are suggested very vaguely: "because of the peculiar circumstances of the crime" or "because it is considered that justice will be satisfied without the taking of this man's life."

Factors influencing pardon officials

Without doubt there are motivating forces which lead pardon officials to grant pardons or commutations but which are not given as reasons for acting. At times the condemned man is a member of a group which exercises great pressure on pardon officials to grant clemency; conversely, the victim of the crime may be a member of a group which just as vigorously opposes clemency. Politics is an important factor, too, especially where the governor alone exercises the pardoning power without being insulated by a board of pardons. As an elected official, he is not impervious to the display of public opinion for or against a condemned prisoner.

An interesting question arises as to how the governor's private views on capital punishment affect his commutation of death sentences. We may expect, for instance, that one who strongly disapproves of such punishment would be more prone to commute death sentences than would others. A number of years ago, the Governor of Oklahoma announced his view that the death penalty was legalized murder and stated that he would commute all death sentences to life imprisonment. The Oklahoma Criminal Court of Appeals thereupon denounced the Governor's position in angry tones, stating that the law forbade him to "allow his scruples to influence him in the least."[6] But since it is uniformly held that the exercise of discretion by pardon officials is a matter not to be reviewed or interfered with by the courts, it is difficult to see how, as a practical matter, there can be any effective way of preventing pardon authorities from letting their views on capital punishment influence their decisions on commutations of death sentences.

Extent of commutation

One last problem is the extent to which pardoning officials have in fact exercised their power to commute death sentences. Figures are not directly available on a national basis as to the number of cases where the death penalty was imposed but sentence was commuted. However, we can learn something by comparing the number of prisoners received by federal and state prisons each year under sentence of death with the number of prisoners executed at these same prisons during the same period. Those not executed must

[5] Thus in one of these cases, Regina v. Dudley and Stephens, L.R. 14 Q.B.D. 273 (1884), two men and a cabin boy were cast away in an open boat with almost no food, 1,600 miles from the Cape of Good Hope. On the eighteenth day, having been without food and water for almost a week, the two men killed the cabin boy and ate his flesh. They were picked up four days later. Probably none of the three would have survived if these extreme measures had not been taken. The two men were convicted of murder and sentenced to death, but their sentences were subsequently commuted.

[6] Henry v. State, 10 Okla. Cr. App. 369, 136 Pac. 982 (1913).

have either received commutation, died (either naturally or by suicide), escaped, or had their cases reversed by a higher court. The latter three possibilities are not very common, however.

For the seven years 1940–46 inclusive, 771 condemned prisoners were received, of which number 587 were executed. Most of the 184 unaccounted for undoubtedly received commutations.[7] It would seem, then, that, taking the country as a whole, commutations are granted in about 20 to 25 per cent of the cases where the death penalty is imposed. This statement is somewhat confirmed by the earlier assertion of the Select Committee on Capital Punishment that "over a given period, the percentage of death sentences carried out to execution is 71.9 in the United States."[8]

Statistics are available in some of the individual states as to the numerical relationship between those executed and those whose sentences were commuted. Thus in New York from 1920 to 1936 there were 252 executions and 83 commutations.[9] In New Jersey from 1907 to 1937 there were 119 persons electrocuted and 27 granted commutation.[10] Texas granted 7 commutations out of 64 cases in the four years 1947–51.[11]

It seems safe to say that of the many persons who are convicted of crimes whose maximum punishment is death, comparatively few receive a death sentence. Of those who are sentenced to die, most are executed, but about one in four or five obtains a commutation to life imprisonment.

[7] U. S. Dept. of Commerce, Bureau of the Census, *Prisoners in State and Federal Prisons and Reformatories*, annual reports for the years 1940–46 inclusive. These reports were apparently discontinued after 1946. In a few states executions do not take place in prisons; instead, prisoners are executed by local sheriffs. The figures in the text are not quite complete, therefore, since they do not take into account the comparatively few prisoners sentenced to death who were not received by or executed at state prisons.

[8] Report of the Select Committee on Capital Punishment, England, 1930, p. 67. This report, however, does not cite the source of this information or indicate the "given period" involved.

REPRIEVE

A reprieve in the case of one sentenced to death is merely a postponement of execution. In general, the power to pardon carries with it the power to reprieve, whether or not the reprieve is expressly mentioned in the constitution among the other forms of clemency. While reprieves are sometimes granted in noncapital cases, they are most important in capital cases, to stay execution of death.

The reports of pardon authorities indicate a variety of different reasons for granting reprieves in capital cases. They are often granted—as of course they should be if the law does not provide for an automatic stay of execution—pending the appeal of the case to a higher court or to allow the condemned man to apply to the United States Supreme Court for certiorari or to allow him to pursue other procedural remedies in the courts. If newly discovered evidence bearing on the case is found, reprieve should be granted pending an investigation into the matter. A reprieve may be granted a woman prisoner who is pregnant. It is a well-settled rule of law that an insane person cannot be executed, so reprieves are often granted to determine the question of insanity; and, if insanity is found, to postpone execution until sanity is regained. Reprieves are sometimes granted for less

important reasons, such as the fact that the date of execution is a holiday or a Sunday or the prisoner's birthday.

CONCLUSION

Pardon authorities are given broad and almost unrestricted discretion over pardons, commutations, and reprieves. This fact is one of the elements of strength in the proper administration of criminal justice. But it has sometimes led to abuse, especially in those states where one man has the final determination over clemency. Unscrupulous governors may build up their political careers by using the pardoning power to please people with political influence. Others, more honest, are influenced by the effect of their decisions on the electorate, rather than by the merits of the particular case.

While the discretion of pardon authorities is so broad that there exists no definite standard by which to determine whether the discretion is being abused or not, yet some situations have arisen which clearly show an abuse of discretion. The most notorious of these cases is that of a former Governor of Oklahoma, who was impeached because he frequently exercised his power to pardon, not on the merits of the case, but rather as an accommodation for friends or for financial rewards for himself.

In spite of occasional abuse, however, it seems obvious that the power to pardon is a necessary part of American criminal jurisprudence, in capital as well as noncapital cases. As long as a conviction cannot be reversed after a period of time for newly discovered evidence proving the defendant's innocence, we need the power to pardon for innocence. There will always be cases of technical guilt but, because of extenuating circumstances, comparatively little moral fault. The pardon power, in other words, is necessary in cases where the strict legal rules of guilt and innocence have produced harsh or unjust results. Doubtless the administration of the pardoning power can be improved, as the Attorney General's Survey of Release Procedures, including Pardon, has concluded. But the power to pardon will continue to play an important part in the ultimate disposition of capital cases as long as capital punishment remains with us.

Austin W. Scott, Jr., LL.B., Boulder, Colorado, is associate professor of law at the University of Colorado, specializing in criminal law. He is a member of the Massachusetts Bar and practiced law for two years with a Boston law firm. He spent four years on active duty with the Navy in World War II.

The Death Penalty in Washington State

By NORMAN S. HAYNER and JOHN R. CRANOR

LIKE a woman changing her mind, the sovereign state of Washington has wavered in attitude on capital punishment. The death penalty was in effect for fifty-nine years, was abolished for six, and now has been in effect again for thirty-three. Why was it abolished? Why was it restored? What is the validity of the argument for restoration in terms of later results?

The statutes enacted by the first legislature of the territory of Washington which met in Olympia in 1854 included a capital punishment law. Any person who either purposely, or in connection with a rape, arson, robbery, or burglary, killed another would upon conviction be guilty of murder in the first degree and suffer death. Such person might, however, be pardoned by the governor or have his sentence commuted to life imprisonment.[1]

It was forty-three years later before any attempt to abolish the death penalty was made. This proposal "to prohibit capital punishment in the state of Washington" passed the House by a vote of 37 to 31 with 10 absentees; it was killed in the Senate. Unsuccessful efforts were again made in 1899, 1901, and 1907. In 1911 Representative Frank P. Goss introduced in the legislature a bill to make first degree murder punishable by life imprisonment in the penitentiary instead of by death. "The House spent most of the afternoon debating the Goss bill for abolition of capital punishment, killing it finally by indefinite postponement, 53 to 40."[2] The measure was also defeated by a small majority in the Senate.

Finally, on February 20, 1913, after two hours of argument and oratory, a similar measure did pass the House by a vote of 70 to 25. During these two hours it was alleged by Mr. Goss that the existing law not only had failed to lessen crime, but was unjust and inhumane. Opponents said that abolition would increase crime and add an economic burden. Religious arguments were put forth by both sides. It was stated that convictions were hard to secure under the existing law: "Many guilty persons go free because jurors do not wish them hanged." After the long debate, "announcement of the vote was received with loud applause in which the packed galleries joined."[3]

CAPITAL PUNISHMENT RESTORED

Attempts to revive capital punishment were made as early as 1915 and again in 1917. Fear of a crime wave following World War I was used as a reason. When in 1917 John Van Dell murdered E. W. Olson, industrial insurance commissioner, and boasted that the state could do nothing to him but board him for the rest of his life, sentiment for restoration of the death penalty flared up. This resulted in passage of a capital punishment statute by the House. The passage of this measure, which was later approved by both Senate and Governor, created one of the most exciting sessions of the 1919 legislature. The *Morning Olympian* for March 12 of that

TABLE 1—EXECUTIONS AND FIRST DEGREE MURDERS PER 100,000 POPULATION IN WASHINGTON STATE BY DECADES

Decade	Estimated Population[a] at Mid-decade	Executions[b]		First Degree Murders[b]	
		Number	Rate	Number	Rate
1. 1902–12	954,824	15	1.57	34	3.56
2. 1912–22	1,292,232	1	.08	72	5.57
3. 1922–32	1,501,364	17	1.13	90	5.99
4. 1932–42	1,687,353	21	1.24	113	6.66
5. 1942–52	2,186,130	12	.55	63	2.88

[a] 1907, 1917, 1927, 1937, and 1947.
[b] Data are for periods from October 1 of the first year in each decade to September 30 of the last year.

year reported the discussion as follows:

The House, by a vote of 75 to 18, passed S. B. 255 by Senators Kuykendall of Garfield, Cox of Walla Walla, and Johnson of Stevens-Pend Oreille, restoring the death penalty for first degree murder. The bill provides that in bringing in a verdict in a first degree murder case, the jury shall, if it finds the accused guilty, bring in a second verdict, deciding whether or not the murderer shall be hanged or shall serve a life sentence in the state penitentiary. Mrs. Haskell of Pierce, the only woman in the Legislature, voted for the bill. Shattuck of Kitsap moved to indefinitely postpone the bill. Shattuck's motion lost by a 78 to 15 vote. "There are too many brutal murders," declared Thompson. "We must reestablish the death penalty. We must send murderers to the gallows." Davis, Pierce, denied that murders had increased in the state since the abolition of the death penalty. He said the records in the Board of Control office showed that murders had not increased. "Do you remember two years ago when Van Dell, the murderer, went into the office of Industrial Insurance Commissioner Olson, on this very floor, and murdered him? Do you remember that Van Dell boasted that he would be sent to the pen for life to be fed and cared for?"[4] asked Reed of Mason. "Yes, I remember that and there was a lot of sentiment about it, too," replied Davis. "They used to burn witches in the olden times," said Shattuck (Sheriff of Kitsap County), closing the debate. "I tell you that I have shot at men and I have hit them. I have taken bad men to the penitentiary and have had them threaten to kill me when they got out. I don't want this Legislature to pass a law to hang the man that killed me. If he is quicker than I am and if he gets me, he is welcome. I tell you no man ever deliberately killed another unless his brain was diseased. Murderers are all crazy. Lock them up for life and take away the pardoning power of the governor. That is the right way. If you vote to pass this law, remember that next time a murderer is hanged in this state, you helped drive a nail in the scaffold. You helped to hang him."

[4] John Van Dell, WSP 8286, was sentenced to life imprisonment for murder in the first degree on March 17, 1917. Since he died June 23, 1921 of natural causes, the state did not have an exorbitant board bill in his case.

WHAT ARE THE FACTS?

Now, after thirty-three more years of experience with capital punishment, what can we say about the validity of these arguments? What has been the trend of executions during the past fifty years? Does this seem to have any relation to the rate for first degree murders? Do all counties use the death penalty? What is the warden's attitude toward executions?

Table 1 shows the number of executions per 100,000 population by decades and the number of first degree murders which resulted in commitment to the penitentiary.

It will be noted that the relation of executions to population remained fairly constant except for the period when the death penalty was abolished and during the last decade, when hangings dropped sharply. Although the murder rate increased during the second ten-year period when there was only one execution, it remained high in the third and fourth decades when hangings were frequent, and decreased with the execution rate in the fifth. These data suggest, but do not prove, (1) that executions have no clear-cut deterrent effect on murders and (2) that the incidence of both executions and murders is a product of other, more basic factors.[5]

TABLE 2—COMMITMENTS FOR CAPITAL CRIMES FOR THREE SUCCESSIVE SIX-YEAR PERIODS BEGINNING MARCH 1907

Period	Total Commitments	Capital Crime Commitments	
		Number	Percentage
1907–13	2,397	16[a]	.7
1913–19	1,904	37	1.9
1919–25	2,001	35[b]	1.7

[a] Seven executions.
[b] Five executions.

Executions became a function of the state penitentiary in 1904. Prior to May 6, 1904, when the first person was hanged at the Walla Walla prison, the counties had performed that duty. Since then there have been sixty-six of them. Twenty of the thirty-nine counties in the state have never sent an individual to Walla Walla for execution. Six counties have sent one; six counties, two or three; five counties, four or five; one county, nine; and one, fourteen. This means that, while the penalty is available to all courts, thirty-two counties are either not using it at all or using it to a limited extent.

The death penalty was repealed March 22, 1913 and restored March 14, 1919. Records available at the prison indicate that there was an increase in the number of capital crimes committed during that period. The higher rate continued, however, after capital punishment was restored.

One of the authors is a penologist who has spent more than twenty years in penal and correctional administration. His first experience with capital punishment occurred three years ago when he came to the Washington State Penitentiary. Two adjacent counties had suffered from almost identical murders. Because of a sharp difference in penal philosophy, the murderer who had many undesirable characteristics was given life, while the other, a fine-appearing fellow who seemed to have much more promise for rehabilitation,[6] had to be hanged. To those who are responsible for the execution of the death penalty, it is no pleasant task. We have never talked with a prison warden enjoined with this duty who was favorable to the death penalty. The late Warden Lewis E. Lawes, perhaps responsible for more executions than any other official in our country, concluded: "My experience has convinced me of the futility of capital punishment."[7] To such wardens an execution seems even less hu-

[5] First degree murders do not, of course, include the many instances where the charge accusing a person of first degree murder has been amended to read second degree murder on condition that the defendant plead guilty. It would be interesting to know whether such arrangements have increased or decreased in frequency during the past decade.

[6] A 1948 study of the 89 first degree murderers released from the territorial and later the state prison between 1882 and 1947 showed that only six were known to have gotten into trouble again.

[7] *Twenty Thousand Years in Sing Sing* (New York, 1932), p. 1.

mane to the man's family than to the convicted person himself.

Although any group that has changed its mind twice could conceivably do so once more, it is probable that the people of Washington State will retain the death penalty. An occasional special case, like that of Van Dell, will tend to prevent abolition of capital punishment again.

Norman S. Hayner, Ph.D., Seattle, Washington, is professor of sociology at the University of Washington. Since April 1951 he has been on leave from the university to serve as a member of the Washington State Board of Prison Terms and Paroles. He was formerly Jane Addams Professor of Sociology and Social Service at Rockford College. He is author of Hotel Life (1936) and The New in Old Mexico (1953), and of articles in the field of criminology.

John R. Cranor, Walla Walla, Washington, is warden of the Washington State Penitentiary. Prior to 1930 he served in the public schools of Michigan, Indiana, and Illinois. His career in penal and correctional administration has included positions in Illinois, Pennsylvania, Connecticut, New York, and Rhode Island, in addition to Washington. During 1947–49 he was Civilian Prison Administrator with General Douglas MacArthur in Japan.

Abolition and Restoration of the Death Penalty in Missouri

By ELLEN ELIZABETH GUILLOT

THROUGHOUT the nineteenth century and up to the present time, there has been in the state of Missouri a more or less academic interest in the subject of capital punishment. Various articles for or against the practice have made their appearance in the press from time to time. The matter was, however, of crucial importance in the spring of 1917 when the legislature abolished the death penalty, and again in 1919 when it was restored. As far as Missouri is concerned, the most significant interest in this subject is confined neatly within this period. It is possible, therefore, to present a fairly comprehensive account of the history of capital punishment in Missouri within the limitations of those two years.

THE MOVEMENT FOR ABOLITION

In connection with the act abolishing capital punishment passed by the Missouri Legislature in 1917, it is to be remembered that the movement for the reform of prison life and the reformation of individual criminals was at that time nation-wide. It is therefore natural to believe that the Missouri act was a part of this greater movement.

The basic idea was that capital punishment forestalled the possibility of reformation. In addition, it had become increasingly difficult to get properly qualified jurors to serve in cases of capital crime, because of their conscientious scruples against the infliction of the death penalty. For example, Judge Nick T. Cave,[1] now of the Kansas City Court of Appeals, told the writer that in 1914, while he was Prosecuting Attorney for Callaway County, he prosecuted, for first degree murder, a colored man who was accused of shooting and killing a white boy. The case was opened on Monday and went to the jury on Wednsday afternoon. The jury did not report until Saturday afternoon, when it was called into court by the presiding judge. It was learned later that on the first ballot the jury was unanimous in its verdict of first-degree murder, but on the question of inflicting capital punishment the jurors failed to agree; seven were for hanging and five for life imprisonment. A decision by the jury regarding punishment was therefore impossible.

The movement for the abolition of capital punishment is described as gradual and as characterized by a sensible approach. A good many reforms in the treatment of prisoners had already been carried out, such as establishment of night classes at the penitentiary, exercises out of doors, dedication of a new playground for prisoners with facilities for playing baseball, elimination of the contract labor system, and the purchase of a prison farm along the rich Missouri River bottoms where quantities of fruits and vegetables were raised and the prisoners given opportunity for work in the out-of-doors; severe punishments (such as hanging up by the thumbs) had been done away with, and the parole system had been rewritten.[2]

[1] The writer is indebted to Judge Cave for much of the material for this article. Judge Cave was a member of the Judiciary Committees of both houses of the Legislature during this decade.

THE ACT OF 1917

The bill for the abolishment of capital punishment in Missouri was introduced in the Forty-ninth General Assembly in 1917 by Representative O. B. Whitaker of Hickory County. Whitaker was a man of importance in the state; he had been president of three small colleges, and had written a number of books on Christian fellowship and social problems.[3] The revised statute as adopted read as follows:

An Act to Abolish Capital Punishment in the State of Missouri. From and after the taking effect of this act it shall be unlawful in this state to take human life as a punishment for crime, and no court shall enforce capital punishment as a penalty for crime. All acts and parts of acts inconsistent or in conflict with this act are hereby repealed.

The act was approved on April 13, 1917. It never appeared in the Revised Statutes of Missouri, since it was repealed before the codification of 1919.

It will be noticed that this important enactment was made just when this country was entering the First World War. There was probably little opposition to the law; so occupied were the people and the newspapers with the war that the enactment was hardly noticed in the press. There were, however, some brief comments expressing satisfaction that the spectacle of public execution, with its attendant debauchery, would no longer take place.[4]

The matter was perhaps exaggerated, since the number of criminals put to death was certainly not large. The *Kansas City Star* reported that there were in Jackson County nine victims in twenty-six years,[5] and the *St. Louis Post-Dispatch* noted that not a single execution had taken place in St. Louis County during the fourteen years previous to the passage of the act.[6]

OPINION FOR AND AGAINST

There were certain serious misgivings and difference of opinion as to what would result from the repeal of the law inflicting the death penalty. Hunt C. Moore, then prosecuting attorney of Jackson County, declared that the new statute was a humane law and that the abolition of capital punishment would have no effect on the spread of crime. It would also, he thought, make it possible to secure better juries in first-degree crime cases.

Judge Ralph S. Latshaw of the same county, however, was bitterly opposed to the new enactment. He thought it had been made by softhearted legislators who allowed their sympathies to overpower their reason. He believed that the penitentiary held no terror for the rapist, the robber, or the murderer, and that life sentences were a joke. He said that there was but one man in the State Penitentiary at that time who had been there over ten years, and that he was a poor, unknown, friendless Hawaiian who would also have been free if he had had a single friend. Judge Latshaw also said that kidnaping and train robbery were so rare since they had been punishable by death that not a single instance had come to his attention. He quoted the Bible as his authority: "Whosoever sheddeth the blood of man by man shall his blood be shed."[7]

Dissatisfaction among law enforcement agencies with the new law abolishing capital punishment seems to have grown during the two years following its enactment, for we find that Prosecuting Attorney McDaniels of St. Louis County issued early in January 1919 an appeal for the re-enactment of the older statute.[8]

This was possibly in some measure provoked by a situation described by Judge Cave, who records the commission of a serious crime shortly before the abolition act was repealed. Men from St. Louis came to Fulton, in Callaway County, where copper wire was stored preparatory to the construction of certain electrical installations. Copper wire was very valuable at that time. The robbers cut the wire into short lengths and loaded it into their truck. They carried it to St. Louis, and it was reported to the police that the truck was to be stored in a garage behind an apartment building. Police officers were stationed at the garage to await the arrival of the robbers. The men drove the truck into the alley leading to the garage, and when officers attempted to put them under arrest, a battle followed. Two policemen were killed. Later the men were caught and came to trial. They were sentenced to the penitentiary for life.

There was a hysterical reaction to these murders. People who had been previously opposed to capital punishment were outraged, and newspapers that had supported its abolition now advocated the restoration of the death penalty for murder. It was argued that the criminal element had no fear of the law and that criminals could "shoot their way out." If they surrendered to the police, they would be sent to the penitentiary; if they murdered the police, they would also merely be sent to the penitentiary. The law thus gave no protection to the police. Law enforcement officers throughout the state urged the restoration of capital punishment.

THE ACT OF 1919

The consequence of McDaniel's appeal and of the situation just described was the introduction in the Missouri Senate, Fiftieth General Assembly, by Senator Mayes of Penobscot County, on January 20, 1919, of Senate Bill 84, entitled

An Act to repeal an Act of the Forty-ninth General Assembly, approved April 13, 1917, entitled "An Act to Abolish Capital Punishment in the State of Missouri" and to enact a section reviving all former laws providing for capital punishment.

The bill went through the ordinary routine of legislative procedure in the Senate and, on April 3, 1919, was passed by a vote of 26 yeas, 8 nays, absent 3. However, when the bill came up in the House, at a time when it was next to impossible to keep more than a bare quorum in their seats, it lacked three votes to pass that body.[9]

One does not know how long the bill abolishing capital punishment in Missouri might have remained on the statute books had it not been for a series of crimes that greatly disturbed the public mind. In the jail at Lamar, in Barton County, there was confined a man ominously named Jay Lynch. It is believed that his wife or mother or both of them delivered to him a package containing a pistol. Lynch, so equipped, made his dash for liberty and in so doing killed the sheriff and the sheriff's son. He seems to have been tried and sentenced to life imprisonment. A mob broke into the jail and seized and lynched him early in June 1919.[10] Representative Chancellor of Barton County

told his fellow legislators that this lynching would not have occurred had it not been for the law of two years previous abolishing capital punishment.[11] Also, at the same time, peace officers of Lafayette County were murdered.[12]

But the most disturbing event of this kind was in connection with the robbery of the Meramec Trust Company in St. Louis County, June 12, 1919, on which occasion one patrolman was killed and another wounded. A number of "Letters from the People" appeared in the *Post-Dispatch,* some of which are extremely interesting in their reflection of public sentiment. On June 17 one correspondent quotes from a recent editorial in the *Post-Dispatch,* "the stolen money was speedily recovered, and two desperate principals were by arrest permanently removed from the class of those who prey on the community." He then goes on:

> The *Post-Dispatch* is slightly mistaken. First, they were not desperate. Desperate men fight to the last. Secondly, they will not be permanently removed, at least so long as there is a workable parole board. They will probably be at liberty in three or four years as is usual in such cases. A short time ago I read in your esteemed paper where five hundred or so murderers were let loose in society. All paroled by the board. Will they commit murder again? . . . It is truly marvelous that we do not have more lynching than we do. The people of Missouri deserve credit for it. If the law don't protect, who will? Shall we have to go back to the day when every man carried his own legislature and his justice strapped to his belt?

Another letter writer on June 28, however, declaring himself opposed to capital punishment, quotes Genesis 9: 6, as given above, and adds, "This would exterminate the race."

ACTION BY SPECIAL LEGISLATIVE SESSION

Significant action connected with the settlement of the issue came from the Tenth Ward Improvement Association of St. Louis.[13] It happened that a special session of the Missouri Legislature had just been called by Governor Frederick G. Gardner to convene July 2 to consider and ratify the amendment to the federal Constitution granting suffrage to women. The Tenth Ward Improvement Association joined in the current demand on the Governor to issue a supplemental message to the legislature calling upon it to consider a bill restoring capital punishment in Missouri. The association complained that St. Louis had been overrun with crime during the past year, and said that crime had been violent because criminals knew that capital punishment was no longer law in Missouri.

Governor Gardner, in his reply to the Tenth Ward Improvement Association, stated that he had not included the question of the restoration of capital punishment in his call because the legislature meeting in regular session had opposed restoration. A new legislature would be chosen in eighteen months, and it might view the matter differently. He added that he had been in communication with the governors of eleven states in which capital punishment had been abolished, and they had been asked if crime had increased. "None said that it had increased, and eight declared that it had not." The Governor was thus reluctant to have the matter of the restoration of capital punishment considered at the special session of the legislature.[14]

[13] *St. Louis Post-Dispatch,* June 16, 1919, p. 12.
[14] *St. Louis Post-Dispatch,* June 24, 1919, p. 14.

A petition was circulated by Representative Chancellor of Barton County that requested the Governor to send a special message to the legislature submitting the question of restoring capital punishment. This petition was quickly signed by 78 members of the House, six more than a constitutional majority. The Governor was anxious to hold down the expenses of the special session and to confine the members to action on the issue they had been summoned to consider. However, he met with four or five petitioners, discussed the matter with them, and demanded of them statistics. In spite of the fact that none of them had any statistics, he yielded to their argument that public sentiment among their constituents was most decidedly in favor of restoring the capital punishment law for the purpose of discouraging highway robberies, bank robberies, and attendant murders.

The Governor thus gave his consent, but the session that restored capital punishment in Missouri was a stormy one. The friends of the Governor resorted to obstructive tactics to prevent the matter from coming to a vote, and the debate was complicated by the proposal of an amendment to substitute the electric chair for the noose.[15]

The legislature at this special session repealed the act of 1917 and re-enacted sections of the revised statutes of 1909, so that treason, rape, kidnaping for ransom, perjury committed in the trial of any indictment for a capital offense, train robbery of certain sorts, and murder in the first degree remained punishable by death at the discretion of the jury.

[15] *Kansas City Times,* July 6, 1919, p. 1.

CONCLUSION

The abolishment of capital punishment in Missouri thus came about as part of a general movement for the amelioration of the lives of the condemned that was nation-wide, and capital punishment was restored by an urgent public sentiment of fear and indignation brought about by crimes following the First World War.

It has been said that the race question entered into the matter of the reenactment, but this seems not to be true. Indeed, Judge Cave assures the writer—and his assurance is supported by examination of the press of the state—that the race question did not enter into the issue of capital punishment as it arose in Missouri, since the crimes were those of whites against whites and were not reflective of race prejudice.

By way of completion it may be said that it was not until 1937 that the administration of lethal gas was substituted for hanging, and the place of execution transferred from the counties to the State Penitentiary at Jefferson City. Since that time there have been twenty-seven executions, distributed as follows: Colored: rape, 3; murder first, 15. White: murder first, 9.[16]

Capital Punishment in Oregon

By Robert H. Dann

CAPITAL punishment was mandatory in Oregon until 1914, when, by a very narrow margin of voter expression, the state substituted life imprisonment for the death penalty. In 1920 capital punishment was re-established, but made subject to the discretion of the jury.

Place of Execution

Prior to 1903, executions were more or less public demonstrations, carried out in the yards of the county jails or in public squares. In that year Governor George E. Chamberlain, in his inaugural address to the legislature, recommended that "all executions should take place within the wall of the penitentiary." In the same year a law was passed requiring that all executions take place at the State Penitentiary at Salem, and two years later Governor Chamberlain said he was sure this law would "be most beneficial in its results."

The Death Penalty Abolished

Governor Oswald West, in his first message to the legislature in 1911, opened the campaign to abolish capital punishment. He denied the validity of the doctrine of an eye for an eye, and called attention to the unreliability of circumstantial evidence and to the reluctance of juries to demand the death sentence. He concluded that the "desperate criminal, relying on the reluctance of the average juror and the caution of the court, in the imposition of the capital sentence, is more willing to take a gambler's chance with death . . . than he would be to face the greater certainty of life spent behind the bars." He also recommended that restriction be placed on the pardoning power of the governor.

In 1912 an initiative petition to abolish capital punishment appeared on the ballot in the November election but failed to secure a majority vote.

A second attempt, led by Governor West, was made in 1914, against the judgment of many, who felt that it was too soon following a defeat. There were thirty-one items on the ballot, but the abolition of capital punishment received a majority of 157.

In 1915 the necessary legislation was passed, repealing three sections of Lord's Oregon Laws and amending the state constitution. The repealed sections, which had been adopted in 1903, were Section 1598, "Warrant to Enforce Judgment of Death"; Section 1599, "Death Sentence, How and Where Executed"; and Section 1600, "Warrant Issued to Sheriff Where Action Commenced." The amendment to the constitution became Section 36 of Article I, and read: "The death penalty shall not be inflicted upon any person under the laws of Oregon. The maximum punishment which may be inflicted shall be life imprisonment."

In his address to the legislature in 1915, Governor West said, "the old barbarous system of capital punishment has been abolished." He proposed that pardons should be granted only upon the recommendation of the court in which the case originated.

The Death Penalty Restored

The matter rested only until 1917, when a House Joint Resolution was introduced with the proposal that it be referred to the people in the election

of 1918. The resolution was to amend the constitution to read: "The death penalty shall be inflicted upon any person under the laws of Oregon, who is convicted of the crime of murder in the first degree." The proposal was referred to the Committee on Resolutions and was indefinitely postponed.

In 1919 Governor James Withycombe, in his address to the legislature, called attention to the fact that since the repeal of capital punishment the state was without any punishment for treason. He hoped the legislature would remedy the situation, even though treason was a concern of the federal government. He was worried about "I.W.W.ism and other forms of disloyalty." He died shortly after his re-election, and the Secretary of State, Ben W. Olcott, succeeded him.

Governor Olcott called a special session of the legislature in 1920, and in his address he said:

> Since the adjournment of the regular session in 1919 a wave of crime has swept over the country. Oregon has suffered from this criminal blight, and during the past few months the commission of a number of cold-blooded and fiendish homicides has aroused our people to a demand for greater and more certain protection. . . . Because of a series of dastardly homicidal offenses a distinct public sentiment has developed that the people of the state should once more be given an opportunity to pass upon the question of the restoration of capital punishment and that there should be no unnecessary delay in bringing this question before the electorate.

At the special session, the legislature passed for reference to the people an amendment designed to re-establish capital punishment. The proposed Section 37 of Article I was to read: "The penalty for murder in the first degree shall be death, except when the trial jury shall in its verdict recommend life imprisonment, in which case the penalty shall be life imprisonment." Section 38 was to re-establish the former sections 1598, 1599, and 1600 as found in Lord's Oregon Laws.

The Voters Pamphlet

Prior to each election the state publishes what is known as *The Voters Pamphlet*, in which candidates set forth their claims to office, and bills initiated by or referred to the public are explained. In the pamphlet issued for the 1920 special election, which was also the primary election, pro and con articles regarding the death sentence appeared.

The article supporting its restoration was sponsored by Senators B. L. Eddy of Douglas, K. K. Kubli of Multnomah, and David E. Lofgren of Clackamas counties. They argued that "to punish cold-blooded murder with death *naturally* has a tendency to deter" even the hardened criminal, while a term in prison "is no serious hindrance." The death penalty marks murder as a "heinous offense," and the psychological effect on the young must be of "greatest deterrent value." "We naturally come to rate an offense as serious in proportion to the weight of the penalty."

The article recognized that crime waves are associated with other factors in the social situation, but pressed the issue of the dangerous criminal who is beyond hope, "whose restraint amounts to no more than holding in leash dangerous beasts who may at any time break away." The authors quoted the Old Testament to support their position, and concluded: "Let us not be weakly sentimental. . . . Sentiment should not outweigh Justice. . . . A person who willfully commits murder writes his own doom—the state merely executes the judgment."

The negative argument was prepared by W. H. Strayer of Baker, and Mrs.

Alexander Thompson and Eugene E. Smith of Multnomah counties. They argued that changing the constitution was a serious matter, and that the forthcoming election was designed for other matters. They doubted the wisdom of leaving much discretion to juries, because they are subject to influence. And they regretted that space did not allow a full discussion of the weakness of capital punishment as a deterrent. "A person seldom kills another with the expectation that he will be punished at all, and if he does kill with a knowledge that he will be punished, the condition of the murderer's mind is such, and his passions are so aroused, that no punishment will act as a deterrent." The article did not carry enthusiasm or show deep conviction.

The Oregon Voter

The Oregon Voter is a weekly publication, edited by C. C. Chapman, which has considerable political influence. In the issue of May 8, 1920, a letter appeared from Rev. W. J. McElven, in opposition to the death penalty. His position was that restoration of the death penalty would be a step backward for Oregon, from its place as a progressive state to the demand for revenge; that criminologists are opposed to the death penalty; that figures do not support the contention that it is deterrent; that there is a tendency to punish those who cannot afford an adequate legal battle; that the executed man is likely to become a hero; that the requirement of death often prevents conviction when the jury has no choice; that capital punishment is unchristian, and a sin is no less a sin when committed by the whole state. He commented on a recent "heinous" murder. A man had been sponsored on parole from the penitentiary by a woman whom he subsequently murdered, and he was reported to have said he would not have committed this murder had there been capital punishment in the state. McElven doubted the value of this man's testimony. He concluded that Oregon needed strict and impartial law enforcement and a limitation on the pardoning power of the authorities.

The next issue of *Oregon Voter*, May 15, 1920, contained a reply from Senator B. L. Eddy, in much the same language as that of the positive article in *The Voters Pamphlet*. He said: "More sophistry and misinformation could hardly be combined in a single article." He criticized McElven for failure to quote criminologist authorities, and then quoted Baron Raffaele Gorofalo, the Italian criminologist, who said: "The death penalty is a defensive measure and based on analogy of the operation of the Darwinian principle of natural selection." Punishment should either eliminate the offender or make reparation for the harm done. He accused McElven of neglecting the Old Testament and espousing theories of human progress. He claimed to be an understanding Christian who believed both Old and New Testaments to be the Word of God.

Pre-election debate

The issue of *Oregon Voter* for May 22, 1920, circulated just prior to the election, contained a strong article against the proposed constitutional amendment, preceded and followed by strong editorial comment. The editor compared a murderer to a rattlesnake that should be killed to defend mankind. He wrote: "And if the duty were upon us [the editor] we would not hesitate to slay a human rattlesnake to protect innocent human beings from murder."

Space was then given to an article prepared under the sponsorship of Norman F. Coleman—listed as president of the Loyal Legion of Loggers and Lumbermen, but not as a professor at Reed College, of which he later became president—Ben Selling a prominent Portland businessman, Bishop Sumner of the Episcopal Church, George Rebec the revered professor of philosophy at the University of Oregon, Sarah H. Evans, Millie R. Turnbull, Frederic K. Howard, and C. S. Kohs.

This article, bounded "fore and aft" by editorial comment, argued against restoration of capital punishment. To the proposition that the jury should have power to decide in favor of hanging, the authors replied that juries more often gave the life sentence when given a choice. They referred to the problem of circumstantial evidence and unjust convictions. They held that the certainty of punishment was more deterrent than severity, and that the Biblical quotations so often used did not fit in with the spirit and teachings of Jesus. They referred to psychological evidence that criminals are sick but that coddling is not the best method of dealing with them. "Sound psychology is not against the death penalty, if it is the best method . . . but it denies that hanging and electrocution are the best methods, but they are the easiest." They advocated individual treatment of each case, and were opposed to classification until a complete diagnosis had been made. They believed that "weakly sentimentality" did not agree with the idea that "brutality begets brutality," and raised the question why we did not execute all misfits. They concluded that the fact that one man had stained his soul with murder was no reason why the whole state should do the same.

This article was followed by quotation of an editorial by George Putnam, editor of the *Capital Journal* of Salem, Oregon. With reference to the famous "California Bluebeard" who under pressure had confessed and saved himself from the death penalty, the editorial commented: "Had this modern bluebeard been apprehended in Oregon, the confession would not have been forthcoming, for there would have been no fear of the gallows to extort it." The editor concluded: "As long as society breeds bluebeards and degenerates of this type, just so long will the gallows be needed as a protection to society. While not a preventive of crime the noose is certainly a deterrent." He failed to comment that California, where the bluebeard operated, had the death penalty, and it did not deter him from his crimes.

TABLE 1—RECORD OF VOTING ON CAPITAL PUNISHMENT IN OREGON

Year	Number Voting	For Capital Punishment	Against Capital Punishment	Majority		Did Not Vote
				For Capital Punishment	Against Capital Punishment	
1912	144,113	64,578	41,951	22,627		37,584
1914	259,868	100,395	100,552		157	58,921
1920	171,592	81,756	64,589	17,167		25,247

The result

At the election held in May 1920, the voters adopted the constitutional amendment proposed at the special legislative session. Table 1 gives the details of the election returns.

WHAT WARDENS AND CHAPLAINS SAY

There is a dearth of reference to the death penalty in the biennial reports of the wardens to the Secretary of State.

Superintendent C. W. James reported in 1910 that eighteen men had been executed in Oregon in the last seven and a half years, "the greatest number ever executed in any similar period in this state." He said: "It does not appear, however, that the increasing number of executions in this state has operated as a deterrent to the crime of homicide; . . . I am fully convinced that capital punishment should be abolished." During his administration, capital punishment was the only sentence for first degree murder.

The next reference in the biennial reports appears in 1925, when three men are listed as being executed. The following years show a constant change in wardens, none of whom make any reference to the death penalty.

The only reference to our topic in the chaplains' reports occurs in the report of Protestant Chaplain Carl H. Bryan in 1923, when he wrote: "I have visited death row as often as I thought wise and rendered what assistance I could to the condemned men, which was always appreciated by them."

RECORDS OF STATE PENITENTIARY

The statistical records of the penitentiary reporting the population of the institution offer very little information, and do not reflect the changes that took place in the law. Table 2 gives the data as presented in the biennial reports.

TABLE 2—POPULATION OF OREGON STATE PENITENTIARY

Year	Manslaughter	Murder	First Degree Murder	Second Degree Murder	Executions
1907	15			24	1903-10, 18
1909	14			32	
1911	20			40	
1913	15			33	
1915	12	7		44	
1917	7	14			
1919	7	16			
1921	10	15			
1923	12	7		7	
1925	7		7	3	3
1927	11		3	5	4
1929	12		12	3	4

CONCLUSION

The evidence presented here does not warrant much conclusion, except perhaps that a majority of 157 is not sufficient on which to stabilize a constitutional change, and the further comment that there is need for objective data that can be presented to the voting public in clear and convincing terms.

Robert H. Dann, Corvallis, Oregon, is professor of sociology at Oregon State College. He has also served as professor of religious education at Guilford College and as assistant manager of the Miles Linen Company. The Errors of Justice

By OTTO POLLAK

I shall ask for the abolition of the penalty of death until I have the infallibility of human judgment demonstrated to me. —Lafayette

TO recognize the fallibility of human judgment and still to act, but act wisely in the light of such fallibility, is one of the great challenges of mankind. For this reason the fact of irrevocability has always been among the arguments for the abolition of the death penalty. It was brought up in the French National Assembly of 1791.[1] In 1948 it was brought up in the debate on the Criminal Justice Bill in the British House of Commons.[2] It was brought up on all conceivable occasions in the time span between these two cornerstones of legislative consideration of the abolition of capital punishment. In all probability it will continue to be brought up until capital punishment has disappeared from the practice of civilized society.

The strength of this argument is revealed by the counterarguments which it has evoked. Apparently very few opponents of the abolition of capital punishment have had the courage to say: Yes, errors of judgment have led to the execution of innocent persons and may do so in the future, but this is a necessary item of social cost. Significantly enough, many efforts to meet the argument have followed other lines. They have resorted to avoidance or to the denial of the obvious. Thus they have shown reactions typically associated with fear, and it is this fear which suggests that the argument is considered as serious even by those who try to deny its validity.

RISK OF ERRONEOUS EXECUTION MINIMIZED

The records show that French, English, Belgian, German, and American lawyers have repeatedly made statements to the effect that because of the safeguards of the jury system, because of the protection furnished by the pardoning power, or because of the possibility to resort to the alternative punishment of lifetime imprisonment, the risk of executing an innocent person did not exist or almost did not exist.[3] A district attorney in Worcester County, Massachusetts is reported to have said in the 1920's: "Innocent men are never convicted. Don't worry about it, it never happens in the world. It is a physical impossibility."[4] Sir John Anderson, for ten years permanent Head of the Home Office, said in the British House of Commons on April 14, 1948:

It is fair to say, and there was a wealth of testimony to that effect in the evidence before the Select Committee, that the risk,

under the conditions as they exist in this country, of the capital penalty being executed on any one who was not in fact guilty of the crime of which he had been convicted is so small, indeed so infinitesimal, that that consideration can be dismissed.[5]

Statements of similar nature have been made not only by practicing lawyers in the heat of public pronouncement, but also by professors of criminal law. Even a man of the international reputation of Wilhelm Kahl asked, on the occasion of a lawyers' convention, where those cases of executing innocent persons had occurred which justified stressing the argument of human fallibility in discussing the pros and cons of capital punishment.[6] Interestingly enough, in 1910 the *American Journal of Sociology* contained an article in which the following statement can be found:

> It is said that the death penalty is irrevocable and thus an innocent man might suffer it. It is well known to prison officials and the police that such instances are mostly mythical and seldom, if at all, can be proved beyond a doubt.[7]

If such denials can be made by practitioners and scholars alike, the argument apparently cannot be countered with Bentham's question: "Is there, or could there be devised, any system of penal procedure which could insure the judge from being misled by false evidence or the fallibility of his own judgment?"[8] The obvious must be corroborated by facts, and such attempts have been undertaken repeatedly and in various countries.

REPORTS OF MISCARRIAGES OF JUSTICE

Actually, by the time Kahl and McDonald made the statements quoted above, they could have found books devoted to reports of miscarriages of justice. The number of these books is large enough to make their disregard or lack of knowledge by these scholars an interesting psychological phenomenon. Certainly McDonald might have been expected to be acquainted with the writings of Charles Phillips and Alfred H. Dymond.[9] Equally, Kahl might have been expected to be acquainted with the works of Mühlfeld, Katscher, Lailler and Vonoven, and Péan.[10]

Since McDonald's and Kahl's statements were made, there have appeared Sello's careful analysis of 153 cases,[11] and Borchard's classic *Convicting the Innocent* which carries the identification of erroneous verdicts in the United States into the first three decades of the twentieth century.[12] To be sure, these works show some overlapping in their reports and show various degrees of reliability. However, they contain a sufficient number of solidly documented reports on actual executions of innocent persons to make the questioning of the real risk in this respect a hardly tenable position. They contain, further, a large number of cases which show to what degree life imprisonment, because of the time element involved and because of the continued interest in the victim

[12] Borchard, *op. cit.* note 3.

which such life terms safeguard, permits the discovery of errors in convicting a person of a capital crime. They show, finally, that the sources of errors in judgment are frequently the same whether the error has led to an actual execution or to a life sentence. Thus they dispel the notion that errors may have occurred in the past but do not occur in the present, and also the notion that errors might occur in the cases of sentencing a person to a life term but do not occur in the cases of actual execution.

Meaningful examples which might illustrate all this can, of course, be taken only from a time span in which the principles of procedure and the rules of evidence were sufficiently close to the present to make the risk which these cases demonstrate a still plausible one. Because of this consideration, the illustrations given below do not go beyond the period of the French Revolution. In order to show the persistence of the same sources of error over the time span, the procedure followed in this paper will be to give for each source of major error an example from the late eighteenth or early nineteenth century on the one hand, and one from or close to the twentieth century on the other.

CIRCUMSTANTIAL EVIDENCE

As might be expected, circumstantial evidence is a frequent source of error in judgment. This category might be illustrated by the two following cases.

Case 1

On January 31, 1811, the barns of the mayor of a French village, Noyelles, were destroyed by a fire which had all the appearances of arson. Public opinion directed suspicion immediately at Maximilien Flament, who was a relative of the mayor. He was known to have lived in enmity with the latter, and some witnesses reported that three days before the fire Flament had voiced threats against him. Others reported that at the time of the fire the wind had blown in a direction such as to drive away the flames from Flament's house, which was situated close to the barns which were consumed. Flament increased suspicion against himself by repeatedly declaring himself innocent before a direct accusation had been made. Finally, the detectives discovered in the hedge which separated Flament's property from that of the mayor's a hole big enough to permit the arsonist to get through; and close by were footprints which fitted Flament.

On the basis of this circumstantial evidence Flament was arrested. He attempted to establish an alibi by only one witness, who first supported him but later showed uncertainty in his depositions. During the trial thirty-one witnesses testified against Flament; only the one produced by him in his defense supported him, and that one only weakly. On that basis he was found guilty and sentenced to die. Clemency was denied to him by the Emperor, and he was executed. Six years later his innocence became manifest in the following manner.

On October 20, 1817, a certain Felix Moreau was executed for murder in the same place. Immediately before the dropping of the knife Moreau, who was attended by the same priest who had stood by Flament at his last hour, confessed having committed the arson for which Flament had been executed, and asked for forgiveness. In recognition of the error in judgment which had sent his father to the guillotine, the National Assembly of 1850 granted Flament's son a pension.[13]

Case 2

On the morning of October 17, 1901, a railroad engineer, H. E. Wesson, was found dead in the shop yard of the Florida Southern Railway at Tilgham's Mill in Palatka, Florida. He had been shot at close range in the back of his head and his pockets had been turned inside out. Close by a

[13] Condensed from Sello, *op. cit.* note 3, pp. 346–48.

.38 caliber pistol was found from which one shell had been fired. Under the pressure of public indignation the authorities right away rounded up a number of suspects and put them into jail. Among them was a yard night watchman, Lucius Crawford. Apparently on the afternoon after the arrest, the jailer observed a colored man approach a crack in the fence of the jail yard and call for Lucius Crawford who happened to be in the yard at that time. The jailer reported that the colored man was J. B. Brown and that he had heard him say to Crawford, "Keep your mouth shut and say nothing."

Brown was arrested and a chain of circumstantial evidence began to form against him. First of all it was reported that two months earlier Brown had had a fight with the murdered man and had threatened to kill him. On October 16, the day before the murder, Brown was reported by one witness as having been without money and having tried to borrow a quarter from him. In answer to the witness' refusal of his request, Brown was reported to have said "Never mind, I'll catch 209 away from here tonight, that is the train going south to meet 208." Two hundred and eight was the train on which the murdered man had worked as an engineer. On the morning after the murder, Brown had been observed to have money when he joined in a card game with a number of men, among whom there was one by the name of Johnson. Brown was reported to have been excited when he arrived for the game and to have taken Johnson aside for a whispered conversation.

After these items of apparent evidence had been collected against Brown, the other suspects were released. The clouds over Brown thickened further when two cell mates of his reported to the authorities that Brown had confessed to them that he had, together with Johnson, committed the murder for purposes of robbing Wesson of his money.

On the basis of all that, Brown and Johnson were indicted for murder in the first degree and Brown was brought up for a separate trial in which he was convicted and sentenced to be hanged. His appeal for clemency having been denied, he was finally led to the gallows. However, at the last minute, the rope having been put around his neck, the executioner was interrupted because of an almost unbelievable event. When the death warrant was read in the course of the execution procedure it was found that by mistake it ordered the execution, not of Brown, but of—the foreman of the jury which had found Brown guilty. Brown was returned to jail, and under the impact of this occurrence his capital sentence was commuted to life imprisonment. The prosecution seemed to have lost the taste for continuing against Johnson, for the case against the latter was nol-prossed.

More than ten years later, Johnson confessed on his deathbed that he alone had committed the murder and that Brown had not been connected with the crime at all. On October 1, 1913, Brown, on the basis of Johnson's confession, was granted a full pardon, and in 1929 the Florida legislature granted him "For faithful service . . . during the period of his wrongful imprisonment the sum of $2,492 to be paid in monthly installments of $25." [14]

FALSE IDENTIFICATION

Another possible source of errors in judgment of criminal cases is false identification of the accused by witnesses. This phenomenon of faulty perception is well known to lawyers, and on occasional instances also reaches the awareness of the public because of the weight of tragedy with which its consequences may strike an innocent person. One of the earliest cases of this kind which falls within the time span here considered is the execution of Joseph Lesurques.

Case 3

In the year 1796, a mail coach was attacked by robbers on the road between Paris and Melun. The coachman and his assistant were killed. Only five persons could be considered as the criminals, the only passenger of the coach and the four members of the group of horsemen who had attacked it. The four horsemen had left Paris on the day of the crime in the early morning. During the day they had stopped at two inns where they had spent enough time and behaved conspicuously enough to be observed by many persons. Seven of these recognized Lesurques as one of the four riders who had committed the crime.

The identification convinced the jury of Lesurques's guilt in spite of the fact that he presented fourteen witnesses in support of his statement that he had spent the whole critical day in Paris. Unfortunately, one of these witnesses, Legrand, referred to a business entry in his ledger as the reason for his remembering the day. When the ledger was produced in court it was found, however, that this transaction had first been booked for the day following the day of the crime and that the date had been corrected later on. When, because of this, another witness who was supposed to have met with Lesurques and Legrand on the day of the crime became uncertain of the date, the jurors disbelieved also the twelve other witnesses for Lesurques's alibi.

After the jury had retired, a woman asked to be seen by the presiding judge and told him that Lesurques was the victim of a resemblance to her lover who had been one of the real criminals. The judge, however, told her that it was too late because the jury had already retired. After the verdict, Couriol, one of Lesurques's co-defendants, stated repeatedly that Lesurques was innocent and asserted this even on his way to the place of execution. After Lesurques had been executed, two other persons, Laborde and Roussy, were found guilty of the crime in separate trials and both asserted the innocence of Lesurques. If some question could still be raised as to whether Couriol had not lied in order to save Lesurques, no such question can be raised with regard to the other two, who made the statements regarding his innocence years after he had been executed.[15]

Roughly a hundred years later a case of mistaken identification caused the sentence to death by hanging of a youth who escaped his fate and lived to see his rehabilitation only because the knot around his neck untied after the trap was sprung.

Case 4

In 1893 the Whitecaps, an organization formed to suppress criminality among the Negroes by private action, took punitive measures against the servant of one of its own members, in Marion County, Mississippi. His employer, a certain Will Buckley, decided to denounce the organization before the Grand Jury of the County, which led to an indictment of three members of the organization. On his way back, Will Buckley, who was accompanied by his brother Jim and the Negro servant who had been flogged by the Whitecaps, was killed from ambush. After he saw Will Buckley fall from his horse, the murderer jumped out into the lane and fired one more shot at the companions of his victim, but they managed to escape.

Close to the place of the murder was the home of the Purvis family. Two days after the murder, bloodhounds picked up a scent which led them in the direction of the Purvis place; and a neighbor, who was an enemy of the family, directed suspicion at young Will Purvis. He was arrested and while in jail admitted that he had been a member of the Whitecaps, but insisted that he was innocent of the murder. However, Jim Buckley, the brother of the murdered man, positively identified Will Purvis as the killer. This, together with the admission of the accused that he had belonged to the organization which Will Buckley had exposed, made the defense, which was based on an alibi, unconvincing although it was supported by creditable witnesses. Will Purvis was found guilty and sentenced to capital punishment.

[14] Condensed from Borchard, *op. cit.* note 3, pp. 33–39.

[15] Condensed from Sello, *op. cit.* note 3, pp. 327–43.

As already indicated, the execution was attempted, but the rope did not tighten around his neck when the trap was sprung. This was a public execution, and the onlookers made it unmistakeably clear that they would not let the executioner make another attempt to hang Purvis. Purvis was taken back to jail, and a new execution was ordered to be carried out on July 31, 1895. Public indignation about this court order ran high. On the eve of the execution Purvis was liberated by a group of friends and hidden from the authorities. This case played a role in the following elections for state governor of Mississippi, and the candidate in favor of commuting the sentence won. When he assumed office Purvis surrendered himself, and the governor commuted the sentence to life imprisonment.

Two years after this commutation, Jim Buckley, who had been the principal witness against Purvis, admitted that he might have made a mistake in his identification of the accused, and Purvis received a full pardon on December 19, 1898. Roughly nineteen years later, that is twenty-three years after the execution which Purvis escaped by so gruesome an incident, an old man, Joe Beard, experienced a religious conversion at a revival meeting and confessed himself a terrible sinner, without, however, revealing the details. Shortly afterwards, when grievously ill, Beard confessed that he and another man, Louis Thornhill, had been chosen by the Whitecaps to punish Will Buckley, that they had been in the ambush, and that Thornhill had fired the deadly shot. In 1920 the legislature of Mississippi granted Will Purvis a compensation of $5,000 "for service done and performed . . . in the State Penitentiary under the provision of an erroneous judgment." [16]

FALSE CONFESSION

It is probably true that nothing alleviates doubt in jurors and judges as much as a confession on the part of the defendant. It is probably even more true that nothing is harder to believe than the possibility that a person accused of a capital crime would wrongly confess to having committed it. Yet this seems to have happened a number of times. Spurious confessions led to death sentences in the frequently mentioned case of Jesse and Steven Boorn.

Case 5

In the year 1812 these two Vermont farmers once worked together with their brother-in-law, Russel Colvin, in the fields. They were observed to quarrel with him. That was the last that was seen of Russel Colvin. Since he was known to have the habit of disappearing for periods sometimes as long as eight or nine months, no suspicion was aroused at first. In the ensuing years, however, a fantastic chain of events seemed to point to the two brothers as the probable killers of their sister's husband.

An enumeration of the individual items of occurrence which led to the formation of this suspicion would take up too much space and it would not be pertinent to the point which this case illustrates. At any rate, seven years after the disappearance of Colvin, the suspicion which had accumulated against the brothers led to their arrest. In the course of the proceedings, first one and then the other brother—probably despondent under the weight of the apparent evidence speaking against them and hoping for mercy—confessed their guilt. Although the confessions were made piecemeal and were in part contradictory, the brothers were sentenced to hang.

Jesse's sentence was commuted to a life term, but Steven's plea was denied. Under the threat of the apparently certain execution he marshaled his powers of defense and asked his attorney to advertise for the whereabouts of his brother-in-law. This was done, and Colvin was located in Dover, New Jersey. Due to the fortunate coincidence that a person knowing him happened to learn about the advertisement and managed to pursuade Colvin by ruses to return home, the innocence of the brothers was established.[17]

For the twentieth century, mention might be made of the case of Louise Butler and George Yelder, which occurred in Alabama in 1928.

Case 6

Louise Butler was a Negro woman who lived with her daughter Julia aged twelve and a small son, as well as two nieces, Topsy Warren aged fourteen, and Anne Mary aged nine. Louise Butler had won the affections of George Yelder and she was very jealous of his attentions. One day upon returning home she learned that George had visited in her absence and had found in the house only Topsy, who was now in possession of a new one-half-dollar piece. Louise Butler's jealousy was aroused and she beat the young girl severely, even threatening to kill her. After this incident Topsy was seen no more.

Rumors that Louise Butler had killed her niece brought the police into action. Incredible as it sounds, the two children, Anne Mary and Julia, accused Louise Butler and George Yelder of having killed Topsy, and gave many gory details. First Louise denied having killed Topsy, but later she confessed and even showed the authorities the spot where she said that she and George had thrown Topsy's body into the river. Afterwards she withdrew her confession but found no credence from the jury, in true accordance with the frequent experience that a prisoner is believed when he incriminates himself but mistrusted when he asserts that he is innocent.

Both Louise Butler and George Yelder were found guilty and sentenced to life imprisonment. Shortly after their having been sent to the penitentiary, Topsy was found well and alive, staying with some relatives in another county. The sheriff later learned that the children had been coached by an enemy of George Yelder's to make the false accusations. The sheriff suggested that Louise Butler might have felt in her ignorance that she would curry favor by doing what the "white folks" wanted her to do, and had confessed for that reason. One cannot help wondering how the authorities would have felt about the reappearance of Topsy if a death sentence had been pronounced and executed in this case.[18]

Examples could easily be furnished also for the occurrence of cases in which a wrongly accused person was forced into spurious confessions by mistreatment or promises at the hands of the police. As already pointed out, such confessions, once made, tend to be believed even if the defendant later withdraws his statement.[19]

EXTENT OF RISK OF ERROR

Examples could further be furnished which show that both the hostility of a prosecutor against the psychiatric expert and the mistake of the psychiatric expert himself have led to the conviction and execution of persons who were suffering from severe mental disorders.[20] Space, however, does not permit any further illustrations. In any case, the necessarily limited number of examples which can be given in a single paper cannot convey any impression of the real extent of the risk of errors in convictions for capital crimes. These are crimes which, by their very nature, arouse strong emotions in the general public as well as in the officers of the law. Where such emotions are aroused, failures in perception are likely to occur.

For an evaluation of the quantity of risk of executing an innocent person, we must turn to the following consid-

erations. As far as the nineteenth century is concerned, a survey of the literature shows that the collections which have been made of such instances fill books. This, of course, was a period of time in which the number of capital crimes and the number of executions were more frequent than they are today.

For the twentieth century, no such collection has come to the attention of this writer except Borchard's book, which has for its emphasis the problem of indemnification of persons who have been erroneously convicted. This work, therefore, is concerned also with offenses other than capital crime. As the examples presented above show, even this work, with its different focus, contains material showing that the danger of executing innocent persons has not yet completely passed from the American scene. On the other hand, if reports published in the literature are taken as an index of the extent of this problem, executions of innocent persons for capital crimes in this country must have become very rare indeed during the last few decades.

It is the opinion of this writer, however, that no collection of cases known to have been miscarriages of justice can reveal the true extent of such occurrences.

FACTORS IN CONCEALMENT

The effort of the truly guilty person to escape punishment is in itself a force which may lead to error in judgment by keeping correct information away from the courts. Furthermore, if crime goes together with strenuous efforts at concealment, so does erroneous judgment in a capital case. If it has led to the execution of an innocent person, the feelings of guilt and regret on the part of those involved in such a judgment cannot but work against the acceptance of the fact of error. Borchard reports that pardons are granted on occasion "without indication or admission of an erroneous conviction probably in order to save the prestige of the prosecuting officials."[21] If such face-saving comes into play where a measure of reparation to the innocent person is still possible, how much stronger must the same factor be in cases when reparation can no longer be made! We are justified, therefore, in assuming that the efforts of the police and of a district attorney's office cannot be relied upon to reveal executions of innocent persons to any extent which might approximate reality.

Even in cases where innocent persons have been sentenced to a life term, it is usually the deathbed confession of the murderer or some effort of an outside person which brings about the elucidation of the facts. However, if an innocent person has been executed, the interest of outsiders will probably be much less active than it will be in cases where there is still the motivation of saving a person from the continuation of his wrongful punishment.

CRITERIA OF RELIABLE REPORTING

It is now accepted theory in criminal statistics that a crime in order to be reliably reported must have three characteristics: (1) it must be considered serious enough to ensure intensive effort on the part of law enforcement officers to elucidate it; (2) it must ensure the co-operation of the victim, or those interested in the victim, with the police; and (3) it must leave public traces.[22]

If one were to apply these criteria to the question whether executions based on errors in judgment are likely to be reliably reported, it is clear that the answer would be negative on all three counts. Such cases will not arouse law enforcement officers to great effort, because that would mean enthusiasm for professional self-indictment. Obviously, they cannot ensure the co-operation of the victim. Furthermore, the impossibility of reparation to the victim of the error will probably weaken the effort also of those who were interested in him as long as there was hope. Finally, the efforts of the actual killer to remain undetected, together with the fact that the case has been decided and led to the punishment demanded by the law, tends to conceal a miscarriage of justice rather than leave public traces of its occurrence.

Thus it is highly probable that erroneous convictions for capital crimes are greatly underreported. This does not mean, however, that we have to assume any considerable number of occurrences every year. The actual figures, absolutely taken, are probably very small—as are the figures of actual executions at present.

THE ETHICAL ASPECT

However, this does not meet the core of the problem, which is ethical and not utilitarian. Ethics cannot be argued in figures. It shows the strange humor of history that the essence of the ethical position involved has never been better expressed than by Robespierre in the National Assembly of 1791. Participating in the debate on the abolition of capital punishment, he said:

> Listen to the voice of justice and of reason! It tells us and tells us that human judgments are never so certain as to permit society to kill a human being judged by other human beings. . . . Why deprive yourselves of any chance to redeem such errors? Why condemn yourselves to helplessness when faced with persecuted innocence?[23]

Otto Pollak, J.D., Ph.D., Philadelphia, Pennsylvania, is associate professor of sociology at the University of Pennsylvania, where he has been teaching since 1942. He was formerly a practicing lawyer in Austria for eight years. Among his publications are The Criminality of Women (1950), Social Adjustment in Old Age (1948), and Social Implications of Industry-Wide Bargaining (1948). He is senior author of Social Science and Psychotherapy for Children (1952).

Movements to Abolish the Death Penalty in the United States

By Louis Filler

THE struggle against the death penalty has been carried on parallel to, though not necessarily hand in hand with, that for better treatment of prisoners. There were no early movements, in the organized sense, to reduce the number of capital offenses. The abolition of death for witchcraft, for example, resulted from a general revulsion against the witchcraft frenzy and its abettors. In the eighteenth century the American colonies averaged about a dozen crimes for which death could be asked. This was very few when compared with England, the common law of which they had taken over, where more than two hundred crimes carried the death penalty. The relatively low number of such crimes in America was due to the scarcity of labor; that there were a dozen was due to a lack of prisons for keeping convicted criminals. With county jails inadequate and insecure, the criminal population seemed best controlled by death, mutilation, and fines.[1]

The "Great Act" of William Penn (1682) showed some concern for prison conditions, and broke with precedents by prescribing death for premeditated murder only. Such extreme mildness offended official sensibilities. In 1718, as a by-product of a serious clash between colony and crown representatives, the harsher penal code of England was adopted in Pennsylvania, and included thirteen capital offenses. As William Bradford was to observe, there was no evidence that the earlier, milder regime had resulted in more frequent or more "flagitious" offenses in that state than had occurred elsewhere.[2]

In 1764 Cesare Beccaria published his *Essay on Crimes and Punishments*, translations of which profoundly impressed American readers. They were also influenced by the writings and example of John Howard, the English prison reformer, as well as by the writings of Montesquieu, Voltaire, and Bentham, among others. In 1776 the Philadelphia Society for Relieving Distressed Prisoners was organized, but in that year of revolution it was not able to get under way. Largely spurred by Quaker interest, however, the Philadelphia Society for Alleviating the Miseries of Public Prisons began its work in 1787, with a membership including Dr. Benjamin Rush, Caleb Lownes, Tench Coxe, Thomas Wistar, and other notables of state and nation, some of whom furnished descendants to carry their work in prison reform down to modern times, with the same organization, since 1833 named the Pennsylvania Prison Society.

Benjamin Rush

As early as 1787, Dr. Rush read a paper at the home of Benjamin Franklin entitled *An Enquiry into the Effects of Public Punishments upon Criminals and upon Society*. His paper expressed, in part, the dissatisfaction of Pennsylvania reformers with the penal law of 1786, which had been expected to reform the 1718 law mentioned above, but had embodied evils of its own, including provisions for "infamous" prison clothes, shaved heads, degrading work and conditions, and public humiliation.

Rush's paper, moreover, contained the first reasoned argument in America favoring the abolition of capital punishment. For this reason it drew criticism and rebuttal. Rush was engaged in open controversy which he summed up in his *Considerations on the Injustice and Impolity of Punishing Murder by Death* (1792). Here he cited (as he had earlier) the arguments of Beccaria, joined issue on what constituted the Christian view of the death penalty, and referred to the experiences of Russia, Germany, Sweden, and Tuscany with abolition. Here were arguments which were repeated, with additions, numerous times in the next hundred years and beyond.

William Bradford

More moderate, yet one of the most influential pamphlets in the entire abolitionist literature, was that prepared by William Bradford, attorney general of Pennsylvania and later of the United States, at the request of the governor of Pennsylvania. As expanded and published in 1793, it contained the valuable addition of Caleb Lownes's "Account of the Gaol and Penitentiary House of Philadelphia, and of the Interior Management Thereof."

Turning to the constitutions of the several states, Bradford observed that New Hampshire's warned against too sanguinary punishments, that Vermont's enjoined hard labor to lessen the necessity for capital punishment, and that the 1776 Pennsylvania constitution had asked for a revision of the penal laws so that penalties would be in proportion to offenses. Maryland's constitution explicitly stated that capital punishment ought to be avoided as much as possible.

Bradford was satisfied that capital punishment, as such, did not stop crime: for example, horse stealing, though capital in Virginia, was the most frequent crime in that state. Nor was it easy to obtain a conviction in such a case: the severity of the penalty was its own undoing. If a law could not be enforced, it was worse than useless. Bradford concluded, with Beccaria: "A mitigation of punishment ought, therefore, to be accompanied, as far as possible, *by a diffusion of knowledge and a strict execution of the law.*"[3]

Bradford was not for abolishing the death penalty, necessarily, and thought it would be rash to abolish it entirely. In analyzing such capital crimes as counterfeiting, rape, arson, manslaughter, and petit treason, he considered each on its own merits. In 1794 he was instrumental in persuading the Pennsylvania legislature to make legal the distinction between first and second degree murder: thereafter only premeditated murder would occasion capital punishment.[4]

Influential, too, was the account by Caleb Lownes of the work of the Philadelphia Society to provide sufficient prison facilities and conditions encouraging criminal reform. As Lownes wrote: "It is a strange kind of oeconomy, to hang our fellow-creatures to avoid the expence [*sic*] of preparing a proper place of confinement."[5] Because of the Society's efforts in both respects, it received inquiries from other states concerning its work and ideas—the most famous and controversial being its system of solitary confinement—

and, in turn, made efforts to secure information about experiences in other parts of the country, by corresponding with prison wardens.[6]

REFORMERS IN EARLY NINETEENTH CENTURY

During the early decades of the nineteenth century, individual reformers made efforts to advance the cause of abolition. In New York, Governors George and De Witt Clinton and Daniel D. Tompkins at various times urged the New York legislature to modify or end capital punishment.[7] Nevertheless, popular understanding of the subject did not advance markedly. A New York beam-maker, of Quaker persuasion, perched his views precariously on Biblical texts, his practical cure for murderous impulses being an "enormous duty" on all kinds of strong liquor. A New York clergyman linked his pacifist convictions with those opposing capital punishment.[8]

Reflections Occasioned by a Public Execution, at Boston, April 25, 1822, anonymously issued, was filled with confused sentiments about the awfulness of the spectacle and a strong concern with the hereafter, which cannot be classed as favorable or unfavorable to the death penalty. Perhaps the most influential of all prison reformers of the time, Thomas Eddy, a Philadelphia Friend whose major work is identified with New York, does not appear to have given deep thought to the problem, though he did to all other problems in penology. The first decades of the century, to be sure, did see progress in prison organization and a general reduction in the number of death penalties.[9]

EDWARD LIVINGSTON

Perhaps the most distinguished of all American reports involving capital punishment was issued in 1821. In 1803, Edward Livingston, at a turning point in his extraordinary career, had emigrated from New York to Louisiana. In 1821, the future Secretary of State and Minister to France under Jackson was appointed a commissioner by the legislature of Louisiana to revise its criminal code. Influenced by the Code Napoleon, he set out to compile the penal law of Louisiana, which he prepared with introductory reports on codes of crimes and punishments, procedure, evidence, and reform and prison discipline. He dealt at length with the death penalty (a subject which had long and actively interested him) as a deterrent to crime and an instrument of justice.

> A great part of my task [Livingston believed] is rendered unnecessary, by the general acknowledgment, universal, I may say, in the United States, that this punishment ought to be abolished in all cases, excepting those of treason, murder and rape. In some states arson is included; and lately, since so large a portion of our influential citizens have become bankers, brokers, and dealers in exchange, a strong inclination has been discovered to extend it to forgery, and uttering false bills of exchange.[10]

Livingston developed a systematic rebuttal of all arguments favoring capital punishment. The official nature of his report, its breadth of argument and illustration, and its well-constructed character gave it great prestige, influenced penal legislation in some South American countries, and inspired the legend in America and abroad that it had been adopted in Louisiana. Its wide influence cannot be questioned, and it inspired abolitionists for generations after, who circulated it with enthusiasm. It was, however, too far advanced for acceptance in Louisiana proper, and Livingston's many concerns left him no time to press for its acceptance by that state.[11]

THE ERA OF REFORM

The 1830's were a time of rising reform, politically, socially, intellectually, and for abolitionists, as well as others. Pennsylvania led the way in 1834 by abolishing public executions.[12] Petitions asking for the termination of the death penalty were now regularly received by the legislatures of the several states. In 1832 a report to the New York legislature citing Beccaria, Franklin, and Livingston, as well as the standard Bible arguments, and the usual appeals to precedence, in this case Russia, Tuscany, and periods in Egyptian and Roman history, introduced a bill to end capital punishment.[13]

In 1835, Robert Rantoul, Jr.—worthy son of a pioneer abolitionist destined to outlive him—an antislavery Democrat and a vigorous leader in Massachusetts reform, reported to the state House of Representatives the first of his abolitionist bills. The next year saw a lengthier report by Rantoul, the most famous, which excited partisan attention and called forth a third from him —the most eloquent and varied of the three.[14]

Thus, Rantoul exhibited what seemed to him the best defense of capital punishment which he had seen, one prepared in 1831 by a Frenchman, Urtis, whose *Necessité du Maintien de la Peine de Mort* defended suicide and concluded that the state ought to be atheistic. Ingenious arguments and illustrations strengthened the propaganda value of Rantoul's work and aided the movement which he led to force modifications in Massachusetts law.[15]

THE "MAINE LAW"

The *Report on Capital Punishment Made to the Maine Legislature* (1836) capped a long period of agitation in that state, accompanied by the usual petitions and memorials. Leaders in

No. 43, Report and Bills Relating to the Abolition of Capital Punishment, January 12, 1837*, Boston, 1837; Arthur B. Darling, *Political Changes in Massachusetts, 1824–1848* (New Haven, 1925), p. 215.

[15] See *Senate [Document] No. 58 . . . Commonwealth of Massachusetts, 1846* (Boston, 1846), for evidence of the pressures put upon the legislature. In 1839 the penalty for armed robbery and for illegal entry into a house at night was reduced from death to life imprisonment. Rantoul also labored for the separation of first and second degree murder, by then accepted in eleven states. See also Benjamin Dole, *A Circular Addressed to the Citizens of Massachusetts* (Cambridge, 1846), which gives an antagonistic account of Rantoul's efforts over eleven years to make "proselytes" to what are deemed his evil views on capital punishment.

the Maine movement included the author of the Report, Tobias Purrington, of Cumberland, a senator in the Maine legislature, and chairman of the investigating committee. A bulwark of the movement, too, was Professor Thomas C. Upham, since 1824 in charge of Mental and Moral Philosophy at Bowdoin College, a pioneer in psychology, and author of *The Manual of Peace* (1836).

As a result of the controversy in Maine, where there had not actually been an execution for some years (the execution of one Joseph Sager in Augusta, in 1835, bringing the matter to a head), a law was framed which in effect abolished capital punishment, or was thought to do so. Governor Dana, in his annual message to the legislature in 1849, referred to the "general impression" that capital punishment had been practically abolished in Maine, and "to the impropriety of enforcing the death penalty while such an impression exists."[16] The "Maine Law" did not permit the executive to issue his warrant for an execution within one year after the criminal had been sentenced by the court; and its discretionary character, so opposed to the imperative of former laws, was responsible for the interpretation given it.

The influence of the "Maine Law" was considerable, extending into all New England, though with various results,[17] and being held responsible for the impulse which made Michigan the first state to abolish capital punishment officially.

THE HIGH POINT OF REFORM

The rising sentiment against the death penalty, the fact that juries were prone to acquit and governors to override convictions, gave new incentive to abolitionists and a new urgency to those who favored the retention of capital punishment. The 1840's were the high point for reform in the pre-Civil War decades, and were filled with effort and debate. As with the antislavery movement, reformist ranks were filled with clergymen; as one defender of the death penalty bitterly charged:

> Who are its [capital punishment's] most fierce antagonists? . . . On the Sabbath, in edifices built to imitate the temples of Jehovah, they reiterate the doctrine preached to our first parents in Paradise—"Ye shall not surely die." The law of God is the great castle at which all their weapons are aimed.[18]

But if the Rev. Charles C. Burleigh, famous among antislavery partisans, issued his dissident *Thoughts on the Death Penalty* (1845), the Rev. George B. Cheever, also firm in opposition to slavery, and even more famous, was the author of two works defending capital punishment which Burleigh himself thought "written with an ability worthy of a better cause."[19] As with other reforms of the time, not a little of the controversy was based on interpretations of Biblical passages presumed to be directives to mankind. Debates were earnestly attended and were influential in organizational campaigns. Thus, a sermon preached in Philadelphia in 1842 favoring capital punishment resulted in a town meeting of dissenters who appointed a committee of twenty-five to examine and report upon it. The abolitionist committee was still extant three years later.[20]

ABOLITIONIST SOCIETIES

In 1844 antigallows societies were formed in Massachusetts and New York, with formidable sponsors. In Massachusetts, among many others were Rantoul, Wendell Phillips, John G. Whittier, and John A. Andrew, who was to become wartime governor of the state. The society's indefatigable secretary was Rev. Charles Spear, one of its founders and author of *Essays on the Punishment of Death* (1844), dedicated to Professor Upham, a large-scale work which was in its fourth edition eight weeks after publication. Spear also founded, in 1845, *The Hangman*, which the next year became *The Prisoner's Friend*. It continued until 1859. Spear was also favorable to pacifism, a movement which provided a quota of active abolitionists; though some pacifists, like William Ladd, did not feel it necessary to "attach" other causes to their major one.[21]

The New York Society for the Abolition of Capital Punishment claimed so influential a figure as Horace Greeley, such dedicated reformers as Rev. William S. Balch and Rev. Samuel J. May, and a host of sympathizers, among whom were John Quincy Adams, William H. Seward, and former Vice Presidents of the United States Richard M. Johnson of Kentucky and George M. Dallas of Pennsylvania. John L. O'Sullivan, talented young editor of the *United States Magazine and Democratic Review*, coiner of the phrase "Manifest Destiny," and author of a highly esteemed report to the New York legislature asking for the abolition of the death penalty,[22] was corresponding secretary.

The meeting in May 1845 of the New York abolitionists resulted in the formation of a national society, which met in the fall of that year in Philadelphia. But before it convened, a Pennsylvania Society for Promoting the Abolition of the Death Penalty had been born. By 1850, state societies existed also in Tennessee, Ohio, Alabama, Louisiana, Indiana, and Iowa.[23]

FEDERAL LAW AND THE DEATH PENALTY

Of distinctive importance was the agitation, in 1852, for commutation of

[16] T. Purrington, *Report on Capital Punishment Made to the Maine Legislature in 1836*, Third Edition, Washington, D. C., 1852. See also *Remarks of John L. Stevens, in the Senate of Maine, February 11 and 12, 1869, on an Order Instructing the Judiciary Committee to Report a Bill Abolishing Capital Punishment*, Augusta, 1869.

[17] Thus, in 1852, Massachusetts adopted the policy of giving the executive discretionary authority (see Purrington, *op. cit.*, pp. 46–47). This did not, however, in fact or in theory, end capital punishment in that state.

[18] Rev. Timothy Alden Taylor, *The Bible View of the Death Penalty; also a Summary of the Webster Case* . . . (Worcester, 1850), p. 23.

[19] The abolition issue also brought together dissimilar personages; thus, in Ohio, outstanding advocates of abolition included not only Amasa Walker, then of Oberlin College, an antislavery partisan, but the Hon. Clement L. Vallandigham, at that time a brilliant young state representative, partial to the south, later notorious as a defeatist during the Civil War; see Albert Post, "The Anti-gallows Movement in Ohio," *Ohio State Archaeological and Historical Quarterly*, Vol. LIV (1945), pp. 109–10.

Titus, upon the Subject of Capital Punishment*, New York, 1848.

the death sentence upon a marine, under United States law, for a murder which was asserted to have been unpremeditated. Basing his appeal on an opinion of Attorney General William Wirt in 1820 and another by Attorney General John Y. Mason in 1845, that the President was empowered to commute sentences, Purrington, of Maine, petitioned Millard Fillmore to prevent the execution. With officers of the Marine Corps, as well as clergymen, adding their pleas to Purrington's, Fillmore acceded to their requests and changed the sentence to life imprisonment.[24]

ABOLITION AND MARVIN H. BOVEE

In 1847 Michigan distinguished herself by becoming the first state legally to abolish capital punishment. Early liberal in her penal enactments, with capital punishment limited to murder as far back as 1820, and the death penalty actually a dead letter since 1830, her proponents of abolition were active and persistent, and skillful in parliamentary procedure.[25] Two other states joined Michigan in abolishing the death penalty in the pre-Civil War era: Rhode Island in 1852 and Wisconsin in 1853.

The latter fight brought to the fore one of the most vigorous of all fighters for abolition, whose work has been inadequately appreciated. Marvin H. Bovee, born in New York in 1827, removed with his family in 1843 to Wisconsin, and later, as a state senator, was chairman of the select committee which reported the abolition bill of 1853. Working without pay, and at personal expense, he traveled through half the states lecturing on capital punishment and co-operating with anti-capital-punishment societies. About 1860 he established a state reformatory which aimed to surround youthful criminals with wholesome influences.[26]

Bovee's efforts took him to New York, where ardent campaigns in 1860 won an equivalent of the "Maine Law." This prevented executions for two years, but was then overthrown. Bovee first visited Illinois for reform purposes in 1859. In 1867 he and his co-workers were able to abolish public executions in that state and give juries discretionary powers in sentencing murderers to death or prison. He then turned his attention to Minnesota, where a similar victory was won.

In 1869 Bovee published a major work: *Christ and the Gallows; or, Reasons for the Abolition of Capital Punishment*.[27] In this he collected a vast number of arguments, endorsements, and new illustrations of the inadequate operations of the death penalty (which included the hanging of a ten-year-old child for murder), and summed up the "Progress of Penal Legislation in the United States" in a fashion which reflected the accomplishments of the time, as well as the too-sanguine hopes of crusaders like himself.

POST-CIVIL WAR TRENDS

In fact, the period of the Civil War and, even more, the temper of the post-Civil War era did seem, at first glance, encouraging to reformist enterprises in abolition. Governor Andrew of Massachusetts in 1861 addressed the legislature on the subject, strongly urging it to do away with the death penalty. Three years later, the governor of Maine made vain efforts to pass a law instituting the death penalty and thus to end the state's abolitionist tradition.[28] Fugitive arguments for and against capital punishment continued to appear, and legislatures to be memorialized on the subject.

Maine added the letter to the spirit of her long experience with abolition, making it legal in 1872. Restored in 1878 following the attack of an insane convict on a keeper, capital punishment was again abolished in 1887. Iowa abolished the death penalty from 1872 to 1878, and Colorado in that same year of 1872 began an erratic career of abolition and restoral. Kansas, too, in 1872 began a long tradition on the abolitionist road,[29] which was only to be stopped, at least temporarily, in the 1940's.

In addition, the subject was debated elsewhere, and gains were recorded in connection with first and second degree sentences, public executions, the shortening of the list of capital crimes, and other aspects of the question. But positive accomplishments appear more as end products of earlier eloquence and seasoned agitators. New progress and interest centered in the larger area of prison reform and administration. As Frederick Howard Wines, himself one of the outstanding reformers of the post-Civil War decades, observed in 1895, the state of American prisons twenty-five years before had been far from satisfactory.[30]

PRISON REFORM AND THE DEATH PENALTY

It was due to the energy and vision of Frederick Wines's father, Rev. Dr. Enoch C. Wines, that a congress of reformers actively interested in prison work convened in Cincinnati in 1870 and formed the National Prison Association. They were interested in the novel aim of influencing the criminal for the better. Many of them knew of the experience of Sir Walter Crofton with the Irish "convict prisons," where notable progress had been achieved; and the creation of the New York State Reformatory at Elmira gave them their opportunity to try out humane approaches to the prisoner.

At this and subsequent meetings they heard of the "indeterminate sentence," developed in this country by Zebulon R. Brockway as early as 1860. This stipulated a minimum and maximum sentence upon a convicted person, and left for future determination how long he would actually serve. And though Massachusetts was not in the forefront of abolition, she did pioneer the system of probation which spread through the other states.[31]

The significant fact for abolitionists was that the new approach emphasized a more scientific view of crime and criminals, and thus seemed to prepare the way for a more reasonable consideration of the value of the death penalty. As Colonel Brockway—who was no gentle hand as a prison administrator—himself concluded by 1890:

[24] Purrington, *op. cit.* note 16 *supra*, pp. 33 ff.

[25] Albert Post, "Michigan Abolishes Capital Punishment," *Michigan History*, Vol. 29 (1945), pp. 44–50. The law abolishing capital punishment retained it for treason. Since treason, however, could only apply to an offense against the United States, Michigan's priority as an abolitionist state is unaffected.

Pigeon, *Probation and Parole in Theory and Practice* (New York, 1942), p. 84.

My experience with prisoners and their disciplinary governing has effected in my mind a depreciated estimate of the value of deterrents. Punishments applied to deter . . . are, usually, pernicious. . . . The strongest argument against capital punishment is not either the uncertainty of convictions, the cruelty of it or the sacredness of life; but rather the injury of it to the public tone. . . .[32]

Prison discipline, then, seemed increasingly to provide an opportunity to abolitionists to move in step with other reformers. At the 1870 meeting in Cincinnati, William Tallack, secretary of the abolitionist Howard Society of England, spoke vigorously in favor of humanitarian treatment of criminals, with many a hint that capital punishment was undesirable. The milestone 1878 meeting of the International Penitentiary Congress in Stockholm was heartily supported by abolitionists. And in 1883 a reorganized National Prison Association heard Alfred H. Love, of the Pennsylvania Prison Society, a pacifist and opponent of the death penalty, who in that period made earnest and unsuccessful efforts to turn his organization to active support of abolition.[33]

[32] Comment in answer to an inquiry from Torajiro Mogi, quoted in Mogi's thesis, *Capital Punishment: Historically, Philosophically and Practically Considered* . . . (Ann Arbor, Mich., 1890), p. 40.

[33] William Tallack, "Humanity and Humanitarianism," *Transactions of the National Congress on Penitentiary and Reformatory Discipline,* edited by E. C. Wines (Albany, 1871), pp. 204 ff.; E. C. Wines, *The Actual State of Prison Reform Troughout* [*sic*] *the Civilized World* . . . , Stockholm, 1878; Bovee, *op. cit.* note 7 *supra,* pp. 241 ff.; Alfred H. Love, "Our Duty to the Prisoner and the Community," *Proceedings of the National Prison Congress* . . . (Chicago, 1887), pp. 92 ff. In 1898 Love embarrassed his organization by writing to the Queen of Spain in a pacifist effort, and resigned his vice presidency of the organization; see Teeters, *op. cit.* note 6 *supra,* pp. 398–400.

Early in the 1880's the impending execution of Guiteau for the assassination of President Garfield provided a point of public controversy, permitting the intransigent Cheever and Wendell Phillips, among others, to speak their opposing minds. Late in the decade the advent of the electric chair offered a novelty and renewed debate on the relative merits of the several modes of execution.[34]

FEDERAL REFORM

One of the strongest arguments of the abolitionists had always been that the conscience of mankind revolted against the death penalty, and that therefore it could not be enforced; in other words, that the death penalty assured the complete freedom of most murderers. In the post-Civil War era, with the high incidence of unpunished killing in the cattle country of the West and with the rise of lynch law in the South, to say nothing of the actions of susceptible juries in the North, the situation came close to being scandalous. As William Tallack pointed out, for the year 1894, in the United States, there were 9,800 murders, which were followed by only 132 legal and 190 "illegal" executions; that is, 29 out of 30 murderers escaped capital punishment.[35]

This, too, was the burden of what was the most important of all abolition crusades of the 1890's. The Hon. Newton M. Curtis, a Civil War general and New York reformer, who had written and spoken against capital punishment for years, now, as a member of the House of Representatives, undertook to per-

[34] [Symposium] "The Death Penalty," *North American Review,* Vol. 133 (December 1881), pp. 534 ff.; George F. Shrady, "The Death Penalty," *Arena,* Vol. XI (October 1890), p. 53.

[35] Tallack, *Penological and Preventive Principles with Special Reference to Europe and America* . . . (London, 1896), pp. 252–53.

suade Congress to define, in the words of his proposed bill, "the crimes of murder in the first and second degree, and manslaughter, and providing punishment therefor, and to abolish the punishment of death."[36]

In the material which he prepared for the consideration of the Committee on the Judiciary of the House of Representatives, Curtis attempted to show that "in the first thirty-seven years of the Republic the letter and spirit of the criminal laws were supported by public sentiment, which is essential to the successful enforcement of criminal statutes," but that a great change had taken place. In the earlier years of the Republic, about 85 per cent of those tried had been convicted, as compared with more recent figures of less than 20 per cent in the federal courts and a still lower percentage in the state courts.

Other statistics were calculated to show that those states having the greatest number of offenses carrying the death penalty suffered the greatest number of homicides, and that lynchings had increased at the expense of legal executions. Curtis brought up to date facts concerning laws of the then forty-one states, and the increasing experiences abroad.

By 1897 Curtis had modified his bill "to reduce the cases in which the penalty of death may be inflicted," and this became law that year. The sixty federal offenses previously punishable by death were reduced to treason, murder, rape, and capital offenses enumerated in the articles of war for the Army and Navy. In addition, in instances of murder and rape, juries might qualify their verdicts by adding "without capital punishment," and the penalty would be changed to life imprisonment at hard labor.[37]

[36] N. M. Curtis, *Capital Crimes and the Punishment Prescribed Therefor by Federal and State Laws and Those of Foreign Countries* . . . (Washington, D. C., 1894), [3].

THE PRE-WORLD WAR I ERA

The reformers of the 1900–1914 period, who concerned themselves so sensationally with all aspects of local and national affairs, did not forget the problem of crime. Organizationally, however, the abolition movement lagged behind that of penal reform. Charles Edward Russell, a leader of the muckrakers, wrote effectively on the question, and maintained an interest in abolition to the year of his death. Maynard Shipley, a California penologist, prepared learned articles on aspects of the subject.

One of the most active of all the reformers was Brand Whitlock, whose interest in abolition dated back to 1893, when he met Clarence Darrow in connection with an effort to save from execution a youth who had assassinated Carter Harrison.[38] As Mayor of Toledo, Whitlock worked earnestly to end the death penalty in Ohio. He wrote in a letter in 1906: "I have been, as perhaps you know, conducting a sort of guerrilla warfare against capital punishment." However, a bill which he engineered through the Ohio legislature failed of passage. His novel, *The Turn of the Balance* (1907), a powerful indictment of backward prison practices

[37] "The Death Penalty in the United States," *Harper's Weekly,* Vol. 41 (January 30, 1897), p. 107. This general rule has persisted to the present. McKinley's assassination resulted in a statute making it a capital crime to attempt the life of a high federal official (*Nation,* Vol. 84 [April 25, 1907], p. 377); and the Lindbergh law added kidnaping as a capital crime. The statement in Teeters, *World Penal Systems, A Survey* (Philadelphia, 1944), p. 180 fn., that "the Federal government resorts to capital punishment (hanging) for treason only . . . ," is inaccurate.

[38] Brand Whitlock, *Forty Years of It* (New York, 1925), pp. 82 ff.

and capital punishment, was harshly criticized, and his unsuccessful efforts appear to have exhausted him.[39]

Yet the 1910's began as a period of brilliant promise. Minnesota abolished the death penalty in 1911. In 1913 the state of Washington followed suit, and after her Oregon, North Dakota, South Dakota, Arizona, and Missouri. Tennessee abolished the death penalty for murder (retaining it for rape) in 1915, but restored it in 1917.[40] As instruments of reform and agitation, a number of organizations and agencies were created during that period.[41] Typical of developments which seemed about to carry abolitionists to a broad victory was the fact that the Pennsylvania Prison Society, without flagging in its zeal for prison reform, and after having avoided the issue of the death penalty for over a hundred years, finally took its stand directly against it.[42]

THE YEAR 1917

The year 1917 promised to be the wonder year of abolition. True, the *Survey* thought that legislators did not "seem to be as favorable to the abolition of the death penalty as the recent spread of humanitarian ideas in the prison field might indicate." In Colorado, Utah, and Vermont measures had been killed outright. A bill had been lost in Massachusetts.[43] But twelve states were already in the abolitionist column, and only twelve states still made the death penalty mandatory for convicted murderers. West Virginia, Indiana, North Carolina, Pennsylvania, New York, New Hampshire, Illinois, and Nebraska were considering the subject, and, in addition, many other bills relating to prison reform as such were under debate.

Nevertheless, 1917 was destined to be catastrophic for the abolitionist cause. Under the nervous tensions created by American entrance into World War I, four of the abolitionist states returned to capital punishment. Promising movements in other states were repulsed.

Typical of the spirit which set back abolition was that which prevailed in Pennsylvania, where the Prison Society, aided by the Prison Reform League, worked to pass an abolition law. It passed the Senate, and was expected to pass the House "with votes to spare." Unfortunately, "A day or two before the vote was taken, there was an explosion in a munition factory near Chester, which was at first thought to have been caused by spies or alien enemies.[44] As a result of this misadventure, members of the Assembly changed their minds and the bill was lost.

FOLLOWING WORLD WAR I

Although there were distinguished advocates of abolition as America entered the 1920's, conditions did not appear promising for them. Governor Harry L. Davis, of Ohio, showed himself as earnest and energetic as Whitlock before him.[45] Dean George W. Kirchwey, Clarence Darrow, Thomas Mott Osborne, and other opponents of capital punishment wrote or presented their views before such influential bodies as they could reach. It was the Loeb-Leopold case that revitalized the movement and gave it direction. The arguments of Clarence Darrow and the prosecutor were both largely based on those deriving from the question of abolition. The new interest in the subject was indicated by the preparation of a bibliography specifically to satisfy demands.[46]

In August 1925 the League for the Abolition of Capital Punishment opened its offices in New York under the active working leadership of Miss Vivian Pierce, and prepared to start a nation-wide campaign. The following February it opened its campaign in Wallack's Theater in New York, its speakers including Warden Lewis E. Lawes, of Sing Sing, a convert to abolition, Darrow, Dudley Field Malone, and Kathleen Norris. The following day, Darrow spoke before Congress on the subject.[47]

In 1927 the Sacco-Vanzetti case, or rather its climax, resulted in the formation of the Massachusetts Council for the Abolition of the Death Penalty, and in that year Mrs. Herbert B. Ehrmann, wife of one of the counsel for the condemned anarchists, began her long services in behalf of abolition.[48]

RECENT TRENDS

Since then, the movement, through organizations more or less vigorous, more or less adequately staffed and supported, has continued to press for reform measures, including abolition, has kept alert to possible reversals in states already free of the death penalty, has prepared bills, distributed educational materials, and directed its crusade through such channels as have been available to it. In the 1930's it gave up its appeal to sentiment and religious opinion, and presented its arguments in more practical and pertinent form.[49] It printed leaflets, brochures by such stalwarts as Lawes and Darrow, and reprinted the arguments of widely known sympathizers. A major campaign aimed to abolish the mandatory death penalty, and today it prevails only in Vermont and the District of Columbia.

To those concerned with the pro and con of the subject, developments in the states have been neither encouraging nor dismaying. World conditions have undoubtedly confused the picture. In 1939 South Dakota re-enacted capital punishment, but authorized no funds for the purchase of an electric chair. In 1942 an appropriation for the purpose was made, but there appeared to be no materials available for the construction of such a chair! In 1944, after Kansas had re-enacted the death penalty, three executions took place at the State Penitentiary. Feeling was high, and the warden of the institution resigned, refusing to enforce the penalty.

A promising token to one protagonist of abolition lay in the fact that capital punishment was no longer a major

means for dispensing justice. Only in New York, North Carolina, and Georgia did it play an important role. In 1943 there were 135 executions in the United States, one-third of which took place in these three states. Of these executions, 118 followed instances of murder, 17 of rape. There were no executions for any other offenses.[50]

WHERE WE STAND

"There is reason to believe," thought one expert on capital punishment in 1926, "that in the course of the present century the use of the death penalty will finally pass away." [51] However, the partisans of capital punishment have not retreated from their position, and those who advocate abolition have been required to take into account two levels of opposition. First, there is the intellectual defense of capital punishment: the argument that there is a moral and legal right to kill, and that capital punishment is a deterrent to crime.[52]

Much challenging, in some ways, is the spontaneous reaction to murder on the part of emotion-stirred people. Much of the essence of the controversy may be found in such responses as the following to the recent murder in New York of a young girl by a psychopathic stranger, who had obviously been released prematurely from hospital care. Her parents were quoted as having taken a "Christian attitude" toward the killer: "They were glad he had been caught and hoped he would be 'put away' so that no one else might be harmed. Some of the neighbors . . . were less resigned and called for vengeance." [53]

The Death Penalty Abroad

BY PETER P. LEJINS

THE main issue with regard to the death penalty in the world today is the conflict between the humanitarian abolitionist movement—with a corresponding actual trend to limit or give up altogether the use of capital punishment—and the tremendous increase in outright executions and veiled, slower methods of exterminating persons for political offenses and divergent political views.

BEFORE WORLD WAR I

Up to approximately the First World War, the issues involved in the controversy over the death penalty were relatively clear and simple. On one side there was the camp of the abolitionists. They were the humanitarians, the liberals, the progressives. Their movement, started in its contemporary form by the philosophers of the Enlightenment, was intrinsically connected with the development of the ideologies of the western society of the eighteenth and nineteenth centuries. Their argument ran along very clear-cut lines: capital punishment is below human dignity, functionally it does not do enough good to justify itself, and it leads to evil consequences.

Opposing the abolitionists were the conservatives, the old-fashioned, the less-educated people, who either did not worry about the executions of criminals or even felt that these were indispensable to keep the human race in line. Now the abolitionists, now the conservatives, had the upper hand; but on the whole, the abolitionists seem to have better expressed the spirit of the epoch, and step by step the number of capital offenses listed in the criminal codes, the number of death sentences imposed by the courts, and the number of executions actually performed steadily diminished in the course of the eighteenth and nineteenth centuries.

The issue of capital punishment for so-called political offenses was also quite clear. Except for some debatable borderline cases, the distinction between a criminal act and a political offense was pretty well established and generally agreed upon. The abolitionists attempted, of course, to expand also into the area of political offenses, but although they were in all probability responsible here too for some decrease in executions, they found the governmental tendency to exterminate the opponents of its political power an especially tough nut to crack. As a result, the abolitionists concentrated on the ordinary crimes and partly closed their eyes to political executions, which, by the way, were not very frequent in the eighteenth and nineteenth centuries except for the outburst of the French Revolution.

The abolitionists had a hard time also with offenses within the military machine of the state and offenses in wartime. Here, as in the case of the political offenses, they met with the hard fact that the military simply would not give up the death penalty, usually arguing that, since the military personnel is professionally exposed to the threat of death, no effective control is possible without a like threat. Likewise, in time of war, when martial law was introduced, the threat to the very existence of the state and the lives of its people was successfully employed

as an argument for using *summum supplicium*.

Whichever of the western countries we take, the situation was very much as just described, and the arguments and issues were very similar. Whether we take the abolition of the death penalty in Imperial Russia in 1753–54—incidentally the first instance of this nature in the Western world—or turn to western Europe for de facto abolition of the death penalty in 1765 and abolition by law in 1786 in Tuscany, or take the more recent parliamentary debates of 1948 in England, the picture is very much the same.

"THEIR MILD VICTORIAN LAMP"

Although the picture just sketched was typical for the Western world at the time of the First World War, the same views, social movements, and patterns of social action to a considerable extent are present also today, and in many respects the above characterization is still valid. On the other hand, since the First World War new developments have changed western society profoundly and have placed new problems before the people concerned with capital punishment, leading Mr. Winston Churchill to comment that the abolitionists "stand against the storm and hold their mild Victorian lamp in the blackness of the twentieth century."[1] This epithet, "mild Victorian lamp," brings into focus the present status of the capital punishment issue. Just what were these trends which set in after the First World War and contributed to a change of outlook on the question of the death penalty?

THE NEW PATTERN OF SOCIAL CONTROL

After World War I there developed in several countries, starting with Russia, an extremely acute internal political struggle. Both communist and fascist movements adopted a new type of political action characterized by a rational approach to the problem of obtaining and maintaining dominance, and by utilization of modern social science for manipulation of people. This pattern of social control is marked by extreme ruthlessness in suppressing one's enemies, in annihilating those who represent an immediate threat, and in gradually but systematically exterminating all the carriers of adverse ideologies.

The upshot of all this was a sudden rash of executions and the mass extermination of political enemies on an unprecedented scale. It is significant how quickly the relatively new term "genocide" was accepted in everyday speech: it denotes something that is a well-established phenomenon of our modern life.

At this point another development which is very important for our times took place. The outright execution of political criminals and active political opponents was rather easily rationalized; but the gradual extermination of the carriers of opposing ideologies ran counter to humanitarian concepts that were deeply rooted and had, in addition, a halo of progressiveness and liberalism. The result was the "social invention" of the concentration camp of the twentieth century. It often appears under very innocent names, but the tremendously high death rate among the internees over a relatively short period of time leaves no doubt that, at least in some countries and in some of the concentration camps, we are dealing with a veiled form of slow execution. It is carried out through confinement under conditions which are impossible for human survival, with poor food, exceedingly high work loads, and occasional direct executions.

[1] *Bulletin of the National Council for the Abolition of the Death Penalty*, No. 27, London, 1948.

The argument of the abolitionists of the old school that all this involves political offenses only, and that the death penalty for ordinary criminals can be handled as a separate issue, simply does not hold.

In the first place, it cannot be denied that the entire cause of abolitionism loses tremendously in popular appeal and in real significance if the abolitionists are worrying about a few dozen or a few hundred criminals while at the same time virtually millions of people are deliberately put to death the world over.

POLITICAL AND NONPOLITICAL OFFENSES BLENDED

Second—and this is very important for this discussion—the labeling of all these executions as a political matter is simply incorrect. There has taken place what at the risk of sounding trite one might term a totalization of governmental control, which tends to wipe out the sharp distinction between political and ordinary criminal offenses and has made considerable headway in this respect. In other words, the new political parties in control in certain countries have rendered some of the activities important to their political adversaries criminal offenses, and have attached to them as sanctions either outright capital punishment or the veiled death in a concentration camp.

Here are a few instances exemplifying this type of procedure: A decree to surrender all valuables in excess of a certain amount makes the illegal holding of such articles a criminal offense. The law refers to the entire population, but only certain wealthy groups are in possession of such valuables. In addition, the law will administratively be directed primarily against these groups. Thus the offenders will be handled as criminals; but in reality, all this can be a purely political action.

Or currency regulations are introduced, making it a serious offense to export currency abroad. Any violator of this law is prosecuted as a common criminal offender; but all of us will recall instances from the recent past where the main purpose of such a law was politically motivated economic pressure on a group, with genocidal plans in the background. Not many of those who violated currency regulations survived the concentration camp.

A somewhat different development, but one also tending to fuse political and nonpolitical offenses together, is the assigning of political meaning to some of the most conventional crimes against property and crimes of violence. What would appear to be a plain theft becomes a counterrevolutionary attack on communal property; an ordinary brawl, interference with the smooth functioning of the people's republic, and aid to foreign enemies and schemers. The operator of a wine bottling plant, who derived a substantial side income by filling the bottles somewhat below the required level, is sentenced not as a common crook, but as an enemy of the people, who endangers the very foundation of the state economy; and his penalty may very well be not even a slow death in a concentration camp, but an immediate execution.

When the death penalty appears as a sanction for offenses endangering the "security of the state" or, as the Rumanian law effective January 14, 1949 puts it, for sabotaging the economic progress of the republic and negligence in fulfilling service obligations in industry, the assignment of great importance to the distinction between political and nonpolitical offenses becomes questionable.

UNRELIABLE DATA

Here are some additional trends which belong in the same complex of events

and have recently exercised considerable influence on the use of the death penalty. The growing awareness of the potentialities of propaganda for the mass manipulation of people is gradually leading to ever increasing divergency between official reports and actual conditions. The popular acceptance and wide use of the term "Iron Curtain" testifies to the general awareness of this situation.

For this reason the text of the laws and official statistical reports regarding capital punishment are often worthless for judging actual policies in the use of the death penalty. The conventional survey of the "status of the death penalty" the world over, which reports what the laws and the officials say, would be completely worthless today with reference to a number of countries.

An outright misrepresentation of statistical data, ambiguous terminology, the previously discussed veiled execution through concentration camps, a frequent resort to martial law, the turning over of cases involving common criminal offenders to military tribunals which have the death penalty in their repertory—these are some of the most common means by which the extent or the very existence of the death penalty is concealed, and with the help of which a country which proudly points to its criminal code as containing no capital punishment can in reality manage to execute many of its citizens every year.

DEATH PENALTY GLORIFIED

Another trend, of less importance but nevertheless of some significance, was what one might term the glorification of the death penalty, which was evidenced particularly in Nazi Germany.[2] It represented the strongest single large-scale attack on the very foundations of abolitionist theory. With the collapse of the Nazi state, it disappeared as a major phenomenon.

QUALIFIED DEATH PENALTY

One might also raise the question as to the revival of the qualified death penalty, that is, death penalty accompanied by torture. The gradual disappearance of the qualified death penalty in the Western world during the last two centuries is a well-known fact, usually heralded as one of the signs of progress. The date of the last time a victim was broken on the wheel in Germany or of the repeal of the provision in the French penal code for chopping off the arm of a parricide just before his execution is always remembered as a landmark in the progress of civilization.

We do not know of any recent reintroduction of qualifying attributes of the death penalty with regard to the ordinary criminal, but the fusion of political and ordinary offenses, discussed above, and the extreme cruelty used in the contemporary extermination of political opponents, might well prompt an inquiry as to the extent to which the twentieth century has de facto revived the horrors of the pre-execution torture chamber.

A TREND REVERSED

Still another well-established trend, which can be traced for several centuries and which has been affected by recent developments, is the gradual decrease in the number of offenses for which the law provides capital punishment as a mandatory or possible sanction. Although in this respect considerable fluctuation has been observed

[2] As a good example of the characteristic "tone" in which the death penalty was frequently presented in Nazi Germany, see Ministerialrat Rietzsch, "Die Strafen und Massregeln der Sicherung, Besserung und Heilung," in Dr. Franz Gürtner, *Das Kommende Deutsche Strafrecht, Allgemeiner Teil* (Berlin, 1935), especially pp. 121–23.

throughout human history, the last two or three centuries have displayed a steady decrease in the number of capital offenses in the criminal codes of the western countries. From well over one hundred capital offenses which were rather typical for the eighteenth century, the number has decreased to three, two, or in some countries even one in the twentieth century. The number of death sentences when the legal provision exists, and the number of executions when the death sentence is pronounced, have also decreased accordingly.

The recent fierce political struggles have, however, resulted in a widening of the circle of political acts for which the offender may be executed, and also in an increase, sometimes to remarkable proportions, of the number of conventional crimes which may result in capital punishment by imputing to them political significance, as, for instance, is the case in the Soviet Union.

PRESENT STATUS OF DEATH PENALTY

Now let us see how the death penalty has fared under these influences. It seems that for western Europe the defeat of the western totalitarian countries meant a return to the pre-World War I tenor of thinking in the area of capital punishment.[3] The ideology and practices introduced by the fascist governments in their fight on crime and political enemies were wiped out together with the rest of the totalitarian regimes. Whether this is just an immediate symbolic consequence of the defeat of a political system, and the abolitionist ideology has in reality been permanently undermined, only the future can tell. One cannot help noting that many western European countries which for a long time had not used the death penalty at all recently reintroduced it for political offenders ("collaborationists" or "quislings"); for example, the Netherlands, Denmark, and Norway.

As to eastern Europe, that is, the countries behind the Iron Curtain, the lack of information really should preclude any definitive judgment. From what little is gleaned of the situation there, it seems that the intensive political struggle of the Communist party to maintain its power and to expand the orbit of its influence makes it very probable that the attitudes and policies described above are prevalent there. The propagandistic repeal of the death penalty for criminal offenses, the denial of executions, the wide use of the veiled death penalty through concentration camp procedures, the harassing of political opponents by regulations to which criminal law sanctions are attached, the interpretation of common criminal offenses as politically dangerous acts—all this seems to be present in the Union of Soviet Socialist Republics itself, and one suspects some of it also in the so-called satellites.

Certain Asiatic areas recently seem to have drifted into the same orbit and are exposed to the influence of similar practices.

What really has happened throughout the world with respect to the death penalty cannot be explained away as an expected and temporary intensification of sanctions in the wake of the violence prevalent in time of war. Let us not forget that in some countries the more intensive use of the death penalty actually had its start between the wars. In view of the foregoing analysis, the optimistic assertion made by some abolitionists to the effect that nothing has really happened and that we can peacefully return to hammering at the remaining strongholds of the death penalty is an oversimplification and cannot be substantiated. Something has hap-

[3] L. E. Deets, "Changes in Capital Punishment Policy since 1939," *Journal of Criminal Law and Criminology*, Vol. XXXVIII, No. 6, 1948.

pened in the last thirty years. The trends have become very complex, and the future of the death penalty can hardly be predicted at the present time.

THE TYPE SITUATIONS

Let us now turn to an examination of the use of the death penalty in those countries which are not discussed separately elsewhere in this volume. The conventional survey of capital punishment in the world usually resorts to a listing of countries according to whether they have no death penalty at all, have it for political and military offenders only, or make use of it in their control of crime in general.

Even a quick analysis of such tabulations, however, will show that they are usually not very exact or reliable. The conventional distinction of the three type situations is too superficial to make possible a meaningful analysis; for example, to piece together trends from slight variations in policy, or to understand the real meaning of reforms. Too often only the text of the basic criminal laws is used as the source of information, and especially today this is not a very reliable source. Quite often these basic laws are supplemented by less widely circulated provisions, such as rules of criminal procedure, and special acts dealing with martial law and military tribunals, which substantially change the whole picture.

If we remember the executions through concentration camp procedures, the denial of these for propaganda purposes, and other integral factors, it will become clear that only a careful analysis of the entire governmental control pattern of a country can serve as the basis for its evaluation from the standpoint of the death penalty. In the limited space of this article one cannot do much more than indicate these shortcomings and suggest some research possibilities. Let us, first of all, formulate the type situations with reference to the death penalty which seem to exist in the different countries:

1. At one end of the continuum there are countries which have no legal provision for capital punishment and actually do not have any executions.

2. At the other extreme there are the countries which have legal provisions stipulating death penalty for political, military, and ordinary criminal offenders and which actually make use of these provisions.

3. Somewhere between these two there are those countries which do not seem to have any legal provisions for the death penalty, but which in reality do execute some of the offenders in some way.

4. Finally, there are some countries which, although the death penalty is provided for in the law, have not made use thereof for such a long time that they may be considered as having de facto abolished capital punishment.

ANALYTICAL POSSIBILITIES

These four basic types will be further complicated if we make a distinction between conventional criminal offenders on the one hand and political and military offenders on the other. Then the four possibilities just listed must be considered separately for each of these two categories. The possible combinations would give us all together sixteen possible type situations, which are represented on the accompanying chart and which could be used as the basis for classifying the countries of the world with reference to their policies on capital punishment. This would make possible a quick reference and manipulation of data.

It is impossible to attempt this here, since sufficient information, as already pointed out, is not available on some of the key countries, and since a considerable amount of research would have to be done to establish the true situation in many others. Space would not permit a detailed description of examples to illustrate all these sixteen type situations. However, here is one, just to show how this kind of analysis might be used.

CHART OF TYPE SITUATIONS WITH REFERENCE TO DEATH PENALTY

Types	All Offenders Treated Alike	Ordinary Offenders	Political and Military Offenders
A. No death penalty either legally or de facto	A	A_i	A_{ii}
B. No death penalty legally but de facto	B	B_i	B_{ii}
C. Death penalty exists legally but not de facto	C	C_i	C_{ii}
D. Death penalty exists both legally and de facto	D	D_i	D_{ii}

NOTE: A country falls either under one of the straight letter situations or under a combination of two different sub$_i$-sub$_{ii}$ letters; for instance, A_i-D_{ii} for the Netherlands today.

Imperial Russia, after having abolished the death penalty in 1754 as the first country to do so among modern western states, presumably retained capital punishment for political offenders. Their exact legal status is not quite clear, but it seems to be agreed that the decrees of 1753–54 did not affect them, and some executions unquestionably took place. As to the conventional offenders, there seems to be a consensus that many of them also actually died as a result of corporal punishment; as a rule persons subjected to 400 strokes of the "knut" or to 10,000 strokes by running the gantlet did not survive the ordeal. Thus Imperial Russia would at that time probably fall into a composite type, which according to our chart could be described as B_i-D_{ii}.

As stated, this seems to be the least amount of analysis necessary to yield some meaningful results. It would not mean very much, and often would be directly misleading, to state that Russia at that time simply did or did not have capital punishment.

Further elaboration might, of course, be necessary; for instance, a distinction might be made between military and political offenses. It can be readily seen that a country which openly executes political offenders but does not use capital punishment within its armed forces, and another which does not execute its political enemies but does use the death penalty within its army, let us say in time of war, represent two potentially very different types of political and governmental philosophy.

This distinction between military and political capital punishment can easily be worked into the chart. Likewise, the distinction between outright executions and the veiled death penalty (for instance through concentration camps or "knut") might be quite significant for certain purposes. The chart can easily be extended to take care of these additional details also.

IN EUROPE

As to the present situation with regard to the death penalty in the countries of western Europe, England, which does have capital punishment for both political and ordinary criminal offenders, is discussed elsewhere in this volume.

On the whole, all continental European countries legally have the death penalty at least in some connection, at the very least for treason, especially treason in time of war. The only exception seems to be Western Germany,

where Article 102 of the Bonn constitution states categorically that the death penalty shall be abolished. The situation in Germany, however, must be considered as still fluid, especially with reference to some basic functions and guaranties of the government and in view of the presence of occupational authorities. The latter, as is well known, do resort to capital punishment.[4]

Some of the countries, after having had no executions for a long time, either by tradition (Belgium) or by law (Denmark, the Netherlands, Norway), returned to the death penalty especially for collaborators with the enemy during the military occupations of World War II.

It is possible that in some cases the legal acts providing for the death penalty could be interpreted as applying exclusively to World War II situations, so one might conclude that these countries are back in the abolitionist camp after completing this specific action. Whatever the exact interpretation of the legal texts, such seems to be the very definite opinion of the people in at least some of these countries. For example, in several interviews which this writer recently had with people expert in penological matters in the Netherlands,[5] the answer to the question whether the death penalty existed in that country was significantly one and the same: "No, only for persons who collaborated during the German occupation."

[4] Deets, *op. cit.*, p. 586; a check of developments since the time of that study showed that there was no change in that particular respect, except in Germany, as stated. The Austrian law of June 21, 1950, in abolishing the death penalty, expressly refers only to the regular criminal procedure (*Im ordentlichen Verfahren*).

[5] Interviews in May 1952 with Dr. H. Van Rooy of the University of Utrecht and Dr. Ernest A. M. Lamers, director-general of the Penal Administration in the Netherlands.

On the other hand, on March 27, 1952, seven years after the end of the German occupation, the Danish Parliament voted to make "gross crimes" punishable by death during wartime and any period of occupation.[6] Denmark thus did not stop with the execution of several war criminals, but made permanent provisions for capital punishment.

Classification of some of these countries as having or not having the death penalty would often depend on a definition of the terms and principles underlying this taxonomy. The law of May 26, 1947, which abolished the death penalty in the U.S.S.R.,[7] was later supplemented; the Presidium of the Supreme Soviet on January 12, 1950 reintroduced capital punishment for traitors, spies, and saboteurs.

As to the countries of Europe which do not have any death penalty for ordinary criminal offenders, a tabulation was prepared by the Howard League for Penal Reform as of September 1950,[8] to be submitted as evidence to the Royal Commission on Capital Punishment. This tabulation lists fifteen countries: Austria, Belgium, Denmark, Finland, Holland, Iceland, Italy, Luxembourg, Norway, Portugal, Rumania, Sweden, Switzerland, U.S.S.R., and Western Germany. The inclusion of several of these can, however, be seriously questioned. Rumania with its law of January 13, 1949 and the U.S.S.R. with its law of January 12, 1950, which has just been referred to, have too broad formulas for capital offenses that endanger the security and well-being of the state to be able to claim that they do not have any death penalty for what other countries refer

[6] *New York Times*, March 28, 1952, p. 4.

[7] K. P. Gorshenin, *Istoricheskii Akt: Ukaz Prezidiuma Verkhovnogo Sovieta S.S.S.R. ob Otmene Smertnoi Kazni*, Moscow, 1947.

[8] Margery Fry, *Arms of the Law* (London, 1951), Appendix G, pp. 237–38.

to as ordinary criminal offenders. Finland seems to have given up the death penalty only for the time of peace,[9] and even the inclusion of Denmark, with its law of March 27, 1952, is questionable.

IN THE AMERICAS

As to the Americas, Canada and the United States are discussed elsewhere in this volume. Greenland, as a Danish colony, does not have any death penalty. There is a question whether the new Danish law of March 27, 1952 would apply.

Two observations are in order with reference to the Latin American countries. One is that these have been for quite some time strongly abolitionist, and a considerable number of them do not have any death penalty in the repertory of the respective law enforcement agencies. The other is the fact that information regarding the death penalty in the Latin American countries, at least what is available in English, is based almost exclusively on the legal documents, primarily the criminal codes. Some research into the actual circumstances and reports concerning them seems to be badly needed; either this would change the picture regarding some of the countries, or it would reassure the foreign students that what the law says is actually so.

The political changes in some of the countries make correct reporting even of the legal status of this question a very difficult task. Professor Deets[10] lists Ecuador and Uruguay as completely free of the death penalty even in the case of treason and military offenses. The above-mentioned tabulation of the Howard League gives twelve of the countries as having given up the death penalty for ordinary criminal offenders: Argentina, Brazil, Colombia, Costa Rica, Dominica, Ecuador, Honduras, Mexico, Panama, Peru, Uruguay, and Venezuela.

On the basis of the evidence submitted by Professor Deets,[11] the inclusion of Honduras in this list should be questioned. Also, Mexico does not seem to be in its entirety without the death penalty. Moreover, there should be further clarification as to whether the statement of the Howard League that the death penalty was reintroduced in Peru in 1949 for political crimes only, is correct, since this writer has seen references to the effect that murder is a capital offense in Peru. In Cuba the present situation is not clear as of this writing.

Of the nonsovereign countries of Latin America, Puerto Rico and Surinam, not mentioned in the Howard League list, are without the death penalty for criminal offenses.

AUSTRALIA, ASIA, AFRICA

As to the rest of the world, Queensland, Australia, abolished the death penalty in 1922. It is interesting to note that New Zealand, which abolished the death penalty in 1941 by an amendment to the Crimes Act of 1908, restored it for certain cases of murder by the Capital Punishment Act of 1950.

For Asia there are currently three references. Of these, Israel is listed by the Howard League, apparently somewhat prematurely, since as late as February 1952 the bill providing for the abolition of capital punishment for murderers had only had its first reading in the Parliament. The measure was sent to a legislative committee, and at the time of this writing there still was no information as to its further fate.[12] The other two countries are Nepal, which suspended capital punishment by decree for five years in 1931 and never reintroduced it, and Travancore, one of

the states of India, which abolished the death penalty in 1944.

In the rest of Asia the death penalty presumably prevails, but the number of countries for which the information concerning its exact status is conclusive, as for instance in the case of Japan, is not great. The same applies to Africa.

LACK OF COMPREHENSIVE STUDIES

The literature on the death penalty is tremendous, but most of it is devoted to a discussion of the pros and cons and the promotion of the cause of abolition, primarily in terms of moralistic and philosophic principles. The bulk of the remaining literature is divided between legal writings on capital punishment throughout the history of western civilization and anecdotal descriptions of the execution methods. Modern scientific studies are mostly limited in scope to the area of western civilization, and at that to a few specific countries, which appear again and again in these writings.

We definitely lack a dependable and truly world-wide study of the death penalty, which would go beyond the legal provisions of the codes and the official answers of government representatives. Such a study, which would have to be a tremendous research enterprise, would be very worth while and revealing.

Peter P. Lejins, Ph.D., College Park, Maryland, has been professor of sociology at the University of Maryland since 1941, where he directs the Crime Control Curriculum. He held the chair of criminal law at the University of Latvia from 1938 to 1940. He is chairman of the Research and Planning Committee of the American Prison Association, and recently served as consultant to the Air Force in the area of human resources. He is author of a number of articles, primarily in the field of juvenile delinquency.

The Death Penalty in Canada

By C. W. TOPPING

WHEN Pierre Boucher, an early resident of Quebec City, was asked by one of the French kings whether his town was a law-abiding place or not, he is reputed to have retorted, "We know how to hang in Canada."[1] Later Canadians also have taken pride in the fact that the legal sanctions of the country have been severe beyond those of other nations. They have also assumed with Pierre Boucher that severity of punishment and certainty of punishment are correlated and that the two together are the chief ingredients in the law-abidingness of a people.

The hangmen of Canada—Radclive, Ellis, and the rest—have put close to six hundred persons to death during the eighty-five years that have elapsed since the Confederation of the Provinces. Have the effects of the judicial acts of these men and their collaborators been what Canadians and others have assumed? A factual study of the death penalty in Canada ought to provide an opportunity to document an answer to this question.

CAPITAL CRIMES IN CANADA

The four capital offenses in Canada, according to the Revised Statutes of 1927 with Amendments,[2] are murder, treason, making war against Her Majesty, and rape. Murder is culpable homicide, and homicide is "the killing of a human being by another, directly or indirectly, by any means whatsoever."[3] Homicide that is not culpable is no offense, and culpable homicide, which would otherwise be murder, may be reduced to manslaughter if the person who causes death does so in the heat of passion caused by sudden provocation.[4] In addition, where the evidence does not indicate that a charge of murder can be sustained, a jury may bring in a verdict of manslaughter. Death must take place within a year and a day if a charge is to be laid.[5]

But many killings are murder under the Canadian statutes that the uninitiated might regard as no offense or as manslaughter. Where death ensues because of an action in the process of committing another crime, the charge of murder is frequently pressed. A common case is where a female has been choked to death during an act of rape or attempted rape. Almost as frequent are cases in which a clerk or attendant was killed while a store or gas station was being robbed. Charges of murder also arise in cases where a representative of the police power has been done to death. The person guilty of piracy is in a particularly vulnerable position, since he may be charged with murder if he merely "wounds any person, or does any act by which the life of any person is likely to be endangered."[6] A would-be murderer who kills some person other than the intended victim is also liable.

Treason is likewise a complicated offense, and ranges from a personal attack

on the monarch with a view to killing him or doing him bodily harm to violating a Queen Consort with or without her consent. It also includes any overt act of intention to do physical hurt to the monarch or her eldest son, or the consort; of instigating a foreign force to invade the country; and, the common case, "of assisting any public enemy at war with Her Majesty in such war by any means whatsoever."[7]

Making war against Her Majesty covers two groups of persons: (1) citizens of a foreign power at peace with Her Majesty, who continue in arms or who enter Canada with the intent of levying war or of committing any offense for which a Canadian would suffer death; and (2) citizens of Canada who join any such persons for one or all of these purposes.[8]

"Rape is the act of a man having carnal knowledge of a woman who is not his wife without her consent, or with consent which has been extorted by threats or fear of bodily harm, or obtained by personating the woman's husband, or by false and fraudulent representations as to the nature and quality of the act."[9] No one under the age of fourteen years can commit rape.[10] In the case of rape the death sentence is permissive rather than mandatory, with an alternative punishment of imprisonment for life and to be whipped.[11]

It is expected that changes will be made in this list of capital offenses if and when the Report of the Royal Commission on the Revision of the Criminal Code is adopted by Parliament.[12] The Report of this Commission, with an annexed draft bill, was presented to the Minister of Justice on February 22, 1952. In the draft bill, rape ceases to be a capital offense but remains subject to "imprisonment for life and to be whipped."[13] The section on piracy has been clarified but still carries the original penalties.[14] A new offense—infanticide—has been added to the homicide section, with a greatly reduced penalty: "Every female person who commits infanticide is guilty of an indictable offense and liable to imprisonment for five years."[15] An alternative penalty of imprisonment for life has been added to the section on treason with which the section on making war against Her Majesty is now integrated.[16]

EXTENT AND TREND OF CAPITAL CRIMES

Details on capital crimes are available in the annual reports of the Royal Canadian Mounted Police and of the provincial and municipal police forces. Accurate statistical reports on murder go back to 1876. The summations of the Dominion Bureau of Statistics are based on the 1,729 reports sent in by officials of the 159 judicial districts (1946).[17] Since 1949 the raw data have been manipulated and tabulated mechanically, permitting more detailed comparisons for a given year but making more difficult comparisons with earlier years. The matter was further complicated in the same year by a change in the basis of the statistics from convictions to persons.

The range of capital offenses in Canada was much wider in the nineteenth than in the twentieth century. The first person hanged, according to Louis B. Duff, was a young woman who had been convicted of theft.[18] The first man to suffer the death penalty in Upper Canada—Josiah Cutten in 1792—had been sentenced for stealing rum and furs from a Detroit merchant. The first capital offender in the London district had robbed a store. And so the record continues. But killers were more common on the gallows of the period than were thieves.

Theft does not now rank as a capital offense in Canada, and the number of crimes subject to the death penalty may shortly be reduced to three—murder, treason, and piracy. Few if any rapists have ever been hanged in Canada, and hangings for piracy have been equally infrequent. Nor have charges of treason resulted in many public executions. Of the ninety-nine persons sentenced to death as a result of the Rebellion of 1837–38, only twelve were hanged.[19] Thus murder has always been and still is the chief capital offense in Canada.

TABLE 1—MURDER CHARGES AND SENTENCES, 1880–1949, BY TEN-YEAR TOTALS

Years	Charges				Sentences				
	Numbers	Mean	Range		Numbers	Mean	Range		Per Cent of Charges
			High Year	Low Year			High Year	Low Year	
1880–1889	254	25.4	40	13	99	9.9	16	4	38.9
1890–1899	223	22.3	28	16	76	7.6	13	4	34.0
1900–1909	310	31.0	42	22	103	10.3	18	2	33.2
1910–1919	596	59.6	86	48	233	23.3	34	17	39.0
1920–1929	540	54.0	77	42	188	18.8	26	11	34.0
1930–1939	450	45.0	54	35	194	19.4	25	13	43.1
1940–1949	450	45.0	66	23	177	17.7	32	9	39.3
Totals	2,823	40.3	86	13	1,070	15.3	34	2	37.9
Mode		26				11			
Median		40				15			

Capital offenses have never constituted as much as 1 per cent of indictable offenses; nor have persons hanged in any year since Confederation constituted as much as 1 in 100,000 of the population. The mean percentage which death sentences constituted of all sentences for indictable offenses between 1880 and 1949 for the ten-year period (1930–39) in which a charge of murder was most likely to result in a public execution was .057. Of the 103,753 investigations made by the Royal Canadian Mounted Police in 1951, only 28 (.027 per cent) concerned an alleged murder.

The charges for murder and the resulting sentences are given in Table 1 for all Canada except Newfoundland for the period 1880–1949. The mean and the range are given for subcategories, and the mean, the range, the mode, and the median for the series. The percentage of charges that resulted in sentences is also indicated.[20]

[20] The tables in this article were compiled from tables given in *Statistics of Criminal and Other Offences* for various years but chiefly for 1946, pp. 174–75, and 1949, pp. 48, 49 (I), 55 (VII).

EXECUTIONS

Table 2 gives executions carried out in all Canada except Newfoundland for the years 1880–1949 by ten-year totals.[21] The mean and the range are, again, supplied for subcategories; the mean, the range, the mode, and the median for the series. The percentage of charges and sentences that resulted in executions has also been worked out for the subcategories and for the series.

It is to be noted that there is a relatively greater spread between the median and the mean for executions than for charges and for sentences. The disturbing factors are the ten-year period 1900–1909 and the ten-year period 1930–1939, particularly the latter. During this period both a charge of and a sentence for murder had the greatest probability of culminating in an execution; the mean for any ten-year period was highest; and the greatest number of executions, gauged by total numbers, by high year, or by low year, took place.

TABLE 2—EXECUTIONS OF CAPITAL OFFENDERS, 1880–1949, BY TEN-YEAR TOTALS

Years	Number	Per Cent of Charges	Per Cent of Sentences	Mean	Range	
					High Year	Low Year
1880–1889	49	19.2	49.4	4.9	12	1
1890–1899	44	19.7	57.8	4.4	10	0
1900–1909	64	20.6	62.1	6.4	13	2
1910–1919	104	17.4	44.6	10.4	19	6
1920–1929	92	17.0	48.9	9.2	13	6
1930–1939	127	28.2	65.4	12.7	22	7

[21] Executions, 1876–1879, totaled thirteen: mean 3.3, range 6 and 1, mode 3, median 3. Canada, *Statistical Abstract and Record, 1886* (Ottawa, 1886), p. 203. Official records go back only to 1876.

ALTERNATIVES TO THE DEATH PENALTY

An accused capital offender may be detained for lunacy, and a sentenced capital offender may be given imprisonment for life. Before these final actions are taken, appeals both to higher courts and to the representative of Her Majesty are likely to have been entered. A Canadian defense counsel seldom spares himself, his client, or the enforcement officials in his attempts to circumvent a sentence of death. And he is likely, in his efforts, to win support from the press, public bodies, and the general public. He has also, with the passing of the years, won greater support from the psychiatrists.

Table 3 gives the number of persons charged with murder who were detained for lunacy, 1880–1949, by ten-year totals, with mean, range, and percentage of charges so dealt with for subcategories; and mean, range, mode, median, and percentage of charges shown for the series.

Despite the fact that some life sentences are for crimes other than capital offenses Table 4 gives total life sentences for all Canada except Newfoundland, 1880–1949, by ten-year totals,

TABLE 3—CAPITAL OFFENDERS DETAINED FOR LUNACY, 1880–1949

Years	Number	Per Cent of Charges	Mean	Range	
				High Year	Low Year
1880–1889	11	4.3	1.1	4	0

with the same measures of dispersion as have been worked out for the preceding tables. Since the ratio of death sentences to sentences to life imprisonment may have significance, it is also included in Table 4. Table 5 will give some indication of the number of these sentences that are for the capital offense of murder.

The Commissioners appointed to investigate the penal system of Canada devoted a chapter of their *Report*[22] to "The Treatment of Insane Prisoners." They stated that the problem of the transfer to provincial mental hospitals of prisoners acquitted on the grounds of insanity is relatively easy, but that the treatment of such persons in these institutions creates serious difficulties for administrators. But in the case of the sentenced prisoner who is certified insane by the penitentiary doctor, either at the time of admission or later, serious difficulty has been experienced in arranging a transfer back to the provincial authorities, who in some cases contend that their responsibility is lim-

ited to the treatment of "law-abiding citizens." [23]

The situation which the Royal Commissioners criticized in 1938 has been improved somewhat since that date, but is not yet entirely satisfactory. It should be clear that when mentally deranged persons remain in the penitentiaries they not only disorganize the discipline of these institutions but they fail to receive the treatment to which their condition entitles them.

The change of a death sentence to some other penalty or arrangement is most likely to take place by action of the representative of Her Majesty, the Governor General of Canada. It may, however, result from an action in an appellate court. An analysis of the appeals against the death sentence for the years 1946 and 1949 will illustrate the possibilities.[24] Fifty-eight persons were sentenced to death in these years and 44 appeals were taken to higher courts. Of these, the appeal was dismissed in 27 cases, a new trial was granted in 10 cases, the sentence was varied in 4 cases, and the conviction was quashed in 3 cases.

[23] *Report, op. cit.* note 22, p. 157.

[24] *Statistics of Criminal and Other Offences, 1946,* pp. 127–33; 1949, V, pp. 9–14.

PARDON AND PAROLE FOR CAPITAL OFFENDERS

Table 5 gives commutations of death sentences for murder by ten-year totals, 1880–1949, with the common measures of dispersion and the percentage of sentences which these commutations constitute for subcategories and for the series.

It is to be noted that the high period of activity by the representative of Her Majesty was the ten-year interval 1910–19, when an average of 10.3 commutations per year were granted. Sixteen commutations were granted in 1914, and twenty-six in the two-year period 1912–13. In the percentage column, commutation of 44.2 per cent of sentences stands out as high for the series and contrasts strikingly with the 21.6 per cent for the period 1930–39.

The chief disturbing factors in determining the trend appear to have been the movement for the abolition of the death penalty during the former period and the movement of the business cycle during the latter. The greater credence given by court officials, in their attempts to determine responsibility for conduct, to the testimony of psychiatrists may also have influenced the trend for the twenty-year period 1930–49. The percentage of accused murderers detained for lunacy rose sharply during this period (Table 3), and the percentage of sentenced murderers granted clemency declined (Table 5).

A number of convicted murderers who have had their sentence reduced to life imprisonment will receive further clemency. In 1946 and again in 1949, to select two representative years, five such persons were released from the various penitentiaries of Canada.[25] Not one of these persons had served what was considered to be half his sentence. One had served twenty years and three months; one, two years and three months. The time served by the other eight ranged between these extremes, with two serving less than eleven years, and six serving eleven years or more.

The conditions of release also varied. Six went out on ticket-of-leave—one of these to employment and five to the care of a guardian—all under the supervision of the Royal Canadian Mounted Police and the Remission Branch. Three were released temporarily and one was deported.

QUESTION OF ADMINISTRATION OF JUSTICE

Th British tradition in the administration of justice has been that it is better for a thousand guilty persons to escape than for one innocent person to be convicted. Have any innocent persons been hanged in Canada? This is a difficult question to answer. Murderers in Canada, as in other parts of the earth, are in the habit of protesting their innocence right up to the dropping of the trap door. Where a signed confession of guilt is available, psychiatric opinion suggests that it should be highly suspect in any subsequent court action. Murder is a low-visibility crime, and evidence is commonly circumstantial.

[25] *Statistics, op. cit.* note 24, 1946, pp. 146–47; 1949, V, pp. 26–27.

The Canadian cases that have caused public disputation have not been those in which the question of guilt or innocence was the issue. They have been the situations in which two or three persons were hanged for a single killing where only one weapon was used or only one shot fired.[26] Bungled hangings have also roused public indignation against the crudities associated with a public execution.[27] But public outcry may well have been responsible for any injustices that have been hinted at in the record. Where a series of atrocious murders have taken place or where a killing has been particularly gruesome, a great hue and cry has commonly arisen. In such an atmosphere the police and the court officials may react emotionally, with fatal results to an accused person.[28]

A close study of Canadian procedure in capital cases strengthens the belief that the British principle noted above is still operative. A thorough examination by a psychiatrist in such cases has become routine, with an increasing number of murderers being held for lunacy. Defense counsel has become highly specialized and exceedingly competent. Appeals to higher courts are permitted and expected. Stays of execution are also routine, as are the final appeal for clemency and the substitution of a sentence of life imprisonment for the sentence of death.

Doubt as to the guilt of the accused at any point in these elaborate procedures is likely to react in his favor and to elicit a response which will work to the advantage of an innocent victim of circumstantial evidence. Once a commutation to life imprisonment has

[26] Robert Bickerdike, Scrapbook, II, pp. 121–25. Two Bickerdike Scrapbooks were made available through the generosity of Mr. J. Alexander Edmison.

[27] Duff, *op. cit.* note 1, pp. 131–40; Bickerdike, Scrapbook, II, pp. 103–14.

[28] Bickerdike Scrapbook, I, p. 15.

been secured, a reduction of sentence for the killer who is unlikely to repeat any offense becomes possible.

But the administration of justice is more than the assurance of protection for the innocent party in a suit. Do we really know how to hang in Canada, as Pierre Boucher held, or do we let the thousand guilty murderers escape in the course of our efforts to save the life of the one who is falsely accused, in harmony with the British principle? In other words, can severity and certainty of punishment be reconciled, or have we here an either-or principle?

The Royal Canadian Mounted Police reported in detail the disposal of the 28 investigations of 1951 which involved murder.[29] Eleven of the charges were reduced to manslaughter; 8 cases were awaiting trial at the end of the year; 4 had been acquitted; 3 had committed suicide; 1 had been declared mentally incompetent to stand trial; and in 1 case only was there sufficient evidence to proceed with a trial for murder. Not a single 1951 investigation had resulted in a conviction for murder, and not one person had been hanged as a result of these investigations.

The significance of this report is that a police force which out of 22,818 investigations had succeeded in obtaining 12,386 convictions, or 54.3 per cent,[30] were unable to locate and assemble evidence to satisfy the prosecutor in cases of murder. And Canadian juries have been equally hard to satisfy. The total charges for indictable offenses in 1949 were 31,134, and the total convictions 30,922, or 99.3 per cent.[31] The convictions for Class I offenses, the group with which murder is classified, were slightly less, with 5,894 convictions to 7,662 charges, or 76.9 per cent.[32] But the highest percentage of convictions for murder to charges of murder for the whole seventy-year period 1880–1949 was 43.1 (1930–39) and the lowest 33.2 (1900–1909), and for the series the percentage was 37.9.[33] When one considers the percentage of charges that result in executions, the differential is even greater: 28.2 per cent for the high period (1930–39), 17.0 per cent for the low period, 1920–29, and 20.3 per cent for the series.[34]

It seems clear that there is an inverse relationship between severity of punishment and certainty of punishment, and that Canadians are suffering under a delusion when they assert that they know how to hang. The net result of the administration of justice in Canada as it relates to capital offenses is that murder has become the least risky of any or all the offenses which a citizen might choose to commit.

Movements to Abolish Capital Punishment

The movements for the abolition of capital punishment have never been Canadian movements, but rather Montreal movements, with Mr. Robert Bickerdike, M.P., and the clergymen of that city as leaders.[35] The group were both active and effective from 1910 to 1920, particularly in stirring up discussion in the public press and in persuading the Governor General to commute death sentences to life imprisonment. However, the private bills which Mr. Bickerdike introduced from time to time for the abolition of capital punishment did not win the support of Parliament.[36]

[35] Bickerdike Scrapbook, II, pp. 104, 121.
[36] E.g., February 18, 1915. See House of Commons Debates, Vol. XLIX, 1915.

Members of the group lost heart and transferred their energies to other reform endeavors.

What arguments did Mr. Bickerdike press in Parliament for the abolition of capital punishment in Canada? The following is a summary of a statement made on March 30, 1915.

1. It is murder and a blot on Christianity.
2. It brutalizes the public as well as the officials.
3. It is not a deterrent and is less feared by some criminals than imprisonment for life.
4. Innocent victims are occasionally executed.
5. All punishment should be reformatory, not vindictive.
6. There are fewer murders per capita in states and countries which have abolished the death sentence than in those which have retained it.
7. It is a relic of barbarism.[37]

The Canadian Penal Association and the provincial John Howard societies, successors to the organizations with which Mr. Bickerdike associated himself, have stressed social work rather than social reform, and members of Parliament have discussed alternatives to hanging rather than capital punishment as such. The Royal Commission on the Revision of the Criminal Code chose as counsel [38] a man who permitted himself to be quoted as follows in the *Financial Post Survey* on capital punishment reported in the issue of October 12, 1946:

I would not favor for Canada the abolition of capital punishment for any period. It would open wide the floodgates of the crime of murder and a vast number of innocent Canadians, including women and children, would, as a result, be murdered because the fear of hanging for such offenses would be removed.[39]

And the Canadian Institute of Public Opinion, in a nation-wide poll, found that almost half the persons interviewed considered hanging as the best method of execution, with only a quarter favoring life imprisonment as a substitute for the death penalty. And the citizens of the province of Quebec still stood with Pierre Boucher, since the strongest support for both capital punishment and for the continued use of the noose was found in that province.[40]

The logical time to abolish capital punishment in Canada, if it is ever to be abolished, is when the bill annexed to the Report of the Royal Commission on the Revision of the Criminal Code is debated in the House of Commons. The serious discussion of the issue at that time does not, at the moment, appear likely, but the representatives of the Cooperative Commonwealth Federation and of the Social Credit Party in the House may take up the fight where the late Robert Bickerdike dropped it.[41] Even under such conditions, prolonged debate, rather than a favorable vote, is likely to result.

Science and Murder

The relationship between science and murder has become closer with the years. The work of the psychiatrist has been noted. The most dangerous of all murderers, the insane repeater, can escape the gallows on recommendation of this scientist. Police laboratories have made little progress except where they have drawn upon the sci-

[40] Quoted in Duff, *op. cit.* note 1, p. 220.
[41] The Cooperative Commonwealth Federation is a socialist movement; the Social Credit Party, a movement greatly influenced by Christianity.

ences of chemistry, physics, and biology. Can the social sciences, likewise, make a contribution? Can the criminologist hope to document the offense of murder, to predict its incidence in a given area, to hedge it about with effective controls. That capital punishment is an ineffective control should be obvious from the above analysis.

What factors in the total situation stood out in a study of seventy years of murder in Canada? [42] The most significant factor was the presence of a suitable weapon—a revolver, a shotgun, a rifle, a hunting knife, a butcher knife, a heavy bottle, or a club. The robbery with violence that results in a killing belongs here by statute in Canada, indicating that lawmakers are aware of the high correlation between available weapon and fatal action. Another important and commonly present factor was alcohol. Canadian husbands, when intoxicated, struck down men whom they suspected of molesting their wives; husbands who wished to kill their wives screwed up their courage with the help of alcohol; men and women were murdered in drunken brawls.

These two factors together outweighed, perhaps, all others. As Thomas Rossler, the bank bandit and murderer, put it, "Whiskey and guns don't mix." [43] Other significant factors have been in-group conflicts—violent family quarrels, quarrels between friends, spite actions within accommodation groups; out-group conflicts—interracial strife, the avenging of damage or insult; actions due to avarice or to great emotional disturbance verging on insanity; and finally insanity itself.

[42] Based on an analysis of the murders described in the Bickerdike Scrapbooks; in the Reports of the Royal Canadian Mounted Police, the British Columbia Provincial Police, and the Vancouver daily papers; and in Duff's *The County Kerchief*, *op. cit.* note 1.

[43] *Report of the Royal Canadian Mounted Police, 1951*, p. 30.

An analysis such as this reveals the difficulty faced by the scientist in this area. Not a single situation described here would constitute a murder in the eyes of large numbers of persons, including court officials and scientists. To them, murder is an action carried out with malice aforethought, the hallmarks of which are planning and an overpowering grudge. But in Canada not only individuals but groups of persons have been hanged for permitting themselves to become involved in the situations documented above. Until recently the now conceded proof of insanity was no sure protection against public execution.

Can the scientist hope to predict the incidence of murder in a Canadian community? The incidence and the location of automobile fatalities have been predicted with dependable accuracy for the city of Vancouver.[44] And murders and automobile accidents show a constant relationship as far as location is concerned. The location of murders for all Canada as a basis for prediction is a much more difficult, if not impossible, project. The provincial police of the province of British Columbia checked up on 326 deaths in 1937.[45] Twelve persons were hanged in Canada in that year—3.6 per cent of the investigated deaths in one of the smaller provinces. The *Vancouver Daily Province* published a file of unsolved local murders and invited testimony with a view to the conviction of the killers. No hangings resulted.

It seems clear that the present incidence of murder is not known in Vancouver, in British Columbia, or in Canada. It seems equally well established that no criminologist can predict the future incidence of murder in an

[44] In a study by Miss Margaret Smith for the Vancouver Town Planning Commission.

[45] *Report of the Provincial Police, 1937* (Victoria, 1938), p. 13.

area until he has determined its present incidence. Thus the contribution of the scientist to description and to prediction is negligible at the moment in Canada.

Does this mean that the scientist can make no contribution to the control of murder in Canada? Absolute knowledge, fortunately, is not essential to a measure of control. It is not known whether convicted Canadian murderers are a representative sample or not; but it is known that they are largely first offenders; [46] and that, in view of the severity of the punishment which they will receive if convicted, witnesses hesitate to testify against them and juries hesitate to find them guilty. Conviction in the case of low-visibility crimes, such as murder, is difficult under the best of conditions. The scientist might well make a contribution which would improve the chances that a murderer who was guilty of this offense would be not only arrested but convicted.

If a more objective approach could be adopted towards the murderer by the public, the press, the police, court officials, prison officials, and parole officers, a clearer picture of this criminal would emerge and it would be possible to determine in general whether he was a good or a bad treatment risk, and specifically what kinds of murderers are good, and what kinds bad, treatment risks. Psychologists, psychiatrists, and social scientists should be of great assistance in such a new operation. There may be sound arguments for the permanent removal from the community of the habitual killer; but the first offender, even in cases where his offense has been murder, merits a more objective handling than he has been receiving.

[46] Thirty out of 32 were first offenders in 1946; 11 out of 18 in 1947; 15 out of 15 in 1942. See Table VII, *Statistics of Criminal and Other Offences* for these and other years.

C. W. Topping, Ph.D., Vancouver, British Columbia, is professor of sociology at the University of British Columbia and a member of the Prison Commission of that province. He was at one time governor of Kingston Gaol, and is a member of the American Prison Association, the Canadian Penal Association, the John Howard Society, and the Elizabeth Fry Society. He is author of Canadian Penal Institutions (1929, 1930, 1943), and co-author of Society Under Analysis (1942) and The Report of the British Columbia Jail Commission (1951).

Murder and the Death Penalty in England

By MAX GRÜNHUT

THE juxtaposition of murder and the death penalty in England, as in any other country, does not necessarily indicate a logical connection between the two phenomena. A penalty prescribed by the law is not always the outcome of a rational assessment of the crime situation and the empirical evidence in respect of the most effective means of prevention and repression. Medical science bases the evaluation of its remedies on clinical experience, but penal policy is a rationalization after the act.

Our traditional penalties, no less than the concept of punishment itself, have deep irrational roots. Throughout history they have played their part in maintaining law and order, though not without considerable losses to the society they were supposed to protect. With a growing social conscience, penalties with the most obnoxious effects were abandoned, and scientific efforts were made in search of new preventive and remedial measures.

However, the extent of this rationalization of penal law varies with the type of offense and the mode of punishment. While retribution has survived only in a symbolic form in any other province of criminal law, capital punishment is a powerful relic of retaliation in kind. There seems to be a resemblance, at least, between the execution of the murderer and the death of the victim.

This fact explains the strong appeal of the inveterate doctrine which regards the death of the murderer as the natural and just consequence of his crime. Its followers would consider the abolition of capital punishment only if they could be convinced that capital punishment is unnecessary for the protection of human life. Those, however, who deprecate the death penalty as a strange anomaly in a rational system of preventive and constructive penal policy would reconcile themselves to its retention only if it could be proved that it is indispensable to stem the otherwise unchecked murderous attacks. This is ultimately a difference in the onus of proof. With a view to this controversy, the present state of opinion on the retention or abolition of capital punishment in England must be discussed in the light of criminological experience.

THE EXTENT OF MURDER

In 1950 the police reported 122 persons, aged one year and over, murdered in England and Wales. While in three of these cases nobody could be detected as the possible perpetrator, the police suspected 109 persons concerned in 119 murder cases. Of these, 38 committed suicide and 71 were prosecuted. Of the latter, 13 were discharged or acquitted, 29 were found insane, and 29 were convicted for murder. Three of the murderers were under 17 years of age and two were expectant mothers, and thus were exempted from capital punishment. Twenty-four were sentenced to death. Of these, 2 were certified insane and removed to a state mental institution, 8 were reprieved and their sentence commuted to life imprisonment, and the remaining 14 were hanged.[1]

[1] *Criminal Statistics for England and Wales, 1950* (London, 1951), p. xxvi. Unless otherwise stated, all the figures in this article are either taken from the official Criminal Statistics for England and Wales, or computed from figures taken from this source.

TABLE 1—HOMICIDE MORTALITY RATES FOR ENGLAND AND WALES

Year	Per Million Population

1940	4
1941	5
1942	6
1943	5
1944	5
1945	7
1946	5
1947	5
1948	5

[a] Rates computed from Decennial Supplement to the Census Report for 1931, Part IV (London, 1947), p. 7, Table 1.

[b] Rates for years 1939–48 taken direct from Registrar General's Statistical Review for 1949, Part I (Medical), p. 38, Table 7.

Criminological data become significant by comparison. A prewar study in the ecology of murder suggests that there are in Europe several zones differing in the intensity of murder criminality. Homicide mortality decreases as one proceeds from the east and southeast to the west and northwest of the Continent.[2]

Homicide mortality rates indicate the number of victims of crime, and for this reason are usually regarded as a most reliable crime index. Under English law, however, this is true only with the reservation that they include as cases of manslaughter the growing number of fatal motorcar accidents due to criminal negligence.

If one turns to criminal statistics and combines the murder rates into groups, it appears that in the first quinquennium of the present century the average annual number of murders known to the police per million of the population was 4.7. This rate remained almost constant at 4.2 between 1905 and 1919, and fell gradually to 3.2 in the decade 1930–39 preceding the Second World War. In the war quinquennium 1940–44 the rate rose again to 3.9, and in the postwar quinquennium 1945–49 to 4.4. The actual rate for 1950 was down to 3.6. The annual averages cover considerable variations. The highest and lowest figures on record during the war were only two years apart. The number of persons murdered known to the police reached its peak of 159 in 1942 and attained its low record of 95 in 1944.

This irregular murder curve must be seen in conjunction with the general trend of crime. Since the end of the last century, when in 1899 the number of crimes known to the police had fallen to the unrivaled low figure of 239 per 100,000 of the population, crime in England has steadily increased to the record figure of 1,209.72 in 1950. Table 2 shows how murder and certain other selected crimes contributed to the significant rise in crime.

Within these fifty years changes may have occurred in the inclination of the public to report cases to the police and in the methods of registration by the police. Taking the figures at their face value, they suggest that crime in England today is five times more frequent than it was half a century ago. This notable rise has even been surpassed by the increase in housebreaking and burglary, which has reached a figure nearly eight times the level of the beginning of the century.

Among the crimes of violence, only rape has increased beyond the mean rate, while wounding today is four times and robbery and extortion are three and a half times more frequent than fifty years ago. Murder, however, is less frequent than it was thirty to fifty years ago. Compared with other crimes, the murder curve seems to be more irregular, with a postwar peak in 1945. However, these irregularities

TABLE 2—SELECTED CRIMES KNOWN TO THE POLICE IN ENGLAND AND WALES
(per million of population)

Annual Average	Murder	Wounding	Rape	Robbery and Extortion	Housebreaking and Burglary
1900–09	4.5	36.5	38.0	8.3	310.8
1910–19	4.2	25.1	44.6	5.3	314.2
1920–29	3.8	22.5	57.2	5.3	482.1
1930–39	3.2	41.0	68.6	8.0	965.7
1940–44	3.9	51.0	95.9	16.2	1,385.9
Actual Figure					
1945	5.1	77.2	127.3	26.4	2,547.2
1946	3.7	70.2	137.0	23.5	2,676.6
1947	4.1	80.4	145.3	25.5	2,583.5
1948	3.9	96.4	160.4	28.1	2,589.9
1949	3.1	98.9	173.0	25.9	2,088.5
1950	3.6	135.7	216.1	29.9	2,433.9

may be due to the small figures concerned, compared with the steady upward tendency in the huge figures for housebreaking and burglary.

Among offenses of violence, rape shows a steady and almost even rise, with a surprisingly steep increase in the last year under observation. While in 1950 the figure for robbery and extortion was the highest on record, the abolition of corporal punishment in 1948 did not hinder a reduction in 1949. For wounding, the steep rise began in the thirties. The general impression, therefore, prevails that the recent increase in murder is a temporary fluctuation within a stable, if not in the long run downward, trend.

A comparison between the curves for murder and suicide seems to confirm the classical doctrine that murder and suicide are mutual substitutes; the year 1942, with an exceptionally high number of 159 murder cases, had the lowest figure for suicides among males for the last fifty years—2,477.[3] However, this time-honored theory has been refuted as a misleading oversimplification. While the fluctuations of the curve of the small figures for murder are indeed difficult to explain, the changing trend of suicides is more dependent on outward conditions. Wartime with its distracting excitements leaves "no time to spare for suicide."[4]

[3] Registrar General's Statistical Review, 1940–1945 (1949), No. 163, 164, p. 243.

TYPES OF MURDERERS

For a complete assessment of the crime situation, the amount of crime must be supplemented by an analysis of its structure. Experience suggests a positive correlation between the frequency of murder and the proportion of murderers acting from acquisitive motives. Countries with a high murder rate have among their many murder cases a large proportion of armed holdups and burglaries.[5] The present evidence from England throws some light on this question.

As a working hypothesis one might classify murder cases into three groups: murder as the expression of a personal conflict, as the outcome of a sudden criminal impulse, and as the result of an acquisitive motive. The first group comprises cases where the offender kills

[4] H. Gruhle, "Jugendselbstmord," 45 *Z. f. Kinderforschung* (1936), pp. 157–202, at p. 163.

[5] H. C. Brearley, *Homicide in the U.S.A.* (Chapel Hill, 1932), p. 81.

his wife, his mistress, or his wife's lover; the second refers to murder from sexual impulse or as the result of a fight; and the last consists of acts committed in the course of a robbery or burglary.

The long-time downward trend in the murder criminality in England manifests itself in the first group. Among the 284 murderers sentenced to death in the decade 1900–1909, 169 or 59.5 per cent had committed the offense in a conflict situation; but of the corresponding (partly estimated) figure of 255 for 1940–49, only 108 or 42.35 per cent belonged to this group.

At the same time, murder from criminal impulse and from acquisitive motive increased both absolutely and proportionately. The total number of murderers sentenced to death increased from 1930–39 to 1940–49 by 29.4 per cent; but while the increase of conflict cases by only 10.2 per cent lagged behind the general rise in murder, acts from criminal impulse rose by 57.4 per cent, and murder for gain rose even by 73.3 per cent.[6] The recent war and postwar peak is therefore due primarily to increased acquisitive crime.

This impression is confirmed by the changing age distribution among men sentenced to death. A comparison of the prewar decade 1930–39 with the war and postwar years 1940–48 shows stable proportions for the intermediate age groups, 24–29 and 30–49, a fall in the number and proportions of men of 50 and over, but an increase from 6.42 per cent to 10.2 per cent of minors between 18 and 21, an age group most probably concerned in robberies and armed burglaries.[7]

[6] Figures computed from Minutes of Evidence taken before the Royal Commission on Capital Punishment, 1–2 (1949), pp. 26–27, Appendix F, Table 2, with kind permission of the Director of Publications, H. M. Stationery Office.

[7] *Ibid.*, pp. 34–35, Table 6A.

Insane murderers

In every country, murderers, among all offenders, show the highest proportion of persons found insane. The natural inhibitions against an onslaught on the life of a fellow man are so strong that their breakdown is often a pathological reaction beyond the individual's control. At the same time, since a murder trial is a question of life or death, the issue of insanity is more often raised and more vigorously pursued.

Under English law, the question of insanity can be considered at three different stages of a murder procedure:[8] (1) Before the trial, a prisoner may be found "unfit to plead" and thus declared "insane on arraignment."[9] (2) If at the trial the defense succeeds with the plea of insanity, the prisoner may be found, in the terms of the Victorian statute, "guilty but insane."[10] (3) When under sentence of death, he may be certified insane as the result of an examination ordered by the Home Secretary.[11] In any of the three cases he is detained in a state mental institution for an indeterminate period.

The proportion of murderers found insane has remained remarkably constant. Their number per 100 persons prosecuted for murder was 44 in the prewar years 1936–38, again 44 in the war years 1939–42, and 45 in the postwar years 1946–50. Most of these insane murderers are duly diagnosed before or during the trial. In the three-year period 1948–50, 51 were found insane on arraignment, 41 guilty but insane, and 6 were certified insane while under sentence of death. This means that 6.4

[8] R. M. Jackson, "A Note on Broadmoor Patients," 11 *Cambridge L. J.* (1951), 57.

[9] Criminal Lunatic Act, 1800; 39 & 40 Geo. III, c. 94.

[10] Trial of Lunatics Act, 1883; 46 & 47 Vict., c. 38.

[11] Criminal Lunatics Act, 1884; 47 & 48 Vict., c. 64.

per cent of murderers were found insane after their conviction.

These conditions are reflected in the composition of the inmates of the State Mental Institution, Broadmoor. In 1949 there were in that institution 419 found insane on arraignment and therefore never convicted after a full trial, 342 found guilty but insane, and 114 other patients certified while under sentence of death or while serving a prison sentence.[12] The majority of insane murderers are diagnosed as suffering from schizophrenia. Of the male population received into this institution during a twenty-year period, 27 per cent were discharged. As a rule, no man has any chance of being released within the first ten years.[13]

Reprieved murderers

In English law, death is the only penalty applicable to the convicted murderer except in the case of minors under 18 years of age or expectant mothers. For all others, the ultimate decision as to life or death lies with the prerogative of mercy. The practice of granting a reprieve shows only slight variations. The percentage of murderers liable to execution who were reprieved was 54 in the prewar period 1936–38, went down to 41 in the war years 1939–42, and rose again to 49 in the postwar period 1946–50.

No reasons are given for the refusal or the granting of a reprieve.[14] It is, however, fair to assume that the reprieved murderers are a positive selection with regard to character and personal motive, and this must be taken into account if one follows up their later careers. In the forty-nine years between 1900 and 1948, of 1,178 murderers under sentence of death, 537 were reprieved. During the same period 418 reprieved murderers, 316 men and 102 women, were released from prison.

The sex rate of 3:1 among released reprieved murderers indicates a lenient practice in respect of women, since the sex rate for murder is 8:1. Seven men and 8 women spent less than a year in prison; 33 men and 49 women served for terms between one and five years.[15] These figures show an even higher rate of women among those released after comparatively short terms of imprisonment.

In 1949, 12 reprieved murderers served their sentence at the Closed Prison Parkhurst, 32 at the Training Prison Wakefield, and 21 at the Open Prison Leyhill.[16] The experience of the Central After-care Association with reprieved murderers after their release from life sentences seems favorable. Of 129 murderers released from prison between 1934 and 1948, 112 had done well when last heard of; the association lost sight of 3, and 14 were reconvicted. Of these 129 murderers discharged to the care of the association, 102 had had no previous convictions.[17]

Compared with a more remote report from Germany, the present English experience indicates a wholesome progress. Of 50 "lifers" received from 1882 to 1912 at the convict prison of Bruchsal in Baden, 15 were discharged. Of these, 7 became maladjusted or dependent. Of 67 "lifers" received between 1899 and 1927 at Waldheim, Saxony, only five were discharged, mostly after long years alternating between prison and mental institution, and out of this small privileged group, three were well adjusted, and one, who had become blind in prison, earned his living as a hawker.[18]

THE DISPUTE ON CAPITAL PUNISHMENT

It is difficult to predict how these facts will affect the outcome of the controversy about the death penalty. The advocates of abolition are able to maintain that, seen in the right proportion, the present murder criminality in England is less menacing than is generally assumed, that the small fraction of actual executions belies the assertion that only death can expiate the guilt of the murderer, and that the experience with reprieved murderers shows that they are far from being a constant danger to society.

To this the adversaries of abolition will reply that if in a time of a spectacular rise in crime the murder curve shows only moderate fluctuations, it would be unwise to abandon a weapon which so far has kept murder at bay, that the small number of executions suggests that only the worst criminals are put to death, and that favorable experience with the positive selection of released reprieved murderers does not imply the same attitude and conduct in all types of murderers.

However, the issue will not be decided by rational arguments alone. Certain intangible factors of a psychological nature may prove more important. The crime situation today, with the rapid increase in the common crimes of housebreaking and burglary, seems to reflect in the domestic field the feeling of insecurity which has become the political fate of the postwar world. It is this unfavorable climate, rather than any empirical evidence in respect of murder, that makes it difficult for public opinion to accept a solution which can be interpreted as an infringement of the armor of the law.

It required the strenuous effort of penal reformers throughout the nineteenth century to reduce the inflated number of capital offenses in the statute book.[19] In 1837, Lord John Russell, a member of Melbourne's government, defined the object of the reform as "taking away capital punishment from all offenses against property, and its continuation in all cases where an atrocious offense was committed against life and person."[20] The Consolidation Acts of 1861 laid down the state of the law as it exists today; that is, capital punishment for murder, treason, setting fire to a King's ship or dockyard,[21] or piracy by an act endangering human life.[22]

Compared with other countries which retain capital punishment for the most serious forms of homicide, or did so up to recent times, in England the range of conduct covered by the threat of the death penalty is very wide. In English law, the concept of murder exceeds the limits of intentional killing, and comprises fatal actions committed with the intention to cause grievous bodily harm, and violent felonious acts causing a person's death. At the same time, the M'Naghten Rules recognize a lack of criminal responsibility for a much more restricted sphere than any other European legal system.

Death penalty suspended and restored

The classic exposition of the case against the death penalty in England is

[19] L. Radzinowicz, *History of Criminal Law*, I, London, 1948.

[20] *Hansard*, III Series, Vol. 38 (1837), p. 912; 19.5.1837.

[21] Dockyards Protection Act, 1772; 12 Geo. III, c. 24.

[22] Piracy Act, 1837; 7 Will. IV and 1 Vict., c. 88.

Roy Calvert's book which first appeared in 1927.[23] Two years later, a Select Committee of the House of Commons was appointed to consider the question of capital punishment in cases tried before civil courts in time of peace. In 1930 the Report of this committee, for which however only 8 out of 14 members accepted responsibility, suggested the abolition of the death penalty for an experimental period of five years. The Criminal Justice Bill of 1938 and the redrafted Criminal Justice Bill of 1947, which brought to an end corporal punishment and penal servitude, left the death penalty untouched apart from a clause which extended the exemption from capital punishment of prisoners under 18 years of age to all offenders who were under the age of 18 years when they committed the offense.[24]

However, the death penalty became the main issue in the parliamentary debate on the bill and in the public discussion of the impending penal reform. In the House of Commons the Home Secretary expressed the view that a time when crimes of violence increased rapidly and more criminals carried arms was not an opportune moment to abolish the death penalty. At the same time he recognized that this was a matter of personal conscience, and therefore the Government left the issue to a free vote of the House; that is, a decision not determined by prescribed party lines.[25]

It was a notable event in the history of capital punishment when on April 14, 1948 the House of Commons voted by 245 to 222 for the suspension of capital punishment for a five-year period.[26] In fairness to the offenders who should not suffer under the inevitable delay till the impending change of the law reached the Statute Book, the Government at once decided to commute thenceforth indiscriminately all death sentences to penal servitude for life. As a matter of administrative practice, there was no capital punishment in England and Wales from April 14 to November 18, 1948.

During the last seven weeks preceding the period of automatic reprieve there were 19 murders; in the first seven weeks after April 14 the number was 25; but in the last seven weeks of the period without death penalty the number was only 17. During the first six weeks after the resumption of hanging, there were 5 executions and 28 murders.[27] Suspension and reintroduction of the death penalty left no visible mark on the murder criminality in England.

In the meantime, a heated exchange of arguments had begun. The *Daily Telegraph* briefed Mass Observation for a survey of public opinion, in the course of which 6,114 persons were interviewed. Of those who had heard of the vote for a five-year suspension, 69 per cent expressed unqualified disapproval and 13 per cent unqualified approval of that proposal. Increasing education seemed to go hand in hand with sympathy for the cause of abolition; 11 per cent of those with elementary, 14 per cent of those with secondary, and 21 per cent of those with higher secondary education were in favor of the proposed suspension. Among the numerous adversaries, the largest group, 40 per cent, gave as their reason the danger for the individual and the community.[28]

On June 2 the House of Lords deleted the clause intended to suspend the death

penalty, by 181 to 21 votes.[29] The Government then tabled a compromise in the House of Commons intended to restrict the use of the death penalty to a specified category of murder. These remaining capital cases were to be limited to murder with express malice, committed under any one of five defined circumstances, namely: in connection with the commission of certain other prescribed crimes including housebreaking and burglary, in the course of resisting arrest, by administration of poison, the murder of a prison officer, and repeated murder.[30] Although even this clause threw the net rather widely, it was assumed that it would reduce the number of executions by at least 55 per cent.[31] On July 15, 1948 the House of Commons accepted this clause, but on July 20 the House of Lords defeated the compromise.[32] On July 30 the Criminal Justice Act received the Royal Assent without any further modification of the law of murder.

Royal Commission on Capital Punishment

After this outcome, it came almost as a surprise when on January 20, 1949 the Prime Minister announced the appointment of a Royal Commission on Capital Punishment. However, the terms of reference were carefully worded, and limited the inquiries to the question "whether liability under criminal law in Great Britain to suffer capital punishment for murder should be limited or modified." Mr. Attlee made it clear that the Commission was deliberately precluded from considering the fundamental issue of abolition, "on which Parliament will, in due course, have to take its decision."[33] The primary object of the Commission seemed to be to investigate, on a broad basis, ways and means of resuming the compromise line of the abortive clause of 1948 with a better prospect of success.

The Royal Commission on Capital Punishment, under the chairmanship of Sir Ernest Gowers, held thirty sessions from August 4, 1949 to February 1, 1951. These sessions were held in public. Verbatim minutes of evidence were published, together with the written memoranda and appendixes submitted to the Commission. This printed material covers 789 foolscap pages. The Report of the Commission is expected to appear before the end of this year.

The Minutes of Evidence bear witness to the thoroughness and scientific interest with which the Commission went to work. In this it exceeds by far the achievement of its predecessor, the Select Committee of 1929, and is a worthy counterpart to the comprehensive studies of the recent Royal Commission on Population.[34] In addition to evidence on personal experience and subjective opinions of many persons concerned with various judicial, administrative, and medical functions in consecutive stages of the procedure in murder cases, the Minutes contain valuable statistical material which otherwise would be almost inaccessible and from which the present paper has drawn repeatedly. The Commission extended its investigations into conditions in other countries, both abolitionist and nonabolitionist. Mr. Justice Frankfurter and

Professor Thorsten Sellin gave evidence in person before the Commission.

Discussion expected

The question whether capital punishment should be abolished or retained is not *sub judice*. Even so, the immense evidence heard and published affects so many aspects of crime and punishment in general, as well as of murder and the death penalty, that a revival of the principal dispute is to be expected once the official report has been published. It is hoped that the renewed public discussion will benefit from the work of the Commission and that the accumulated evidence will help to substitute facts for prejudice, and rational arguments for sentiment. The empirical basis of the controversy needs a good deal of extension and consolidation, but on such a foundation there will still remain the ultimate choice as a matter of high principle.

Lord Templewood, who by his personal work for the Criminal Justice Act, 1948, has done so much to replace obsolete and inexpedient legal sanctions by adequate modes of remedial and preventive treatment, found an admirable expression for the present English case for abolition. He said:

> The savage executions that have disgraced Europe [since 1938] have convinced me that the time has come for us to give a conspicuous example of our detestation of brutal punishment, and to abolish a sentence that cannot reform and does not seem, on the available evidence, to deter.[85]

[85] *Observer*, November 9, 1947. See also Viscount Templewood, *The Shadow of the Gallows*, London, 1951, in which the author presents the case for abolition on a broad empirical basis.

Max Grünhut, M.A. (Oxon), Dr. Jur. (Hamburg), Honorary Professor (Bonn), is Reader in Criminology at the University of Oxford, England. He has served as professor of law at the universities of Jena (1923–27) and Bonn (1928–33). He has been briefed as a special expert by the United Nations, Division of Social Welfare, for studies on probation. He is author of Penal Reform (1948) and co-author of Lawless Youth (1947, 1950).

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

CHEEVER, DANIEL S., and H. FIELD HAVILAND, JR. *American Foreign Policy and the Separation of Powers.* Pp. xii, 244. Cambridge, Mass.: Harvard University Press, 1952. $3.75.

This book tackles the question whether the United States, with its constitutional structure resting on the principle of the separation of powers, can be relied upon to follow disciplined and stable foreign policies. This question is one that troubles all serious students of American diplomacy. They are aware, as these authors are, of the deeply rooted jealousies between the executive and legislative branches of the American government and of the virtual futility to which this unfortunate relationship has from time to time reduced foreign policy during the past. No thoughtful reader will be inclined to take issue with the thesis of this book, which is that sheer survival requires the two branches to cooperate. Nor is the problem a superficial one, to be remedied by a few changes in the administrative machinery. Basic political attitudes, formed back in the Revolutionary period and strengthened by generations of teaching glorifying the system of checks and balances, must be altered.

These authors have done a useful job in analyzing the vast governmental wilderness, the ponderous bureaus and legislative committees and their hordes of "advisers," "assistants," "consultants," and "co-ordinators," from which in some way vital policy decisions emanate. The State Department makes a good whipping-boy for irresponsible politicians, but it only takes the blame for the sins of omission and commission perpetrated by a multitude of governmental agencies. The book at least explodes the simple theory that foreign policy is made by the President or the Secretary of State. It relies heavily upon "bipartisanship," as practiced by the late Senator Vandenberg, for opening a road to permanent collaboration. But it skips lightly over the activities of Senator Taft, does not even attempt to calculate the damage wrought by such episodes as the General MacArthur affair, and is generally oblivious to the influence of minority groups and special interests. It also plays lightly on the follies of personal diplomacy, as practiced by Franklin D. Roosevelt, which led to bitter interdepartmental controversies within the administration. There is nothing to prevent a future president from behaving in the same manner.

The weakest part of the book is to be found in its earlier chapters dealing with American diplomatic history. The authors are not experts in this subject and rely upon the books of a few text writers. Japanese-American rivalry is poorly under-

stood, excessive reliance having been placed on the authority of one book, the scholarship of which is subject to doubt. Thus the legend of Secretary Stimson "leading" the League against Japan in 1931–32, but being "left out on a limb" by the British government, is repeated, although the diplomatic documents, published several years ago, show quite a different account and although several historians have exploded the legend.

These faults to the contrary notwithstanding, the book contains much valuable information and will no doubt make its contribution, insofar as it is read, toward altering basic political attitudes.

RICHARD W. VAN ALSTYNE
University of Southern California

JACKSON, ELMORE. *Meeting of Minds: A Way to Peace Through Mediation.* Pp. xxii, 200. New York: McGraw-Hill Book Company, 1952. $3.50.

This book reviews the history of mediation in industrial disputes in the United States, Great Britain, and Sweden; examines the record of mediation in international disputes under the auspices of the United Nations; and deduces from the experience of industrial mediation principles by which international conflicts can be resolved peaceably. The book's premise is a simple one: international relations are a species of human relations, hence the protagonists of social conflict and international conflict, however different may be their respective stakes and strategies, are linked by "the common core of humanity." Though Mr. Jackson acknowledges the "obvious and striking" dissimilarities in the conduct of labor-management relations and foreign policy, he insists that the growing awareness of the "public interest" on the part of the international as well as in the national community traces significant psychological and institutional parallels.

The first part of the book consists of three chapters: the first prepared by Mr. Jackson with the assistance of Donald Strauss, the second by Carl Christian Schmidt of the Swedish Royal Social Board, and the third by Sir Frederick W. Leggett, former Chief Industrial Commissioner of Great Britain. The second part summarizes Mr. Jackson's understanding of the nature of international disputes and reviews the general practices developed by United Nations bodies for the purpose of achieving a cease-fire and a settlement. The concluding chapters set forth the similarities and dissimilarities of the two settings—the arenas, respectively, of labor disputes and international strife—and propose for handling international disputes procedures which, the author holds, have given good results in both kinds of conflict. An Appendix, compiled by Lois Jane Stone, supplies a summary of provisions for handling of industrial disputes in the Union of Socialist Soviet Republics.

Since the book embodies, aside from the signed contributions noted above, the mature thought, as Mr. Jackson gratefully acknowledges, of a galaxy of prominent U.N. officials, social scientists, and practicing mediators who joined in the inquiry of the Friends Service Committee, it must itself be taken as a true product of a meeting of minds. Notwithstanding the massed authoritative opinion backing this inquiry and the exemplary scholarship displayed by Mr. Jackson and his contributors, the work sheds but a dim light on the nature of international conflict here and now and possible avenues leading toward a settlement.

Mr. Jackson's introductory remark reads as follows: "The United Nations has had a fair measure of success over the past four years in the peaceful settlement of international disputes." The evidence is, to say the least, far from conclusive. The four cases which complete Mr. Jackson's selection of exhibits, namely, the Indonesian, Greek, Palestinian, and Pakistani-Indian disputes, can hardly be classed as success stories of mediation. The Indonesian case was "settled" partly by the geographical distance separating the contenders, partly by the enfeeblement and weariness of the motherland, partly by the direct diplomatic (and mostly secret) pressures of the Great Powers; the Greek case was "settled" by the fortuitous defection of Tito from the Soviet bloc which insulated Greece geographically against Soviet intervention; the Palestinian case was settled by Israeli military superiority over the Arab armies and the overt support given Israel by the leading Great Power; and the "settlement" of the Kashmir dispute was as precarious as it was inconclusive. Mr. Jackson and his distinguished confreres to the contrary, a good case can be made for the contention that U.N. mediation has *never* produced significant results except in disputes over minor issues or between minor powers or as a face-saving device applied to major issues which *had* been settled by shifts in the balance of power. Incidentally, these limiting qualifications on the efficacy of mediation can be shown to apply with equal force to the field of domestic disputes.

One cannot lay this book aside without asking a question which the author does not pose explicitly: Can voluntary resort to mediation resolve the one dispute which endangers universal peace, namely, the contest between the West and the Soviet Union over the balance of power? Mr. Jackson and his two European contributors espouse unqualifiedly the case for *voluntary* mediation of labor disputes and cite in its support the experience of the Western democracies. The appendix on the Soviet Union reveals that Soviet legislation—presumably inspired by the dogmatic assumption of the "classlessness" of Soviet society—neither recognizes the kind of industrial disputes which are the most important topics of mediation in Western countries nor provides for voluntary mediation except in disputes over frills and trifles. Even without this appendix we may surmise that voluntary mediation and totalitarian dictatorship are contradictions in terms. Mediation, relying on the meeting of minds rather than on compulsion, *does* presuppose a common core of humanity. If one party is concerned not with meeting another party half way but with the latter's annihilation, then that "common core" shrinks to the vanishing point.

Though the analogies drawn in *Meeting of Minds* between mediation in labor disputes and mediation in international disputes will be of interest to the practicing statesman, he will not find them as startling as does perhaps the specialist in labor relations. Diplomatic history supplies a long compendium on mediation. Competent diplomats, familiar with, for example, the conferences at Vienna in 1815 and at Berlin in 1878 and with routine diplomacy in most any capital any day, will learn from Mr. Jackson's volume that they have been speaking the prose of voluntary mediation for a long time. Incidentally, there might possibly be a market for a book on how to apply the techniques of traditional diplomacy to the settlement of industrial disputes.

ROBERT STRAUSZ-HUPÉ
University of Pennsylvania

FERRELL, ROBERT H. *Peace in Their Time: The Origins of the Kellogg-Briand Pact.* Pp. x, 293. New Haven: Yale University Press, 1952. $4.00.

This book is the thirty-second volume in a series published under the direction of the Department of History of Yale University on the Kingsley Trust Association Publication Fund. It is an expansion and extension of a doctoral dissertation on the origins of the Kellogg-Briand Pact. As such it affords the reader a comprehensive view of the background and nature of that famous treaty for the renunciation of war as an instrument of national policy. Conspicuous among the authors of this compact are Nicholas Murray Butler, James T. Shotwell, and several advocates of outlawry of war of whom Salmon O. Levinson, John Dewey, the Reverend John Haynes Holmes, Charles Clayton Morrison, and Colonel Raymond Robins were prominent. On page 66 Dr. Butler is credited with planting the idea of renunciation of war in Briand's mind, and on page 68 Dr. Shotwell is quoted as stating that he (Shotwell) "suggested" that M. Briand should "propose renunciation of war as an instrument of national policy" in a treaty "along that line."

Throughout the book one finds a well-documented and well-written account of the reaction of our State Department and the ultimate emergence of the Pact.

W. LEON GODSHALL
Lehigh University

DAVIS, JEROME. *Peace, War and You.* With an introduction by Clarence E. Pickett. Pp. 282. New York: Henry Schuman, 1952. $3.00.

"If man is rational, then the elimination of war is possible."

This is the key sentence in this timely and useful work by a well-known American sociologist, penologist, and journalist. It is simple, the author says. We got rid of dueling. Now is the time to get rid of war. We need only apply the findings of the social sciences to the field of international politics.

The behavior of the Soviet leaders and our own negative reactions "merely raise the scientific question: how can we arouse their friendship and change their behavior patterns?"

Not by opposition alone, the author answers. He cites thirty years of "dismal and ghastly failure in our Russian policy." He omits the period of the Grand Alliance. He was in Russia as a relief worker during the Allied military intervention after World War I. Earlier he had been in charge of all YMCA war work there. Our "negative policy of force and violence . . . actually helped Communism everywhere," he concludes.

"Naturally the social psychologist would also criticize Soviet behavior," he comments, "but two wrongs do not make a right."

In addition to hammering on reform through rationality, along with a firm endorsement of the Golden Rule, the author lines up many of the classic arguments against war including its cost and horror. Moreover, he brings them up to date with examples from Hiroshima and Korea.

While the facts and figures make the book useful for general reference purposes (unfortunately there is no index), it is in the field of current events that *Peace, War and You* might awaken some of the liveliest reader reactions.

For example, the author quotes a letter by no less a person than Sir John Pratt, a British expert on the Far East, which, after recounting some evidence, asserts that no one "can doubt that the Korean war began with an attack upon North Korea launched by Syngman Rhee with the support of his friends in the American Military Advisory Group."

The author offers this British quotation under Hint Number Ten: "Try to keep informed about the point of view now opposite to whatever is dominant in America." This is in a chapter "Hints on Waging Peace." Whether we accept this version of Korea or not, he says, "a balanced opinion takes cognizance of all angles."

The "Hints," which are tailored for individual use by private citizens, come as the last chapter of the book and are advanced as logical how-to-do-it correctives for the ills of national apathy, prejudice, and conceit which are diagnosed in earlier chapters.

The role of the profit motive in causing wars is gingerly dealt with. The "insiders . . . can manufacture a war scare without too much difficulty," the author says. But limiting his charges to what the evidence will support, he neither makes, nor tries to make, a specific case.

Nonetheless, as a solution to the presumedly dangerous drive for profits he suggests the further development of the Rochdale co-operative movement in each country and internationally. He thinks, for example, it would ameliorate the world struggle for oil.

Other institutional developments he favors are: a United States "general staff for peace," limited world government, an enlarged United Nations international economic development program, and universal disarmament.

As the author says, "It is always easier to chart utopia than to build it." Nonetheless there is an earnest Sunday-morning optimism pervading the book which seems entirely warranted by the author's workaday facts and use of them.

JAMES FINUCANE
National Council for Prevention of War
Washington, D. C.

TEW, BRIAN. *International Monetary Co-operation 1945–52*. Pp. 180. London: Hutchinson's University Library (distributed in the U. S. by Longmans, Green and Co.), 1952. Text $1.80; trade $2.25.

This small volume, a lucid exposition of intergovernmental collaboration (including supranational action) in the monetary field, should be a useful manual to those who seek information on recent activities in that field. The reader does not need to be versed in the technical aspects of international finance, although some knowledge of economic theory and policy will assist in the full understanding of the study.

The first part of the volume deals with general principles of international monetary co-operation (intercountry payments, exchange rates, international liquidity, international disequilibria, and the international transmission of depressions). The second part contains a discussion of the machinery of intergovernmental monetary co-operation, and pays particular attention to the operation of the International Monetary Fund and of the European Payments Union. This part also considers the history and structure of the Sterling Area. The third part deals with developments in the monetary field after the Second World War, and analyzes important aspects of the problem generally referred to as "the dollar gap."

The book gives evidence that, in the design of a rationally organized community of nations, the segment of financial co-operation is as important as it is complex. In this connection, the author shows that the establishment of the International Monetary Fund was a forward step of considerable extent in international relations.

The presentation of such intricate matter in such short space is very successful. However, a technical point, which seems to this reviewer somewhat obscure, may be indicated here. In discussing the obligation of members of the International Monetary Fund to refrain from imposing restrictions on the making of payments and transfers, the author refers (p. 81) to a "legal" interpretation of the term "transfers" which implies that a member need not "make its currency . . . transferable as between one foreigner and another." It would have been useful if the author had cited the source of such a legal interpretation and had analyzed it more in detail, especially since the author proceeds to conclude (pp. 81–82) "that no member need repatriate his currency unless he is eligible to exercise purchase rights against the Fund." This conclusion is based on the provision of the Agreement of the International Monetary Fund which requires its members to convert balances held by other members (Article VIII, Section 4). Before drawing that conclusion, Professor Tew might have considered the obligation of Fund members to convert at par value rates in their markets currency acquired in current transactions. That obligation is not dependent upon the eligibility of drawing on the Fund resources (Article IV, Sections 3 and 4(b) of the Fund Agreement). This point (though important for the specialist) is of little weight if viewed in the perspective of the many lucid explanations of involved problems.

The volume is recommended as a useful survey both to specialists and laymen.

ERVIN HEXNER
Washington, D. C.

CARR, EDWARD HALLETT. *German-Soviet Relations Between the Two World Wars, 1919–1939*. Pp. ix, 146. Baltimore: The Johns Hopkins Press, 1951. $3.00.

"During the past two centuries," Mr. Carr reminds us, "German-Russian relations have been a key-point in the international politics of the European continent." A year and a half after these Albert Shaw Lectures were given, relations between these countries are still a key point not only in European politics, but in the narrow dividing line between cold war and total war.

Mr. Carr also reminds us at the beginning of this brief, clear, and altogether excellent account of German-Russian relations during the long armistice, that ever since Frederick the Great many Germans have believed that things go well with Germany so long as Russia is kept friendly or neutral and that things go badly, as in 1914–18 and 1941–45, when rulers of the Reich have ignored Frederick's advice to "cultivate the friendship of these barbarians." Even after Russia had been transformed by revolution, Germans both of the Right and the Left acknowledged the importance of "the Russian-German bridge." Some Germans wanted a Left bridge between a revolutionary Germany and a revolutionary Russia; some wanted a Right bridge between a nationalist Germany and

a "restored" Russia. The Russian Communists also wanted a bridge and, in fact, worked on two bridges at the same time, encouraging German revolutionists to wage war against nationalist elements while negotiating with those same elements political, economic, and secret rearmaments.

A dozen years later the Communists worked as relentlessly as the Nazis to destroy the Weimar Republic. Mr. Carr believes that even if the Communists, instead of attacking the middle-of-the-road parties, had made a common front against the Nazis, the outcome would have been the same, except that Hitler probably would have resorted to illegal measures sooner than he did. We do not know yet, Mr. Carr says, just why Hitler ended the Rapallo policy in 1934 contrary to the wishes of his generals and in spite of Soviet conciliatory assurances that the Communists would not let their anti-Nazi feelings dictate their policy.

Stalin made his famous pact with Hitler in 1939, Mr. Carr believes, to prevent at all costs a combination of capitalist states against Russia; Hitler wanted to avoid a war on two fronts. Three years later Hitler repeated Kaiser Wilhelm's blunder and the Russian-German bridge was broken. Will postwar German leaders rebuild the bridge? Or have the technological and political revolutions of our time affected the significance of political bridges as well as other kinds? What the Germans decide is of greater concern to Europe and the world now than when Stalin and Hitler made their fateful compact a decade and a half ago.

HAROLD H. FISHER
Stanford University

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

APPLEBY, PAUL H. *Morality and Administration in Democratic Government.* Pp. xv, 261. Baton Rouge: Louisiana State University Press, 1952. $4.00.

This volume is a defense of administration as an agency of social control against the attacks that have been directed against it by law and politics. The morality of administration is equated with the purposes which administration endeavors to advance in a democratic society. In essence, its morality is the public interest, and the author accepts Dewey's definition of the public as expounded in *The Public and Its Problems* (1927). The author, who has a distinguished record of public service, is critical of the relation of law to the morality of administration, but he seeks a rapprochement between administration and a reformed party politics. He recognizes the interaction of administration and politics, and the fundamental subordination of administration to politics. The moral delinquencies of administration are in its tendency to respond too much to the claims of highly organized private interests, or special publics, and not enough to the public interest, or the inchoate majority public. The difficulty is that special interests control political parties and because of the virtual absence of party responsibility the special interests are in a position to control administration, which is not in a position to protect itself from the perversions of politics. The technical key to the ability of administration to function effectively in the public interest is its organization on the principle of hierarchy. The author places Congress at the top of the pyramid, but he criticizes the inability of Congress to function within an ordered concept of its responsibilities as a branch of government.

The material on the utility and functioning of the hierarchy is a solid achievement. Beyond this, there is much that is debatable. The pluralism of an earlier decade is inadequate today as a foundation for a science of social action. To say that "public morality" is ethically superior to "private morality" is to say only that the public interest is supreme, but this does not help identify that interest, and the author does not point to any special craft of administrators in this matter. The author is critical of law (really of the tenets of analytical jurisprudence), but law is in a position to protect its ideals and its craft from the perversions of politics. The ideals that are listed as constituting the morality of administration are also to be found in juristic theory as the end of law.

NATHAN D. GRUNDSTEIN
Wayne University

FLECHTHEIM, OSSIP K. (Ed.). *Fundamentals of Political Science.* Pp. vii, 587. New York: The Ronald Press Company, 1952. $5.50.

In American colleges, there is a sharp division of practice in shaping the introductory course in government. In some institutions, perhaps the majority, the basic course in American government serves as the introduction. In others, a general treatment of the nature and scope of political science is prevalent. (In some curricula, either avenue is open to the student or to his advisers.) This volume, edited by a professor in the department of history and government at Colby College, is designed to fit the text requirements of the generalized introduction.

Eight authors, including the editor, contribute under their own names to various sections of the symposium. This arrangement brings to the volume differences of style and emphasis. Authors co-operating under the general editorship are Robert J. Koblitz, Bard College; Norman D. Palmer, University of Pennsylvania; Lawrence L. Pelletier, Bowdoin College; Ithiel de Sola Pool, Stanford University; S. Grover Rich, Jr., University of Utah; George Schueller, Radio Free Europe; and Margaret Spahr, Hunter College.

With competence and with some literary skill the writers deal with the characteristics of political science, with the history of political theory, with the elements and the constitution of the state, with public opinion and political parties, with the structure and powers of government, and with international law and relations. Valuable comparative data are assembled from governmental forms and political behavior throughout the world, with particular attention to the United States, Britain, France, Germany, and the Soviet Union. This treatment is not a new approach to political science, but it is modern and educationally important.

FRANKLIN L. BURDETTE
University of Maryland

BAILEY, STEPHEN K., and HOWARD D. SAMUEL. *Congress at Work.* Pp. x, 502. New York: Henry Holt and Company, 1952. $3.50.

It is gratifying to find more and more attention paid to our legislative bodies by competent scholars who do not live in ivory towers. *Congress at Work,* as the title indicates, is truly the story of a functioning legislature. By means of a score of cases, rather than a connected treatise, congressional procedure is so explained that Congress comes to life as a dynamic human institution.

The story of the enactment of specific bills is not a description of formal procedural steps that follow one another in accordance with the letter of established rules. It illustrates rather, through the careful selection of bills, all kinds of Parliamentary situations and decisive factors, not always based on the merits of the substantive legislation by which one course of action is followed rather than another. For example, a vivid description is given of how the Emergency Banking Act of 1933 became law in less than eight hours from the introduction of the bill to the affixing of President Roosevelt's signature. More often, however, the case illustrates the varied factors, situations, and procedures that operate in the legislative process stretched out over many years.

In one case the driving force of a Norris, the "Father of TVA," in another the unprecedented power of a committee chairman is the center of the story. This is one study of Congress in which the committee system receives the attention that is requisite to an adequate understanding of how Congress operates, although in most of the cases the specific role of the chairman of the relevant committee could well have received more intensive examination. At this writing, there is much speculation as to how much aid and comfort Southern political leaders will offer Republican candidate Eisenhower—for these leaders do realize that a Republican presidential victory in 1952 is, more likely than not, to carry with it a Republican Congress. Many powerful Southern members from "one-party" states who have rolled up long tenure records, would then topple from

their thrones as chairmen of Congressional committees.

A distinct contribution of the Congressional Legislative Reorganization Act of 1946 was its recognition of the need for additional professional staff. Central figures in the story of *Congress at Work* are the professional staff attached to committees and rank and file members. At the very least, the professional personnel make significant contributions to the orderly transaction of business—and not infrequently are influential in affecting decisions of policy.

Throughout the volume ample evidence is given of the attention members of Congress pay to the political and other constituent problems of the folks back home. In a chapter devoted to the election campaigns of Senator Lehman of urban New York, of Representative Ayres from a politically balanced constituency of Ohio, and of Representative Frank E. Smith from a rural district of Mississippi the reader sees different patterns of grass-root influences at work in which crucial decisions and novel techniques spell the difference between success or failure in close elections. The offices of these three members of Congress come to life as the authors take the reader through a day of their work. The pressures are there in all three cases though the patterns are sure to vary—the character of the legislator's constituency the all-important factor.

Although the activities of pressure groups and lobbies are everywhere in evidence, legislative-executive relationships are recognized, too, as important in a comprehensive discussion of the legislative process. The Truman Committee emerges as one of the best investigatory committees. To round out the picture of *Congress at Work*, an early chapter is devoted to the first week of a Congress and another to the closing week of that famous Eightieth Congress.

In 1950, Professor Bailey gave us a real feel of Congress at work in his excellent *Congress Makes a Law*, the story of the Employment Act of 1946. In this broader study, he and his colleague have made a splendid contribution to the presentation of free government by enhancing the public's understanding of their Congress, and in providing an exciting volume for students of the legislative process.

BELLE ZELLER

Brooklyn College

MCGOVNEY, DUDLEY O. *The American Suffrage Medley*. Pp. vii, 201. Chicago: University of Chicago Press, 1949. $4.50.

This little book by a former Professor of Law, now deceased, carries the subtitle: The Need for a National Uniform Suffrage. The subtitle indicates the central theme of the book. Except for the limitations imposed in the Fifteenth and Nineteenth Amendments against race and sex discrimination, the states are free to determine suffrage qualifications as they see fit. Consequently, wide variations in voting requirements have existed in the past. Many potential voters are still disfranchised in this way.

The wide variations in the percentages of nonvoters from state to state cannot be explained, however, wholly on the ground of legal disqualifications. The small turnout in many southern states, for example, is undoubtedly partly a result of the one-party situation which prevails in that section of the country.

The most serious legal disqualifications still in existence are the literary and educational tests and the poll tax prerequisite. The extent, nature, and purpose of these disqualifications are examined by Professor McGovney with great care. He then turns to the constitution to see to what extent Congress might have power to restrain the states from imposing such disqualifications. It is his judgment that Congress does not have such power. Thus the anti-poll tax bill, if it ever gets over the hurdle of a filibuster, would be declared unconstitutional.

A better approach, he believes, would be the submission of a constitutional amendment which would state in simple positive terms the qualifications for voting in primaries and elections throughout the country. He would include merely an age and a residence requirement with disfranchisement of those who are serving terms for crime or who have been adjudicated unsound of mind. Inasmuch as many states have literary and educational qualifications, he suggests that it might be expedient to include a section either stating an educational qualification or giving Congress power to enact such legislation.

Obviously, Congress is not likely to submit an amendment of this kind in the near future. Should Congress decide to do so a more flexible amendment than the one proposed by Professor McGovney would be preferable—one that would merely give Congress power to fix uniform suffrage requirements. There is no clear-cut crystalization of public opinion as yet on age, residence, and educational qualifications. Congress should be left free to respond to changes in public attitude on matters of this kind.

BLOUGH, ROY. *The Federal Taxing Process*. Pp. x, 506. New York: Prentice-Hall, 1952. $5.00.

This is one of the half dozen most valuable books in the field of public finance that have appeared in the past quarter century, or even longer. Only Dr. Blough could have written it, since it is the fruit not only of thorough fiscal scholarship but also of his eight years as director of the Treasury Division of Tax Research and his current position as a member of the Council of Economic Advisors to the President.

The Federal Taxing Process covers two subjects—(1) a description of the agencies and procedures involved in the passage of federal tax legislation and the administration of federal tax laws, and (2) an analysis of the principal issues (that is, fields of controversy) that have developed in connection with federal taxation during the past two decades.

To most readers the descriptive portions of Dr. Blough's book will be the most interesting, because here, for the first time, is presented a comprehensive "inside" picture of the infinitely complex procedure whereby an interlocking group of Treasury and Congressional agencies initiate and develop a tax "program." This is a "primary" presentation, for the greater part of it is derived from Dr. Blough's long and intimate participation in the federal tax-making process. Evaluation is closely intermingled with description through these sections of the book. Under the circumstances, evaluation involves much personal judgment. But personal judgment, in Dr. Blough's case, is detached and rational, consistently free of personal bias. The wisdom, witlessness, and self-seeking that characterize federal tax formulation, like any other field of legislative procedure, are clinically portrayed and objectively analyzed. No individual, no group, no agency is dogmatically praised or condemned.

In his analysis of major federal tax issues, Dr. Blough does not cultivate new ground, as he does when describing tax formulation and administration procedures. All of these issues have been argued pro, or con, or pro and con by many other writers. Dr. Blough's contribution here is three-fold: (1) He classifies and tabulates several score points of issue associated with over-all federal budgetary policy or with specific federal taxes. (2) He analyzes pro and con arguments of each point at issue in the light of their economic, social and political assumptions. (3) He traces the part each of these issues has played in federal tax history during the past twenty years. Dr. Blough refrains from taking sides on most of these issues; when he does, as he does in favor of "making the best possible use of compensatory budget policy," he scrupulously announces his personal position.

Special commendation must be accorded to the writing style. It is beautifully lucid. Sentences are short. Chapters are organized into sections and subsections, with introductory chapter and section paragraphs which effectively summarize or introduce the topics to come. Here is a wealth of material that will be welcomed by students of public finance and government, written without complexity or confusion.

JANEWAY, ELIOT. *The Struggle for Survival: A Chronicle of Economic Mobilization in World War II*. Vol. 53 in "The Chronicles of America" series. Pp. v, 382. New Haven: Yale University

Press, 1951. Trade $5.00; subscription $6.00; text $2.50.

There have been so many memoirs about how World War II was fought and won and a sufficiently large number of official histories to supply the data, that Mr. Eliot Janeway makes no effort to include this in his own striking work. Even so, one might complain that the bare bones of an accomplishment like that of economic mobilization in World War II, in terms of the sheer power and volume of the effort, are needed as a framework of the political analysis that is the essence of this book. The struggle for survival seems to be limited to a struggle for power among leading figures on our home front. It does not chronicle the nation's accomplishment, which seems to have occurred almost in spite of Roosevelt and his warring puppets.

Students of politics in particular can be grateful for Mr. Janeway's "inside" story of the nature of the struggle for power in this world of political maneuver. It is essentially a Machiavellian analysis, and his hero, Roosevelt, emerges as an intensely Machiavellian character. To write of leadership only in these terms is interesting to the professional of politics, but it may well miss the essential characteristic of leadership that cannot be boiled down to mere maneuvers for power. There has to be some lift in any "Prince" in the Machiavellian tradition, or a Cesare Borgia becomes merely a figure of scorn—as Machavelli's hero did in fact.

Eliot Janeway, starting from Machiavelli, naturally awards the palm to the hard-boiled. His heroes are Baruch and Eberstadt; though he has a great admiration for Frankfurter, who represents the opposite side in the field. However the picture is much more complicated in personal relations than even Mr. Janeway's excellent sources have indicated to him. The inner combinations and permutations betwen Henry Wallace and the allies of the Left cannot be reduced to the simple picture that emerges here. One would also get very little impression of the machinations of the Communist-controlled groups like those that are emerging in the investigations of the postwar years. Their crucial influence, *after* the attack on Russia, was on the side of more production at all costs. But the play of *where* the goods went is of some importance, and what theaters were played up.

If there is a hero, it is the very hero that Mr. Janeway finds it unnecessary to sing. By his own analysis, whatever war mobilization occurred in terms of really successful volume production occurred in spite of Roosevelt's organizational juggling, rather than because of it. The patience of Donald Nelson and his real economic insight and breadth are condemned or forgotten because, forsooth, Nelson was a "weak" man in terms of Janeway's analysis. The fact is, however, that Nelson rode out substantially the whole war and remained in control in a bitterly contested struggle with Baruch and Eberstadt and finally came crashing only when his job had been substantially done. The unsung heroes of production were actually, of course, the great business organizations which turned out the products, in spite of every type of fumbling of controls. The patient labors of staff men and others to make sense of the organizational nightmare which Roosevelt had imposed upon the scheme in the interests of checks and balances and his own political controls, too, might get some mention. But this is not the stuff of highlighted drama and conflict.

It is not a struggle for national survival, in short, that Mr. Janeway chronicles. It is a personal struggle for dynastic power, and one on which he takes sides in what may seem to more cautious historians a somewhat reckless way. My own sympathies happen to be in the main like those of Mr. Janeway, so far as admiration for Baruch and Eberstadt go. But that does not preclude me as an intimate participant of much of what he chronicles from recognizing the virtues of others in the dramatis personae. Everyone is entitled to his preferences. But a historian interested in the most whole truth that he can achieve ought to attempt at least to balance accounts and not to seem omniscient when no one can really know the facts. Mr. Janeway's book may be livelier for the sacrifice of balance in favor of dash.

MCCANN, FRANKLIN T. *The English Discovery of America to 1585.* Pp. xiv, 246. New York: King's Crown Press, 1952. $3.50.

This book is much more than a discussion of early English voyages to America. By "discovery" the author means the intellectual as well as the physical discovery of America—the realization by Englishmen of the existence and significance of a vast new land across the Atlantic. That the discovery, in an intellectual sense, was a consummation of a long period of years is made abundantly clear by the author. As to this, it may appear to some readers that the author devotes too much space to medieval and early modern notions of the earth and universe that have only remote relevance to his main theme. Taking the book in its entirety, however, this extensive background material appears logical and essential; it serves to provide setting for and to give meaning to much that was done and left undone in the New World by sixteenth century Englishmen.

As the story unfolds, there is, among other matters, a consideration of how the concept of a three-part world was expanded into one of a four-part world; of the role of the astrolabe, compass, and portolano; of the belief that gold was a product of the hottest rays of the sun and therefore was to be found in quantity only in equatorial areas; and of the conviction long held that the torrid and frigid zones were uninhabitable. These last two concepts seem to have served as a deterrent to English interest in North America; and when Frobisher's "gold," carried from Baffin Island, proved to be only so much rock, the equatorial theory of gold was strengthened.

In rounding out his narrative, the author has included helpful accounts of the search for northeast and northwest passages and of how America was for long regarded mainly as an obstacle on the road to the riches of the East.

Real and imaginative literature relating to the New World is treated at length, especially Brant's *Narrenschiff*, Barclay's *The Ship of Fools*, More's *Utopia*, and writings and compilations by Peter Martyr, Richard Eden, and the Hakluyts. Marlowe's *Tamburlaine* is presented as a climax to nearly a century of English hesitation regarding the New World and as an indication that henceforth a positive course is to be set.

Of significance to geography, history, and literature, *The English Discovery of America to 1585* is an admirable example of how different disciplines can be drawn upon and synthesized in the interest of a richer scholarship.

Washington, D. C.

BRYAN, WILLIAM ALFRED. *George Washington in American Literature, 1775–1865.* Pp. xiii, 280. New York: Columbia University Press, 1952. $4.00.

The problem of the actual versus the mythical Washington is not a new one for historians. Only in recent years has the "true" Washington begun to emerge from the work of historians from Henry Cabot Lodge to Douglas Southall Freeman. The godlike remoteness and formality of the Stuart portraits and the Marshall life vied with the informal prudery of Parson Weems for a century to prevent Americans from knowing their first President, the leader of the Continental Army, or the Virginia planter.

The present study is a contribution to the other side of the problem: to an understanding of the mythical rather than of the real Washington. Myth is as vital an element in a culture as is fact, and often it has greater influence. Dixon Wecter some years ago defined the problem in *The Hero in America* as a deliberate effort on the part of a people to create its own national mythology. Dr. Bryan has accepted the terms of this definition and has filled in the story with generous documentation. He concentrates on the word portraits of Washington that together created a national symbol.

The task was not as exciting as it sounds. The nature of the evidence made it forbidding by sheer bulk and monotony. Thousands of poems, plays, novels, orations, biographies, and miscellaneous works have dealt in some way with Washington,

but a reading of the first hundred established certain conclusions which subsequent source hunting is not likely to challenge. Dr. Bryan wisely limited his field to the period prior to Lincoln's death (when the rival Lincoln myth began) and stopped his work in each section of the study when the law of diminishing returns set in. No one need do the job any more thoroughly than it has here been done.

The "literature" under consideration was disappointing also. The creation of the Washington myth was not the act of a vigorous and romantic national imagination. With a few exceptions, the major American writers did not turn to the father of their country for inspiration because the hard shell of reverence closed in almost immediately when the man died, and a free imaginative treatment of the symbol became impossible. Freneau, Cooper, and Dunlap tried various mixtures of fact and myth with partial success but the results were not too happy. Minor writers swarmed in like flies in summer and by sheer repetition fixed the image forever. In this conscientious and intelligent arrangement and examination of these writings by the literary types into which they fall, Dr. Bryan has left a satisfactory and documented record of the case.

CAEMMERER, H. PAUL. *The Life of Pierre Charles L'Enfant, Planner of the City Beautiful, the City of Washington.* Pp. xxvi, 480. Washington: National Republic Publishing Co., 1950. $10.00.

Dr. Caemmerer, Secretary of the National Commission of Fine Arts, author of several books on the history of Washington, prepared this biography of the "architect-engineer" for the recent sesquicentennial of the city. Original research in France enables Dr. Caemmerer to assert that L'Enfant was neither architect nor engineer when, at the age of twenty-two, he joined the band of thirty French officers who offered their swords to Washington's revolutionary army. L'Enfant had studied at the Royal Academy of Painting and Sculpture under his father, a "court painter" who drew chiefly cartoons of battle scenes for the Gobelin tapestry works.

L'Enfant was at Valley Forge and Savannah. He was "the artist of the Revolution." He sketched Washington for Lafayette; Washington commissioned him to design the medallion for the Society of the Cincinnati (he chose "the bald eagle, which is peculiar to this continent"); he staged patriotic parades and pageants; Hamilton turned to him to design the first national coins. He was therefore in a position to receive favor for his petition to Washington to plan the capital city "on such a scale as to leave room for that aggrandisement and embellishment which the increase in the wealth of the Nation will permit it to pursue at any period however remote."

Washington as chief executive had his troubles with "Mons. Lenfang," whose talents he clearly respected, but whom he could not break to harness. Washington tried in vain to get L'Enfant to deal with the Commissioners in charge: he sent Jefferson, as Secretary of State, a draft of a stiff letter to L'Enfant, to get Jefferson's judgment whether he dared to push L'Enfant so hard without alienating him. L'Enfant tore down a wall of a dwelling built by Daniel Carroll, largest and most resistant of the local property owners, as though it were an obtruding rock or tree, because it encroached upon the line of a proposed avenue; Washington tried to make L'Enfant understand that the new United States proposed to resort to processes of law in such cases.

Alas, L'Enfant suffered the fate of many planners. Washington felt forced to dismiss him as an impractical idealist. L'Enfant pleaded in vain with Washington and the Commissioners not to auction off lots from a map and stakes in the ground in order to raise cash for civic improvements, but to hold the land and borrow against it, so as to curb speculation and capture the increment for the nation. The endless "memorials" that L'Enfant poured upon the President in broken English must have been trying; they are reproduced in full in this volume.

L'Enfant died penniless, protected by a branch of the Carroll family, having spent

years memorializing Congress for just recognition for his part in the plan. Men associated with him carried his planning principles to Buffalo, Detroit, Indianapolis.

I had hoped for more evidence of Jefferson's contribution to the plan of the capital and more than one reference to Benjamin Banneker in this loosely-written book. In sum, the author can only characterize L'Enfant's plan as a "stroke of genius." From what we know of his background and personality, perhaps that is what it was.

CHARLES S. ASCHER
Brooklyn College

ROOSEVELT, THEODORE. *The Letters of Theodore Roosevelt.* Vols. V and VI: *The Big Stick, 1905–1909.* Edited by Elting E. Morison. Pp. xxiv, 864; viii, 865–1715. Cambridge, Mass.: Harvard University Press, 1952. $20.00 for 2 vols.

This is the third two-volume set of Theodore Roosevelt's letters to appear under the editorship of Morison and his associates. The fourth and final set will bring us *The Days of Armageddon, 1910–1919.* The exceptionally high standard that characterized the editing in the earlier sets has been maintained in these, *The Big Stick*, volumes. Although the letters in this set include less than 8 per cent of those available for the four-year period, the care and skill with which they were selected result in a letter picture of Roosevelt hardly less complete than would have been obtained by publication of all the letters. Professor Morison's interpretative essay is richly rewarding, and the notes are invaluable to the scholar and most helpful guides to the general reader.

The volumes contain letters on all the significant issues of the day—the Panama Canal, labor relations, pure food legislation, railroad problems, the tariff, conservation, the Navy, Japanese exclusion, and so on. And there are letters, many of them, in which he characterized men. William Randolph Hearst is often "of real use in attacking abuses," but "he preaches the gospel of envy, hatred and unrest" (pp. 468–469). William Jennings Bryan is "shallow, but he is kindly and well-meaning, and singularly free from rancor" (p. 339). He rather liked the Kaiser, William II, but he feared the possible effect of one of his brain storms. The Churchills he did not like, neither Lord Randolph nor his son and biographer Winston, although he longed to duplicate Winston's African hunt. Liberal writers like Lincoln Steffens and Norman Hapgood he viewed with mixed feelings. "I think Steffens ought to put more sky in his landscape," he wrote. "It is an unfortunate thing to encourage people to believe that all crimes are connected with business, and that the crime of graft is the only crime" (p. 45).

There are letters on or about judges, ambassadors, books and authors (many of these), race suicide, simplified spelling, sports, and why he did not "settle the Mormon question." Nearly all of them are interesting and most of them contain good common sense. His prejudices of the earlier years remained—against Jefferson, for example—and he still had complete assurance that he know what was right and what was wrong, and acted accordingly.

As he came to rely more and more upon William Howard Taft as a member of his executive team he developed for him a genuine affection. He picked the "big, generous, high-minded fellow" (p. 1231) as his successor, and on March 3, 1909, he gave him this "closing legacy": "Under no circumstances divide the battleship fleet between the Atlantic and Pacific Oceans prior to the finishing of the Panama Canal."

CLAUDIUS O. JOHNSON
State College of Washington

CAHILL, FRED V., JR. *Judicial Legislation: A Study in American Legal Theory.* Pp. ix, 164. New York: The Ronald Press Company, 1952. $4.00.

One of the liveliest and most important intellectual controversies of our times has been between the traditionalists and the realists in the realm of legal theory. And one of the major issues at stake in this controversy has revolved around the question of what judges do or should do. More specifically, the question has been: do judges legislate, and, if so, should they? The principal arguments of the main protagonists in this debate are summarized in this learned and lucid book by Professor Fred

V. Cahill, Jr., of the Political Science Department at Yale University. Those who are already thoroughly immersed in the literature of contemporary legal theory may find little new knowledge in this book, and much that is quite familiar. For the uninitiated, for the beginning law or political science student, or for the general reader, this urbane little book will serve as an informative introduction to a large body of significant writing. The various points of view are presented in an orderly fashion showing lines of growth and illustrated with references to the leading books and articles which have dominated legal theory during roughly the past half-century.

The orthodox, traditional view of the nature of the judicial function has been that judges do not make law, but merely discover and apply it. It is essentially negative in character, since it assumes that judges do nothing positively but are merely the impersonal instruments through which the law, as to which they have no value judgments, is applied in the settlement of controversies. This was Blackstone's conception of the judicial power, and Mr. Cahill points out that in the formative days of our constitutional history it was this theory which made judicial review palatable. Thereafter, judicial review and the orthodox theory of the judicial function were linked together, the latter supporting the former. The general social philosophy upon which the traditional theory rested underwent profound erosion with the growth of the concepts of evolution and pragmatism.

A separate chapter is devoted to Justice Oliver Wendell Holmes, who "occupies in great measure the position of official judicial philosopher for the modern age." With his distrust of systems and system-builders, and the natural and universal principles of the eighteenth century, Holmes was the bridge from orthodoxy to modern realism. Holmes thought that law was the will of society's most powerful group, and that therefore law must reflect actual social conditions. Accordingly, he held that law was a growing thing, and that in this growth the judge necessarily has an active role. Thus he frankly recognized, as Cahill points out, that judges make law, and are motivated by the same considerations that move the legislator.

In a broader sense, Professor Cahill demonstrates that the discussions of the problem of judicial review directed attention to the larger subject of the legislative aspects of the judicial function. The enlarged concern with judicial review resulted from the more vigorous wielding of the judicial axe in the age of increasing social and economic legislation, with the invalidation of more and more federal and state laws and the judicial control of administrative boards and commissions. Especially as protectors of established property interests, it became obvious to many observers that the judges held in their hands a legislative weapon of great magnitude. To illustrate this position the author examines briefly the writings of F. G. Goodnow, James B. Thayer, and Felix Frankfurter.

Attention is then directed to the earliest school of the new realism, that of sociological jurisprudence. Here Mr. Cahill summarizes the ideas of three representative figures, Roscoe Pound, Benjamin N. Cardozo, and Harlan Fiske Stone. These and other writers formulated "a general legal theory for the modern state." Believing that the law is a social institution and that its method is pragmatic, they not only stressed the fact that judges legislate, but also thought that they ought to do so.

Now Professor Cahill reaches modern legal realism, which, he emphasizes throughout, is not a coherent and consistent school of thought, but rather is largely a point of view and a slogan. First he reviews some of the earlier realists, with special emphasis upon John Chipman Gray, Joseph W. Bingham, Jr., Arthur F. Bentley, and John Dewey. As for the later realists, the author singles out for extended treatment Karl N. Llewellyn, and among the radicals he concentrates upon Edward S. Robinson, Thurman W. Arnold, Jerome Frank, and Fred Rodell. The author then directs attention to the latter-day criticism of the realists by such men as John Dickinson, Morris R. Cohen, and Roscoe Pound, and shows how the realists attempted to restate their position in the light of the criticism. Mr. Cahill believes that in their restatement the realists gave ground, and he cites Edwin Garlan's book, *Legal Realism and Justice* (1941), as an illustration.

Mr. Cahill does not believe that the realists have as yet supplanted the traditional concept of the judicial function with a new one that has achieved general acceptance. In fact, while the realists seem to agree that law is a social technique, that the legal system is a process concerned with social policy, and that judges do and should legislate, they do not agree as to the scope and quality of their law-making power. Finally, Mr. Cahill believes that one of the basic failures of the new realists lies in the fact that they have not fully explored the relationship between judicial legislation and popular, responsible government. But it is clear that the realists have done much to illuminate the nature of law and of the judicial process, and that Professor Cahill has done much to explain the realists.

DAVID FELLMAN

University of Wisconsin

BERGER, MORROE. *Equality by Statute: Legal Controls over Group Discrimination.* Pp. xiii, 238. New York: Columbia University Press, 1952. $3.25.

Endless are the discussions of problems which can or cannot be solved by the enactment and enforcement of law. The concern of Dr. Berger is with laws enacted to protect minorities against majority discrimination. In this field, the author admits, law can work both ways. "It can sustain discrimination, as it does throughout the South and in some states in the North, or it can sustain equal rights, as it has been doing more and more in the last decade or so" (p. 4).

Antidiscrimination legislation is opposed both on the ground that it interferes with the expression of the majority will, which is a necessary ingredient of democracy, and because, as is alleged, law can be enforced only when it has majority support behind it. Without entering upon an abstract discussion of the rights which are so sacred as to be superior to the right of majority rule, the author attempts to show that antidiscriminatory legislation can and does have some effect in protecting minorities against the cruel impact of prejudice in majority groups.

He traces the history of the struggle over civil rights from the Reconstruction era until the present day. He summarizes Supreme Court decisions on the subject over that period. He shows in particular the changed attitude of the Supreme Court in recent years which has resulted in extended protection to the rights of minority groups. In one chapter he presents in detail the history of the enactment and the enforcement of the New York State law against discrimination. The theoretical aspects of the subject are worked out in a final chapter entitled "Law and the Control of Prejudice and Discrimination."

The conclusions reached are drawn together in part as follows (pp. 192–193): "Law in our society is a formidable means for the elimination of group discrimination and for the establishment of conditions which discourage prejudicial attitudes." Law "can codify our society's loftiest ideals rather than its basest practices—that is, the legal machinery can be withdrawn from the support of discriminatory patterns." Law "can put the state's influence and power on the side of those who are discriminated against and give them effective means for defending themselves. Law can also help establish those fundamental conditions of social life which encourage free association of all groups on a level of equality and which discourage prejudicial attitudes." Favorable laws "can be the wedge for advances in the status and welfare of groups which are made the objects of unfair discrimination. In summary, law can affect our *acts* and, through them, our *beliefs*."

So it is, as the author sees it, that proper legal controls fortify the unprejudiced and the believers in fair play, while weakening the position of those who discriminate for whatever reason. The book constitutes a significant analysis but does not offer, and does not pretend to offer, the final word on the subject.

CARL B. SWISHER

Johns Hopkins University

BROWNELL, EMERY A. *Legal Aid in the United States: A Study of the Avail-*

ability of Lawyers' Services for Persons Unable to Pay Fees. Pp. xxiv, 333. Rochester, N. Y.: The Lawyers Co-operative Publishing Company, 1951. $4.50.

Legal aid is the practical response of the legal profession to the deep-seated desire of the American public for fair play for persons unable to pay fees. In *Legal Aid in the United States,* Emery A. Brownell, Esq. makes a contribution of the first magnitude by charting the way towards fulfillment of the Declaration of Independence that every citizen stands equal before the law.

Since 1947, preparations have been under way for this authoritative, encyclopedic publication. When the Honorable Arthur T. Vanderbilt, as director of the Survey of the Legal Profession, was designated in the latter part of 1947 as Chief Justice of the Supreme Court of New Jersey, it was most fortunate that Reginald Heber Smith, Esq. was available to succeed him. It was Mr. Smith who startled and challenged civic-minded people throughout the United States when, in 1919, he published his thought-provoking book, *Justice and the Poor.* With his sympathetic and broad vision of legal aid, Mr. Smith became the recognized pioneer in publicizing this great movement. Under Mr. Smith, as director of the Survey, and two well-chosen committees of experienced people such as John S. Bradway, Esq., on the civil and the criminal aspects of legal aid, plans were well laid for the report.

Providentially, Mr. Brownell was selected to succeed Mr. Smith as consultant. Mr. Brownell has had years of experience as attorney in charge of the Rochester, New York, legal aid office and as secretary of the National Legal Aid Association. Following the decision of the committees of experts, Mr. Brownell had the energy and capacity to travel well over 40,000 miles to visit 123 legal aid organizations in 103 localities. The draft of his report was revised with the help of the committees of experts and a State consultant in each State.

The report as published under the title, *Legal Aid in the United States,* is worthy of such tremendous and devoted preparations; worthy of the truly great men who dedicated themselves to its establishment. As attorney in charge of the Pittsburgh, Pennsylvania, office for ten years—from 1924 to 1934—I gained personal knowledge of their heroic stature through the privilege of close association with one of them —M. W. Acheson, Jr., Esq.

It is gratifying that their efforts and those of numberless other men and women have continued to attract the active support of leaders of the Bar, as personified by Harrison Tweed, Esq. Much as has been done to extend and expand legal aid service to those in need of it, the coverage throughout the United States is still far from adequate.

Legal Aid in the United States is recommended to everyone who wants the facts, however detailed; who is interested in the brief but substantial history of the legal aid movement; who wants to help in its advance; who is interested in his country and its high principles.

GUSTAV L. SCHRAMM, Judge
Juvenile Court, Pittsburgh

BRINTON, CRANE. *The Anatomy of Revolution.* Pp. xi, 324. New York: Prentice-Hall, 1952. $5.00.

Professor Crane Brinton has revised and reprinted his *The Anatomy of Revolution,* which first appeared in 1938. Like all his books, this, too, shows him as an accomplished writer whose urbane grace and whose wise understanding will be appreciated not only by students of history but by the general reader as well. He analyzes in the present book the English revolution of the seventeenth century, the American and French revolutions of the eighteenth century, and the Russian revolution of the twentieth century, and he tries to point out the parallel developments in those four events. He discusses and compares the old regimes, the first stages of the revolution, the types of revolution, the rule of the moderates, the accession of the extremists, the reigns of terror and virtue, and ends with the Thermidorean reaction, the end of the revolutions.

In all these four revolutions Professor Brinton discovers uniformities and analyzes them. He does not claim to make any great discoveries. Most of the similarities are obvious, but it is good to be reminded of them and thus to gain historical perspective. No event in history is absolutely unique, or as Professor Brinton puts it in his unimitable way: "History is essentially an account of the behavior of men, and if the behavior of men is not subject to any kind of systematizing, this world is even more cockeyed than the seers would have it. You have only to look at a page of Theophrastus or of Chaucer to see that Greeks of more than two thousand years ago and Englishmen of six centuries ago seem in many ways extraordinarily like Americans today."

In one point, however, the Russian revolution seems different from the preceding ones. There seems to have been no Thermidorean end of the revolution yet. After a careful analysis of the trends in Russia for the last fifteen years, Professor Brinton comes to the conclusion that there might be some element in the Russian revolution which will single it out from all previous historical experience, but he doubts it. "At any rate, the issue is clear: If the Russian revolution in its later years follows the pattern of other great revolutions as clearly as it did in its beginnings and in its earlier years, then most Russians will eventually be no madder than the rest of us, and we can communicate with them in our mutual misunderstandings—and flashes of insight; if there really is a new thing in Russia, a totalitarian element that really transforms human beings, we can look forward to more Yezhov periods, more Lysenko's and more Stalin's—permanent revolution indeed."

HANS KOHN
City College of New York

LEE, ALFRED MCCLUNG. *How to Understand Propaganda.* Pp. xii, 281. New York: Rinehart & Company, 1952. $3.00.

This is a probing, well-documented study of the build-up and impact of propaganda as it is used to achieve both good and bad political, economic, and social ends and enhanced sales of products. The author, who is professor of sociology at Brooklyn College, has previously published *The Fine Art of Propaganda* and *The Daily Newspaper.*

Approaching his subject with a free, enquiring mind, Dr. Lee shows no political bias unless a predilection for social action which will improve the lot of the common man can be called a bias. While the methodology he prescribes for detecting propaganda and appraising the motives of its purveyors could be more simply and less repetitiously explained in several of his chapters, he presents as useful and thought-provoking a guide as I have seen.

Dr. Lee was executive director of the Institute for Propaganda Analysis, a unique institution which survived from 1937 to 1941. He defines propaganda analysis as "an effort to substitute a sensible objectivity for emotional acceptance or rejection" of what one reads and hears. Most well-educated persons make this effort in respect to certain subjects or fields, but how many of us are capable of the intellectual self-discipline which rules out all wishful thinking and feeling?

The need for such a book at the moment need hardly be stressed. Witness the psychological warfare that is being waged by both sides in the cold war and the myths and symbols—omnibus words, the author calls them—which we are asked to accept in an election year.

Of special value to the general as well as the academic reader is the chapter entitled "The Pall of Orthodoxy," which covers the creeping monopolistic control of the press and the often allied centralized control of radio and television.

The final chapter, "What Can Individuals Do About Propaganda?" strikes a note of hope. Dr. Lee points out that persons of more than average courage, lone voices, have effectively made themselves heard in modern America. He instances Thorstein Veblen, Charles Beard, Mrs. Vashti McCollum, who carried her case against religious instruction on released time in the public schools to the Supreme Court and won it, and Larry Gara, a Quaker and a conscientious objector.

"We can all," Dr. Lee concludes, "refuse to be stampeded by anyone for any cause. . . . We can stand on our own feet in our thinking and help others to do the same."

DOROTHY DUNBAR BROMLEY
New York City

CHENERY, WILLIAM L. *So It Seemed.* Pp. xi, 300. New York: Harcourt, Brace and Company, 1952. $4.00.

When a famous editor sums up 40 years of experience in American journalism what formula does he follow? Mr. Chenery offers a rather typical answer: first you tell how you happened to get into journalism in the first place, and then you record in chronological fashion what you saw pretty largely in terms of personalities rather than through forces, issues, and movements.

Mr. Chenery applies this autobiographical formula to his own career in American newspaper and magazine editing between 1910 and 1950 in a very pleasant and easy-going fashion. He has no axes to grind; he has no enemies to be exorcised, no friends to be exalted. He recalls the past, as he repeatedly emphasizes, simply as something he witnessed and on occasion reported from the editorial podium.

The history of journalism is replete with the names of editors who entered the profession with a burning desire to achieve some goal. They had a message which they felt the public must read. Not so with Mr. Chenery. His embraced journalism, as a reporter for the Chicago City Press Association, as a temporary means of getting established at something after having considered at some length a career devoted to religious activity.

Once Mr. Chenery became familiar with the smell of printer's ink he never considered changing professions. He enjoyed a succession of editorships, starting with the *Rocky Mountain News* in 1914 and culminating with the editorship of *Collier's* from 1925 through to the end of World War II.

Mr. Chenery's editorial philosophy when he took charge of the *Rocky Mountain News* was: "to make whatever comment seemed fair and interesting on the views of the day." Years later, after achieving success as the editor of *Collier's,* he elaborated slightly: "What the editor can do," he writes, "is to seek consciously a particular audience to adopt definite principles and policies and to present what he has to offer with all the professional skill he possesses or can enlist."

The personalities whose names crowd the pages of Mr. Chenery's recollections are described with candor, clarity, and, in most instances, praise. For example, four entire chapters are devoted to *Collier's* staff writers (Winston Churchill heads the list) who worked under Mr. Chenery's direction. There are also detailed descriptions of William Hayward, Jane Addams, Samuel Insull, George Creel, Frank A. Munsey, Calvin Coolidge, Herbert Hoover, and Franklin D. Roosevelt.

In fairness to Mr. Chenery, one must emphasize that these individuals are related to the news developments which made them subject to editorial treatment. Certain of these events—the fight against Prohibition and the Roosevelt administrations to name two—are treated with great deftness and interest.

Mr. Chenery's preoccupation with what people did and said attests anew the well-known fact that the recording of contemporary affairs by the journalist can be done in no other fashion if he wishes to reach a wide audience.

ECONOMICS AND INDUSTRY

BURNS, ARTHUR F. (Ed.). *Wesley Clair Mitchell, The Economic Scientist.* Pp. ix, 387. New York: National Bureau of Economic Research, 1952. $4.00.

The aim of the book is to emphasize Mitchell as a scientist. The chapters are mostly by friends and admirers, though the editor states that "some effort" was made to include different schools of thought. Much of the material has appeared before. The new parts consist of a eulogy by A. F. Burns and a revealing biographical sketch by Mrs. Mitchell.

Milton Friedman's discussion of "the economic theorist" seems best. It emphasizes Mitchell's cycle theory as being his strongest claim to scientific achievement; but concludes merely that it is possible to construct from, or read into, Mitchell's work an integrated cycle theory (p. 258). One gets the impression that Mitchell himself merely presented thorough, well organized, and thoughtful evidence on cycles.

Schumpeter's eulogy refers to Mitchell as a kindly, moral man who left a survey of work done and a program of work to be done.

A. B. Wolfe's criticism of Mitchell's thought as lacking the guide of "purposive" equilibrium economics seems to hit the mark.

T. W. Hutchison praises Volume I of Mitchell's early work on "Types of Economic Theory" but states that he "noticeably does not succeed in carrying out his institutionalist program in Volume II . . . to anything like the extent he does in Volume I."

Throughout, one finds references to the great influence of two men on Mitchell: *Thorstein Veblen and John Dewey.* He always saw economic phenomena through Veblen's "pecuniary veil." This fact is sufficient to cast doubt on claims to true science. One finds (1) that Mitchell sought an "empirical science"; (2) that he emphasized relativity, holding that each period has a different science as a by-product; (3) that he was a pragmatist; (4) that he favored the experimental approach, saying that "we cannot do anything unless we try to do something"; (5) that accordingly science was regarded by him as a mere method; and (6) that his main underlying interest was in reform.

A follower of Veblen and Dewey, Mitchell visited Hobson, Beveridge, the Webbs, and the Graham Wallases in England, and joined Charles Beard, J. H. Robinson, and A. S. Johnson in founding the New School for Social Research in New York. Certainly he was not scientific by association.

This book clinches the fact that Mitchell was an institutionalist, falling between Veblen and the more planful younger group. His two basic weaknesses as a thinker were: (1) emphasis of behavior as opposed to motives, and (2) overemphasis of differences among different time periods. How could one who so thinks hope to find true cause-and-effect relationships?

LEWIS H. HANEY
New York University

HIGGINS, BENJAMIN. *What Do Economists Know?* Pp. ix, 166. Carlton, Australia: Melbourne University Press, 1951; and New York: Cambridge University Press, 1952. $2.75.

This book states a case for economics as a science and as a profession. Its author argues that economists, regardless of political affiliations, agree substantially on objectives and methods. They are scientists and should preach to convert others to their conclusions. If their field were professionalized, like accountancy and medicine, the public would be protected against charlatans. In a democracy broad decisions should be made by legislatures, but detailed procedures should be left to professional economists. "As long as no other stated objective is involved, the right of the electorate to choose between higher taxes in the upper brackets or appreciation of the currency as a means of checking inflation is no more vital to democracy than their right to decide whether penicillin or sulpha shall be prescribed for septic sore throat," Higgins declares, although this is not a particularly good example for his purpose because the alternatives he mentions would affect differently the distribution of wealth, and individuals who are concerned by this would want to be heard. In general, the argument will give economists assurance in their craft and courage in developing policies by applying it. It should also convince some laymen who are willing to study a closely reasoned book.

The author, while criticizing the maximum satisfaction concept, advocates great equality in distribution. He relies as much on moral revival as on government action to curb exploitation by influential groups. A Keynesian, he believes that continuance of full employment is requisite and that economists know how to ensure it; but his Keynesian emphasis does not prevent his conceding important contributions to economics as a science by other schools, including the Marxists.

As a Canadian professor lecturing in Australia, Higgins takes a more detached view of the current dispute between Western democracy and Russian communism than is usual in the United States. The clash is essentially ideological: neither side

has territorial ambitions, he thinks, although each is willing to fight in defense of its system. Neither allows freedom of expression to those within its borders who oppose its ideology. Even a war victorious to the West is likely to destroy Western democracy. Communism as such cannot be killed by military defeat of Russia, but "if the western world can find a way to maintain a smooth-working economy within a democratic framework," it need have little fear of aggresion from within. There is much truth in this.

EDMUND WHITTAKER
Colorado Agricultural and
Mechanical College

SOULE, GEORGE. *Economic Forces in American History*. Pp. viii, 568. New York: William Sloane Associates, 1952. $4.75.

This is a new textbook in American economic history. There are about ten texts in print, and as many more have come and gone since Katherine Coman wrote the first one in 1905. Every new one brings some improvements. Since more historians than economists write these texts, it is reasonable to expect that a good economist will contribute more new ideas than an equally good historian. George Soule is an economist. He is also a member of the board of the National Bureau of Economic Research, a former editor of the New Republic, the author of a number of books dealing with economic history, and professor at Bennington College.

Whereas most American economic history texts have sought to tell the story from Columbus or Jamestown to the present with some relationship between years and pages, Professor Soule just sketches the colonial period and handles the nineteenth century with considerable dispatch. It is recent economic history that concerns him. Out of 531 pages 310 are devoted to the period since 1900. A good case may be made for this approach. There is more abundant and more reliable statistical data for the twentieth century than for earlier periods. Thus an economist can be at his best in this period. The book may also be an answer to a definite demand in part of the market. Some professors have been looking for: (a) a shorter text, (b) a text emphasizing the modern period, and (c) one containing more national income economics. This text goes far towards satisfying those requirements.

The first two chapters deal with our economic growth before about 1800 and give summaries of the economic topics that will be treated more fully in the next seven chapters. These seven cover the nineteenth century. A second seven chapters stress the same topics in the twentieth century. These are "vertical slices" through history of such subjects as agriculture, manufacturing, finance, and transportation. The last four chapters are the chronological treatment of the same period. This is Professor Soule's way of striking that essential happy medium between the purely topical and the purely chronological approach.

The earlier and more historical sections of the book are the least satisfactory. There are strange omissions. Why include the panic of 1815 and leave out that of 1819 in a list of panics (p. 208)? Why leave out Queen Anne's War in a list of colonial wars (p. 7)? The earlier parts also have most of the errors—for example, most cotton did go directly from southern ports to England; an important minority went via New York (p. 89). The organization is not so good in this portion, and there is a tendency at times to chronicle many facts rather than to dwell on the significance of a select few. The book contains no pictures.

The book has a great many points in its favor. Throughout Professor Soule writes in a judicious tone that is admirable. The economic explanations are generally excellent. Chapter 13 on National Income and its significance in economic history is superb. Professor Soule makes effective use of the National Bureau's findings. The selection of charts and tables, many from the National Bureau, is very good. When he dwells on the significance of the contributions of Eli Whitney (interchangeable parts rather than cotton gin), Oliver Evans, Adam Smith, Herbert Croly, and others he weaves biography and economic history together brilliantly. The basic section since 1900 is of high quality throughout; thus he was eminently successful in his main aim. There is a good up-to-date bibliography and a list of topics for further research by students. Altogether this is an impressive addition to the list of American economic history texts.

DONALD L. KEMMERER
University of Illinois

FLEXNER, ABRAHAM, with the collaboration of ESTHER S. BAILEY. *Funds and Foundations: Their Policies Past and Present*. Pp. xiii, 146. New York: Harper & Brothers, 1952. $2.75.

In 1910 Abraham Flexner's report on *Medical Education in the United States and Canada* was published. Dr. Flexner had visited all the 155 medical schools, and he reported objectively on their curriculums and laboratories and clinical training, their facilities and faculties and student bodies. Within two years one hundred of them had closed their doors and the rest were undergoing basic reorganization. Probably no man in history ever accomplished so much in so short a time, armed with no authority, no power, nothing but facts and the courage and freedom to publish them.

Dr. Flexner's medical education study was made for the Carnegie Foundation for the Advancement of Teaching. In 1913 Dr. Flexner became Assistant Secretary and a member of the General Education Board, and in the years thereafter Rockefeller Foundation agencies contributed upwards of $100 million to set the modern American pattern of medical teaching. Dr. Flexner's imagination and initiative as the first director of the Institute for Advanced Study at Princeton in the 1930's is well known throughout the world.

Out of all this experience come the essays that form the chapters of *Funds and Foundations*, which amply attests that he is not "retired" at eighty-five. *Funds and Foundations* is vigorous and controversial. Dr. Flexner reviews the technique of assistance and philanthropy in a series of selected cases, the Freedman's Bureau, the Peabody Fund, the Rockefeller Foundation, the Carnegie Foundation for the Advancement of Teaching, the Carnegie Corporation, and the Julius Rosenwald Fund. He explores methods, policies, organization, personnel, and objects of expenditures. Persons of influence in the development of philanthropy are discussed and sometimes sharp disagreement is expressed.

Dr. Flexner deplores the trend toward relatively small, individual grants for specific research and other projects. A foundation staff, he feels, is "far too small to study properly the wisdom of the grants" and, moreover, the foundation thereby invades the administrative responsibility of the universities. The proper foundation aim, as Dr. Flexner sees it, is the building of strong, independent, standard-setting institutions, and, if that means in specific cases endowment and building, so be it. His final chapter deals with the neglect of the humanities. "America has been oversold on science," he quotes and urges that modern philanthropy explore more constructively the arts and humanistic fields.

PHILIP S. BROUGHTON
Pittsburgh, Pennsylvania

SLICHTER, SUMNER H. *What's Ahead for American Business*. Pp. 216. Boston: Little, Brown and Company (an Atlantic Monthly Press Book), 1951. $2.75.

Dr. Sumner Slichter's vision of the "foreseeable future" of our economy is interesting chiefly as a stimulant of discussion by one who became a convert to the theory of the dynamic economy rendered dynamic by government intervention through spending, debt, and controls. The author thinks our society is under the influence of a "defense economy" and that what he calls normal underlying economic conditions will return when there is no longer a substantial shortage of all kinds of goods and that this will occur when the outlay on armaments shifts from the present frantic effort to arm to a replacement basis. Then defense expenditures will drop to ten or twenty billions a year in two or three years.

At this point the budget will show a surplus followed by pressures for reduced taxation. Controls of materials will disappear and price controls will languish to a form looser than during World War II. But the country will be committed to the policy of maintaining a high level of employment. As a result, the expenditures

of local, state, and federal governments will be a high fraction of the national product. But the economy will be more stable because government intervention will continue in the form of public works, measures to limit fluctuations in business and to increase the proportion of income distribution on the basis of need, the regulation of industrial relations, controls to raise or lower prices and to regulate the structure of business. There will be continuing intervention in world economy to replace what he calls our *present stop-gap* measures. There will be more welfare. But we are in danger of neither socialism nor the planned economy. Apparently, according to this dispensation, we are destined to slide more or less comfortably from our present frantic war effort into a continuing, government-supervised, -financed, and -regulated economy which somehow escapes the label of "planning."

Thus the book offers a series of headings for lively dispute, but skirts completely the possible dislocations which might ensue from our abnormally swollen debt. After all, Dr. Slichter took his stand, somewhat belatedly, with the Spenders and the Borrowers. One of the consequences of this policy is now with us—a debt of $263 billion which promises to be much larger before it stops growing. A fundamental blemish in this prophetic vision is the failure to appraise the impact of the debt when the borrowing stops. There is no room here to enumerate the possible consequences, but one obvious problem is the economic effect of an interest charge which may be as much as seven or eight billion dollars a year. This will represent the extraction of that much money from expendable income for transfer to capital funds, which will have a precisely opposite effect from that created by the original borrowing that involved a transfer from capital funds to expendable income or the pumping into expendable income of funds created by bank loans.

JOHN T. FLYNN

Bayside, New York

GORDON, ROBERT AARON. *Business Fluctuations.* Pp. xvi, 624. New York: Harper & Brothers, 1952. $5.00.

Because of the preoccupation of economists in the last fifteen years with both the great structural changes in the American economy and the revolution in theory wrought by Keynes, there has not been much general literature on the subject of business cycles in recent years. Professor Gordon's book is to be welcomed for that reason, and especially so because his work deserves the highest praise. Although it is written as a text, his book should be of value to those economists whose interests lie in other fields and who would like to be abreast of the investigations and theories of business fluctuations.

Professor Gordon devotes four chapters to national income analysis, which he handles with unusual clarity. There then follow five chapters on the description of secular changes, the business cycle itself, its phases, and its generation. Here too Professor Gordon must be complimented on his masterful treatment and well-balanced manipulation of the diverse materials. Theories of the business cycle are treated in only two comparatively short chapters, which is perhaps just as well in an undergraduate text. His own approach to the causes of cyclical fluctuations is eclectic; he avoids the attempt, so characteristic of many theorists of the past, to find one cause or group of causes. He does, however, emphasize the role played by the saving-investment processes and the accompanying cycle-generating factors of the economy. Professor Gordon does not agree with those who have argued that the business cycle is obsolete. Instead, his opinion is that despite the greater efficacy of present-day controls and the recent structural changes the business cycle will continue to be a normal feature of the functioning of the economy. Two chapters are devoted to a description of the cyclical behavior of the economy since 1919. Six chapters cover the subjects of forecasting, the international aspects of the cycle, and the problems of the goals and methods of stability.

The book is written in clear and straightforward fashion. The material is not, as is true of so many textbooks, written down. The undergraduate, however, will have to bring to Professor Gordon's book a good grasp of many economic concepts. If fault is to be found, it would be in points of emphasis. Thus, there is insufficient emphasis on monetary policy, although the brief treatment of it is good. The extensive discussion of counter-cyclical fiscal policy does not perhaps take sufficient account of the unavoidable political realities. The national income analysis is disproportionately long. For the student of business administration there is not quite enough material on the impact of the cycle on segments of the economy, on particular industries, and on forecasting for industries and segments.

But if these are faults, they must be counted as very small when weighed against the excellence of Professor Gordon's book. He is to be congratulated.

D. S. WATSON

George Washington University

MAXWELL, JAMES A. *Federal Grants and the Business Cycle.* Pp. xiii, 122. New York: National Bureau of Economic Research, 1952. $2.00.

This volume is the fourth in the series of "Fiscal Studies" issued by the National Bureau of Economic Research. It deals with grants by the federal government to state and local governments, principally from the point of view of their possible and actual use in counteracting business cycles. Mainly because of their fiscal limitations state and local governments in their economic activities behave almost like private businesses, in that their expenditures are expanded in prosperity and contracted in depression. If this tendency is to be corrected part of the activities of state and local governments must be financed by federal grants, which can be expanded in depression and contracted in prosperity. The author reviews succinctly the history of these grants, and gives some appraisal of the possibility of varying them countercyclically. Although the history of these grants stretches back almost to the foundation of the Republic, they did not become large until 1934. From 1919 to 1933 they ranged from $86 to $228 million, and from 1933 to 1949 from $901 to $2,909. About half the grants are now for social welfare; about a quarter for transportation and communication. The main possibility for countercyclical grants lies in public assistance and in public works, and the author gives a careful appraisal of the possibilities in each case, being somewhat optimistic about the first and pessimistic about the second. In the course of the inquiry a number of other interesting problems are touched on, notably a suggestion for the apportionment of federal grants among the states in order to make some compensation for their differences in per capita income. The work is admirably equipped with tables and diagrams. It is a worthy addition to the impressive National Bureau list, both in content and in style.

K. E. BOULDING

University of Michigan

TAX INSTITUTE. *Taxation and Business Concentration.* A Symposium conducted by the Tax Institute, June 15–16, 1950, New York. Pp. viii, 264. Princeton, 1952. $5.00.

In *Taxation and Business Concentration* the Tax Institute upholds its tradition of interesting and useful symposium volumes on controversial subjects in the field of taxation. A large measure of the success of the symposia and the resulting volumes has undoubtedly been due to careful program planning. In the case of *Taxation and Business Concentration,* the important role that planning played is attested to both by the titles of the papers presented, each of them dealing with a significant aspect of the main topic, and by the over-all excellence of the papers.

The introductory paper, "Recent Trends in Industrial Concentration and Taxation" by Professor J. Keith Butters, provides in succinct form essential background material and a conceptual framework for the papers that follow. The next two papers, "Taxation and Large Scale Retailing" by Dean Harold M. Somers and "Concentration in the Tobacco Industry as Affected by Tax Policies" by H. M. Robertson, are particularly well done.

Also worthy of special attention are the papers dealing with the effects on concentration of certain tax-exempt forms of business enterprise—farm co-operatives and government-owned and -financed enter-

prises. Cogent arguments on both sides of each issue are discussed in a stimulating and intelligent fashion. Few will read these papers without gaining fresh insights into these matters.

Despite the general excellence of the papers included, a few shortcomings of the volume may also be noted. At least one important factor contributing to business concentration since the end of World War II—namely, the effect of taxation on mergers of competitive businesses—has been almost entirely neglected. Although a few contributors touch on this matter briefly, for the most part the analysis is confined to the relative burden of taxation on small business as compared with large business.

The last paper in the volume, "The Theory of Business Taxation" by Professor Alfred G. Buehler, President of the Tax Institute, while interesting in itself, fails in some respects to sound the proper concluding note for the papers preceding it. In addition it may be well to forewarn the prospective reader that this symposium, despite its many merits, does not make any major theoretical contribution to the field. The volume does, nevertheless, serve a useful purpose, and it deserves to be widely read.

LEO FISHMAN
West Virginia University

FLOYD, JOE SUMMERS, JR. *Effects of Taxation on Industrial Location.* Pp. xiv, 155. Chapel Hill: The University of North Carolina Press, 1952. $3.00.

This little volume deals with a highly controversial question, and a problem on which countless hours and many thousands of dollars have been spent by legislative bodies, tax officials, corporation executives, chambers of commerce, and other groups.

The question relates to the effect of tax differentials among the various states upon industrial location. The problem, which frequently must be dealt with apart from the controversy, is how to determine the tax differentials. Findings and conclusions of this study are not particularly new or startling, but the book should serve a useful purpose.

Following a critical examination of previous investigations of the relationship between tax conditions and the selection of plant locations, the author concludes that sweeping generalizations concerning the influence of tax differentials on the choice of plant sites should be treated with suspicion. Based on a theoretical analysis set forth in the study, tax considerations have little or no weight in determining the location of certain industries, such as resource-oriented concerns, but tax factors may, under given circumstances, become quite important to other types of concerns. Among the latter, for example, are corporations manufacturing seamless hosiery, furniture, and cigarettes, which industries were selected by Dr. Floyd to illustrate a suggested method for measuring tax differentials.

After discussing some of the basic causes of interlocal tax differentials and setting forth the various methods which might be used to measure such differentials, the author explains, in considerable detail, the manner in which the "hypothetical tax bill" technique was employed in this study.

Tax bills for the three industries were computed at 96 urban and rural sites—selected to show high-, median-, and low-tax locations—in nineteen different states. Apparently all state and local taxes except unemployment contributions were included in the survey. With the inclusion of local property taxes, the author encounters the same obstacles to valid conclusions met by others who previously have attempted similar studies.

The computations, based largely on 1946 data, reveal substantial differentials in the tax loads of identical concerns, both between median-tax sites of different states and between localities within individual states. However, the analysis indicates there are few states in which tax bills are uniformly high or uniformly low for all types of corporations and for both urban and rural sites. Moreover, relatively few generalizations can be made because tax differentials are produced not only by variations in state and local tax systems but also by changes in the balance sheet structure of a corporation, as well as in the rate of return upon property investment. Currently, the magnitude of interlocal tax differentials is considerably reduced with the inclusion of federal taxes in the computations.

Various methods are set forth to reduce tax differentials in order to promote maximum industrial development of the nation, but most of them will not seem very practical except, perhaps, to the extreme optimist.

ARNOLD L. EDMONDS
Pennsylvania State Chamber
of Commerce
Harrisburg, Pennsylvania

HULL, I. HARVEY. *Built of Men: The Story of Indiana Cooperatives.* Pp. xii, 212. New York: Harper & Brothers, 1952. $3.00.

This little book is both a history and a eulogy of agricultural co-operation as it has developed in Indiana. It is written by a man who has had many years' contact with the co-operative movement in that state. Perhaps its main contribution is to illustrate and document the old adage that "the Lord helps them that help themselves." The history of co-operation in Indiana is almost entirely confined to the thirty-year period since 1920. During that period the author claims great progress for farmers and farming conditions in general in Indiana. He credits much of that progress to the work of the co-operative organizations most of which are federated in the Farm Bureau Cooperative Association.

While the story told about co-operation in Indiana is interesting, and doubtless on the whole historically correct, there are some explicit points and other obvious inferences that suggest a strongly favorable bias on the part of the author. The emphasis in the first chapter might even leave the impression that farmers first found themselves in difficulty at the close of World War I. Also, the impression is given that farmers turned to co-operation for the first time in that period. Certainly neither of these two impressions is correct even for Indiana. Having read some of the journal kept by my grandfather who started farming in Indiana in the 1830's I am convinced that there were other periods just as adverse to farming in that state as were the 1920's. Moreover, having watched the growth of the California Fruit Growers Exchange from 1900 I realize that farmers turned to co-operation as a method of self help, at least, a couple of decades earlier than the beginning of Mr. Hull's history.

One very important point that comes out clearly in the book is the emphasis on the inadequacy of small business enterprises to meet present-day business conditions. The co-operative organizations in Indiana in several instances started as small decentralized units handling such farm products as grain or livestock. According to the author it has come to be clearly recognized that a federation of such organizations is much more effective than the individual units. One might almost conclude that in any lines of business that have products to sell outside their immediate locality small concerns are doomed. Actually, however, studies of concentration in American manufacturing business, starting with that made by Willard L. Thorpe in 1924, show that there was very little increase in business concentration between 1890 and 1950. What the co-operative organizations in Indiana and elsewhere have accomplished is to provide the owner of agricultural resources with the same type of centralized sales department, or in some cases purchasing department, as has long been available to many manufacturing industries.

One claim made by the author certainly must be challenged. The statement is made that "while cooperatives are integrating and growing they cannot build a monopoly as that term is ordinarily used since a co-op is owned by the people who use it." Someone said many years ago "cooperation is prima facie wicked. It is an obvious attempt to take advantage either of those from whom you would buy or of those to whom you sell." While this is prima facie possible, it need not be true in specific cases. On the other hand, it may be true. Certainly some co-operatives have taken advantage of those to whom they would sell by restricting output. Even in cases where restriction has not actually occurred the opportunity exists for co-operatives to restrict output, and when purchasing co-operatives become strong enough they can use precisely the same power tools as any other large buying organization. The social evils of oli-

gopoly and oligopsony or even those of monopoly may quite as possibly accrue from agricultural co-operatives as from any other large business enterprise; and I note that Hull argues that only large co-operatives are likely to be successful.

One other point of criticism may be made of this book. Nowhere does it make quite clear to the unversed reader just what the Indiana Farm Bureau Cooperative Association does. Obviously, it is a federation of co-operatives. It seems apparent that many of the federated units carry out their own sales programs, but the degree of autonomy is not made entirely clear. The division of responsibility as between the different local units in diversified areas and the central organization might have been spelled out in a much more informative way.

In the appendix there is a brief statement concerning the major national organizations concerned with the co-operative movement. Thus a thumbnail sketch is given of a much wider field than Indiana.

In conclusion, the author states that "co-operatives in Indiana as throughout the world have grown from economic distress." The assumption seems to be implicit although it is not spelled out that having been born as one "product of human misery, sacrifice, and effort" they will continue to serve a useful purpose even in a happy clime. Probably this is an acceptable assumption, and perhaps they will serve for a considerable period to make family size farming possible. Co-operative enthusiasts and perhaps all farmers should be on their guard, however, lest the concentrated sales and purchasing organizations take over so much of the control of agriculture as to weaken the position of the family farm which they were designed to aid.

ROLAND S. VAILE
University of Minnesota

WALKER, CHARLES R., and ROBERT H. GUEST. *The Man on the Assembly Line.* Pp. x, 180. Cambridge, Mass.: Harvard University Press, 1952. $3.25.

In this slim volume the authors present the first results of their inquiry into the human relations problems of *The Man on the Assembly Line.* This is not, as they modestly point out, a complete and rounded study of *all* of the problems of this man; for this, more investigatory work is necessary—work under somewhat different conditions and climes, and work with groups of different backgrounds than these here studied.

What the authors have done is to take a new automobile assembly plant, and within this plant they selected 180 workers engaged in final assembly work. With the average mass production job defined as having the characteristics of mechanical pacing, repetitiveness, minimum skill, predetermination of tools and techniques, minute subdivision of product, and surface mental attention, work on the assembly line is the epitome of mass production. Against this technical background, they examine the elements which made for satisfaction or dissatisfaction in terms of the immediate job, relations to fellow workers, pay and security, relation to supervision, general working conditions, promotion and transfer, and the relationship of the worker to the union.

The choice of a new plant is significant. It enabled the authors to study not only the workers in their present environment, but because practically none of them had previously been in an industry with the mass production characteristics of automobile assembly, it allowed them to study the problems in terms of transition from one type of work to another. In a sense, this broadened the meaning of the study, but in another sense the effect was to narrow its meaning. To take just one factor which illustrates this point: The most important items in dissatisfaction with the immediate job were mechanical pacing and repetitiveness. For here is where these workers found the greatest difference from their previous jobs. For industries which are less advanced in the characteristics of mass production, the moral is pointed that less mechanical pacing and less repetitiveness will ease the transition. But do the same items of dissatisfaction reign in the older plants—with workers long since accustomed to these things? Here is where the meaning of the work is narrowed. It would be most interesting to compare notes, and to follow the sample workers of this study through more years of their working lives and discover whether they stay "on the line" or move to other jobs or other industries. One suspects that the mechanical pacing problem remains, but the same may not be true of the problem of repetitiveness.

Perhaps the most interesting finding of the volume is that there are distinctions in assembly line work which loom large to these workers, but which have not yet had much attention from previous researchers. These distinctions have a definite bearing on immediate job satisfaction or dissatisfaction, and they revolve around the number of "operations" in each particular job. To put it simply, "the man who puts a nut on a bolt" is different from the man who does five or ten operations. The difference shows in his attitude toward the job and in other ways. Yet all are frequently lumped together indiscriminately as workers "on the line" though they show wide variations in pace, variety, and skill.

This finding is just one among other interesting aspects of the work, for it is one of the handicaps of a short review that more attention is given to the defects than to the virtues. In truth, this is an excellent volume overall. In just two places do the authors seem to slip. The first is in not discounting some of the workers' accounts of their previous jobs. Since work "on the line" has a low "status" connotation, it is entirely possible that previous job experience was "built up" to more variety and skill, for example, than it actually possessed. The second is in the conclusions where remedies for repetitiveness, for example, may be applicable or necessary only for transition problems rather than for permanent ones.

HERBERT J. LAHNE
Washington, D. C.

SCHNEIDER, ERICH. *Pricing and Equilibrium: An Introduction to Static and Dynamic Analysis.* Translated from the German by T. W. Hutchison. Pp. xii, 327. New York: The Macmillan Company, 1952. $4.00.

Professor Schneider has provided a competent and satisfactory synthesis of the economic theory of the firm and the household in his book *Pricing and Equilibrium.* The book purports to be an introductory text to partial and general equilibrium analysis. While it contains a good deal of analysis of the type which is now commonplace in the elementary text, in its attempt to be complete it also contains considerable advanced analysis which is not likely to be grasped by the elementary student. For the "spoon-fed" American student, untutored in even the simplest of mathematics, Professor Schneider's book will have little appeal. The analysis is extremely concise, more or less devoid of illustrative material, and most of the proofs of his propositions are couched in mathematical terms. However, for the advanced undergraduate student in economic theory or for the graduate student, the book provides a useful review. The book is not as encyclopedic as Professor Boulding's *Economic Analysis,* nor does it have the light style of Professor Stigler's *Theory of Price.*

Professor Schneider's approach to partial equilibrium analysis is conventional. He treats first the economic plan of the household, drawing heavily on J. R. Hicks's indifference-curve approach. Although he treats consumption of the household as a function of income, prices, and assets, the demand for individual commodities is related only to income and prices with no consideration of the size or form of assets. In building the consumption function of the household there is no consideration of the work of Duesenberry or of other contemporary consumer behavior theory.

In his treatment of the economic plan of the firm the analysis is more or less similar to Mrs. Robinson's and Hicks's work, with some attention paid to the theory of oligopoly. Very little attention, however, has been paid to developments in the fields of *oligopolitic* price behavior which occurred in the last three years, and little or no attention has been devoted to the wealth of material provided by industry studies on price behavior. One chapter is devoted to the "Long-term economic plan of the firm," but this turns out to be an analysis of the determinants of investment for the firm rather than a discussion of intertemporal relations of costs, prices, demand, and profits.

His treatment of partial equilibrium includes both static and dynamic analysis, indicating clearly the inadequacy of static analysis for many problems. When the reader completes the sections on the indeterminacy of equilibrium under conditions of oligopoly and bilateral monopoly he is convinced that these subjects cannot be easily handled in an introductory text.

PHILIP W. CARTWRIGHT
University of Washington

MAIER, NORMAN R. F. *Principles of Human Relations.* Pp. viii, 474. New York: John Wiley & Sons, 1952. $6.00.

This book is an exposition of techniques for use in influencing employees constructively (principally by changing their attitudes toward their jobs, their supervisors, and themselves) without arousing resentments in them. The author stresses the importance of the maintenance of good morale in the work group if maximum production is to be achieved. He points out that much contemporary employee training fails because it does not effect any real change in workers' attitudes—it is too rational and takes too little account of emotional factors in both trainer and trainee. Value judgments, he feels, also play too important a role. He states that "a training program that does not alter people may be interesting, but it is *exposure* and not training. A good training program must not only change people, but must change them in the way that is intended."

The method in which the author places his greatest reliance and which he describes in most detail is that of Group Decisions (the procedure in which the employees, under the guidance of their supervisor, participate as a group in the analysis of problems and reach a unanimous decision relative to the action to take). Other techniques which he discusses and illustrates are role playing, various types of contacts and interviews in dealing with individuals (for example, the free or casual contact, the training contact, the making of job assignments, the induction of new employees, the employment interview, the transfer interview, the promotion interview, the evaluation interview, and the exit interview), and nondirective counseling. Ample case material is provided for explanatory and practice purposes.

Dr. Maier's treatment of these topics is down-to-earth and remarkably objective. He feels that the Group Decision method has a major contribution to make at all levels of employee, supervisory, and management training. On the other hand, he is equally aware of the difficulties and resistances which such a radically different approach to training will encounter in industry. He stresses particularly the extent to which the thinking and attitudes of the supervisor himself must be changed if he is to use this method effectively. He is also aware of the problem of and dangers of a lack of top-management support in realizing the full potentialities of such a program.

Only to a lesser extent does he appear to accept the limitations of the *scope* of this method, that is, the restriction of the types of problems to which it is applicable (principally "how to do it" questions) and its doubtful utility when truly elegant solutions are demanded or responsibility for action must be accepted by the group. Even his evidence of the value of the method as a medium of influencing attitudes is not wholly convincing. When it was subjected to an empirical test the findings, as he himself reports them, are inconclusive.

The book contains little that is strikingly new or original with respect either to concept or methodology. Its chief contribution is its reiteration of the point that training demands far more than an orderly, logical presentation of the subject matter if it is to influence attitudes and through them behavior. The author not only makes this point tellingly but he provides a clear exposition of the methods he advocates and ample material for use in training students, supervisors, and trainers in their principles and application. As a handbook covering the rationale and use of the Group Decision method of training and, to a lesser extent, role playing, interviewing, and nondirective counseling, *Principles of Human Relations* makes a very worth-while contribution to the literature.

ROBERT N. MCMURRY
New York City

BARBASH, JACK, with the assistance of KATE BARBASH. *Unions and Telephones: The Story of the Communications Workers of America.* Pp. viii, 246. New York: Harper & Brothers, 1952. $2.50.

This is an account of the development, organization, leadership, and bargaining experiences of the Communication Workers of America (CIO). Because it deals only briefly with the International Brotherhood of Electrical Workers, does not dwell at length on the National Federation of Telephone Workers, and ignores independent unions and telephone companies while focusing on the CWA and the Bell System, it is necessarily an incomplete survey of telephone unionism.

This book was prepared at the invitation of CWA president Joseph A. Beirne. It is designed, according to the Preface, for union members first and general readers second. Yet those particularly interested in the 10-billion-dollar plant, 35 million telephones, 985,583 stockholders, and, especially, the 602,466 employees (1950) of the Bell System will find this well outlined but somewhat hastily written book stimulating.

When some of the 300,000 or more CWA members gaze at this mirror of themselves they will note that in union there is strength; affiliation with other national unions is worthwhile; strikes, strike threats, and organization bring wage boosts; and in industry today it is union versus management. The "frame of reference" here outlined is clearly that of the author; it is, of course, the *sine qua non* of the official, commissioned union biographer. One is not surprised when Mr. Barbash urges upon a centralized telephone monopoly the plowing of new fields by living with the union (CWA). He points out correctly that all the devices of scientific human relations—morale surveys, systematic employee selection and counseling, and the training of supervisors—did not prevent union growth in the Bell System.

Two sources basic to the study of telephone unionism are FCC commissioner Paul A. Walker's *Proposed Report, Telephone Investigation* (1938) and the Senate Subcommittee on Labor-Management Relations hearings (1950) on Bell System collective bargaining. Mr. Barbash uses both, ably summarizing CWA testimony and exhibits in the latter. He does not do justice to the basic company dilemma in this reviewer's opinion, that is, how to grant CWA demands for national American Telephone and Telegraph Company bargaining and avoid government antitrust action. The devotion of the Alliance of Independent Telephone Unions to divisional bargaining and autonomy is ignored. The book is silent on the significance of extensive stock ownership among Bell employees and the vital connection between wage patterns and rate structure. Bell pioneering in employee welfare needs more attention.

Barbash quotes the *CWA News* editor as confiding, "It is not an objective paper in the sense that the daily press is supposed to be—and rarely is. It tries to tell labor's story, in particular the story of CWA-CIO. . . . We stress grievances. . . ." He uses all of his union journals, nevertheless, as sources of facts without sufficient questioning.

Some research scholar will one day try to prepare the full story of telephone unionism in historical perspective from CIO and AFL central archives (and CWA private files), AT&T and Bell divisional personnel records, and the personal correspondence of union and management leaders—sources not now open to Mr. Barbash and his capable wife. He will find in *Unions and Telephones* contemporary insights of great value. CWA, in the meantime, should find it a potent weapon for the union cause.

Stanford University

SOCIOLOGY AND EDUCATION

PARK, ROBERT EZRA. *Human Communities: The City and Human Ecology.* Volume II of *The Collected Papers of Robert Ezra Park,* edited by Everett Cherrington Hughes, Charles S. Johnson, Jitsuichi Masuoka, Robert Redfield, and Louis Wirth. Pp. 278. Glencoe, Ill.: The Free Press, 1952. $4.50.

Under the editorship of five of his former students and associates, the collected papers of one of the luminaries of the past generation of American sociologists are being published in a three-volume series. This second volume is comprised of nineteen articles, prefaces to other monographs, and book reviews which have been arranged appropriately under the two topics indicated in the subtitle.

Developed during his earlier career as a newspaper reporter, Park's interest in the conditions of the city found both a practical and scientific focus in the problem of social change. This is attested by the bulk of the selections contained in the first section of *Human Communities,* particularly those papers prompted apparently by Park's original suggestions for investigating human behavior in the urban environment and dealing with juvenile delinquency, community organization, a summary of research on the urban community and its personality problems and institutions, the "gold coast" and the slums, the hobo, the gang, the ghetto, and the role of the city in civilization. Each of these essays relates to some aspect of social change in the urban milieu. The theorization which Park attempted draws prominently on the diverse contributions of Ogburn, Thomas and Znaniecki, Simmel, Freud, Adler, Spencer, Comte, and Teggart.

But only when these theoretical fragments are viewed in the context of the second section of the book dealing with the ecological frame of reference does their unity become apparent. An adaptation of evolutionism as expanded by the students of plant and animal communities, human ecology proposed that the basic process of competition produced a structural equilibrium among any human aggregate in a given habitat. The consequent territorial and occupational distribution of persons comprised the symbiotic substructure of human association called the "community." In the urban community, competition and its derivative processes of selection, segregation, dominance, and succession formed natural areas characterized by typical social groupings. But the symbiotic substructure will give rise—in a way never satisfactorily explained—to the process of communication and a cultural superstructure. Termed "society," this form of association is characterized by consensus, convention, and moral order, with three hierarchical levels: the economic, political, and cultural.

When the problem of social change is directly confronted, the ambiguity of the relationship between the biotic and cultural phases leads to a contradiction of the assertions that the two phases are reciprocally interrelated and that human social relations are primarily a matter of communication. Social change seems basically unilateral and nonsocial from the ecological viewpoint which "assumes that the origin of social change, if one could trace it to its source, would be found in the struggle for existence . . . [and its consequences]" (pp. 230–1).

Because his attention centered upon competition which compelled each individual to seek the task he could *best* perform if he wished to survive, Park could not explore certain facets of contemporary urban sociology—social class, social power, bureaucracy, factory organization, and mass communication. Nevertheless, his work will remain a monument in American sociology, testifying to his contagious enthusiasm for concrete, empirical research which has inspired his students and succeeding generations. His engaging style, colorful illustrations, succinct phraseology, incisive terminology, coupled with a cosmopolitan, scholarly vision, have won for Park a preeminence in the study of urban life.

ROSCOE C. HINKLE, JR.
University of Maine

STALEY, EUGENE (Ed.). *Creating an Industrial Civilization: A Report on the Corning Conference Held under the Auspices of the American Council of Learned Societies and Corning Glass Works, May 17–19, 1951, Corning, New York.* Pp. xvi, 368. New York: Harper & Brothers, 1952. $4.00.

This little book is an interpretative report of a conference of industrialists, social scientists, and humanists held in Corning, New York, in May 1951.

The occasion was the centennial celebration of the founding of the Corning Glass Works. The 96 conferees were chosen jointly by the officials of the latter company and the section of the American Council of Learned Societies devoted to humanistic studies. It thus included some of America's most outstanding "men of thought" and "men of action."

Discussions dealt with various human problems occasioned by our living in a progressively industrializing society and with what might be done to ease or solve those problems. The tentative program called for a discussion of the "changes in the nature, conditions, rhythms and personal relations of daily work; to changes in the amount of leisure and the opportunities presented for its use; changes in the relation of the individual to his family, to his local community and to broader contacts; and to changes in the attitudes and expectations, hopes and fears with which men face life's problems and mysteries. How do men and women feel about these changes and about the life they lead today? Can we discover new ways to increase the meaningfulness of life for modern man? To enhance human satisfactions? To decrease the tensions and conflicts that threaten our civilization?"

The three-day conference seems significant mainly in the fact that it was held and thus afforded an arena for the frank exchange of opinion by the highly articulate social science specialists and the industrialists. It did something to vindicate the wide diversity of thinking about the awareness to and the complexity of the problems presented for discussion. It showed also the unanimity of the feeling that something constructive should be done about this overlooked or underemphasized human factor in our changing society.

As might be expected in an "off the cuff" discussion of problems in the field of social change, the discussions which are reported in detail reveal little that is new. The value of the conference lies rather in the breaking of new ground, always a necessary preliminary to the long process of purposeful planning and planting, cultivating out of weeds, and nurturing of plants most promising for the maintenance of the society of tomorrow.

The book shows every evidence of careful editing by an experienced reportorial staff. It is more readable than most conference reports and is probably the first promising step toward the elaboration of a plan of action for solving the human problems of industrial society.

CHARLES W. COULTER
University of New Hampshire

AMERICAN JEWISH CONGRESS AND NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE. *Civil Rights in the United States in 1951: A Balance Sheet of Group Relations.* Edited by Joseph B. Robison. Pp. 128. New York, 1952. 40 cents.

This booklet is the fourth in an annual series which state the facts and assess the progress in the United States of efforts to break down the barriers which result from prejudice, discrimination, and segregation. The report appraises the events in 1951 in the fields of citizenship, elections and public office, mob violence and law enforcement, employment, education, housing, public accommodations, armed forces, the nation's capital, voluntary associations, athletics, group defamation, media of mass communications, and community action.

The passing of the nefarious McCarran-Walter immigration bill is foreshadowed; the failures of Congress to act on fair employment, the poll tax, lynching, and statehood for Alaska and Hawaii are recorded. The Executive Department continued to press for integration in the armed forces, with the Army trailing the Air Force and the Navy. Segregation in housing operated by the federal government itself was prohibited, but in the far more extensive program of public housing operated by the states with federal aid, segregation was permitted. Moreover, segregation was directly encouraged by private building interests in the defense housing program aided by federal monies. President Truman appointed a Committee on Government Contract Compliance, a weak gesture far short of the FEPC (Committee on Fair Employment Practice) of World War II.

This incomplete summary of the facts concerning the federal government is typical of the entire spotty group relations

record for 1951. While two states (South Carolina and Tennessee) repealed the poll tax laws, and while voting by Negroes in the South increased markedly in absolute numbers, many cases are reported where officials tried to prevent registration and voting. Alabama passed a constitutional amendment to preserve white supremacy. On the other hand, Florida enacted a law eliminating segregation at the polls. Florida, Georgia, and South Carolina passed anti-mask legislation. Of fair employment bills introduced in eighteen states, only one (Colorado) was passed. But eight cities adopted such ordinances during the year. The most significant development of the year was the attack on the equal and separate doctrine as applied to public schools in the South: the aim was to get the Supreme Court to rule on the proposal that segregation per se is unconstitutional. South Carolina and Georgia took strong counter-measures.

All in all, 1951 was not an outstanding year for improvement of group relations. Mob violence, highlighted by the riot in Cicero, Illinois, and a series of outrages in Florida against Negroes, Jews, and Catholics, was duplicated in a lesser degree in too many parts of the nation. At the same time progress was made in higher education, employment, athletics, and in the election to public office and appointment of Negroes to positions heretofore not open to them. The most distressing note, however, is the evidence of popular apathy to the problem of undemocratic group relations and the failure to appreciate not only its evil at home but its disastrous effects on our position as a leader of the democratic forces of the free world.

MARTIN P. CHWOROWSKY
University of Pennsylvania

SCUDDER, KENYON J. *Prisoners Are People.* Pp. 286. Garden City: Doubleday & Company, 1952. $3.00.

In the past ten years, California has developed one of the most progressive state correctional systems in the country. What was only a few years ago a group of politically dominated and inefficient institutions is now a highly integrated Department of Corrections, staffed with competent and professionally trained personnel. But even more significant than the rapid development of new types of institutions and the revitalization of the programs in the older institutions is the fact that California was the first and to date the only state to put into actual practice the principles of both the Adult and the Youth Authority. Thus, the combination of a unified system of state penal and correctional institutions with the adult and youth authority gives California a unique place in the correctional systems of this country.

This plowing of new ground has not been limited to a revamping of the overall administration of the California correctional system. They have the experimental approach on custody and treatment methods as well. The truth is that we are just beginning to learn how many men can be held safely in open institutions, how important is the atmosphere and setting of an institution, and the extent to which we can bring about true rehabilitation through appealing to a man's self-respect and self-reliance. *Prisoners Are People* dramatizes all of these problems in telling the story of the California Institution for Men at Chino by the man who watched it grow and achieve an international renown. For one familiar with the development of this institution from its earliest blueprints there are some important omissions and here and there an over-emphasis on the role played by some of those prominently mentioned, but this does not detract from the interest in the book or its value in demonstrating what can be done by those who are able and willing to put to the test the shiboleths and slogans which have for so many years frozen penal progress.

Prisoners Are People is full of the quiet drama of those human values which Mr. Scudder consistently refused to compromise. A genuine respect for the individual; a freedom of communication between administration, staff, and the prisoner; a reliance upon an intelligent, trained, and sympathetic staff rather than upon force and physical restraints; and a program offering constructive work and opportunities for individual growth; these values form the philosophy upon which Chino was established. Incontrovertible as these objectives are, Mr. Scudder had to struggle against vested interests, political influence, and sheer public indifference and ignorance.

Told simply and without flourish, the story of Chino is nevertheless an engrossing one. Many of the ideas in contemporary correctional treatment often considered as unrealistic or even visionary have been translated by Mr. Scudder into sound administrative practice. This is the book's real contribution, and, while it undoubtedly has a general reader appeal, it should be read by every student of penology and prison administrator.

JAMES V. BENNETT
U. S. Department of Justice
Washington, D. C.

MORRIS, NORVAL. *The Habitual Criminal.* Pp. viii, 395. Cambridge, Mass.: Harvard University Press, 1951. $5.00.

Morris' work is an analysis and evaluation of recidivist laws in some 25 countries, with primary emphasis given to England and Commonwealth countries. The book has an introductory chapter in which "the habitual criminal" is defined. The rest of the material is divided into two parts. In Part I, Morris presents an analysis and evaluation of the laws adopted by many countries in their attempts to deal with the habitual criminal. In Part II, he analyzes the records of about 300 confirmed recidivists and habitual criminals. The purpose of the entire work is to ". . . protect society from the habitual criminal, and this will not be achieved until we comprehend the characteristics of habitual criminals, and the various means the criminal law (of this and other countries) can contrive to this end. Progress in criminology must be founded on an understanding of the criminal and his relation to society. It is hoped that this work will provide for an understanding of habitual criminals" (p. 29). The habitual criminal laws of the United States are not considered by Morris. He believes, erroneously in this reviewer's opinion, that "in conception and execution they are of a different character from the European preventive detention legislation" (p. 83).

Morris includes three elements in his careful attempt to define "habitual criminal." First are "criminal qualities inherent or latent in the mental constitution." This phrase refers to a condition, and Morris explicitly avoids any decision as to the etiology of that condition. He does, however, exclude those certifiable under English law as insane or mentally deficient. Secondly, there must be "settled practice in crime." In discussing this element, Morris excludes the "extreme position" adopted in certain medical and psychoanalytic approaches to criminology. This is the approach that would base "treatment-punishment exclusively on the social dangerousness of an offender or potential offender. It completely excludes the conception of *nulla poena sine lege* and would appear to exaggerate the adequacy of our existing knowledge." Thirdly, the offenses must constitute a "public danger." This enables Morris to exclude from his study, quite arbitrarily, prostitutes, vagrants, habitual drunkards, and other habitual petty delinquents.

Morris shows, beyond reasonable doubt, that at least two practices are common in all the countries for which he supplies figures. First, the courts avoid imposing the severe habitual criminal sanctions in the vast majority of cases in which they could legally be applied. Secondly, these statutes are most frequently invoked (when they are used) for criminals who are *neither* violent nor dangerous. This is shown conclusively to be the case for England. In short, these laws are predominantly used against a type of offender for whom they were not intended!

England and Wales had a prison population in excess of 20,000 in 1948. There were 32 preventive detainees among this number; they were *all* those male prisoners sentenced as habitual criminals and in custody at the time Morris conducted his study. These 32 committed a grand total of 3,069 offenses of which they were convicted. They concentrated on burglary, housebreaking, and minor larcencies—offenses similar to those causing them to be imprisoned as habitual criminals. Morris says of their last offenses that these men did not threaten society with any crime of

a public nature nor with any offenses to the person. "Their crimes all related to property, and, except in [three cases], did not involve property of any great value. In short, they were nuisances rather than serious dangers to society" (p. 296).

Morris' work deserves serious study by those in this country who are interested in the problem of repeated crime.

FRANK E. HARTUNG
Wayne University

KORNITZER, MARGARET. *Child Adoption in the Modern World.* Pp. xiii, 403. New York: Philosophical Library, 1952. $4.50.

Touching at points from Alaska to Zanzibar with main stopovers in the western British Commonwealth and the United States, this is a guided tour on adoption by an English leader. Her experience covers nearly a decade of research as well as staff membership in a child care agency and service as a press representative for adoption societies. Slightly more than one-half of some eighty bibliographical references are from British sources, the remainder mostly from America. Philosophy and procedures, social and legal aspects are compactly presented as in no other single volume.

It is an informative work. In most Latin American countries the adopter must not have legitimate children, exceptions being Uruguay and Argentina with their more advanced laws. North American adoptions present a "somewhat blurred vista full of experiment, energy and endeavour, though still marred by a good deal of old-fashioned inferior legislation." Yet, quite apart from this legalistic defect, adoption work in the United States and Canada—with some exceptions for Quebec—is marked by a highly developed sense of responsibility and a mature social philosophy. "Where agencies take part in an adoption, which unfortunately does not always happen, the applicants are chosen 'for their warmth and ability to give a good home to the child.' "

Warm concern there is in the author's writing, a realistic interest in all "deprived children" for whom adoption can be a normally happy life journey. She reflects a British trend for which there is an American parallel in placing younger infants, older children, and those with slight handicaps or less than perfect health, not only to offer the pleasures and benefits of complete family life to more children and adopters but also as a stabilizing factor to meet national unrest.

Adoption is still in an experimental stage in most countries. However, it seems that there is a modernity of purpose and practice almost everywhere, workers meeting similar problems and tending to tackle them similarly. Laws themselves have more similarities than differences. Legislation is moving, notably in Britain and America, toward the stability of the adoptive family by safeguarding the inheritance of property. Yet, more planning needs to be done here and abroad about the citizenship of adopted foreign children, also about soldier-sired children born to unmarried mothers on foreign soil. More research is needed on the results of adoption, particularly with the long view several years after the adoption has taken place, something more easily done where questionnaires and interviews are accepted chores than in countries where The Family lives behind a high wall of legal and social inaccessibility.

Here is a needed contribution in the field of child welfare. It will be highly valuable for the professionals and students; of less interest to the general reader.

LEE M. BROOKS
University of North Carolina

CUSSLER, MARGARET, and MARY L. DE GIVE. *'Twixt the Cup and the Lip: Psychological and Socio-Cultural Factors Affecting Food Habits.* Pp. 262. New York: Twayne Publishers, 1952. $3.95.

This is a scientific little book in popular language on food habits and their relationships to culture and society. It is a report of the findings from a detailed field study of three localities in the southeastern part of the United States. The communities selected were: (1) a one-crop economy in the tobacco-growing coastal plain in North Carolina; (2) a live-at-home economy of diversified farming in South Carolina; and (3) a prosperous cotton economy with long-term tenants in Georgia. The plan of research is based positively on food preferences rather than negatively on food aversions.

It might be expected at first thought that regional studies of food consumption and diet would be chiefly concerned with the nutritional needs of the biological organism and the available resources within the physical environment. Such a simple formulation would be inadequate, however, and extremely misleading, because it ignores the persistence of food habits and culturally induced attitudes towards food among any group of people. It cannot be assumed that accessible foods which best meet nutritional needs will be in greatest demand or, indeed, that they will be used to any important extent. Neither can it be assumed that added knowledge of food needs and the resources in any area will be effective in correcting diet deficiencies. Food selection is not a matter that is easily settled between the knowledgeable head and a needful stomach; rather the area of food choices seems to be "an area of great unreason." Society and culture enter in with a powerful slanting of sentiments and tastes, through points of prestige and other factors, to tip the scales in favor of sociological preferences, even at the expense of biological deficiencies and prevalent diseases. Just to know what to eat and to be able to get it cheaply is not sufficient to solve the problems of the foodways, as this book points out. Some excellent precautions and suggestions as to how to change the climate of opinion and food preferences towards a more scientific diet are included.

The book appears to be well documented with empirical data and shows good workmanship, although in spots it b comes rather dull reading. There are excellent pictures, and the field techniques and methods of analysis are easy to follow. It may perhaps be regarded as a suggestive model for similar studies in other areas.

LEO W. SIMMONS
Yale University.

FARIS, ROBERT E. L. *Social Psychology.* Pp. vii, 420. New York: The Ronald Press Company, 1952. $5.00.

This text purposes to demonstrate the essential unity of social psychology, "those aspects of human personal behavior which are developed and controlled by the interaction which takes place between the individual and his . . . primary groups" (p. iii). While the omission of collective behavior phenomena is in harmony with this purpose, the failure to discuss the role of language in behavior cannot be likewise excused, particularly if Faris actually is—as he professes to be (p. 352)—a follower in the Chicago tradition. At the same time that other standard social psychological topics are examined by a technique of illustrating general definitions with perspicaciously selected recent American experimental data, polemics are pursued against such things as excessive biological determinism, psychoanalytic concepts and theories, frustration-aggression. Consequently mental mechanisms describing how behavior is produced are a rarity in all but the three chapters analyzing personality problems. In the fifteenth and final chapter a general discussion of current trends and problems is conjoined to an historical resumé of social psychological theories. Overgeneralization in the historical section, however, inaccurately represents the relationship between the rise of the Chicago school and the debacle of the biological, particularly the instinct, theories.

Theoretically Faris appears basically committed to evolutionism, individualism, and free will. The first is manifest in the sequence of chapters which proceeds from considerations of the biological nature of man, to the social nature of human nature and consciousness, to homogeneous social roles (social organization), and to conflicting social roles (social disorganization, the basic cause of many forms of personality maladjustment). Secondly, individuals are unique because they possess (innately?) personal dispositions (p. 269), normal, natural tendencies (p. 50), natural inclinations (p. 56), innate drives (p. 56), innate capacities (p. 4), attitudinal equipment (p. 200), and so forth, and they select social roles in keeping with their unique experiences. The free will assumption is evidenced when Faris repeatedly indicates not only that men desire or will those kinds of behavior in which they engage, but "why" they do so—at least if they

are "normal" men. The most common reasons given include personal satisfaction, interest in novelty, progress, and complexity, efficiency of time and resources, enhancement of communication, and the conservation of personal energy. These reasons are subsequently utilized as scientific facts for the derivation of universal human values, suggesting to the reader that values are not derived from the sociocultural tradition. Thus, for instance, persons adhere to conventional forms of behavior, enforced by informal social controls, because such behavior is most "natural" to them and "easiest" (p. 269). Faris erroneously assumes that the reduction of behavior to these basic forms of motivation is an explanation of "how," by what mechanisms, behavior comes to be as it is—a not uncommon confusion of metaphysics and science!

GISELA J. HINKLE

Orono, Maine

GREBLER, LEO. *Housing Market Behavior in a Declining Area: Long-Term Changes in Inventory and Utilization of Housing on New York's Lower East Side.* Pp. xix, 265. New York: Columbia University Press, 1952. $4.50.

This case study of an area in New York City's colorful Lower East Side was undertaken as "a prototype for a series of analyses of market behavior in declining areas."

Among the findings are that the number of dwelling units declined sharply between 1909 and 1940; that the area population dropped faster than the housing inventory; that there was an extraordinary amount of demolition; that new land uses have been small-scale except for public housing, and that the "filtering-down" of housing did not operate here appreciably.

Another conclusion is that vacancy ratios declined not during periods of low incomes but only under "the impact of acute housing shortage coupled with high incomes at the end of and after the Second World War." This does not seem to square with the survey of the New York City Housing Authority (January 25, 1937) which shows a marked decline in vacancies before prosperity had set in. Home relief in a depression rather than prosperity may have caused the sharp decline. The Housing Authority report shows that in 25 typical blocks, in which there was an average of 45 vacant apartments in March 1937, vacancies had dropped to 27 per block by October, and three months later to 15.

One of the most interesting conclusions in the book is that despite large vacancy ratios the Negro population from overcrowded Harlem did not pour in. With the problem of "Negro invasion" of white areas now one of the big issues, the finding stands out as a challenging contradiction of what is now dogma in respectable real estate circles.

One of the difficulties with sampling the area is that it was subject to several abnormal and volatile developments which remove it from the framework of "sample areas." These include a sudden awakening of public conscience to the existence of dangers in old-law tenements and an enormous imposition of forced expenditures upon owners. Thus it may be incorrect to conclude that turnover of ownership from individuals to corporations represented "no more than an institutional change in business organization." Responsible owners as well as banks which had inherited buildings during the depression sold them at catastrophic losses, the corporate veil may have appeared as part of the devices designed to avoid personal identification with the new "obnoxious ownership," and sales of bank mortgages at discounts might have replaced the usual quota of foreclosures.

The book poses many interesting questions and gives many interesting answers, some established, some debatable, but the whole area of housing is in issue today, and it is only by constructive studies of this sort that the problem can be spotlighted and clarified.

CHARLES ABRAMS

New York City

COOPER, GORDON. *Dead Cities and Forgotten Tribes.* Pp. xiii, 160. New York: The Philosophical Library, 1952. $4.75.

To anyone like myself who knows very little about the obscure and little written about areas of the world, Mr. Cooper's book is extremely enlightening. The book is divided into four parts according to the sections in the world in which the peoples live. Part One is divided into Europe and North America, Part Two is divided into Central and South America. Africa and the South Seas make up the Third Part, and he ends with the Middle East and Asia.

In every one of these sections are fascinating materials for the professional anthropologist and layman alike. The following are a few examples. In the African section there is a chapter entitled "People of the Veil." These are the Tuareg who live in the mountains of the desert and are perhaps traceable to the vandals. They occupy a million and one-half square miles of the Sahara Desert. The men wear veils called Tagilmus which are dark blue or white strips of thin cloth six feet long and eight inches wide. The men never unveil for it would be indecent. In the section on Europe he describes the Sarakatchans, an aboriginal people inhabiting the high mountains on the borders of Greece and Albania. They are organized into small communities which have an autocratic type of government with one head shepherd known as a Tcherlingas. The arrangement, however, is voluntary in that the people have a choice of whom they select to rule them, and if they wish to continue the partnership at its termination. It can certainly be said that they are a nomadic people. It is interesting to note that all the hard work is done by the women.

The book suffers from a few shortcomings. Some of these are academic, some rhetoric, and some matters of composition. As an example of the first, "Though there are only a few hundred yet they are divided into two races, the Saratchans proper who speak Greek; and the Albano Vlachs who speak Vlach" (p. 27). Here the use of the word "race" will be unacceptable to the anthropologist since the author is speaking merely of differences in language. Rhetorically the author's tendency to high praise of the beauty and splendor is often unnecessarily exaggerated. One becomes tired of phrases such as, "none is more interesting and fascinating than that strange and mystifying. . . ." An example of the fault of composition is that, though the illustrations are beneficial, they are not always in the right place. One looks at the facing picture to find it is referring to a chapter ahead or behind the one being read.

All in all this is a book worth reading. It may even lead many explorers and anthropologists to many of the obscure places and peoples in search of fuller knowledge about them.

FRANCIS L.-K. HSU

Northwestern University

BROWNELL, BAKER. *The College and the Community.* Pp. vii, 248. New York: Harper & Brothers, 1952. $3.50.

This is the second volume resulting from a project in American culture and the community. The project is financed by a foundation and is set up in co-operation with Northwestern University. The first volume by the same author was published in 1950 under the title *The Human Community.*

The subtitle, "A Critical Study of Higher Education," is an apt description of the book and, as the author indicates, many individuals will disagree with the criticisms. They will disagree also, not with the projected remedies, but with the implication that those proposed are the only ones that have promise.

Briefly stated, the criticisms of higher education are twofold: its bigness and its failure to apply the Dewey philosophy to higher education: "liberal education cannot be imposed on students from above. It must grow from the normal pastures of their experience and behavior. It must be an unfolding of inherent tendencies, values, insights and traditions of their native culture."

The author repeats his sociological premise many times, namely, that "human significance and value are created in the small community. . . . In this pattern and only in this pattern does the human being behave as a whole human being in relation to other human beings. He participates here in the values that are called moral, intellectual, spiritual. Only in the true community is human integration possible." Dr. Brownell finds no compensating values in city life.

From this biased point of view he accuses most colleges and universities of contributing to the drain of young people from

the small community to the city. "It has built the city and all that it symbolized in concentrated power and control, and thus has created the instruments of its own destruction."

There are curious inconsistencies in the book. After castigating interdepartmental courses, the author devotes a full and enthusiastic chapter to a description of the course he has directed at Northwestern. After criticizing large classes he states "attendance at these lectures averaged from one to two thousand persons each week."

Few would take exception to his generalizations as to the desirable direction of remedial measures: more integration of subjects, closer relationship of the humanities to life, more social understanding in engineering, more folk art, and greater service of the institution to its own community. But, unhappily, many of these suggestions conclude by admitting he is only citing the remedies and does not propose to indicate the necessary changes.

As a remedy for size, the author is more specific: establishment of community colleges either as branches of the university or as independent institutions; the application of the apprentice system to higher education; greater use of the tutorial system, study groups, round tables, workshops, and the library.

The present writer is as concerned as Dr. Brownell with preserving primary group relationships of the family and the community, but he does not concur in the author's frequently repeated statements that these cannot be preserved in the large city and the large university. Size is one, but by no means the only, criterion of a primary group.

In fact, the great majority of institutions of higher education have for years been developing integrated programs, primary group situations and values, and relationships with their communities, both urban or rural, far beyond the author's proposed remedies.

Washington, D. C.

REED, THOMAS H., and DORIS D. REED. *Preparing College Men and Women for Politics.* Pp. x, 180. New York: Citizenship Clearing House, Law Center of New York University, 1952. No price.

Preparing College Men and Women for Politics represents the most comprehensive and thorough attempt made to date to deal with the problem of the "transfer" or the lack of "transfer" of academic instruction in political science to the life and behavior of students after they leave college. The current study, financed by the Falk Foundation, should be read in connection with an earlier report by Mr. and Mrs. Reed to the Citizenship Clearing House published in 1950, *Evaluation of Citizenship Training and Incentive in American Colleges and Universities.* These reports together with *Goals of Political Science,* published by a committee of the American Political Science Association, demonstrate that the profession is becoming aware of its deficiencies in the field of teaching and has started to do something to make up for the lack of communications within its own membership concerning the methods and objectives of instruction.

In order to familiarize themselves with the work of American colleges and universities in the field of practical politics the Reeds conducted an extensive correspondence, visited many campuses, interviewed instructors and students, visited classes, and conducted a series of conferences with groups of political scientists in the various parts of the country. The report represents, therefore, a great deal of the common wisdom of many of the best teachers of political science in the country. To simplify and give point to the report the Reeds have concentrated largely on the single problem of the preparation of students for participation in party politics.

What Mr. and Mrs. Reed have to say about current instruction in political science is not always complimentary and, because their conclusions are based on actual interviews with students and observation of classes, is sometimes devastating. Classroom discussion in the introductory courses is described as often little more than the "pooling of its mutual ignorance" by a minor fraction of the class in the passive presence of the others. Concerning the use of graduate students as teachers they comment drily that "no other class of apprentices is allowed to go on perfecting its own mistakes without guidance from superiors."

Altogether the Reeds have assembled a great deal of information about what is now being done to bridge the gap between classroom instruction and active participation in politics, and they make numerous excellent suggestions for the improvement of transferable instruction. What they do not say is that one of the principal reasons for the paucity of the practical results of political science instruction is that there is so little about political science itself, as a discipline, that is related to the making of the kind of world we want to live in. Political science is a recent offshoot of history, and political scientists are never so happy as they are when they describe the past.

E. E. SCHATTSCHNEIDER
Wesleyan University

BRAMMELL, P. ROY. *Your Schools and Mine.* Pp. viii, 438. New York: The Ronald Press Company, 1952. $4.50.

For the citizen who has been trying to keep up with changes in his local public schools, but who has had only an occasional look at fractional parts of the schools instead of the whole, I would recommend reading Dean Brammell's book, *Your Schools and Mine.* I would recommend it also, for the college student, whether he plans to be in the profession of education or not, if he intends to take his place in his community in shaping the future of American democracy.

There should be adult study groups in every American community making careful, systematic studies of the relation of free public education to American ideals and values. The fact that such adult education about education is not more extensive has been due, in part, to the scarcity of sound, factual materials easily accessible to the public. Dean Brammell's book brings the findings of many of these scattered materials together and presents them in common sense English, stripped of most of the educational jargon, tables, and footnotes except where these serve the purpose of adding to clarity.

The author relates these findings and experiences of American free public schools of the past and present to the fundamental question of whether the schools can open the doors of maximum development of the individual and at the same time educate the individual to assume his social responsibility. In brief, he presents the facts about education as it is, its strengths and weaknesses, its problems and potentialities, and he gives practical suggestions as to what part the citizen, the school staff, and the student can take in improving their public schools.

The whole range of public school practice, organization, curriculum, guidance, and evaluation is written in meaningful relationship to such problems of the parent and citizen, as well as the professional educator, as the following: What lies behind modern methods of teaching and learning? Who should be educated? What is the reason for objective tests and modern report cards? Why all this stir among educators about counseling? Why do we need buildings that provide facilities for adults as well as children? How much state aid should we seek in school support, and how much should we assume locally? What part can each citizen play in improving public education?

These and many other questions which disturb the adult citizen about his schools are placed in the perspective of cause and effect and their relation to the ideals of American democracy. Stimulating challenges for discussion groups are presented at the end of each chapter and in the final chapter of the book. A good bibliography for each chapter assures possibilities for flexibility and differences of opinion.

No book is complete to any reviewer, and probably not to any author. Much more could have been done in giving the reader some idea of current research in accelerating improvement of public education, based upon the diffusion and dissemination of frontier invention in better schools. The book also falls somewhat short of its excellent standards established in discussing research in teaching-learning relationships and counseling when it comes to dealing with the school and the community. Here the author could have for-

warded these relationships much more than he did by including what is known about measurement of public understanding about education, community factors affecting the quality of education, the relation of education to the economic welfare of the community, and other important developments which the reader should understand.

These, however, are omissions which can be filled in as supplementary study. On the whole, the book is a significant and useful tool for orienting the citizen in making his schools instruments of the maximum development of personality and of shaping a culture of free people.

PAUL L. ESSERT
Columbia University

NATIONAL MANPOWER COUNCIL. *Student Deferment and National Manpower Policy: A Statement of Policy by the Council with Facts and Issues Prepared by the Research Staff.* Pp. x, 102. New York: Columbia University Press, 1952. $2.00.

This volume presents a vital and continuing American problem in its today and tomorrow setting. Since we have only 6 per cent of the world's population, how can we best achieve both national security and future welfare? In Part One the National Manpower Council, under a grant from the Ford Foundation, presents a sound and coherent series of recommendations which are of concern both to the specialist in social or political science and to the general public since they involve student deferment, deferment of apprentices, and military manpower policies.

The basic concept is that the broadest possible student deferment policy is important to the nation's future welfare since "security is based on political, moral, and economic strength as well as armed might." The main change in present policy recommended by the Council is the removal of dependency as a ground for deferment lest postponement of service turn into exemption and the democratic principle of universal obligation to serve be flouted.

Part Two of the book, "Facts and Issues of Student Deferment," presents material to supply background for the recommendations. It is really an appendix with material on the student deferment program, the military manpower pool, the selection of students for deferment, financial aspects of student deferment, skilled and specialized personnel, and student deferment and democratic values. Some of this material is interesting and valuable, but the disclaimer of intent to render judgment on the present policy of student deferment is so seriously undercut by the fact that the volume opens with the recommendation of the Council that the reader wonders whether some of the fine rhetorical questions might not have been omitted. The numerous statistical tables present many aspects of the problems facing us in clear and understandable form. In several instances the chapter conclusion in Part Two seems to be a loose expansion of material already presented in Part One.

The study suffers from two defects: Though short, it is repetitious because of its organization; the account of the stages leading to present deferment policy is necessary for the specialist but may confuse the voting citizen for whom it is also intended. Finally, one who has been in communication with individual draft boards about individual students may note that, handsome as the plan is, things do not always proceed according to plan.

FRANCIS R. B. GODOLPHIN
Princeton University

PHILOSOPHY AND RELIGION

HEXTER, J. H. *More's Utopia: The Biography of an Idea.* Pp. xii, 171. Princeton, N. J.: Princeton University Press, 1952. $3.00.

The author of this interesting little book, the fifth in the Princeton Press's "History of Ideas" series, sets himself the task of showing that those critics are mistaken who have concluded that More's intention in writing the *Utopia* "must remain mysterious" (p. 11). This task Professor Hexter seems to have accomplished. He is able to show, fairly conclusively in this reader's opinion, that much of the seeming obscurity of the *Utopia* vanishes when it is realized that the work falls into two distinct parts. The two parts are: (1) a "Discourse of Utopia" (now Book II), written in the Netherlands, and (2) a "Dialogue of Counsel" (the principal part of Book I), composed in London some months later and in quite different circumstances, after the author's return from the Netherlands. From this it follows that attempts to treat the work as a "unified literary design" have naturally miscarried, and their miscarriage explains the confusion about More's intention. There are in fact "two different and separate sets of intention" (p. 28).

According to Professor Hexter, the "Discourse of Utopia" is intended as an attack on what More took to be the basic evil in human nature—pride. More advocated the abolition of money and of private property because he believed that only by such radical measures could this "disastrous infection of man's soul" be inhibited (p. 76). It follows that "the ideologically motivated scholars" of both "the Left and the Right" are mistaken in their conflicting interpretations of More. He cannot be interpreted as a modern socialist, for he did not find "the ultimate explanation of the evils of his day in the mode of production" (p. 66). Nor can he be fairly understood simply as the "staunch defender of . . . medieval order and liberty . . . against . . . nascent capitalism" (p. 77). He was rather a Christian humanist, who made an acute diagnosis of the economic and social ills of his own day.

The "Dialogue of Counsel," in Professor Hexter's view, grew out of conversations with Erasmus concerning the civic responsibilities of the Christian humanist, and it reflects, without resolving, More's inner debate as he saw the growing imminence of the moment when he himself would have to decide whether or not to enter the King's service.

This is admittedly a book for the specialist, and even here the author modestly disclaims any "brand new insight" (p. 15) and insists that he is merely reviving the view of the *Utopia* held by More's own contemporaries. All of this is true, but the book should have a wider appeal as a useful and ingenious piece of historical analysis and reconstruction.

W. T. JONES
Pomona College

JONES, W. T. *A History of Western Philosophy.* Pp. xviii, 1036, VIII. New York: Harcourt, Brace and Company, 1952. Text $6.50 in one volume, $8.00 in two volumes; trade $8.75.

The book contains almost one million words. Three main principles guide the writer: (1) concentration upon major figures; (2) extensive quotation from sources (author steers a course between a book of selection and a textbook); and (3) full presentation of cultural background. Philosophy is an integral part of a general culture.

About one third of the book consists of direct quotations. These key passages are bound together by a connective text of comment, criticism, explication, and interpretation. The connective text is well done. The quotations are fitted into it smoothly, and the critical comment is incisive.

Ninety pages are devoted to "Pre-Socratic philosophy." The treatment of the subject matter conforms to the traditional pattern. There is little indication of the fragmentary basis on which the exposition rests. One hundred and fifty pages are given to Socrates, Plato, and Aristotle. All citations on Socrates are from the *Dialogues of Plato.* The central theme in the discussion of Plato is the theory of forms, and the frequent references to Plato in later discussion are almost exclusively on this central theme. It seems not to have occurred to the author to consider whether a view of Plato as "a man of letters" would have any value. Nor does he seem to have considered whether the dramatic style of the *Dialogues* makes it hazardous to assert that Plato is firmly committed to any given set of "doctrines." The discussion of Aristotle is more general. He gives attention to Aristotle's ethics, politics, art, science, and especially logic. The logic is even presented in five pages of Euler diagrams.

Two hundred and forty pages cover the rise and development of the Christian

Church and its theological doctrines. The first theme of this discussion develops a difference between a "Jesus religion" and a "Pauline religion." The main interest, however, is an extensive discussion of St. Augustine and St. Thomas. This is a valuable section in a history of philosophy, especially if there is any significance in Whitehead's statement that "Aristotle was the last great unprejudiced Metaphysician." The end of the Middle Ages, the Renaissance, and the Reformation are given a well-considered discussion in nearly 100 pages. Science and scientific method from Leonardo to Galileo are given fifty pages. Attention is centered on Leonardo, Gilbert, Francis Bacon, Copernicus, Brahe, Kepler, and Galileo. It is puzzling that Newton, whose name appears twelve times in the index, is not mentioned in the text except incidentally in connection with a discussion of other men's ideas. The remaining 300-odd pages are given to much the same list of names found in most standard texts with those nearer in time casting proportionally longer shadows.

Mr. Jones has told his story in an interesting style. He avoids jargon. He tells his story in his own words but gives his authors about a third of the space to speak for themselves. Students of special fields—political philosophy, as an example—will find much of interest in his selections and comments.

Mr. Jones has written of philosophy as an element in general culture, but he becomes a "philosopher" in the end. He finds that the "philosophers" have not found *the answers* and feels some necessity for defending them. But how could one expect to find *the answers* if a culture is living and creative? Such a hope indicates a departure from history and a retreat into an academic department. It is out of place at the close of this book.

M. R. GABBERT

University of Pittsburgh

HAYEK, F. A. *The Counter-Revolution of Science: Studies on the Abuse of Reason.* Pp. 255. Glencoe, Ill.: The Free Press, 1952. $4.00.

The melodramatic title of this excellent study is likely to deflect from it many an interested reader. There is very little in it about "counter-revolution," and the word does not even appear in the index. Actually the book contains a series of articles, previously published in learned journals, but expanded and connected for the present purpose. Many will, like the reviewer, welcome their being brought together in this book.

Its central thesis is concerned with what Hayek calls "scientism"—a mechanical and uncritical application of habits of thought to fields different from those in which they have been formed, more especially its application to the social studies. To it is related the "engineering type of mind" when operative in fields to which engineering, properly speaking, cannot be applied. Hayek is much impressed, as has been this reviewer, with the fact that during the hundred or more years that this sort of misapplication has been practiced—and it is still the *haute mode* in contemporary American social studies—it "has contributed scarcely anything to our understanding of social phenomena."

Hayek presents his reflections in three parts—the first dealing with scientism and the study of society, the second with the alleged "counter-revolution," and the third with Comte and Hegel. The second is actually a very penetrating critical assessment of Saint Simon and his school, and including Auguste Comte. His special study on Comte and Hegel undertakes to show that these two thinkers, usually seen in the diamentrically opposed camps of Idealism and Positivism, actually have exercised a joint influence because of their broad agreement on many points. All in all, Hayek would assign to Comte an even more decisive influence in shaping the patterns of thought that are prevalent in contemporary social science, especially in America, *and* in totalitarianism.

The first part traces the central issue of the book from "the influence of the natural sciences on the social sciences" to "engineers and planners." Here one must note Hayek's advanced view of science: "the world in which science is interested is not that of our given concepts or even sensations. Its aim is to produce a new organization of all our experience of the external world. . . ." He has much of value on historicism and "conscious direction," but the hard core of his focus is reached in his critique of planning which he identifies with central economic planning and defines as "nothing but an application of engineering principles to the whole of society based on the assumption that such a complete concentration of all relevant knowledge is possible." He reinforces his case against central economic planning by a brilliant analysis of the engineering mind, its preoccupation with things and their properties, as contrasted with the merchant's awareness of human needs and relations. The argument Hayek presents is sound enough as far as it goes. It seems regrettable however that he appears to have learned nothing from the controversy which his *Road to Serfdom* precipitated with regard to the problems of planning. He pays no attention whatever to the theory and practice of emergent planning within a democratic context of a working constitutional order, as contrasted with the blueprint planning of an authoritarian society against which he rightly protests. Incidentally, it might be remarked that Hayek wrongly assumes that the idea of a fully implemented and stable man-made order is a modern "scientistic" invention. Writers like Machiavelli and Harrington cherished it; medieval thought is full of it, too; in fact, it is one of the most persistent strands of political thought.

The Counter-revolution of Science is a challenging and highly significant book reinforced by over 600 very instructive and illuminating notes. By its very exaggerations it helps to establish its central point: the dangers resulting from the application of natural science methods to the problems of society.

C. J. FRIEDRICH

Harvard University

LEYS, WAYNE A. R. *Ethics for Policy Decisions: The Art of Asking Deliberative Questions.* Pp. xiii, 428. New York: Prentice-Hall, 1952. $4.75.

The explicit aim of this book by the Dean of Faculties, Roosevelt College, is to exhibit how ethical standards as formulated in philosophical systems of ethics are applicable to issues in public and private life. Its central thesis is that the chief value of these systems resides in the questions they articulate or suggest in forming responsible decisions, rather than in the detailed content of their ethical doctrines.

Part One of the book is therefore a review of ten historically influential philosophical approaches to ethical theory. It contains readable and often entertaining expositions and critiques of utilitarianism, casuistic ethics, Platonic idealism, Kantian rigorism, Stoicism, Aristotelian moderation, the psychological ethical doctrines of Hobbes and Butler, Hegelian and Marxian historical and institutional analysis, instrumentalism, and the liguistic or semantic standpoint on ethical philosophy; and it concludes with a list of questions that are supposedly the distillation of whatever is pertinent to policy decision in these various approaches.

Part Two is a survey of nine fairly recent but controversial cases of policy making, and includes discussions of the Chicago and Pasadena school issues, the Ward and Sears decisions on their conduct of business enterprise, the Kings River and Tennessee Valley developments, and the problem of the partition of postwar Germany. Dr. Leys tries to show that while not every one of the above ethical systems is relevant to each of the cases examined, good judgment in policy matters can profit from the "organizing ideas of philosophers," since these ideas complement in essential ways "the fact-hugging insights of the practioners." He believes that wisdom in making choices consists in being aware of the kind of consideration that should influence judgment; and he argues that if there is a logic of practical judgment, it is the logic of raising the right sort of questions.

The conception underlying this book is eminently sane and stimulating; and despite some limitations in execution, it supplies much genuine illumination on the role of theoretical ethical analyses in the settlement of complex practical issues. However, Mr. Leys's expositions of philosophic systems are sometimes, and perhaps inevitably, superficial; and though he attempts to deal fairly with all positions, he

seems to this reader to go out of his way occasionally—as in the case of pragmatism—in directing criticisms against what are surely less responsible statements and applications of doctrine. There is also not infrequently a moralistic overtone in his comments, possibly a consequence of his desire to show the immediate practical worth of ethical theorizing. And finally, the discussions of the nine concrete instances of policy making are handicapped by the fact that they serve merely as *illustrations* for the author's general thesis, rather than as genuinely *problematic material* for the institution of ethical analysis.

ERNEST NAGEL

Columbia University

MEAD, HUNTER. *An Introduction to Aesthetics.* Pp. vii, 307. New York: The Ronald Press Company, 1952. $4.00.

For reasons that are made clear in Professor Mead's book, aesthetics has a special place of its own in the philosophical disciplines of today. Although aesthetic speculation dates back to the period of classic antiquity, and the Renaissance of the fifteenth and sixteenth centuries witnessed much writing and thinking in the general field, aesthetics as it is now understood is a peculiarly modern manifestation. If one reason for this is perhaps suggested by Professor Mead's opening sentence—"He who tries to reason about love only loses his reason"—it is that even such a subjective experience as that of aesthetic value must be brought to the test of objective analysis and speculation in our time.

The three general divisions of *An Introduction to Aesthetics*—Aesthetic Experience, Aesthetic Value, and Philosophies of Art—are a clear and logically developed presentation of the author's reasoning in arriving at his basic definition of the aesthetic experience—that it is "a pleasurable absorption in the perceptual aspects of phenomena." Intended for use primarily as a textbook, the volume is written simply and directly, with adequate definition of the inevitably subjective terms and expressions and a constructively critical presentation of the most generally encountered theories and/or misconceptions of the nature of the aesthetic experience. A selected bibliography lists outstanding writings in the field with particular emphasis on recent works.

Although the author presents the result of his thinking as a general discussion of the aesthetic problem, his examples are largely chosen from the field of painting. His qualified but nonetheless ever-present thesis that appreciation of "formal values" must be the foundation of aesthetic experience is, of course, demonstrable with peculiar aptness in the pictorial expression of modern times, and the discussion of this aspect of contemporary aesthetic principles is among the most enlightening features of the book. However, to this reviewer at least it seems that the thesis developed by Professor Mead on pages 44–45 in distinguishing between what he terms conceptual and perceptual reactions to art objects is somewhat too exclusive. Surely there is more than one road to Parnassus.

DAVID M. ROBB

University of Pennsylvania

JURJI, EDWARD J. *The Christian Interpretation of Religion.* Pp. 318. New York: The Macmillan Company, 1952. $4.50.

This book consists of, essentially, two things: an affirmation of the principles of Christianity professedly based on faith; and a description of some of the world's great religions. This description is, as would appear to be proper in a scholarly treatment, a description which would be little changed, presumably, if given by a scholar who professed any religion outside the Christian pale. The description, moreover, gives the setting of the respective religions in historical perspective and in relation to personalities, culture, and contacts. It is from this approach that we read about the religions of Egypt, Babylonia, the Old Testament Jews, their precursors in Palestine and Syria, as well as Confucianism, Taoism, Shinto, Buddhism, Hinduism, and Mohammedanism. In one brief paragraph the author mentions the indebtedness of the New Testament to Judaism (p. 237); and on the following page he states that "the New Testament is not only free from traceable Gentile religious influence but also independent from the Jewish tradition, though fulfilling the promises of Israel."

The tone and tenor of the book is a far remove from what is sometimes called the "Chicago" theological approach. The chapter entitled "The Making and Dynamism of Christianity," for example, abandons the historical point of view from which other religions are described and is, to use theological terminology, dogmatic; that is, it asserts the superiority of Christianity because it was founded by Jesus. As for "The Responsibility of Christianity," as the concluding chapter is called, "it is . . . on the issue of ontology—that is, of man's total being, destiny, and place in the universe—that Christianity is moved to fix its gaze." The book is scholarly; but it can scarcely be said to make a scholarly appeal. It would be interesting to see as a supplement to *The Christian Interpretation of Religion* a book on *The Christian Interpretations of Religion.*

WILSON D. WALLIS

University of Minnesota

SMITH, HOMER W. *Man and His Gods.* Pp. x, 501. Boston: Little, Brown and Company, 1952. $5.00.

"Man stands among the ruins left from some five millenniums of civilization, surrounded by shattered hopes and burned-out creeds where once were impregnable faith and assured belief, asking himself again, What is his place in Nature?" The constant reshaping of the answers and their influence in reshaping life in historical sequence and in cumulative impact form the meat of this challenging book. Its reason and manner are best explained by a little book within the book—the last chapter entitled "The Story of This Book": "I went back to the Beginning. I wrestled, in my own terms, with the Meaning of Things. I took a sharp scalpel and took the wrappings off life and took a close look at its insides." And this the author proceeds to do with candor, for he writes like a poet, he perceives like a historian, and he dissects like the physiologist he is. Add to this a distinctive talent for perspective, utmost sincerity, and courage, and you have a mixture of subject and presentation that makes for an important contribution, regardless of the reader's personal dogmas and prejudices in the field.

The book is provocative to thought, to the very deepest conscience of man, for—in the words of Albert Einstein's pithy Foreword—". . . man's fear-induced animistic and mythic ideas with all their far-flung transformations and interrelations . . . the impact of these phantasmagorias on human destiny and the casual relationships by which they have become crystallized into organized religion" have frequently limited man's physical and intellectual freedom and caused "boundless suffering."

Once again we come to grips with many cultures and their contributions in the form of talismanic righteousness (Egyptian), the one and only eternal Yahweh (Hebrew), the absoluteness of good and evil (Persian), the immortality of the soul (Socratean), the perfectiveness of the spirit (Platonic), Satan (Babylonian), and the later threading together of all of these (Augustinian). We sense the finality of the crumbled splendor of dynasties built on the more or less voluntary acceptance of frauds and blunders and tales and fearborn superstitions.

One might object here to a recurrent oversimplification (as it is attacked in the historicity of Jesus) or a partisanship for ideas, but Smith knows what he is talking about historically, and he enjoys talking about it, so that his ideas become quite infectious. And being sarcastic and caustic in spots is even acceptable when he takes the bottom out of many pet ideas; he does it so effectively surgically. His question persists: Why do many of the errors of a prehistoric age and the terrors of a prescientific age continue to plague us?

That such re-evaluation is not new is proved by the bulk of the book, a treasure chest of literary look-see into the functions and ideas of men at all times, at all levels. As in political arrangements of our own day, Strabo many centuries ago asked for the use of fairy-tales and hocus-pocus to lead "promiscuous vulgarians to piety and holiness and faith." As to love, law, and morality—there is a story so twisted and changeable that even in this enlight-

ened age there are those who would believe with Chrysostom that woman is "a necessary evil, a natural temptation, a desirable calamity, a domestic peril, a deadly fascination, and a painted ill." Montaigne suggested long ago that the "supreme purpose of human learning (is) . . . to teach us how to live happily rather than how to die safely." Opines Professor Smith, this may be a "brilliant period for the human intellect but with promises unfulfilled, aborted because that intellect was too immature for its promises to complete gestation. . . . He [man] alone can choose, out of his vision of the present and the past, his future course."

MCKENZIE, JOHN G. *Nervous Disorders and Religion: A Study of Souls in the Making.* Pp. 183. London: George Allen and Unwin (distributed in the U. S. by The Macmillan Company), 1952. $2.25.

This small book contains the Tate Lectures essentially as given at Manchester College, Oxford in 1947 and repeated on two other occasions. The style is easy flowing, as would be expected from a spoken statement. Footnotes are present to give support to significant statements, but the book carries none of the pedantic textbook style.

The author starts with the statement that man's personality grows out of his response to his basic needs. These needs are both biological, such as the needs for sustenance, for shelter, and to reproduce his kind; and social needs, such as the needs for affection, for status, and for a moral and rational unity. The way in which the individual responds to these needs must be woven into a harmonious whole both in its inner and its outer relations. He states that wherever there is inner conflict between the tendencies, there we have the basis for a personality difficulty.

Mr. McKenzie is not a cultural relativist, assuming that personality is the product merely of an interplay between these needs and the social environment, but rather that "the individual is always the chief agent of his own destiny" (p. 64). He compares his own position with that of Rivers in, "the assumption of Rivers is that the environment is the vital thing; whereas I should say that the reaction of the individual is the deciding factor" (p. 67). This lays the foundation for his contention that "the ultimate cause of the kind of personality failure which leads to nervous disorders and maladjustments lies in the inability of the self to canalize its energy, thought, and emotions along the line of self-chosen ends, or its inability to integrate its childhood experience with more mature experience" (pp. 68–69). This is not to say that the author deprecates all emphasis on the importance of environment, but rather that the environment does not determine. It is the individual living in that environment who determines. This individual may have a weak will or a strong will, he may choose an efficient way to answer his need, or if he has been unduly thwarted, choose some perverted way. His point is that it is the individual who does the choosing.

All this leads up to his lecture on "Spiritual Healing." The problem here is the same as in any other method of psychotherapy, namely to get the person's wants and needs to coincide. After comparing and contrasting his position with that of Freud, Adler, Jung, Flugel, Rivers, Horney, Fromm, and others, he states that spiritual healing deals with the same kind of difficulties that other modes of psychotherapy do. The difference is that in "practically all spiritual healing there is the assumption that power can come to the individual from sources outside himself, and that he can by prayer, the sacraments and spiritual devotions increase his capacity to receive that power" (p. 122). He does not tell us how to get at this power other than to indicate that it is available only to those who have faith in it. However, he does warn the psychotherapist that he must not rely on this "power" alone, but rather he must accompany this by and base it on some knowledge of why and how the self has failed to unify its own dynamic elements. Nor does he contend that spiritual healing can cure a person of all kinds and sorts of disease, including the replacing of degenerated tissue. Rather he would limit its use to psychosomatic and functionally neurotic disorders. He speaks rather harshly against the indiscriminate resort to faith, prayer, and the laying-on of hands. "Religious helps can be used only along with all the knowledge we can have of the disease both physical and mental. They are a means of aiding, not a substitute for the means open to our hands" (p. 137).

This is the kind of a book that a person who is interested in reading a well balanced, cautious, yet clear statement as to what is encompassed in spiritual healing would do well to read carefully. It will neither convince nor offend those who basically disagree with the author, but it will clear the atmosphere. For those who tend to agree with the value of spiritual forces, it will clarify the relationship between spiritual healing and other forms, or emphases, in psychotherapy.

CARL A. NISSEN
Ohio State University

BLANSHARD, PAUL. *My Catholic Critics.* Pp. 53. Boston: Beacon Press, 1952. 50 cents.

Three and a half years ago, Paul Blanshard struck hard at what he conceived to be a serious threat to democracy by publishing his book, *American Freedom and Catholic Power.* On March 21 of this year a blow intended to be a haymaker was sent his way by James M. O'Neill, who on that day published his *Catholicism and American Freedom* (New York: Harper & Brothers). Now Mr. Blanshard, in a small but solid work of rebuttal, gives evidence that he is by no means ready to be counted out, and alleges that most of the counterblows he has received—from Mr. O'Neill and others—have been low ones.

At the heart of the argument between Mr. O'Neill and Mr. Blanshard is a dispute over authorities. Mr. Blanshard denies that his charges can be refuted, as Mr. O'Neill attempts to do, by citing "professional Catholic sources, published under Imprimatur, written by American Catholics anxious to reconcile their love of independence with papal power." He points out that Mr. O'Neill frequently cites "liberal" statements from Catholic theologians of lesser rank (or even laymen) to distract attention from "reactionary" statements by popes and other top leaders of the hierarchy as cited in *American Freedom and Catholic Power.* For example, Mr. Blanshard notes that "On page 89 Mr. O'Neill quotes at length from Father John Courtney Murray on *Governmental Repression of Heresy,*" but ignores the fact that Father Murray's "liberal" position has been repudiated by Father Francis J. Connell, who outranks him, and by high Jesuit leaders in Rome. (As if to give added force to Mr. Blanshard's point, the editor of Catholic University's *American Ecclesiastical Review* in its June issue criticizes Mr. O'Neill's book for having "seriously misrepresented the Church's power of jurisdiction" in his effort to refute Mr. Blanshard.)

Mr. Blanshard's booklet, in addition to 40 pages concerning Mr. O'Neill, contains the text of "Father Connell and the Scholarship of Paul Blanshard," an article by Mr. Blanshard reprinted from the *Cornell Law Quarterly* of the Winter of 1951, and the text of a letter submitted by Mr. Blanshard for publication in the *New York Times Book Review,* but rejected by the review editor. This rejected letter and also Mr. Blanshard's revelation at the beginning of his booklet of the reasons for Harper's six-month delay in publishing Mr. O'Neill's book furnish real food for thought for those who are concerned with newspaper and publishing ethics. Ethical questions are also raised by Mr. Blanshard's remarks (pages 26 and 27) concerning Everett R. Clinchy of the National Conference of Christians and Jews, whom he accuses of misrepresentations as "bald" as those of Mr. O'Neill.

This is more than a conflict between Catholic and non-Catholic leaders—it involves issues which cut across denominational and political lines. Thoughtful Americans will continue to follow the running controversy between Blanshard and his critics in spite of the tedium of seemingly endless charges and countercharges.

STANLEY LICHTENSTEIN
Washington, D. C.

SCHILPP, PAUL ARTHUR (Ed.). *The Philosophy of Sarvepalli Radhakrishnan.* Pp. xviii, 883. New York: Tudor Publishing Co., 1952. $7.50.

This monumental volume, a veritable encyclopedia of philosophy, released on June 15, 1952, is the eighth of a series which, since 1939, has dealt with living philosophers. It deserves and will receive immediate attention for its timeliness and its thorough contents. Its huge proportions include: 77 pages of Fragments of a Confession by Radhakrishnan himself, sketching his own philosophic career, 700 pages of comment and criticism of his work by twenty-three distinguished writers (nine Eastern and fourteen Western), 20 pages of bibliography of Radhakrishnan's writings since 1908 (amounting to over 7,000 pages!), and 53 pages of his Reply to Critics.

His Reply assembles his own criticisms and restates his philosophy under the four heads of Metaphysics, Religion, History of Philosophy, and Ethical, Social and Political Philosophy—and is a thorough job, for he had at hand the writings of his critics, not only what they said of him, but also what they had written otherwise in the philosophic field. Any reader of the volume here and now reviewed quite inadequately for want of space, for one thing, may assume at once that rich returns will reward his thorough reading. He will encounter every element rightly falling within the scope of a comprehensive view of human thought as it has dealt with men's affairs of late in our troubled world. The sources are mostly English, of which Radhakrishnan is a master—although, of course, he has command of other tongues, including Sanskrit and Indian vernaculars. He is virtually a product of long and thorough English education, although he is at heart a "proud Hindu," as he says.

Indeed, the key to thorough comprehension by us of his system of philosophy is that he is Hindu and as such he meets his critics, the westerners, especially, who often fail to catch the Hindu point of view bred of five thousand years of religious and philosophic history (*cf.* p. 669). Hinduism has had no formal or official creed, and it has the dynamic character of utter freedom to incorporate within itself, let us say in terms of monistic idealism, or, perhaps, the Absolute, the divergent manifestations and expositions of the One (*cf.* p. 497). Radhakrishnan is consistent in his resolution of the "world" (*cf.* p. 104) into metaphysical, historical, moral, political and religious Unity. It need surprize no one that he makes Buddhism accept the Upanishads (*cf.* p. 572), that all dualisms and contradictions are resolved into "undifferentiated immediacy," the same in all objects and subjects (*cf.* p. 647). His philosophy is a "sustained attempt to understand the universe as a whole" (p. 789), and for him everything "converges and culminates in Spirit." To this reviewer, however, it all amounts at last to a certain measure of inertia, tolerance, and accommodation—in short, pure Idealism. But there are in the volume penetrating comments on matters of pressing interest and concern, including culture, society, politics and the state (see, for example, pp. 829–837, in the light of his ambassadorship to the U.S.S.R.).

COMMONWEALTH OF NATIONS

BAILEY, SYDNEY D. (Ed.). *Political Parties and the Party System in Britain: A Symposium.* "The Hansard Society Series in Parliamentary Government," Vol. V. Pp. xii, 211. New York: Frederick A. Praeger, 1952. $3.50.

At a time when some people in the United States express the fear that Great Britain is turning toward socialism and away from our kind of a free society this little volume comes as a strong corrective.

The editor of the book has drawn together well-known writers to present a symposium on British party life. He has been very skilful in getting articles that fit a plan, so that there is an evident unity to the volume. He opens with a section on the evolution of parties, continues with an exposition of the three major parties of modern years and of minor parties and independents. His third section is a series of essays upon problems of party life such as party organization, finance, formulation of policy, mandate from the people and party personnel. He closes with a chapter of reflections on party life by Sir Ernest Barker and with a very well chosen bibliography. All of this is done in the scope of two hundred pages.

As a nonpartisan review of partisan politics the symposium leaves one with a feeling of satisfaction about Great Britain. There is certainly portrayed here the free political society that is worth understanding. Each of the major parties—the Conservative, the Labour, and the Liberal—has its history succinctly but well told and its principles and philosophy briefly expounded. Because each is done by a sympathetic writer, and well done, it is very convincing. Almost one is persuaded to value the long established bases of British society and to join in his thought the Conservative Party when Kenneth Pickthorn is being read. There are moral values in maintaining the fundamental freedoms.

But after reading G. D. H. Cole and Francis Williams on the Labour Party and finding one's self faced with moral man and not economic man only, with an idea of rewards based upon social values and a sense of community, and with human rights similar to those expressed in the Declaration of Independence being emphasized, one wonders whether he might not go along with Labour. Francis Williams does well to distinguish between post-war policies based upon necessity and policies that are true to Labour theory.

And then one reads Dingle Foot's exposition of the Liberal Party with its emphasis upon freedom of enterprise and its interest in the status of the worker as encouraged by co-operative ownership programs and of consumer welfare as promoted in government development of natural resources, and he wishes that the Liberal Party had more strength. The function of criticism as illustrated by both major and minor parties—and also by independents—is given proper emphasis.

In Ernest Barker's closing chapter of observations one gets the idea that perhaps the parties are losing their appeals in terms of principles and are more and more reflecting the economic and social segments of British society. "We seem to be drifting," he says, "into a state of division between the town and the country mouse; and there is peril in that division" (p. 200). To the reader this is another evidence that parties are still in flux, that society in Britain is still free to express itself politically in manifold ways, and that the British are working, just as we are in the United States, to establish a sound basis for political democracy as a protection for a free society. This symposium gives one full opportunity to form his own judgment.

SLAVIC COUNTRIES

STOWE, LELAND. *Conquest by Terror: The Story of Satellite Europe.* Pp. xv, 300. New York: Random House, 1952. $3.50.

Academically, Stowe's book suffers from a meager documentation and from its efforts to give the impression that the material it covers is unavailable in English publications. (As a matter of fact, the September 1950 issue of THE ANNALS covering the same area has a table of contents which closely resembles Stowe's.) But, on the "popular side," Stowe has done a magnificent job. His book has the distinction, in fact, of being the most able journalistic presentation of the transformation of Satellite Europe into a Soviet colony.

Stowe summarizes ably the revealing statistics of Soviet progress among Moscow's six puppet states and Eastern Germany: 1 million slave camp prisoners, some 15 million trained soldiers, more than 2 million men in security and other internal armed forces, 18 million farmers and their families (who are now being sucked into Soviet machinery), and more than 15 million industrial workers who are helping to transform the region into a military base for future Soviet aggression. The over-all

picture contains interesting details on secret police, how satellite civilians are trained for war, the use of food as a weapon, the utilization of education and religion, and the "Russianization" of foreign cultures.

The constant exhortations of Stowe about the Soviet menace might antagonize those inclined to view the burning problems of the day more "academically" than he does. But the fact remains that no liberal can continue apologizing for the Soviet system in satellite Europe after reading this popularized account of what is happening to the "shatter zone" of Europe.

JOSEPH S. ROUCEK
University of Bridgeport

VOGELER, ROBERT A., with LEIGH WHITE. *I Was Stalin's Prisoner*. Pp. 314. New York: Harcourt, Brace and Company, 1952. $3.75.

Even if this book were only—as it is advertised—"the complete Vogeler story," it would belong with the most valuable contributions to understanding conditions of life and human fate in the satellite countries. But Mr. Vogeler's book tells us much more than a personal story.

After Mr. Vogeler had "confessed" everything invented about him and his activities by his persecutors, and a few days before his trial, he got the following warning from one of the investigators:

"Your entire future will be determined by your behavior at the trial. If you fail to answer the president's questions in the proper spirit, you will be removed from the courtroom and taken to a special hospital. There you will be given treatment that will make you happy to come back and answer the president's questions. But it will also make you a cripple for life." There was no escape.

In Mr. Vogeler's book the so much discussed question, Why they confess, gets a definitive answer. What the author tells about his experiences—and he does it with remarkable precision—makes it perfectly clear that for "Stalin's prisoners" there simply does not exist any possibility of not confessing. The modern inquisition has elaborated an infinite variety of methods to extort "confessions": from a refined psychological pressure to physical tortures of sheer unimaginable cruelty. Mr. Vogeler describes how the prisoners are given occasion to learn, sometimes even to see, which new methods they may expect if they do not give up their resistance. Sooner or later they give up.

After completing the story of his own ordeal, Vogeler adds some chapters about the cases of Oatis and of four American flyers. No less than with his personal tragedy he is concerned with the tragic situation of his country as revealed by his own and other cases. In the concluding chapter he writes: "I was not the first American to be imprisoned by Stalin, and, unless we change our tactics, Oatis, I fear, will not be the last." Mr. Vogeler is convinced that this country has efficient means to defend its citizens. He mentions, for instance, an ultimatum reinforced by a demonstration of American air power. The most common objection against such strong methods is that they involve the risk of open war. This objection can hardly be considered a realistic one. More pertinent and convincing appears to be Mr. Vogeler's observation that "just as we won't go to war with Russia to prevent the unlawful imprisonment of a lone American, neither will Russia go to war to keep him in prison."

GEORGE DENICKE
Washington, D. C.

HALECKI, OSCAR. *Borderlands of Western Civilization: A History of East Central Europe*. Pp. xvi, 503. New York: The Ronald Press Company, 1952. $6.00.

This is a distinctly second-rate book written by a first-rate historian. One of the principal drawbacks of Professor Halecki's new work is its overambitious geographic and political scope. To this reviewer it seems an almost impossible enterprise to cover adequately the entire sweep of historic development of a vast European "middle zone" in a volume of about 500 pages.

Thus *Borderlands of Western Civilization* is in reality a strange and uneven compound mixture. Its first 356 pages offer a detailed and authoritative history of the Slavic nuclei of Eastern Europe—Bohemia and Poland—and of the adjoining Danubian countries—Austria and Hungary. The last 120 pages, on the other hand, contain little more than a superficial and hesitant review of the major political developments since World War I. The last chapter of the book, "Stalin's Peace," is particularly disappointing in its strangely simplified once-over coverage of all of Eastern Europe's history "from Nazi Occupation to Soviet 'Liberation.'" With the mushrooming new literature on Iron-Curtain Europe, spurred on particularly by such recent British contributions as Hugh Seton Watson's *The East European Revolution* (London, 1950), it seems unwise to retrace well-covered ground in a brief, and necessarily superficial, chapter.

Dr. Halecki, Professor of Eastern European History at Fordham University, is at his professional best in the comprehensive review of the history of Poland, particularly throughout the phases covering the thirteenth to the sixteenth centuries. The scholarly and succinct survey of these crucial decades dramatically stresses the almost innumerable "quasi-permanent opportunities for interfering with Poland's internal problems" (p. 237), which were so eagerly seized upon by Orthodox Russia and Protestant Prussia. The author's analysis of the successive waves of imperialist conquest of Poland by foreign powers effectively sets the stage for an understanding of the Soviet Union's present, iron-fisted control over this prominent "Borderland of Western Civilization."

The reviewer is impressed by Professor Halecki's ability to grasp and present complex historic phenomena in an alert and frequently lively style. To re-emphasize an earlier point, the major liability of this work appears to be its overly ambitious scope combining two separate books under one cover. The faults of the second practically overshadow the merits of the first. However, advanced students of Eastern European politics and government should acknowledge the author's accomplishment in presenting a comprehensive coverage of East Central European historic developments. The bibliography of the book, although limited to works in English, French, and German, is thorough and will prove to be a useful instrument in encouraging further study in this complicated field.

ANDREW GYORGY
Yale University

OSTOVIĆ, P. D. *The Truth About Yugoslavia*. Pp. xxiii, 300. New York: Roy Publishers, 1952. $3.50.

The sensational title of the book will disappoint the reader, for there is nothing "sensational" in *The Truth About Yugoslavia*. The author has tried to strengthen his presentation by having a very good introduction prepared by Ivan Meštrović, one of the greatest living sculptors of our times.

In a nut shell, Ostović presents the Croat viewpoint on Yugoslavia's royal regime and puts his finger on the "small ruling clique of Serbians" who ruled the Kingdom of Yugoslavia under King Alexander. In Part II, "The Birth of the Second Yugoslavia," Ostović tends to favor Tito rather than Mikhailovich. In no respect, however, is the chapter an expression of a thorough and exhaustive research of the material which has become available recently. (Incidentally, the author uses an esoteric method of documentation which will irritate even those not scholarly minded —for example, see page 207, footnote 15.) The concluding section of the work suggests that Tito's regime presents "no visible alternative" (p. 295), especially since the emigré leaders of the Serbs, Croats, Slovenes, Montenegrins, Macedonians, Albanians, and Hungarians cannot "agree on a constructive plan" which would also keep Yugoslavia together. Ten documents pertaining to the problems of Yugoslavia's history between 1915 and 1934 are appended together with four well-drawn maps.

If anything, the publication is an emotional presentation of "how much real and sincere idealism the Croats contributed to the foundation of Yugoslavia and how broadmindedly they conceived the union and worked for its realization over a period of a hundred years"—as expressed in Meštrović's Introduction (p. xiv).

JOSEPH S. ROUCEK
University of Bridgeport

WESTERN CONTINENTAL EUROPE

GALANTIÈRE, LEWIS (Ed.). *America and the Mind of Europe*. Pp. 125. New York: Library Publishers, 1952. $2.75.

The theme of this little book is one of the most important that can be conceived at this moment. For there is raging a war for the mind of Europe, as well as for its material resources. And in that war, as M. Galantière and M. Raymond Aron rightly insist, there is no guarantee that the United States is winning. The Marshall plan, the North Atlantic Treaty Organization, and all the apparatus of political and economic co-operation may come to nothing if the European mind is poisoned against America or even left in what is now a too common state of indifference between the two great power centers, Moscow and Washington.

That millions of Europeans should profess and, in many cases, genuinely profess a "plague on both your houses" attitude, naturally surprises and distresses the well-meaning and inexperienced American, voter, congressman, soldier. The reasons for this attitude are acutely analyzed by M. Aron who combines understanding for the attitude with intellectual contempt for its pretensions. There is a determined refusal to face the facts about America and an equally determined resolution to pretend that the Russian and American "menaces" to the old culture of Europe are much the same thing; indeed, the "trahison des clercs" is more manifest in this than in any other of the European attitudes of refusal.

The plan of the book calls for comments on the general alienation of the European intellectual leaders both by countries and by subjects. Germany, France, music, literature—are all dealt with with varying degrees of thoroughness, and there is a very able, informative, and depressing general survey by Mr. Melvin J. Lasky, editor of *Der Monat*. Some of the contributions, like Mr. Stephen Spender's, have, for all their interest, little to do with the subject, and it is a pity that there is no chapter dealing with the problem in its specifically English setting. It is also a pity that the interesting article on "tourism" ignores the fact that the representative American in Europe for the past ten years has been not the tourist but the soldier, so that the opinion of Sweden matters much less than that of the countries which had and have the G.I. among them. But despite the possibly inevitable limitations of a symposium, the *Saturday Review of Literature* deserves thanks for arranging the series, and the articles are even more welcome in book form.

D. W. BROGAN
Cambridge University

EINAUDI, MARIO, and FRANÇOIS GOGUEL. *Christian Democracy in Italy and France*. Pp. x, 229. Notre Dame: University of Notre Dame Press, 1952. $4.00.

When two specialists so well qualified as Professors Einaudi and Goguel combine their talents, the result is likely to be a volume well worth reading. This book lives up to its promise; it is the best brief survey in English of a vital political movement whose most interesting manifestations are found in France and Italy. An earlier volume in the same series examined the French and Italian Communist parties. It is to be hoped that others will follow.

Dr. Einaudi's brief but cogent essay on Italian Christian Democracy reveals a deep sympathy for the movement, yet at the same time a willingness to criticize its faults and its limitations. He regrets the fact that the postwar party has lost some of the autonomy and some of the vigorous, far-sighted realism of Luigi Sturzo's prewar Popular Party. This is not because De Gasperi fails to realize that "in the long run, a firm show of autonomy vis-à-vis the Church is essential" for any Italian party. Rather, it is because the Mussolini era left postwar Christian Democracy "mortgaged" to the hierarchy and especially to Catholic Action. Dr. Einaudi is concerned at the possibility that Catholic Action leaders like Luigi Gedda may force their program of "authoritative democracy" upon the party, or may create a rival Catholic party to do the job. Either prospect strikes him as disastrous. His sympathies do not lie with the voluble left-wing faction in the party; but he does hold that Christian Democracy must be socially progressive and must "understand the requirements of a modern state" if democratic government is to survive in Italy.

French Christian Democracy is analyzed by François Goguel who, although a Protestant, also has close ties of sympathy with his subject. His lucid essay examines the background of the Mouvement Républicain Populaire (MRP), its doctrines, its leadership, its tactics, and its achievements since 1944. In general, M. Goguel justifies the major decisions which the MRP has made at critical moments, and implies that if such a party had not existed in postwar France, democracy might not have survived. His case, I think, is sound. It is a bit surprising, however, to find no mention at all of the MRP's relationship (or lack of it) with the Church hierarchy or with such groups as Catholic Action. Nor is there any reference to such Catholic youth movements as the JOC and the JAC, which have fed so many members into the MRP. I should have wished also that M. Goguel, whose knowledge of French political sociology is unsurpassed, might have given us a clearer picture of the MRP's social base now that the party's conservative hitchhikers have gone over to De Gaulle. M. Goguel seems to suggest that the MRP has held its strength best in the industrialized departments—in what is sometimes called "dynamic France" (pp. 185–187). Some prominent MRP officials believe, on the other hand, that the party is becoming "ruralized," and that its hold seems to be greater in "static France." The MRP's future course may depend in part upon the character of its electoral support.

I for one regret that this volume does not contain a brief introductory essay comparing and contrasting Christian Democracy in its French and Italian forms. It is also regrettable that the translation of M. Goguel's section is overliteral and somewhat wooden. But these are minor reservations. On the whole, the book is a first-rate contribution to our knowledge of Western European politics.

GORDON WRIGHT
University of Oregon

ORWELL, GEORGE. *Homage to Catalonia*. With an introduction by Lionel Trilling. Pp. xxiii, 232. New York: Harcourt, Brace and Company, 1952. $3.50.

The English edition of Orwell's moving and vivid account of his experiences as a volunteer for Republican Spain attracted little attention in 1938. The book was not published in America (and considering the mass of shoddy material on the Spanish Civil War printed here, that is saying a great deal). As in so many of the things he wrote, Orwell was swimming against the vulgarly obvious current of history.

Perhaps for that reason, fourteen years later, the first American edition of *Homage to Catalonia* is still of importance.

When Orwell went to Spain, he was favorably impressed by the Communists. Mere chance enlisted him in the militia of the P.O.U.M., an anti-Stalinist Marxist group, rather than in a Communist-controlled unit. But Orwell was both intelligent and honorable: he did not have to engage personally in mental prostitution, treachery to his friends, and treason to his country before he recognized dirty-dealing. He was, as Lionel Trilling points out in his fine introduction, a man of virtue. Thus the book has none of the frantic self-accusation, paranoid egotism, flight from reason, and inside-out authoritarianism of the typical "convert" literature, which makes so much of that genre so repellent. It is a straightforward, manly account with none of the trappings of the reformed drunkard. And like anything Orwell has put his hand to, it is superbly written.

In Spain, Orwell found Communist influence approaching dominance. Thanks to the arms embargo policy of the democracies, Russia was the important source of military materiel. Russia was quite willing to choke off the hope of Republican victory, rather than allow arms to go to "unreliable" commands.

The Communist slogans were conservative: stop revolution, join with middle class groups, win the war—on paper, they were appealing. But they also meant violent suppression of the radical Anarchists and Left Socialists, and a world campaign of lying and slander. (As the Republican

Minister of the Interior said in a notable understatement, "We have received aid from Russia and have had to permit certain actions which we did not like.")

In a few months, Orwell left Spain, a fugitive suspected of "Trotskyite-Fascism," with many of his friends dead or imprisoned. He had seen the leading Idealists of our era putting the techniques of Ends-before-Means into action, and he was reaffirmed in his hope in the decent materialism of ordinary men. Most of his later, more important writings are variations upon this theme.

The political aspects of the book should not overshadow the aesthetic. At least half of the chapters are brilliantly readable accounts of the rather primitive warfare of 1937 Spain, of the people of Catalonia, to whom the book pays homage.

OTHERS

SWEARINGEN, RODGER, and PAUL LANGER. *Red Flag in Japan: International Communism in Action, 1919–1951.* Pp. xii, 276. Cambridge, Mass.: Harvard University Press, 1952. $5.00.

Professor Edwin O. Reischauer, in his introduction to this study of the Communist movement in Japan, well points out the significance of the subject. Asia is the great area for maneuver in the world struggle between Communism and democracy. In this area, Japan holds a key position, not only because of its obvious power, but because its large urban proletariat population makes it the Asiatic country which above all others, according to doctrinaire Communists, should logically be Communist. Japanese Communism closely parallels Western Communism while affording special insight into the situation in Asia. Japan therefore comes close to being a "median land" in the study of a typical Communist movement.

The authors, Messrs. Swearingen and Langer, have done justice to their significant subject. They have made full use of their unusual linguistic skill, academic training, experience in military intelligence, and wide contacts in Japan to analyze competently the flood of party literature, reminiscences of Japanese Communist leaders both active and apostate, formerly secret police records, and other materials which have recently become available.

The first third of the book which deals with the prewar and wartime periods, while full of fascinating revelations to the student of Japanese history, reads somewhat like a concentrated chronicle. Space limitations, no doubt, prevented the integration of the story of the Communist movement more fully with the general history of Japan.

There can be little complaint, however, about the remainder of the book which deals with the spectacular resurgence of the Communist movement under the peculiar conditions prevailing in postwar Japan. The organization, program, strategy and tactics, leadership, factionalism, international connections, and domestic repercussions are all exposed so systematically and skillfully as to be thoroughly elucidating.

There are a very few factual slips, such as the identification of Hatoyama as a leader of the Progressive instead of the Liberal party. One might wish for more adequate explanations of such intriguing matters as the apostasy of men like Sano, the personality incompatibility between Tokuda and Nozaka despite their agreement on policy, and the recurrence of systematic violence even during the period of the "lovable party." But this would be asking for definitiveness and perfection in a pioneer work.

The authors have succeeded admirably in showing how the kaleidoscopic Communist maneuvers amid the confusion of postwar Japan fit into a definite pattern of international Communist intrigue. Despite the moderate and objective tone of the book, it conveys disquieting implications of the impact of the conflicting ideologies of the West upon an Orient in ferment.

KAZUO KAWAI

Defense of Freedom. By the former Editors of *La Prensa.* Pp. 315. New York: The John Day Company, 1952. $4.00.

If there were an award for loyalty and endurance—and incidentally one for understatement!—the editors of the now eclipsed Argentine newspaper *La Prensa,* who also authored this book, would receive both without competition, for this is the story of the rape and murder of this venerable and great Spanish newspaper of Buenos Aires. It is much more sanguinary than the scattered accounts in our own newspapers permitted one to surmise. I am assured that officially we activated ourselves strongly, and editor-publisher Dr. Gainza Paz is reported agreeing that the virtually unanimous rally by the world press was unequalled and together surely delayed if not prevented the final demise. To read about the ways and methods employed by a vain despotic government to force a critical and free newspaper into *Gleichgeschaltung,* even when reported in a coldly objective, reservedly dignified manner, makes one's blood boil. This was a cat and mouse game, with the mouse enjoying the respect of honorable service, the courage of its staff, the dignity of its purpose—the defense of freedom. While the cat wins temporarily at least, the spirit for free access to truthful information quite obviously persists in this (until recently) archaic matriarchate, which even banned Grimm and Twain.

The end came on January 26, 1951, via newsprint restrictions and seizures, character defamation, huge fines on trumped-up charges (such as *descato*—disrespect to the Peróns), shutdowns, mob assaults by direction, arrests, a government inspired labor dispute, Propaganda Bureau's (Sublabor dispute, Propaganda Bureau's (Sub-secretariat of Information and Press) chicanery, and finally overt gangsterism with wrecking and deaths. The editor driven into exile, the 1300-strong staff forced out and hounded down, plant and property stolen, the name usurped, and the hoax of a newspaper perpetuated with the help of stooges—this is the state of affairs now. But no one is fooled, not even the dictator. For he must be haunted by some of *La Prensa's* old editorials, reprinted here. They are testimony that Peróns come and go, but that the freedom of the press shall persist, as it must if we are to enjoy any other freedom. For indeed, as Kierkegaard is quoted in one of the editorials: "The content of freedom is truth, and truth makes man free."

BORIS ERICH NELSON

Hampton Institute

ADLER, JOHN H., EUGENE R. SCHLESINGER, and ERNEST C. OLSON (in collaboration with the Research Department of the Central Bank of Guatemala). *Public Finance and Economic Development in Guatemala.* Pp. xix, 282. Stanford, Calif.: Stanford University Press, 1952. $5.00.

The purpose of this study was to analyze the interaction between the Guatemalan government's fiscal operations within the last decade and the country's economic development. Techniques of analysis and experience in research gained by Adler and Henry C. Wallich in the preparation of a similar study of El Salvador (published last year) were utilized and indeed it was the acceptability of the latter work which brought from the Banco de Guatemala an invitation to undertake the study under review. The co-operation of that institution was one of the factors in the high degree of success achieved by the authors.

In the last five years, the Guatemalan government has devoted an increasing proportion of its financial resources to the country's long-run economic and social development. While much of this policy did not begin to take shape until 1949 (which year is only partly covered in this study) numerous problems involved in the process of fostered development had become clearly evident by that time and are made the focal point of the study.

The difficulties encountered by the authors in obtaining certain basic data and the necessity forced upon them of using incomplete samples or crude estimates are familiar to those who attempt research in the Hispanic-American area and place some parts of the study upon quantitatively uncertain grounds. This the authors frankly concede. The disadvantage of limited quantitative information was to some extent offset by the relative simplicity in the Guatemalan economy, but there will be readers who will feel it cannot be said, as the authors maintain, that the period cov-

ered and data available proved sufficient to determine the more general and basic quantitative features of the developing economy of Guatemala. There will be readers, also, who will regret that the study could not be projected beyond 1949. Notwithstanding these limitations, the authors have produced an illuminating study, soundly conceived and as well executed as circumstances permitted. The kind of cooperation in economic research in this hemisphere which their work has evoked is much to be welcomed, and the high quality of their discriminating research attests to the value and necessity of this cooperation.

R. SMITH SIMPSON
American Embassy
Mexico, D.F.

RICHARDSON, H. G., and G. O. SAYLES. *The Irish Parliament in the Middle Ages.* Pp. x, 395. Philadelphia: University of Pennsylvania Press, 1952. $8.50.

In their introduction the authors describe this book as a monograph on the history of an institution. It is far more than that. It is that rare and delightful phenomenon, a contribution to the history of medieval Ireland which not only makes sense but assumes that there is sense to be made. While its central theme is the changing nature and function of the Irish parliament from its earliest inceptions to the passage of Poyning's Law, the book illuminates by many cross-lights both the society which that parliament served and the early history of the institution in England as well. Few students of medieval Ireland or England can have fields so specialized as to permit them to neglect this work.

So rich a book cannot be summarized here. Perhaps the simplest way to indicate its value is to remark that the final chapter, on Poyning's Law, gives no usual picture of a sudden, dramatic reversal in the relations between the colony and Westminster. Though they are fully conscious of the decisive and cumulative effect which that law was to have in the centuries that followed, the authors have already demonstrated its inevitability and that the principles contained in it were no unfamiliar novelties. In particular it represented no change in what had always been the intent of the Crown toward its Irish Lordship: ". . . for the most part, the statutes of Poyning's parliament . . . , all tended to the same end, an end that all English kings had had before them when their attention was turned to Ireland. No great spirit of independence on the part of the Anglo-Irish, but the long interruption of the Hundred Years War and the War of the Roses, had accounted for the apparent factious freedom of the colony. In 1494 the neglected reins were picked up again and tightened.

Now for an objection. There is one fault with the book which is not excused by its special subject. The authors do not treat, or seem to regard, Ireland as a country whose history for any period must be taken as a whole, with the result that they perpetuate the stale historical division between the doings of the native Irish and the Anglo-Irish, a division that at most was a broad shading, never a clear line. Not one Irish annal is cited, even for the dating of an event. No Irish name appears in a normal spelling, English or Irish; few are even casually identified; and thus it is no surprise that the most definite identification is clearly wrong. Why, for instance, should two words, "McMurgh" and "McMorghowe," be used in the index to indicate one most important family, the MacMurrough (MacMurchadha) kings of Leinster—and also fail to show that these cover references to four different persons, Art Óg, Donnchadh Mór, Murchadh Ballach, and Domhnall Riabhach (the Downaulde Reagh also mentioned)? The Anglo-Irish themselves were acutely aware of the difference. Certainly it is necessary to give the phonetic spellings of Irish names that occur in the documents cited, but, since these are so often misleadingly vague, the Irish form should be given as well: otherwise cross-referencing with native sources is terribly difficult for the student who knows no Irish, and the old fiction of two utterly divergent histories separated by a hairline continues by inertia. In this book the defect does not bulk large. However, its implications for Irish historiography are unhappy.

JOHN V. KELLEHER
Harvard University

LETTERS TO THE EDITOR

Dear Sir:

Few people are as sincere in their advocacy of good government as Mr. George H. Hallett, Jr., the executive secretary of the Proportional Representation League, who reviewed my book, *Europe Between Democracy and Anarchy,* in the January issue of THE ANNALS. But, I submit that also few people are as incapable of understanding the arguments of those who disagree with them.

One of the reasons springs from professional duty. Mr. Hallett has, on account of his position as the recognized leader of the American P.R. movement, the obligation to foster the cause of that system of voting. It is equally important that Mr. Hallett's academic background—as that of so many proponents of P.R. throughout history—lies in the field of mathematics rather than that of political science.

It is natural for the mathematician to be struck by the discrepancy between the share of the votes and the share of the seats obtained by parties under the majority system. He feels that the discrepancy is unjust, and sets out to devise a system which removes it. The political scientist, on the other hand, will ask himself whether the mathematician does not take for granted what he is supposed to prove. He first considers the question whether representation in the sense of a mere reflection of existing political divisions is the true purpose of parliamentary bodies, or whether, since it overlooks the requirements of integration and decision, it does not mean fragmentation. Furthermore, he will, as soon as he thinks in terms of political philosophy, be inclined to agree with what Jacques Maritain has expressed in these words: "In order to eliminate, in addition, every attempt to introduce the 'Trojan horse' of proportional representation into the democratic structure, let us note that just as the common good is not a simple sum of individual goods, so the common will is not a simple sum of individual wills."

The political scientist will finally remember that the "will of the people" is in a democracy, among other factors, a function of the system of voting. We get one kind of public opinion, tending toward integration and decision, under the majority system, and another kind, tending toward disintegration and indecision, under P.R. In the words of Maurice Duverger, the proposal of the proponents of P.R. to "photograph" the different sections of opinion, as if they had an existence independent of systems of voting, amounts to an attempt to "photograph the fog."

Mr. Hallett errs in regard to points of fact as well as in regard to points of principle. Considerations of space limit me to just one example. Mr. Hallett starts out with the statement: "In the recent British elections the Labour party polled . . . more votes than any other party." Evidently, he fails to consider the uncontested constituencies. A correspondent of *The Times* (issue of October 29, 1951) who assigned, as is customary, seven-eighths of the vote in these constituencies to the party which carried them, arrives at the conclusion that the Conservatives had the support of 6,000 votes more than Labour. What is more important, British elections are considered primarily a decision as to which cabinet the electorate intends to be formed, rather than a mere designation of deputies. There remained in 1951 more than 700,000 Liberal votes. As Mr. Attlee said, "when it came to a point" the great majority of the Liberals preferred Conservative to Labour candidates. If we take this factor into account, the Conservative lead in popular support, as of that time, becomes incontrovertible.

Mr. Hallett errs, once again, when he says that the Conservatives "were given power to undo as much of its [Labour's] work as they pleased." Anyone acquainted with British politics could advise him that this is not the case. In fact, the Conservatives have to limit their revisions of Labour's policies very carefully. Besides, Mr. R. A. Butler, the present Chancellor of the

Exchequer, is no laissez-faire economist; his far-reaching acceptance of Labour-sponsored policies demonstrates rather clearly what I termed "inter-party integration," that is, the adjustment of one major party to the other in response to the common dependence on the marginal voter.

In conclusion, I should like to refer to Mr. Hallett's claim that "Professor Hermens . . . suggests that the British Labour party would have been justified in some deliberate gerrymandering to compensate for the wastage of its votes in the districts where it has top-heavy majorities." This is an insinuation. I referred to the redistribution of seats made in favor of the mostly Conservative suburban areas where population has increased heavily, and added: "While this redistribution was an overdue measure of fairness, the previous situation had served to compensate for a factor which operated to the disadvantage of Labour." I merely stated a fact; in this case as in others Mr. Hallett feels qualified to impute motives to me for which there is no basis, except the assumption that there must be something morally amiss with anyone for whom the virtues of P.R. are not as self-evident as for him.

FERDINAND A. HERMENS
South Bend, Indiana

Dear Sir:

Professor Hermens' letter really amazes me. My opinion of him agrees completely with the opinion he expressed of me—that "few people are as sincere in their advocacy of good government," but "also few people are as incapable of understanding the arguments of those who disagree with them."

Take the paragraph with which he ended his letter. He thinks I attacked his moral character (!) because I stated that he suggested a gerrymander. What I said had nothing to do with morals. Unlike most gerrymanderers Professor Hermens suggested manipulating districts with the commendable motive of correcting some of the vagaries which characterize the single-member district system with plurality voting. After the sentence about reapportionment that he quoted as presumably the one on which I based my "insinuation," he went on to say: "The latter (Labour) had been 'carrying coals to Newcastle'; it enjoyed top-heavy majorities in a number of constituencies from which it benefited no more than in the United States the Democrats benefit from their top-heavy majorities in the solid South. The Conservative vote was more evenly, and much more advantageously, distributed. . . . Where such a condition prevails, and the division of the popular vote is fairly even, with the handicapped party enjoying a small lead, near-deadlocks may repeat themselves. Awareness of this fact could suggest the adoption of measures designed to mitigate the effects of this condition until such time as a sufficient shift in the popular vote is expected to give a clear parliamentary majority to one side or the other." This is something more than a mere statement of fact, and I do not think I have misstated its purport.

Professor Hermens says I erred in points of fact and then gives as his only example a statement in which I was patently correct: "In the recent British elections the Labour party polled . . . more votes than any other party." He seeks to disprove this by allowing for votes which were not cast, about which I said nothing. What he meant, doubtless, was that my statement was misleading. But was it? To bring the Conservative total barely above that of Labour he assigns the party which returned its member in each uncontested district seven-eighths of the district's votes, which is clearly preposterous. Does he really think that Labour and Liberals together would have polled only one-eighth of the votes in the uncontested Conservative districts if they had chosen to contest them?

And as for his adding in the Liberal votes as supporters of the Conservatives, that is pretty unfair to the Liberals. The Liberals would prefer to elect their own members, as they could under proportional representation. If they had been fairly represented, they would have been in a position to put some restraints on the Conservative minority whenever they disagreed with it. As it is, the Conservative minority with its unrepresentative majority in Parliament is restrained only by its conscience and sense of propriety and by its judgment as to what is good politics for the future.

Professor Hermens attempts to discredit my observations, first by suggesting that my advocacy of P.R. arises from "professional duty" as a leader in the P.R. movement and executive secretary of the Proportional Representation League, and second by saying that my "academic background . . . lies in the field of mathematics rather than that of political science." The case I made ought to be judged on its own merits regardless of how I came to make it, but actually both of these statements are misleading and are fairly typical of the half-truths which pervade his writings. For nearly twenty years I have received my salary not from the Proportional Representation League which I serve on the side as a labor of love, but from the Citizens Union of the City of New York. And as for my academic background in mathematics, it was confined to the years preceding receipt of a doctor's degree from the University of Pennsylvania in 1918. My whole professional life since then has been in the field of political science, mostly in close contact with the actual operations of government and frequently participating in it, rather than in academic circles, though I have also taught political science courses at Brooklyn College, Hunter College, City College (New York), and New York University. Anyway, a little training in the logical processes of mathematics never hurt anyone.

With these few comments I invite the readers of THE ANNALS to reread my review of Professor Hermens' book and see if they do not consider it both logical and fair. Professor Hermens did not prove his theories about P.R. which he elaborated in his book and repeated as if they were facts in his letter. GEORGE H. HALLETT, JR.
New York City

Dear Sir:

My attention has just been called to what purports to be a serious review of the Reinhardt, Meadows, and Gillette *Social Problems and Social Policy* by one Joseph Mayer (THE ANNALS, July 1952, pp. 152–53). The reviewer condemns the book on two counts: (1) The book is based on earlier editions by Gillette and Reinhardt and is not a "thorough-going" revision, and (2) "Most of the book . . . is in the form of a brittle superficiality."

Except for two legitimate criticisms of the authors, one for failure to catch an outdated brief discussion on government expenditures and improvement, and another for allowing a typographical error on national income to pass, the reviewer's first count rests on a contention that: (1) Reading lists at the ends of three chapters (2, 9, 15) are not up to date; (2) Chapter 11 dealing with Child Welfare is ". . . highly utopian and based largely on a so-called 'Children's Charter' formulated at a conference . . . in 1930"; and (3) Chapter 14 which deals with crime gives too much attention to ". . . Reports of the National Commission on Law Observance and Enforcement."

In support of the second count, the reviewer quotes out of context sixteen sentences culled from the entire book.

Even a cursory reading of the chapters themselves would have shown the reviewer that Chapter 2 deals with basic principles and concepts, and Chapter 9 mainly with the historical development of migration policies in this country. Other aspects of these subjects are developed elsewhere in the book. That fact might be reason enough for criticism, but one would hardly know that merely from counting publication dates at the chapters' ends. The reading lists for these chapters might have been improved by the addition of some more recent titles. The absence of such titles, however, does not reflect the content of the book as the reviewer assumes. Moreover, in my thirty years of University teaching, I have never known an instructor who relied upon the textbook reading lists for up to date materials. For such about all the author can do in the way of "suggested readings" is to provide some substantial titles least likely to be on the instructor's reserve shelves.

Even so, the reviewer reckoned without the facts. There are 294 reading references in the remaining seventeen chapters of the book; of these 123 appeared after 1941 and half of them after 1946. It should be noted also by any serious re-

viewer that the book, whatever its shortcomings, was never intended to deal with social problems as if generated and marooned in the "here and now."

If Mr. Mayer really wanted to write about this book without taking time to read it, footnotes would have been more useful than chapter reading lists. Footnotes are generally a part of the author's real working capital. There are approximately 666 footnote references in the book; of these 270 appeared later than 1942 and more than half of these after 1946.

As to the criticism of Chapter 11: This chapter quotes the "Children's Charter" formulated at the 1930 White House Conference. This formulation was a landmark in the history of Child Welfare in this country. It covers about 2 out of 23 pages in the chapter. Then follow 19 pages of discussion on stages in the Child Welfare movement and on a variety of Child Welfare services, needs, and legal and administrative problems. These discussions carry 29 footnote references later than 1941, 15 of which appeared more recently than 1945. Chapter 14 makes 10 footnote references to materials published since 1945, 2 of which are 1950. There are earlier dates in the fotnotes. They include references to such durable materials as Sutherland's *White Collar Criminal*, Murchison's early study of criminal intelligence, Harper's brief classic on *The Pragmatist Process in Law* and, of all things, to the "Report of the National Commission on Law Observance and Enforcement."

If the reviewer had looked at the footnotes in Chapter 15 instead of stopping with a publication date count of the suggested readings, he would have found that 13 out of 32 footnote references are to materials published later than 1946. Moreover, if he had actually compared the chapter content with that of its most recent Gillette-Reinhardt forerunner, he would have noted not only a revision of the statistical data but also that 15 of the chapter's 33 pages have been almost completely rewritten. With practically no effort at all, the reviewer could have found, too; that the present work is 234 pages smaller than the earlier one.

There seems little need to make a critical comment on the reviewer's collection of sentences ripped from their contexts and offered as evidences of the book's "brittle superficialities." The average reader of the review, whether or not in agreement with the author's position on the subjects discussed, will be able to sense their legitimate use as a part of a wider discussion. The sentence noted from page 7, for instance, is followed by ". . . social problems have been the result particularly of the development of certain social and cultural conditions." One of these conditions enumerated and discussed is the acquisition, ". . . insight and the power to make scientific analysis . . ." and to recognize social need. Again without the context: "Planning is essentially the foresighted and cooperative adaptation of means to ends" (p. 190), isn't it? The author is, of course, talking about *social* planning. One can only wonder about the reasons why this kind of book reviewing was ever done. At any rate, the reviewer has given us a new use for an old adjective: "brittle" (See Webster's Unabridged).

JAMES M. REINHARDT
University of Nebraska

Dear Sir:

In the foregoing letter by one James Reinhardt, in what purports to be a serious comment on my review, I should like to call attention to the following:

"Even a cursory reading . . . would have shown. . . . It should be noticed also by any serious reviewer. . . . If Mr. Mayer really wanted to write about this book without taking time to read it. . . . If the reviewer had looked at the footnotes. . . . With practically no effort at all, the reviewer could have found. . . . The reviewer quotes out of context. . . ."

That Mr. Reinhardt does not like my review is understandable. But with respect to such innuendos, to quote him further, "one can only wonder about the reasons." Could it be that the man himself, like his ratiocinations, is also frangible? (As for "brittle," I would, of course, not dare use the term again.)

To the readers of this column, I would suggest a comparison of my review in the July 1952 ANNALS with the pages of the book to which reference is made in Mr. Reinhardt's letter; also, with other pages of the book at random. Naturally, in a review, one can adopt nothing more than a sampling procedure. To one trained, as was the reviewer, under such men as Peabody, Carver, and Palmer at Harvard and Devine, Lindsay, and Giddings at Columbia, the book in question is replete with thin generalities, doubtful platitudes, and, what is worse, with the type of glib utopianism (to use a colorless word when a much stronger one might well be in order) to which most Americans rightly take exception.

This may be further illustrated from Chapter 2, which Mr. Reinhardt says "deals with basic principles and concepts" but which in the main strings together dogmatic assertion about democracy and government, much of which is highly questionable, especially the statements about "planning." Quoting:

"To carry into operation anything like the total national planning will, of course, involve much regimentation. . . . Business will have to take directions and sometimes be put in a strait jacket. . . . Much resentment, struggle, and resistance is to be anticipated. To many thoughtful people this seems to be the only way to save our collective lives and individual entities. To them the alternative appears to be the collapse of modern society through self-destruction. On the other hand, such overall and drastic planning would not leave much of the former democracy" (p. 45).

As for the author's definition of social planning as "foresighted and co-operative adaptation of means to ends," he also approves of its being defined as "an effort at simultaneity" involving a "succession of actions," which he then outlines in such broad generality (p. 191) that a "foresighted and co-operative" gang of criminals planning a bank robbery and "adapting means to ends" with split-second "simultaneity" would fit the description admirably.

In connection with the author's contention that the book has been considerably revised, methinks he protests too loudly. All that my review pointed out on this score was that the revision has apparently "not been thoroughgoing"—this Mr. Reinhardt admits.

Yours truly,

JOSEPH MAYER
