Introduction: A Philosophy of Aging

By CLARK TIBBITTS and HENRY D. SHELDON

THIS volume has a purpose. The purpose is to present an inventory of the characteristics of aging people, to assess their potentialities for further integration in community life, and to examine the conditions essential to maintaining such integration.

The title of the volume is "Social Contribution by the Aging." The underlying philosophy of all the contributors is (*a*) that there are positive roles for aging and aged people through which they can make valuable contributions to American society and (*b*) that these roles offer opportunity for continuing, if not increased, individual satisfaction in the later years. A corollary of this point of view is that assignment of active roles to our older citizens will resolve many of the individual, family, and community problems that have arisen out of the growing number and proportion of older people.

OUR AGING POPULATION

The presentation of statistics on the aging population poses something of a dilemma. On the one hand, it is insisted, with a good deal of justification, that there is no single chronological age above which the population may be regarded as elderly; on the other hand, the specification of such a lower limit is a necessary condition for statistical analysis. This situation is met in part, at least, by the presentation of figures for several age levels.

Preliminary sample data from the 1950 Census indicate that approximately 12 million persons, or about 8 per cent of the total population, were 65 years old and over. The corresponding figures for persons 60 and over were about 18 million, or 12 per cent; for persons 55 and over, 25.5 million, or 17 per cent; and for persons 50 and over, 34 million, or 23 per cent of the total population.

The older population, defined in terms of any of these various levels, is not evenly distributed among all segments of the population. There were, for example, relatively more elderly persons among whites than among nonwhites in 1950. Thus, persons 55 years old and over constituted about 17.5 per cent of the total white population but only 11.5 per cent of the nonwhite population; and for persons 65 and over, the corresponding figures were 8.5 per cent and 5.7 per cent respectively.

The difference in age between whites and nonwhites is reflected in the figures on the geographic distribution of the aging population. In the Northeast, the North Central States, and the West the proportions of persons 55 and over, and 65 and over closely approached the national percentages for these age groups. In the South, where about one-fifth of the population is nonwhite, these proportions were somewhat lower. It was not, however, purely a matter of color. The proportions of persons 55 and over, and 65 and over in the white population of the South were 14.5 per cent and 7.0 per cent respectively, as compared with 17.5 per cent and 8.5 per cent for the total white population.

Variations in the relative number of elderly persons among the states were somewhat greater than among regions. In states such as Iowa and New Hampshire more than 10 per cent of the

population were 65 years old and over, and more than 20 per cent were 55 and over. At the other end of the scale, less than 6 per cent of the population in New Mexico, South Carolina, and North Carolina were 65 and over, and less than 12 per cent were 55 years old and over. In the absence of migration, the older population would be expected to be a relatively small proportion of the population of those states characterized by high fertility and mortality, and a relatively high proportion in those states in which fertility and mortality are low. Such expectations of course must be modified in terms of historical trends in the volume and age distribution of both in-migrants and out-migrants. Since these trends tend to be unique from state to state, there is no general formula for explaining specific differences. It may be noted in passing that in general, elderly persons move less frequently than young adults. Thus, even for states such as Florida and California, which are the most widely recognized destinations for elderly migrants, the impact of large numbers of migrants at the upper age levels on the total age distribution is cushioned by the simultaneous in-migration of larger numbers of young adults.

Among persons 65 and over, the number of women exceeds the number of men by somewhat more than half a million. For every 100 women in this age group there were fewer than 90 men. These figures reflect the fact that death rates, throughout the age scale but particularly at the upper age levels, are higher for males than for females. This higher mortality among males, combined with the tendency of women to marry, on the average, about three years earlier than men, makes widowhood the most characteristic marital status of women 65 and over. In March 1950, slightly more than one-half of the women in this age group were widowed, whereas less than one-fourth of the men were widowers.

The demographic revolution

The American population of 1950 was a considerably older population than that of 1850. In this hundred-year period the median age increased from 18.9 years to 30.1 years. As the accompanying table indicates, for ages 30 and over, the proportion of persons in the total population at each ten-year interval was greater in 1950 than in 1850, and the relative gain increased progressively with age. Thus, the proportion of persons 40 to 49 years of age in 1950 was about one and one-half times as great as in 1850; the proportion 50 to 59 years, more than twice as great as in 1850; and the proportion 70 years and over, more than three times as great.

The contrast between the age structure of the current population and that of 1850 is apparent from the accompanying chart which presents in graphic form percentage distributions of the population in 1850, 1940, and 1950 by age and sex. The shaded areas in the age intervals for the population 30 and over in the "age pyramids" for 1940 and 1950 represent the relative increases in these intervals over 1850.

This shift in age composition is the result of what has been called the demographic revolution which followed closely upon the heels of the industrial revolution in western Europe and in the United States. The demographic changes involved are revolutionary in the sense that there were unprecedented declines in mortality and in fertility.

In the United States the declining fertility is clearly evidenced by changes in the ratio of children under 5 years of age to women of childbearing age. For the white population, this ratio, adjusted for the underenumeration of children and for shifts in the age distribution of females, dropped from 892 children under 5 years of age per 1,000 women 20 to 44 years old in 1850, to 419 in 1940.[1] This decline was generally continuous, decade by decade, throughout the period. The culmination of this trend is reflected in the census figures for 1930 and 1940; in both of these years the absolute number of children under 5 was less than it had been in the immediately preceding census.

The decline in mortality is reflected in the increasing expectation of life at birth. The available evidence indicates an expectation of life in the neighborhood of 40 years during the middle of the nineteenth century, whereas by 1949 this figure had increased to 67.6 years. Although a large part of the increase in the expectation of life can be attributed to the reduction in the mortality of children, there has also been an appreciable decrease in the mortality of older persons.

POPULATION OF THE UNITED STATES, BY AGE AND SEX: 1950 AND 1850

Age and sex	Number		Per Cent	
	1950	1850[a]	1950	1850
Total	150,697,000	23,191,876	100.0	100.0
Under 10 years	29,565,000	6,743,185	19.6	29.1
10 to 19 years	22,094,000	5,423,744	14.7	23.4
20 to 29 years	23,420,000	4,279,958	15.5	18.5
30 to 39 years	22,794,000	2,827,577	15.1	12.2
40 to 49 years	19,048,000	1,847,806	12.6	8.0
50 to 59 years	15,504,000	1,110,226	10.3	4.8
60 to 69 years	11,010,000	610,301	7.3	2.6
70 years and over	7,262,000	349,079	4.8	1.5
Male	74,633,000	11,837,660	100.0	100.0
Under 10 years	15,126,000	3,412,511	20.3	28.8
10 to 19 years	10,982,000	2,712,898	14.7	22.9
20 to 29 years	11,381,000	2,196,171	15.2	18.6
30 to 39 years	11,211,000	1,491,291	15.0	12.6
40 to 49 years	9,549,000	968,323	12.8	8.2
50 to 59 years	7,644,000	576,131	10.2	4.9
60 to 69 years	5,393,000	309,755	7.2	2.6
70 years and over	3,347,000	170,580	4.5	1.4
Female	76,064,000	11,354,216	100.0	100.0
Under 10 years	14,439,000	3,330,674	19.0	29.3
10 to 19 years	11,112,000	2,710,846	14.6	23.9
20 to 29 years	12,039,000	2,083,787	15.8	18.4
30 to 39 years	11,583,000	1,336,286	15.2	11.8
40 to 49 years	9,499,000	879,483	12.5	7.7
50 to 59 years	7,860,000	534,095	10.3	4.7
60 to 69 years	5,617,000	300,546	7.4	2.6
70 years and over	3,915,000	178,499	5.1	1.6

[a] Figures include adjustments for age not reported.

Effect of fertility and mortality changes

The net effect of these changes in fertility and mortality has been to increase the proportion of the total population at the upper age levels. As the birth rate continued to decline, the pro-

POPULATION OF THE UNITED STATES, BY AGE AND SEX: 1850, 1940 AND 1950

portion of younger persons decreased and, by default, so to speak, the proportion of older persons increased. The decline in mortality reinforced this trend, not only because of the modest reduction of mortality at the upper age levels, but also because the reduction in mortality at the lower age levels permitted an increasing proportion of persons to survive to the upper age levels. According to mortality rates at the beginning of the century less than 60 per cent of the children born would live to reach the age of 50; whereas by 1948, almost 86 per cent would reach this age.

The increase in the proportion of older persons was augmented by the addition of about 27 million immigrants to the population in the last quarter of the nineteenth century and the first quarter of the twentieth century. These immigrants entered the population in large part as young adults, but with the passage of time have moved into the older ages. The effect is particularly marked because immigration has been relatively negligible since 1925, and thus this group has not been replaced at the young adult level.

If the trends in mortality and fertility characteristic of the period prior to 1940 are projected into the future, the proportion of aging persons in the population will continue to increase. The fertility experience of the decade 1940 to 1950, however, raises some questions as to whether a pattern of declining fertility should be projected into the future. During that decade the birth rate rose to about the level of the early twenties, and at the present writing there is no evidence that a return to the low levels of the thirties is imminent. If this pattern of low mortality and high fertility were to continue through the next several decades, it seems probable that the proportion of aging persons would remain roughly at its present level. It may be noted in this connection that even with the increasing number of births within the past decade, the median age of the population rose from 29.0 years to 30.1 years, and the percentage of persons 60 years old and over rose from 10.4 to 12.1.

Current projections of the population under the assumptions of "high" fertility and "low" mortality indicate for 1960 a population 60 years old and over of 23.5 million or 13.1 per cent of the total population.[2] Assumptions of "low" fertility and "high" mortality indicate corresponding figures of 22.1 million and 13.7 per cent. What will happen, of course, will depend on the relative magnitude of changes in fertility and mortality, particularly as the latter is related to age. If, for example, real progress is made in reducing mortality from those diseases characteristic of later and middle life, such as heart disease and cancer (and there is evidence in support of this supposition), then substantial increases in the aging population are to be expected both as a proportion of the total population and in absolute numbers.

In view of the fact that elderly persons have become an increasingly large segment of our population, and the probability that their numerical importance will increase, it is particularly fitting at this time to give serious consideration to the development of positive philosophy as to their role in the larger society.

THE CHANGING CONCEPT OF AGING

The point of view expressed at the beginning of this introduction calls for a new concept of aging—a concept that

[2] Jacob S. Siegel and Helen L. White, *Current Population Reports*, Series P-25, No. 43, "Illustrative Projections of the Population of the United States 1950 to 1960," U. S. Bureau of the Census, August 11, 1950 (processed).

gives recognition to the positive as well as the negative aspects of maturation. More and more of us are living beyond the period of reproduction and nurture of children and beyond the conventionally defined period of economic usefulness. Hopefully, we have begun to arrest and reverse the attitudes and social practices that have tended to ignore the needs of older individuals and the potentialities for social contribution that lie in these new, later years.

The concept we are outgrowing

The concept of aging which we are outgrowing is based on an assumption of general organic, functional, and psychological deterioration beginning in middle life and proceeding rather rapidly until it becomes disabling and finally incapacitating. Cosmetic changes, deliberation in thought and action, attainment of the status of grandparent, have been taken as signs of advanced age and as indication that the period of usefulness is drawing to a close. Consistent with these beliefs, little or nothing has been expected of older people, and many of them do little or nothing.

Looking back, it is not difficult to see the origin of the attitudes that have tended toward regard of older people as superfluous. The country was shifting to an industrial economy in a period when youth was plentiful and when comparatively few people lived beyond the 50's or early 60's. Industry required great strength and long hours of work. Young, strong bodies were needed and were available. There were relatively few old people because childhood diseases, the infectious diseases of early adulthood, and the accidents of childbirth took off a good many before middle age.

Increasing application of machines and power produced more goods than purchasing power could absorb, and simultaneously shortened the work week. The birth rate continued to decline and operate as a further check on the total capacity of the country to consume the industrial output. Thus, when a plethora of workers developed in the 1930's it was the older ones (along with the very young) whose services were eschewed.[3]

With industrialization has come urbanization and other new ways of life. Oriented toward work outside of the home and toward educational and social activities provided by community agencies, the large, self-sufficient, consanguineal type of family has begun to give way to the two-generation, conjugal group in which grandparents have no positive role.[4] As one consequence, most urban housing has been designed for two generations and does not meet either the space or psychological needs of children, middle-aged, and grandparents trying to continue on in the family group.

The mobility of the American people has furthered the separation of the adult generations. Likewise, fewer children per family and longer-lived parents in the new type of economy have made it more difficult for the middle generation to provide for both their own young children and their aging parents. Faced with the necessity of choosing, it has favored the children and left it to the community to look after the parents.

Our first attempt at adaptation to aging, then, was to set older people

[3] E. W. Burgess, "The Growing Problem of Aging," in *Living Through the Older Years* (C. Tibbitts, Ed.), Ann Arbor: University of Michigan Press, 1949; and Philip M. Hauser, "Social Implications of an Aging Population," presented at the Northwestern University Fourth Centennial Conference, Chicago, June 7, 1951.

[4] Wilbert E. Moore, "The Aged in Industrial Societies," in *The Aged and Society*, Champaign, Ill.: Industrial Relations Research Association.

aside as no longer useful but, having made their contributions, as entitled to withdraw and enjoy the leisure of their declining years. Private and public pension systems and grants-in-aid appeared and tended to formalize retirement in the seventh decade of life. We even talked of lowering the age when it should become financially feasible to do so.

In voluntary activities, too, we frequently encouraged older people to give way to an oncoming generation eager for advancement and for opportunity to try out new ideas. In consequence, although with tongue in cheek, we undertook to establish behavior patterns for older people, organized around hobbies, fishing, and reflection. Lacking suitable housing facilities, we consigned the older generation to corner rocking chairs, to lifeless rooming houses, and even to mental hospitals.

To a degree, older people have accepted the concept of limited usefulness, but they have not been satisfied. There is, in fact, evidence of a good deal of dissatisfaction.[5] There is ample evidence of their bewilderment and feeling of insecurity in a fast-moving world that has failed to provide assurance of income and opportunity for obtaining normal satisfactions and for making continuing contributions to community life.[6]

We are now beginning to question the validity of earlier assumptions and the attitudes and practices they led us into. In two nation-wide meetings within recent months—the National Conference on Aging called by the Federal Security Agency, and the Second International Gerontological Congress—along with scores of state and local meetings, hundreds of people have begun to explore the nature and the implications of both individual and population aging and are reaching new understanding. This volume, in a fairly real sense, presents the status of current thinking on the subject.

The nature of aging

The aging process is now under intensive study in the laboratory, in the clinic, and in the field. Enough is known to characterize it as a process involving numerous interrelated elements, biological, psychological, and sociological in nature. Aging per se is so complicated with disease processes on the one hand and with the restrictions of culturally assigned roles on the other that it is difficult as yet to describe or measure it with any degree of confidence.

Biological aging is described by Dr. Carlson and Dr. Stieglitz in this volume and by Shock and others, largely in terms of tissue desiccation and lowered rate of oxidation, cellular atrophy, and decrease in elasticity and strength of tissue and muscle. It has been shown, also, that the process is a very gradual one, that it differs widely among individuals, and that there are variations in the rate of aging of different organ systems within the same individual.[7]

It appears on the basis of recent research that the rate of biological aging may be subject to some control through reduction of the insults of disease, through nutrition, and through modification of endocrine function. Thus the period of vigor may be extended into the period now regarded as old age. Indeed it has probably already been

extended. Furthermore, since most human tasks are being lightened, it is virtually certain that, in biological terms, potential usefulness is being prolonged. A good deal of physiological decline, in fact, may have very little significance in the light of our ability to match individual traits with job requirements and to adjust requirements to specific capacities.

Psychological aging is being studied with reference to sensory and perceptual processes, motor ability, general intelligence, learning and memory, vocabulary, personality, and adjustment. Studies reveal measurable declines in the capacities that have a clear organic base, as is indicated in Dr. Kaplan's article. It is too early to come to definite conclusions regarding traits such as intelligence, learning, and vocabulary, because of their relationship to other factors, including occupation, education, and extent of activity or use. One specialist in the field, Dr. Donahue, has made the cogent suggestion that it may be impossible to measure changes in certain of the mental characteristics until a sizable group in the population is able to experience normal, active aging.[8] Nevertheless, it has been demonstrated that mental functioning can persist into advanced years. The variations and differentials found in biological traits are present also in the psychological sphere.[9]

Sociologically, aging is partly a function of one's situation and partly of the attitudes and folkways of the society in which one lives, as is clearly shown in the article by Professor Simmons. Socially defined roles that encourage the individual to withdraw from participation and to submit his affairs to the management of others make him aware that he has entered a new phase of life.

[8] Wilma T. Donahue, "Psychological Aspects of Aging," *ibid.*

[9] *Ibid.*

Situationally, aging has its onset during the 40's and 50's when offspring begin to fend for themselves and to require less parental attention. The problem (or opportunity) of utilizing leisure time is increased when children leave home altogether. Similarly, as Professor Burgess shows, the need for companionship or close ties becomes still more acute with the passing of husband or wife, relatives, and close friends.

Sociological and psychological aging advance still further when retirement from work comes and when infirmity or long-term illness reduces mobility. Here needs for useful activity and social participation assert themselves, along with problems of financial security, medical care, and suitable living arrangements.

Despite the variety of factors involved, it must be apparent that the possibilities of arresting the sociological aging process are at least as great as those in the biological and psychological areas. Social attitudes that define aging are clearly susceptible of change, and healthy adjustment can be made to some of the events or crises of the later years.

The new concept

Here, then, lies the challenge of aging, both individually and socially. There are organic and mental changes characteristic of aging. They are gradual, however, and need constitute little or no serious impairment until much later than has been commonly supposed. There are situational changes to which adjustment can be made and some of which offer new opportunities.

Attainment of middle age may be viewed as bringing us to the threshold of a new phase of life—a phase that can represent a new stage of development, growth, maturity, and social contribution. Freed to an increasing extent from the responsibilities of early adulthood, we find ourselves ready to make further and broader contributions to the social welfare, effective because they grow out of half a century of experience gained through living. And this, we submit, is the role older people would choose for themselves. Dr. Havighurst shows, beyond question, that older people want activity, friendships, emotional security, a sense of usefulness. Socially, our aging people constitute a huge natural resource eager to be exploited.

AREAS OF CONTRIBUTION

Part II of the present volume discusses the question of continued participation in gainful employment. Miss Bancroft describes the current situation and discusses trends and prospects, after which Mr. Abrams analyzes existing barriers to increased participation. The views of management, labor, and the farmer are given in a series of shorter essays under the general title "Should There be a Fixed Retirement Age?"

Part III is concerned with potentialities for contributions in other spheres. Mr. Wheeler, an older man himself, discusses the desire for continued contributory status and the creative potential behind it. Miss Bunker outlines the opportunities and satisfactions in creative handcrafts. The Ogdens describe the potential roles of older people in community life. Professor Burgess considers the older person as a family member and points out that we need much more information in this area.

THE ENVIRONMENT OF AGING

The reader who has come this far and who traverses the first three sections of this volume will recognize that the environment of aging has a good deal to do with the aging process itself and with the extent to which the aging person may remain an active member of society.

Section IV is devoted to consideration of the conditions that need to be provided for maintenance of function and contributory status. The point of view of the several contributors, Dr. Wilma Donahue, Dr. Hertha Kraus, Miss Dorothea Ramsey, Miss Mary Switzer and Dr. Howard Rusk, Mr. Wilbur Cohen, Mr. Harry Levine, and Mr. Charles Odell, is that most older people can and will maintain themselves as self-sufficient members of society once they are given the opportunity. Thus, education, housing, community services, health promotion and rehabilitation, income maintenance, activity programs, and employment counseling are seen as just normal community facilities, as are elementary, secondary, and college education, pediatric clinics, vocational counseling, playgrounds, and clubs for children and young adults. They are not to be regarded primarily as welfare services in the sense of ministering to psychologically, medically, and financially dependent old people, but rather as part of the environment through which we make normal adjustments to the changes and circumstances of the later years.

This is not to say that health, welfare, and custodial facilities will not be required for the sizable number of people who have reached and will reach the later stages of infirmity or disease. While, under the new concept, increasing numbers will die in harness, there will still be need for infirmaries, nursing homes, long-stay hospital annexes, and other forms of intensive assistance. But even these facilities are now recognizing the contributory potential of older people and are beginning to develop sheltered workshops, community activity centers, and programs for the homebound.

There is one final thought. Tradition-

ally, families and employers have tried to assume direct responsibility for the well-being of the older population. The new concept, which makes functional citizens of the aging, places responsibility for provision of the environment and services on the entire community. Increasingly, the middle generation will discharge its responsibilities to the older generation through support of community services. When those of us in the middle generation, who are also aging, see ourselves and our parents as satisfied, useful members of society, self-managing and self-sufficient, we shall lose the bewilderment, the fear, and the feelings of guilt that characterize the older members of an aging population. Our attitudes and our culture are now in a stage of transition. In developing the programs for financial security, for independent living and activity, for service to society, as outlined in Section IV, we are adopting the new philosophy.

ACKNOWLEDGMENT

The plans for this issue of THE ANNALS were developed with the assistance of the members of the Federal Security Agency's Committee on Aging and Geriatrics. The committee is an advisory body designed to assist and to promote co-operative activities among federal agencies that have programs that affect the well-being of the aging. It seeks to develop a keener recognition by government and by the public of the special needs and problems of the aging, and to foster the development of programs for their solution.

The Special Editor wishes to acknowledge the help given by Dr. Lewis Rohrbaugh, Dr. Carl C. Taylor, Dr. Esther Phipard, Mrs. Lydia Lynde of the Department of Agriculture; Dr. Henry Sheldon, Department of Commerce; Dr. Leonard Silk, Housing and Home Finance Agency; Mr. Charles Odell, Mrs. Pearl Ravner, Miss Helen Ringe of the Department of Labor; and from the Federal Security Agency the help of Dr. Homer Kempfer, Office of Education; Mr. Irving Ladimer, Dr. J. W. Mountin, Dr. Benjamin Shimberg, and Dr. C. J. Van Slyke, Public Health Service; Mr. Jacob Fisher, Miss Rose McHugh, and Miss Naomi Riches, Social Security Administration; and Mrs. Phyllis Frances and Mr. Donald Dabelstein, Office of Vocational Rehabilitation.

Clark Tibbitts, Wahington, D. C., is chairman of the Federal Security Agency's Committee on Aging and Geriatrics. He has been connected with the United States Public Health Service; was director of the Institute for Human Adjustment at the University of Michigan; directed the National Conference on Aging in 1950; and served as vice president of the Second International Gerontological Congress in 1951. He is coeditor, with Wilma T. Donahue, of Living Through the Older Years, Planning the Older Years, and Growing in the Older Years.

Henry D. Sheldon, Ph.D., Washington, D. C., is chief of the Demographic Statistics Section of the Population and Housing Division, Bureau of the Census, Department of Commerce. He has served as statistician with primary responsibility for institutional statistics and statistics on nativity and parentage with the Bureau of the Census and has published a number of analyses in these fields.

Social and Psychological Needs of the Aging

By ROBERT J. HAVIGHURST

IN considering the needs of older people it is well, first, to remember that older people have the needs that are common to all people, and, second, that they have special needs due to the fact that they are old people.

The needs which are common to all people are: (1) emotional security and affection, met by receiving love and by living in a world where things are predictable and come out usually in a favorable or at least tolerable way; (2) social recognition and status, met by receiving respect from people who count in one's world; (3) a sense of worth and self-respect, met by living up to one's ideals; (4) adequate food, clothing, shelter, and health.

Whenever these common needs are not met as well as people have grown accustomed to expect, there is a social problem. If we have a social problem of old age today, it is because these needs are not being met adequately in the lives of many older people.

Why are these needs not met as well for older people as they are for middle-aged people in our society? The reasons lie in the fact that both the human body and the human society systematically "insult" the person as he grows older and make it difficult for him to meet his needs.

HOW OLD AGE INSULTS THE PERSON [1]

Loss of physical attractiveness. Most of us, men as well as women, learn to place a high value upon our beauty and our strength. At the very least, we value highly our physical and mental vigor, our ability to do a hard day's work. In addition, most of us value our manliness or womanliness—the things that make us attractive to the other sex. Against these values the advancing years wage war. They rob a woman of her ability to have children, usually before she is fifty. Many women interpret this as a sign that they have lost much of their worth as women. Men do not fare much better. Already in the forties most of them lose much of their hair, grow fat in awkward places, and have to wear bifocal glasses. Both sexes lose the smooth skin that they value highly as a sign of youth. Then as the years go on, there is a real decrease of enjoyment of the physical aspects of love between the sexes, and finally the external sense organs of hearing and sight begin to lose their acuity.

These insults to the self usually strike us in vulnerable places. We express it by saying that we do not like to grow older—but what we really mean is that we have invested a great deal of emotional capital in our physical attractiveness, and this investment is going bad on us.

Loss of supporting persons. As if this were not enough to do to us, advancing years also rob us of the people who could best reassure us that we are still attractive people, worthy to be loved. Death of husband or wife, and loss of old friends, leave us without emotional support just when we most need it.

Loss of status. In spite of inevitable loss of physical attractiveness due to middle age, most of us get along very

[1] The writer wishes to acknowledge his indebtedness to Dr. Jack Weinberg for this concept of the insults due to aging. See Weinberg's "Mental Health Needs of the Aged" in *Proceedings of the National Conference of Social Work, 1948* (New York: Columbia University Press, 1949), pp. 403–409.

well with the status and prestige and power of middle age. At this age we are usually at the peak of our ability to work, we are as well off financially as we shall ever be. More people look up to us than ever before. Then we begin to lose these things. Younger people come along and take the lead away from us in our social and civic organizations. We are no longer in line for promotion in our business. And the crowning blow of all may come in the form of forced retirement from work at a time when we need more than ever to have the assurance that we still count for something in the world. In addition, to some people old age means economic dependency. They are no longer able to support themselves, and must take a status of old-age pensioner which many of them have thought to be an unworthy status.

Loss of useful and respected roles. The status-giving roles begin to disappear. We lose our hold on work, the principal status-giving role for men in middle age. A woman who has become the mother of an attractive group of sons and daughters sees them depart from the home, and one day she finds that people have forgotten what a fine mother she has been. Leadership roles in civic and political and social life are taken over by younger people. There is left the custom of respecting older people for what they once were, not for what they are. A few specific roles of older people become available, and have some value, such as those of grandparent, world traveler, village sage. But these are usually poor substitutes for the roles we have lost.

Lessening of physical health and vigor. When we have asked people in their sixties what they feared most about old age, a great many of them have said they were afraid their bodies would fail them and they would become helpless. At the very least they must anticipate a decreased physical vigor, but this could be tolerable if it were a slow, predictable change. What undermines emotional security is the fear that one may suffer a heart attack which will leave one an invalid, or that a crippling arthritis may come on, or that cancer may develop insidiously.

DEVELOPMENTAL NEEDS OF OLDER PEOPLE

The aging body conspires with society's youth-favoring attitudes and practices to create a set of special needs of older people. Because these needs are part of the process of human development, it is well to call them "developmental needs" and to regard them in somewhat the same positive light with which we regard the developmental needs of youth and middle adulthood.

These developmental needs pose learning problems that are fully as complex as any problems faced during a lifetime. In fact, later maturity requires more learning of most people than they have had to achieve since their early adulthood. They meet more new and strange and difficult situations as older people than they have met as middle-aged people.

Later maturity is, then, a period of learning, rather than a period when learning is past. It is a period of facing new and unsolved problems, rather than a period of floating gently on the surface of familiar solutions to familiar problems. Everybody during the age period from 60 to 75 experiences several of the following developmental needs:

Adjustment to death of spouse

Often in our research we hear a man or woman say, "I hope when my wife (husband) dies I can go too. Life won't be worth while after that." This expresses the fear that a man or woman has, after living forty or fifty years with a marital partner, of having to face life without the partner. A man and wife become so thoroughly wedded that they work out a single life pattern which cannot go on when one of them drops out.

Getting along without one's spouse is usually a woman's task in the United States, because men die younger than women, and women tend to marry older men. The average woman becomes a widow before she is 70. The average man does not lose his wife until he is 85.

If a woman loses her husband, she may have to move from her house to a smaller place, she may have to learn about business matters, and, above all, she has to learn to be alone. A man has the same adjustment to make to loneliness, and he may have to learn to cook, to keep house, and to keep his clothes in order.

The solutions of this task run through the range of living on alone in the old home, moving into a small home, living in a rooming house, moving in with brothers or sisters, living with children, remarrying, going to an old people's home. Every solution requires unlearning of old ways and learning of new ways, at a time when learning comes harder than it did in earlier years.

Adjustment to loss of employment and reduced income

In the American society a job is the axis of life for most men and for many women. If the occupation goes, the individual feels that he does not count, that he is not a worthy member of society. Yet the occupation must be abandoned by the great majority of people, whether they be professional or manual workers, sometime between 60 and 70. Half of American men quit work by the age of 65.

Some people fill up the vacuum created by retirement in their lives with a useful and interesting leisure-time activity; others find a part-time job which keeps them busy and happy; too many fret and mope over their forced inactivity.

When retirement also means a serious reduction in income, another adjustment problem appears—that of reducing expenditures—which often means a narrowing of contacts. For instance, an elderly lady feels that she must drop out of the church ladies' circle because she cannot pay her dues. An old man must drop out of his lodge just at a time when he has increased leisure.

Affiliation with the age group of elders

Try as one may to keep young and to avoid being classed with the "elders," the day must come to everyone when he says to himself, "I'm not as young as I used to be. I'd better *be* my age." This day is brought on by the fact that the costs of continued participation in the middle-age group rise more rapidly than the gains. The costs consist of fatigue due to the too rapid tempo of middle life; embarrassment at being unable to keep up, physically and financially and vocationally, with the middle-age group; and a feeling of being ignored or pushed aside by younger people.

Over against these costs are the rewards of participation in the older-age group, such as a more comfortable tempo of life; ease of finding companionship among other people who have leisure time; availability of positions of prestige and leadership in organizations of older people.

Adjustment to decrease of physical vigor

The human body ages in almost every one of its cells and cellular systems. The cells gradually lose their self-repairing properties. They slow

down in their nutritional processes. The senses lose their acuity. In at least a third of the people, heart disease comes on slowly and cuts down their ability to do hard work. The individual must learn a new way of life that is in harmony with his decreased strength and health.

Making satisfactory physical living arrangements

The high incidence of heart disease and "rheumatism" in older people makes physical exertion difficult or dangerous for many of them, and argues against stair climbing and heavy housework. There is increasing danger from falls, due to the increasing brittleness of bones and their slow mending rates. A decreasing ability to masticate foods, with an increasing need for a good diet, makes good selection and preparation of food necessary. Decreasing metabolic ability of the body makes it difficult for older people to keep warm, and requires good heating facilities.

The principal values that older people look for in housing, according to studies of this matter, are: quiet, privacy, independence of action, nearness to relatives and friends, residence among own cultural group, cheapness, closeness to transportation lines and communal institutions—libraries, shops, motion pictures, churches, and so forth.

These values vary for different people. Most older people tend to cling to established housing arrangements until they become very unsatisfactory. Yet residential mobility is high, especially among the very old. Thus, living on in the familiar quarters one has known for years is not the most common solution of the problem. The older person has to decide whether to: live on in a large and increasingly burdensome house or find a smaller and more manageable place; live on alone in the old house after death of the spouse or find smaller and more convenient quarters; live alone or with one or more other people; stay in the community where he has lived as an adult or move to a place with a better climate.

GROUP NEEDS OF OLDER PEOPLE

If older people are to meet their developmental needs in satisfying ways, they must have a certain minimum of help, in the form of attitudes and services, from the community in which they live. As a group, older people have the following needs:

Satisfactory social roles, which bring social recognition and self-respect. It lies within the power of the individual to create for himself some of the satisfying social roles, such as those of friend, member of a social clique, constructive user of leisure time, informed citizen, active church member; and therefore the individual is responsible to that degree for his own happiness. But some significant social roles are denied to many older people by the community. For example, the role of worker may be denied through the practice of arbitrary retirement or prejudice against hiring older workers. Since to most people work has certain personal satisfactions as well as the purely economic meaning, the assurance of economic security does not take the place of the worker's role.

A chance to earn a living, or economic security. Older people need economic security, but under existing conditions relatively few of them can live in reasonable comfort on their own lifetime savings. Hence they need work, if they are able to work, or a system of pensions which gives them reasonable economic security.

Social and recreational facilities. Just as the community provides recreational facilities and leadership to meet the needs of youth, so it should meet the needs of older people with analogous facilities through municipal recreation departments, churches, schools, and clubs. At a minimum, the older people require meeting places, equipment for games, leadership for group recreation, and instructions in arts and crafts.

Health services. The one set of eventualities that few older people can prepare for is the chance of ill health with need for expensive medical services. This need is not met by a comfortable pension or modest savings or the willingness of grown children to help when they have families of their own to support. For older people there should be a guaranteed health service to which they can turn as a matter of right. Whether this is financed through an insurance company or through a public-supported fund is not here an issue.

WAYS OF MEETING PERSONAL NEEDS

When the community has done its share toward meeting the needs of older people, the main burden still falls upon the individual himself. He must learn a way of life appropriate to his years and his strength. He must erect his own defenses against the insults of aging.

In general, the individual has a choice of two kinds of defense—the irrational and the rational.

Irrational defenses

If one has great difficulty in meeting one's developmental needs due to the insults and deprivations of aging, one is quite likely to adopt certain defenses which seem to other people to be irrational. There are several types:

Memories and fantasies. Since the present is uncomfortable and the future does not seem to promise much, it is natural for the self to turn to the past and dwell on the pleasures and triumphs of bygone days. Why think about today's fading beauty when one can live over in retrospect the parties and the dances when one was the most beautiful, the most charming of persons? Why worry about the complaints that are being made about one's work today when one can remember the days when one was the most productive and successful of workers? And if the reality of yesterday was not rosy enough, one can add color in one's fantasies. One can imagine that one had a dozen beaux and all handsome and dashing, instead of the one or two plain and conservative boys that came around for Saturday night dates. One can imagine that one had a fine, profitable business and many civic responsibilities, instead of the struggling little shop that was always on the verge of bankruptcy.

Regression to infancy. When the present reality becomes very unpleasant, one can rediscover a long-forgotten solace—that of becoming an infant again. Usually this is outgrown about the age of eight or ten, when a boy or girl becomes independent enough and mature enough to take the bad things of life without crying in mother's lap. Then, fifty or sixty years later, the long-forgotten way of escaping from hard reality may come back to one. As an elderly person one may revert to infantile behavior. One may become dependent for feeding and dressing upon another person. One may go to bed and stay there as much as possible. If one is denied the normal adult sexual outlets, particularly if one is a man, one may revert to infantile sexual behavior.

Loss of hearing, sight, and memory. Since the present is becoming uncomfortable, one may commence to shut it out by becoming "hard of hearing," "forgetful," and dim-sighted. This is not to say that people do not actually

suffer a decrease of hearing and of visual acuity, and brain damage which possibly results in forgetfulness. But the actual biological changes of aging are not always responsible for the changes in older people in the behavior of hearing, seeing, and remembering. Sometimes an older person gets a reputation for being hard of hearing, and people converse in his presence in ordinary tones about things they do not want this person to hear. Just then the elderly person is likely to hear what is being said, and people complain, "He hears what he shouldn't hear." If it is convenient to forget an appointment or to overlook a task one does not wish to do, an older person may forget such things and yet remember events of yesteryear with clear fidelity.

Hallucinations. Sometimes a woman who has lost her husband or a man who has lost his wife will go on talking to the absent loved one. Why not? It is a pleasure to have someone to talk to. So why not go on talking to the people one loved? If one listens carefully, one may hear them reply; and so a person living alone may converse a great deal with absent persons. Then when someone—a son or daughter—notices this, that person becomes disturbed and goes to a doctor and says, "My old mother (father) is having hallucinations." Yet when a child discovers what we call an imaginary playmate, which often happens with only children or first children, and carries on long conversations with that imaginary person, the parents are often quite proud, and they say, "My, what a good imagination that child has!"

These are some of the irrational but natural defenses that a self may muster to meet the insults of old age. They are not morally wrong, but they are not particularly useful. At best, they tend to be an escape from reality.

Rational defenses

On the other hand, there are some rational, or positive, defenses, which actually make for a happier and more highly approved life.

Good care of one's body. It is possible for most people to retain a good proportion of their adult vigor and physical attractiveness if they make an effort. A person can see his doctor for a medical examination once or twice a year. He can eat a balanced diet containing adequate amounts of protein and plenty of minerals and vitamins. It seems possible that older people will more and more take medicines of certain hormones, to keep themselves vigorous and alert.

A man as well as a woman can pay attention to grooming. Older people should dress more carefully than younger ones, because they can thereby make better use of their physical attractiveness. There are few women, for example, who do not have the possibility of attractive hair as they grow older. Few men have the advantage of a magnificent head of white or gray hair, but they can dress carefully, select neckties with care, and perhaps add little affectations such as pocket handkerchiefs and gaily colored socks.

New friends. When one's old friends disappear, one can find new ones. One can join new social groups. If husband or wife dies, one can marry again.

Interests in civic and community affairs. Who can make a better citizen, ideally, than a man or woman with time for study of civic problems and for community service, and with the wisdom of maturity? Older persons can read more thoroughly, can explore into complex political and economic problems more clearly, and should vote more intelligently than younger people.

New leisure-time activities and hobbies. When the extra time gained from retirement or reduction of hours at work gives the opportunity, a person can do things which he wanted to do during middle age but for which he could not find the time. Travel is one possibility, arts and crafts are another, so are gardening, reading, collecting, and other pursuits.

Release of one's children. Sometime during middle age, parents should set their children free and expect that henceforth their relations will be on the basis of mutual respect and mutual consideration, and no longer on the emotional basis of a dominant parent and a dependent child. Once this has been accomplished, a parent is in a position to make whatever arrangements are appropriate for living with or not living with grown children, for supporting grown children or being supported by them or being financially independent of them. Too many parents go into their later years quite unprepared to meet their grown children on a grown-up basis.

Avoidance of reminiscence. An insidious habit is that of telling stories about the olden days as a means of "entertaining" younger people. It is so obviously enjoyable to an old-timer to recall and recount events of great importance that occurred before his listeners were born that he must be warned against and almost prohibited from engaging in this pleasant vice. Young people simply are not interested, unless they are very young. A good rule to follow is to tell stories of the past only to people under eight years old or to people one's own age. Another good rule is to listen to other people's reminiscences two hours for every hour one asks them to listen.

CONCLUSION

The conclusion is inescapable that the individual, if he is to be reasonably happy and secure in his later years, must himself find rational and practicable ways of meeting his needs. No one else can do it for him. One's old age is what one makes it. But in modern America the community must carry the responsibility of creating conditions that make it possible for the great majority of older people to lead the independent and emotionally satisfying lives of which they are capable.

Robert J. Havighurst, Ph.D., Chicago, Illinois, has been professor of education and chairman of the Committee on Human Development at the University of Chicago since 1940, and is also chairman of that university's Committee for the Study of Later Maturity. He was formerly director for general education with the General Education Board of the Rockefeller Foundation. His research activities have been in the social psychology of adolescence and of later maturity. He is co-author of Who Shall Be Educated (1944), Father of the Man (1947), Adolescent Character and Personality (1949), Personal Adjustment in Old Age (1949), and a forthcoming book, Older People.

Physiological Changes in Aging

By Anton J. Carlson and Edward J. Stieglitz

THE sciences of biology and medicine have not yet reached the stage when a comprehensive factual chapter on the physiology of aging can be written. At the end of an excellent review of the biochemical aspects of aging, McCay concluded that "almost nothing is known of the biochemistry of aging."[1] The physiologist and clinician need not be quite so pessimistic.

Aging Defined

Aging may be defined briefly as that element in life pertaining to the passage of time. Thus, living is inseparable from aging. Aging begins with conception and terminates only with death. As aging is a part of living, it can never be arrested without ending life. However, this does not imply that the complex and interrelated changes which are consequent to the passage of time in the living organism are not amenable to alteration. There is hope that in the future medical science may be able to retard the rate of aging change and/or alter its consequences.

It must be emphasized that although aging is a continuous process, beginning with the onset of a new organism, the rate of change is not uniform throughout the life span. Changes occur much more rapidly early in life, and as the organism grows older the rate of change declines. Furthermore, there is great variation in the rate of aging change and in the character of aging between different species of organisms. It is well known that the white rat at 300 days of life is the biological equivalent of a human being at 30 years of life; a 600-day-old white rat is the biological equivalent of a 60-year-old man.

Even within the same species there is considerable variation in the rate of aging change between different individuals. All of us are aware of the fact that we know people who are biologically, mentally, and functionally relatively young at 70 and others who are relatively senile in their early 50's.

Most interesting of all is the extraordinary asymmetry which takes place within the individual organism as to the rate of aging change. It can be said that none of us are of the same age throughout the organism. Different structures age at different rates at different times in the life span. This is beautifully illustrated by the accelerated changes which take place in the organs of reproduction at the time of puberty and at the time of climacteric, although the rest of the individual does not show parallel accentuation of change in other structures, functions, and capacities.

Aging involves two essentially antagonistic processes. As aging begins with conception, growth or evolution is included, as well as atrophy or involution. These two phenomena take place simultaneously throughout life. In youth growth and development predominate, but even as early as within embryonic life atrophic changes occur. The atrophy and involution of gill clefts in the mammalian embryo is an example in point. Similarly, growth continues until the end of life, though in the senescent period atrophy or involution predominates. The hair, the jaw, and all cellular replacements are examples of continued growth up to the moment of death. With the exception of a few cells of the central nervous system, none of the cells of our body are so old as the whole organism. The tissue cells are being constantly replaced by new cell growth. The ultimate understanding of aging must wait upon such a time as we comprehend fully the forces which accelerate and/or retard growth in contrast to atrophy.

[1] From Clive McKay in *Problems of Aging*, edited by E. V. Cowdry, 2d ed., 1942.

Constitutional and Environmental Factors Blended

Many age changes in the animal body have been clearly established. The genesis of these age changes in structure and function is still obscure. We are not yet in position to determine, with the certainty of science, to what degree the changes in the machinery of the body which parallel advancing age are due to the genetic constitution of the individual and of the species—or, to state it differently, the aging process per se—and how much they are due to the vicissitudes of living, such as faulty diets, infections, intoxications, traumata, emotional stresses, overwork, laziness, or gluttony. As regards determination of the typical life span of a species, plant or animal, the genetic constitution undoubtedly plays a primary role, for on no other basis can we account for the fact that some species of plants live only one year or less, and other species live several thousand years. Disease and other exigencies of living cannot account for such great differences in life span in plants, nor can they account, in our judgment, for similar differences in animals.

Certainly, as regards the study of the aging processes in human beings it is impossible, now and in the future, completely to separate the consequences of aging, as defined as due purely to the passage of time, from the results of various accumulative insults which are part of living. An attempt to do so would involve complete isolation of an individual from all sources of injury, infections, intercourse with other human beings, and the like. Such a dreadfully specialized, sheltered, laboratory-controlled type of environment would not represent what we think of as living, but merely existing. Under these circumstances the psychological elements of extreme loneliness, isolation, and purposelessness would create an individual by no means normal. Therefore, it is to some degree academic and theoretical to attempt to distinguish between the changes in structure and function which occur as a result of aging per se and those which occur as a result of the experiences characteristic and inevitable in a so-called normal life.

It is notable that no two individuals undergo identical experiences during the course of their lives. Not only are their experiences, in the form of infections, fatigue and intoxications, emotional battles within themselves and in interpersonal relationships, different in character, but they differ in severity and in sequence. Even if we had two individuals who had suffered from identical diseases, let us say measles, scarlet fever, chicken pox, lobar pneumonia in the right lower lobe of the lung, these would not necessarily have occurred in the identical sequence or in the same severity, and thus their effects upon the organism would differ. The significant conclusion is that we are what we are today, to a great degree, because of what happened to us in our yesterdays, and no two people have had identical sequences of yesterdays. Furthermore, the effect of all these experiences increases with age, because they accumulate.

Importance of constitutional factor

There is growing evidence that hereditary constitution is also a factor in the life span of specific individuals

within a given species, irrespective of ignorance, faulty diets, and other accidents in the life of the individual. This appears also to be true in the life span of individual organs or systems within the unitary organism. For while it is true that faulty diets, infections, and other factors may hasten the atrophy of the ovaries in primates and thus bring on premature menopause, and that similar accidents and diseases may hasten the loss of elasticity in the lens of the eye, it is nevertheless true that these changes occur so consistently at fairly well demarcated periods in the life span that these typically early involutions can hardly be accounted for solely by the accidents and stress in the life of an individual. The relative and typical life spans of these two organ systems must be determined by some peculiar and obscure physiological time clock inherent within some particular genes of the hereditary constitution.

Other organ systems of the body reveal impairment of function so insidiously and gradually (at least in all cases where the life of the individual is not specifically altered or terminated by overwhelming accidents to individual organs such as malignant growths, peptic ulcer, pneumonia, tuberculosis, nephritis, or arteriosclerosis) that it is practically impossible to separate the consequences of aging per se from the result of accumulated injury due to accidents or disease. Of course, germ cells themselves may be acted upon unfavorably by these accidents and strains and the poisons to which we are exposed during life, and may thereby perhaps alter the character of aging in individuals of succeeding generations. However, this is highly unlikely, for if it were true we should have evidence of progressive degeneration of the species as a whole, and gradual shortening of the life span of typical individuals within the species. We know that this is the exception rather than the rule.

The relative importance of the genetic constitution in the processes of senescence as opposed to the environment is illustrated by experiments on the fruit fly, where, with identical environment but with experimentally modified genetic constitution, the life span may be made to vary as much as 400 per cent. To be sure, it is a long distance from the fruit fly to man, and by and large science has as yet been able only to degrade rather than to strengthen the genetic constitution by experimental means. Nevertheless, similar factors probably play a role in the phenomena dimly foreshadowed in the life of men —in the relatively long-lived and relatively short-lived human families. As once wisely said by Oliver Wendell Holmes, the physician and poet, "one of the best ways to insure a long life span is to make a careful and wise selection of grandparents."

The life of cells

If further justification of our primary thesis, namely the practical impossibility of separating the factors of aging per se from the effects of the accidents of living, is needed, we may cite the case of many plants in which tissue degenerations once thought to be due solely to aging seem now to be due to virus diseases, of which we have at present only the scantiest of information. And in plant seeds, age degeneration seems to be due to progressive chemical changes in the cell nuclei, changes which in turn interfere with later cell division and growth.

Unicellular animals are commonly said to be immortal. Nevertheless, these lowly cousins do seem to degenerate with age. This degeneration appears to be in the physiologically active nucleus, and unless this aged nuclear tissue is replaced by the reserve micronucleus, as occurs in conjugation and endomixis, decline and death of these unicellular organisms appear to be inevitable. This is, in principle, not so different from sexual reproduction and death of the soma or body in the higher plants and animals. It is further confirmed by the fact that an annual plant may be made to survive for two years, if it is prevented from going on to bearing seeds in the first year of its existence.

On the other hand, the *potential* immortality of cells cannot be denied. The classic experiments of Carrell in maintaining a tissue culture of chick embryo heart cells over a period of thirty-six years (many times the normal life span of the chicken) is evidence in point. At the end of this long time interval the cells within the tissue culture were growing with the same rapidity, vigor, and enthusiasm that they had at the beginning of the experiment. The experiment was finally discontinued because it appeared that it would yield no further significant results. Carrell concluded that with the ideal environment which was maintained within the tissue culture chambers, the cells were actually immortal. The most significant part of this conclusion, however, is the fact that this immortality exists only if the environment in which these cells live is maintained at an optimum or nearly ideal condition.

Inadequate nutrients, undesirable chemical reactions, acidity and/or alkalinity, any accumulation of the chemical debris of metabolism, quickly retard the development of tissue culture cells and lead to their rapid senescence and death. In attempting an interpretation of these experimental studies as they apply to multicellular and complicated organisms, such as man, we must comprehend that in all probability the major factor which leads to aging per se exists in changes in the intercellular environment within the organism, rather than within the cells themselves. Structural changes occurring in tissues due to aging in the absence of known disease (which does not imply that there may have been unknown, unidentified, or unrecognized disease processes going on) consist largely of changes in that part of tissue which we call the matrix. The body matrix is actually not a living tissue, but consists of fibers and fluids through which nutrients are brought to the living cells and waste products are removed. The changes in the matrix which gradually accumulate with advancing age are of such nature as to interfere insidiously with the nutrition of the cells in the broadest sense of nutrition. Nutrition must be defined not as being limited to the ingestion of food, but as involving also its absorption, its transport, and its utilization by the billions of individual cells which make up the composite organism.

To debate further the question as to the relative importance of heredity versus the strains and accidents of living as cause of aging change is a waste of time and paper. It is not a question of one *or* the other. Evidence now at hand shows conclusively that both forces play roles in the aging process. If a longer life span or a longer abundant life, with vim, vigor, and continued enthusiasm, is the desired goal, both biologically and socially, we must obviously reduce the production of those with less than optimum hereditary potential, and simultaneously provide optimum environment for the most fit.

AGE CHANGES IN THE PHYSIOLOGY OF MAN

The following principal changes due to age in the physiology of man and other animals can be listed, though

they appear at different age levels in the individual and at different age levels in the organ systems of the total organism. The universality of these age changes, even in the exceptional persons whose hereditary constitutions and fortunate experiences have been able to meet the accidents of living for one hundred or more years, renders it highly probable that we are here dealing with changes inherent in the constitution of living matter, no matter how greatly these changes may be accelerated or altered by the vicissitudes of existence.

Progressive age changes, not as yet shown to be due to specific diseases, are:

1. Gradual tissue desiccation. Recent studies of electrolyte (salt) concentrations in the tissue cells have cast some doubt as to the reliability of older experiments which formerly appeared to have established gradual tissue drying as part of the aging process.

2. Gradual retardation of cell division, capacity of cell growth, and tissue repair. This involves also a decline in capacity to produce the products of secretion, whether they be known substances such as pepsin or thyroxine or the less well identified antibodies involved in immunity.

3. Gradual retardation of the rate of tissue oxidation (lowering of the speed of living, or, in technical terms, the metabolic rate).

4. Cellular atrophy, degeneration, increased cell pigmentation, and fatty infiltration.

5. Gradual decrease in tissue elasticity, and degenerative changes in the elastic connective tissues of the body.

6. Decreased speed, strength, and endurance of skeletal neuromuscular reactions.

7. Progressive degeneration and atrophy of the nervous system, impairment of vision, of hearing, of attention, of memory, and of mental endurance.

8. Gradual impairment of the mechanisms which maintain a fairly constant internal environment for the cells and tissues (a process known as homeostasis). It is evident that sufficient weakening of any one of the numerous links in the complex processes of homeostasis produces deterioration.

These changes are not listed in the order of their primary significance, for this is as yet unknown. Nor do we imply that the list includes all the changes of senescence. It is evident that aging is a continuous and complex series of processes, some of the changes starting early, others later in life, and proceeding at variable rates.

Compensation

It must be emphasized that all changes are not necessarily in the direction of decline, as regards the competent operation of the organism in the complex social environment in which we must exist. For example, although muscular strength, vigor, and speed of reaction decline with advancing years, skills tend to increase with long practice. Though there may be less intense emotional drive, often labeled ambition, there occurs an increase in loyalty and calmness, with clearer definition of purpose in living, with further maturation. These compensate for the restless drive of ambition in youth.

Similarly, there develops an immensely significant compensation in relation to the loss of acuity in vision: though the older eye may not see as clearly in the strictly somatic and physical sense as that eye of the youngster with a perfect 20/20 vision, what is seen is comprehended much more fully. The child sees a page of printed type such as this, and it is utterly meaningless. The older individual, plagued with the infernal nuisance of spectacles, which are always somewhat dirty and blurring, comprehends what all these hieroglyphics mean, as long as he can see sufficiently to identify words.

As speed declines, our physiological endurance increases in certain areas. It is notable that while the records for all the sprint races, such as the hundred-yard dash or 220 run, are held by youngsters from 18 to 22, the records for the long grind of the marathon race are held by men between 38 and 45.

Similarly, intellectual and emotional endurance gradually increases with advancing age up to a given point. When this endurance finally breaks, the failure is more often associated with the accumulative consequences of disease than it is with aging per se. The aging individual requires less sleep, though the capacity to call upon reserves and fall back on "second wind" is lost. Thus, when the need for sleep arises, it becomes an imperative requirement, which can no longer be postponed by stimuli such as love, patriotism, ambition, dexedrine, coffee, or fear.

Ability to learn

We should not be depressed and feel hopeless over the decline in certain capacities, for the diminution is an extremely gradual one. Let us take, for example, diminution in the ability to learn rapidly. Very carefully controlled experimental studies have indicated that the maximum speed and rate of learning occurs at age 22. At age 80 the rate of learning is practically the same as at age 12. Thus, the decline from the maximum requires nearly sixty years to reach the level from which it rose over a period of ten years. In other words, the diminution in the ability to learn rapidly progresses at about one-sixth the rate of the evolutional growth in this functional capacity.

Furthermore, there are qualitative as well as quantitative differences in the ability to learn. It has been demonstrated that though it takes older individuals longer to memorize a given paragraph than it does younger persons, their recitations are usually more accurate. Though speed is lost, accuracy is increased. This change in the qualitative nature of memory is most important in relation to employment of older individuals, because there are many positions requiring accuracy, persistence, and endurance in the long, steady grind of competitive existence, rather than the brilliant, gazelle-like speed characteristic of younger persons.

Two environments

Item number 8 of those listed above is of extreme importance to the maintenance of good health. It must be emphasized that we actually live in two environments: (1) the obvious, visible, external one, the atmosphere about us, full of smoke, turmoil, politics, competition, noise, and dust, and (2) the internal milieu which intimately surrounds the living cells of our bodies. The survival of any cell depends upon its continuing existence in an environment which will supply it adequately with the chemical substances necessary for its metabolism and which is free of such substances as will seriously poison or injure it. Not only is the chemical constitution of the cellular environment essential to life and health, but its physical properties, such as temperature, are important. Life is incompatible with any gross deviation from an average condition in either one of these two environments. Physiologists have long been aware that the constancy of the internal environment is requisite to health. That the majority of organisms manage to maintain a reasonable level of health and live as long

as they do is the result of many extraordinarily effective mechanisms operating to maintain the necessary high degree of uniformity in the internal environment. The phenomenon of maintaining such equilibria is known as homeostasis.

With the development of more complex organisms from the simple, primitive, single-cell amoeba, some of the cells of the new forms of life became separated from the sea-water environment in which their ancestral forms had been bathed on all sides. Therefore, these organisms had to create means of bathing the internal cells in fluid similar to sea water. It is not accidental that the internal tissue fluids of all animal forms are extraordinarily similar in saltiness and chemical balance to the conditions which obtained in ocean depths millions of years ago. Today we are still amphibious, externally living on the land and in the air, but internally in a sea of our own making. When we consider the violence and the multitude of forces operating to throw the internal environment out of balance, it is truly extraordinary that such constancy has been maintained, not only in a single individual but throughout the ages.

Maintenance of balance

The constant effort to maintain balance within the permissible ranges of change in the internal environment may be compared to the tight-rope walker's efforts to retain his equilibrium with the aid of a pole. It is true that the acrobat sways slightly from one side to the other, just as the chemical balances of the body fluctuate within a relatively narrow range; but if these swings exceed a certain limit, the acrobat will fall, and so will health. The great difference between the acrobat and what occurs in the body is that the organism must maintain equilibrium in a great many different categories simultaneously, whereas the performer is consciously concerned only with his physical balance at the moment.

To mention but a few of the multitude of balances which must be maintained, we may say that we cannot tolerate much deviation of the normal body temperature, or the concentration of sugar in the blood, or of calcium, chloride, phosphate, or many other chemical constituents in the blood stream or tissue fluids. The acid-alkaline balance must be maintained despite great variations in supply or intake. For example, we ingest food at irregular intervals through the day and often undergo relatively long periods of starvation. Also, our expenditures of energy are likewise variable. During sleep we burn far less fuel than when actively exercising.

Lowered homeostatic efficiency

As these balancing mechanisms become less vigorous with advancing age, the ability to withstand stresses from without is diminished. This is beautifully illustrated by the fact that the older individual cannot tolerate extremes of temperature. Witness the annual trek to the warmer climes during the winter by older persons, and the resulting accumulation of the aged in the balmy sun of Florida. Likewise, they cannot tolerate extremes of heat. It is well known to industry that older men cannot take what are known as "hot jobs," such as those in a steel rolling mill or a stoke room. This impairment of the ability to withstand extremes of external temperature is due to many factors, among which are a decreased vascularity of the skin so that heat is radiated less readily, a diminution in the ability of the skin to perspire and thus cool the organism, and a lessening ability to generate more heat when the external environment is cold.

Similarly, the aging organism cannot well tolerate long periods of starvation, because the blood sugar falls to undesirably low levels. Gluttony, or excessive ingestion of sugar or other substances, is likewise less well tolerated, for the reason that the ability to withdraw glucose from the blood stream and store it in the tissues is less competent.

These changes in homeostatic efficiency have very significant implications to us as individuals and to physicians dealing with older patients. For example, because the reaction to stresses —whether they be intoxication, fatigue, or physical stresses—is less violent, *the symptoms of illness are much less conspicuous in the older person.* It is well known that an old individual may be walking around with a temperature of 99.5° F. and still show the physical signs and other evidences of an extensive lobar pneumonia. In a child or young person the infection in the lung would be associated with fever of 103° F. to 104° F. and other very acute, dramatic, and conspicuous symptoms and signs of disease. Consequently we must be extremely alert to minor and subtile symptoms. The reason why the evidences of disordered functioning are less conspicuous in age than in youth is that symptoms are not directly consequent to injury, but represent reactions of the organism to the injury. It is the *reaction* that becomes less vigorous, violent, and evident in the aging person.

Likewise associated with the lowering of the vigor of homeostasis is the fact that it takes the body tissues longer to repair following a given injury. This demands that there be a longer convalescence following an infection or trauma of any sort. Third, it must be recognized that when stress is unavoidable, the margin of safety is reduced and other compensatory mechanisms must be assisted to maintain that level of internal balance which constitutes health.

PREVENTIVE MEDICINE

The picture of aging is in fact not so depressing as it may appear at first glance, and it is becoming brighter as medical science and practice are learning how to anticipate and prevent many unnecessary sources of injury. Most of the detriment, most of the depreciation, which occurs in later years is unquestionably due to the cumulative injuries of chronic and progressive disease rather than to aging per se.

An efficient mental life is possible even with reduced factors of safety, well into the seventh, eighth, and perhaps the ninth decade. Moderation in all things, together with competent medical guidance in regard to the avoidance of accidents and diseases to which we are all vulnerable, tends to prevent undue corrosion of specific life links, so that all of them proceed gradually and in step. A man or woman who has passed the first sixty or seventy years in honest toil and persistent efforts at understanding man and nature and the phenomena of interpersonal relationships has, or should have, accumulated a vast reserve of wisdom and self-discipline which should be made available to the younger generation. This reserve of wisdom and quiet inner strength learned by long practice in adaptation is an immensely significant antidote to the stresses and strains induced by the fears, the vanities, the greeds, and the ignorance of earlier years.

It is now known that many of the

chronic and progressive disorders which are so prone to beset us in later maturity, particularly such diseases as arteriosclerosis, high blood pressure, diabetes, and the like, are potentially amenable to prevention with proper guidance and proper acceptance of the guidance during the years of youth and young maturity. These are not disorders which arise from without, such as the acute infections, which can be prevented by control of the external environment. Their control, retardation, or even complete prevention, involves effort and self-discipline on the part of the individual. These disorders arise from within; they are silent, sneaking, fifth-columnist type of saboteurs.

To illustrate this, it is well known that obesity is a most significant element in the genesis, progression, and severity of diabetes mellitus late in life. Obesity is invariably due to eating more food than is required by the individual. Control of obesity is impossible without the acquisition and application of self-discipline on the part of the obese.

Similarly, the phenomenon popularly called "second childhood," which is likely to occur in the truly aged, is actually not a "second childhood" due solely to the depreciations of senility, but a continuation of the first childhood in individuals who have never actually matured emotionally or intellectually. When it is no longer necessary for them to make an impression upon those about them, they revert to their behavior pattern of childhood and infancy.

In the clinical experience of one of us it has been demonstrated repeatedly that those old people whose behavior becomes increasingly childish have lived lives so extremely conventional, so strictly patterned after the opinion of others, so rigidly conforming to the attitude of the herd, that it is quite obvious that they have never grown up or developed an idea or conviction of their own. We have even come to the point of considering an excessive conventionality as an a priori reason for suspicion of emotional and intellectual immaturity. However, deliberate and equally rigid unorthodox smug superiority and/or negativism may be likewise evidence of arrest in maturation. The truly mature can be original and yet conform to the broad patterns of their cultural environment.

Areas of prevention

In the last five to ten years research studies have yielded evidence indicating that arteriosclerosis may be amenable to preventive procedures. It is highly doubtful whether we can reverse the pathological process significantly once it has been fully established, but there is considerable hope that with proper nutritional balance and proper control of metabolic activity during the years of young maturity, much of arteriosclerotic change is open to prevention or at least definite retardation. This hope is most significant, because approximately two-thirds of the disabilities, both mental and physical, which incapacitate older individuals are secondary to arteriosclerotic or vascular disease.

Further intensive research into the many unknowns of the aging processes may some day enable the science and practice of medicine to delay involution. This must not be confused with "rejuvenation," either in the popular or in the quack medical sense. What we have in mind is a much more extensive application of what may be called anticipatory medicine, or constructive medicine, where the objective is to increase the degree of health rather than merely assist repair of injury after it has occurred. Constructive medicine involves periodic guidance, early discovery of disorders or of the changes contributing to the development of disease, and their immediate treatment. It involves also self-discipline and effort on the part of the individual. Health is always relative. There is always room for improvement.

Objectives of geriatric medicine

There exists considerable confusion as to the objectives of geriatric medicine, or that part of medical science and practice concerned with the care of the aging and the aged. There are those who resent the implication that geriatric medicine should attempt to prolong life. Many among the aged, and even more among the young, feel that most of the older members of our population are living too long as it is, and that the vastly increasing numbers of the old are becoming naught but a burden on the community. But the primary objective of geriatric medicine is not merely to prolong life. It is to modify the abnormalities characteristic of senescence and to control the progressive disorders of later years, thus adding to the health and usefulness of those who are aging. There can be no better definition of the major objectives of geriatrics than that given by Piersol and Bortz: "The society which fosters research to save human life cannot escape responsibility for the life thus extended. It is for science not only to add to the years of life but more important to add life to the years."[2] The core of geriatric medicine is in prevention and anticipation.

Preventive medicine for mature adults as a part of geriatric medicine is in its early infancy. Until recently there was little need for preventive activity in this area. But the proportionate increase in the numbers of elderly persons in our population makes the menace of chronic and progressive disease characteristic of the senescent period of life a problem equally as urgent as the hazards of infections. In the future, preventive medicine must add individual personal health construction to the practice of environment control, or else fail.

The full potentialities of personal health guidance cannot be realized until research has illuminated the etiology of degenerative disorders. But even with our present and admittedly extremely incomplete knowledge, much unnecessary illness of the later years can be prevented by more thorough and more widespread application of existing information. Reawakening of a sense of individual responsibility is essential to this accomplishment. Mature adults must realize that longevity and health are privileges, and not inherent rights. As privileges, they carry the inescapable obligations of effort to maintain health.

As all the so-called degenerative disorders begin long before symptoms become apparent, preventive geriatric medicine must begin long before senility. Prevention must precede. More can be accomplished for the aging than for the aged. Therefore, the two decades from age 40 to age 60 constitute the critical periods in geriatric medicine. There are many reasons to hope that the next fifty years will permit of progress in this field comparable to the advances made in the last half-century in the control of infectious diseases, subsequent to the birth of bacteriology. Longevity with vigor and usefulness retained until true senility creates infirmity is an objective worthy of the best and most energetic efforts. There

[2] G. M. Piersol and E. L. Bortz, *Annals of Internal Medicine*, Vol. 12 (Jan. 1939), p. 964.

is no greater tragedy for the aged than the sense of uselessness that is so often imposed upon them both by their own disabilities and by society's rejection of those prematurely shelved.

NUTRITION AND THE LIFE SPAN

Since scientific information on the kinds and quantities of foods required for optimum growth, health, and maximum longevity is as yet extremely incomplete in relation to the history of the human race, it is evident that man's diet, both as to kind and as to quantity, was in the past determined by appetite, hunger, and availability of foods. We may therefore assume that both underconsumption and excess consumption of foods, and alternation between starvation and gluttony, between emaciation and obesity, are phenomena as ancient as man himself.

Life insurance statistics show clearly that marked underweight, as well as obesity, tends to shorten the life span of man. The studies of McCay with experimental rats reveal that a diet adequate in quality but so reduced in caloric quantity that the growth of the animal is retarded, increases the life span most significantly. In these experiments the control group of rats was fed the same kind of foods ad libitum. This group may have had its life span shortened by excessive eating—by physiological obesity.

It is well established that most, if not all, persons showing marked and persistent underweight or emaciation are underweight by reason of functional disorders interfering with digestion, absorption, or metabolism of foodstuffs. Chronic disturbances of appetite are commonly of emotional origin. Thus most individuals are underweight by reason of illness.

That such persons die prematurely is not particularly puzzling to us, for they die of disease which creates an early corrosion of some essential links in the life chain. But why does the overweight person, who seems otherwise healthy, die prematurely? This is a fundamental problem in geriatric medicine, for in the absence of specific disease, overweight tends to increase in men and women past 40 years of age. Is obesity itself a disease? Or is the shortening of the life span merely a consequence of obesity, as implied in the popular saying that "fat people dig their graves with their teeth"?

Food intake and the life span

The profoundly significant studies of McCay on the increased longevity of animals whose growth rate has been retarded by lowered caloric intake have recently been confirmed by other studies of a somewhat different nature carried out by Carlson and Hoelzel. Littermate rats on the same diet given no food at all every second, every third, and every fourth day from the day of weaning until the day of death, lived significantly longer than their sibling rats eating the same diet ad libitum every day. This amount of fasting did not retard body growth and size, as measured by tibia length, but the rats on this type of fasting did not become obese. On days when these rats had no food they were usually more active and restless than their litter mates on the same food without limit.

It seems probable that the rats given all the food they chose to eat *every* day shortened their life span by overeating, rather than that the fasting and greater physical activity of their litter-mates actually lengthened their genetic life span; for when considerable indigestible bulk was added to the same diet and the rats were allowed to eat this every day, the life span of these rats also was lengthened. The rats on indigestible bulk in the diet, or those fed only every other day, had fewer tumors and smaller tumors and less gastro-intestinal pathology at the time of death than had the rats on the concentrated diet eating every day.

Food intake and obesity

During the last twenty-five years considerable, though relatively superficial, attention has been given to the possible relation of thyroid, gonad, and pituitary disorders to human and animal obesity. It now seems established, or at least highly probable, that there is no such thing as a primary endocrine obesity, apart from endocrine influences on appetite, hunger, and physical activity. The marked obesity that follows destructive injuries at the base of the brain seems to be largely due to an increased food consumption because of increased appetite. Endocrine therapy of obesity has been disappointing except in the case of thyroid extract, and that has to be administered to the point of inducing symptoms of the disease hyperthyroidism before weight reduction is secured in the absence of reduced food intake.

On the basis of present information it seems likely that the development of obesity in people past 40 years of age is primarily due to the persistence of the habit of eating excessively, and to the satisfaction of specific appetites for foods at a time in life when the rates of tissue oxidation and general motor activity are both on the decline.

It is not difficult to understand why ingestion of food to the point of obesity is injurious to people whose factor of safety is reduced because of a gradual decline in their production of insulin, which significantly affects sugar and fat combustion. Such dietary excesses damage by overworking an already impaired mechanism. But in the absence of diabetes, actual or incipient, why does obesity, maintained for years, initiate or aggravate cardiovascular, kidney, and other disorders that shorten the life span? The answer to this question is being sought by experiments and accurate observation on both mice and men, but in the meantime the prevention of obesity in all people past age 30 appears to be a prophylactic imperative in preventive geriatrics.

Dietary elements

Aging and the metabolic changes which go therewith raise many other problems in the whole field of nutrition. Diet and nutrition are not concerned only with intake of calories and vitamins, and balance between protein, fat, and carbohydrates. Impairment of the efficiency of digestion, difficulties encountered in chewing, and the problem of constipation demand attention to the physical characteristics of the foods which are ingested. Likewise, there arises an increasing need for certain substances. This is particularly applicable to the requirements for calcium. It is characteristic of aging tissues and particularly of aging bones, that calcium is withdrawn and lost from the organism. There occurs a gradual demineralization of the osseous structures in aging individuals. This can be prevented to a great degree by a deliberate and intentional increase in calcium intake. However, this intake must begin long before the great depreciations have occurred. Similarly, there is an increased need for certain vitamins and for iron to maintain a normal metabolism.

One of the most significant discrepancies in most dietary studies and advice arises from the fact that the role which

water plays in the maintenance of good health is too often ignored. Water is a dietary factor secondary to none in importance. In the elderly individual water is significant not only from the point of view of nutrition, but also because of its importance to the kidneys' function of getting rid of the accumulated debris of metabolism, to the flow of digestive juices essential to adequate digestion, and in the avoidance of constipation.

Essentials of good nutrition

In the light of present knowledge, the essentials of good nutrition in geriatric medicine must include consideration of the following principles:

1. Moderation. Excesses are as undesirable as deficiencies. Both induce malnutrition. It is often most helpful for older persons to eat small quantities frequently rather than to attempt large meals.

2. Individualization. Individual variation increases with advancing years. Generalizations and routine dietary programs are often unsatisfactory. Many variable factors, such as digestive and circulatory efficiency, habits, and dentures, affect the prescription of diet in the elderly.

3. Water. The importance of an adequate fluid intake must never be forgotten.

4. Maintenance of hemoglobin content. Anemia, even if minor, is immensely more significant in later years than in youth, for the ability to compensate for inadequacy declines. In the presence of any circulatory handicap (arteriosclerosis, hypertension, or cardiac impairment) the quality of the circulating medium assumes a role of major importance. Optimum hemoglobin concentrations should be the objective; the average does not suffice.

5. Balance in dietary is as important here as at any age. Asymmetry in utilization, however, may alter the optimum proportions of various elements in contrast to the usual standards of young adults. Protein, iron, and calcium are the elements apparently most likely to be inadequate in spontaneously selected dietaries among the aged.

6. The focus of attention must be on the person rather than on his disease or diseases. The human being is indivisible; psyche and soma are one. Insulin does not suffice for the anxious diabetic patient, nor does equanimity come to the exhausted anemia patient. An attitude of constructive prophylaxis is essential to effective geriatric medicine. The primary objective is the construction of health to as near the optimum as possible. Wise nutrition is a most powerful tool for the attainment of vigor in later years.

SUMMARY

Herein we have attempted merely to point out some of the problems inherent in the processes of aging in the living organism. They are many and complex, and inter-react one upon the other. It must be emphasized that though a considerable mass of knowledge is accumulating, those who are concerned with either research or clinical application in this area are at the same time becoming more and more aware of the inadequacy and incompleteness of our knowledge. As has been said by an ancient and very wise Chinese, "He who knows, knows that he does not know."

There is reason to hope that with continuing study and better application of what knowledge does exist, not only can the life span be somewhat further extended, but the period of usefulness to the community can be prolonged. Longevity without continued health and usefulness is not a blessing. Long disablement from chronic illness is a greater tragedy than rapid death from acute illness.

In closing, let us remind ourselves that though it is the young scientists whose brilliant researches have revealed so much about the physical world (even to the fission of the atom), it is only mature adults who can reveal all the immense and significant potentialities of mankind. At last we are approaching an era in which man lives long enough to have time to think. In thinking he grows, and in growing, lives.

Anton J. Carlson, Ph.D., Chicago, Illinois, is Frank P. Hixon Distinguished Service Professor Emeritus of Physiology at the University of Chicago, having been in the Department of Physiology of that university since 1904. He is a member of numerous biological and medical societies in the United States and other countries, and has been a member of various international congresses of physiology. He is author of Control of Hunger in Health and Disease, The Machinery of the Body, and some two hundred research reports.

Edward J. Stieglitz, M.S., M.D., F.A.C.P., Washington, D. C., is in the private practice of internal medicine, with emphasis on preventive geriatrics. He is consultant in geriatrics to the Veterans' Administration and St. Elizabeths Hospital, and is chairman of the Advisory Council on Professional Education for the Commission on Chronic Illness. He has served as associate professor of internal medicine at Rush Medical College, Chicago, and as chief of the Unit in Gerontology of the National Institutes of Health. He is author of some 130 publications, including the following books: Arterial Hypertension (1930); Obstetric Medicine (coeditor with F. L. Adair, 1934); Abnormal Arterial Tension (1935); Geriatric Medicine (1943, 1949); A Future for Preventive Medicine (1945); and The Second Forty Years (1946).

Psychological Aspects of Aging

By Oscar J. Kaplan

A STRIKING characteristic of the literature on the psychology of later maturity is the almost complete absence of systematic investigations. Some of the most widely quoted studies in this field were developed with other problems in mind, the age data being incidental to research beamed at other areas. Many of the widely publicized investigations are based on small and often not very carefully selected samples. The methodological tools used have frequently been inappropriate. The literature suffers from a lack of stimulating hypotheses and theories. Description rather than explanation is the objective of most of the published work in this field.

Under such circumstances the wise reviewer approaches his assignment with humility, realizing that he may live to regret some of the more positive statements that he makes. This article does not pretend to cover its topic thoroughly, seeking merely to list the major achievements and methodological difficulties that now exist. The reader in search of details is referred to the more comprehensive reviews of N. Shock,[1] S. Granick,[2] H. Jones and O. Kaplan,[3] W. Donahue,[4] and R. Kuhlen.[5]

Older persons living in 1952 are persons whose tissues have weathered the storms of sixty or seventy winters; they are equally the products of a long cultural experience. Most of these men and women grew up in a period when education beyond grade school was the privilege of a few and when educational methods were less efficient that they are today. They grew up in a period when mental testing in schools was just beginning to show its head. The intellectual climate in which they have spent most of their lives probably differs markedly from that which awaits older persons in the next half-century. Later-maturity studies conducted in the year 2000 may yield results on many problems which will part sharply with present findings. The role of culture in the psychology of aging remains to be delineated.

Sensory and Motor Functions

The incidence of hearing difficulties increases with age, particularly in relation to higher tones. At low illumination levels, older persons with adequate acuity are visually inferior to the young and middle aged. There is a tendency for visual acuity impairments to be more common in the elderly. Quickness of visual perception begins to decline soon after adulthood is reached.

Using subjects of different ages matched for visual acuity on unspeeded ophthalmological tests, H. C. Weston[6] has demonstrated that a speed emphasis leads to a sharp drop in scores on a task demanding fine visual discrimination. The drop was sharp even between the twenties and the forties, being particularly pronounced under conditions of poor contrast or dim illumination. Results obtained in many physiological stress tests also indicate that often changes are taking place which ordinary tests may not reveal.

Motor response speed declines gradually in many task situations, the rate of decline and the age of onset varying with the task and with the individual being studied. Decline is most pronounced in tasks demanding speed and strength of response, and is especially evident in activities or abilities which have not been appreciably exercised. Soon after maturity is reached, the efficiency of many simple performances begins to drop; for example, swiftness of blow, simple reaction time, strength of grip.

A number of investigations have shown that older persons are more comfortable and proficient at tasks which stress accuracy above speed. Typical of these studies is one by R. A. Brown[7] in which subjects were asked to trace digits with emphasis on both speed and accuracy. Time scores remained fairly constant from the twenties into the thirties, but errors increased markedly during this period. Beyond age 40 speed dropped steadily, but errors decreased to a level considerably below that achieved by subjects in their twenties. It is of interest that in the group of sixty-five subjects, the two quickest ones were in their twenties, but the third-best time performance was turned in by a subject aged 74!

According to one study, at age 65 the average man requires 0.06 second more time to apply his brake than he needed at age 23. If the car moved at the rate of fifty miles per hour, it would travel five additional feet during the 0.06 second period. On the basis of this finding, one might expect older drivers to be involved in a disproportionately large percentage of accidents. This is not the case. Older persons are less likely to be involved in serious accidents than young persons at the very summit of their physiological prowess. Older individuals, cognizant of their limitations, are less likely to expose themselves when driving conditions are hazardous, and also are more safety-minded than their juniors. These two factors more than compensate for the sensory and motor losses which afflict many persons of advanced years. Personality and experience factors are important in determining the practical significance of age changes in biological functions.

An indication that practice plays a significant part in the preservation of manual abilities is provided by the work of W. Miles.[8] He found that mechanically trained older men retained the ability to work on a mechanical assembly test at young adult speed levels, surpassing untrained men aged 50–69 who were equal to them in intelligence and formal schooling.

It would be enlightening to repeat the Miles study just referred to, providing additional training for the inexperienced older men. Would practice lift the untrained men to the level of the trained ones? Does disuse or lack of training lead to an irreversible loss? These are questions with many practical implications.

The role of experience was even more

dramatically illustrated in the performance of men and women of different ages on the McFarlane Coat Assembly Test, a test of manual skill. On this test the average 20-year-old man was found to be inferior to the average 70-year-old woman.

It has been pointed out that laboratory research, based on short time periods, may not be representative of performance under everyday conditions over long periods. Support for this position comes from the investigations of K. Smith,[9] who found that an eight-hour work period accentuated differences in performance between men in their thirties and those in their fifties. The task involved assembly of bolts and nuts.

Compensations

Since workers seldom operate at the peak of their capabilities, loss in sensory and motor functions is not necessarily reflected in lowered output. The older worker may be more conscientious, more dependable, and more capable of meeting emergencies than his juniors. In complex tasks he may maintain his performance level in the face of sensory and motor decline by developing new methods of work which circumvent the losses experienced.

It seems reasonable to suppose that engineers working with psychologists could redesign many industrial machines in such a way as to compensate for sensory and motor losses. One of the mainsprings of human progress has been the ability of man to extend the range of his senses and to multiply his strength by mechanical means. The new science of human engineering, in which the characteristics of men and machines are reconciled, can contribute immeasurably to the adjustment of the older worker to his industrial task. Even if it be acknowledged that many older persons cannot succeed in industry as now operated, it does not follow that they cannot be salvaged for useful work. We must support research designed to promote the preservation of psychological and physical competence, but we must also try to adapt jobs to the abilities of older workers. It is probable that human engineering can do more in the next two decades to maintain the employability of persons over 40 than can medical science.

LEARNING ABILITY

The fate of learning ability in the adult years has been the subject of a number of inquiries, chief among which have been those of E. L. Thorndike *et al.*[10] and F. L. Ruch.[11] It is clear from these studies that the products of early adult learning may survive the ability to learn skills of equal difficulty. The man of 80 may be able to speak a language which he could not easily master for the first time at his age.

One of the earliest and most comprehensive studies of adult learning was undertaken by E. L. Thorndike and his associates. They found only a slight decline in learning competence from the peak age of 22 to age 45; beyond age 45 the rate of loss was accelerated. The investigators reported that tasks which measured "simple modifiability," such as learning a letter code, drawing lines of specified length while blindfolded, learning to write with the nonpreferred hand, and associating numbers with nonsense syllables, exhibited the largest age decrement. Material based on elementary school subjects

[10] E. L. Thorndike, E. O. Bregman, J. Tilton, and E. Woodyard, *Adult Learning* (New York: Macmillan, 1928).

[11] F. L. Ruch, "The Differentiative Effects of Age upon Human Learning," *Journal of General Psychology*, Vol. 11 (1934), p. 261.

seemed equally easy to the young and old subjects in this experiment. Summarizing their findings, the Thorndike group claimed an over-all loss of about 15 per cent in learning efficiency between ages 22 and 45. They were quick to point out that greater motivation and improved work methods may easily compensate for loss in learning ability.

F. L. Ruch, on the basis of a survey of the literature and his own investigations, concluded that learning ability diminishes soon after adulthood is reached. Nonsense material and motor skills are more difficult to learn than meaningful verbal material. Reorganization of practiced habits was particularly difficult for the older subjects in the Ruch studies. Assignments which permitted older subjects to profit directly from their previous experiences were the most favorable to proficiency in learning.

There is experimental evidence to support the claim that those who continue to apply themselves to the learning of verbal materials all through life are able to maintain their efficiency as learners better than those who do not have such a history. This fits in very well with the observation that aged persons who have practiced motor skills for many decades often surpass young persons at these skills.

B. M. Bernardelli[12] has examined the effects of various types of instruction on acquisition of ability to deal with electrical problems. Persons over age 30 tended to learn more readily if the instructions were in written form and to profit less by demonstration than those under 30. This has been interpreted to mean that older persons are slower in comprehending new material; written instructions afford more opportunity for review. There is a tendency for people at all ages to be reluctant to ask that demonstrations be repeated. If it is true that efficiency of learning varies with different methods at different ages, we may be able to accelerate the learning of persons of advanced age by using methods more appropriate for them.

Writers on later maturity have not given sufficient attention to the possibility that older people may become very competent at tasks with which they have more initial difficulty than the young. A. B. Cherns[13] reports an experiment in which subjects were asked to reject aluminum blocks which were below standard. Although the older subjects were much slower in arriving at judgments on the first few blocks, they approximated the speed of the younger subjects as the experiment progressed.

Many of the learning experiments centered on older persons have been very artificial. It seems reasonable to suppose that in certain types of learning situations the older person may actually have an advantage. For example, if we were to compare the performance of a 25-year-old chemist with that of a colleague aged 50 in digesting and comprehending the content of an article in a professional journal, it is quite possible that the older man would win out because of his greater familiarity with the field. Although it is entertaining and informative to study learning ability "in the raw," in a large number of occupational situations it is impossible to divorce experience and apperceptive mass from other factors in learning.

MEMORY

Since memory is the keystone of intelligence, binding us to our past and enabling us to exploit our experiences

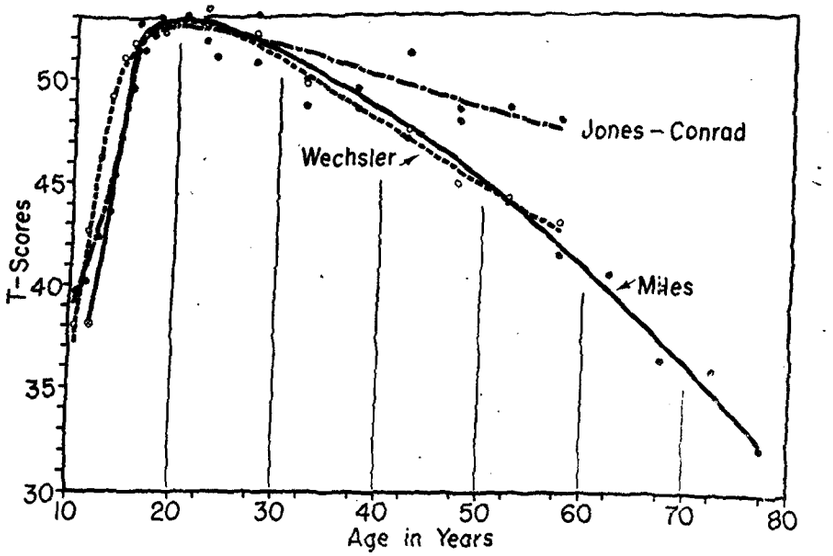
[12] B. M. Bernardelli, mentioned by A. T. Welford and D. Speakman, *op. cit.* note 7 *supra*, p. 191.

[13] A. B. Cherns, mentioned by Welford and Speakman, *op. cit.* note 7 *supra*, p. 188.

in the solution of current problems, the fate of this function in the later years is a matter of much importance. Regrettably, much of the research on this topic has been very superficial. It does appear, however, that memory changes vary with the complexity of the task, loss being smallest on simple memory tests, such as one dealing with visual memory for digits. There is a tendency for those of superior intelligence to sustain less memory loss than those who are mentally dull.

Much of the data on memory has been collected in the course of intelligence studies. The dynamic nature of memory and its relationship to personality and motivation have been largely neglected in most of the published work. Although marked individual differences in memory ability have been described, no serious effort has been made to account for these differences in psychobiological terms.

INTELLIGENCE



Those who write confidently about the relationship between age and intelligence may some day have a rude awakening. The studies thus far undertaken have been so limited in terms of sampling and so inadequate in terms of experimental control that it would be foolhardy to assume that we have a solid basis for discussing this subject. Although the work of Jones and Conrad, Miles, Wechsler, and others points to a lowered average performance at higher chronological ages, these findings do not dispose of such possibilities as the following: (1) some maintain their mental abilities into advanced later maturity without appreciable loss; (2) losses that occur are due largely to disuse or lack of appropriate training; (3) the test instruments and procedures are unsuited to older persons; (4) motivational factors differ at various ages.

Our so-called tests of intelligence are instruments for the assessment of mental abilities rather than capacities. At the present time there is no accurate way of gauging mental capacities directly. This requires that we exercise caution in interpreting test results relating to older persons.

It is conceivable, for example, that a person who has the capacity to do problems in differential calculus may lack the ability to solve such problems because he has never been instructed in the subject. Another possibility is that the ability to work problems was once in the possession of the subject and has atrophied because of disuse. In such a case the possibility exists that the ability may be rewon by additional study. Still another possibility is that the subject may be able to solve readily problems in differential calculus, but may be incapable of acquiring easily other abilities of comparable difficulty. In short, abilities may survive the capacities which permitted the acquisition of the abilities. Unquestionably, this accounts for the vocabularly levels of deteriorated senile psychotics, their knowledge of words being unattainable on the basis of present capacities.

The accompanying chart [14] presents smoothed age curves based on three of the best-known investigations, by Wechsler, Miles and Miles, and Jones and Conrad. Age means derived from raw scores have been transformed into T scores in terms of the average mean and average standard deviation of the age groups 25–40. The three curves concur in showing rapid gains in test intelligence during adolescence, with a peak around age 20, after which decline begins.

[14] Fig. 6.—Mental test scores as related to age: a comparison of results from three investigations. From H. E. Jones and O. J. Kaplan, *op. cit.*, note 3 *supra*, p. 72.

Findings on superior men

Recent studies on superior men present a somewhat different picture. W. A. Owens [15] has reported what is in effect a longitudinal study of the mental abilities of a group of college men. Retesting his middle-aged subjects with the same instrument used with them when they were college students, he found no appreciable change in their scores after an interval of thirty-two years. As a matter of fact, there were significant increases on items based on general information, verbal opposites, disarranged sentences, and common sense. Ability to handle items dealing with arithmetical computation, digit symbols, block designs, number series, and analogies did not fare as well, presumably because they were more culture-free.

Another study that fits into this same pattern has been reported by K. Sward.[16] He gave a diversified and difficult mental test to a group of forty-five professors aged 60–80 and to a control group of forty-five colleagues aged 25–35. Sward feels that the two groups were roughly comparable in terms of motivation and initial ability. He found individual differences far more impressive than age differences. Although there was a significant difference in favor of the younger men on six of the eight subtests, the losses appeared to be largely a by-product of disuse and an artifact of the particular test employed. The older men did better than the younger ones on the subtest dealing with vocabulary. Sward concludes that age has the effect of slowing the rate of mental operations far more than of impairing their quality or accuracy.

It is of some theoretical and practical interest that those who do well on intelligence tests are less subject to loss

[15] W. A. Owens, article in *1950 Newsletter*, Division of Maturity and Old Age of the American Psychological Association.

[16] K. Sward, "Age and Mental Ability in Superior Men," *American Journal of Psychology*, Vol. 58 (1945), pp. 443–79.

of the abilities measured than are those who make mediocre or inferior scores. It is not clear at the present time whether this is due primarily to biological or to environmental factors, although it appears likely that the latter are primary.

Differential decline

Older subjects are not greatly handicapped on test items which permit solutions to be reached in terms of past experience. Unfamiliar tasks and problems which require reorganization of data are much more difficult for the average older person than for the average young adult. "Test intelligence" is a composite made up of a number of related but somewhat distinct abilities. It is worthy of note that most studies show that vocabulary and general information items hold up much better with age than items that are more novel for the subject. Of both theoretical and practical importance is a sound explanation for the finding that mental abilities decline differentially. Why do general information and vocabulary items hold up so much better than those dealing with number series, completion, and reasoning? What are the relative roles of practice and biological change?

Relevance of tests

It is generally agreed that speed tests of intelligence discriminate against older persons. Some have argued that it is unfair to administer speed tests to such persons. Although it must be admitted that older individuals may be excessively penalized, it seems that a reasonable solution calls for de-emphasis or isolation of this factor rather than for its elimination. It is important to know the speed with which a person works at intellectual tasks. Research is needed on the causes which underlie the drop in speed which is so commonly observed. It may be due in some cases mainly to lack of familiarity with or practice of the task. It may have a neurological basis in other instances.

Loss in speed is not necessarily disastrous, and often is more than compensated for by experience. The top executive may have a week in which to arrive at a major decision. It is far more important that he arrive at a correct decision than that he be able to make it quickly.

It remains to be established that the functions measured by existing mental ability tests are significant in the lives of older persons. These tests have not yet been validated against acceptable later-maturity criteria. A test may be useful in a school situation but may have little value in appraising the fitness of an older person for a specialized job. It cannot be denied that profound memory loss will disable an individual, or that certain other abilities featured in our tests are important to successful adjustment. However, if our present tests continue in use, subscores rather than global scores should be emphasized.

Most psychologists now recognize that our intelligence tests do not sample all the higher mental abilities. The tests provide little opportunity for the measurement of such functions as creativity and judgment, which assuredly deserve to rank at the very top of the mental ability hierarchy. It is conceivable that some persons add all through life to their ability to arrive at sound decisions in complex problems and to the ability to think independently.

Various measurement problems

A major measurement problem derives from the fact that the same intelligence test may be assessing different mental abilities at different ages. For example, B. Balinsky [17] made a factor analysis on Wechsler-Bellevue test scores achieved by subjects ranging in age from 9 to 59. Using the Thurstone centroid method with axis rotation, he isolated factors from the intercorrelation of scores on subtests for each of six age groups. He obtained different factor groupings for the six age groups. Specificity of performance increased with age, and mental organization varied in the groups studied. The Wechsler-Bellevue test apparently measures somewhat different functions at different adult ages.

The possibility that motor and sensory changes may partly explain the drop in test scores with age has occurred to several workers in the later-maturity field. J. Birren and J. Botwinick [18] have demonstrated loss of writing speed in later life, in "normal" subjects, and a more pronounced reduction of speed in those diagnosed as suffering from senile psychoses. These investigators conclude that tests of writing speed may profitably be added to the psychological examination of the older person.

Verbal intelligence tests proceed on the assumption that those being examined have had comparable intellectual backgrounds. Unless this condition is met, scores have no meaning. Since intellectual histories become increasingly unique as persons age, the condition of comparability of background becomes progressively more difficult to attain. One possible solution is the development of a number of different tests for people of various backgrounds.

Motivation is acknowledged to be an important factor in test performance, and one whose role is very difficult to evaluate. Cumulative experience, biological change, and many other variables surely intervene to influence the attitude that the subject adopts toward the test situation. Adult life rarely provides the type of competitive challenge represented by a mental ability test. The school, on the other hand, constantly provides experiences which prepare the student for the test situation, giving an advantage to the young.

The Wechsler-Bellevue intelligence scale has been very widely used in the measurement of the intelligence of older persons. This test is one of the few psychological instruments that has taken cognizance of the problem of age change. Age decrements are eliminated by adding a fixed number of points to each score on an age basis. This mechanical solution to a difficult problem is not entirely adequate. N. Shock [19] points out that the test procedure would give an 85-year-old cadaver 22 points on an age basis, enabling him to score as a "borderline defective." Here we have a good example of the lack of tools appropriate for the study of aging persons.

It is regrettable that we know almost nothing about the role of race in connection with psychological change with age. The Stanford-Binet, Wechsler-Bellevue, and most of the other widely used tests were standardized on white Americans.

Need for longitudinal studies

Although longitudinal studies of test intelligence are beset by many methodological problems, they eventually must be undertaken if we are to gain insight into the fate of mental abilities in the later years of life. Such studies may direct us to many individuals whose performance undergoes no decline. If such studies could be linked with thorough research on the biological and social progress of these individuals through life, we might emerge with some challenging hypotheses.

Even if it be convincingly demonstrated that the average person experiences decline in the abilities measured by our tests with advancing chronological age, we must still decide whether environmental factors or the aging process is primarily responsible. It is well within the realm of possibility that the decline between ages 20 and 50 is determined mainly by lack of exercise or poverty of the intellectual environment, and that only in the closing decades of life does biological aging become an important factor in test performance. If the writer were compelled to cling to a single hypothesis, he would risk the guess that this is the more correct explanation.

INDIVIDUAL DIFFERENCES

Insufficient emphasis has been placed on individual differences in aging, and little attention has been given to persons retaining their physical and mental abilities to advanced years. The latter provide living proof that frailty of body and mind is not the inevitable lot of men and women in the closing decades. It is reasonable to hope that an intensive study of these fortunate people will teach us how to spread the blessings of physical and mental vigor more widely among the elderly.

Summarizing the literature on individual differences in aging, R. Kuhlen points out:

> In Jones and Conrad's study of adult intelligence only 10 people out of a total of 1,191 exceeded the score interval occupied by the brightest 55 to 59-year-olds. In Galton's data on adults the strongest man in the 60 to 70 year age group was exceeded by only two per cent of the 20 to 29-year-old males. A report by Misiak dealing with age trends in critical flicker frequency, a phenomenon of some interest to students of aging, states "that there were critical flicker frequencies at age 82 as high as at age 7, and . . . critical flicker frequencies at age 7 as low as at age 80." [20]

A Edwards [21] has supplied data on body sway which indicate that many 70-year-olds are as steady as or steadier than many young subjects. In the matter of finger tremor, the oldsters did not differ greatly from college students. Individual differences were striking at all ages.

A man of 106 with an intelligence quotient of 126, who is active in organizations and keeps abreast with world events, has been described recently by D. Schuster.[22] The literature contains references to a number of other persons who have distinguished themselves on intelligence tests at very advanced ages. The average college graduate at age 60 does better on an intelligent test than the average high school graduate at age 18. It is reasonable to assume that a person's test performance in the later decades may be predicted roughly on the basis of early adult scores, barring neurological or psychiatric disease.

CURRENT RESEARCH

Although interest in the field is growing, relatively little research is being done on the psychology of aging. Many of the projects now operating are modest in scope and handicapped by insufficient funds. Some graduate students and psychologists with the doctorate who have worked in the field have been wooed away by offers promising greater security and opportunity for advancement. This is particularly depressing when one considers the importance of the problem of an aging population and the fact that only the surface has been scratched in the areas that have received the most attention, such as the relation of age to intelligence. We know very little about the etiology of the sensory and motor changes which apparently occur in a very large percentage of older people. We are almost wholly ignorant of the factors responsible for the major mental disorders of later life. There are wide areas in the psychology of later maturity where not a single study has been undertaken.

Polling the Fellows and Associates of the Division of Maturity and Old Age of the American Psychological Association in the summer of 1949, Shock found that forty projects were being actively prosecuted in the field of aging. A large percentage of the projects centered on attitudes and personal adjustment of the aged. Interviews, questionnaires, and rating scales were the instruments most frequently employed. Three-quarters of the projects were based at Baltimore, Chicago, and Syracuse.

Repeating the Shock study in the summer of 1951 on the same group, Kaplan found that an increase had taken place in work on the psychology of aging during the two-year interval. Fifty distinct projects were being investigated at twenty-two centers. Particularly impressive were the appearance of many new faces among the researchers and the spreading of activity over the country. There was proportionately less emphasis on personal adjustment and the tools usually employed in assessing it. The diversification of research activity is an encouraging development. It is probable that the Shock and Kaplan surveys do not fully represent the extent of American effort in the later-maturity field. Many psychologists who are interested in aging are not members of the Division of Maturity and Old Age, and many data on aging are obtained as by-products of research which has some other focus.

Titles of current research projects include the following: The Mental Health of the Centenarian; Evaluation of an Educational Program for Vassar Graduates over Sixty Five; Psychological Factors in the Development of Heart Diseases; Evaluation of Sex Hormone Therapy in Aged Women; Processes of Aging in Chimpanzees; Employment Potentialities of Older People; and A Study of Strength of Grip in Senescence. There are at least a dozen studies in progress on the intellectual aspects of aging. One of the most important investigations now underway is one on the role of heredity which is being carried forward by Kallmann and his associates.

The science of gerontology is in its infancy. Few of the scientific giants of our time have been attracted to its service. Many who profess interest in its problems are concerned with them only in a peripheral way. Gerontology

is the stepchild of public and private agencies that support research in the social and life sciences. Some even question its right to a separate existence. Understaffed, neglected, at the very beginning of its career as a science, it stands at the threshold of a long and brilliant history.

Oscar J. Kaplan, Ph.D., San Diego, California, is chairman of the Department of Psychology at San Diego State College. He is editor of the Newsletter of the Division of Maturity and Old Age of the American Psychological Association, and represents his division on the Council of that association. From 1946 to 1950 he served on the Gerontology Study Section of the United States Public Health Service. He edited Mental Disorders in Later Life (1945) and is author of numerous articles on the psychology of later maturity.

Social Participation of the Aged in Different Cultures

By LEO WILLIAM SIMMONS

A PROMINENT physician recently remarked that pediatrics is essentially a medical matter, but that geriatrics is, after all, a sociological problem. However much one may choose to qualify such a statement, there will remain some pertinent and provocative truth in it; for in the course of human experience it is apparent that the initial priority of biological forces in life becomes profoundly affected by the superimposed sociological factors. This is especially true with respect to aging, and provides a source of insight both into the evolution of human societies capable of carrying large numbers of old people and also into the life cycle of the individuals who manage to reach and to face a ripe old age.

SOCIAL ASPECTS OF AGING

The farther back one goes into primitive and rudimentary forms of association the fewer old people are to be found, and those, quite generally, with old age attributed to them at a much earlier chronological date than in advanced societies. It is reported, for example, that the Arawak of British Guiana, under native conditions, seldom attained more than fifty years. "Between the thirtieth and the fortieth years, in the case of men, and even earlier in the case of women, the rest of the body, except the stomach, shrinks, the fat disappears, and the skin hangs in hideous folds." Arunta women of Australia were regarded as very fortunate if they reached fifty, and it is said of the Bontok Igorot in the Philippines that a woman reached "her prime" at twenty-three, at thirty she was "getting old," before forty-five she *was* "old," and by fifty, if she was so fortunate as to see fifty, she was a "mass of wrinkles from foot to forehead." Among the Bushmen of South Africa it it is reported that "really old people are rare." The Creeks of North America had a saying that parents were lucky whenever they lived to see gray hairs on the heads of their children.[1]

It is of further note that human societies met the problems of a fruitful and satisfying old age for *some* individuals long before there was any opportunity for many people even to grow old. Indeed, in certain quite primitive groups the aging years of life have been actually regarded as the best. Probably nowhere, for instance, has age been viewed in a more favorable light or accorded greater homage than among the Palaung of North Burma, who attribute their longevity to virtue in a previous existence. In anthropological perspective it is literally true that societies achieved a very good old age for a few long before there could be any substantial age at all for the many. But modern civilization has reversed the process and the problems.

Another interesting contrast is portrayed in the relative uniformity of the patterns of adjustment to birth and childhood and the very much greater diversity of socially prescribed ways of coping with the problems of age and death.

Some of the extremes in cultural variations with respect to aging can be sketched offhand: Old age has been

[1] Leo W. Simmons, *The Role of the Aged in Primitive Societies* (New Haven: Yale University Press, 1945), p. 17. Cites original references.

said to begin quite early or rather late in life, and it may last a very long or a short time. By conventional norms, its coming may be resented and discounted or welcomed and treasured. It may be considered an idle and useless period in life or an active and fruitful one. It may bring promotions in position and homage or demotions in both. It may be expected to drag itself out in dull, tedious boredom or to go by quickly with interest and zest. Thus, the onset of aging may be viewed as a curse on the one hand or as a challenge on the other. But most peoples meet it somewhere between these two extremes.

The liability phase

A stage is reached, however, in the experience of aging where one finds almost everywhere a surprising degree of uniformity in attitude and social response. Although there is wide range of socially sanctioned adaptations in different societies, a point comes in senescence where any fruitful participation is regarded as past, and the incumbent is looked upon as a definite liability. Senility may be a suitable label for this phase of life; but it is not entirely apt in that it implies extreme physical weakness and/or mental infirmity, while the main idea conveyed is that of being regarded by members of the group as inconsequential and a hopeless burden. This is a status which may be attained under various degrees of physical and mental debility in different societies. Some primitive folk use a term which implies "overaged," "useless," or the "sleeping" stage in life. And everywhere for the aged in this state, unless death provides an early release, the prospects for further aging, and the attitudes toward it, tend to be uniformly dismal. Apparently all societies differentiate between old age in general and this pathetic plight in which the individual is regarded merely as a long-sufferer and a social obligation.

Of particular pertinence in the evolution of the social dynamics of aging is the observation that the overaged, useless, or liability phase of senescence actually has had little significance for the simple societies which were never able to sustain more than a few really old people anyway, and those under conditions in which the very helpless could not long survive. But this helpless and hopeless period in life takes on paramount importance in our modern times and in complex civilizations which are so successfully solving the physical problems of a potential old age for the multitudes. When we envisage the possibilities of sustaining and prolonging life far into this phase, perhaps even with eliminations and substitutions for all but the more vital organs and elements of the human body, the emerging problems of overaging are greatly magnified. If we add to this the recognized fact that the "useless" period in life is socially and culturally determined and may be moved up as well as pushed back in years, the potential problems of anything like successful aging become staggering. The societal fates can become most unfortunate for aging in our times, of course, if so many old people are made to feel useless much too early in life and find the twilight years empty, lonely, and too long-lasting. Thus can civilization create more problems of aging than it has yet solved.

INDIVIDUAL INITIATIVE IN AGING

We have stressed the conditioning impact of society upon the experience of aging in general. But this is not the whole story. The initial and basic biological forces in life are no less critically affected by sociological factors in the life history of every person who lives

to be old. Anyone's success in aging will depend measurably upon facing up to these factors in an active and participating way. And while society sets the stage, sketches out the plot of the play, and provides the conditions for more or less successful aging, the initiative must spring substantially from the individual. And where many fail, some will always succeed.

It would appear that any sustaining group support for aging comes primarily through the adaptive behavior of the individual to group life. There are tremendous possibilities for a ripe and rewarding old age in some societies, but only in those that have *acquired* the norms, attitudes, and patterns of reciprocal response between youth and age which provide group support, and then mainly by personal participation and adaptation thereto. Thus, successful aging is something to be achieved both by society and by the individual.

In sum, then, the opportunities to grow old and to participate effectively in group life stem very largely from social rather than innate factors and from acquiring individual skill and initiative instead of, or in addition to, biological endowments. These same opportunities may be won or lost by pressures or changes in the social milieu, or by the apt or inept attempts at adaptation by the particular individual. It takes the two parts, neatly fitted, to make for wholesome and prolonged participation. The secret of success for anyone facing a long life, therefore, is to find for himself a suitable place in his society in which to age with grace and usefulness, and to participate tactfully and fully up to the very end if at all possible.

MANIPULATION OF DEPENDENCY

It is perhaps a truism that everywhere in the human cycle life begins with the dependency of the young on those who are older, and it generally ends with the dependency of the old on those who are younger. But while there is no way to escape a set period of dependency in youth, there can be much or little dependency in old age, conditioned in part by how long a person may live and also by how well he is able to participate in the affairs of the group.

It is also easy to see that protective care is more firmly assured for dependency at the beginning than at the end of life. Whatever there may be of a protective parental "instinct" is certainly not matched with as strong filial tendencies. A good old age for almost anyone anywhere depends essentially upon the amount of persuasion or enforcement which can be brought to bear upon the young and the strong to respect and provide for the interests of the old and the feeble who are no longer able to provide for themselves. In personal relationships this will depend largely, as always, upon the homage which can be inspired, the contributions which still can be made, and the rights and prerogatives which can be manipulated by the aged. Even in the most favorable societies for aging, it is still mainly up to the old to elicit and secure the kind of respect and support which the culture dictates as rightfully due them. Any aging that is worth the effort is rarely a passive and withdrawing role; and as the situation becomes more desperate the interpersonal relationships become more vital, and the participation must needs remain active and effective, however veiled and subtle.

Indeed, the degree and the quality of the participation may constitute the measure of success in aging even when the individual is finally confined to his room and bed. Anyone observant of these last days and years of aging can note a very significant lapse of group interest and supportive care when an aged sufferer has reached a state of

being "comatose" and without further powers to respond. Perhaps it should be no surprise that success here correlates so closely with the degree and quality of sustained participation. It would seem that just to remain in touch, "gamy," and responsive to the end helps out in aging, at least if one wishes "to make it good" to the very last.

AREAS AND FORMS OF PARTICIPATION

In addition to ensuring opportunities for longevity, we have seen that society provides the framework for the participation of at least some of its aging members, and it also assigns, as well as defines, the positions and functions which they are to perform. In relatively simple and static societies the statuses and roles of participation are sex typed, and sometimes aptitude rated, as well as age graded. Everyone belonging to a society of this kind comes to know approximately where he stands and how he may participate at a particular period in his life span, and this is especially true of the older members of the group. But in complex and fluid social systems with rapid change and recurrent confusion over status and role, no one's position is so well fixed —least of all that of the aging. Thus, a general principle is that in the long and steady strides of a social order the aged find themselves fixed and favored in position and performance, but when conditions become unstable and the rate of change reaches a galloping pace the more youthful find opportunities in their favor and may become much earlier seated in the saddle.

With such qualifications regarding social change, it is reasonable to forecast, roughly, that an aging person's opportunities to participate successfully in his social milieu will depend largely upon the structure and the development of such major social institutions as the economic order, the forms of family life, the types of recreational and educational facilities, the religio-magical rites and functions, and the political system. Within these five institutional configurations, old people are found participating everywhere, with various degrees of success, in at least the following five distinguishable forms of activity: the performance of auxiliary services, the pursuit of specialized skills, the exercise of established rights and prerogatives, the dispensation of knowledge and wisdom in decision-making, and the administration of rites and rituals related to the crises and mysteries of life.

AUXILIARY SERVICES

By all odds, the most basic and widespread form of participation for aging persons with waning physical powers is to be found in assisting others with economic enterprises and household chores —essentially simple and routine work with the hands. Indeed, the *hands* of the aged, as adaptive and surviving organs of participation, grow in significance along with the years. Everywhere in human societies the aged are found helping out with the lighter tasks on the trail, in the field, the camp site, the shop, the office, and the household, and at almost any jobs that they can find to do. By these activities they retain a sense of place and performance in the group, and gain thereby a little more consideration and security.

An example may be drawn from a contemporary aboriginal group, the Hopi in northeastern Arizona, a herding and farming people.

> Old men among the Hopi tend their flocks until feeble and nearly blind. When they can no longer follow the herd, they work on in their fields and orchards, frequently lying down on the ground to rest. They also make shorter and shorter trips to gather herbs, roots, and fuel. When unable to go to the fields any longer they sit in the house or kiva where they card and spin, knit, weave blankets, carve wood, or make sandals. Some continue to spin when they are blind or unable to walk, and it is a common saying that "An old man can spin to the end of his life." Corn shelling is women's work but men will do it, especially in their dotage. Old women will cultivate their garden patches until very feeble and "carry wood and water as long as they are able to move their legs." They prepare milling stones, weave baskets and plaques out of rabbit weed, make pots and bowls from clay, grind corn, darn old clothes, care for children, and guard the house; and when there is nothing else to do, they will sit out in the sun and watch the drying fruit. The old frequently express the desire to "keep on working" until they die.[2]

Although opportunities for participation differ greatly under various social systems, they have tended to increase with cultural advances, especially up to and including agricultural economies, and have proved to be great assets to the aging. In modern industrialized societies the opportunities for such labor of the hands may be greatly multiplied, but the competition of younger persons for the same tasks may simultaneously become so intensified as to rule out any extended participation of the aged. Therefore, retirement from even the simpler tasks may come earlier and more abruptly for the aging. It is not enough that there are a multiplicity of these tasks for aging hands; the continued services of the aged must be needed and appreciated by those in the society who are in a position to make the decisions.

It is also true that such labors of necessity often ensure little more than a bare subsistence, for the menial and humdrum tasks which not infrequently fall to the lot of old people may sometimes become little more than demotions into drudgery, and they can constitute something like the last feeble attempts at participation and survival. A satisfactory relationship for the aged generally requires additional and more effective adjustments.

[2] Leo W. Simmons, "Attitudes Toward Aging and the Aged: Primitive Societies," *Journal of Gerontology*, Vol. I (Jan. 1946), p. 79.

SPECIALIZED SKILLS

In most societies, however primitive, the more gifted and diligent among the aged generally possess some expert skills which enable them to monopolize, or at least to supervise, certain specialized tasks or functions. Not infrequently, they are experts in the arts and crafts, such as pottery, basketry, housebuilding, boat construction, metal work, and the manufacture of clothing, tools, weapons, and other implements. They may also excel in the decorative arts. Moreover, they are often in demand as directors of hazardous projects, of complicated techniques and procedures, and as specialists in the performance of such personal services as operations to enhance physical charm or the treatment and relief of physical ailments. In the course of a long life they can and do take advantage of the opportunity to acquire superiority in practical and esthetic skills that stand them in good stead during the years of declining physical prowess.

But again, in our complex civilization, where the range and the number of specialities are so vastly magnified, the aging really find fewer opportunities to compete successfully with more youthful experts. Indeed, except for a very few highly gifted persons, the organization and the professionalization of the specialities have reached such high development, and the training of youth in these skills is accomplished so early in life, that a capable young person may reasonably expect to overtake or surpass a parent or grandparent long before he himself begins to age.

Probably never in the history of man have the skills of the aged become so

effectively shelved by the trained aptitudes of youth. Unless the aged are very gifted, their chances now for prolonged participation, except as a pastime, are better in the esoteric or "fringe" specialties, where competition is light, than in the skills which are in common demand. Relatively few really old people are regarded as indispensable any more because of their specialized capabilities. And perhaps it is chiefly this fact that calls for and justifies in our culture the rise of the modern hobby interests, which provide at best a kind of playful participation.

RIGHTS AND PREROGATIVES

One of the most important areas for prolonged and effective participation is in the exercise of rights and prerogatives. Long lives have afforded the aged ample opportunities to fix their claims in close accord with the cultural codes; and as their days shorten and their physical powers wane, these established prerogatives become for them like long arms for extended participation in the daily affairs of life. In many societies the effects of these prerogatives are felt long after death has claimed their possessors, as, for example, in the last testaments respecting property and in the late admonitions of departing patriarchs.

Property rights are excellent examples of these prerogatives. They are among the most flexible, impersonal, and effective means of obligating others to do one's biddings. Generally, where such rights are firmly entrenched in a society, they enable the possessors to accumulate and to store up credits against the hard days ahead; and since the enforcement of property rights rests upon the social codes and the surveillance of appointed agents, empowered with group sanctions, all that an aging possessor needs to do is to meet the terms of the code. He does not have to defend these rights by his own strength. Thus with a backlog or a bank roll of established claims, he is in a position to manipulate other people into obeying his orders long after he is too feeble to do much himself. It is certainly true that wherever these rights are well developed in a society, there is a marked difference in the participation of aging persons with and without property. Indeed, few contrasts are more pronounced in the status and role of the aged.

In an over-all survey, it would appear that property rights as a means of participation by aging persons had a very simple beginning and have increased in importance with the development of more complex social systems and advanced cultures. Of course, wherever the existing property of a group becomes concentrated in the hands of a very small proportion of the population, its effectiveness as a means of participation for the majority of the aged is greatly diminished. Under such circumstances it is possible for large numbers of old people to become very dependent in a land of plenty.

Another way in which the aging may exercise their rights and prerogatives to very good effect is in family relationships. Within the ties of kith and kin, the obligations of youth to age are so nearly universal that they cut across most cultural traits and trends and are not greatly hindered by varied combinations of them. Not infrequently aging persons manipulate such bonds to great advantage, finding in these relationships opportunities for participation which reach far into senility and sometimes past it, as by the last wishes and testaments.

One means by which the aging hold onto effective family ties is by marriage to younger mates—a rather widespread practice, especially among men. Aged

women who wish to extend their influence through family life more often find themselves unable to marry younger men, but in some societies they encourage their husbands to take younger spouses whom they may be able to manage.

But a more extensive right than marriage is the rank and authority which aging persons hold in the family, and these powers and vested interests often affect a wide circle of relatives. A relationship of special interest here is the close association of the old with the very young. Frequently they are left together while the able-bodied of both sexes go forth to secure the family fare. These older people protect and instruct the children, who, in turn, are as "eyes, ears, hands, and feet" to their enfeebled old friends. In a social sense, the aged thus return to childhood, finding therein a useful occupation and an active interest for the long, dull days of their dotage.

But as the old people suffer increasing loss of both physical and mental powers, without prospects of regaining them, they differ significantly from the young, the sick, and the temporarily disabled. They have to retreat permanently from the rigors of life and seek their refuge in the bosom of the family, there to take up a kind of last stand and to rely more and more upon their kinsmen. Such a retreat to domestic shelter, however, does not imply a passive existence. Success up to the end requires that participation continue, however restrained and subtle it may become.

KNOWLEDGE AND WISDOM

In primitive societies an aged man or woman has a distinct advantage in knowledge, wisdom, and good judgment in decision-making. Without written records, where all that is known must be retained by memory, old people are repositories of valuable information and are in a favored position to make seasoned judgments. Such powers accumulate with age, and outlast physical stamina. The possessors of these qualifications are in constant demand for imparting general information, interpreting strange and mysterious phenomena, pronouncing upon ethical standards, diagnosing personal ailments, and providing comfort and guidance to the distraught and bereaved. Seers, magicians, medicine men, and priests are frequently old people. They serve as mediators between man and the great unknown, the imaginary environment which is believed to be peopled with unfriendly spirits and devils as well as benevolent beings and gods. When faced with common perplexities and personal crises of every kind, primitive people generally turn to their "old wise ones" for help and counsel; and the aging individual with enough experience, insight, and gumption to suggest or do something, or even make it appear that something can be done in the hour of human need, usually reaps a reward. The Hebrew axiom that "with the ancient is wisdom; and in length of days understanding" is practically universal among primitive peoples.

Political, judicial, and civil preferments and positions are often, also, the normal outcome of such personal growth in the lifetime acquirements of knowledge, wisdom, and sound judgment. The titles and often the offices tend to be lifelong. Old men may serve long and well as lawmakers, judges, and administrators of justice. Moreover, as leaders in exclusive societies and in initiatory rites, the aging quite generally exercise the powers of discrimination and receive considerable deference.

Positions of influence in decision-making, which depend little upon the

manipulation of things and greatly upon the manipulation of people, constitute perhaps the peak of power in participation. Thus the influence gained from the strain and toil of physical activity rarely matches the power exercised by knowledge, wisdom, and skill in social relationships. In other words, it is the exercise of brain more than brawn, of wits more than works, that sets and maintains the highest levels of participation by old people.

In old age, such opportunities and powers appear to depend mainly on three factors: individual ability and initiative, sex, and a favorable combination of social and cultural conditions. Age alone rarely qualifies one here. There must also be individual ability, and growth in experience, wit, and tact. Even then, however, a point is reached in aging where these may disappear.

RITES AND RITUALS

Aging persons with special qualifications in knowledge, wisdom, and experience also find many opportunities to exercise their influence in the more formalized ceremonies, magical rites, and religious practices. They often become the officiating agents in the critical events of the life cycle, such as childbirth, child naming, initiations, weddings, funerals, and memorial ceremonies.

There is usually an element of mystery and chance associated with these emergencies and critical events of life. It is generally believed that it is not always strength of brawn or practical work that staves off bad luck, that wins the maiden's hand, that brings children to bless a family, that drives out or heals disease, that controls the weather, divines omens, casts out evil influences, and placates angry gods. It is a special power, strange, mysterious, often ritualistic, and most potent, as well as safest, when guided by the wisdom and experience of the aged and wise ones.

Here, also, the aged possess a further advantage, for should a charm or rite or ceremony miscarry, they can with their superior knowledge and experience explain away the failure. They can confidently affirm in the face of mischance that had it not been for the additional rite of performance, matters could have turned out far worse. Thus in many societies the wise old people are able to serve on into their late years by a ritualization of their experience of the past, by tempering the ill luck of the present, and by cushioning the hard fate of the future—and this is often an indispensable contribution to the younger members of the group.

DISCUSSION

This summary exploration of attitudes toward the participation of aging persons in the affairs of life reinforces the idea recurring from varied approaches, namely, that while modern civilization has greatly progressed in the promise of longer life for larger proportions of the population, it has disrupted many of the time-tested adaptations of the aged, and perhaps even regressed in its solution of the problem of successful aging. Probably the most important lesson to gain from a broad coverage of different peoples is that the basic qualities of successful aging rest, after all, upon the capacity of individuals to fit well into the social framework of their own times, to win their rights to prolonged participation and recognition, and to know when they are through. Apparently there are no equally successful substitutes for this, the functional rights and the appropriate behavior in aging.

There are grounds to believe that while we have made much ado over the discovery of adolescence as a unique stage in life experience, and recognized it as quite different from adulthood, we are continuing—mistakenly—to regard aging as little more than a somewhat discredited extension of mid-adulthood. This conception of old age as a hang-over of mid-life implies a pattern of adjustment which may be characterized as holding on and/or trying to beat a slow and often resentful retreat from the norms and standards of mid-life, rather than a challenge for a different kind of life with new horizons. A "holding-the-line" pattern, while good strategy for some, may be much less than the best course of adjustment for others, especially for those who are still forward-looking, capable, and resourceful.

There are some quite justifiable reasons to assume that a shift from mid-life to old age can be as significant a change as that from adolescence to adulthood, and the range of variations in the successful fruition of life in old age may really be much wider than it is for youth. We may find it very profitable, in short, to explore the possibilities inherent in the idea that old age in our modern civilization constitutes what may be quite properly regarded as a new lease on life which, in optimum fulfillment, calls for new ways of living, ways possibly as different from those of mid-life as adolescence is from adulthood.

We are accustomed to hear a great deal about the *problems*, and little about the *opportunities*, of old age, almost as if aging were to be regarded as a curse, after all our efforts to attain it. We often seem to forget that the prospect that so many of us will reach old age is a most remarkable achievement and known only to recent times. Likewise, we stress what society may do for the aged, instead of what the aged may discover in themselves and for the rest of society. We need to heed the principle that people have aged most successfully when they have discovered or created for themselves effective positions and roles in the very societies of which they are a part. It is possible that these potentialities wait to be rediscovered, developed, and refitted into our own times. This may, indeed, be an old frontier that calls for new pioneering.

Leo William Simmons, Ph.D., New York City, is professor of sociology at Yale University, at present serving as social anthropologist with the Russell Sage Foundation and visiting professor of anthropology in medicine and nursing at the New York Hospital-Cornell Medical Center. His chief publications are Sun Chief: The Autobiography of a Hopi Indian (1942) and The Role of the Aged in Primitive Societies (1945).

Older Persons in the Labor Force

By Gertrude Bancroft

THE position of older persons in the labor force today and their probable status during the next few decades should be of absorbing interest to all adults. Among population groups subject to possible disadvantage or discrimination in the labor market, the older group is the most universally vulnerable. Many persons can live out their working lives untouched directly by the factors that adversely affect the employment of women, of Negroes, of the foreign-born or other minority groups, but none can escape the effects of age—as it influences both his own employment and that of someone to whom he is closely related.

It is hardly a revelation to point out that with the advancing age of the population, the number of workers who are retired or facing retirement or striving to remain in the labor force for economic or emotional reasons will be growing every year. Likewise the number of families using part of their income to help support older persons, whether in the labor force or not, may be expected to become ever larger. Hence, it is important to examine what can be anticipated in the way of opportunities for older persons to continue to keep their place in the productive economy and to contribute rather than to become wholly dependent on their families or on society.

Attitudes Toward Retirement

Much of the current discussion on the problems of the aging assumes at the start that it is socially and economically desirable for older people to remain employed on some basis as long as they wish to and are able to. Furthermore, most older workers are assumed to want to remain in the labor force. This latter is probably a valid assumption, although it has not had statistical verification except on a limited basis. One piece of evidence is that by no means all workers eligible for old-age and survivors insurance benefits are receiving them. At the beginning of 1951, about two-fifths of the persons 65 and over who were fully insured were not drawing payments, most of them, presumably, because of employment. It may be inferred that they chose to remain at work.

Other evidence derives from studies of old-age insurance beneficiary "retirements" between 1940 and 1947 [1] made in twenty middle-sized and large cities. These suggest that in those areas retirement of the beneficiaries studied had not been voluntary. Only one in twenty had been able to quit work voluntarily and in good health. After retirement many had again sought and found employment. The compelling reason for return to the labor force seemed to be not a desire to be busy and useful, however, but need for additional income to maintain anything like the previous standard of living. These studies were made in fairly large urban centers. In smaller communities or in rural areas, where living costs tend to be lower, the findings might differ. Fortunately, a similar survey on a nation-wide basis by the Bureau of Old-Age and Survivors Insurance is in prospect which should give more conclusive answers.

It is possible that if retirement did not bring financial hardship for most people, attitudes might differ sharply as to the desirability of retaining a place in the labor force. There was some evidence of a temporary reduction in labor force activity of men 65 and over following the 1950 liberalization of the Social Security Act, despite the new provision that a person could earn as much as $50 a month in covered employment and still draw benefits. This suggests that some older workers believed that employment was no longer necessary and perhaps welcomed the chance to enjoy a more leisurely life. The average size of monthly benefit ($42 for a retired worker, or $72 for a retired worker and his wife, in December 1950) would hardly be enough to permit a life free from financial cares but, in combination with income of other family members or income from other sources, might in some cases be the crucial amount.

It is hoped that through the growing interest in the aging population valid information will be developed on the relation of income to attitudes of this group toward complete or partial retirement, both for persons anticipating retirement and those already out of the labor force, voluntarily or involuntarily.

[1] Margaret L. Stecker, "Beneficiaries Prefer to Work," *Social Security Bulletin*, January 1951, pp. 15–17.

Definition of "Older Worker"

The use of the comparative adjective "older" in a discussion of this kind is in part an obvious form of escape through euphemism. No one wants to be labeled "old" but all of us are "older" than someone. In part, however, its reflects the elasticity of the concept. Age, like beauty, may be "in the eye of the beholder," but it is also closely related, as far as labor force activity is concerned, to occupation. The age at which a person becomes an "older worker" will vary by as much as forty or fifty years depending on whether he or she is a prize fighter, a chorus girl, a ballplayer, a plasterer, a piano tuner, a symphony conductor, a lawyer, or a college president. For purposes of summarization, it is necessary to be arbitrary and to ignore these basic differences, however.

Tradition and social insurance provisions tend to set 65 as the retirement age, but the problems of older persons in the labor force give evidence of their existence before this age. On the basis of the census statistical classifications, older persons in the labor force might be defined as those 55 years old or more. For men, the peak age groups are those from 25 to 54, in the sense that these are the groups which have the largest proportion in the labor force—employed or looking for work. Therefore, the next age group, in which the statistics show a marked dropping off in this proportion, might be said to begin the "older" group. In the following discussion the activity of persons 55 to 64 years of age will be shown separately from that of those 65 and over, wherever possible.

Older Persons in the Labor Force Today

Currently, in a typical month one out of every six civilians in the labor force is at least 55 years old.[2] That is, almost 11 million persons working for pay or in a family business, or looking for work, are 55 years old or over. (Three millions are 65 or more.) More than 8 million are men; over 2 million, women. Most of the older persons who are not in the labor force are "voluntarily" idle, retired, or engaged in keeping house (12.6 million). Only 2.3 million are estimated as permanently unable to work or in institutions.

[2] Based on data from the Current Population Survey, a monthly survey of a cross section of the population conducted by the Census Bureau. See *Current Population Reports*, Series P–57 and P–50.

TABLE 1—PER CENT OF CIVILIAN POPULATION IN LABOR FORCE BY AGE, APRIL 1951

Age	Men	Women
14–15 years	22.1	7.3
16–17 years	43.5	26.4
18–19 years	70.6	48.3
20–24 years	85.0	44.8
25–34 years	95.1	34.4
35–44 years	96.1	38.7
45–54 years	94.4	37.8
55–64 years	86.0	28.0
65 years and over	43.5	9.1

Source: U. S. Bureau of the Census, *Current Population Reports*, "Monthly Report on the Labor Force," Series P-57, No. 106. Adapted from Table 6.

When expressed in terms of "worker rates," that is, proportion of population in labor force, the participation of older persons in gainful economic activity is seen to be significantly less than for the central age groups. Among older men it corresponds roughly to participation in the late teens and early twenties, but among women it drops back to the level common among girls of high school age. As of April 1951, the percentage of each age-sex group in the labor force is shown in Table 1.

The industries in which older persons make the largest contributions, numerically, are extremely varied with respect to their wage levels, and consequently their status, social as well as economic. Industries with one-fifth or more of their work force consisting of men 55 and over in April 1951, were agriculture, transportation (railroads in particular), finance, insurance and real estate, personal services, professional services, and state and local government.[3] Men 65 and over had the best chance in agriculture, finance, insurance and real estate, and personal and professional services.

No industry provided relatively as many jobs for older women as for older men. In agriculture, retail trade, service industries, particularly service in private households, professional services, and public administration are found the largest proportions of women 55 and over—roughly 10 per cent.

On the one hand, then, in activities where principles of seniority have been long established or where job security is legal or quasi-legal such as government, education, or transportation, the older worker has an advantage, or at least is not at a disadvantage. On the other hand, industries in which wage rates are comparatively low, such as agriculture, trade, and some of the service industries, make use of older workers, as they do of youngsters of school age, because they cannot attract the more productive workers in the other age groups. Finally, where small independent enterprises are common, such as in agriculture and trade, the older worker can continue along for many years as his own employer if he can make a go of it financially. In April 1951, almost one-third of the employed men 55–64 years of age were self-employed, and almost two-fifths of those 65 and over. Among women 55–64 only 15 per cent were self-employed, but for those 65 and over the percentage was about 25.

[3] Bureau of the Census, unpublished data from the Current Population Survey. Unless otherwise specified, all of the figures cited in the remainder of this article are from this source. Since they are based on a sample, they are subject to sampling variability which may be particularly large for the 65 and over group.

PART-TIME EMPLOYMENT

Part-time employment has often been proposed as a means by which older persons can remain at work on a basis that takes account of their strength and health. Currently, however, the great majority of older workers are still full-time workers. Almost all male workers in the central age groups and about three-quarters of the female workers work full time (35 hours a week or more) as a usual thing, except for illness, vacation, or other factors. Part-time employment becomes much more common in the 55–64 age group, but even among persons 65 and over, far fewer than half were working less than 35 hours in April 1951 (25 per cent of the males and about 40 per cent of the females). More farm workers than nonfarm workers work part time, as a rule, in these age groups.

The picture taken as a cross section of activity during a single week is confirmed by the work experience pattern over a whole year. Part-time work was a usual thing for less than one-tenth of men 55–64 years of age who worked during 1950, but for almost one-quarter of those 65 and over. For women, who at almost all ages must combine housekeeping with other activities, one-third usually worked part time in the 55–64 ages, and about one-half among those 65 and over. Full-time employment was the goal of the remaining workers in these age groups, but, as among workers in other age groups, many of them did not have full-time employment the year round because of periods of slack work, sickness, withdrawal from the labor force, and other reasons. These interruptions were noticeably more frequent for the population 65 and over; little difference was observed between the 55–64 group and the next younger group.

To what extent do older workers work less than full time because they wish to? Various studies of part-time employment conducted by the Census Bureau have given a basis for judgment on this point. These studies have repeatedly shown that part-time employment is usually voluntary in an era of full employment, like the present. Older persons work part time on a voluntary basis fairly frequently after the age of 65, but, even at this age, the majority of employed persons usually work full time. The situation, again, differs for men and women, as is shown in Table 2.

Few of the regular part-time workers were in manufacturing, the largest single major industry class. Should a program of planned part-time work for older workers be inaugurated in this industry to meet labor shortages or as part of a general program for older workers, it is likely that the situation shown by the census study would change markedly. Not only would some workers

TABLE 2—PERSONS AT WORK, CLASSIFIED BY FULL- AND PART-TIME STATUS, MAY 1951
(Per cent distribution)

Employment status	Men			Women		
	45–54 years	55–64 years	65 years and over	45–54 years	55–64 years	65 years and over
Total at work	100.0	100.0	100.0	100.0	100.0	100.0
Worked full time	94.6	90.9	78.7	75.6	71.2	58.7
Worked part time	5.4	9.1	21.3	24.4	28.8	41.3
Usually work full time	3.0	4.2	3.8	4.4	3.8	1.9
Usually work part time	2.4	4.9	17.5	20.0	25.0	39.4
Prefer and could accept full-time work	1.0	1.1	1.5	3.1	2.2	2.8
Do not prefer full-time work	1.4	3.8	16.0	16.9	22.8	36.6

currently working full time prefer a less exacting schedule, but retired workers might be expected to return to the labor force under those more favorable conditions.

WARTIME EXPERIENCE OF OLDER PERSONS

Anyone who remained in civilian life during World War II will remember the numerous aged telegraph messenger "girls," delivery "boys," waiters and waitresses, plumbers, doctors, and their contemporaries filling in for younger workers who had gone to war or had transferred to war production jobs, generally at higher rates of pay. These were the people who met the public. Thousands of other older workers were employed in factories or on construction jobs. Statistically, how did the older ones count up? In 1944 there averaged 6.7 million men and women 55–64 years old and 2.9 million 65 and over in the labor force—almost 10 million persons or nearly one-fifth of the civilians who kept the American economy going. In 1940 the number had been only 8 million or about one-seventh of the total.

Because of the long depression of the 1930's, a fairly substantial decline in labor force activity of older men had taken place, giving further impetus to an already recognized long-term trend. Thus, during the war it was estimated that close to one million of these workers were "extra"—that is, they would not have been in the labor force except for the war. It was expected that when the war ended the long-term downward trend would be resumed and the shrinkage of the older labor force might be especially sharp after the war demand for manpower was over. Subsequent developments have not confirmed these speculations. Rather, although wartime peaks were not sustained, the postwar period of relatively full employment and now the heightened activity of the renewed defense program have thus far maintained labor force participation at prewar levels for men and allowed for a further increase for women 55 and over.

TABLE 3—PER CENT OF NONINSTITUTIONAL POPULATION IN THE LABOR FORCE ANNUAL AVERAGES 1940–1950

	Men		Women	
	55–64 years	65 years and over	55–64 years	65 years and over
1940	87.2	45.0	18.7	7.4
1941	88.6	46.5	19.6	7.7
1942	90.5	47.8	22.1	8.4
1943	92.1	50.6	24.3	10.1
1944	92.1	52.3	25.5	9.8
1945	91.4	52.1	26.5	9.6
1946	89.6	48.5	23.6	8.4
1947	89.6	47.8	24.3	8.1
1948	89.5	46.8	24.3	9.1
1949	87.5	46.9	25.3	9.6
1950	87.0	45.8	27.0	9.7

Source: Bureau of the Census, Current Population Survey. Averages for 1940, 1941, and 1942 estimated from broader age groupings.

Generally speaking, the industries that normally employ older workers relied more heavily on these age groups during the war. Some war plants could cite a few spectacular instances of 70-year-old lady chemists on their pay rolls, but those dramatic examples were the exception and are overshadowed by the more pedestrian jobs of the great mass of workers. Construction, in particular, was outstanding in the use of older workers. In 1944, 28 per cent of all construction workers were 55 or older as compared with 19 per cent in 1950. In trade, 16 per cent were in this age group during the war as compared with 14 per cent in 1950, and in service industries, 22 per cent as compared with 19 per cent.

IMPLICATIONS FOR PRESENT DEFENSE PROGRAM

If the present defense program together with the high-level activity in civilian production presses too hard on the readily available labor supply, there is a substantial reserve among persons no longer in the labor force but who had wartime or postwar work experience, and who still are considered able to work. A Census Bureau survey in March 1951 disclosed about 13 million such persons, of whom 1.7 million were 65 or more. On their highest-paid war job, about half of the 1.2 million men 65 or more in this group had been skilled craftsmen, semiskilled operatives, or farmers; most of the women, semiskilled operatives and service workers.

When asked why they stopped working, most of them indicated that they thought they were too old to work, that they had become ill or disabled, or that they had wished to retire. Nevertheless, none of the group surveyed was currently considered permanently unable to work, so it is likely that for some the opening up of job opportunities would again serve as an attraction into the labor force, at least on a part-time basis. One-quarter of the older women but only one-tenth of the older men had been part-time workers.

Separate data are not available on the wartime work experience of persons 55 to 64 years of age not currently in the labor force, but on the basis of other information it may be estimated that about 1.5 million had recent work experience, war or postwar, and that a substantial proportion would be available to work again.

The Department of Labor has estimated that in order to meet manpower needs as projected in April 1951 for the 1951–52 defense program, it will be necessary to add a net 1.4 million to the labor force, over and above the normal growth, and that these "extra" workers would have to come from among such groups as women, youth, the handicapped, and older workers.[4] The census survey gives ample evidence that there is an adequate number of persons with recent work experience who are physically able to work, but that some of them are in the upper end of the age scale where special recruitment and placement measures will be required to make a satisfactory adjustment of workers to jobs.

PROSPECTS FOR OLDER MEN IN THE LABOR FORCE

If it is agreed that retirement from the labor force, in most instances, may not result in individual and social gain, then prospects for the future may be far from encouraging. Recent studies have made it possible to estimate the "working life expectancy" of men, using the same techniques that have long been familiar in the field of construction of life tables.[5] This analysis shows that, if past trends continue into the future, we may expect the length of time a man spends in retirement to increase. Advances in medical and other science have prolonged the life span of the average man, but social and economic developments have tended to put a terminal point to his work activity.

To illustrate, a 40-year-old white man in 1900 could be expected on the average to live until he was almost 68 years old and to remain at work until he was 64½, having somewhat less than four years in retirement. In 1940, however, a 40-year-old white man could,

[4] U. S. Department of Labor, Bureau of Labor Statistics, "Projected Manpower Requirements and Supply for the Defense Program, 1951–52," Manpower Report No. 7, April 17, 1951.

[5] U. S. Department of Labor, *Tables of Working Life*, Bulletin No. 1001, August 1950.

on the average, expect to live until he was 70 but could expect to retire from the labor force about six years before that. If the prewar trend in labor force activity of older males should continue, by 1975 the average retirement period might extend to nearly nine and a half years.

This calculation for the future, as has been indicated, is based on the assumption that prewar patterns will continue. Considerable discussion currently centers around the probable trends for older men—whether or not the sharp long-term decline in labor force participation of men 65 and over observed between 1890 and 1940 will continue or whether the experience of the wartime and postwar years in the employment of older workers means that a permanent change has taken place in attitudes toward their employment and in their job opportunities.

Factors tending to reduce labor force activity

One or two demographic factors which operate in a known fashion may be considered first. Chief among these, perhaps, is the growing urbanization of the population and the migration away from farms which have had the effect of reducing employment opportunities for older workers. In an agricultural economy, many hands are needed to meet seasonal and emergency needs, and there is room for the not too efficient worker, both young and old. Another factor operating in the same direction is the increasing longevity of the population. As the group past retirement age consists to a greater and greater extent of septuagenarians, the probability of employment in the group will diminish.

On the economic side, there are many factors whose effect is to reduce the probability of labor force activity among older men. The list is familiar. Increasing industrialization and the development of highly mechanized operations in many industrial processes have put a premium on those attributes which tend to wane with advancing years, such as agility and speed, and have reduced the value of skills that become more highly developed with age and experience.

Another development which over the long run has meant reduced employment opportunities for older workers is the increase in wage or salaried employment and the decline in self-employment. Although the operator of a small independent business faces many financial hazards, it is nevertheless true that the man who is working for himself is not nearly so often handicapped by age. He may continue to operate his business or practice his profession at a reduced rate of activity or profit, if he so desires, long after his contemporary in a wage or salaried capacity has been retired. During the decade of the 1940's the decline in self-employment was very marked. In 1940, just over half of all employed men 65 and over were working their own farms or operating their own businesses; in 1951, only two-fifths. In the next younger age group (55–64), the decline was from two-fifths to one-third.

The ability to retire voluntarily from the labor force at an advanced age and to remain self-supporting has always been rated high in our society. One manifestation of this is, of course, the social security program for old-age insurance and the recent rapid growth of private pension plans, now so important an issue in trade union policies. There is no reason to believe that, short of a depression, there will be a halt to the development of such plans.

Economic depression in itself would bring about labor force retirements of the most painful kind. The experience of older workers during the Great Depression of the 1930's showed that although they had a lower unemployment rate than the younger workers, they were less able to achieve re-employment, and had longer periods of joblessness. As a consequence, many left the labor force permanently, after the fruitless search for jobs.

Factors tending to increase labor force activity

What are the factors which may be expected to operate in the other direction—that is, to permit or compel workers past the usual retirement age of 65 to remain active in the labor market? Most of these might be called "short-run" factors in the sense that their operation has been observed only in the fairly recent past in a period of full employment, and, at times, of labor shortage. With the present state of international tension and the wide-scale defense program, however, it is possible that what has seemed a temporary interruption of normal peacetime trends may become the normal. As indicated earlier, an unprecedented increase in labor force activity took place during the years of World War II. As a result, the long-term downward trend was interrupted, and at the end of the decade of the 1940's the proportion of men 65 and over in the labor force was at about the level of ten years earlier. For the first time in the past sixty years, there was no drop between the beginning of one decade and the beginning of the next. On the basis of what we know about the past, it is not unlikely that some further decline will be seen in the coming decades, but the extent or rate of the decline is a matter of controversy.

As the defense program steps up, it is expected that manpower will again have to be shifted from trade and service pursuits to activities labeled essential, and that again the older person who desires to work may be welcomed to fill the empty jobs in the occupations which traditionally have been open to him. On the basis of World War II experience, close to a million men 55 and over could possibly be added to the labor force. Impetus for them to seek employment has undoubtedly already been given by the rise in the cost of living and the diminishing value of the dollars they may be receiving in pensions or other forms of fixed income. This last factor may be more important than any other consideration affecting the tendency of older workers to seek employment.

Apart from the needs of the defense program, the factor of cost of retirement is likely to force some permanent changes in policy. The cost of pensioning off larger and larger segments of the population may become an intolerable burden on the economy. Recognition of the need for the productive services of persons past 65 may lead to the adoption, under public or private auspices, of some of the proposals that are now being put forward more or less casually. Various of these require public action, and concern such procedures as reduction of pay-roll taxes on the earnings of workers past retirement age, or the use of income from the federal old-age insurance funds to subsidize the earnings of older workers. Another suggestion is to raise the legal retirement age under certain conditions. A proposal requiring not legal steps but negotiation between labor and management is that the piecework method of payment for older workers be used as a way of meeting declining productivity but providing continuing employment. The combination of rising retirement costs and the defense program needs for manpower may lead to removing such proposals from the realm of speculation to that of serious consideration.

Other influences that may act to

bring about continuing employment of older men are beyond the province of the economist or the statistician. They include such things as increased awareness on the part of the community of the need for some opportunity for oldsters to be occupied in ways that command respect—a development resulting from changing attitudes toward retirement on the part of psychiatrists, welfare workers, industrial relations experts, and others. Greater sympathy and understanding may obtain as a larger and larger part of the population enters the upper age brackets itself or numbers a veteran worker in its own family group.

PROSPECTS FOR OLDER WOMEN IN THE LABOR FORCE

A spectacular increase in the propensity of women to work outside their homes took place in the decade of the 1940's, continuing a development that has been observed during the last fifty or sixty years. The sharpest changes were noted among women past 35 years of age. Furthermore, gains made during the war were maintained, as was not the case for men.

Older women shared with younger women the new opportunities for employment. Those 65 and over were only in rare instances in the labor force (less than one in ten), and, although the proportions have increased, they are still negligible. Big gains, however, were made by women in the 55 to 64 age group. In 1940, on the average, 18 per cent were in the labor force; in 1944, 25 per cent; and in 1950, 27 per cent (see Table 3).

Women's prospects not similar to men's

Curiously enough, some of the factors that have pointed toward a reduction in employment among older men might produce the opposite results among older women. For example, the diminishing importance of farming in our national life and the expansion of urban areas will tend to mean that more and more women will have paid jobs. Opportunities for employment for women are much greater in urban areas than on farms. Industries that are more likely to provide jobs suitable for older women particularly—in public utilities, retail trade establishments, insurance and real estate offices, hotels and lodginghouses, and some of the professional and government services—are "city" industries for the most part, or at least tend to cluster in urban areas.

The reduction in the work week in American industry and business which may be expected to continue in the absence of war is often cited as a factor favorable to employment of older people, particularly women, who generally carry responsibilities for housekeeping in addition to their jobs outside the home. The sizable proportions of women 55 and older who report that they prefer part-time work (see Table 2) suggest that if the use of part-time workers should extend into more and more fields of employment, an increase in the labor force participation of older women would be assured.

For women, the pattern of working life that seems to be developing is to find a job after leaving school and to work until marriage or until children become a major responsibility. Beginning at the time that the children reach school age, and at an accelerating rate as they grow up, their mothers tend to return to the labor force. A second high point for employment is between the ages of 35 and 45, after which the relative numbers gainfully occupied start to diminish.

Households where both the head and his wife are in the labor force have shown a sharp increase in number. One in five households were in this class in 1950, but only one in nine in 1940.[6] As more and more American families establish living standards based on the earnings of both husband and wife during their forties it will become increasingly desirable, and perhaps acceptable, for the wife to continue working into her fifties and sixties. This is already true in specific areas where employment opportunities for women are abundant. In Washington, D. C., for example, the preliminary sample data from the 1950 Census of Population show that the proportion of women 55–64 in the labor force was 38 per cent as compared with 26 per cent for women in all urban areas, and the rate for women 65 and over, 14 per cent, was almost double that for all urban areas.[7]

These considerations lead to the conclusion that more women past middle age will be desiring employment in the coming decades and that, on the basis of current trends, their opportunities for employment will become more numerous.

[7] Bureau of the Census, 1950 Census of Population, Preliminary Reports, PC–5 No. 53 and PC–7 No. 2.

CONCLUSION

The American economy is providing jobs for about 8 million full-time workers 55 years old or over and for some 2 million part-time workers. World War II experience demonstrates that almost a million more men in this age group would be available for employment if jobs were to open up. There is no question that failure to employ these involves a loss of productive power to the nation in a wide range of activities. Many of the "housekeeping" tasks in the economy are being performed by older workers—service jobs in particular—but also many of the jobs requiring highly developed manual skills, as in construction, or advanced educational and technical abilities, as in the professions. There is some reason to think that the exigencies of the present defense program may result in at least a temporary solution for the older worker who finds retirement unpalatable. For the long run, the probable pattern is not clear, but it is likely that without basic changes in current attitudes and policies the older man will find himself facing a long period of retirement.

Gertrude Bancroft, Washington, D. C., is Coordinator for Manpower Statistics in the Population and Housing Division of the United States Bureau of the Census. She has been chiefly responsible for the census data on labor force and consumer income, obtained in connection with the Current Population Survey and the 1950 Census of Population and Housing.

Barriers to the Employment of Older Workers

By Albert J. Abrams

THERE are two main types of barriers that hinder the older job applicant—the indirect and the direct. The indirect type is found in industrial processes and techniques which exclude older job seekers though not instituted primarily to do so. (These include restricted-entry jobs, promotion-from-within systems, pensions, unvalidated medical and psychological tests, time-pressure tasks, and certain union regulations.) The indirect type of barrier is also found in culture bars within and without industry which have an impact on industry, such as glorification of youth, upward gradients, a high-energy society, and success values based on job status and monetary return.

The direct type is found in the following: written rules excluding job seekers over a predetermined chronological age; unwritten rules followed by hiring or screening authorities to bar applicants over a predetermined chronological age; deficiencies of the older worker, whether in training, adjustability, or preparation for job seeking; and lack of public or private counseling and placement service geared to older job seekers.

It should be emphasized that barriers against older job seekers are not peculiar to American industry. There is evidence that they exist in underdeveloped and agrarian economies as well as in industrial societies, and in statist as well as democratic regimes. The extent and intensity of such obstacles may vary depending upon a host of factors, such as the significance of work in the culture, the role assigned to older persons in the family, and provision of work substitutes; but throughout the world, employers generally are not eager to hire older persons.

Measures of Formal Age Barriers

The resistance of employers to the employment of older workers is indicated by three post-World War II surveys. A community-wide study of 38 firms employing 62,828 workers in Rochester, New York indicated that 29.5 per cent of the companies imposed a maximum age limit "above which new employees are not ordinarily hired."[1]

A state-wide survey by State Senator Thomas C. Desmond, chairman of the New York State Joint Legislative Committee on Problems of the Aging, disclosed that 39 per cent of 172 companies admitted imposing formal aging barriers.[2]

A nation-wide joint survey of 277 concerns by the National Association of Manufacturers and the United States Chamber of Commerce in 1949 indicated that 26 per cent of the firms "did not follow a practice" of hiring older workers.[3]

The NAM two decades earlier had conducted a similar inquiry and found that 28 per cent of the firms had such age barriers.[4]

[1] Industrial Management Council, Community Survey of Employment of the Elderly, Rochester, N. Y., Jan. 1, 1948, 7 pp.

[2] Albert J. Abrams, "Industry Views its Elderly Workers," in *Birthdays Don't Count* (Albany, N. Y.: New York State Joint Legislative Committee on Problems of the Aging. Leg. Doc. 61 of 1948), pp. 152–53.

[3] National Association of Manufacturers, Industrial Relations Department Report, *Employment of the Physically Handicapped and Older Workers* (New York, 1949), p. 15.

[4] *National Association of Manufacturers, Public Old Age Pensions* (New York, 1930), p. 24.

A 1930 study of firms in New York State concluded that "in approximately one-quarter of the moderate-sized and large companies including 40 per cent of the jobs in the state, the older person would encounter an insurmountable hiring bar. His chances of being accepted would be practically zero."[5]

Thus over a period of twenty years, from one-quarter to two-fifths of firms queried in various surveys have admitted the imposition of direct formal barriers.

These figures are only suggestive. A more realistic yardstick to measure the prevalence of formal age barriers is the data in job orders filed with public employment service agencies. A study made in 1950 showed that in New York State, of 3,500 job openings 25 per cent had an age limitation; in Columbus, Ohio, of 3,925 openings 81 per cent had age restrictions for women, 75 per cent for men; in Lancaster, Pennsylvania of 511 openings 60 per cent had age restrictions; in Birmingham, Alabama 90 per cent of the openings, and in Dallas, Texas 50 per cent, specified age restrictions.[6]

Another measurement of age bias is the extent to which "help wanted" advertisements contain such restrictions. A recent analysis of 3,474 job opportunities for males advertised in the *New York Times* showed that 38.2 per cent included an age limitation.[7]

Pattern of Age Barriers Varies

It is clear that age barriers are a pervasive force in industry. However, the pattern of the barriers varies widely from industry to industry, from job to job, and from community to community. Advertising and public utility firms are notorious for rigid utilization of inflexible age requirements. New industries such as chemicals, plastics, and aviation customarily impose age restrictions to a greater extent than older industries. The age bars are not as numerous in the service industries or in service jobs in any industry. There is a tendency to ignore age restrictions for jobs requiring a high degree of skill, such as tool and die maker. Large concerns are more likely to impose age restrictions than are medium or small firms.

An indication of the different levels at which age barriers are imposed in various jobs is seen in the fact that restaurants will take highly skilled people like cooks up to 65 years of age, but waitresses, waiters, and counter people meet resistance at age 50 or earlier. Hotel clerks run up against age barriers at 40. Professional nurses over 40 find difficulty obtaining jobs on hospital staffs but can be placed on private duty. In commercial offices, the age limit is frequently 35 for women and 45 for men except in specialized fields such as legal stenography, insurance brokerage, and sometimes bookkeeping.

Culture Barriers

The disregard in our high-energy culture for the biological, social, and economic demands of life in the later years must be viewed as a temporary, transitional phenomenon. More satisfactory adjustments are being sought amid rapidly changing values. There

is developing a planned, conscious effort to re-examine, re-evaluate, and reshape the attitudes and policies of society toward its older people.[8] This issue of THE ANNALS is in itself an overt manifestation of this conscious effort.

These efforts clash with our traditional culture values which impede the hiring of older workers. We are a nation of youth worshipers. Our national heroes are not philosophers or physicists, but twenty-year-old baseball players and teen-age Hollywood stars whose obvious lack of dramatic powers is obscured by more obvious features. Many respectable corporate fortunes are being made today by successfully conditioning the public to a dread of aging. The purveyors of face creams, liver pills, slenderizing mechanisms, and so forth hold before us the grim prospect of a wrinkled, obese, ill old age. Youth, youth, youth! We idealize it. We crave it. We fear its loss.

How natural that industry should fall prey to the theme fostered by itself, and call for workers with "zing," "bounce," "drive," "aggressiveness," and for women "with looks"!

Age respect has certainly withered before intergeneration mobility, industrialization, and urbanization. But another restricting force is the exaltation of upward gradients. Anthropologists inform us that we value not past success or past eminence but continued upward achievements. "Going to the top" is our goal. And once at the top, we must continue to find new heights. Confronted with pressures of this type, the older person is likely to flounder, become disheartened, deem himself a failure, accelerate the likelihood of his inability to obtain work, and remove himself from the labor market entirely.

The gradual disappearance of the kinship-oriented conjugal family which provided status, emotional security, and often work security for the aged is another block in the path of the older person. In days gone by, "working for relatives" was quite common among older persons. The family took care of the work needs of older people. Today with the family economy gone, and with family businesses replaced by corporate structures, the opportunities for such jobs are restricted.

CULTURAL AIDS

There are numerous cultural forces which are operating to advance work opportunities for older persons. The premium we place on autonomy from infancy to senility forces many older people into the labor market who otherwise might not seek employment. Since opportunities for older persons to be autonomous are less numerous than such persons, our older adults are often held in disrepute in the family, in the commnuity, and in the personnel office. Increasingly older persons want to be "on their own." Sociologists point out that apart from any biological need for activity, paid work becomes the means of mediating the conflicts that rage in families when individuals have feelings toward responsibility for their parents which conflict with pressures to protect the living standards and future of their own children.

One of the most hopeful of the current cultural forces is the tendency to glorify the worth of the individual and to maximize his opportunities. The emergence of this culture value will serve to mold industrial, economic and policical policies to the advantage of older men in the labor market.

Other societal pressures operating for the older job seeker are those which establish work as status, as prestige, as success, as power. The lack of interhuman associations apart from work also helps to build up pressure for expanding job opportunities for older persons. There are thus at present conflicting cultural forces in our society which are stimuli and inhibitors of employment opportunities of older persons.

LACK OF JOBS

As obvious as Cyrano's nose, the *main* barrier to the employment of older workers is simply a lack of available jobs. A United States Employment Service survey disclosed that as "unemployment increases, employer specifications with respect to age are tightened and the per cent of older workers among the jobless increases . . . and if not reemployed at their regular work, [the older workers] are usually downgraded in skill and pay."[9]

Similar conclusions have been reached by studies in various foreign countries.[10] World-wide, the plight of the older worker varies in intensity with the extent of employment or the condition of the labor market.[11] If the demand for labor can be broadened particularly in areas of high technological change, declining industries, contracting employment, or underdevelopment, older workers will find it easier to obtain work.

However, the condition of full employment will not ipso facto eliminate all obstacles to the hiring of older workers. Prejudice against them may not diminish in a tight labor market, but its overt manifestations and its practical impact are lessened. The prejudice lies simmering, awaiting an opportunity to steam forth in repressive age restrictions.

Even in times of labor shortage, defense plants and governmental agencies will advertise for workers "under 35" or "under 45" depending on the type of position. One recent study, however, indicated that among those 65 and over, only 17 per cent had been seeking a job for twenty weeks or more in a tight labor area, compared with almost 29 per cent in an area of very substantial labor surplus.[12]

BARRIERS ERECTED BY OLDER JOB SEEKERS

Out of the new research on the older job seeker has come awareness that he is one of his own main obstacles.[13] He often comes to the task of seeking a job with little understanding of the nature of the project. He lacks skill in merchandising himself—does not know how to carry on an aggressive sales campaign in his own behalf. He may be a poor letter writer. He may be so affected by what can only be described as "unemployment shock" that he reacts in interviews either with overtimidity or with overaggressiveness. He often lacks familiarity with the job leads in his field, such as trade directories and publications.

Very frequently, the older worker is unfamiliar with the principle of conversion. A watchmaker thinks only in terms of watchmaking instead of any

related precision work. A sheet metal worker thinks in terms of sheet metal work alone rather than allied metal work jobs. This failure to dissect his own talents properly hits especially hard at those men who have worked for years at one single operation which has become obsolete.

The high obsolescence of machinery and skills in modern industry and the increased mobility of industry itself are severe, real barriers to the employment aspirations of older persons. They often serve to leave older workers, with long experience on a single job or single machine, high and dry. The pace of modern production lines often is not attuned to reaction timing of aging nervous systems.

Experienced counselors are familiar with the reactions of older men with stable work histories who are suddenly cast out of a job; the counselor often finds that "time purges unrealistic demands," but it is a harsh cure.

The worker whose production is declining imposes his own barriers when he refuses to recognize his own failing capacities and adjust to them, when he refuses to accept work of lower prestige or status, lower skill, or lower pay than he has been accustomed to in the past. Many men resist wearing hearing aids, glasses, or other appliances which would enable them to remain on the job or expedite their adjustment to a new job. They often fail to realize that they would be much more likely to obtain employment if they searched for work in plants that are out of town or uptown instead of downtown, or if they would consider split-shift jobs.

When the older worker is "set in his ways," when he obviously has a know-it-all attitude that alienates younger supervisors or other associates, when he suffers from emotional disturbances which may be related to climacteric changes, family difficulties, or other factors, he is obviously his own barrier.

Sometimes women resist brushing up on old skills when they re-enter the labor field after years of layoff to raise families, and find difficulty obtaining work such as bookkeeping, stenography, typing, or photography.

Many of these obstacles fortunately can be prevented or overcome. The older workers can themselves block development of many of these self-made barriers or can be aided in skirting them through the aid of skilled employment counselors.

INDUSTRY OBSTACLES

Many of our foremost production executives argue that hiring older job seekers means increasing production costs. Mr. Charles E. Wilson, shortly before leaving General Electric Company to become Director of Defense Mobilization, informed the Desmond Committee that "keeping older people with diminished capacity in the labor force tends to raise costs appreciably and reduce efficiency." The coupling of "older people" with "diminished capacity" is significant, as one of the dominant stereotypes in industrial thinking is the linking of older workers with decreased production. However, there are no data which indicate that older men generally produce less than younger men, or that younger men can keep pace with older men on certain types of jobs, or that older men cannot keep up with younger men on other types of jobs if permitted to sit rather than stand, or if permitted occasional rest periods.

On the contrary, a Desmond Committee survey showed that nearly three-fourths of the firms reporting indicated that older workers produce as much as younger workers. A NAM survey indicated that one-third of the reporting concerns felt that the quantity of work of the older person was greater, and a majority of them believed that the quality of work was superior.

Nonetheless, there is widespread belief in management circles that since our American economy is based on low-cost mass production, this conflicts with the hiring of older job seekers. Closely associated with this concept is the rationalization that younger men are needed for competitive strength. "We need young, hard-hitting, aggressive employees," the employer says, "if we are to compete successfully." The values of mature judgment, experience, and know-how are rarely equated with "drive," "pep," "dynamic personality."

Pension and compensation rates

Pensions may indeed prove costly, when older men are hired. For example, a single premium for a newly hired 40-year-old who is to be retired at 65 with a $100-a-month annuity may cost a firm $6,823; for a 55-year-old, $10,623; for a 60-year-old, $13,860.[14] While these figures are approximations, and will vary depending on the type of pension arrangement set up, they indicate that the penalty for hiring an older worker under current pension systems may be felt keenly; this is not likely to be true, however, of pension systems operated on a cents-an-hour basis which disregards the age of individual employees.

Mr. William White, president of the Delaware, Lackawanna and Western Railroad Company, recently informed the Desmond Committee that since pension plans usually require long periods of service to qualify for annuities, concerns are hesitant to hire those who will not benefit from the pension plans because of an insufficient number of years remaining before compulsory retirement. Firms are reluctant to hire short-term help who will be retired on a pittance. Mr. Eugene Holman, president of Standard Oil Company (New Jersey), emphasizes that pension plans which require workers to serve a long number of years with a particular concern "introduce inflexibility into the labor market and discourage the hiring of older employees."

There is no conclusive evidence that workmen's compensation rates generally go up as older men are hired. Senator Desmond assails this contention as "a myth of management," conjured up from isolated cases of large compensation awards granted in instances of injuries to older men. He reports:

> Investigations show that while accidents tend to be more severe among elderly and the duration of disability longer, older workers tend to have fewer accidents, and are less likely, due to their know-how, to be burned, crushed, cut, punctured, or lacerated on the job. Too, the rate-making process does not take into account age. Adoption of so-called Second Injury Laws tends to reduce the risk of employers in hiring older persons with disabilities.

Other personnel policy factors

Another frequently expressed reason for barring older job seekers is the need to maintain a balanced labor force. Since many American companies do keep in their employ workers of many years' seniority, they sometimes fear permitting entry of newcomers in the upper age brackets, as tending to an overload of aged.

"But if we hire older men we will be cutting down job opportunities for youth. Youngsters have to be given a chance too." This lament is often heard. It is based on the questionable assumption of a restricted job pool.

[14] Assumes a 2¼ per cent interest rate, based on 1937 standard annuity mortality rates, set back one year and loaded 8 per cent of gross.

Furthermore, there are many jobs youngsters do not want or cannot fill, such as dead-end jobs, monotonous jobs, technical supervising jobs. Nonetheless, the youth-versus-age conflict is a very real restrictor of job opportunities for older workers.

Many companies cite their policy of "promoting from within" as seriously restricting their ability to hire older workers. Entry jobs are restricted to low-pay, low-skill posts, such as office boy, sweeper, and junior clerk, and it is expected that persons filling those jobs will be promoted through the ranks in accordance with an industrial career system. For the company this is expected to build a "team spirit" and "better morale," which in turn are expected to lower turnover and step up production. The inflexibility of these promotion systems which bar entry of high-level talent of mature years and conflict with the realities of an aging labor force calls for re-examination. Even when a company does not have a rigid promotion-from-within policy, there is often a feeling that the "family spirit" within the plant cannot be developed in workers hired late in life.

Among the main impedimenta to the hiring of older workers are a host of unverified premises. For example, a recent study in the needle-trades industry disclosed these attitudes: "Old people think they know everything and insist on doing things their own way"; "they're sick too often"; "they can't get along with younger workers"; "old people can't turn out enough work"; "they're going to retire soon on pensions, and we need workers who will stay on the job"; "they can't get around fast enough"; "they can't stand on their feet too long"; "you can't ask old folks to do heavy work."

The validity of many of these attitudes is questionable; all cry out for scientific analysis and verification. But that they compose a very formidable barricade to the older job seeker is unquestioned.

EMPLOYMENT TECHNIQUES

Recent inquiries have shown that older job seekers are commonly given little consideration in public employment agencies. Experiments in the United States and Canada have indicated that when special attention is given in the form of counseling and extra placement efforts, twice as many older persons obtain employment as under usual procedures. Until the public employment service is financially enabled to provide the necessary personnel to give special service to the 40-plus group, and until federal funds are allocated to the state employment offices on a work-load basis, the older worker will continue to meet his first barrier to a job when he steps into a public employment office.

At the plant, a magnificent array of pseudo-scientific medical and psychological tests authorized by personnel directors who confuse the apparatus of science with science itself adds to the obstacles that lie in wait for the older man or woman who seeks a job.

The medical job-screening examinations, for example, are rarely related to the job that is available. Too, they aim to ferret out disease rather than to assess health status or ability to work in relationship to a specific job. Industrial physicians are primarily doctors, and, as such, are disease hunters, rather than physiological experts capable of determining with precision stamina and and health status. Cardiac specialists, for example, constantly complain of medical generalists in industry who simply are unaware of the work tolerances of a job applicant with a heart impairment. The physician attached to a small plant in particular is likely to be wholly unfamiliar with job demands.

Psychological tests of personality or aptitudes generally have been validated on younger persons—college students for the most part. No one knows whether they are at all valid for older people; in fact there are a number of reasons to doubt their applicability to older persons. They are often unmeaningful to older persons who are not test oriented, as are young people who have been tested and retested from elementary grades through colleges. The tests are often unrelated to the specific job opening. They may impose time-pressure limitations that are not imposed by the job itself. The president of one concern which utilizes psychological tests to screen job applicants informs me that he has come to appreciate the deficiencies of the test when dealing with older persons, and so automatically upgrades scores of the 40-plus applicants! "Evaluation of the work ability of older persons is less simple, is less adapted to routine procedure, and requires more time and consideration," one investigator points out.[15]

When hiring is done at the gate, individual prejudices against older men block their obtaining an equal chance at jobs. When the hiring or screening is done in the personnel office by crew-cut, bow-tie juveniles fresh out of college, the older worker is often at a serious disadvantage. Dr. Irving Lorge and J. Tuckerman of Columbia University Teachers College have conducted research which indicates that even sophisticated individuals such as graduate students of psychology have absorbed prejudices against older job applicants.

One of the major obstacles to the employment of the older worker is the lack of job analysis data which would give management an accurate picture of the demands of each job. These, used in conjunction with physical demands data, could be utilized to place older workers in jobs for which they are suited.

Is it in the very nature of our industrial society that our older workers must be discarded and thwarted in their efforts to obtain work? There is no indication that there is anything inherent in a complex, mass production economy to prevent the hiring of older workers. Some large companies, such as Eastman Kodak and Endicott Johnson, do hire older workers successfully. The main obstacle is lack of data, lack of research, lack of knowledge. Stemming from these are obstacles of attitudes and prejudices. Machines can be adapted to gray-haired men, and gray-haired men can be adapted to machines. But when the foe is not machines but ignorance and prejudice, the task is much more difficult.

BARRIERS BY UNIONS

The barriers imposed by unions to the hiring of older workers are largely of an indirect nature and have not been given thorough, critical analysis.[16] The older worker is one of labor's constituents, and the unions are, it may be assumed, just as likely on the whole to seek to promote his interests as is a California Congressman the interests of a Long Beach taxpayer. Union pressures for old-age insurance, corporate pensions, medical benefits, seniority, and full employment have operated to protect the older person. However, the interest of unions in the older worker varies considerably depending

[15] Arthur J. Noetzel, Jr., *Personnel Administration and the Older Worker* (Cleveland: Welfare Federation of Cleveland, Occupational Planning Committee, Jan. 12, 1951, mimeo.), p. 6.

[16] A preliminary analysis is contained in Albert J. Abrams, "Unions and the Older Worker," in *No Time to Grow Old, op. cit.* note 8 *supra*, pp. 119–44.

on a host of factors such as age of union members, age of union leadership, nature of the industry organized, and stage of unionization achieved.

One of the obstacles to the hiring of older workers is the refusal of many unions to permit workers of declining abilities to be downgraded in pay or position. Sixty per cent of the international unions reporting to Senator Desmond in one survey said they permitted older workers to take lower-rated jobs at lower wage rates, 30 per cent that they refused to allow such downgrading, and 10 per cent that they left the matter up to the locals. All of the internationals reporting, with the lone exception of the International Typographical Union, refused to permit older workers to remain at their same jobs at lower wage rates if unable to do a full day's work. Management reported that even when union rules permitted downgrading, in the actual give and take of collective bargaining, the labor leaders strenuously opposed such moves.

Unions with closed shops or hiring-hall arrangements reported they were able to combat management barriers against hiring older workers quite effectively by controlling the employment referrals. However, where unions utilize work permits and older men seek to switch from one skill to another or from one industry to another, the man of mature years is likely to run into severe obstacles.

Some unions have been loath to open up entry jobs for older persons which would enable them to get a foothold in plants. Older workers coming to a plant for work are sometimes confronted with the regulation that they must start as apprentices to obtain employment, but they are too old to start as apprentices!

Thirty per cent of internationals reporting to Senator Desmond stated that they placed some bar in the way of part-time work for retired union members. The exploitation of homeworkers in the early decades of the twentieth century and fear of the tearing down of wage structures have led to a refusal to reopen the question to permit homebound elderly people to earn a living and to enable many on old-age assistance roles to gain an income.

One of the barriers imposed by unions in the past has been an understandable subordination of interest in the older job seeker to the larger issues of higher wages, union security, and better working conditions. Even today, some union leaders are prone to dismiss the problem of the aged job seeker as an insignificant but inseparable aspect of the issue of full employment. However, many unions are beginning to recognize that their constituency is aging, and that the problems of older job seekers, while akin to those of all job seekers, are often unique, and demand careful consideration and prompt action.

PROGRESS BEING MADE

The barriers that block the employment of older persons are formidable but not insuperable. They are being slowly penetrated.

The National Association of Manufacturers, the National Industrial Conference Board, the American Management Association, and the United States Chamber of Commerce have conducted surveys or educational programs. Both the American Federation of Labor and the Congress of Industrial Organizations, as well as some independent internationals, have assigned personnel to explore this area and to help promote the hiring of older workers. Foundations are beginning to allocate funds for basic and applied research. At many universities, including Columbia, Cornell, and the universities of California, Minnesota, Wisconsin, and Chicago, research in this area has started.

Governmental agencies are undertaking research, education, and service functions. The Federal Security Agency's Committee on Aging and Geriatrics, the United States Bureau of Labor Statistics, and the Women's Bureau are stimulating or engaging in research and education. The United States Bureau of Employment Security has undertaken fundamental research and has issued a manual on counseling older job seekers. Research on capabilities of older workers has been underway for some time at the Gerontological Division of the National Institutes of Health. Significant studies of skill and age are being made from grants made to Cambridge University by the Nuffield Foundation.

Private groups such as the National Committee on Aging have set up special task forces to promote the interests of older workers. The National Planning Association, the Twentieth Century Fund, and other such groups are making contributions to understanding the gray-haired man who comes to the factory gate in search of a job. Newspapers, magazines, radio, and television are beginning to do an effective interpretative job of employer and employee problems in this field.

On the state level, the New York State Joint Legislative Committee on Problems of the Aging has pioneered in development of programs in this field. Massachusetts by virtue of a 1950 law has become a testing ground for the efficacy of the approach of the Fair Employment Practice Committee to banning discrimination against older job seekers. Many other states are turning their attention to this field.

In Schenectady, Syracuse, Cleveland, Indianapolis, Portland (Oregon), Chicago, and Los Angeles, local community groups are seeking to improve the opportunities of older job seekers to obtain equal consideration in employment. Forty-plus clubs are active in obtaining work for older executives.

The goal of all these efforts is to assure an opportunity to obtain work for all older men who want work and can be fitted for work. The mental blocks of attitudes and myths can be smashed. Research and education will overcome the barriers of myth and ignorance that strengthen stereotypes about older workers and block sound personnel procedures. The barriers that stem from lack of technical tools, such as suitable testing apparatus and training facilities, will be overcome as money, time, and personnel become allocated to the task. New experiences in utilizing an aging work force will speed up acceptability of older persons by industry. And since the product—older men and women—is constantly being improved by better education, better medicine, and better living conditions, there is every reason to believe that in the not too distant future when a 40-plus or 60-plus job seeker applies for work his birthdays will not be counted against him.

Albert J. Abrams, Newburgh, New York, is director of the New York State Joint Legislative Committee on Problems of the Aging, acting chairman of the employment section, National Committee on Aging, and research associate to State Senator Thomas C. Desmond. He has been chairman of the employment section, President's National Conference on Aging, director of the New York State Joint Legislative Committee on Nutrition, director of the New York State Trichinosis Commission, staff director of the New York Senate Committee on Affairs of Cities, and assistant to the Mayor of West New York, New Jersey. He is editor of No Time to Grow Old (1951), Young at Any Age (1950), Never Too Old (1949), and Birthdays Don't Count (1948). He has written articles on government for lay and professional journals.

Should There Be a Fixed Retirement Age?

SOME MANAGEMENTS SAY YES

By Stanley C. Hope

FOR a half-century Esso Standard Oil Company and its predecessor and affiliated companies have been concerned with the importance of making it possible for career employees to retire with continuing incomes. More than thirty years ago a formal annuity plan was adopted. Two important principles—first, that all employees from top to bottom could acquire annuities under the same terms, and, second, that all employees should be retired not later than a fixed age—were parts of this plan. In the case of male employees retirement was made mandatory at 65; in the case of women, at an earlier age. The original annuity plan was amended from time to time and has been superseded by new plans as conditions changed, but in none of these plans have we departed from these two principles. Our annuity plans have been the subject of constant study, and the advantages of a definite retirement age have, in our opinion, outweighed objections raised to them.

Among the advantages of mandatory retirement at a predetermined age are these:

1. *All employees are treated alike*

From the employee's standpoint, he cannot feel that he is discriminated against or another employee is favored. When retirement may be postponed beyond a fixed age, seldom will the employee, his working associates, his superior, and the retiring authority all agree as to the correctness or justice of a decision. One or more will feel that the employee is being favored or discriminated against, thus weakening employee morale in general and raising a question in the minds of other employees as to the value, acceptability, and fairness of the retirement program.

From the stockholder standpoint, retention of officers or employees in positions of major responsibilities to the detriment of efficient management will not depend upon the influence which a given employee may be able to exert to postpone his retirement.

2. *Effective plans for retirement can be made*

From management's standpoint, replacement tables can be developed with reasonable certainty so that no efficiency in operations is lost becaue of retirement of the employee. Necessary preparation and training can be planned well in advance.

From the employee's standpoint, plans can be made for satisfying activities to commence upon the given date. Programs have been inaugurated by the company to counsel prospective annuitants and help them to prepare for their retirement. Should the employee wish to engage in a professional or business activity he can plan to do so with the knowledge that such activities will in no way affect his annuity from company plans. In fact, the reasonable certainty of the date of retirement permits the individual employee to plan his retirement, including the financial aspects of it, many years in advance.

3. *It provides incentives for capable younger employees*

One of the most important reasons for a retirement system warranting, from the stockholder viewpoint, company participation in financing, is the incentive provided to capable younger employees. Under a mandatory retirement system, they know they have a greater chance for promotion through continued creation of vacancies by retirement. The lack of such a system may impair or even destroy this incentive, with commensurate effect upon morale. This might result in inefficiency and the loss of younger capable employees. Renewed vigor is put into the business when younger capable employees with up-to-date viewpoints are placed in positions of responsibility. Superannuation among executive or supervisory forces can seriously affect efficiency of a company's operations and may seriously impair its success. Superannuation among employees impairs the morale of the employee group.

4. *It is desirable from the employee's personal standpoint*

The employee retires without apologies, excuses, or explanations. Any implication of physical or mental deterioration or incapacity is avoided.

5. *It provides the most practical solution*

Because of the human element, the exercise of discretion cannot always be accurate. Under the best of circumstances, where retirement is discretionary, mistakes will be made in borderline cases. Some employees may in fact meet the desired standard of mental and physical capacity but will be retired earlier than others, while some of mental and physical capacity actually below the desired standard will have their retirements postponed.

While various criticisms have been leveled against the principle of mandatory retirement, those who have studied the problem carefully have found no satisfactory answer to the question as to who is qualified to render a decision in individual cases based on human judgment.

6. *It is desirable from the general economic and social standpoint*

While the requirements of an aging population may dictate a review of the age at which mandatory retirement is to take place, it does not affect the basic soundness of mandatory retirement. Other advantages to the economy and to society in general, which are most likely to develop under mandatory retirement, cannot be ignored. There are many activities and positions in the business, economic, and political communities which need doing and filling, but which now receive only part-time or even no attention. Mature, experienced people who have not exhausted their mental and physical capacities in their career employment and who are not required, because of monetary considerations, to continue in their usual lifetime activity, can find satisfying work in these activities, making valuable contributions to the social, economic, and political development of the communities in which they live or to which they may retire. If retirement is postponed until there is an actual deterioration of mental or physical capacity, no such contribution can be made.

. . . . .

When all is said and done, even with its limitations, the mandatory retirement rule provides the most practical solution to the problem. It is a reasonable tool necessary to give adequate assurance of the continuing efficiency of the working organzation. While other plans administered on a discretionary basis may continue in service some still efficient workers, they are more likely to retain the inefficient in employment, thus ultimately developing a full-salary "pension roll" more costly to the company in dollars and more detrimental to

the company's interest because of loss of effective operations. Those who are more able and efficient will have the initiative and foresight to plan their affairs looking toward their normal retirement dates, and thus will leave the company's service no matter what retirement rule is followed.

Stanley C. Hope, New York City, is president of Esso Standard Oil Company. He was formerly president of Gilbert & Barker Manufacturing Company and of Stanco, Inc., both affiliates of Standard Oil Company (New Jersey), and he has been a member of the Standard Oil Company's Coordination Committee. During the war he was cited for distinguished serivce by the United States Army Ordnance Department for co-ordinating the work of twenty-one firms manufacturing sighting and firing devices.

SOME MANAGEMENTS PREFER FLEXIBILITY

By CRAIG P. COCHRANE

NOT many years ago, planned retirement from active work was a purely academic consideration. The individual's struggle to make a living normally continued until death or disability wrote an end to his working life. Not until industrialization multiplied individual productivity did society face the dual problem: should a man retire before the disabilities of old age force him to, and, if so, at what age should he retire?

We are, of course, fortunate in having this problem of retirement. Whatever disagreement there may be over the answers, the very fact that retirement has become a new opportunity for men is further evidence of our economic progress, of our ability to produce more while still increasing our leisure time. Retirement is a problem which people in many other lands would assuredly welcome.

One of the questions concerning retirement which sometimes arises is that of a "fixed retirement age"—that is, a definite and specified age at which the individual is compelled to retire irrespective of the circumstances. I have been asked to present in this article some arguments, as I see them, against a fixed retirement age. I have been glad to do this because I believe that, from the standpoint of both the individual and the company he works for, there are a number of valid arguments against it. It should be understood, however, that these arguments are not intended to apply to a "normal retirement age." Here, an entirely different concept is involved and I shall want to touch briefly on this a little later. Furthermore, my comments are based on the assumption that a reasonable retirement income is available. I am not attempting to deal with the question of the individual's economic situation.

NEED FOR FLEXIBLE RETIREMENT POLICIES

Experience seems to show a need for flexibility in all formal industrial relations policies and procedures. Whether we are dealing with wage policies, insurance plans, a communications program, provisions for assisting the individual's development, or other phases of the industrial relations program, it is important to avoid procedural strait jackets. Unless we do, occasions will arise when the administration of the program may harm rather than benefit those affected. A retirement plan with a compulsory retirement age lacks this flexibility.

We can readily think of situations wherein a fixed retirement age would work to the disadvantage of individuals, groups, or even society as a whole. For example, changes in general economic conditions and in the country's manpower situation may call for great flexibility in retirement policies. When defense or wartime production goals have demanded every last reserve of available manpower, it has been difficult to justify the forced retirement of an able person at an arbitrarily established retirement age. On the other hand, in periods of reduced business activity, the forced retirement of a man—say at age 65—may be socially and economically sound. Certainly, if a choice must be made for layoff between a man without family responsibilities who can retire on an assured income of social security and company pension payments as against a younger man with growing family and no assurance of continuing income, I believe the choice is an obvious one.

Flexibility also works to the advantage of the individual, because a better adjustment to retirement may result if some leeway can be permitted. I think, however, that this consideration grows less important as time goes on. Retirement is becoming a normal and accepted thing, and an increasing percentage of employed people are preparing for, and even looking expectantly to, the normal time for retirement. This, certainly, is far better than an attitude of being forced into retirement.

From industry's point of view, it seems to me, flexible retirement policies are desirable because all decisions with respect to retirement bear on industry's responsibilities to many different individuals and groups. The wishes and best interests of the older worker are not alone involved. The opportunities and aspirations of the younger people in industry must also be considered. Furthermore, retirement policies should be socially valid because industry must always take account of the general public interest. And, finally, a company must keep in mind its own position in a competitive economy and its continuing ability to provide steady employment at fair rates of pay.

When we have in mind these many—and often conflicting—interests, I think we must conclude that retirement policies should be flexible enough to provide an acceptable degree of fairness to each of the individuals or groups affected. I do not believe a policy calling for compulsory retirement at a specified age will permit this in many situations.

In the last analysis, the establishing of a fixed retirement age implies that everyone reaching a given age automatically becomes incapable of further active employment. We know that this is not true. The physical and mental abilities and the general health of people vary greatly at any given age. Equally important, the requirements of different jobs make different demands on the individual. Some jobs require little more than the maintenance of good physical condition. Others have much broader requirements. Executive positions, for example, necessitate an alert mind, initiative, and a willingness to explore new fields. When we take account of both these variables—the differences in people and the differences in job requirements—we can appreciate the difficulty of trying to establish general and inflexible retirement procedures which will fit all cases.

NORMAL VERSUS FIXED RETIREMENT AGE

Perhaps some of the situations I have referred to above will point up the difficulties in the operation of a fixed retirement age. At the same time, I believe we must recognize the need for a stated age which will serve as a "normal retirement age." Unless we have

a specified normal retirement age, neither the individual nor the company can work in a logical way for the successful retirement of the older worker. Retirement takes preparation and planning, and the individual's retirement program needs a specific goal—a specific time when he will expect to alter his way of life according to plan. A specified retirement age offers both the incentive and the basis for such planning and preparation.

The company also must work on the assumption that its people will retire around a certain age even though they may not always do so. Otherwise, it would be virtually impossible to plan effectively for future promotions and personnel changes. Retirement from supervisory and other management positions according to plan is especially important because the general health of a company depends to a large extent on the enthusiasm, resourcefulness, and energy of the men in administrative positions. Progression up the management line, made possible by a regular program of executive retirements, also contributes much to the morale and adds to the incentives of the entire management line.

The need for a normal retirement age is recognized in our social security laws and in company pension plans. Without it, formal retirement programs, either of a statutory or voluntary kind, could not be administered in a practical way.

I believe the value of a stated or normal retirement age is now widely recognized. But, there is not complete agreement on this. There are those who hold that continued employment at his regular occupation in a person's later years is the goal to be worked for. I wonder if there is not a contradiction in this point of view which deserves our attention. Within the past forty years, working hours have been reduced from 60 to 65 hours a week to the now widely accepted 40-hour week This striking reduction in working hours has given Americans a freedom and leisure unequaled in history. It has given us an opportunity to enrich our lives—though an opportunity, to be sure, which is not always used to full advantage. While we are proud of our progress in reducing the work *week*, it does seem to me that we sometimes overlook the benefits we have also gained by reducing the work *years*. Yet the potential benefits to the individual and to society may be even greater in the latter case.

The conflicting points of view we find here may arise from different conceptions of what retirement means and what it is or should be.

MEANING OF RETIREMENT

If retirement were to be accepted as a final period of uselessness and dependency on others, then it would seem that the older person should be continued as long as possible at his regular job or some special job set up for him by his employer. But this conception of retirement is, I think, a faulty one. If retirement in fact proves to be a barren and unproductive interlude between regular employment and death, it is only because society and the individual have failed to utilize the rich possibilities of planned retirement. As I see it, retirement is a time for taking up new and useful activities adapted to the older person's capabilities—activities that do not demand his participation beyond voluntary limits. True, adequate preparation must be made for this kind of retirement. The individual must develop his interests and resources over the years against the day when he is free to leave regular employment.

When all is said and done, where will the older person find self-realization and carry on with a full measure of self-respect in these later years? Will it be in carrying on and meeting as best he can the demands of regular employment? Or is it not more likely to be found where a person is free to apply his efforts and talents wherever he wishes—either to normal activities at a reduced pace or to entirely new and appealing pursuits which may never before have been within his reach?

By continuing our present efforts to provide financial security for the later years and, in addition, by seeking out new and worthier goals for the older person, we should be able to make better use of the precious time which industrial efficiency has given us. If this comes about, I believe retirement will be regarded with anticipation. The problems of retirement, including the question of a fixed retirement age, will have largely disappeared.

Craig P. Cochrane, Rochester, New York, is director of industrial relations at Eastman Kodak Company. He has served as chairman of the Industrial Relations Committee of the Rochester Industrial Management Council, as a member of the executive committee of the Rochester War Council, and as a member of the boards of the Rochester Family Society and the Rochester Hospital Service Corporation.

ORGANIZED LABOR SAYS NO

By SOLOMON BARKIN

THE practice of establishing compulsory fixed retirement ages flows from pension programs in private industry and the drive to avoid employing older, less effective persons. Pension programs were originally designed particularly for executive personnel to encourage their retirement. Their orderly exit would make way for new talent, points of view, and experience. New persons could be more profitable and valuable. The more useful older persons could be re-employed as consultants or on other part-time and occasional services with the company.

The above practice has been carried over, with undesirable results, to the general mass of employees. The transition was easy, as the first pension programs required long service and predominated in such industries as railroads, utilities, and other service industries. The high continuous service requirements weeded out a large proportion of potential beneficiaries. Unions were not there to force a careful consideration of the merits of this practice.

FIXED RETIREMENT POLICIES INAPPROPRIATE FOR INDUSTRIAL WORKERS

The underlying attitudes which produced the policy of compulsory fixed retirement ages are wholly inappropriate for industrial workers. First, the worker is not anxious to retire. He has adapted himself to industrial employment. The maintenance of self-support and personal independence rate high in his scale of values. He prefers not to be dependent. His life pattern has always included the regular performance of work. It has provided him with a means for productive participation in the community. Most of his vital associations have been developed around his employment.

Unions have strengthened this experience. Many individuals have devoted time to union activities which offered them personal satisfactions and opportunities which no other interest had previously provided them. To continue to fulfill these interests, the worker must retain his job. His most crea-

tive experience has been his work and he prefers not to interrupt it. Forced retirement is a traumatic rupture in his life pattern. Counseling and preparation for retirement will not aid in the adjustment of most of those who now attain old age. Quick deterioration of personal and physical well-being is not uncommon among retired or unemployed workers.

Second, most workers cannot afford to retire. At best, the payments received in pensions or retirement benefits are a mere pittance. Those who received $100 to $125 per month could not easily subsist with these funds. The inadequacies have been disclosed by the United States Bureau of Labor Statistics, which reports that the net cost of services in October 1950 to maintain an aged couple at a modest living level was $1,700 to $1,800 a year. The result is that great numbers of aged persons seek employment and prefer it to retirement. The huge numbers who return to employment during periods of full employment is abundant illustration of this fact. The discrepancy between benefits and needs becomes greater in a period of rising prices, and the desire to remain in employment is then strengthened. The benefits now generally received are only sufficient to induce the physically exhausted and those unable to work to choose the lesser of the evils and live less adequately and less strenuously.

JOB ADAPTATION FOR OLDER WORKERS

Third, there are numerous jobs in industry for older persons, and many others can be made fully available. There is abundant evidence in support of this conclusion in the experience during periods of high employment. The proportion of older persons in the labor market and the ratio of employment then rise markedly. The standards of employability are changed to allow for the hiring of older persons. Placement is then more careful so that younger persons are shifted to jobs for which they are fitted, and jobs are reserved for older persons for which they are adapted. The jobs in industry are diverse and there are many at which older persons can be as productive as any other group of employees.

Moreover, jobs must be redesigned to allow for the increased employment of older persons. Job patterns are flexible and can generally be arranged to meet the characteristics of the persons in the labor market. As we learn about the productive capacities of the older age groups, more jobs must be designed to allow for their employment.[1] The increased proportion of older persons in our population and the diversion of millions of young persons to military pursuits demand that this task be undertaken immediately.

Much can be done to increase the workers' capacity for longer and more effective employment. Physical care and rehabilitation are necessary. In some instances psychological treatment and guidance are called for. Vocational counseling and retraining can be helpful. In this connection it must be underscored that the techniques for training older persons are essentially different from those for younger workers.

Fourth, the social and economic costs of retirement are so huge that we must consider means of extending employment opportunities. Millions of men and varying proportions of our national products are being devoted to the production of military goods and the increased security of the democratic world. By increasing our work force,

[1] Solomon Barkin, *The Older Worker in Industry* (New York: J. B. Lyon Co., 1933), pp. 131, 318-25, and 409-23; and A. T. Welford, *Skill and Age—An Experimental Approach* (published for the Trustees of the Nuffield Foundation, London: Goeffrey Cumberlege, Oxford University Press, 1951), p. 145.

the burden of carrying these tasks will be eased for each one of us. The larger number of workers increases output and relieves the economy of the cost of maintaining unproductive persons. We are seeking to recruit women, the handicapped, and other persons who are not in the labor market. It is essential that we enlist all older persons who can be brought in. Jobs must be adapted to them.

UNION POLICY ON COMPULSORY RETIREMENT

The general trade-union policy has been to resist compulsory fixed retirement ages. In a number of instances unions have challenged these policies and prevented their application by strikes. Trade unions have been insistent upon the worker's right to a job while he is qualified and able to do the job. The pension program should not be designed to force retirement, but to facilitate the retirement of those desirous of it, who have found employment burdensome. Unions have been guided by the principle that, insofar as possible, jobs should be adjusted and workers transferred to other employments if they are not able to maintain themselves productively on their own jobs. Moreover, it is common in many industries for the workers to carry along older persons whose productivity has been faltering. Such aid is an expression of the common concern for the security of all persons on the job.[2]

Managements which have tried to maintain or introduce compulsory retirement policies have been faced with frequent union efforts to break down the practice. The legality of such action has been challenged where the contract did not specifically provide it and the action conflicted with seniority rules. Unions have contested such retirements by considering them as discharges and have sought reversal of such decisions in arbitration. Where companies have been insistent, unions have arranged for flexible retirement age provisions wherein employees may voluntarily retire at one age, usually 65 years or less. The company retains the right to petition for compulsory retirement at a slightly higher age. Compulsory retirement is set above this level with the right of the employee to petition for an exemption. Trade unions have been opposed to compulsory fixed retirement age policies no matter how high they are placed, where there are no opportunities for exemptions to be granted at the employee's request.

On the other hand, there have been instances where unions have recognized the propriety of more abundant retirements among the aged in plants. Such attitudes have been particularly common in industries or employments which have been contracting either because of their decline or because of far-reaching technological changes. In such instances it has been observed that the retirement of the older persons would allow for more adequate employment of the middle-aged persons in the market. But unions have not fostered compulsory retirement even when they have recognized that such withdrawals may be desirable for the group as a whole. They have also felt keenly about the right of the individual to determine his needs for continued employment up to the point of not handicapping the economic well-being of the enterprise.

Individual business concerns have proposed that personal retirements should be reviewed by joint committees of unions and employers. Such committees can deal effectively with ob-

[2] Solomon Barkin, "Union Policies and the Older Workers," in *The Aged and Society* (Industrial Relations Research Association, 1950), pp. 168-82.

vious cases of incapacity. The usual practice is to provide the committee with production and medical reports. But doctors tend to use absolute standards of capacity. While they may be prepared to recognize real abnormalities, they are unable to measure workers' capacity to perform various occupational tasks. Not only do they lack measures, but they have no terminology for itemizing these capacities or appraising the range of capacity possessed by a worker. At best, they will give loose personal judgments. Nor are records of production adequate, since employees may be better suited to other jobs, and the task is that of finding those for which they are better adapted. There are no scientific criteria for determining the propriety of retiring workers, except in extreme cases. The union must take the position that the personal preference of the worker should be binding. Management will usually seek to effect the retirement of those it believes are less productive, unless its policy dictates the more generous treatment.

SOCIAL RESPONSIBILITIES OF INDUSTRY

Those who argue for compulsory fixed retirement ages on the basis of simplicity of administration or necessity of granting a priority to the interests of the enterprise are insensitive to the social responsibilities of industry. Management is an agent of the enterprise which society has allowed to utilize the community's natural and human resources effectively in a socially approved manner. Management must meet the test of employing all persons who are willing to work when it can thereby increase our national well-being and the satisfaction of the individuals who make up our society. The means of achieving this end lie within management's hands through the redesign of jobs and the rehabilitation of older workers.

Solomon Barkin, New York City, is director of research of the Textile Workers Union of America (CIO). He has served as assistant director of research of the New York State Old Age Commission, as assistant director of the Labor Advisory Board, National Recovery Administration, and as chief of the Labor Section, Division of Industrial Economics, United States Department of Commerce. He is author or co-author of Old Age Security (1930), The Older Worker in Industry (1933), and other books and aritcles.

THE FARMERS' VIEWPOINT

By MARSHALL HARRIS [3]

THERE appears to be no composite attitude of farm people, so far as I have been able to discover, toward a fixed retirement age for themselves. The widely varying economic status and social position of farmers make it impossible to arrive at an average or a central tendency. The typical farm owner has accumulated more worldly goods than the average tenant of the same age, although both are independent entrepreneurs. As a consequence, the owner's economic retirement problem is much less. Furthermore, he has reached a highly coveted goal—farm home ownership—whereas the tenant is landless. Thus, the owner's psychological attachment to the land and to farming is greater than the tenant's.

[3] The opinions expressed in this article are those of the author and do not necessarily represent the views of the Bureau of Agricultural Economics or the Department of Agriculture.

Considering only these two items, both the owner and the tenant are in a paradoxical position. The owner may be economically able to retire, but he is not psychologically prepared to do so. The reverse is true of the tenant. Since the problems facing the typical owner and tenant are different, any retirement plans and programs, including private and voluntary ones, must be tailor-made to meet the needs of each group.

Looking at the retirement problems of farm laborers, we must distinguish between the year-round worker and the migrant laborer, although they have many characteristics in common. Neither is as deeply rooted in the land as are farm owners. Their savings, if any, are notoriously inadequate. Both migrant and year-round laborers are accustomed to working for others. Yet there are significant differences. The year-round worker is established in the community. The community, if not the employer, has a feeling of responsibility for him—it is ready to furnish him odd jobs, little services, and petty assistance to help out. On the other hand, the migrant laborer has no community ties; no one feels responsible for him; and often he finds it difficult to supplement retirement income.

A tentative generalization and a hypothesis can be presented at this point for consideration. (1) The economic problems of retirement at a fixed age diminish, while the psychological problems increase, as farm people attain higher rungs on the so-called agricultural ladder. (2) If retirement plans and programs are adapted to the distinctive needs of each farm group, the benefits of retirement will be maximized and costs will be minimized. We need to consider more fully farmer economic and psychological problems to determine if the generalization is based on facts and if the hypothesis is worthy of testing.

ECONOMIC PROBLEMS

For farmers who are forced to retire or who want to retire, the largest single problem is an economic one. Having assurance that income will be available until the end of life is part and parcel of this complex. This is shown clearly in an Illinois study.[4] The magnitude of the economic problem increases when the price level rises rapidly, as during the past two decades, and when rising prices are coupled to an ever improving level of living. These two factors have tended, over recent years, to make retirement with a fixed income rather uninviting, whether such income be derived from savings, pensions, or public assistance.

Compulsory retirement at an arbitrarily selected age would deprive many owners, most tenants, and practically all laborers of the food, housing, and clothing that minimum standards would indicate as acceptable. If not physically disabled, they could supplement their retirement income with gardens and subsistence livestock. Some could do odd jobs in the community to add to their income. But few of them are interested in public assistance that would require one "to sign papers against" his house, as a retired man in Pennsylvania put it. Retirements can be made most effective by blending private self-help and public old-age assistance.

There is another economic aspect to the matter of retirement at a fixed age. It would entail a large, needless, money cost to society; for numerous farmers at age 65 still have many hours, properly rationed, of physical labor to con-

[4] Cleo Fitzsimmons, *Provisions for Security Made by a Number of Farm Families in Three Areas of Illinois*, Illinois Agricultural Experiment Station Bulletin 537, Urbana, 1950.

tribute. And, more important, there would be an uneconomic dissipation of much knowledge gained through years of experience, if farm operators had to retire at a given age.

PSYCHOLOGICAL PROBLEMS

Keeping occupied, fighting idleness, is a problem of considerable magnitude for many farmers when they retire, whether voluntarily or involuntarily. The problem of keeping occupied for a person who has maintained an active physical life is largely a matter of being physically busy at something that is needed, something that counts. This is difficult for a retired person who has worked hard all his life at farming, giving little thought to the development of a time-consuming avocation.

A Pennsylvania study [5] shows that physical disability causes much more retirement than all other reasons—physical disability 70 per cent, voluntary retirement 12 per cent, and all other causes 18 per cent. When retirement is thus involuntary, the matter of keeping occupied is greatly aggravated.

Farmers, generally, in my observation, do not understand why anyone should want to retire voluntarily; they are amazed that a person should want to be unproductive. This viewpoint is strongly undergirded with long tradition. Farmers vie with neighbors to see who can produce the most. They pride themselves in providing food and fiber for an ever increasing proportion of the population. Although the farm may be one of the few places where the innerspring or air foam mattress has not completely replaced the feather bed, farmer psychology frowns upon "featherbedding" as practiced in some urban industries. The rural mind cannot sanction permanently any means employed to limit the output of a day's labor.

RETIRE OR RETREAT

The problem of retirement of farm owners is traditionally throught of as a problem for mother and father. However, what mother and father do after they become 65 or so is of much concern to the younger people. With the disappearance of free land and the declining possibility of buying a farm, the young couple have a problem in getting started in farming before they become old. Retirement plans of family farmers determine quite specifically what the young people can do. Can family arrangements be worked out whereby the objectives of both couples can be attained?

An ever increasing number of farm families appear to think so. Numerous sons are being introduced to farming via 4-H Club and Future Farmers of America projects. They gain experience and accumulate capital while working with father. At the proper time, when dad is wanting to take it easy and son is rearing to go, a father-son agreement is made for joint operation of the farm. Later, without divesting himself of his old-age security, the father makes arrangements for the son to take over full operation of the farm with the assurance that he will become owner of the farm when his parents die.[6]

The father does not *retire* from the farm, rather he *retreats* from active management and hard work. He remains on the farm, gets income from it, works when and as it suits him, enjoys the things to which he is accustomed, and lives in happiness and security at peace with the world. Lucky indeed are a rapidly increasing number of farm owners who can retreat yet not retire. Obviously, very few tenants and practically no laborers have been able to work out arrangements whereby they can retreat from farming in this way.

[6] Marshall Harris, "A New Agricultural Ladder," XXVI *Land Economics*, 258, Aug. 1950.

CHANGING ATTITUDE

A generation ago, many well-to-do farmers looked forward to the day when they could retire and move to town. But today, as a result of modern improvements, the typical farmer with means plans to spend his last years on the soil that he knows so well and in the house where his children played. A New York study indicates that about seven out of eight farmers planned to live on the farm after "retirement" and continue to work.[7]

Another urban attitude that appears to be spreading in rural areas is the decreasing feeling of responsibility for the old folks on the part of the children. In an earlier generation or so, the young people saw to it that mother and father were adequately taken care of during their declining years. Today the mantle of filial responsibility seems to rest somewhat more lightly upon farm youth. This is not by way of lamenting the passing of a custom, but to point out one of the problems of present-day retirement.

This trend is being accelerated by a lengthening life expectancy and a diminishing size of farm families. These trends have increased by leaps and bounds the magnitude of the burden of parental care that falls on rural children. In former years the farm family was made up of six to ten children, and many a mother and father passed on soon after normal aging began to sap their vitality. Today, with smaller families and longer life, three or four children would have to provide for mother and father for many years of low physical vigor.

FLEXIBILITY NEEDED IN RETIREMENT PROGRAM

Farmers do not age at the same rate nor do they look with favor upon retirement while still able to do productive work; retirement at a fixed age is not advisable. The economic and psychological problems of retirement are different for owners, tenants, and laborers; as a consequence, retirement plans, whether private or public, voluntary or involuntary, should be tailor-made to suit the needs of each group. Barring severe physical disabilities, farmers should retreat rather than retire from farming. Many farm owners are doing this now, but it is a difficult accomplishment for tenants and laborers. Any retirement program must be kept flexible to meet the changing attitudes of farmers resulting particularly from apparent lessening of family responsibilities, decreasing size of family, and increasing life expectancy.

Marshall Harris, Ph.D., Washington, D. C., is an agricultural economist with the Bureau of Agricultural Economics, United States Department of Agriculture. He has been in charge of the Department's research work on land tenure and has served on several regional and national committees dealing with the land problem. He is author of numerous extension circulars, technical articles, and research bulletins and is co-editor of Family Farm Policy (1947) and Agrarian Reform and Moral Responsibility (1949).

Creative Activities of Older People

By Howard Wheeler

I HAVE been asked to contribute to this survey a layman's view relative to creative activities of older people. An endeavor to comply has been based upon an assumption that by "creative activities" is meant exercise of the native creative capacities of the individual in making his full contribution to society throughout the entire course of his life. To find and apply measures that will ensure the maximum of freedom in the exercise of creative capacity, therefore, seems to me to be the crux of this aspect of problems connected with aging.

Now a lay adventurer into waters largely uncharted must be wary about crossing the bows of explorers more scientifically equipped. This observation comes out of a feeling that when a writer enters upon an assignment in an environment new in his experience, it is highly desirable that he establish at once a basis of understanding with the reader.

A reporter in the field of popular journalism ordinarily has little opportunity to familiarize himself with the methods and the tools of scientific investigation. He relies mostly upon seeing, hearing, and reading as much as he can, understanding as much of it as he can, and telling about it as accurately and clearly as he can. When it comes to a consideration of the creative activities of human beings in the later years, therefore, this reporter would seem to have little choice but to continue to make these his chief reliance. Included in the aggregate can be some fortuitous experience as a participant in the First National Conference on Aging, held in Washington, D. C., in August 1950. Here was opportunity not only to broaden horizon by watching the play of specially qualified minds in dealing with the various aspects of a national problem, but to observe at close range the approach, attack, and techniques of scientific research. This, and a deal of reading since, have more than ever persuaded a lay investigator that in undertaking an exploratory venture into the terrain of the gerontologist he would better stick to tools comfortably suited, through long use, to his hand.

Some Lay Concepts

As well worn as any of these, perhaps, is one fashioned of necessity for drawing from the pigeonholes of experience those things needed for servicing a specific need. Use this as I will in the present need, I find myself arriving always at three rather well-defined conclusions: first, that creative activity is creative imagination at the point of self-expression; second, that creative imagination, chronologically, is age-free; and third, that while the creative imagination may decline in liveliness in the later years of life, the value of its product may steadily increase, even right up to the life experience identified as death.

To find Science inclined to give the nod to conclusions such as these is to give edge to zest in a reporter's quest for the facts about man and his years. Gerontology is a new science, geriatrics a new profession. The words themselves are still strangers on the tongue of the uninitiate. Gerontologists and geriatricians who took part in the Conference on Aging were as one in their

emphasis on the need for a tremendous amount of research before the sciences can give anything approaching final answers to a myriad of questions that have to do with the aging of the individual and the aging of a population. One of the conclusions reached by a conference group made up of specialists in the van of investigation, the section on Research, was this:

> There is no intelligence test in existence which samples all or even most of the mental abilities known to psychology. Creative thinking, for example, usually is not measured by our tests. . . . Equally important it is to promote research aimed to delay or fully prevent the loss of mental abilities. If we couple added years of life with undiminished mental vigor, who can say what wonders will emerge from our laboratories, or what songs our poets will sing?

A conclusion of another group of the same conference, the section on Population Changes and Economic Implications, gave further reassurance:

> "Aged" or "old" are relative terms. . . . There is no single criterion or classification by which an individual or class may be unequivocally designated as aged or old.

An ageless faculty

Here and elsewhere in the deliberations of men and women from many regions and diverse callings, a newspaperman gathered that comfortable feeling of being safely on course. He had watched human actions and reactions, including his own, in earthquake, conflagration, pestilence, social upheaval, and war, as well as in more normal settings. He had watched genius at work, and had bought some of its product for its value in the humdrum business of attracting readers, building circulation, increasing advertising at increasing rates, and so holding place in an editor's chair. Ideas had been his stock in trade—ideas and the promotion of them. He had experienced occupational victories and defeats; good times and hard times; the elation of fruition and the bitterness of frustration—including a rather long stretch during which he had no eyes to see with, and so, perforce, had learned not a little about the baleful work of destructive imagination as well as about both the prophylactic and therapeutic power of the creative imagination. Out of it all had come no hint that the number of times the earth makes its circuit of the sun in the course of a lifetime has aught to do either with the actuality of the creative faculty or with the individual's right and ability to channel it for his own and others' good.

Thus it was that a lay investigator, without much awareness of it, had been more or less well conditioned for an enlivening experience in conference participation in a field to which theretofore he had given scant thought, and for a sharp new interest in the reading and listening which were to follow. The reading, by a happy circumstance, was to include a close study of the entire manuscript of the group accounts of the conference discussions and the reaching of conclusions. Going on from there has been something like following the blaze marks of a newly broken trail. Explorers out ahead have been finding scientific support for a lay observer's impression: that the human faculty which finds its expression in creative activity is time-immune.

The "Curve" of Contribution

If this should turn out to be the truth about the faculty itself, what of the quantity and quality of its expression? Here it is clearly part of a reporter's job to take into full account the work of those who have sought in the history of great achievement a relationship of chronological age to creative contribution.

H. C. Lehman's studies of the creative impulse, in *Scientific Monthly* and elsewhere, Dorland's analysis[1] of age averages at which four hundred eminent persons produced their masterpieces—such as these make memory-provoking reading. It seems out of line with experience, somehow, that writers of best books and military leaders should be grouped together as reaching their peaks in the middle 40's; that medical men should be classified with certain types of musical composers as at their zenith between 35 and 39; that philosophers should be bracketed with men of affairs as not reaching full creative stature until the late 50's.

Out of clear-cut recollection come items of individual performance by the outstanding which do not seem to check. It is quite easy to thumb through memory records of high-level contribution, of friendships or close contacts with men and women distinguished in creative work, of opportunities to be at the scene of action when certain of the world's great were transforming ideas into creative action—Wilson, Lloyd George, Clemenceau; Pershing, Joffre, Foch; Walter Hines Page, Brand Whitlock, Hull; Steffens, Brandeis, Norman Hapgood; Lillien Martin, Ida Tarbell, Helen Keller; E. W. Scripps, William Allen White, Fremont Older; Oliver Herford, George Bellows, Gordon Grant; Frederick Palmer, Sir Philip Gibbs, the Irwins; John Drew, Otis Skinner, the Barrymores. Names bring back personalities—the detail of outstanding performance; and nowhere, or so it seems, an age-performance pattern.

Surely, one thinks, Science will find ways by which to identify and evaluate factors other than chronological age which can enter in when creative activity shows a downward curve in the later years. Immediately, and again out of personal experience and observation, several such factors suggest themselves. Prominent among them are economic insecurity; lowered living levels; anxiety; age barriers to gainful employment; frustration; loneliness; a sense of being "out of it"; deeply grooved social attitudes running all the way from indifference as regards the aged and aging to contempt and outright antagonism; defensive reactions of older people themselves, causing emotional blocks to creative expression.

Again the lay investigator comes upon evidence that scientific method has been out ahead of him, and has not been overlooking factors such as these. For example, he finds Lawton making a point of Lehman's general conclusion that individuals may think creatively and make invaluable contributions at practically every age level beyond early youth; that it is merely a question of when a gifted person produces either his masterpiece or the greatest quantity of high-quality performance.[2] And this from Miles:

> The aging person quite naturally does not want to admit that the total psychological organism, the personality, is changing in an unfavorable way. Nor should he, because until the true course of adult personality development is plotted in detail with as full regard for positive as for negative aspects, the available picture, although correct as far as it goes, may be fundamentally misleading. . . . The peak values are interesting and significant, but they do not tell the whole story. . . . The pertinent conclusion, for average as well as for specially gifted people, is that good work is not limited by life age.[3]

Senescence but not senility

Says Gumpert,

> Senescence has to be, and there will be more and more of it to the degree in which people stop dying prematurely from disease. Senility need not be, and its presence will in the future be evidence of individual or of social neglect. . . . We have scores of magnificent examples that life is not ended at "threescore and ten" or at the point where our social security laws put an end to it. . . . The "master work," the climax of creative life, is often produced in what we consider old age. . . . Most of the great old men . . . were leaders and fighters. Their brains could not deteriorate because they used them hourly in creative activity.[4]

Only historic exceptions in the operation of a rule, these "magnificent examples"? Perhaps. Yet almost as this is being written, Dr. Gumpert moves out of the historic to report a trip abroad, during which he visited a number of distinguished persons of advanced age who still lead active and useful lives. The youngest was 77. In concluding an account of his adventures, he says:

> I wonder whether life as a whole will not be richer and happier for all of us once we start discovering the unknown riches of old age, now hidden under old age's miseries. . . . We sometimes call an old man's dotage "second childhood." I would suggest there is often, instead, a second prime of life which we should discover and explore and cherish.[5]

Will scientific research one day turn suggestion into a solid fact? Should the normal curve of creative contribution show twin peaks, rather than a single one? Certainly there is much in the experience of the later years to encourage a layman's belief that the physician and others of like or similar mind are on the trail to something close to the core of the aging problem.

THE CREATIVE POTENTIAL

As a nation more or less engrossed in mobilizing our resources for defense, we have fallen into a way of using the word "manpower" as though it were possible to compute the sum total of it from a unit of it. Yet in the run of the news, as well as in the run of a day's work, there is plenty to indicate the importance of the mental factor as an element of manpower. It asserts its authority while defying scale and slide rule. This, as the senescent well knows, becomes especially apparent as the years pile up. (I use the term "senescent," of course, in the sense of a normal, natural, healthy moving into the older years, not with the derogatory connotation which much thoughtless usage has given it.) Indeed, there can be times when the mental factor becomes the determinant of creative endeavor. So it can be like light in the clearing when a disheartened traveler through the older years comes upon evidence that experts are alert to this, and on the job; evidence, for instance, such as this from a prominent urologist:

> The physical let-down with senescence is largely mental. Frustration, discouragement, unhappiness and fear are the hazards that lead to loss of appetite, insomnia, apathy, and then the physical break-up. . . . The ounce of prevention must come from within. . . . A plan is needed which will make useful and active the later years of life.[6]

Fruitage of imagination

What is the creative imagination? Where does it come from? Reading, a lay inquirer gathers that definitions and explanations, ancient, modern, and current, run the whole gamut from the furthermost in materialism to the absolute in philosophy.

As an American, it may occur to him that in the American way of life which he enjoys there is much whose source is intangible—much which stems directly from the creative thinking of somebody. Evidences of the actuality and the potency of the creative imagination have become commonplaces in his experience. When he looks back, it may seem close to incredible that within the span of his own life he should have seen the first telephone and the first motor-driven vehicle to appear in his home town; should have witnessed the advent of the flying machine, the motion picture, radio, television, and a new era brought in through the interplay of human imagination and ingenuity in releasing, harnessing, and turning to use the awe-inspiring energy of that which can neither be seen, heard, touched, tasted, or smelled. As hard to realize, almost, is that it was only as far back as 1828 that the school board of Lancaster, Ohio should have written to a debating society of young men:

> You are welcome to the use of the school house to debate all proper questions in, but such things as railroads and telegraphs are impossible and rank infidelity. There is nothing in the word of God about them. If God had designed that His intelligent creatures should travel at the frightful speed of fifteen miles an hour, He would clearly have foretold through His holy prophets. It is a device of Satan to lead immortal souls down to hell.

What, comes the irreverent thought, would the good men have said of an idea that one of those creatures might eat a day's breakfast in the nation's capital and the evening meal on the Pacific Coast? Here imagination falters.

To accept the creative faculty as an actuality is one thing. To think of the potential of its contribution is something else. It was only last evening that an aging Austrian, Haydn, reached across sea, land, and a century and a half, to give to a troubled and tired American, of about his own age, a full hour of complete relaxation; a blessed release from the bombardments of a world in conflict; an hour of life-renewing vacation in a world of serenity, beauty, master harmony. To how many millions of others, this free gift? To how many in the years past? To how many in the years, or centuries, to come?

Release of creative capacity

Lawton says:

> It is fear of aging, rather than the aging process itself, which often causes a functional loss in the mental realm, just as it does in the physical. Anticipating the loss of efficiency, we hasten the arrival of what we expect. If the confidence in one's ability is essential at earlier life periods, it is most important during senescence. . . . There are unsuspected potentialities in almost everyone.[7]

If this is true—and experience in aging certainly tends to confirm it—then the obvious thing to do is to get rid of the smothering overlay of fear and so reveal and release the creative potential of older people. How to do it would seem to be a difficult problem. But surely not, once we accept, as essential of our continuing security and well-being as a nation, a change in social attitudes from those of indifference toward our aging, and worse, to that of the prospector—the expectancy of rich discovery. For appreciation of his worth is meat and drink to the fear-ridden senescent. Low evaluation, or none at all, is the father and mother of most of the anxieties which obscure the vein of his capabilities.

To survey; to dig; to analyze; to appraise and reappraise; to discard or refashion old tools; to invent and try out new ones; to do anything and everything that American ingenuity can devise to uncover and identify, community by community, individual by individual, the precious deposit of creative capacity; to open opportunity for its self-expression, and so to utilize —this, if appearances give true promise, is going to be the way.

A long and tedious process? Or one not distinct and isolated, but all one with the whole American process of growth? Only relatively, the thought comes, have we been a long time at work on the structure of a new, free society in the New World. We are still a young nation. As we are confronted by the fact of an aging population, perhaps it would be for the better to see ourselves as only accepting in stride the challenge of a new problem encountered in our building. Looking back, it does seem that that has been the way with us—always something new to surmount as we have moved to higher and higher ground, closer and closer to realization of the American ideal. Clearly, discrimination against the older members of our national family can be no part of that ideal. So we try new ways for meeting new situations, and hold course.

Indifference turns to interest

Gerontology is drawing prospectors from all the sciences. The list is impressive, and a heartener for those who are trying under heavy impost to "put life into the later years." Almost every week brings news of some research project expanded, planned, or being pressed forward. This and much more, surely, may safely be taken as herald, at least, of a new and determined approach to the problems of aging, full of real promise.

Great question marks are being hung over personnel theories and employment practices affecting older workers. Means of rehabilitation are being made more available to them. Techniques of job and worker analysis, job adjustment, retraining, and selective placement are being re-examined and revised. It was only the other day that the United States Department of Labor announced a new program for special older-worker counseling in public employment offices.

Responsive to widespread and insistent demand, the Federal Security Agency has made a start toward establishing a national clearing house for exchange of information and ideas, and has set up a Committee on Aging and Geriatrics. Countrywise, conferences, lecture courses, and institutes are on the increase. Programs of adult education are being broadened and improved. Closer attention is being given to the maintenance of the health and the incomes of older people, to their housing and family life, and to the provision of opportunities for social, civic, and recreational activities.

Horseshoes are all right. Pitching them can be fun. There is nothing to say against parchesi, square dancing, shuffleboard, or guessing games. All can be diverting, at times. But an aging worker ventures to rise in his place to say this: An attitude that would make children out of older adults is a mistake. As he watches a shift in attitudes, particularly as regards the

[7] George Lawton, *op cit.* note 2 *supra*, pp. 25, 27.

recreational needs of the aging, he is encouraged at indications of a widening recognition of the fact. There has been proof in his own experience that when the senescent is given opportunity to demonstrate that he can pull his own weight, lesser forms of recreation will take care of themselves. In his book, creation and recreation are one. The handicaps of the later years are at once challenge and distinction. It is the dignity of usefulness that counts: the certain knowledge that his creative potential is recognized and wanted in the work of the national community. That is living.

CONSERVATION OF CREATIVE RESOURCES

A time of national danger has given rise to more than ordinary interest in our human resources and their utilization. Perhaps, it occurs, there would be advantage in a little more emphasis on the difference between utilization and conservation; for a nation with more than 12 million men and women over 65 in its population, and with a prospect of having 17 to 20 million by 1975, is faced by long-term problems of wise utilization as well as by immediate problems of utilization in emergency—of conservation as well as of mobilization.

Mr. Marion Clawson is the director of the Bureau of Land Management, United States Department of the Interior. As such, he is a conservationist who speaks with authority. He said recently:

> Conservation means maximum, continued use of resources both material and human. While conservation relates very largely to the use of material or physical resources such as land, and the resources above and below the earth, it can apply also to the use of human resources. . . . Thus defined, conservation is an attitude of mind, rather than a specific program of any kind. Conservation in this sense involves primary emphasis on human values. We are concerned with the maximum well-being of the individual, both now and in the future.[8]

Can it be that here—in "an attitude of mind, rather than a specific program" —we shall find the key to problems connected with the aging of our population? During the months since the holding of the National Conference on Aging, certainly, a growing public awareness of the serious implications of census figures has been clearly discernible at any point of convergence of citizen thinking and community activity. It has been reflected not only in conferences, educational extension work, and research, but also in the launching of community programs for the solution of problems of aging, in the spread of "golden age" clubs and similar groups, in legislation enacted and proposed, and in definitely expressed insistence on the need for a national policy and co-ordinated action.

The signs are provocative. These evidences of a new outlook—could they not add up to a conservation movement in the making? Can they not be taken as indicative of a people's revaluation of a resource heretofore unsuspected or unappreciated—ignorantly, thoughtlessly, or contemptuously abandoned as worked out? From some vantage point of the future will not the careful historian see them as advance markers of a nation's attainment of new heights of wealth, well-being, and power through the reclamation, utilization, and conservation of the creative abilities of millions of seasoned Americans too long barred from opportunity to contribute by reason of chronological age alone?

[8] Commencement address, Eastern Montana College of Education, Billings, Montana, June 4, 1951.

Trying the impossible

One thing, at least, is certain. Time was, and not so far back, when we would admire, wonder, and let it go at that, if the creative drive of someone well advanced in years would break through all barriers in an astonishing display of capacity. Now we try to understand. Pitkin, for example, in an endeavor to explain "Grandma" Moses, makes use of this "bit of wisdom":

> There was a man who asked, "Why
> Can't I see in my ear with my eye?
> If I put my mind to it I'm sure I could do it.
> You never can tell 'til you try."

Professor Pitkin thinks

> Here is the fountain of all science, as well as all common sense. Here is more wisdom than is set down between the book of Genesis and the last line of the Bill of Rights. Please do six impossible things before breakfast. If you don't end up painting 1086 paintings, at good prices, you may hit on something better.[9]

If a volunteer gerontologist's first reaction is to lift an eyebrow, second thought brings this reflection: After all, every time we turn on a light instead of fussing with a candle or wasting good expletives on a balky and smelly kerosene lamp, every time we pick up the telephone, climb into an automobile or plane, use the radio or television, or read about some new wonder in an atomic age, aren't we, literally, experiencing the success of somebody who was sure he could "see in his ear with his eye," and found what it took to try it? Besides, it is true that old people, by and large, have more time than young people for trying the impossible.

The Gumpert idea of a second prime of life recurs. Tibbitts, always the pioneer, seems also to be looking in this direction. There was that in a recent offering of his which suggests a whole new region for exploration:

> Changes characteristic of aging are but part of the continuing life process. They may well mark the beginning of the phase of life in which the individual possesses the maximum accumulation of knowledge, experience and judgment. Indeed, it has been suggested that survival beyond the period of reproduction and responsibilities of parenthood may be part of the master plan of life. For not until we are freed of these responsibilities do we have the time and energy to make our greatest contribution.[10]

"The master plan of life." The concept attracts strongly. Why not? We of America have not found it hard to accept the concept laid in the base of our nationhood—that of certain specified rights divinely given and inseparable from the individual. It was only the other day that we read of a new and costly process being used by the government, the better to preserve the declaration of our belief in the actuality of these rights and our readiness to fight for the enjoyment of them. Would it be too hard to include a concept of the creative faculty as an aid, similarly bestowed and likewise inseparable? Or to think of what we call old age as a period of lightened load, intended for maximum enjoyment through greater freedom for expression of creative power?

Certainly if our whole nation should begin to think this way, our older people would move again into their place of dignity and importance. They could stop thinking about their age, or even about themselves. For all of us would be as alert and determined in defense

[9] Walter Pitkin, *The Best Years* (New York: Current Books, Inc., 1946), p. 49.

[10] Clark Tibbitts, address, 11th Annual Townsend Convention, Detroit, Michigan, July 2, 1951.

of unseen potentials as we are in defense of unseen rights.

THE JOB AHEAD

"Master plan." Perhaps that is why the creative faculty does not wear out. And perhaps the job ahead of us may be broadly conceived as a three-pronged attack on the problems implicit in an aging population, with the objectives these:

1. To bring about a general citizen acceptance of the actuality of the creative faculty of each individual, regardless of age, as a national asset.

2. To bring about a general citizen recognition of the immeasurable value of its potential.

3. To bring about a general acceptance of citizen responsibility for opening and holding open opportunity for its free expression, and for provision of capable evaluation and wise utilization.

Indeed, at least one lay observer has become convinced that we have on our hands a job of education and re-education whose scope is national and whose challenge is such as to call for the best we have in American ingenuity and the demonstrated American capacity for achievement of the difficult.

Howard Wheeler, Washington, D. C., is a veteran journalist whose experience as reporter, news analyst, war correspondent, and editor covers almost half a century. He is a former editor of the San Francisco News, Harper's Weekly, and Everybody's Magazine. Following World War II, during which, commissioned as a commander, he served as editor and officer-in-charge of Mast Magazine, United States Maritime Service, he became actively interested in problems connected with aging. He participated in the 1950 National Conference on Aging, helped to edit the reports of the various sections for book publication, and is now an editorial consultant attached to the staff of the Federal Security Agency Committee on Aging and Geriatrics.

Creative Activity Through Handcrafts

By RUTH BUNKER

FOR many older persons handcrafts as a second career can provide an absorbing energy outlet and vocational resource which not only will replace but can exceed the job satisfaction hitherto enjoyed. And handcrafts will pay, too. But the greatest dividends in terms of success and enjoyment are gained by those who make plans and start on them early, so that the transfer from a first to a second career is an easy one. All of this takes hard work. Communities can contribute by organized planning.

PERSONAL SATISFACTION THROUGH CRAFTS

For years the idea has been spreading that everyone should have a hobby of some kind, some absorbing interest that will be a change from the regular routine. To my way of thinking, if the choice is one of the many handcrafts, the individual making it is especially fortunate.

There is a basic need within us all to create things with our own hands. Experience has shown that older people have a heightened appreciation for anything which they themselves have made.

The extensive use of the handcrafts in occupational therapy has had far-reaching results. In the years since World War I, thousands of patients have become familiar with crafts as used in hospitals, and have been so intrigued that they have chosen one of the crafts as their hobby or even as their vocation. The therapeutic value of crafts is now accepted and well known. Crafts are an ideal solution for many of the problems facing the older people in our population.

The great variety of crafts from which to choose means that there is one to fit almost any physical capacity, inclination, or capability, and practically any purse! The numerous craft guilds give opportunities to participate in a group, to become a leader in that group. Craft groups answer the need for companionship, recognition, and status. There are local and national shows in which to compete. One can develop a small business to augment one's income. All this activity can fill one's days to overflowing if one wishes. The membership of the craft guilds is composed of a healthy mixture of all ages and both sexes. The older person may naturally gravitate to his own age group for close companions, but younger individuals in the same guild will keep him more alert and mentally young.

Frequently husbands and wives find in crafts an opportunity to work together. The husband may be the craftsman, with the wife handling the business or vice versa. There are cases of wives who became interested in a craft and managed to inveigle their husbands into a much-needed chance to use their hands. One instance was an older woman who decided to take up pottery. After a few months her husband, a professional man, became so intrigued by the formulas used in glazes that he now makes all her glazes. A woman who loved to make silver jewelry finally persuaded her husband to try cutting gems for her; as an engineer who had recently recovered from a serious illness, he became fascinated and now has a much-needed leisure-time occupation. They are making retirement plans which center around these mutual interests.

HANDCRAFTS GAIN RECOGNITION

Twenty-five years ago, the craftsman had little opportunity to exhibit his work. If he belonged to one of the few guilds, there would be a small private showing of the members' work, going quite without notice by the general public. The museums had many examples of ancient Japanese ceramics, of American Indian pots, of Colonial silverwork; but the work of contemporary craftsmen received no attention.

Since the late twenties the craft movement in the United States has been growing, at first slowly and then more rapidly until now there are thousands of craftsmen in all sections of the country. With this growth in interest there has come a parallel growth in the recognition of crafts as a valuable part of our culture.

Today the artist-craftsman is an accepted member of the art world. Museums, both large and small, sponsor annual craft exhibitions in their areas, and purchase prize-winning pieces for their collections. Some artists now work both in the fine arts and in the crafts without any loss in stature. The sculptor frequently makes small ceramic sculpture for the modern apartment; it is but a step for him to make other ceramic pieces and ally himself with a craft group. Lithographers, etchers, and printers are often found in the craft guilds. Artists working in serigraphy (the silk-screen process of printing) find a welcome among the craftsmen. These few examples illustrate the increased awareness of the craftsman as a valuable contributor to our culture.

Society is also willing to give more than recognition; it is willing to support handcrafts by buying them. The better gift shops now stock handcrafted items. The gift departments of the big stores are glad to carry the work of craftsmen who can meet their large orders. The shops that depend entirely on tourist trade have found that crafts from their own localities sell well as mementos of trips. The huge attendance at the large summer craft fairs demonstrates this growing interest on the part of the public. The fairs have become focal points around which to plan vacation trips. There are demonstrations to watch, fellow craftsmen to talk to, work to compare with one's own, and the judges' decisions to challenge.

STATUS OF CRAFT MOVEMENT

People not directly connected with the craft movement have little realization of how widespread this movement is today. There are many elements which have contributed to this growth —the teaching of crafts to children in summer camps, the frequent inclusion of craft courses in the public school curricula, the extensive use of occupational therapy in treating the veterans of two world wars, the use of crafts in adult education programs, and now, in a few communities, in homes for the aged and for older people confined to their own homes. All these factors have produced many people with at least a preliminary knowledge of craft work. Even for those who have not taken up handcrafts seriously, it has led to a genuine appreciation of the work of the producing artist-craftsman.

Craft guilds, older and more numerous in New England, from which the craft movement has spread, are now to be found all over the country. Some are large, some small, some include crafts, and some but one type of craft. Founded in 1897, the Society of Arts and Crafts in Boston, Massachusetts, is the oldest of the craft groups. Its aim has always been to uphold a high standard of craftsmanship, and it is credited with great influence in the present craft movement.

An example of the state-wide type of guild is the well-known League of New Hampshire Arts and Crafts. The first to be state supported, it functions under a council and has a paid staff and many volunteer workers. Now in its eighteenth year, it has over 3,800 members. Maine was the second state to have a state-aided program. The program was discontinued during World War II and has not yet been resumed. However, handcrafts in Maine are flourishing, generally on an individual basis, but with several local guilds. In Connecticut, where there is a state-wide guild, state aid for crafts has been directed only to the educational aspect. This is true also in Massachusetts, where there are twenty-one handcraft groups. The state-wide Pennsylvania Guild of Craftsmen has over 1,000 members and is still growing. It is not state supported, and its activities are centered in the various county chapters. New York has recently established a state program, and it is too early to judge what direction its emphasis will take.

While local craft groups may be urban or rural, these state-wide groups are a mixture of both. There is a growing tendency for retired people to settle in small rural communities. A craft guild membership makes this transfer from urban to rural an easy, natural shift, with new friends and associates ready-made.

One large guild which works entirely with rural people is the Southern Highland Handicraft Guild. Established in 1930, it was formed to help the mountain people of the southern Appalachian region to improve and preserve their handcraft skills and market their products. Many of its members are older persons who continue to work at their crafts until well into their eighties. This guild has grown steadily, until now it has eight shops in various cities, including New York and Washington. It has become an important factor in the income of many families in that region.

Local craft groups exist in practically all the states, with the crafts of weaving and ceramics predominating. New York and Florida have recently formed state programs. The Midwest and the Far West have no state-wide groups that I know of, but there is great activity in many regions, such as among the potters in Ohio and in California.

FACILITIES FOR TRAINING IN CRAFTS

Many thousands of people now enjoy crafts as a hobby or as a part-time or full-time profession. Where do they get their training? The facilities are better than might be expected.

In urban areas there are craft classes at the museums, summer courses under the art departments of colleges and universities, craft courses in art schools, adult education courses in crafts in the evenings at public schools, and innumerable private instructors (both adequate and inadequate).

In rural areas, probably the best sources are the home demonstration agents, employed co-operatively by the State Extension Service and the Department of Agriculture Extension Service. For many years the federal Extension Service had a craft consultant who spearheaded this work nationally. Since her retirement no national leadership has been provided, but the home demonstration agents continue to advise rural people, primarily women, on how to improve and market their handwork. While much of this work is not

of top quality, the extension workers are of definite assistance.

As noted earlier, the movement of older people to small communities for retirement has brought top-notch craftsmen into rural areas, where they are available for teaching. Another interesting factor in some rural areas has been the settling of displaced persons who have brought European techniques to add to our knowledge. The intensive, short-period, summer training courses now offered by many universities and colleges have made training facilities available to almost everyone. There are summer camps for adults which specialize in craft instruction. Although some of these camps are conducted by the guilds, most are the undertakings of individual craftsmen.

HANDCRAFTS CAN PAY

The question which almost immediately crops up is: Can handcrafts be a source of income? The answer is definitely, Yes. In recent years numerous books have been written about making money at home with one's hands. Most of these deal with the handwork, hobby-type activity, too much of which consists of poorly designed and crudely made work. But some of the books are written for those who do want to turn out craft work of a high standard. The good ones contain suggestions about marketing, packaging, advertising, efficiency in production, and similar problems.

To be self-supporting from craftwork calls for skill, salesmanship, and hard work. It is not easy, but it can be done, as many cases prove. One young World War II veteran who was given weaving as occupational therapy found he had an unexpected talent for it—he is a born weaver, his teachers say. He went on to weaving as a profession, and enjoyed almost instant success. A middle-aged woman, advised by her physician to do some weaving as light exercise for her arms and legs, developed such skill in a few months that she now has more orders than she can fill comfortably.

It is, of course, less difficult to earn only a partial income from crafts, as is the need of many retired people with a small pension or retirement income. This is quite within the realm of possibility for a great many. A librarian, facing retirement within a year, took up jewelry work with the object of establishing a small shop in her home town. The small town had many tourists and no gift shop, so she planned to sell other crafts, also. She had no exceptional talent, but did good, workmanlike pieces of conventional design. Her plans have worked out just as she hoped.

Many professional men are attracted to crafts. Dentists, with their training and experience in work with gold and silver, frequently take up jewelry making as a hobby. Engineers often like metalwork and gem cutting. A surprising number of men make rugs—hooked, braided, woven. For all these craft products there is a market. It may take time to find the right outlet, but if designed well and made well, they will sell.

Many people who only supplement their income through crafts rely on the summer fairs of the guilds as their sole outlets. Their sales at the fairs, plus the orders taken, provide them with all the work they can handle for the rest of the year. One weaver makes up a few yards of sample patterns each spring. She has a tiny shop during July and August, and takes enough orders then to keep her busy through the fall and winter. At last summer's sale of The Maine Coast Craftsmen there were none of the hooked rugs for which the state is famous. On inquiring I learned that the craftsmen who usually bring their work were entirely sold out before fair time. The tourist trade, an important business in many states, is a good source of income for the craftsman.

The craftsman's marketing problem is one place where both guilds and states can help effectively. One of the aims of most guilds is to advise craftsmen in marketing, and to provide an outlet, often through a guild shop.

One of the most successful programs of government aid to craftsmen is that of the province of Nova Scotia, Canada. Administered by the Department of Trade and Industry, this handcraft program includes extensive training courses for any groups requesting it, individual advice on marketing problems, aid in contacting buyers, the renting of equipment, a library, exhibits, and a design service. It has been so successful that handcrafts are considered an integral part of the economy of the province. New York has a similar but less extensive or technical program, which advises women who want to make money by doing handwork at home.

COMMUNITY FACILITIES FOR HANDCRAFTS

Communities wishing to further the craft movement in their areas can do several concrete things. They can sponsor the formation of a guild. The guild will be interested in ensuring that standards of workmanship are maintained, training in crafts offered, exhibitions given, and sales outlets explored. A central meeting place is needed. Perhaps there is a room in the public library, the museum, the art club, the Young Women's Christian Association, a church building. Schools can be encouraged to offer craft classes in the evening adult education program. And so on.

An active craft guild can be a most important factor in promoting a full and satisfying life for older people. The retired person who has time to give to it will find ample opportunity for participation, and for leadership if he is qualified. Age has never made any difference among craftsmen—skill, yes; enthusiasm and interest, yes; but age, no.

Ruth Bunker, Washington, D. C., jeweler and silversmith, is editor of the monthly news bulletin The Cross-Country Craftsman. Medicine and art have shared her interest. She was successively a staff member of the Pennsylvania Hospital, Philadelphia, of the Social Security Board's (Administrator's) Bureau of Research and Statistics, and of the Department of Agriculture's Farmers Home Administration.

Sharing Community Responsibility

By Jean and Jess Ogden

TWO years ago the University of Virginia's Extension Division published a leaflet on the aging population.[1] On the cover page is the following statement: "The facts show that people are living longer in Virginia. . . . They want nothing so much as to share in the daily responsibilites and enjoyments of their communities." The pamphlet carries the suggestion that the problem of continued participation of older citizens is one that must be studied thoughtfully in every community by people of all ages and varied interests and by every institution and agency in the community.

"We have published this bulletin," it continues, "in the hope that it may initiate a process of cooperative inquiry that will serve to formulate the needs in this field, assess available resources, and devise plans for bringing resources to bear on the needs." [2]

Community Responsibilities

It is only, we are convinced, in the communities where they live and move and have their being that people "can devise plans," for every community has its unique pattern and its special resources. Any plans devised on a national or even a state-wide scale must be general. Communities can undoubtedly make specific application of the generalizations in terms of their special needs and potentialities. And certainly a pooling of ideas, achievements, and experiences by many communities seriously engaged in "cooperative inquiry" could help other communities throughout the nation. But those that are so engaged are a small minority—largely in urban areas. Some means must be devised for helping all of us to understand the implications of the age shift in our population and to accept the necessity for seeing public life and the institutions of our communities in new relationships.

In looking over the rapidly increasing literature on the subject of our aging population, one finds many articles whose titles, and frequently contents, suggest that "we" must do something for or about "them." "We," presumably, means society or possibly the younger segment of the community; "they," all too frequently, means the poor, the sick, the physically and emotionally inadequate among the aging. There will always be some of these for whom others must bear the burden of planning and care. But they constitute only a small part and will become a smaller part as medical science understands better the diseases of age, as industry progresses with its study of jobs for older workers, as financial plans for retirement are improved. The body of able elder citizens who can be real assets to the community is already large. It will be larger. Planning is not a job that any "we" can or should do for any "them." It is a job that involves the total community. Only as we "see the community whole" can we do any intelligent planning for any segment of it.

Reports from most of the communities that have been working on the problem of the aging give considerable attention to clubs, hobbies, sociability, recreation, and similar activities—in addition, of course, to physical needs, housing, and financial problems. Too few make any mention of civic and social activities and ways in which the older citizens might bear a share of their responsibility for the common welfare. Among the exceptions is a report [3] from Kansas City in which we find this statement:

> The progressive, prosperous community of the future will be one that makes use of older persons who want to participate in social and economic affairs. Kansas City cannot afford to neglect this largely untapped source of talent and experience.

No community can afford to neglect it—particularly in view of the fact that a smaller proportion of younger people must carry a heavier burden of those aspects of living that require physical strength and vigorous bodies. Enlightened self-interest places on the citizens of every community the necessity for analyzing the contributions that can best be made by each age group in its population. Then they must so proceed as to disassociate themselves from old, accepted patterns and accept the implications of the age shift in our population.

Unless careful planning of this kind is done, we shall all be the victims of what happens to happen. Nothing is to be gained, however, by approaching the problem of community responsibilities of the aging from the purely sentimental point of view. Thought must be given to their liabilities as well as to their assets; and much thought must be given to the kind of preparation for aging that will prepare all of us as we grow older to carry our civic responsibilities wisely and well.

Years and Wisdom

In most primitive societies and early civilization, the "Old-Men-Who-Knew" were assured of a pretty important place in public life, as Professor Simmons shows in his article. The Spartans, at a relatively advanced stage of civilization, were governed by a council called the gerusia made up of thirty gerontes, each of whom had to be at least 60 years of age.[4] But, with the rapid progress made by science in the past century and other factors contributing to longevity, the mere fact of age nowadays does not guarantee wisdom. That is, we are being kept alive. This is a far cry from keeping ourselves alive. The latter required an eternal vigilance, a continuous alertness, a conscious habit of learning from experience that made for a self-directed program of continuing education throughout life—the kind of approach whereby the knowledge that is acquired becomes the wisdom that lingers. By the same token, age, per se, does not today command veneration or even admiration. Older people—like children, adolescents, and younger adults—are respected as individuals rather than as a group; and they are respected because of what they are, rather than because of the number of years they have, or have not, lived.

Yet the available evidence does not show that the wisdom of the elders is being disregarded today in relation to the common welfare in the United States. In the Seventy-ninth Congress, thirty-two out of the ninety-six senators were over 65—one-third of the total group. In the House of Representatives, 21 per cent belonged to the same age group. In 1948 we elected the oldest Vice President we have ever had, and with him the third-oldest President. We have, during the war and the period following it, drawn back into public life retired men whose former experience and accumulated wisdom were felt to be

needed—for example, Herbert Hoover, Bernard Baruch, George Marshall, and many others at slightly lower age levels. During the same period, in a national list of top business executives, 28.6 per cent were past 65.

THE SPEED-UP IN "THIS CHANGING WORLD"

But there is another side to the picture. As it becomes a statistical fact that people are living longer, it becomes an equally important statistical fact that the proportions of old to young are changing rapidly. Census figures show that whereas today we have only 13 million adolescents, we have more than 18 million Americans who are 60 or over. More than 12 million of these are at least 65. Less than a century ago seven-eighths of our population was under 45. We were indeed a young country! In those early societies in which the elders were so important their numbers were relatively small. The same was true of our country when the Constitution was written. It is sometimes hard to remember that in setting the minimum age of the President at 35, the writers of the Constitution were providing that the chief executive be chosen from the elder citizens of that day. That the first President was 57 is further evidence of recognition of the need for the kind of wisdom that comes with years.

The figures quoted from the Seventy-ninth Congress seem to indicate that as our age level has advanced, the age of our governing bodies has kept pace. But these elder statesmen generally have been participating in public affairs for many years. Few of them reach the age of retirement and then suddenly assume civic responsibilities. Of course, exceptions can be found. But in general, citizenship is something that needs to be practiced during one's earlier years if one's contribution during later life is really to count.

Together with shift in proportions of young to aged, there is another important consideration. This shift in age groups in the population comes at a time when change has been speeded up to a point that makes it difficult for even the most alert to keep up. Up until *day-before-yesterday*, figuratively speaking, in the long stream of recorded history, social change was relatively slow. Knowledge of the heritage and keeping things steady were, in general, enough, as far as rulers and educators were concerned. The elders had the relatively simple task of giving to the oncoming generation understanding of the tools and accumulated knowledge of the past.

Yesterday, however, in this long period of development of mankind, technological progress speeded up. And *today* the acceleration continues at an even more rapid rate. Changes in methods and speed of travel and communication, changes in ways of working in a mechanical world, realization of the fact that the world has shrunk so that we are now part of a complex society whether we want to be or not—all the changes in our ways of doing and thinking implicit in the results of technological change, the facts of life in the world of today, present an unprecedented challenge to those who are charged with planning and policy making at the several governmental levels.

The rapidly changing world calls likewise for changes and readiness for continuous change on the part of the established and hard-to-change institutions of our society. Education, for example, must now equip individuals for control of living in a world in which change is the only constant. It can no longer rely on teaching solutions to problems. The solutions of yesterday can no longer be relied on to meet the problems of today and tomorrow as they could in the more simple societies of long ago, in which the institution of education has its roots.

Religion faces similar problems. It must help individuals prepare for the complexities of living rather than (or as well as) prepare them for dying. During the increasing perplexities of recent years churches have tended to accept the latter, and infinitely easier, role. Harry Overstreet points out that religion does in

69623

if it clings to old interpretations of human life simply because it has built these into revered institutions and practices. Where a thing as complex and inadequately known as our own nature is being dealt with, there is need for a constant alertness to new discoveries and implications.[5]

To this we would add the need for a constant alertness to the increasing complexities of society as it relates to a "thing as complex as our own nature."

AGE AND ADAPTIVENESS

Accepting the fact of the acceleration of change and the need for individuals and institutions not only to accept but, even more important, to become able to guide change in desirable direction, we must give serious thought to the implications of the increasing proportion of age to youth in our society. As George Lawton points out, it is a "normal tendency of all of us to grow somewhat more rigid and hostile to change and new ideas as we get older."[6] We are therefore faced with the dilemma of having to accept and guide change at a greatly accelerated rate when inevitably, by sheer force of numbers, the older portion of our population will be able to determine policy and program.

[5] H. A. Overstreet, *The Mature Mind* (New York: W. W. Norton Company, 1949), p. 265.

[6] George Lawton, *Aging Successfully* (New York: Columbia University Press, 1946), p. 261.

Evidences of this control by the elders are already discernible in the rural communities of the South. These communities have continuously, over a period of years, lost their young adults of the productive years to industrialized areas. Frequently the children remain in the rural community with their grandparents or other kin because of crowded and unhealthy living conditions in the city to which their parents have gone. (This is particularly true of the Negro population when parents go off to jobs in Baltimore, Washington, Akron, or other congested cities where housing is a serious problem.)

In such rural areas, one cannot presuppose even the average imbalance of of age groups. It is greatly exaggerated. The great proportion of the population is at the extreme ends of the age range. This of necessity means that the governing bodies, the welfare boards, the boards of education, the planning groups in these rural communities are made up of older citizens. Many of them are looking towards and clinging to the past. Their tendency to do this is easily understandable. In the past they feel secure. The swirling present and the uncharted future are terrifying to persons whose lives—and, more important, whose timing—are geared to horse and buggy days.

ASCENDANCY OF THE ELDERS

In one very prosperous county where men in their 70's and 80's hold the balance of power on the board of supervisors, the children go to the same school buildings that these old men went to sixty years ago. These men disregard the increased school population—especially in the high schools—due to higher age limit for leaving school and to more strictly enforced compulsory attendance. They disregard the need for laboratories in an age of science. They disregard everything but the importance

of keeping taxes down. They have formed a "Taxpayers League" of men all of whom are their contemporaries. One of these remarked in a public meeting: "I went to that school and I went on my own two feet. And I done pretty well in life, didn't I?" As far as economic success is concerned, his question must be answered in the affirmative. But has he done well in keeping informed as a citizen and keeping his mind alert to changing needs in a changing world and in a community whose children, as adults, will have to compete with children educated in more farseeing communities?

In almost any community, especially the smaller ones, there are people who deplore the lack of interest of youth in the church. At the same time the churches tend more and more to have programs planned by the elders for the elders. (The very use of the term "elders" for their policy-making bodies in some Protestant churches is in itself indicative of a deeply ingrained attitude.) A minister in a rural community —himself over 60—suddenly realized that "we keep telling the young people not to dance, not to go to unwholesome roadhouses and juke joints. We surround them with prohibitions. But have we people of this church ever helped them find something to do?" He was not "too old to change his ways." He, with the help of others who saw his point of view, launched a fine community recreation program that served the needs of all ages. To be aging is not necessarily to become inflexible. But we must admit that the tendency for all of us is to become more resistant to new ways of doing.

In another church situation—this one in a small city—two elderly and deeply religious parishioners protested to the minister about his sermons. They were too lively, had too many examples drawn from present-day life, contained too little church doctrine. He was sympathetic and assured them he wanted to meet the needs of all members, but it was a matter of very special concern with him to keep the young people in the church. His sermons were geared to their needs. These two elderly people now hold their Sunday service together in their own living room.

NOT A NEW PROBLEM

It is interesting to note that this problem of conservatism of the elders is not new. It was felt even in ancient societies where they were accepted as the teachers and the rulers.

Even in the Spartan society, referred to above, the people who accepted the rule of the gerontes were forced to set up another body as a kind of system of "checks and balances." This consisted of three younger and more able men called "ephors." As a matter of fact, they were appointed by the kings on the strength of their abilities and not for their venerabilities. The point for us to remember is that even as early as 1000 B.C. the problem of the power of the aging was in evidence. Even then it was recognized that the contribution of the individual to society depended upon his "personal balance and social wisdom," rather than the incidence of his longevity. Neither youth nor age in itself is a guarantee of such balance and wisdom.

THE POSSIBILITY OF CONFLICT

We have admitted that we can point to "councils of elders," at both national and community levels, who are carrying a heavy share of their civic responsibility. We recognize the fact that most "boards" in every community have a large proportion of gray-headed and bald-headed members. Some of us find that in many communities it is the young adults who have no voice in public affairs. It is still necessary to contend for their right to have a part in planning activities instead of having their affairs planned for them by their elders. Why, then, are we concerned about elder citizens feeling bereft of responsibilities in their communities? Why have we said there is need for serious stocktaking by each community?

We are concerned because of the increasing number of elders. Those to whom we have referred are not new participants in public affairs. They have "been in there" working for years —and often their fathers and mothers before them.

What then do we need to do?

1. We need to understand the total community and analyze the potentials of the total population in terms of community service. Any attempt to set apart any segment of the population as a special group is dangerous. In the September 1941 issue of *Platform* a statement appears that may be startling to those who believe the no-longer-young are "on the shelf." We quote the statement in part:

> Don't think the more healthy and active of America's older people are patiently waiting for the rest of us to decide their fate. . . . On the contrary . . . it may be they who decide ours. Robert Havighurst, professor of education at the University of Chicago, predicts that by 1980 the balance of power in any election will be held by those over sixty. The Townsend and newer, similar movements . . . . indicate what this may mean in the life of the country if the rapidly growing number of oldsters are forced to band together as a "special interest" group. Couldn't age *vs.* youth, "retired" people *vs.* workers, become as real a conflict as capital *vs.* labor? [7]

We concede the possibility. We refuse to concede the necessity, or even the probability, of such a conflict. But, in spite of our optimism, we know that careful planning and intelligent action by all concerned are essential to ensure against such an eventuality.

[7] "Has Old Age a Place in a Young Man's World?" *Platform*, September 1941, p. 7.

POPULATION FACTS AND IMPLICATIONS

2. We need to help every community accept the population-trend facts and see their implications in terms of rethinking community life. By community we mean not only private citizens, community councils, social service agencies, and recreation departments. The community involves all these. But it also involves industry, business, educational institutions, churches, government, planning boards, and every agency or institution concerned with total community prosperity and general welfare.

Many older people have been able to do their own thinking and planning in terms of their community contributions. A retired lawyer gives his time and attention to persons needing legal aid but unable to pay for it. A retired doctor, disturbed by the needs of the medically indigent in his rural community, decides to open his office and let it be known that money is not a primary consideration with him; he needs to serve. A group of retired Quakers have made themselves part of a rural community in Florida where they are fostering a remarkable, if not unique, program of sharecropper education. Their aim is to help raise the total social and economic level of that area. Each member of this group is past retirement age, has financial security, and can devote his years of wisdom to a socially useful community program.

Among the professional group with assured income countless examples could be cited of conscious planning for social usefulness during the years of leisure. And some individuals can be found in nonprofessional groups who have worked out a way of sharing com-

munity responsibility. There is the elderly housewife in a small suburban community, self-sufficient in her own small home, who has become a self-appointed information center. Anyone who needs a maid or a baby sitter or information about where and how to register to vote in this district calls her. She is in no sense a gossip, but she makes it her business to *know*. Everyone else in the community is so busy, she explains, that the least she can do is to try to use her time to save theirs. She also volunteers her services for various fund-raising drives. Her families must be within walking distance, for she has no car. But she is a fine walker!

There is the elderly man in another small community who is concerned about the small proportion of persons eligible to vote who ever go to the polls. Many give as their excuse that they do not know enough about the issues and do not have time to find out. What better use, he asks, could he make of his new-found leisure than to become well informed on the way government works and to study the issues and the qualifications of candidates for public office? This would make him a more intelligent voter, and he might be able to share what he learned with those who "don't have time."

There is a retired farmer in a small western town made up primarily of retired farmers. He has prepared for retirement and is enjoying it. But he is made miserable by seeing the unhappiness of his neighbors who have achieved their life's goal—retirement—but who have retired *from*, with nothing to retire *to*. What can be done for them? he asks. Or are they now hopeless, and would it be better to concentrate on helping the young folks get ready for retirement? He is now working at both—"and have never had so little time for my hobbies in my life!"

Cases of this kind prove that talents of the elder citizens can be used in important community service. The fact that it is a small minority who can work out their own salvation indicates the need for accepting the facts of the increasing aging group and rethinking community life with their contributions in mind.

CONTINUOUS EDUCATION—CRADLE TO GRAVE

3. We need—and perhaps this is what we need most of all—a plan for continuous education from the cradle to the grave. In a rapidly changing world with a rapidly aging population, elementary, secondary, and higher education are not enough. The fine courses on and for aging that are being given at such institutions as the University of Michigan and the University of Chicago are not enough. They are exceedingly important for those who have grown into mature years without the kind of preparation that continuous education could provide. But only a few can avail themselves of the opportunity offered by such courses. Those who have the initiative and the funds to go to a distant university to learn how to make the most of the mature years are undoubtedly those who have already done some thinking and planning. Again our concern is with the increasing number who need the help of total community planning for all age groups and by all age groups. Each community must assume responsibility for the program of continuous education if it is to be available to everyone.

Another advantage of the community education program is that it could help the individual to relate himself continuously to the community to which he may devote much of the leisure of his later years. It would, of course, provide help in self-understanding in each age group, but would also provide help in relation to other age groups and to the community as a whole. Again we underline the importance of wholeness. Every community has babies, children, adolescents, young adults, adults in their middle years, and elder citizens. But these groups are not mutually exclusive, nor are there clear-cut lines of demarcation.

A program of "education for aging" tends to set this group apart as a problem group. A problem group, like a problem child, is all too likely to capitalize on the fact of being a problem. And the community is the loser. On the other hand, lifelong learning can help to keep limber the mind that tends to become inflexible with age. And the community is the gainer.

Moreover, the aging are in no more need of help in self-understanding and in understanding relationships than are adolescents; or young adults who are eagerly assuming adult privileges but rebelling against adult responsibilities; or the no-longer-young but not-yet-old who feel that because they are no longer young life is sterile. There seems to be no doubt that there is real need for continuous education if we are going to live with the kind of people and in the kind of communities that are really good to live with and in.

The adult education program has given some attention to problems of aging. George Lawton's course on "Aging Successfully" has been outstanding and, without doubt, has been most helpful to those it has reached. But adult education has always been spotty. There has been little unified planning for a program that would serve the whole man in his total environment. Lyman Bryson explains this by saying that in America adult education has always been meeting the urgent need rather than finding and meeting the important need. By "urgent" he means immigrant education, emergency-education programs of depression years, education for civilian defense and other wartime needs. What might be considered the important function of adult education? May it not be that in helping citizens to find ways of sharing community responsibilities at all ages on local, state, national, and world levels the urgent and the important have become one? Might it not be in this way that we could move most effectively toward "organizing the world for peace and collaboration," which Dr. Bryson considers the important role of adult education? [8]

[8] Lyman Bryson, *Handbook of Adult Education in the United States*, edited by Mary L. Ely (New York: Institute of Adult Education, Teachers College, Columbia University, 1948), p. 3.

Jean and Jess Ogden, Charlottesville, Virginia, are codirectors of the University of Virginia's Community Services. They are a husband-and-wife team, and their community development programs have grown out of an experimental and exploratory project set up in 1941 to find ways of helping communities help themselves. They are responsible for 125 studies of communities in the Southeast, published as the New Dominion Series. Previous to 1941 they made similar studies for the American Association of Adult Education. Mr. Ogden served as educational director at Hull House, and Mrs. Ogden as director of the Bryn Mawr Summer School for Women Workers in Industry. Both have written numerous pamphlets and magazine articles, and together they have written four books, the last two of which are Small Communities in Action (1946) and These Things We Tried (1947).

Family Living in the Later Decades

By Ernest W. Burgess

ONLY recently has attention centered on the family life of the aging. Other aspects of changes with aging have been studied: physiological, psychological, economic, and social. But research on the status and problem of family living has been conspicuous by its absence.

Three recent events have called attention to the needs for research and to the importance of family living to persons in the later decades. In outlining the fields of study in his research planning report for the Social Science Research Council, Otto Pollak devoted a chapter to "The Family."[1] The First National Conference on Family Life held in Washington in 1948 called attention to family living in old age as the last stage of the family cycle. Finally, the First National Conference on Aging, held in Washington in 1950, included the subject of family living, living arrangements, and housing as one of its ten major divisions.

As yet, however, no systematic study of the social psychological aspects of family living in the later decades has been attempted. Within the last year two doctoral dissertations have made significant contributions to an understanding of the family relations of older persons, although not focused on this topic. They are *Isolation and Conduct in Later Life: A Study of Four Hundred Sixty-four Chicagoans of Ages Sixty to Ninety-five* by William H. Harlan[2] and *The Social Roles of Old People* by Ruth Albrecht.[3]

The findings of these two studies especially will be relied upon in discussing the majority of the following topics: basic facts relevant to family living, the last stage of the family cycle, the married couple in old age, living with in-laws, the widowed, and further research.

Facts About Family Living

There are a number of facts significant for understanding the family living of the aging that must be presented first. These are selected from three different sources.[4]

1. The proportion of older people is increasing. There are twice as many people in the United States today as in 1900, but nearly four times the number of persons 65 years and over.

2. The rural population is declining. Fifty years ago 60 per cent of the population was rural; at present only 41 per cent is. Of the rural population, those living on farms declined from 30 per cent in 1920 to an estimated 19 per cent in 1949.

3. The marital status of the population aged 65 and over is as follows: 66 per cent of the men are married, as compared with 37 per cent of the women; 54 per cent of the women are widowed, as compared with only 24 per cent of the men; the proportion that have remained single is the same for both sexes—8 per cent; 2 men and 1 woman per 100 of each sex are divorced.

4. The great majority of persons 65 years and over are living in families: 82 per cent of the men and 76 per cent of the women. Thirteen per cent of the males and 22 per cent of the females are living alone or with nonrelatives. Only 6 per cent of the men and 3 per cent of the women are living in institutions.

5. Low income is common among the aged. Nearly all persons receiving wages or salaries experience a sharp drop in their income at 60 or 65, which at present are the favored years for retirement. About one-fourth are receiving public assistance. The income distribution of older persons and the sources of income are given in detail in the article by Wilbur Cohen in this volume. The big drop in income of persons after age 65 is shown by the fact that their median income was only about $1,000 in 1948, compared with around $3,000 for men in the age group 35 to 44 and approximately $2,400 for men of 55 to 64.

6. There is a decline of older men and an increase of older women in the labor force. The proportion of men 65 years of age and over who continue to work dropped from 68 per cent in 1890 to an estimated 45 per cent in 1950 while employment among older women increased from 5.7 per cent to 8.7 per cent. The changes and present situation are discussed in the article by Gertrude Bancroft in this volume.

7. There has been little increase in the life expectation of older persons. In fifty years the average life span has increased from less than 50 to more than 67 years in 1948. At the age of 65, however, the increase of life expectancy is only from 11.9 to 13.4 years. While more people live longer, those who have arrived at age 65 do not live much longer than they did a half-century ago.

8. Older persons average less schooling than those younger. Each age group in our society has had on the average more formal education than the next older group.

9. The amount of close companionship decreases with age. This is caused not only by the death of spouses but by the loss of intimate friends by death, change of residence, or other reasons.

10. Participation by older men and women decreases. This is shown by attendance at meetings, offices held, number of hobbies, and plans for the future.

11. There is an increased feeling of economic security in spite of lowered amount of income. The greatest economic insecurity seems to be in the 60's when the adjustment to loss of employment is necessary. In each succeeding decade the economic condition of the person becomes further stabilized.

12. Physical handicaps increase with age. Illness and nervousness are more frequent, and the feeling of satisfaction and health decreases.

13. Older citizens increase their religious activities and dependence upon religion. Frequency of church attendance drops in the 80's and 90's. Incapacity to go to church, however, is more than compensated for by listening to church services over the radio and by Bible reading.

14. Feelings of happiness, usefulness, zest tend to decrease with age, and lack of interest in life grows correspondingly.

15. Psychological tests show a lower median attitude score, indicating poorer adjustment. Attitude scores are repre-

sentative of the way older people react to their experiences in the major areas of their life such as work, family, friends, recreation, leisure, and religion. They include also the subject's statements of attitudes on health, economic security, zest for life, and happiness.

THE FAMILY CYCLE

The above statement of facts relevant to the family living of older adults presents a static picture. In actuality a longitudinal point of view is necessary for perspective and for the understanding of the problems of the aging.

Paul C. Glick, in an article on the family cycle, has indicated seven stages in the married life of individuals. The first four stages occur in youth and middle adulthood, the last three in the decades of the 50's, 60's, and 70's as determined by the median age of husband and wife. These stages are shown in Table 1.

The family cycle demonstrates that middle-aged and elderly people pass through different experiences. Therefore they may be listed variously at different times as (1) parents living with single children, (2) parents living with married children, (3) parents living alone, (4) widow or widower living away from children, and (5) remarried aging persons.

One phase of the family cycle is change of residence. While there is no universal pattern, two variations may be hypothetically presented to indicate the series of residences in the life experience of older persons.

One urban pattern for middle-class persons presents the following residential cycle: (1) birth and rearing on the farm, in town, or in a small city; (2) attendance away from home at college or university, often in dormitories or rooming houses of a town or small city; (3) marriage before or shortly after graduation and living in furnished rooms or small apartment; (4) birth of first or second children and removal to a small single dwelling in the suburbs; (5) with growing family, purchase on time of larger residence in the suburbs; (6) after departure of children from the home and on retirement of husband, return of couple to city and rent of a small apartment; (7) after death of spouse removal of surviving member to hotel, furnished room, or kitchenette apartment.

Variations of the last two stages are

moving to California or Florida to a small home and later to a small apartment or rooming house. Two other variations are having married children move in with parents, or taking up residence in the home of a married son or daughter.

Other patterns of residential change will occur to the reader. For example, when farmers retire they typically move into a smaller home in the nearby small town. Patterns of the residential cycle vary considerably with social class, ethnic group, and marital status of the older persons. Studies of certain trends in the mobility of older persons in a town of 6,000 persons are now being completed by Marian McLaughlin.

THE MARRIED COUPLE IN OLD AGE

Of the population aged 65 and over, 35 per cent of the men and 18 per cent of the women constitute married couples living in their own homes apart from their children and other relatives. The great majority of these are first marriages, but they also include some remarriages of widowed or divorced persons.

Couples in this over-65 group comprise a high proportion who have been married for a long time and have been happily married. Most of them have celebrated silver weddings; some have had their golden wedding anniversaries. Husbands and wives have shared joys and sorrows. They have weathered crises. Their lives have become more or less closely intertwined. Now they are often living, perhaps more than ever before, in the lives and activities of their children.

The following personal document gives a picture of a successful married couple in Prairie City.

Mr. Royce is 68 and his wife is 62, but both look younger. Their four children, now married, live within a radius of 200 miles from the parental home. They are financially independent of their parents, have their own friends, and handle their own problems, but seem to enjoy visiting their parents and try to space their visits so one or two families visit every weekend. . . .

While the children were growing up the Royce family lived in a large eight-room house. . . . They attended school with other children of this upper-lower class neighborhood and had room to play and entertain their friends at home. When they finished school the boys went to work or joined the armed forces. There is no evidence that the break from home was overly difficult for either parent or the children.

Mr. and Mrs. Royce sold the large house when the children left home and moved into the five-room cottage next door. It is more modern and comfortable, but Mrs. Royce says, "Sometimes we wish we still lived in the big house so all of the children and their families could visit us at the same time. The old house seemed so empty with all the children gone. Now they are all married and there are two in each family, and in one the family is four, so we don't have room for all of them at one time. . . ."

The Royces look forward to the children's visits. . . . Mrs. Royce keeps the guest bedroom ready at all times and has the baby beds set up for the grandchildren. They are proud of these grandchildren, have their pictures framed and prominently displayed.[5]

Unhappy marriages in old age have not often been depicted in sociological studies. Waller, however, gives an account of an incompatible couple. He traces the process of alienation to its culmination in old age.

Conflict was constant and unremitting from morning until night, from one week's end to the next; no intervals of peace relieved the tension [except] when one of the children was seriously ill. . . .

The initiative of these quarrels was almost wholly with the wife. . . . The refusal of sex relations was one of her most potent weapons, and she inflicted a terrible price

[5] See note 3 *supra*, pp. 84–85.

upon her husband for any yielding. She nagged constantly, complaining about every possible point. At about the twelfth year of marriage, she developed a new technique, that of constant whining, and for a time her husband objected strenously to this, but soon it, too, was a part of the folkways of the marriage. She was an adept at dry, sarcastic humor; her genial wit and humor made her highly popular outside her family, but when her jokes were directed at her husband they always had a sharp edge.

. . . Throughout the long middle period of their marriage this pair continued to live together in the manner described. . . . They made no effort to get along; . . . The adjustment of the pair was conflict; conflict in its most inclusive and destructive forms. Every quarrel left each member of the pair partly satisfied, but with new injuries to redress and therefore ready to take up arms again. The pattern of association was not one of distance, but one of extraordinary neurotic closeness. Both suffered from these quarrels, but they also took pleasure in them. In between times they prepared their statements, and when they managed to get off a telling shot, the triumphant expression on their faces and the gloating tone of voice demonstrated their glee over their success. . . .

When this marriage reached the period of devolution, it slowly but steadily improved, although within very definite limits. . . . The two never departed from their quarreling pattern. The wife never ceased to fuss and whine and complain; the husband never ceased to be emotionally bound up in his conflict relation with her.[6]

RELATIVES

In Prairie City ties of kinship appear to be less strong than in rural communities. Albrecht reports that only thirty-seven of the group of one hundred persons who answered the questionnaire claim one or more of the following: frequent social contact with relatives, close family feeling, assistance during illness. Of the remainder, fifty have little or some contact, ten have little or no interest or contact, and three have no living relatives. The actual nature of association with relatives is shown by the following excerpts from two contrasting statements by people in their later years:

We have all our relatives in this town or near enough to visit. We have our car and go to visit them often. They come to see us all of the time and there were six different visitors here yesterday. I came back . . . here because my brother is here and when my husband died I came back to the town where I grew up. I have lovely nieces and nephews, their pictures are on the table, and I hear from them often and get a chance to visit them once in a whole. Our brothers and sisters are scattered all around here and we see them often. I like to make pies and make a lot of them for cousins. I have a brother in Denver and see him ever so often. . . . We always kept up with our families and like to visit them. Since we have no children of our own, we like to be with nieces and nephews. On vacation we visit around with relatives.[7]

. . . My brother is here but his wife is sick and we don't see each other often. . . . I try to get to my sister's home about once in three months and then I see other relatives but usually I am too busy for any visiting.[8]

IN-LAWS

Among many primitive, ancient, and present-day Oriental societies, the newlyweds take up their residence in the home of the parents of either the bride or the bridegroom. When this occurs, the young husband generally works for his father or father-in-law, and the young wife carries on household duties under the direction of her mother or mother-in-law. The authority and power are clearly in the hands of the aging parents. Old age is honored and respected not only in the community but also in the extended kinship groups by the children and the grandchildren.

Under these conditions, conflicts and antagonisms no doubt exist, as indicated by life histories and personal documents. In general, however, manifestations of these attitudes are repressed and controlled. Traditions, ceremony, and ritual regulate relationships, and the younger generation fits into the expected roles. Even with retirement from active physical labor of the aging parents, provison is made for their maintenance, and their position is secure.

In our own society, the norm is for the newly married couple to establish a home of their own. Nevertheless, through economic necessity, shortage of housing, or sense of responsibility, many older persons are living with their children, married or single. Statistics indicate that 32 per cent of all older men and 17 per cent of all older women are living with both their spouses and other relatives. These other relatives are not broken down in census reports, but undoubtedly include a considerable percentage of married couples. Among older persons who are not married (largely widowed, but also including the single and the divorced), 14 per cent of the men and 41 per cent of the women are living with relatives, the majority of whom undoubtedly are their own married and unmarried children.

The discussion of the relation of in-laws to their children will be taken up under three headings: (1) aging parents living with children; (2) aging parents residing apart from their children but maintaining satisfying relations with them; (3) aging parents living apart from children but in conflict with them.

Case studies of young married couples made by Burgess and Wallin[9] indicate conditions which make for satisfying or frustrating relations between aging parents and their married or unmarried children. These data are the basis of the discussion which follows.

Living with children

This situation may be a matter of choice or of necessity. Where both parents and children elect to live together, the arrangement may work out more or less satisfactorily. Where the wife is working, the mother-in-law often takes on the major charge of the household responsibilities. She may be very happy to function as a baby sitter when the young couple take a night off. Although there may be some disagreements these tend to be minor, and both generations report the relationship as satisfying.

Often, however, especially where the arrangement is one of necessity, difficulties arise. During the present housing shortage, many young couples have had to move in with either the husband's or the wife's parents. In these situations the wife generally gets on better with her mother than with her mother-in-law. Often the relationship may be satisfying to the aging parents, although a difficult one for the children. Sometimes the situation would be satisfactory except for the attitude of the young husband or wife.

Living apart from children but having satisfying relations

At the present time, the most satisfactory situation from the standpoint both of aging parents and of the married children is where the two generations have separate residences but maintain satisfying relations.

[8] See note 3 *supra*, p. 132.

[9] Ernest W. Burgess and Paul Wallin, *Engagement and Marriage*, Philadelphia: J. B. Lippincott Co., in press for 1952 publication.

Mr. and Mrs. Brown have been a happy couple, independent of their children but with a close social relationship.

Mrs. Brown: I have four children, 19 grandchildren and 13 great-grandchildren. I see them often. They come in here a lot and sometimes bring the little ones for the day.

Mr. Brown: The grandchildren and their families come here and visit once or twice a week. It depends on whether I am working. We go with our children on long trips for vacations and one of our children always comes in and takes us to church.[10]

The following case study illustrates a new type of attitude on the part of aging parents:

What do I think of children continuing to live with their parents after they are married? It is a fine idea and I am for it for everybody except myself. I have a twelve room house with two screened porches on a forty acre farm and I am always glad when my married son and his wife and children and my married daughter and her husband and children come for a visit. My wife and I are delighted to see them and the grandchildren, but after they have stayed two or three days, what a relief for both of us when they and the children all depart![11]

In her study, *The Social Roles in Old Age,* Ruth Albrecht concludes:

These old people are representative of other parents in roles they take and in their attitudes toward their children. Some parents like to be independent and want their children to allow them to remain so. Others appreciate the attention and care their children and other descendants offer unless they try to take too much responsibility away from them. Parents who have a good relationship to their children do not dwell on their own early lives but are happy in the present time.

Parents who are mutually independent of their children show the following characteristics:

1. They can accept or give favors or suggestions without feeling threatened. A basic security in loving and feeling loved removes the threat that could be present for either parent or adult-child.

2. They enjoy working or playing with the second generation.

3. They are proud of their children, like them and have not grown too far apart in interests and mode of life.

4. They accept in-laws as members of the family. Since they have interests outside of the family they are not threatened by the spouse of any second generation member.[12]

Living apart from children but in conflict

Not infrequently aging parents and their children are in conflict with each other. Typically, the antagonism tends to be between the mother-in-law and the daughter-in-law or son-in-law. The aging father or father-in-law seems to get on better with his son-in-law and daughter-in-law than does his spouse. Often there are differences in culture, particularly in religion, that make for chronic conflict. Where the aged parent or parents are dependent and do not live with the couple, the burden of financial support, although assumed by the son, may cause financial stress and even emotional difficulties on one or both sides.

More research is needed on the types of relation between aging parents and their children and the conditions under which they are emotionally satisfying or disturbing. Particularly significant is the hypothesis that the mutually satisfying relations are much more likely to be maintained where living with or away from parents is a matter of choice and not of necessity both for the elderly and for the younger couple.

THE WIDOWED

Widows and widowers constitute a high proportion of persons 65 and over (54 per cent and 24 per cent respectively). They are persons who have experienced family life and are now deprived of it.

The higher proportion of widows as compared to widowers can be explained in three ways. First, the expectation of life is higher for women than for men. Second, brides on the average are younger than bridegrooms. Third, widowers who remarry select women on the average much younger than themselves.

The death of a husband or wife is a crisis forcing the person to make decisions important for family living. This crisis experience and its aftermath will be considered in two aspects: (1) bereavement, and (2) reasons for not remarrying. Interviews secured by William H. Harlan in his unpublished study *Isolation and Conduct in Later Life* provide the data for the following discussion.

The death of a spouse after a marriage of forty or more years does not terminate the association. The departed one, especially at first, may be recalled with a vividness that simulates actual presence. An eighty-year-old widower reports this experience, as well as the shock of his wife's sudden passing.

My wife died . . . sudden; got to feeling bad one night, so I called the doctor and he sent her to the hospital. The next night she died. I was lost for a time afterward; felt like it was the end of the world. For a while I went on thinking she was still there. I could imagine what she would be doing at a certain time, or what she would have said to something. Well, that went on for quite a while, but in the last few years I haven't thought about it so much. I guess in a few years more I won't remember it at all.[13]

Another widower married for twenty-five years when his wife died attempts to preserve his house as he thinks his wife would wish.

I've tried to keep everything just as it was when she was alive. I've kept it just as I thought she would like it. I've always taken a great deal of pleasure in caring for the lawn and garden. Some men take up golf; my house has always been my recreation.[14]

Reactions of widows to the deaths of their husbands are similar to those quoted from widowers. There is the disposition to reconstruct in memory and imagination the illusion of the departed.

Harlan summarizes the reasons widowers give for not remarrying, as

a feeling that life purposes had been achieved in first marriage; feeling that remarriage would signify disloyalty to memory of wife or to her family group (and perhaps to children); and, an idealization of the first marriage. . . . Others quite obviously were not touched upon, such as necessity to support an invalid relative, devotion to career, unattractiveness, chronic illness and so forth.[15]

Many of these reasons apply equally well to widows who do not remarry.

PROBLEMS A CHALLENGE FOR FURTHER RESEARCH

The materials presented indicate that aging in the later decades presents its particular problems of family living. Instead of their children being dependent economically and emotionally upon them, parents in old age often find they are dependent upon children for financial and emotional support. There arise new problems of relationships with their married children complicated by the attitudes and behavior of sons-in-law and daughters-in-law. These difficulties may be chronically disturbing if they are sharing the same living quarters, especially when this housing arrangement is a matter of necessity rather than of choice.

[11] See note 3 *supra,* p. 86.

[12] See note 3 *supra,* pp. 91–92.

[13] See note 2 *supra,* p. 217.

[14] *Ibid.,* p. 220.

[15] *Ibid.,* p. 186.

There are those deprived of family living—the widowed, the single, the separated, and the divorced. The problem of loneliness seems particularly prevalent and poignant among them, although some have made more or less satisfactory adjustments.

The many different patterns of family living among older persons and the various types of problems they encounter constitute a challenge for further research.

A quite complete outline for further research in the family relations of older persons is presented in Chapter 6 of Pollak's *Social Adjustment in Old Age*.[16] Therefore only a few significant projects will be mentioned here.

1. Studies are desirable of the various patterns of family living of the aging by urban or rural residence, by region, by ethnic and occupational group, and by social class.

2. Particularly interesting studies could be made of patterns of family living according to the nature and degree of dominance exerted by the aging father over his wife and over his children, whether or not they are residing with him.

3. A significant study could compare the factors making for and against satisfying relations of the aging parent or parents with the children and grandchildren. Among those to be considered are temperamental and emotional compatibility or incompatibility, attitude toward marriage of children, acceptance or rejection of reciprocal roles, common or diverse interests, and adaptability or unadaptability.

4. A public opinion poll might provide interesting data on the approved patterns of family living for aging persons classified by the age of respondent, by region, by ethnic and occupational group, and by social class.

5. A valuable study could be made of couples who have celebrated golden wedding anniversaries to discover the factors associated with the happy and with the unhappy unions.

6. The quasi family of older nonrelated persons is important for study, particularly from the standpoint of conditions and arrangements making for its successful or unsuccessful operation.

7. A study is feasible of the factors determining whether a widowed person does or does not remarry or does or does not wish to remarry.

8. Demonstration or experimental projects on preparation of the aging for retirement should include a section on planning for family living.

Ernest W. Burgess, Ph.D., Chicago, Illinois, is professor of sociology at the University of Chicago. He is active in many sociological organizations and projects and has been president of the National Conference on Family Relations, of the American Sociological Society, and of the Sociological Research Association, and chairman of the Social Science Research Council. He was editor of Marriage and Family Living and of the American Journal of Sociology. He is co-editor and co-author of numerous works in his field, of which the latest are Predicting Success or Failure in Marriage (1939), The Family (1945), and Successful Marriage (1947).

Education's Role in Maintaining the Individual's Status

By WILMA T. DONAHUE

AGING is a process of change, and can be fully understood only when it is viewed in the perspective of a continuous life flow from conception to death. The differentiation and maturation of cellular material and its involution and senescence constitute the continuously changing biological substructure of the aging organism. Each change in function is conditioned by concomitant or preceding biological circumstances and by environmental stress to which the aging individual is exposed. The concept of the individual as a functional but changing whole moving through a dynamic life space has been accepted in the study and treatment of children; it has not yet been fully comprehended as including the total life span.

The period of later maturity has been traditionally regarded as static, as a time when the individual's development has been halted and his potentialities dissipated by the blight of age, during which he can only await his ultimate dismissal from life. Fortunately, there is a growing awareness that age in itself need not impale the individual and transform his life from a state of useful participation to one of doddering retirement. Resources for personal development are lodged within the individual throughout all his years. Educators have assumed responsibility for stimulating, developing, and preparing youth for the roles of early adulthood; their responsibility for rendering a corresponding service to the older adult for his role in later life appears obvious.

FUNCTIONS OF EDUCATION FOR THE OLDER ADULT

The major function of education for older adults is to help them to continue the exploration of their potentialities, and to assist them in preserving their integration in society. To achieve such a broad objective, education must design a fourfold program. First, it must aid in the adjustment of the individual to the personal and social changes accompanying aging by providing information necessary to achieve lifelong adjustment. Second, it must promote the adjustment of society to its aging population by helping to create appropriate attitudes and by encouraging the development of opportunities for the continued use of the talents and skills of older citizens. Third, it must train personnel to serve older people by establishing courses of study, programs of field practice, and in-service training in gerontology. Finally, it must promote research for the development of a body of knowledge about aging and its implications for individual and social practice.

Although there is admittedly much to be learned, gerontologists already have sufficient information, if they were to apply it, to improve markedly the economic status, the health, and the emotional welfare of aging adults, and to assist communities in developing patterns providing for role maintenance with age. This information must be made available to the aging and their society through broad educational chan-

nels. The programs currently in progress and others which are under consideration represent important advances in this new phase of adult education. Before reporting upon these, however, it is in order to discuss some of the considerations common to all approaches of education for the older adult.

PROBLEMS AND NEEDS

Modern education for youth has attempted to identify the critical life issues and basic needs with which the developing individual must be equipped to deal. Through the regular curriculum, it has then set about to provide training and skill for making the necessary adjustments. This approach has not been extended to form the basis of adult education. As Thomas Van Sant has pointed out, "education for adults has been and to a large extent still exists as a second chance for them to pick up things they missed for good, bad or indifferent reasons when they were children, teen-agers or young adults."[1] More realistic and pertinent programs of education for all adults will result when their social, personal, and economic needs are analyzed, with these analyses used as a basis for designing programs which will help them in finding solutions and making adjustments throughout life.

Reaching the older adult

A primary problem encountered in implementing the ideal of lifelong learning is that of reaching the older adult. Those individuals who are now old have been exposed only casually to adult education. They suffer from fears generated from knowledge that they have experienced both physical and mental change, and that they do not measure up to the academic requirements set for their children and grandchildren. They are unaccustomed to entering into group learning experiences. They are aware that public attitudes condone, if not encourage, their acceptance of passive patterns of behavior or the pursuit of happiness through purely recreational activities. As a result of these factors, they have not demanded educational opportunity, and, in far too many instances, have ceased from intellectual exploration upon graduation from the "little red schoolhouse" or its more modern counterpart.

If the few statistics available concerning the age distribution of students enrolled in regular adult education classes are typical, it is clear that present programs are not attracting many older adults. Willis Reals reports that only 4 per cent of students enrolled in the evening classes at Washington University are over 50 years of age.[2] In one city school, the mean age of students in the adult education program is 26 years, with only 5 per cent over 50 years of age. In classes specifically designed for but not restricted to older adults average ages are of course higher: 53 years at the University of Illinois,[3] and 62 years at the University of Michigan.[4]

In recognition that, at least for the present, only a limited number of older persons are becoming involved in activities offered directly by the school, the New York State Education Department now provides aid to local school systems for the implementation of programs being offered by other agencies. Under this arrangement, the educator is enabled to serve groups which are well established (such as golden-age clubs), to co-operate with industries in developing educational programs for retirement, and to assist churches, clubs, private and public community agencies, libraries, and homes for the aged in providing educational services to old people.

Learning and the older adult

Basic to a program of education for the older adult is the assumption that people can continue to learn throughout life. It has been estimated that 70 per cent of our older people are still mentally alert and active. There is good reason to believe that the way to maintain this mental alertness of the aging is through continued intellectual activity, such as educational experiences provide. That educators have been laggard in offering programs for older adults may reflect a lack of awareness of the effectiveness of learning as an antidote to psychological aging. When both educators and the aging are convinced that the adjustment of older people can be greatly improved through educational channels, it is probable that many new developments will take place.

Content

No clear-cut roles have crystallized for the adult beyond retirement age. This fact creates a problem in designing educational programs for older adults, since the starting point for planning should be the actual needs of the people served. Adult educators are loath to undertake the development of programs, preferring to wait until the ultimate role of the older individual in society and his associated problems are more clearly defined.

Although research data relative to the most appropriate content of educational programs for older adults are not yet available, we do not have the pooled judgments of the eighty members of the Education Section of the First National Conference on Aging as to the most important areas to be included. Areas recommended included education for physical and mental health, family and group membership, economic security, vocational skills, leisure-time pursuits, social and civic responsibility, and religious experience.[5] At the Governor's Conference on the Problems of the Aging held in Sacramento, California, in October 1951, a study group recommended that education center its function around economic problems, physical and mental health, and leisure-time interests.[6] In Homer Kempfer's study of the needs of older people, guidance services are also included in the recommended content of educational programs.[7]

It is appropriate with reference to content of educational offerings to point out the need for modification of existing curricula at the various school levels in order to provide an interpretation to all ages of the potentialities and roles of older people in contemporary life.

Techniques and materials

It is perhaps fortunate that uniformity does not exist in the techniques being employed in the various educational programs throughout the country,

[5] National Conference on Aging, Washington, D. C., 1950, *Man and His Years* (Raleigh, N. C.: Health Publications Institute, 1951), pp. 135–36.

[7] Homer Kempfer, *Education for a Long and Useful Life*, Office of Education Bulletin No. 6, 1950 (Washington, D. C.: Federal Security Agency), pp. 14–29.

because we are yet at an experimental stage of development. Research has not been done on such questions as whether older people learn better in mixed age groups or in peer groups, whether smaller assignments are indicated, whether more time should be allowed for discussion, and whether the lecture technique is better suited to classes of older students than, for example, are group project techniques. Other questions which need to be probed include: What and how much visual aids material will be of value in the instruction of people whose visual and auditory acuity is diminishing? Do special materials need to be prepared? What type of leader is best suited for instructing older people, that is, how important are age and prestige factors in speakers?

Some progress in the development of materials has been made. There are at least three documentary films—*Steps of Age*,[8] *Life with Grandpa*,[9] and *Date of Birth*[10]—which are valuable for discussion purposes. Lectures on problems of aging have been recorded by national experts and are available with instructional aids for use by educational groups, clubs, industry, and others.[11] A manual for a course on retirement has been prepared by the Bureau of Adult Education of the New York State Education Department.[12]

In addition to the usual classroom techniques of lecture and discussion, radio and television have been employed to educate older people and other age groups about the potentialities of the aging.[13]

Financing education for older people

After retirement, a large proportion of people must live on drastically reduced budgets. The fear of outliving their financial reserves leads to programs of severe economy, and hence to an avoidance of such expenditures as tuition for educational courses and materials.

It has been suggested that schools should offer free services to the aged, who have contributed to the building and maintenance of schools in their communities for many years. It has also been pointed out that school buildings and facilities normally receive far less than maximum use and can therefore be made available for use by adult groups at little added cost.

Certain types of programs can be operated with state or federal aid. Vocational education, for example, could be offered as part of the federally subsidized vocational educational program in agriculture, homemaking, trade and industrial education, and business occupations. The example of New York State has already been cited, in which funds are being made available for educational programs carried out by communities and industries, and for such services as counseling and retraining of older persons. Many other states have financial aid programs which provide reimbursement for each individual enrolled in an educational course. Unfortunately, under these programs educators have sometimes preferred to emphasize numbers enrolled, failing to consider the needs of minority groups such as represented by the aging.

Who shall do the educating?

The problem of leadership in the education of the aging is complicated by the fact already observed that older adults are not usually found in large numbers in educational programs. They do constitute significant groups, however, in industry, community organizations, and churches. A national survey of educational programs has not been conducted, but casual observation would lead to the conclusion that more programs are offered under community and employment auspices than under the supervision of educational institutions. In a few instances educators have been invited to provide leadership for programs conducted under noneducational sponsorship.

Industry is not agreed as to the educator's responsibility in conducting programs for the older worker. According to one viewpoint, industry should assume entire responsibility for the education and pre-retirement conditioning of the older worker up to the point of retirement, after which the responsibility is transferred to the community. Other representatives of industry contend that educators should provide education for the aging worker either under the auspices of industry or by direct course offerings in the community. It is unlikely that educational programs which do not permit integration of industrial and community planning for the older worker will be maximally effective.

CURRENT EDUCATIONAL PROGRAMS

Some of the representative programs offered by educational agencies, by community groups, and by industrial and business organizations will be reviewed in order to assess the present status of education for the aging and to determine the respects in which its fourfold functions are being served.

UNIVERSITIES AND COLLEGES

Adjustment programs

In 1949 the New York State Joint Legislative Committee on Problems of the Aging conducted a survey of 468 American colleges, from which it was concluded that "our colleges are slowly but surely beginning to set up a wide variety of courses, institutes and research studies aimed at the ultimate goal of making man's later years his golden years."[14]

Among those colleges offering courses directed toward the adjustment of the individual to the problems of aging are Syracuse University, the University of Illinois, the University of Chicago, and the University of Michigan. The most direct approach to individual diagnosis and counseling is to be found in an experimental course offered currently at the University of Chicago under the direction of the Committee on Human Development. The course is entitled "Making the Most of Maturity," and is designed to assist men and women between the ages of 55 and 64 in developing specific plans for their later years. In the weekly class meetings, extending over a period of approximately thirty weeks, information is being provided on gerontological problems on the basis of the needs of students, with emphasis and direction in the course content being determined by the class. Students are being aided in the formulation of individual plans for the retirement years by expert counseling in such areas as financial planning, vocational

[14] October 28, 1949 release from the office of State Senator Thomas C. Desmond, Chairman, New York State Joint Legislative Committee on Problems of the Aging, Newburgh, New York.

guidance, health, and personal and family problems. A medical examination including a diagnostic psychiatric interview is an integral part of the course.[15]

The programs in "Living in the Later Years" offered for older people through the Extension Service of the University of Michigan are based on the assumption that the individual older person who is equipped with essential information about aging and experienced in the skills necessary for adjustment to the problems of aging will be able to solve his own problems and adjust to age changes.[16] The casework approach of individualized counseling for everyone is not feasible in terms of time and personnel; nor should it be necessary. Most people at younger ages maintain their emotional equilibrium through the satisfactory execution of purposeful life tasks for which they have been trained. We consider this to be mature living. There is no reason to assume that old people have any less capacity for mature behavior.

The Michigan courses have taken difference forms, but all have been based on the achievement of adjustment by a group procedure. One course is currently underway in which the first part of a three-hour weekly period is used for instruction in the discussion of common gerontological problems and then followed by laboratory practice in social living.[17] In another course, students defined some of the major problems with which they were concerned and set up projects for exploring them. The class divided into three groups; the projects selected by the groups and carried out during the semester were concerned with a study of the satisfactions and dissatisfactions of older people with the church, an analysis of work and training opportunities for older women in the local community, and planning a community center for older people. The students designed interview schedules, collected and analyzed data, and prepared final reports. In addition to gaining information, they learned about the community and the techniques to be used in approaching the problems of changing conditions for older people.[18]

In 1950, Dr. Henry Curtis, himself a man past eighty, proposed that colleges and universities establish a one-year college to help older people learn how to adjust to the problems of old age.[19] His proposal is based on the assumption that old age is a specific life period, and that people need training for living during this period just as for the earlier phases of life. The college which he proposes would have separate buildings, a campus, and its own staff. Its courses and training programs would be individualized and would be based on the results of a physical examination, appraisal of capacities, and financial resources for future living. Students would be taught the best daily habits regarding nutrition, exercise, play, and rest. They would also be stimulated and trained in the development of new interests, new fields of endeavor, new skills and creative activities.

The recently announced Sunk Mine Project, sponsored by the Walt Foundation, embodies much the same principle as Dr. Curtis' proposition.[20] A college for over-sixty Vassar graduates and their husbands has been established at the Sunk Mine Farm, located twenty-five miles from Vassar College. The farm was provided by Mary Babbott Ladd, and the project will be directed by Mary Fisher Langmuir of the Vassar faculty. The educational plan is designed to meet the needs of older persons who are still physically fit, still adventurous in their attitude toward life, but in a quandary as to how to spend their presently enforced leisure. The opening month will be devoted to orientation courses in problems of readjustment, in world and national affairs, and in the arts and sciences, following which students may choose special interests for further study.

Establishing attitudes

Two methods have been employed by colleges and universities to bring the problems of an aging population before the public and to help change attitudes toward the aging. One method has been the sponsorship of radio and television programs which has already been mentioned. These programs have presented the older person with dignity and with emphasis on his positive qualities, in contrast to the semicaricature of old age characteristic of such commercial programs as "Life Begins at Eighty."

A second procedure used by colleges and universities in the education of the general public as well as professional groups has been the holding of conferences and institutes. Conferences have been held at the University of California,[21] the University of Florida,[22] and the University of Chicago to explore research needs. General explorations of the problems of an aging population have been conducted in conferences at Marshall College,[23] Ohio State University, Northwestern University, New York University, and the University of Michigan.[24] Special topics have been considered by some conferences: geriatric nursing at the University of Minnesota; employment and social casework for the aged at the University of Wisconsin; and rehabilitation of the older worker at the University of Michigan.

Training personnel

In 1947 the results of a survey by the Division of Maturity and Old Age of the American Psychological Association showed that university and college instruction relating to problems of the older adult lagged behind the concern and needs of labor unions, social welfare groups, and the aging themselves. From the responses of seventy-one medical schools only five were found to offer specific courses in geriatrics, and only two of sixty-two departments or colleges of education reported courses on the psychology of maturity.[25]

The situation has not improved significantly in the last five years. Everett Soop examined the 1949–50 catalogue

of sixty schools of social work and found that only five listed special courses focused on the aging.[26] In 1949 the New York State Joint Legislative Committee on Problems of the Aging found that out of 486 colleges and universities only 13 had special courses on some phase of aging.[27] The same survey showed that some emphasis was placed on the aged in other courses in 463 schools, most frequently in departments of sociology or social work (234) and in economics (104). Since 1949, a few more schools have instituted training courses. For example, New York University conducted a two-week workshop on gerontology as part of its adult education curriculum in the summer of 1951.[28]

Research

Every medical school in the United States is carrying out research on the diseases of old age. Other research areas, however, are receiving much less attention. The extent to which researches in the physical and medical sciences have outdistanced investigations in the psycho-social and economic spheres is indicated by the fact that more than three-fourths of the entries in Nathan Shock's *Classified Bibliography on Gerontology and Geriatrics* fall under the categories of "Biology of Aging," "Organ Systems," and "Geriatrics." The Committee on Human Development of the University of Chicago has taken leadership in the investigation of psycho-social problems of aging. The University of California, Cornell University, and Columbia University are concerned with investigations on the employability of older people. As Shock points out, however, aging is not the major concern of any university research organizations, and most data have been accumulated by isolated investigators.[29]

CITY SCHOOLS AND COLLEGES

The public school system is the center of adult education in most communities. State aid programs make it possible for schools to receive remuneration for adult students in many states. Although there is no upper age limitation in such financial aid programs, few schools have emphasized education for the older adult.

Statistical data regarding the number and kinds of programs offered by the city schools are lacking. Homer Kempfer conducted a survey of schools in 1947 to determine the number offering courses for people past retirement age.[30] He found that only seven schools were offering such courses; four offered training in handicrafts, one offered a course on nutrition, another a course on current events, and one school offered a course on family life.

The situation today is somewhat better than when the Kempfer survey was made. In Michigan alone, at least fifteen city school systems have provided general courses on the problems of aging. San Diego, California has a similar course. The Los Angeles city schools report the most ambitious program, with 1,600 individuals enrolled in sixteen different evening schools. These courses continue from October to June and are made up of a series of lectures devoted to each of the following

topics: health, personal affairs, nutrition, psychology of aging, philosophy, and crafts.[31]

Henrietta Rabe of the New York State Bureau of Adult Education reports that in the past two years there has been a significant increase in the number of local adult education programs provided for older adults in New York. These have developed among special interest groups in clubs and in homes for the aged, and some of the activities are concerned with preparation for retirement, vocational counseling and retraining, and community education.[32] In order to stimulate and encourage public schools to expand their programs for older adults, Mrs. Rabe has prepared a guide for a series of meetings designed to help the individual plan his retirement and find some secondary purpose in life.[33]

Direct attempts to change community attitudes have not been made in most of the school programs. Some programs, however, have featured community hobby shows and choruses which at least draw favorable attention to old people.

There appears to be little effort to design school programs so that they will yield research data, which are vitally needed for the guidance of other educators in developing programs.

COMMUNITY EDUCATION PROGRAMS

With the advent of compulsory retirement, communities have become aware of the problems of the increasing numbers of idle citizens. Concern for their welfare and their inadequate preparation for old age has led many communities to undertake educational programs to assist in adjustment to the problems of aging.

The educational programs developed by community agencies have varied from courses of lectures to institutes and conferences. A few examples will illustrate the variety of community agencies sponsoring programs: Young Men's Christian Association in Minneapolis[34] and Hyde Park, Chicago; welfare councils in Dayton,[35] Cleveland, New York City, Chicago, Rochester, Philadelphia, and Denver; libraries in Cleveland and Detroit; churches in Toledo, Cleveland, Grand Rapids, and Pasadena; and special research agencies, such as Community Studies, Inc. in Kansas City, Missouri.

Significant research on the community level has been carried out by Community Studies, Inc., which has surveyed the needs of the aging in Kansas City and has conducted an evaluative study of one of the local homes for the aging. The Community Project for the Aged, a committee of the Welfare Council of Metropolitan Chicago, has made an exhaustive study of the needs of the aged in Chicago. The Family and Children's Service of Minneapolis is making a study of the effects of an activities program in boarding homes for the aged.

PROGRAMS FOR THE OLDER WORKER

Education for older workers may have several goals: (1) training and retraining for new jobs, necessitated by technological changes or by age changes; (2) training for continuation

of employment after retirement from primary occupations; or (3) preparation for retirement from work. Not only the older worker, but unions, employers, and the community also have an interest in providing education which will increase security in old age and maintain the older individual's participation. Industry recognizes that preparation for retirement is important, but it is also becoming concerned with the corollary objective of keeping older men in the labor force, since the proportion of laborers in the normally preferred age groups is now declining. Organized labor is concerned not only with maintaining adequate pensions, but also with the right of the individual to continue in employment as long as he is able to work. Communities have responsibility for utilizing the skills and the wisdom of the older worker.

These various interests should develop integrated programs to serve the needs of the older workers. Arthur Carstens points out that this will involve "training and retraining facilities, an adequate placement service, educational opportunities and all kinds of professional service," and he comments that "while active experimentation has begun, *no* comprehensive program for the older worker is underway anywhere in the United States." [86] Perhaps it will be possible to correlate the isolated programs being carried out by industry, unions, and the community so that the older worker will not continue to experience such a marked contrast between his pre-retirement life and that which follows.

Most industrial programs at the present time are concerned solely with preparation of workers for retirement, and these programs are of several types. Some consist of a series of lectures presented either by professional educators, as in the General Motors of Canada experiment,[87] or by personnel officers, as in the Standard Oil of New Jersey program. The programs of the Prudential Insurance Company of America and the Ford Motor Company are examples of those which provide personal counseling services. In other programs, printed literature on problems of the aging is issued, for example, the series "My Time—Is My Time" published by General Motors.

Research on employment and retirement practices is underway. Probably the most comprehensive is that being directed by Elizabeth Breckinridge of the University of Chicago's Committee on Human Development. It is from such studies as these that hope for integrated programs to serve the aging is to be found. As research reports are published, educators should study them with a view to determining what contributions can be made by educational programs toward maintaining the older individual as a participating and useful member of society.

CONCLUSION

It appears obvious that adult education has given but scant attention to the needs of older adults. Growing awareness of the problems and of the opportunity to assist in maintaining older people in functional roles is apparent, but little more than sporadic and isolated action will be taken by educators until more systematic information and more trained leadership are available.

In appreciation of this need, the Adult Education Association of the United States has adopted a recommendation that a study group be established to survey the educational needs of older adults, to provide direction and content for programs, and to develop plans for the integration of educational programs with total community planning for the older adult. A second recommendation adopted by the association was that a workshop for the training of leaders in the education of older people be conducted for the purpose of assessing needs, developing programs, and evaluating outcomes over a period of years.

The tempo of developments in the field of aging, however, precludes postponement of action until the results of such undertakings are available. Education for and about the aging must be developed at every level. Local communities can provide services to the individual older person; state organizations can assist in the formulation of policy and the promotion of co-operation between agencies; and national groups can provide for broad-scale research and for an over-all integration of activities for the aging. By these means, education can make its contribution to the maintenance of the older person as a useful member of society.

Donahue, Ph.D., Ann Arbor, Michigan, is research psychologist and chairman of the Division of Gerontology, Institute for Human Adjustment, and lecturer in psychology at the University of Michigan. She has served as director of the Bureau of Psychological Services, mental hygienist in the Student Health Service, and psychological counselor in the Veterans Service Bureau at the University of Michigan. She was chairman of the section on education of the National Conference on Aging, and is a member of the Michigan Governor's Commission for Study of the Problems of Aging and the Committee on Education for an Aging Population of the National Education Association.

Housing Our Older Citizens

By Hertha Kraus

MODEST but regular cash incomes, as provided by social insurance benefits, by industrial and government pensions, by annuities, and also by old-age assistance have given to many of our older citizens a new freedom. Some are thus given freedom to determine whether they want to live in their own households as owners or tenants, whether they prefer to be partly or wholly relieved from housekeeping responsibilities by moving into a hotel, a rooming house or a boarding house, whether they wish to live under the care and management of a public or private charitable institution, or whether they would feel happier and more useful moving in with married children or other close relatives, sharing their homes and some of their responsibilities. Such choice represents great improvement indeed as against earlier periods, not so long ago, when mostly for economic reasons the older generation was forced to yield its independence in exchange for family support, or for the far less acceptable support of almshouses and other congregate institutions.

In reality today the choice may be quite restricted, however: by anxiety in anticipating need for personal care in illness and emergencies; by the shying away from responsibilities for household management, cooking, cleaning, marketing; or by failing strength. There are the inconveniences and hazards of dwellings not planned for the older years. In many cases, income is so limited as to prohibit an easy change to a more suitable dwelling. And there is definitely a shortage of desirable dwelling units of low and medium cost, and of desirable living arrangements in pleasant and welcoming institutions.

Income Restrictions on Housing

There is a general belief that most older people wish to live in their own homes. Data from the 1950 Census show that, whether by choice or circumstance,

> over 80 per cent of the urban and rural nonfarm families of people 65 years of age and over maintain independent households. Generally speaking, their housing circumstances are worse than those of the rest of the population. The aged tend to occupy relatively more very low rent dwelling units and low value structures, and their housing is relatively more dilapidated and deficient in plumbing facilities.[1]

Limited purchasing power is, of course, a primary factor influencing choice of living arrangements of older people. Families at the upper age levels are disproportionately numerous among all low income families. The best data available on money income of the older population are summarized in the article by Dr. Cohen, "Income Maintenance for the Aged," in this volume.

Obviously there is little or no problem in this respect for people of substantial means who can select hotel or apartment living or independent homes at prevailing rates, and who have the funds from which they can supplement their housing by invited, usually paid, companions, and by professional and personal services as their conditions may require them.

There is also, perhaps, little of a housing problem for those who continue in employment, earning incomes high enough to maintain acceptable living standards in a familiar setting among old associates with some money to pay for lightening domestic responsibilities and to meet the exigencies of ill health. Continuing employment and earning may delay their housing problem—not necessarily solve it for a later period. And, finally, there is a group of unknown size—parents and grandparents—needed and personally wanted by a younger generation of their family, and willing and able to adjust to the younger generation's life pattern and friends in exchange for the satisfaction of continued usefulness and an affectionate climate.

Factors in Unsatisfactory Housing

In the records of community agencies, in national and local studies,[2] and in the experience of many professional workers and volunteers there is ample evidence that housing and living arrangements for many of our older people are often most unsatisfactory. Ministers and physicians, caseworkers, visiting nurses, and visiting housekeepers know of the problems. Councils of social agencies and information centers receive innumerable requests from older persons to find new living quarters for them. Boarding and nursing homes serving the aged often have long waiting lists, particularly those which offer desirable arrangements in familiar neighborhoods. Hospitals, general and mental, know of many patients who might be released if they could only have a home suitable for some continued care.

Severe family tensions, most painful conflicts and injuries to old and young, are reported by psychiatrists and caseworkers when families are trying to combine arrangements satisfying for two or three generations in the same home. People living alone or with elderly spouses may fight a constant depressing struggle with environmental hazards: difficult stairs, poor lighting or heat, inconvenient kitchens and bathrooms which grossly overtax the capacity to deal with daily needs. Malnutrition and neglect of personal care and cleanliness may result for some, while others are filled with increasing anxiety and guilt. But even a convenient home may be lonely because of its inaccessibility for relatives and frends.

Besides, housing costs may be too great, quite out of proportion to total incomes. Pricing rentals for an elderly couple in eight large cities, Social Security Administration Studies found in 1946–48 that they must spend from 37 to 51 per cent of their total budget on rent, heating and light.[3] Among nonfarm householders 65 and older, 1946 figures of the Bureau of the Census show that more than two-thirds—2.5 million of the 3.5 million households in this group—owned their own property.[4] We may also wonder how

[1] L. S. Silk, "The Housing Characteristics of the Aged in the United States, 1950," paper presented at the Second International Gerontological Congress, St. Louis, Sept. 13, 1951, p. 4.

[2] Editor's Note: Dr. Kraus supplied a large number of references to United States and foreign literature on housing for older people. Unfortunately, there was not space to print them. The Revised Division of the Housing and Home Finance Agency, Washington 25, D. C., has incorporated Dr. Kraus's references in a bibliography which is available on request. See also Hertha Kraus, "Older Persons Have Special Housing Needs," *Journal of Housing*, Jan., 1950.

[3] See Social Security Administration, "A Budget for an Elderly Couple," *Social Security Bulletin*, Feb. 1948.

[4] See Subcommittee on Low Income Families, Joint Committee on the Economic Report, *Low-Income Families and Economic Stability* (Washington: U. S. Government Printing Office), pp. 27–28, 83.

many of the 2.5 million homeowners are actually able to maintain their property in adequate condition, and how many contribute to deterioration and blight of entire neighborhoods.

The overwhelming evidence of need and social damage can be offset only to a very small degree by the positive response of those older people who in recent years have been helped to strengthen their living arrangements and are now occasionally reached by newer community services extending into their homes. Friendly visiting and counseling, housekeeping and nursing aid, recreation, library, and hospital extension services have brought a new outlook and a new lease on life to a fortunate few.

COMMUNITY RESPONSE

There has also been a new sympathetic response to the gradual discovery of the housing needs of our senior citizens. We begin to recognize that the rapid increase of the aging population, the longer life span of many individuals, the longer span of married life—in combination with other well-known factors such as urbanization, industrialization, physical mobility, and class mobility—have created conditions which can no longer be met by traditional measures and practices. We have also become a little more sensitive to the meaning of emotional needs which will hardly be satisfied by extending minimum economic support.

Current attention and efforts, responding to increasing demand, have approached the housing problem from various angles, including: (1) nationwide attempts at modernization and expansion of various institutional facilities; (2) extension of diversified services into the homes of aged persons or at least into their immediate neighborhoods in an attempt to strengthen and prolong independent living arrangements, similar to the services described by Miss Dorothea Ramsey in the article, "Community Services for Self-Maintenance in the United Kingdom," in this volume; and (3) fact-finding and exploratory studies, workshops, conferences, and programmatic statements on better housing.

The Working Committee on Aging in its progress report[5] to the Federal Security Administrator set forth six principles with regard to housing, confirmed by the 1950 National Conference on the Aging: (1) development of substitutes for family life and encouragement of opportunities which will allow older people to form new families; (2) consideration of certain amendments of the National Housing Act which would permit federally aided public housing projects to include units for the elderly who are living alone; (3) exploration of the merit of government loans to municipalities, co-operatives, and other nonprofit groups to build low-cost or low-rent housing for older people; (4) expansion of nonresident community services, with special emphasis on housekeeping and nursing; (5) allocation of some space for specially designed and equipped units in all public housing projects and in those supported by private investments; and (6) mobilization of extensive research for the study of existent facilities and trends, and appraisal of current efforts.

It must be noted with distress that, within the entire range of activities and plans, least attention is being given to improving and increasing the actual supply of low- and medium-cost dwelling units for those who wish to live outside of institutions and also independent of their own families if such exist.

[5] Federal Security Agency, *Programs for an Aging Population*, March 1950, pp. 23–25.

Waiting for a solution are those in inadequate dwellings, those spending far too much of their meager income on maintaining their independence, those forced into rooming houses and rented rooms who crave the dignity of their own homes, and those forced into dependency on a younger family without being compatible or welcome.

There are practically no new developments in this area. We scan the literature and meet the same old friends: a few cottage colonies for the elderly developed by public enterprise as in Millville, New Jersey or by fraternal efforts in a few spots in California and Florida; fewer than three hundred apartments designed for the aged in public projects in New York City, Chicago, Denver, and Bridgeport, Connecticut; and even a smaller number of apartments for the aged under the auspices of voluntary agencies in New York City.

More must and can be done. We may need a clearer focus. Experience, observation, assorted studies—all available information indicates: (1) a clear preference of an overwhelming majority of aging people for noninstitutional living; (2) great benefit for the individual of continuing as long as possible in familiar surroundings in personal homes; (3) the need to protect many specialized and expensive institutions against the growing demand for long-time care by patients who might be cared for differently at less expense to the community and to themselves, and with far greater comfort; and (4) the high capital and operating costs of institutional care of every type—general hospitals, mental hospitals, hospitals for the chronically ill, nursing homes, and boarding homes of adequate standards—which can rarely be met without substantial subsidies.

ALTERNATIVE HOUSING PATTERNS

What then shall we do? Shall we try to build up a stronger feeling of family responsibility so that the homes of the younger generation will increasingly provide a solution?

Is return to the three-generation family the natural, the decent, the most economical way? Many factors point in the opposite direction. The answer is likely to be "no." The arguments of great mobility, urban living, smaller size of families and of family homes, all in line with long-time trends, have been stated frequently.

If, then, a return to family care and three-generation living arrangements seems rather unlikely for considerable numbers of the aged, now and in the near future, what can be done realistically to provide large numbers with more adequate homes? Will the present community services, expanding, provide the answer?

All true friends of individualized service must recognize the inherent limitations of community services outside institutions, must wish to protect them against the dangerous and crushing pressures of mass demand. Their continuing extension into numerous homes will depend on a number of rather uncertain factors: leadership; sustained community interest, understanding, and support; availability of qualified personnel in specialized fields, capable of functioning both independently and as part of interprofessional teams.

Even if there should not be any lack in most of these areas, the problem of priority and of balance in the utilization of a limited service potential must arise. Who shall have first claim on highly skilled and costly services if not all can be helped: the younger or the older generation? the well, those only

slightly handicapped, or those severely disabled? those who can be helped to reach a high level of social and economic productivity, or those where such expectation would be entirely unrealistic?

Is a further expansion of general and specialized institutions for the care of the aging urgently needed? Frankly, we do not know. The obvious current demand may be partly, if not largely, a result of inadequate domestic living arrangements. The pressure on institutional services, including mental and other hospitals, may represent a last choice, an escape out of intolerable conditions—not necessarily a desirable, suitable, and advantageous solution in meeting real needs.

Caution seems indicated before we decide to make substantial permanent capital investments in order to create institutional service units which cannot easily be converted if housing conditions or policy should change. The surplus of children's institutions, of antiquated almshouses, or correctional institutions for youth should serve to underline this consideration. It may be one of the most important characteristics of the expanding noninstitutional home-service program that, without capital investment, they can be stretched to meet urgent needs temporarily, taking some of the pressures off the institutions until we are more ready to focus attention, energies, and co-ordinated action on the greatest gap in our resources for the aging—special housing with built-in facilities.

We are dealing with a mass problem, rather similar to the problem of income protection as we discovered it in its true proportion only during the depression of the thirties. Then we learned, at the cost of great and prolonged suffering of millions of people, that mass problems cannot be solved by improvization, by voluntary action alone, by personal resourcefulness, or even by a maximum of professional individualized service, and certainly not by charity.

FOREIGN DEVELOPMENTS

At this point a brief look at foreign developments in our field may be in order. Limited space will allow only a sketchy analysis of available data, and an attempt at their interpretation in reference to the American scene.

Old-age housing is receiving marked public attention in a good many countries. Outstanding illustrations of carefully planned projects have become known especially in England, Sweden, Denmark, the Netherlands, Germany, and Switzerland; also in the Union of South Africa, New Zealand, and Australia. On this continent, Canada and Mexico have produced interesting developments in recent years.

Most of these countries have a tradition of nation-wide public housing programs for the planned improvement of neighborhoods and family dwellings covering all population groups, not only those in the minimum income brackets. Most of them have also established public old-age insurance and pension schemes which for many years have provided large groups of aged with modest but regular cash incomes, outside public assistance.

In their current planning for the aged, all recognize typical repetitive conditions which can be anticipated. Needs differ only slightly, in degree, among several groups: the ablebodied older folks, those frail and in need of some help, those more seriously disabled, and those disabled requiring hospital care and service. Foreign countries now tend to integrate facilities for these groups, so that any transition as needed may be easy and will not represent a complete break with familiar surroundings. They also tend to relate institutional units more closely with the community at large, making small institutions part of integrated neighborhood schemes, to become available in every planned neighborhood. Such an approach has meant the development of projects where institutions have taken on many features of living arrangements once typical of private dwellings only, and specially designed private dwellings have been increasingly enriched by built-in services once typical of institutional care.

Isledon House in London (England), the Protestant Evening Sun Home at Velp (Holland), the sixty Catholic institutions following the design of Raalte (Holland), the standard model for town planning as approved by the Dutch Ministry of Reconstruction and Housing with its senior apartment-cottages-hospital unit, may illustrate this point. So may the Riehler Heimstaetten in Cologne (Germany), the Sabbertsbergs Alderdomishem in Stockholm (Sweden), and the Eventide Home at Rockhamton (Australia).

These and many other projects are imaginative attempts, many frankly experimental, to deal effectively with a world-wide problem. Solutions have been encouraged by close co-operation of public bodies with mutual aid, co-operative associations and other voluntary agencies. A policy of mutual trust and partnership, applied also to many other fields of social welfare, has provided public funds for a substantial part of the capital outlay without stifling private initiative and freedom of management by nongovernmental groups.

Design and management

Foreign design for community housing of elderly people is quite varied. There are nursing homes everywhere (also modified as rest and "halfway" houses); there are boarding homes and hostels; there are residence clubs with light housekeeping facilities; and there are many low-rent cottage colonies, including one-family and duplex buildings. There are also many small and large apartment houses, practically always with special provisions for housekeeping and nursing aid and for group recreation. Many have nursing units for those who are incapacitated, or simply sick bays—a somewhat controversial feature. While all newer units have been designed with very special attention to health and accident hazards, and to the convenience of elderly people, there is a clear influence of national preferences and living patterns on each nationl program and its unit design.

Responsibility for management of the housing units varies. Often the municipal government has charge through its public welfare department. Public housing agencies, also administering other housing projects, may carry full responsibility, unless co-operative associations, voluntary nonprofit housing societies, or church-related or other humanitarian agencies assume the role of landlord. In the same country several different forms are practiced side by side.

Financing

There is, however, a practically uniform source of finance for the entire investment capital, or at least a very substantial part of it. Public funds are used everywhere. They are at the core of all newer projects. They may stem from different budgets: from funds allocated to housing in general, from social insurance reserve or operating funds, or from the budgets of local public welfare and health agencies in line with their traditional policy of developing adequate social facilities. In addition to public funds, capital investments by co-operative associations have played

some role; also generous contributions from foundations and private trust funds, mostly interested in social experimentation. Churches of all denominations have channeled substantial funds into housing developments for the aged, supplementing public grants for the same purpose.

In the main, projects try to cover most of the operating expenses from earnings: income from rentals, boarding fees, or service charges. Rentals follow a sliding scale related to current tenant incomes. There is also, frequently, regular project income from subsidies, from social insurance funds, or from government housing funds. Some voluntary contributions and a great deal of voluntary personal service enrich the programs of both public and voluntary enterprises.

An additional word about subsidies may be in order. Their pattern in each country follows closely the general pattern of government subsidies for all kinds of social welfare purposes. Subsidies may be attached to specific housing units or, as more recently in Sweden and some other countries, to individuals and families wherever they find adequate housing, as long as they are eligible for such subsidy within a given legal category.

It should, however, be clearly understood that these subsidies are not part of a public relief scheme, and are never administered as such. Under European conditions, subsidies not only reflect a different, completely accepted policy, hardly controversial: they may serve as a device in equalization in order to meet, at least in part, the differential between the cost of prewar and postwar housing, thus spreading the advantages of modern housing to all income groups. They may also serve the purpose of supplementing rather inadequate social insurance benefits which reflect heavy losses of capital by inflation and other retarding factors. Low-cost housing and subsidized rents may offer an inflation-proof supplement to many beneficiaries, while cash benefits follow but slowly the ever rising cost of living.

Scope of programs

The scope and speedy expansion of many programs for special senior housing is truly impressive against the background of impoverished economies struggling with a multitude of pressures and social responsibilities. England and the Netherlands both aim at producing not less than 5 per cent of special housing, counting all dwelling units, old and recent. This means at least 10 per cent of all new buildings —a figure not yet completely reached but a clear objective. In 1947 there were already 13,000 housing units for old-age pensioners in little Denmark; the current goal is 20 per cent special units for the population 65 and over.

Observation, study, and reports of foreign developments reflect clearly: (1) a rapidly broadening concept of public social policy; (2) wide interest in active support for good housing and neighborhood planning as an important community resource; (3) a leading role of local government in planning, initiation, and operation of community services for the aged, often assisted by strong citizen participation; and (4) a sincere recognition of the peculiar needs and urgent claims of an aging population.

They also reflect the strong impact of war and destruction on many countries: a heightened sensitivity to human misery, a readiness to yield a high priority to the needs of a sinking generation involved in the shocks and losses of at least two wars. Shortages of supplies and scanty capital have not interfered substantially with imaginative design, nor with carrying plans into action.

CHALLENGE TO AMERICA

On the American scene with its mass problem of more than 12 million aged right now—a rapidly increasing group according to all population forecasts—we note the hopeful beginnings in federal legislation and public opinion of a new national housing policy, but a tragically small public housing program. It currently provides 50,000 units a year narrowly confined to the minimum income groups, and among them to families coming from substandard housing, with some exceptions for veterans. Shall we simply expect the aging in the American community to take their chances in housing along with other millions of limited means? Shall we refer our friends and ourselves for our sunset years to the famous "filtering down" process in housing, which perhaps may yield some cheap housing which no one else wants?

What counsel do we have for the 4 million people over 65 with incomes between $500 and $2,000 a year (1948), or the 5.5 million with less than $500 (among them some spouses of the first group)? We are not even sure whether the three-quarter million people who boasted incomes between $2,000 and $3,000 a year in 1948 will find adequate dwellings.

The validity of special housing schemes for the aging, particularly of low-rent projects, is questioned by some well-meaning people, while it is strongly endorsed by most experts. The latter are not afraid of segregation in any well-planned scheme. Nor are they convinced that most elderly people would prefer to live in the midst of crowds of children, teen-agers, young couples, and their visiting friends. Older people will always be quite free to do so if they wish.

Adequate housing for the aged must develop at the crossroads of two important programs: better housing in better neighborhoods within the reach of all income groups and more adequate services to meet the peculiar needs of a large and growing senior consumer group commonly characterized by waning ability and a proneness to multiple handicaps. Because of these characteristics, service resources for them must be widely available, highly decentralized, truly accessible. Those commonly in greatest demand and of greatest importance should be built into their homes and immediate neighborhoods—resources for preventive care, support, and active aid.

PLANNED ENVIRONMENT, A BASIC RESOURCE

We all know the importance of a positive, helpful environment. Why not deliberately create such environments and put them to work? An environment may be planned in such a way that it will release the powers of self-help and mutual aid; it may stimulate satisfying activities and give them scope. It may form a strong supporting base for those specialized services and facilities which may be needed at times, and which the community at large must continue to provide in increasingly adequate manner—leisure-time facilities, casework, nursing and medical services; hospitals, nursing and convalescent homes, and clinics of all kinds.

In American communities, as abroad, oldsters should have a choice among a variety of living arrangements, priced within reach of medium and low income groups but meeting high standards: nursing and boarding homes, residence clubs (all managed by nonprofit organizations); senior apartment hotels; colonies of single and two-family dwelling units arranged in clusters, in addi-

tion to traditional dwelling units in one-family or multiple dwellings. Standard hotels and apartment houses might devote some sections or entire floors to a senior unit with special facilities. Some homeowners favoring stability and preferring to continue in their own homes with a reduced income, or just looking for a sound investment, might plan for their own retirement a small but independent senior annex—creating the American version of the British "Plus Granny" flat.

In line with foreign experience and with a natural approach, it would seem that many neighborhoods in both urban and rural communities should have several or all of these facilities under good management, as closely co-operating units and part of a balanced neighborhood scheme.

COMPANION APARTMENTS

Realism suggests an additional design which at first glance may find little approval. But are we not dealing with a group whose economic status is rather low and who cannot expect to improve it substantially in any foreseeable future, a large number of whom tend to be lonely, would enjoy more visiting, and would profit from help in keeping house?

Under American cultural conditions, companion group apartments may be a practical answer, promising economy in investment and operation. They are designed for economy and comfort for otherwise lonesome people, for people who during their working years have been quite used to eating out and rather enjoy eating in company, for people whose idea of fun is doing something with others, for people who like to be good neighbors and have naturally and simply helped when there was trouble or some special strain, for people who enjoy friendly relations without expecting to become close friends. Such folk seem to be abundant in the American community. Many have great ease in working together without direction for some immediate tangible purpose.

Aging people of such background and long-established habits of co-operation may be suited by a dwelling which allows for both privacy and group experience in the same unit.

The standard basic unit, similar to a large apartment, would provide family-style facilities for a pseudo family of approximately seven residents, among whom one, the senior resident, would have specific responsibilities. Seven pleasant single rooms, some connecting, all with running water, would be planned around a large, comfortable living-dining-kitchen, preferably with a common porch or balcony. There would also be a small office in each unit for the senior resident's outside contacts and for sickroom supplies. There would be two toilets, one spacious, well-equipped bathroom, convenient for people who might need assistance for physical care. The family kitchen would be planned to allow for individual preparation of meals if so desired or for doing things together. Each would have his own food locker and space for supplies. All essential kitchen utensils, pots and pans, china and silver, would be part of the initial equipment of the "family" unit. A reasonable number of such basic units would be clustered in one apartment house or in a block of such buildings, with a minimum of common facilities, preferably a spacious multiple-purpose workshop, a hobby room, and some club rooms.

There might or might not be a small professional staff; the regular community agencies would extend their professional services into the buildings.

The management would provide, as standard housekeeping service, the regular cleaning of bathrooms and toilets, and the periodic cleaning of individual rooms. Laundry service for all household linen, if not for personal items, should also be part of the service covered by rentals.

The extent of additional services within each unit would depend on the grouping of residents in each and on their particular needs or desires. As needed, the senior resident in a number of units (or one member of a resident couple) might actually be a practical or graduate nurse, an attendant capable of meeting the problems of mental disorders, a housekeeper-cook, a skilled semiprofessional homemaker and case aide. Some units might also decide, as a family group, to hire a part-time cook to prepare the main meal. They might share a practical nurse with a neighboring unit in the same building. Some might be fully capable of managing all their own affairs as a co-operative group, perhaps taking turns in handling the role of the senior resident and his public relations.

Expected advantages

This plan claims a number of distinct advantages, of which only a few may be listed here. It allows for utmost flexibility in grouping of residents and in their service, adaptable to changing needs, advancing years, and decreasing capacities. It offers the physical framework within which mutual and neighborly aid may be readily available and may be stimulated into new and satisfying experiences. It forms a solid base for many organized community services and would thus strengthen home care, even in critical days.

It is likely to meet such personal needs as the desire for sheltered independence, for belonging, for recognition, for sociability and friendly relations. It makes self-help convenient by providing fully adequate physical facilities (bathrooms, kitchens) and by decreasing the chores of individual housekeeping. It lends the support of neighborly help and, incidentally, provides a new outlet for resourcefulness, initiative, and skills, as applied to daily and familiar problems.

It improves the standards of sanitation and cleanliness, and probably also of nutrition. It has a potential for all kinds of leisure-time activities at home without the need to face traffic and unpleasant weather conditions. It may attract many more "friendly visitors" from the community willing to share time and skill with groups of older folks who have become easily accessible.

It offers physical care and companionship in familiar surroundings during periods of disability and reduces the anxiety about such days. In other words, it substantially strengthens the potential of home care, even for the chronically ill.

Last, but not least, it may provide an increasingly eager group with work opportunities, creating suitable part-time and full-time positions. In addition, neighborhood demand may discover many capable baby sitters, seamstresses, part-time household aides, secretaries, bookkeepers, and handymen ready and waiting for calls. The common workshop would also allow the placement of some industrial homework under favorable conditions.

This unit plan of a companion group apartment with semi-independent housekeeping is also applicable to cottages and small buildings designed along similar lines, and to the remodeling of large, outdated family homes if they have at least seven bedrooms on the first and second floors.

Personnel and management

The management of these group apartments would best be in charge of various co-operative and voluntary agencies, including "senior housing" associations. In the long run, nonprofit associations of women managers, somewhat similar to the Octavia Hill Associations of England, might handle most effectively the innumerable daily details of such projects. Personnel would need some training and provisions for staff development. Early model units should be equipped as training centers for additional staff groups needed elsewhere. Each unit might well offer new and satisfying work opportunities for a middle-aged group and for the "young" old folks whose employment on a mature level we desire so urgently.

FINANCING SENIOR HOUSING IN U. S.

What about the financial aspects of such and similar ventures? Should they become a part of the public housing program? In line with present American traditions and laws, probably they should not. They should not be tied up with the replacement of substandard housing, with slum clearance, with severely restricting requirements for tenant selection. They should not be in competition with all too limited housing funds for the urgent improvement of living conditions of families with growing children. They should not be tainted by the unfortunate stigma of public care for the lowest income group. And perhaps they should not aim at a form of financing which is characterized by annual public subsidies.

Units may and should, however, profit from redevelopment plans and their financial advantages in cutting the cost of land. A good many of them belong in downtown districts, close to the busy life and to the old, familiar places. Incidentally, broad developments in senior housing should release many low- and medium-cost family homes for younger families, according to foreign experience—an advantageous exchange for both parties and for the community at large. They might also release some definitely substandard housing ready for demolition or at least for major repairs, again to community advantage.

Apart from public housing and redevelopment funds, there are obviously various sources for investment capital for senior projects: insurance companies, national and local foundations, churches, and special state and municipal funds which may become available. Co-operative associations of church members, union members, fraternal, professional, and interprofessional groups may be able to raise substantial funds. There are also, as a new and rapidly growing capital source, important labor welfare funds resulting from collective bargaining programs and their "fringe benefits."

The most important potential source for developing adequate senior housing as the very core and center of old-age security all over the land must be seen, however, in a substantial common property of the working people of this nation—the Old Age and Survivors Insurance Trust Fund with assets of $14.5 billion (as of May 1951). According to present responsibilities and estimates, this reserve fund will continue to grow for some time. At its peak in 1990, it is expected to hold $83.5 billion or eight times as much as the highest expected annual disbursement for the following five years—from all angles an exceedingly strong reserve. According to law, it is now invested exclusively in United States Government securities for general government purposes at less than 3 per cent interest.

Let us assume a review of fiscal policy and an amendment to the law which would authorize the Secretary of the Treasury, managing trustee, to invest $500 million a year for, we may say, a period of five years, in nonprofit housing developments (under various auspices) for the exclusive benefit of older people and their dependents. Then those insured, 90 per cent of the population, would become eligible as tenants at a minimum age of 60 to 65 years. Let us further assume that the average per capita cost of senior housing units would be $5,000 exclusive of land, the latter to be contributed locally. Investing roughly one-half of the yearly increase of the OASI reserve fund in various approved types of senior nonprofit housing units as a basic community resource would thus yield 100,000 units a year, or half a million units in five years—a reasonably adequate supply until further experience is gained. A return of 3 per cent interest would keep the reserve fund on at least the same earning level as now. It would provide approved senior housing projects with a source of capital at least 2 per cent cheaper than ordinarily available and thus contribute also to the economy of operating costs. It would provide a stable security factor, limited rent for shelter plus, in the midst of generally rising prices and dwindling values of earnings and benefits.

Must this capital be amortized? Perhaps very slowly, perhaps not at all. It might thus become a permanent social investment of the American people raising the senior citizens' living standards, generation after generation. It might keep annual costs of community services to the aged, public and private, within more reasonable bounds, thanks to built-in social security.

Must we now pay for and pile up a tremendous reserve in order to relieve the economic burden of future generations alone, while those who are elderly now or will be in the near future, and their families, have not yet been relieved from the crushing burden of seriously inadequate housing and its consequences? Why not put our capital to work to meet immediate as well as permanent needs?

VENTURES IN SOCIAL INVESTMENT

A recent survey[6] of organized community planning for old age, covering 155 American communities with populations of 75,000 and more, showed that "the most pressing need pertains to living arrangements and housing." "Extremely few community areas are operating programs and services that are on the frontier of knowledge or are substantially experimental." There is urgency for action, for putting available knowledge and experience to work. Action should mean experimentation on a limited scale, experiments as a responsible first phase of a large-scale program of national scope. We need linked experiments, not on paper but built right into community neighborhoods in selected communities: offering a welcome and active participation, a grant of land in the right setting, an enthusiastic citizens' committee (with a good share of senior citizens) with some modest funds of its own as an equity and token of sincere interest.

From the very start, experimental housing units for the aged, following different designs, should be studied and become part of an integrated research project. Live research in controlled environments should, after a few years of intensive study and participant observation, yield concrete answers for many

[6] P. W. Swartz, "Organized Community Planning for Old Age," *Journal of Gerontology*, Vol. 6, Supplement to No. 3 (Sept. 1951), Abstract, p. 154.

questions of the senior citizen and his family; of the taxpayer, the social economist, and the designer, manager, and administrator of the planned services; and of the various occupational groups and interprofessional teams concerned with the welfare of the aged.

The immediate call is for venture capital and leadership in free nonprofit enterprise for the common good.

Hertha Kraus, Ph.D., Bryn Mawr, Pennsylvania, is associate professor of social economy at Bryn Mawr College and has studied, planned, and administered community services for the aged for many years. She has taught at the University of Washington, Columbia University, Carnegie Institute of Technology, Haverford College, and Swarthmore College. She also served as consultant to the Russell Sage Foundation, the American Friends' Service Committee, and various United States federal and international agencies here and abroad. She is author of International Relief in Action, 1914–1943 (1944) and editor of Case Work in the U. S. A. (1950). She has contributed to various journals in the fields of gerontology, housing, and social work.

Community Services for Self-Maintenance in the United Kingdom

By DOROTHEA RAMSEY

AS a rule an individual, as he grows older, comes to cherish more and more closely the wish to remain independent. Those among us who are ready to sponge on friends and relatives for money, or to become more and more demanding of attention, though conspicuous by reason of our claims, are in the minority.

It is pretty clear that many workers who are now forced to retire by mandatory regulations would be glad to continue in work if suitable employment could be found. This is not only because earnings mean more independence and freedom of action, but almost more because the regular pay check brings with it a feeling of self-respect ultimately based on the fact of making a definite contribution to society.

Unfortunately it is difficult today to find jobs for those over age 40, and insufficient efforts have been made to explore the possibilities of part-time work for the older worker. Thus, one of the most valuable sources of contribution to the wealth of the community is being unused, while the potential happiness of the older individual remains unfulfilled in many cases.

USUAL HOME LIFE PREFERRED

In the United Kingdom there is no doubt that the aging man or woman, whether working or not, wishes to remain independent and live in his own house, apartment, or just one room, however squalid. Therefore we can take this fact as a starting point in a discussion on the social contribution which the older citizen can make. We can normally assume that we shall find willing collaboration in any service which the community may be able to bring, and that the alternative, which is to seek entrance into a communal home, will not be acceptable unless and until an independent life has proved quite impossible.

While on humanitarian grounds we can claim to be fulfilling the wish of the older person when we enable him to continue to live as an ordinary citizen outside an institution of any kind, it is very fortunate that this is the case, for the burden on the nation's finances would soon become quite intolerable if we were to assume that the older person should as a general rule be cared for in a home or hospital.

It has been estimated that it costs from 8 to 15 pounds a week to maintain a patient in a hospital,[1] while the maintenance cost in a home for old people will vary from 3 to 5 guineas a week according to the size and character of the home. It is therefore of the greatest importance that this type of care should be kept for those who need it.

At present in the United Kingdom a great many elderly people are occupying hospital beds because there is no other place for them. Many of these patients could be removed to a communal home if a suitable one could be found, while many doctors feel that relatives would be more willing to take their elderly folks from hospitals if more home care services were available and if an immediate bed could be relied upon in time of real crisis.

[1] *Hansard*, June 7, 1951.

In fact, however, it is extremely difficult for new cases of elderly sick to gain admittance to most hospitals, because of the pressure on beds. This is due partly to a shortage of nurses, but partly also to the fact that the supposedly chronically ill old person is occupying, sometimes for years at a time, a bed which might have been used for a very large number of acute or surgical cases.

REPORT OF BRITISH MEDICAL ASSOCIATION

In July 1946 the British Medical Association established a special committee to consider the care and treatment of the elderly and infirm. The Report (1947) of this committee recommended

> the establishment of a co-ordinated geriatric service for the better investigation and treatment of disease and disability in old people. It was proposed that this service should be based on geriatric departments in selected general hospitals. The main functions of these departments would be to investigate the condition of elderly patients with a view to the arrangement of suitable treatment; to co-operate with the other departments of the hospital in the treatment and rehabilitation of such patients; to assess the condition of such patients on the completion of treatment and arrange their discharge to their own homes, or to residential hostels providing domestic care or, in irremediable cases, to long-stay annexes for prolonged nursing care; to conduct research into disease in old age; and to take part in the teaching of medical students and student nurses.[2]

In addition, the committee stated that its plan would relieve the shortage of hospital beds in two ways:

> First, the expert investigation of all elderly patients in the geriatric department would prevent the occupation of beds by those old people who in present conditions are allowed to become bedfast unnecesarily owing to lack of systematic arrangements for thorough diagnosis, treatment and rehabilitation. Secondly, through the provision of sufficient long-stay annexes for irremediable cases, and residential homes or hostels for elderly people too infirm to conduct homes of their own, but not in need of continuous nursing, it would be possible to make arrangements, under the control of the hospital geriatric departments, for discharge from hospital of the large numbers of infirm old people who at present, to their own disadvantage, remain indefinitely in hospital beds because more suitable and homely quarters for them cannot be found.[3]

HOME CARE FOR THE SICK

That this is an effective way of saving the pressure on hospital beds has been proved by Dr. E. B. Brooke at St. Helier Hospital, Carshalton, Surrey, England. At this hospital the procedure is as follows. The patient's own doctor will ring up the hospital and ask for a bed for his patient. Dr. Brooke or his assistant will then ask permission to visit the old person in his own home "to assess urgency and priority." A report is made, and after consultation with the patient's own doctor, arrangements are made to bring the hospital services to the home whenever possible. Such services may include nursing equipment, investigation by X rays or laboratory, physiotherapy at home, or transportation to the outpatients' department for physiotherapy Only if there is real urgency is the patient admitted to the hospital.

This is in great contrast with the more usual method of simply placing a patient's name on a waiting list, which in nearly every case means very serious delay which is discouraging to both patient and doctor, and may even be fatal in its consequences. Dr. Brooke affirms, too, that often by promising an immediate bed if the illness should become acute, he has encouraged relatives to continue to look after their elderly people at home in the knowledge that when the burden becomes too great it will be taken from them. There is no doubt that this makes for the greater happiness of the sick person, who may often be able to end his days with those he loves around him, instead of in a hospital ward with other sick and dying people.

The pioneer of this form of home care was Dr. E. M. Bluestone, until recently director of the Montefiore Hospital, New York: there are important differences in the method of dealing with the problem, but the principle is the same. Dr. Bluestone deals with his out-patients direct, and patients rely entirely on the Hospital Department of Home Care. In addition to a "medical service around the clock, seven days a week," the Montefiore patient has the help of a social worker visiting him in his own home, and a housekeeping service provided by the hospital for five to ten hours weekly. It is estimated that a patient can be treated in this way for between a quarter and a third of the sum which would be spent in keeping him in the hospital.

In the United Kingdom the Health Visitor and the Home Help perform a similar service, and specialist nursing which the patients receive from the Visiting Nurse Service of New York is paralleled by the District or Home Nurse under the National Health Service.

NURSING HOMES NEEDED

A spectacular reduction in beds for the chronic sick can be made through thorough diagnosis and active treatment for those previously classed as "bedridden," and it is of great relevance here to stress the importance of the provision of more nursing homes to which patients can be discharged when no longer in need of a hospital bed. Today many old people are occupying hospital beds for social, not medical, reasons, simply because they have no relatives who will take them and there are not enough suitable homes to receive them. In fact there is an urgent need for special homes with a high ratio of staff and much ground-floor accommodation. This is a far less expensive type of accommodation than a hospital bed, and its value is exemplified by a case quoted by the British Medical Association Report

> of a fully equipped general hospital, where, over a period of two and a half years, eight old men not in need of active treatment had continuously occupied beds which otherwise could have been used during the same period for 360 acute surgical cases.

Further, the eight old men were removed to accommodation less formal and restrictive than the hospital, to their own greater happiness.

The pressure on hospital beds could be relieved all over the country—perhaps all over the world—by proper classification before admittance, accompanied by the necessary services in the nursing home and by speedier discharge from the hospital either to such a home, temporary or permanent, according to need, or to the patient's own home with the necessary home care services.

Not only, however, is the pressure on expensive institutional facilities minimized, but also that on health manpower. From the point of view of the nation's health, it is most important that the time of doctors and training personnel should be used to the best advantage. If we consider the long years spent and the high cost of train-

[2] British Medical Association, *The Care and Treatment of the Elderly and Infirm*, London, 1949.

[3] *Ibid.*

ing doctors and nurses, it is obviously uneconomic to employ personnel attending the sick if the sickness could have been prevented. Home care services are therefore essential to the nation's economy, and, properly used, are also a valuable source of preventive medicine.

HOME NURSE

One of the most effective services in the home is that of the visiting nurse. There is a long tradition of service in the United Kingdom from the home or district nurse. Until the passing of the National Health Service Act (1948) this was a service of fully trained nurses organized by a voluntary society—the well-known Queen's Institute of District Nursing (founded in 1889). These nurses visit the sick in their own homes, sometimes several times a day, and carry out the directions given by the patient's own doctor. Although this is now part of the National Health Service, the Institute continues to provide nurses for the local health authority.

The District Nurse is a real friend, particularly in rural areas, where she is a cherished member of the village community. To the elderly who are frail and lonely she is a real guide and philosopher and a link with the outside world. Today she is often hard pressed, because of the general scarcity of trained nurses, to fulfill the many calls on her time; and the two great voluntary societies whose charter calls them to care for the sick—the British Red Cross Society and the St. John Ambulance Brigade—have in some areas developed a Nursing Aid Service which works through the official scheme by performing simple nursing tasks in order to relieve the fully trained nurse for more expert work.

HOME HELPS

For thirty years in the United Kingdom there has been a Home Help Service for maternity cases. During World War II acute illness and other emergencies induced the government to authorize the extension of this scheme to other types of cases. During the war also the value of the Home Help Service for aged people was demonstrated by the Old People's Welfare Committee of the Plymouth Council of Social Service. This voluntary body started in 1941 to recruit and employ women to help those whose increasing infirmity made domestic work a problem. The scheme proved two things: (1) what a boon this service could be in preventing deterioration in personal hygiene and in the care of the home, and (2) that this type of service appealed to women, who came to look upon it as a service rather than as a job.

The Plymouth Scheme started with two part-time Home Helps. Now there is an average of 70 Home Helps, looking after 440 old people, averaging 1,850 hours' work each week. It is now operated by the Old People's Welfare Committee for the local health authority.

Increasing powers to extend the scope of the official scheme were gradually given by a number of Circulars from the Ministry of Health (179/44 and 110/46) and have now been brought together under Section 29 of the National Health Service Act (1948), and today old people are able to look for this help along with the rest of the community. It is interesting to note that recent figures given by the National Association of Home Help Organisers show that 75 per cent of the domestic help is in fact going to assist old people to remain in their own homes.

The local authority either operates the service through its own organizer or grants aid to a voluntary society to operate it—for example, Women's Voluntary Services. The organizer recruits the Home Helps, looks up references, and visits the homes requiring help and assesses the amount of help required. She chooses the Home Help to suit the home, and thereafter keeps a check on the service provided. Scales of payment are determined by each local authority, but those who cannot afford the charge are assessed and the whole or part of the cost is borne by the local authority.

The value of this service to an old person cannot be overestimated. To many, the provision of this domestic help means that they can stay in their own home surroundings, with their own personal possessions, and continue to live a normal, independent life, when otherwise they would have to be removed to a communal home.

The gradual increase of infirmity obviously makes the ordinary work of keeping a home clean and up to standard more and more difficult. Too often in the past, and even today, we have found too late the solitary person whose infirmity has prevented the continuance of a high standard of personal cleanliness and home care. The resulting unhappiness and serious consequences to health need no emphasis and the value of the Home Help Service as preventive medicine cannot be overestimated.

The Home Help goes from case to case, like a visiting nurse, but she does domestic work; she cleans rooms, makes beds, carries down ashes and slops, and carries up coal and water. If required, she can do shopping or provide a simple meal. Sometimes only an hour a week is needed for a fairly able-bodied old person; sometimes an hour daily. The organizer will pair off suitable Home Helps and cases—a quiet woman to someone with heart trouble, an understanding one to a difficult or awkward character.

COST OF HOME HELP SERVICE

This service is expanding very rapidly, but in some areas there is a shortage of Home Helps, not always due to the difficulty of recruiting, but also to the fact that in some districts the local authority has had to restrict the service because of the cost.

There are some who feel that the Home Help Service is being used to care for patients who should be cared for in hospitals, and that therefore the Regional Hospital Board should contribute towards the cost of the service. It can also be argued that the Regional Hospital Board should contribute because patients can leave hospitals sooner and so free beds more quickly if the Home Help Service and other home care is readily available, and because if we compare the figure of between £8 and £15 per week per bed in a hospital with the cost of home care, including Home Help and domestic service, estimated at about £3,[4] we find there is a saving of between £5 and £10 for the hospital. It has also been suggested that the National Assistance Board should pay for domestic help to those who are in receipt of assistance grants. Viewed as a whole, however, there is no doubt that it is far more expensive to maintain a patient in a hospital or even in most residential communal homes than to provide care for them in their own homes.

THE HEALTH VISITOR

The Health Visitor is an experienced nurse who has completed an approved course of instruction in medico-social work. She works under the local health

[4] *Hansard*, June 7, 1951.

authority as a nurse with special training in health education, child welfare, and social work. Her knowledge of social contacts affecting the welfare of the family often means that she is the first person to become aware of the needs of old people, and she is in a unique position to judge how far these needs can be met by adjustment within the family circle. When the aged are physically ill, it is the Health Visitor's duty to:

(a) co-operate fully with the general practitioner, almoner, home nurse and/or geriatric unit in treatment, to assist in procuring domestic help, loan of equipment, and rehabilitation;

(b) assess the need for admission to hospital on social grounds and the suitability of the home for ultimate discharge;

(c) to promote good neighbourliness and link those willing to give service with those in need of help.[5]

It is clear that the Health Visitor can do much towards helping the old person to maintain his capacity to live independently.

VOLUNTARY SERVICES

So far we have been describing what might be called the professional services for the aged; but in the United Kingdom a real opportunity for the voluntary societies, and for the ordinary "lay" citizen, to help and supplement these services has been eagerly seized upon.

The number of professional workers is necessarily limited, and they should by rights be kept for those old people who need professional care. In the United Kingdom today there are found numbers of old people who are isolated and lonely and who need a friend more than anything else. If a voluntary worker can be found who will drop in regularly and chat, say once a week, who knows how valuable a form of preventive medicine this may prove to be? Too often old people are found who do not know of the services that are available to them. They do not know how to contact the National Assistance Board if they are in financial need; they do not know how to contact the Home Nurse or the Home Help. Many of them are found to be quite out of touch with everyone and to have no contact with a doctor or anyone in the outside world. Such a person "turns in on himself" and is unable to make any contribution to the community. His own future rapidly becomes a nightmare which he can discuss with no one, and the very dread of infirmity may itself cause illness which brings the long-dreaded state of helplessness.

So it is important to count among the valuable home care services the contact of friendly visits carried out by many voluntary societies and to know the value of the clubs for old people which are springing up all over the United Kingdom. Members of such clubs are never isolated, for if they miss a club meeting someone will make it his business to go and find out the reason. If a member falls ill, other members will visit while the sick one is in a hospital or in bed at home, and when he comes out of the hospital someone will have been to see that the house or room is ready and clean for him. These facts, together with the psychological effect that the interest of membership in a club for old people brings, make this, too, come into the category of home care.

There are other services, such as chiropody and mobile physiotherapy, which voluntary agencies[6] and local authorities are trying to arrange. Neither of these services comes under the National Health Service at present unless it is given within the hospital. Chiropody in particular is found to be of great importance in the relief it brings, for with the increased activity comes more opportunity for going out, for managing shopping and cleaning. How much of the malnutrition which is found among the aged when they are admitted to hospitals is due to the fact that painful feet have prevented them from making the necessary effort to purchase and cook the foods required for health? The once active old person easily becomes isolated through inactivity caused by lack of attention to feet.

EFFECT ON DEMAND FOR BED SERVICE

Unfortunately there are as yet no figures available to show the measurable saving on demands for hospital beds brought about by such services as we have been describing. The figures so far obtained in the United Kingdom are local, though very interesting. Far more research is needed before national figures can be obtained, and it is to be hoped that this research will soon be forthcoming; for without it, it will not be easy to persuade public opinion to press for more home care as part of the integrated pattern of care for the elderly.

EFFECT ON INDIVIDUALS AND FAMILIES

If the capacity for living independently can be fostered and assisted, the individual old person will be far happier and will be able to make his contribution to the community in many ways. The effect of such a policy on his relations will be, we may hope, a tightening of the bonds of family affection. Today there seems to be a tendency to be unwilling to accept the responsibility of caring for the older members of the family. This is surely due in part to the strain imposed on the small family when home care services are insufficient and hospital beds hard to obtain. The strain of caring for the present needs of the elderly is increased by anxiety as to the care that may be needed in the future.

If we consider the increasing numbers of old people in the population today, we shall see the problem in its correct setting. "Between 1871 and 1947, the number of people over 65 in Great Britain increased fourfold, and the proportion rose from 4.8 per cent to 10.4 per cent."[7] We are told that the number of people over 65 will grow steadily over the next thirty years and increase to at least 2.3 millions and very probably much more. This will of course increase the proportion of old people to the total.[8]

This makes the position of old people and their proper care of the greatest consequence to the balance of the community. Unless we can give to the old their proper place, the whole community will be thrown out of balance in trying to care for them. The matter is one of national, and possibly international, importance, economically and socially, as well as being fundamental to the happiness of thousands of individuals.

Dorothea Ramsey, M.B.E., London, England, is secretary of the National Old People's Welfare Committee, a private agency co-ordinating work for the aged throughout the British Isles. She has been engaged in work for the elderly since 1940. She recently spent three months in the United States at the invitation of the Department of State, and was an official delegate from the United Kingdom at the Second International Gerontological Congress in St. Louis in September 1951.

Keeping Older People Fit for Participation

By Mary E. Switzer and Howard A. Rusk

Vanity is to wish a long life and take but little pains about a good life.—Thomas a Kempis [1]

WHEN asked at the beginning of 1950 to comment on the events of greatest significance which had occurred in the first half of this century, Mr. Bernard M. Baruch listed the increase of man's life span by eighteen years in a period of fifty as having even more profound medical, economic, and social implications than such things as atomic energy, air transportation, and communication.[2]

The lengthening of man's life span has traditionally been one of the primary objectives of medicine and the other health professions. Ironically, however, the achievement of this objective with increasing success year after year has created new and mounting problems not only for the health professions but for all aspects of our culture.

The Extent of Chronic Illness

Seventy-five years ago chronic diseases caused one-fifteenth of all deaths; they are now responsible for as much as three-fourths. Added to these increased death rates is the tremendous long-term toll of chronic illness and disability. Acute infectious disease usually results in rapid recovery or death, but chronic illness may linger for years. Its social and economic costs cannot be measured by mortality tables alone.

As our population becomes older, it can be expected that the prevalence of chronic disease and its resultant physical disability will increase correspondingly; studies indicate that the higher the age group, the greater the percentage of chronic disease and disability. The National Health Survey of 1935–36 showed the following numbers of persons with a chronic disease or impairment on a given day per 1,000 population: over 65 years of age, 515; aged 45 to 64, 309; aged 20 to 44, 177; aged 5 to 19, 70; and under age 5, 34.

In the twenty-year study that the Public Health Service conducted among 1,822 white families in Hagerstown, Maryland, it was found that the five-year incidence rate of chronic disease and major impairments at age 25 was about 35 for every 1,000 persons, and gradually rose till at age 45 it was about 100 per 1,000. After that there was a much steeper climb, reaching nearly 250 per 1,000 at age 60, more than 500 per 1,000 at age 80, and more than 900 per 1,000 at age 90.

More recent data on disability are available from a special survey made in February 1949 by three units of the Federal Security Agency through the sampling facilities of the Bureau of the Census. This survey, based on the civilian noninstitutional population aged 14–64, revealed that the prevalence of disability lasting for seven months or more increased slowly through the age group 35–44 and then rose sharply. The percentage disabled for seven months or more was 0.86 for the age group 14–19; 0.95 for the group aged 20–24; 1.04 for the 25–34 group; 1.44 for the 35–44 group; 3.01 for the 45–54 group; and 6.16 for the 55–64 group. A recent study of the Bureau of Old-Age and Survivors Insurance estimated that between two-thirds and three-fourths of those currently receiving old-age insurance benefits—men and women 65 years and over—are disabled when considered in terms of their ability to work full time at their usual occupations.

[1] *Imitation of Christ*, Chap. I, p. 14.

[2] In the first half of this article we have drawn heavily on an article by Howard A. Rusk and Eugene J. Taylor, "Rehabilitation," in *The Annals of the American Academy of Political and Social Science*, Vol. 273 (January 1951), pp. 138–143.

Chronic Illness and Economic Status

The incidence of chronic disease and its resultant disability is definitely related to economic status. It occurs most frequently among families of low income, and when it strikes, results in further reduced income and depletion of financial reserves. In the National Health Survey of 1935–36, chronic illness, disabling for one week or longer, was found to occur nearly twice as frequently among persons on relief as among those earning $3,000 a year or more.

A more recent study in Illinois showed that 23 per cent of all public assistance recipients were chronic invalids. In Connecticut the percentage was 20 and in New Jersey 38. In New York 37 per cent of those receiving old-age pensions suffer from some form of chronic illness—just double the average for their age group. The fear of chronic disease and disability is the most haunting specter of increasing age.

Lack of Services for the Chronically Ill

Except for those with pulmonary tuberculosis or mental illness, there are no well-planned and integrated services for most of the chronically ill aged. They find refuge in general hospitals, convalescent homes, homes for the aged, and the back bedrooms of relatives.

Much of the acute financial plight of both municipal and voluntary hospitals is caused by the increasing numbers of the chronically ill who enter the hospitals and stay for long periods. Dr. Edward M. Bernecker, former Commissioner of Hospitals in New York City, has reported that 22.5 per cent of the general care beds in municipal hospitals in New York City are occupied by patients with long-term illnesses. The percentage in voluntary hospitals is said to be around 20. In a survey in Syracuse, New York, it was found that 84 per cent of 902 successive patients in medical wards were chronically ill.

It is agreed that a great many of the chronically ill must have general hospital care initially. Many, however, remain in the hospital purely because of the lack of any place to which they can go if they are discharged. Convalescent or nursing homes are totally inadequate to meet the need, and patients discharged to their homes, where there are no facilities for their care, frequently must be readmitted to the hospital.

Problems of Rehabilitation

Until medicine finds the specific answers to the problems of the diseases of the heart and circulation, rheumatic fever and arthritis, cerebral palsy, multiple sclerosis, poliomyelitis, and the other crippling diseases, we must utilize the techniques of physical rehabilitation, psychology, social service, vocational counseling, and the auxiliary specialties to teach the disabled to live within the limits of their disabilities but to the full extent of their capacities.

Although we have in this country the

finest institutions in the world for medical care and for vocational training, there are, outside of the military services and the Veterans Administration, but a small handful of civilian agencies and organizations equipped to provide for the physically disabled the necessary retraining in physical skills which is a requisite for later vocational training. The physician has thought too much about the physiologic and clinical aspects of the patient's disability. The vocational counselor too frequently has thought only in terms of physical skills which could be utilized vocationally. Between the two, however, there is a wide area through which most physically handicapped persons must go when their medical care is completed but before they are ready to undergo vocational training or retraining. In this area lies the physical retraining in skills necessary for the carrying on of the activities inherent in daily living and common to all types of work.

Except in a few isolated instances, the physically handicapped person must be retrained to walk and travel, to care for his daily needs, to use normal methods of transportation, to use ordinary toilet facilities, to apply and remove his own prosthetic devices, and to communicate either orally or in writing. These are such simple things that they are frequently overlooked; but the personal, vocational, and social success of the handicapped person is dependent on them.

Today in our medical schools, hospitals, and scientific laboratories we are learning much through research in the physiological aspects of aging. This is useful and valuable, but we are failing to put equal emphasis on the psychological, social, and vocational aspects. The listings of current university research on gerontology carry such titles as "Nucleocytoplasmic Ratio of Different Ages in the Liver of Rats," "Mitochondrial Morphology in Arrangement of the Glandular Tissue of Rats," and "Aging Changes in Vascular Tissue of Human Subjects." This research "from the cell up" has important implications, but unfortunately we do too little research "from man as a human down."

With the tide of chronic disability which threatens to engulf us medically, socially, and economically, we must redouble our efforts to see that the lag between that which we already know and its application to those whom it would benefit is reduced.

POSSIBILITIES OF REHABILITATION

One of the great needs is provision for total treatment of the chronically ill patient in terms of his whole problem. Many such patients can be rehabilitated to the extent of employability, and a great percentage of the others can be brought to the point of sufficient self-care to enable them to live at home, requiring a minimum of aid from other members of the family.

Both the Veterans Administration and some civilian hospital programs have demonstrated that rehabilitation to the point of self-care, and even to full or limited employment, is possible for many of the chronically ill who have been hospitalized over long periods.

Typical results obtained by the Veterans Administration are shown by a study of 130 chronic neurologic patients in one hospital, all but two of whom were World War I veterans, and many of whom had not been out of bed in ten years. After nine months of medical rehabilitation, 25 had left the hospital and were employed; 40 others had been discharged to their homes capable of light work; and of those remaining, 30 were ambulatory and undergoing advanced rehabilitation and 25 were capable of some self-care. All but 10 of the group had shown worthwhile permanent improvement. With a five-year life expectancy of these patients, and per-patient-day hospitalization cost of over $12, rehabilitation of this one group has saved the government, and eventually the taxpayer, over $1,250,000. It would seem logical that a similar program for the civilian chronically ill would result in comparative savings.

In another study at the Veterans Administration Hospital at Manhattan Beach in Brooklyn, through rehabilitation, 74 of a group of 126 patients suffering from such diseases as arthritis, multiple sclerosis, paralysis, and Buerger's, Parkinson's and heart diseases have been discharged from the hospital and are now at home taking care of themselves. All but 13 of the original 126 patients have recovered all or part of their ability for self-care. At the beginning of this program, 83 of these veterans were "completely hopeless"; but 49 of that group have been rehabilitated to the point of complete independence, and the rest are capable of self-care. However, in most of our civilian hospitals, the patient receives no such services. Hospitals complain that the chronically ill are responsible for their crowding, but they do little to provide many with the training services that will permit them to leave the hospital.

That many general hospitals recognize their limitations is shown by a study made in New York State on the medical, social, and institutional aspects of chronic illness. Although almost 70 per cent of the 139 hospitals surveyed accepted chronic patients, relatively few had specialized departments for their care. The great majority frankly admitted trying to avoid their admission.

THE PROBLEM OF RESOURCES

The problem of providing an integrated service for the chronically ill is a complex one. It affects tremendous numbers of persons, numerous diseases and types of disabilities, various types of medical and semimedical institutions, and, particularly, all community service agencies. There is one facet of the problem that stands out glaringly at the present time. That is the need in our general hospitals for dynamic training programs to enable many of the so-called chronic invalids to live independently within their own homes.

In searching for resources which can be redirected toward the growing problem of chronic disability associated with aging, many states have turned toward the utilization of the county home. The almshouse, poor farm, or county home in this country has been traditionally regarded by self-respecting individuals as "the end of the road." Its residents and their relatives have long borne the painful social stigma of destitution or pauperism. Years ago, and unfortunately still in some isolated instances, the county home was the dumping ground for all those who could not compete economically or socially with normal society. Its "inmates" consisted of homeless children, healthy but inadequate indigents, the sick, the insane, the senile, and the feebleminded. They had but one common characteristic—they were destitute.

Today such practices are universally recognized as being socially undesirable, and specialized institutions have been found to meet the needs of the various groups who formely lived in the county home. Mothers' pensions, old-age assistance, and other aid programs provided by the federal Social Security Act and state programs also have materially

altered the population of public homes. As a result, the function of county homes has changed, and today they are primarily homes for the aged and the chronically ill.

THE NEEDS OF THE AGED

As several studies have brought out, accessibility and privacy are two of the main factors to be taken into consideration in converting public homes into facilities for the chronically ill. Aged patients fear isolation and want to be where their friends and relatives can visit them, and where they can shop, go to the movies, and see friends. They want a place in which to keep their possessions, and to live, if possible, in a private room or small dormitory—a place where they can live in dignity.

This, however, is not enough. The older person who must live an institutional life must also have the opportunity to do something purposeful and constructive. The majority of older persons have worked steadily and industriously in a society that respects only the productive. The ending of ability to do gainful work is, for most, a tragedy; it symbolizes the end of independence and purpose in life.

By failing to utilize activity, we have neglected one of the most valuable tools in the management of the chronically ill and aged. All who have gone through an institution have noted the apathy and hopelessness of the residents. There are always a few, however, who are bright and alert. They are the residents who have voluntarily assumed or have been assigned to tasks within their physical capacities.

The use of selective placement, whereby the physical capacities of the individual are matched against the physical demands of the job, can be used in an institution as well as in industry. Even though their disabilities may be severe, the great majority of the residents of public homes can do some tasks about the home. For some, it may be only simple housekeeping assistance; others have the ability and the experience to assume greater responsibilities.

If the aged and the chronically ill are to have the comfort, security, dignity, and companionship that should be the heritage of every older person, public homes must provide them with cheerful, attractive surroundings, as much privacy as possible, a place for their belongings, opportunities for recreation and social activities, and a chance to do something productive.

With the introduction of rehabilitation programs in general hospitals, and increased facilities for effective convalescent care and home care programs of medical, social, visiting nurse, and visiting housekeeper services, many of the aged and chronically ill will not need to seek admittance to public homes. Many present residents could also be restored to either employment or self-care with suitable rehabilitation programs.

VOCATIONAL REHABILITATION

The Federal-State Vocational Rehabilitation Program is giving increased attention to the aged handicapped person who could remain in or re-enter the labor force if provided co-ordinated services directed to his particular problems. Except for the program for veterans with service-connected disabilities, this is the only public program of vocational rehabilitation. This program serves all segments of the population, including the aged who are handicapped. The services available through the program include counseling, vocational and personal adjustment, vocational diagnosis, physical restoration, vocational training or retraining, and other services to restore work capacity. After the provision of these restorative services, assistance is given in finding employment suited to the individual's capacities and abilities.

Vast expansion of this program is needed, however, if we are to meet adequately the needs of the hundreds of thousands of disabled aged persons who are with us today and who tomorrow will be with us in even greater numbers. There is urgent need for rehabilitation centers to provide co-ordinated restorative services, for workshops for building work tolerance and providing useful and productive employment for those who are not able to enter the competitive labor market, and for research to develop and test new techniques and methods.

It is estimated that about 10 per cent of the current labor force at all age levels has significant physical impairments that must be taken into consideration in job placement. Using selective placement techniques in which the physical capacities of the individual are matched against the physical demands of the job, these less severely handicapped individuals do not present great placement problems. The older person with a chronic disability, however, has two strikes against him when he seeks employment—his age and his disability.

EMPLOYMENT OPPORTUNITY

It is the discrimination based on lack of understanding, which is discussed in greater detail in the article by Mr. Abrams, that prevents the older worker with a disability from getting a job—not his lack of ability. Statistical data on the productivity of older workers compared to younger workers in the same occupation are almost entirely lacking. Several studies, however, have shown that older workers, even those with disabilities, make reliable and safe employees.

Among the most significant of these was one survey of the work records of 17,800 employees in 109 companies in which the absenteeism rate decreased consistently as age increased. In every age group above 50 years, employees lost fewer scheduled workdays than those in any age group below 50. Disabling injuries reached their peak at about age 41 and then declined continuously until age 75, except for a slight rise between 50 and 55. The peak of nondisabling injuries came at about age 26 and then declined steadily and sharply all the way to age 75, when they amounted to one-third of the peak number.

Nor is it true that older workers cannot be retrained for new operations. Many industrial programs during the last war demonstrated that with careful, selective placement and with simple changing of engineering design, many of the jobs formerly assigned to younger workers could successfully be performed by older people.

The experience of the Federal-State Vocational Rehabilitation Program has shown that even disabled persons in the older age groups can become independent wage earners if they are given proper services. In 1949 its agencies gave services to 12,469 persons aged 45–64 and 931 persons over 65. Prior to rehabilitation, two-thirds of this group were unemployed; after their rehabilitation, the average weekly earnings of the 45–64 group were about $35, and of the over-65 group, about $28.

Of the 11,000,000 persons over 65 in 1948, about 3,500,000 had no money income of their own. Of the 7,500,000 with some money income, almost one-third had incomes of less than $500.

It is significant, however, that employment constitutes the major source of income for the 65-plus age group. Almost half of the older workers work for themselves, as compared with one in five in the total male working force. They are more frequently farmers, proprietors, managers, officials, and service workers. Fewer are found as clerks, sales personnel, craftsmen, foremen, and machine operators.

Although the great industrial concerns have thousands of jobs which older persons can successfully perform, we must remember that "big business" actually hires only a fraction of America's workers. About 70 to 75 per cent of the nation's workers are employed in the 99 per cent of the industrial plants in the nation which have fewer than 500 employes. It is to small industry, commerce, and the service trades that the great majority of older workers must turn if they expect to be successful in finding new jobs in competitive industry.

FACTORS OF THE "GOOD LIFE"

These facts and figures underline the responsibility of all agencies, public and private, to show the way to the mature handling of this problem in the years ahead. Its magnitude makes the teamwork of these agencies even more essential in developing services for our older citizens than has been true in many other health and welfare fields. The core of our theme—"to take pains about the good life"—demands a balanced consideration of all factors that make for total security, economic, social, spiritual.

The national government may find its role to be primarily in the broad areas of income maintenance, in cooperation with states and local communities in the welfare field and with the whole working population in the old-age insurance field. Federal support will also be needed to stimulate research into the medical and social methods essential to aid the individual in having "the good life" from age 60 to 80 as well as from age 30 to 60. But, as has been true traditionally in our country, it will be the voluntary institutions—hospitals, community groups, and religious organizations—that, by virtue of their close ties with their people, can point the way to precise methods to accomplish our ideal. Housing for older people, particularly for those living on old-age pensions, is one of the most difficult problems to solve in our society. The federal government should have a broad program, working with all forces in the housing field, both public and private, to meet more nearly the needs of older people.

The importance of chronic diseases in older people places on hospitals treating chronic patients a major responsibility for research into their treatment and rehabilitation. No more fruitful endeavor can be undertaken than the continued effort to find ways and means to ensure that the chronically ill shall be as nearly self-sustaining as modern medical knowledge can make them. Physicians dealing with people as patients all through life will be an important influence in guiding us to "embrace old age proudly" and with the conviction that it is the crowning glory of life. Teachers will show their charges that each stage of life has its special compensations. The many voluntary and religious institutions serving the aged must continue experimentation in ways of living to keep fit for participation to the end of life. Colleges and other educational institutions increasingly will need to readjust their programs to put more emphasis on adult education and particularly on education and the pursuit of knowledge as an enriching influence for a full life.

The traditional relationships which have been built through the years by those interested in health and welfare, both in and out of government, must be closer and more responsive than ever; for "keeping fit for participation" is the moral responsibility of our whole country.

Mary E. Switzer, Washington, D. C., is director of the Office of Vocational Rehabilitation, Federal Security Agency, having previously served as assistant to the Federal Security Administrator from the time of the establishment of the Federal Security Agency in 1939. From 1934 to 1939 she was assistant to the Assistant Secretary of the Treasury in charge of the Public Health Service. She is a member of several health and rehabilitation organizations.

Howard A. Rusk, M.D., New York City, is professor and chairman of the Department of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center; associate editor of The New York Times; consultant in rehabilitation to the United Nations, the Office of Vocational Rehabilitation, Federal Security Agency, and the New York City Department of Hospitals; and chairman of the Health Resources Advisory Committee of the Office of Defense Mobilization.

Income Maintenance for the Aged

By Wilbur J. Cohen

THE year 1951 was a very important milestone so far as income for the aged was concerned. For the first time in our nation's history the number of persons receiving old-age *insurance* exceeded the number receiving old-age *assistance* (February). Likewise, for the first time, the total amount of insurance payments to aged persons exceeded the amount of old-age assistance payments (August). The number of aged persons on the assistance rolls declined slowly and steadily in 1951 from the high of September 1950, while the number receiving insurance steadily increased (see chart). At the end of 1951, over 4 million persons, representing nearly one-third of the population aged 65 and over,[1] were receiving some form of public insurance benefit or pension or were the wives of such recipients. About 85 to 90 per cent of all persons working for a living were earning credits under some public retirement or pension program.

Despite these noteworthy developments, there are still many aged persons with inadequate incomes, many pressing problems with respect to income for the aged still unsolved or awaiting consideration, and a need for much more information on the economic status of the aged.[2] Some of the most important of these pressing problems and future trends will be summarized. The entire area of income for the aged is a very swiftly changing subject. The situation five years ago was very different from that today. As a result of programs recently established or improved, the situation five years from now will have changed markedly from that today.

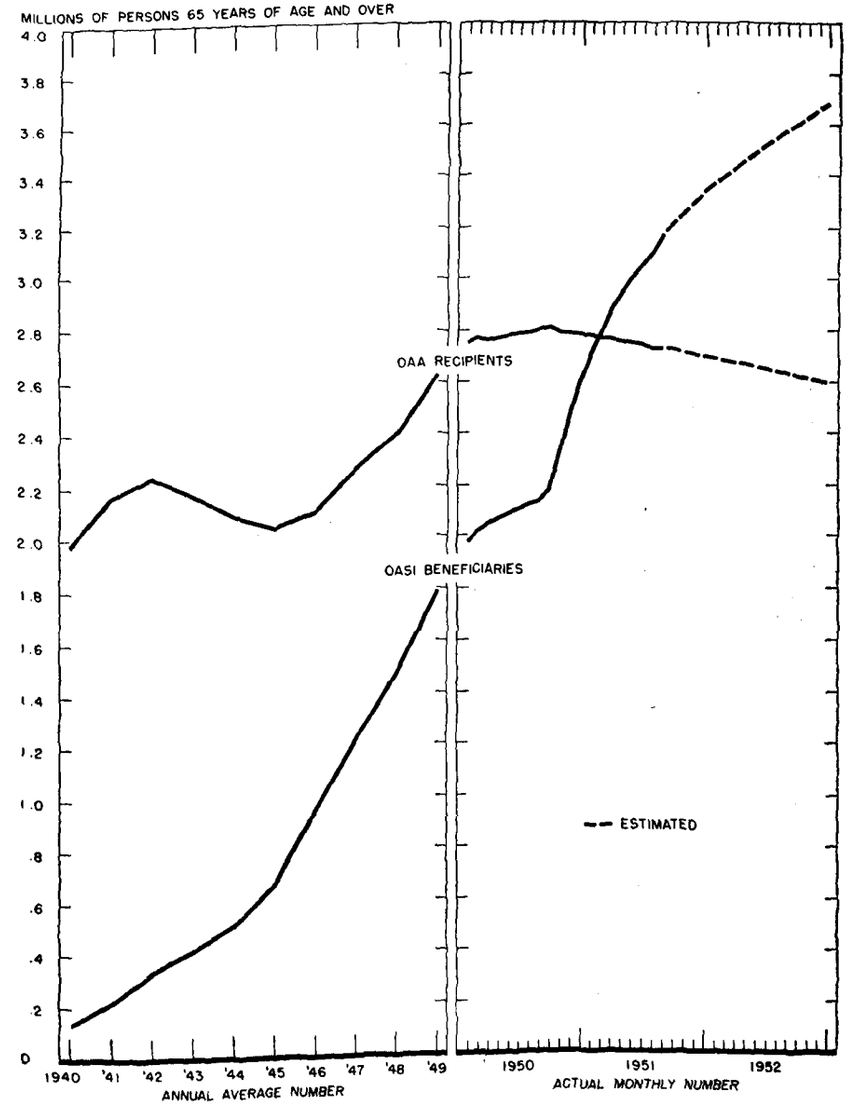
Sources of Income of the Aged

Five main sources of income of the aged will be considered: (1) earnings from employment, including self-employment; (2) income from individual savings, individual insurance policies or annuities, or property; (3) benefit payments from public or private insurance or pension programs; (4) assistance payments from public agencies; and (5) assistance from voluntary agencies, friends, or relatives.

Employment

About 2.9 million, or a little less than one-fourth of all persons aged 65 and over, are employed in an average week at the present time.[3] Of this number 2.3 million are men and 0.6 million are women. In addition, there are about 0.9 million women aged 65 and over who are the wives of aged earners. Thus, about 3.8 million aged persons representing a little less than one-third of all the aged were in receipt of earnings from employment or were the wives of earners.

There is some reason to believe that because of manpower needs during the present defense period, the number of aged persons employed during the next few years will increase. There is considerable doubt as to the long-time



[1] In this article it is assumed that the number of persons aged 65 and over was 12.3 million in April 1950, was about 12.6 million in mid-1951 and will be about 13.0 million in December 1952.

[2] For further research which is necessary, see National Conference on Aging, Washington, D. C., 1950, *Man and His Years* (Raleigh, N. C.: Health Publications Institute, 1951), pp. 60–64.

[3] This figure greatly understates the number who work during the year. The number during the year is nearly 725,000 more than the average number employed during the year. "Work Experience of the Population in 1949," *Current Population Reports, Labor Force*, Bureau of the Census, Series P-50, No. 24.

INCOME MAINTENANCE PROGRAMS FOR THE AGED, 1940–1952

OLD-AGE ASSISTANCE INCREASED IRREGULARLY UNTIL 1950 AND IS NOW DECLINING SLOWLY. OLD-AGE INSURANCE INCREASED RAPIDLY AND, AS THE RESULT OF THE 1950 AMENDMENTS, BECAME THE LARGER OF THE TWO INCOME MAINTENANCE PROGRAMS EARLY IN 1951.

ESTIMATED NUMBER OF PERSONS, AGED 65 AND OVER, RECEIVING INCOME FROM SPECIFIED SOURCES, DECEMBER 1940, 1945, 1950, AND 1952.[a]
(In millions)

Source of Income	December 1940	December 1945	December 1950	December 1952
Total population 65 years and over	9.1	10.2	12.3	13.0
Employment	2.8	3.7	3.7	4.0
Earners	2.1	2.8	2.8	3.0
Wives of earners	.7	.9	.9	1.0
Social insurance and related programs				
Old-age and survivors insurance	.1	.8	2.6	3.7
Railroad retirement	.1	.2	.3	.3
Federal civil-service retirement	[b]	.1	.1	.1
Veterans' program	.2	.3	.3	.3
Other[c]	.2	.3	.4	.4
Old-age assistance	2.1	2.1	2.8	2.6

[a] Some persons received income from more than one of the sources listed.
[b] Less than 50,000.
[c] Federal employee retirement programs other than civil service; state and local government retirement programs; wives of male beneficiaries of programs other than old-age and survivors insurance.

SOURCE: Data for 1940, 1945, and 1950 from *Social Security Bulletin*, June 1950, p. 16, and June 1951, p. 19. Data for 1952 estimated by author.

trend.[4] In 1890 a little more than two-thirds of the aged *men* were in the labor force; this proportion dropped to about 54 per cent in 1930, to 42 per cent in 1940, rose to about 50 per cent in 1944–45, and declined to nearly the 1940 level by 1950. In June 1951 the proportion was about 43 per cent. The decline from 1944–45 to 1951 was largely a reflection of the failure of employment opportunities to keep pace with the gain in the size of the aged population, rather than a drop in the absolute number of aged workers, which remained at about the wartime levels. If the 1920–50 trend continues, the percentage of aged men in employment will drop by 1975 to 35 per cent.[5]

For older persons who are able to work and want to work, employment can be both a satisfying means of securing an income and the most productive as far as the economy is concerned. The value to the national economy of the services of the aged who are now working is about $10 to $12 billion per year. If the wartime proportion were again reached, perhaps about 500,000 additional aged persons would be working, which would increase the national production about $1.5 billion annually, while at the same time the costs of relief and insurance benefits for the aged would be reduced.

Savings, annuities, property

Only very scanty information exists on the amount of income available to the aged from their own savings, or from individual annuities or private insurance they purchased, or from property or investments. From various information available it seems that about 800,000 aged persons were receiving *insurance company annuities* in 1950 exclusive of any payments under any group retirement or annuity programs. The average payment was about $40 per month.

About 46 per cent af all spending units in which the head of such unit was 65 and over saved some of their income in 1950; 19 per cent came out even; and 35 per cent had expenditures *in excess of income.*[6] Surveys made of the income and assets of old-age and survivors insurance beneficiaries suggest that about half of the commercial and industrial workers who have retired in recent years have some assets other *than an equity in a home, but that such* assets typically are small. In the areas studied, between only a sixth and a fourth of the retired male workers had assets enough to last for their life expectancy *if withdrawn at the rate of* $25 a month.

Perhaps it would be fair to say, in conclusion, that while available data are not very satisfactory, they suggest that most people do save, in various *amounts, and that in recent years* about half the aged have been able to accumulate some savings. Such savings are generally small, and for most persons are not large enough to provide a significant resource in old age.

Insurance and pension plans

About four million aged people are now receiving regular monthly payments under some type of public or private group *insurance retirement*, pension, or *annuity plan*. Of this number, about three million persons are drawing benefits under the federal old-age and survivors insurance program, and one million under some other program.

There are probably about 350,000 persons drawing retirement benefits or annuities from private employer plans or collective bargaining plans. These benefits probably average about $55 per month. However, a very large proportion of the persons receiving such benefits are also receiving benefits under one of the public insurance or retirement programs.

The number receiving insurance benefits will *continue* to grow in the *future*. By the end of 1952, it is estimated that there will be about 3.7 million persons receiving federal old-age and survivors insurance benefits. This number will *increase* to about 5.5 million by 1960 and continue growing steadily for many years thereafter.

Public assistance

About 2,700,000 needy aged persons are receiving assistance. This represents about 22 per cent of the aged population. While the number of aged on assistance is much higher than it was ten years ago, the proportion of all aged persons on assistance has slightly declined. From a high of 2.8 million in September 1950, old-age assistance rolls have declined about 5,000 to 10,000 a month. A more detailed discussion of assistance is given later in this article.

Contributions from relatives

Only the most fragmentary and incomplete information exists on the contributions received by aged persons from their children, other relatives, or friends.[7] Some information exists which

[4] According to Peter F. Drucker, manpower shortages and public pressures will compel the employment of more older workers during the coming decades. "Population Trends and Management Policy," *Harvard Business Review*, May 1951, pp. 75–76.

[5] Harold Wool, "Long-Term Projections of the Labor Force," paper presented before Conference on Income and Wealth, National Bureau of Economic Research, New York City, May 25, 1951, Table 5.

[6] "1951 Survey of Consumer Finances," *Federal Reserve Bulletin*, September 1951, Table 3, p. 1063.

[7] Incomplete information also exists on the number of aged persons in nursing homes, hospitals, and other institutions. The number is probably close to 400,000 but we do not know to what extent these persons have some income of their own or are supported by relatives or from public funds.

indicates that a number of individuals receiving old-age assistance also receive some contributions from relatives,[8] but the proportion is currently not known. The number of such beneficiaries receiving cash contributions is probably very small, but contributions in kind such as shelter and medical and other services are probably more extensive. However, information is not available on the extent of such contributions to aged persons not receiving assistance. It is generally assumed that there must be at least 2 or 3 million aged persons being supported wholly or in large part by their children or other relatives, and a large additional number receiving partial support from children or other relatives.

INCOME DISTRIBUTION

In 1948, about 9,200,000 of the 11 million aged had some income or were the wives of individuals with some income.[9] However there were wide variations in the amount of income. Information available to date does not give an accurate picture of income or resources of the aged,[10] and it is evident that existing information tends to understate income and assets. Nevertheless, it is clear that a very large number of the aged have a very modest cash income. Omitting those without any income of their own, including wives of income recipients, available statistics for 1948 show that out of the remaining 8,000,000 aged there were approximately:

2,500,000 with under $500 for the year
2,300,000 with $500 to $999
1,600,000 with $1,000 to $1,999
750,000 with $2,000 to $2,999
500,000 with $3,000 to $4,999
200,000 with $5,000 to $9,999
100,000 with $10,000 or more

The Social Security Administration, in co-operation with the Bureau of Labor Statistics, has worked out budget estimates to show what it costs an elderly couple to maintain a "modest but adequate" level of living in an urban area. These estimates, as of October 1950, ranged from $1,620 in Mobile, Alabama to $1,908 in Milwaukee.

It is clear from these statistics that much remains to be done to improve the economic status of the aged.

SUMMARY OF PRESENT PROGRAM

Federal old-age and survivors insurance

The federally administered old-age and survivors insurance program now covers most employees in commerce and industry, self-employment (other than in farming and certain professions), certain employees of federal, state and local governments not covered under a retirement system, employees of nonprofit organizations, regularly employed farm workers, and regularly employed domestic workers in private homes. Approximately three-fourths of the nation's gainfully employed are now covered by old-age and survivors insurance. The chief groups not covered are farmers, seasonal and migratory farm workers, domestic workers employed on a day basis, and persons covered under other government retirement systems.

The program provides monthly benefits, related to previous earnings and paid as a matter of right without investigation of need. Approximately 60 million individuals are insured under the program. About 4.2 million persons were drawing insurance benefits in August 1951, of whom 3.2 million were aged persons, 800,000 were children, and 200,000 were widowed mothers of the children receiving insurance benefits.

The average benefit for retired workers is currently about $42 a month; and for a retired worker and wife, aged 65 and over, $68. For those retiring in the next few years, the average will be between $50 and $60 for an individual, and between $80 and $90 for a man and wife. The minimum monthly benefit is $20 for a single individual and $30 for a man and wife. The maximum monthly benefit is $80 for a single individual, $120 for a man and wife, and $150 for a family of three or more persons.

The program is financed by contributions from covered employers and employees. At the present time the contribution rate is 1.5 per cent of pay roll for each. The rate is scheduled to increase to 2 per cent each in 1954 and gradually to 3.25 per cent each in 1970. Self-employed persons are required to contribute three-fourths of the combined employee-employer contribution.

Public assistance

To be eligible for old-age assistance, an individual must meet a test of need. Each state sets its own standards for determining whether a person is needy. State policies commonly allow recipients to own their homes, have small life and burial insurance policies, or maintain small cash reserves. The amounts and kinds of property that a recipient may have and the circumstances under which he may retain it differ from state to state. In some states, automatic liens are placed on the real property of a recipient so that at his death or that of his surviving spouse the state may recover for assistance granted. Some states require a recipient to surrender title to the property to the state or locality as a condition to receiving aid.

Very great variations are to be found among the states in the number of recipients of old-age assistance in relation to the aged population. In June 1951 the recipient rates ranged from 50 per 1,000 in the District of Columbia to 671 per 1,000 in Louisiana. In general, the states that are predominantly rural—and consequently have least protection from the old-age and survivors insurance system—have the highest recipient rates. These are for the most part states with low fiscal resources and with a relatively large amount of need.

Old-age assistance payments in June 1951 averaged $43 for the United States, but ranged from $76 in Colorado to only $18 in Mississippi and $7.66 in Puerto Rico. In thirteen states the averages exceeded $50, the maximum monthly amount in which the federal government will share. In eleven states —all but one in the South—the averages were under $30. The variations in assistance levels reflect differences among the states in their ability to finance their share of assistance costs and in attitudes toward meeting need.

The federal share of old-age assistance costs in 1950 was 54 per cent, but in individual states it ranged from 75 per cent to 39 per cent. Total expendi-

[10] For over fifteen years there have been various attempts to analyze the economic status of the aged. Some indication of the difficulty of the task, the gaps in the available information, and the differences in approach in analyzing the data, can be obtained by studying some of these attempts. See Marjorie Shearon, "Economic Status of the Aged," *Social Security Bulletin*, March 1938; Barkev S. Sanders, "Economic Status of the Aged in Urban Households," *Social Security Bulletin*, October 1940; *Hearings before the Senate Special Committee to Investigate the Old Age Pension System*, pursuant to S. Res. 129, 76th Cong., 1st sess., 1941; *Hearings before the Senate Committee on Finance* on S. 1932, 76th Cong., 1st sess., 1941; *Issues in Social Security;* A Report to the House Committee on Ways and Means, 1946, pp. 268–71.

tures in 1950 for old-age assistance were $1.5 billion, of which the federal government contributed $0.8 billion. Under present law the federal government shares in individual assistance payments up to a maximum monthly amount of $50. The federal share of assistance costs is three-fourths of the first $20 of the average payment and one-half the balance within the limit on individual payments. Thus, the federal share is highest where payments are lowest. States making payments about $50 get a relatively low percentage of federal funds, but the amount per case is higher than in the low-payment states.

GENERAL IMPROVEMENTS SUGGESTED

A full discussion of the many changes which are necessary or desirable to improve the income status of aged persons would take many pages. In the limited space available here, it is not possible to enumerate the changes which are necessary in existing private pension plans [11] or in public assistance.[12] Nor is it possible to consider the over-all economic and fiscal implications of improving all the various programs for the aged [13] or the pros and cons of various incentive plans for reducing the extent of premature retirement.[14] Many alternatives have been proposed, and these proposals are in large part controversial and involve many difficult problems of economic, fiscal, social, and political philosophy. In these few pages, only a brief reference can be made to a few of these proposals and issues.

One fact, however, seems quite certain. The United States has accepted the principle that the government acting for all the people is responsible for providing a system of income payments to aged persons. No responsible group is advocating a reversal of this policy. But there is a good deal of difference of opinion as to the most desirable way it should be carried out. In general, there are a number of alternative ways being discussed for improving the situation:

First, there are the advocates of the present contributory insurance plan who urge that the coverage of the program be made universal, that its benefits be liberalized, that the benefits continue to be geared to wages with substantial differentials between benefits to low-paid and higher-paid workers, and that such benefits continue to be paid as a matter of right upon retirement.

Second, there are those who advocate that under such a universal coverage program, all the present aged should be "blanketed in."

Third, there are the advocates of a universal uniform pension (such as the Townsend plan) supported out of earmarked taxes.

Fourth, there are those who advocate a federal assistance program, supported by a general personal income tax, under which benefits would be paid only to persons with income under a stated amount.[15]

R. 6000, 81st Cong., 2d sess., May 17, 1950, pp. 313–19. For the views on those opposed to the Meriam-Butler plan see Senator James E. Murray, *Congressional Record*, June 19, 1950, p. 8963 (daily issue); Edwin E. Witte, "Social Provisions for the Aged," in *The Aged and Society*, Industrial Relations Research Association, 1950, pp. 131–32; and Robert M. Ball, in *Public Welfare*, October 1950, pp. 187–90.

IMPROVEMENTS IN OLD-AGE AND SURVIVORS INSURANCE

It seems highly likely that most serious attention will be given to improvements in the existing program rather than a basic change in the program. Among the proposals made for improving the existing program are:

Universal coverage

While most persons who work for a living are covered by the existing program, farmers, some professional persons, and about one-half of all farm workers and domestic workers are still excluded. These groups should be included. Also excluded are a number of different groups covered under their own retirement plans, such as employees working for the railroads and federal, state, and local governments, and military personnel. Various proposals have been made which will improve the retirement protection of persons who move from one plan to another without reducing the protection afforded to the long-service employee under a particular plan.

Further extension of coverage will make the program more effective in the long run, and will help to keep the assistance burden from growing in the future Extension of coverage will not help so far as the present assistance load is concerned. Most of the old people now getting assistance will probably never work again, and therefore cannot be expected to acquire benefit rights under the insurance program no matter how broad its coverage. This fact has led to proposals to work out some sort of arrangement to pay benefits under the insurance program to all of the present aged.

Such proposals would not solve the problem and could not be adopted without destroying the essential contributory nature of old-age and survivors insurance unless two major conditions were included. The first condition is that the insurance program would have to be extended to cover all gainful employment. Otherwise, many persons becoming aged in future years would still be without insurance protection and in need of public assistance. The second condition is that the cost of these noncontributory benefits would have to be financed from general revenues and not from employers' and employees' contributions.

Increases in benefits

Another way to increase the effectiveness of the program is by making it more responsive to increases in wages, prices, and standards of living.[16] If benefit amounts fail to adjust promptly to these factors, more people dependent on benefits will become needy, and increased supplementation of benefits by assistance will be necessary.

Under the present provisions, benefits are based on an average wage computed over the worker's working lifetime. This means that low earnings in the early years of a worker's lifetime reduce the benefit amount. Moreover, the long-run trend of wages is upward. Benefits could be related to rising wages that had determined the worker's standard of living before his retirement if the average monthly wage

[16] See Wilbur J. Cohen, "Should Old-Age Assistance Again Outpace Old-Age Insurance?" *American Economic Security*, July–August, 1951.

were computed over the five or ten consecutive years of highest earnings.

One additional element should be reflected in the benefit formula. Under present law, a man who is now aged 60 will get the same benefit amount after contributing for only five years as a man now aged 40 with the same average earnings who has contributed for twenty-five years. Before the 1950 amendments, the basic benefit amount was increased by 1 per cent for every year the individual spent in covered employment. The 1 per cent increment should be restored to the benefit formula, so that the long-term contributor would get some return for his extra contribution.

Even if these changes are made, benefit amounts will not keep pace with rising wages unless the maximum on wages which may be credited toward benefits is raised. The limit was increased in 1950 from $3,000 a year to $3,600, but the $3,600 ceiling is not enough to take account of increases in wage rates in the past twelve years. In 1939, when the $3,000 limit was established, only 5 per cent of all year-round workers earned more than $3,000. In 1950, 22 per cent earned more than $3,600. To keep the proportion of workers with all their earnings credited toward insurance benefits at the 1939 level, the maximum wage base would have to be about $6,000 at the present time.

Similarly, as wages go up, the portion of the average wage to which the first part of the benefit formula is applied should be increased. Under the new formula the benefit is equal to 50 per cent of the first $100 of the average monthly wage, plus 15 per cent of the remainder. This formula expresses the intent of Congress to replace a larger percentage of wages for low wage workers than for those with high wages. However, as wage rates rise, the concept of what constitutes "low" wages also changes. Unless the amount to which the 50 per cent part of the formula applies is increased to $115 or $120 as wages rise, the intent to replace a larger proportion of low wages will not be effectively carried out.

Finally, as wages go up, the amount (at present $50 per month) which beneficiaries may earn and still get benefits should be increased. The amount should be large enough so that the beneficiaries may supplement their benefits by engaging in part-time work; as wages increase, the amount of wages which can be earned by part-time work also increases.

Further consideration should also be given to the question of permitting women to qualify for benefits at age 60. Wives are usually a few years younger than their husbands, and it cannot reasonably be expected that when a man retires at 65 his wife will be able to get a job to supplement his retirement income. Similarly, a woman widowed at age 60, or an aged dependent mother, may have a very difficult time getting a job if she has not previously worked. If wives, widows, and dependent mothers are permitted to receive benefits at age 60, consideration may be given to lowering the retirement age for women workers, also.

Hospitalization insurance

Many beneficiaries have heavy emergency expenses—such as for needed hospital care—which the benefits cannot be expected to cover. It would not be practicable to increase payments to all beneficiaries sufficiently to cover hospital expenses, since not all of them have such expenses. A recent survey of insurance beneficiaries in two large cities showed that only one out of twelve aged couples who had obtained hospital care had any form of hospitalization insurance. Most beneficiaries are not members of groups to which such insurance is available, and they unquestionably have higher-than-average hospital needs. The need for insuring beneficiaries against hospital costs can be met through the old-age and survivors insurance program.

Insurance against disability

About two million of the civilian population between the ages of 14 and 65—not counting persons in mental, tuberculosis, and other hospitals—are unable to go about their regular pursuits because they have a prolonged disability. Moreover, the number of disabled people is increasing, and will continue to increase as proportionately more of the population is in the older ages.

The approach to the problem of disability must be twofold. It is essential to rehabilitate and return to productive employment as many disabled workers as possible, and it is essential to provide income for those who cannot be rehabilitated, as well as temporarily for those who can eventually return to work.

A program of disability insurance should make rehabilitation services available to all those in danger of suffering permanent and total disability. Moreover, during the rehabilitation process, such a program should provide cash benefits to support the disabled persons and their families. A program of this sort would ensure that as many disabled people as possible would be rehabilitated. It would bring about an expansion of rehabilitation facilities, which are now severely limited, and it would promote the training and employment of additional expert personnel, since rehabilitation services would be paid for from the trust fund.

Such a program should also contain provisions to preserve the retirement and survivor protection of disabled workers. Under the present insurance program, a disabled worker not only must get along without benefits until age 65, but even when he reaches that age he may not get adequate benefits because his period of disability will have substantially reduced his benefit amount or will have entirely wiped out his right to benefits. Similarly, if he dies prematurely his family may be left with inadequate benefits or none at all.

CONCLUDING OBSERVATIONS

A sound and comprehensive program for improving the income of the aged requires: (1) more employment opportunities for the aged; (2) more adequate incomes during their working lives in order to increase home ownership, savings, and insurance protection; (3) a method of insuring families against medical costs; (4) broadening and improving public and private retirement and assistance provisions for the aged and the disabled; (5) more adequate rehabilitation and medical services for older persons.

Wilbur J. Cohen, Washington, D. C., has been technical adviser to the Commissioner for Social Security for the past sixteen years and has worked on the original Social Security Act and its amendments. He has represented the United States Government at international social security meetings in Chile, Mexico, Brazil, and Argentina, and at the International Labor Conference. He was chairman of the Tripartite Panel on Health, Welfare and Pensions of the Wage Stabilization Board, 1951. He is coeditor of Readings in Social Security (1948).

Community Programs for the Elderly

By Harry A. Levine

Old age is in fact a quality of mind and body whose onset varies from individual to individual rather than a mere quantity expressed by a term of duration applicable to all.
—Nuffield Report

THE purpose of society is the elevation of human life. Step by step, society has taken to itself the responsibility for public health, public education, public welfare, the care of the defective, the aged, the dependent, and the unemployed; and in the area of recreation, the provision of free parks, playgrounds, libraries, and museums. More and more, with the higher development of our civilization, we are including education in the helpful use of leisure time and the provision of means for such use.

Recreation and activity programs for the older person are peculiarly a function of democratic society. In his lifetime, the older person has made his contribution—given us his energy, his skill, and his children. We owe him the possibility of living his later years without frustration and rejection. We owe him the opportunity to prolong his usefulness—to contribute his energy and his wisdom to the life around him.

Recreational Resources

While society has largely accepted responsibility for the physical welfare of the older person, little consideration has been given to activity that will give him a feeling of usefulness and belonging, of adequacy and accomplishment, of acceptance and understanding—the things that tend to preserve the personality.

The institutions and resources for the older person that are presently available are limited. They have in no way kept pace with the increase in the number of older people, and with their strength and vitality. For the most part, they have paid little heed to the emerging concepts in the field of gerontology. These institutions were organized for a shorter life span and the different needs of an earlier era; they have changed little, despite the fact that the tired and worn old man or woman has been replaced by an aging person of considerably greater potential, with a whole set of new values, needs, and problems.

In the last decade the very numbers of older unemployed people drew attention and forced recognition of their presence. The recent interest in recreation and activity programs is a result of that recognition.

In many cities, councils of social agencies have special committees to work with the problems of the aging. They have stimulated the organization of a number of clubs and club programs. New York, Philadelphia, Chicago, Cleveland, Detroit, Washington, Milwaukee, and San Francisco have clubs sponsored by social agencies; some are co-sponsored with national organizations, like the National Council of Jewish Women; some in co-operation with settlement houses and community centers.

Settlement houses and community centers are very much interested, and are developing club programs. A few are developing day center programs.

Churches, synagogues, and other religious organizations have an important contribution to make and are becoming aware and interested, but the facilities

are not often conducive to free and easy associations. Church rules about smoking and playing cards are restrictive; also, janitorial service and heat seem to be a primary factor for many churches.

Some homes for the aged have recognized the value of creative and recreational programs in maintaining the strengths of the older resident. They have arts and crafts, choral groups, entertainment and occupational therapy programs. They are only now becoming aware of the possibilities of extending services to, and of their responsibility for, the nonresident as well as the resident older person.

Libraries and museums are co-operating; Cleveland has its Live Long and Like It Club. Libraries plan book clubs and reading clubs, lectures and discussions, with hobbies and health as the major interest.

A few universities in this country, such as the Institute for Human Adjustment at the University of Michigan, sponsor courses and institutes on aging. Some school boards, like the Board of Education in New York City, sponsor courses and adult centers. They have opened some of the public schools in the evening for recreation and activity programs. Some park departments and home economic departments sponsor hobbies, crafts, gardening, lectures, and educational activities.

The golden age clubs

There are some golden age clubs sponsored by business and professional groups; a few have been started independently by older people and are completely autonomous, like the grandmothers' clubs. Most are open to all, regardless of race, color, or creed; others have been formed with particular cultural and professional interests in mind. There may be as many as three hundred clubs in the United States. All clubs provide social contacts; many include lectures, discussion groups, motion pictures, and television.

Noncommercial recreation for the older person is best exemplified by these golden age clubs, meeting once a week or once a month for a few hours in an afternoon or evening. They are a blessing for those who have other activities during the day; they can and often do supplement work or household chores. In some cases they are a substitute for membership in societies and organizations which the old people can no longer afford. They provide companionship and have cultural value. They are a valuable addition to recreational resources.

The day center

A recent development and a new resource—one which recognizes the broader needs of the older person—is the day center. The Department of Welfare in New York City developed the first day center in this country some eight years ago. There are now twelve such programs, open from nine to five o'clock, five days a week, in New York City and a number in other cities in this country. The idea of the centers has spread to England, Canada, France, and Australia.

The centers have adopted the knowledge, the techniques, and the programs developed by the recreation field. They have found that the values and benefits accruing to younger people in such organized programs are applicable to older persons. They recognize that recreation is a basic human need, and the facilities are planned accordingly.

Facilities in the centers include lounges for talk and reading, large rooms for mass activities, playrooms or play areas for cards, checkers, and chess, workshops, meeting rooms, classrooms, and libraries. A number have darkrooms for photography; one has a

poolroom. Some have yards for outdoor games. A kitchen is part of every center, for lunch and refreshments and to make parties possible.

The members of the centers sing, dance, and play cards and games. They make friends. They visit each other. Some even find romance; there have been eleven marriages in one center to date. They visit museums and places of interest regularly. They celebrate each other's birthdays once a month. They plan boat rides and picnics, and celebrate holidays. They have motion pictures, bazaars, and exhibitions of their work. They paint, write, and participate in editing magazines. They write their own plays and act in them. They make clothes, hats, jewelry, and costumes for plays. They have classes in woodwork, copper, leather, ceramics, English, sculpture, poetry, music and music appreciation, elocution, and acting. They maintain old skills or develop new skills and interests. They have discussion groups and regular information programs on health and geriatrics. The center becomes a major source of information. They have orchestras and choral groups. They do all the arts and crafts. The retired or unemployed older person may well bring a renaissance of folk art and craft to America.

There seems to be no limit to the interest and activity that may be developed. Interest can be aroused that will hold groups of different cultural levels. There are unlimited areas for activity, both intellectual and physical, for continued personal development.

Staff members include caseworkers, group workers, registered occupational therapists, and specialists in activities such as music, dramatics, carpentry, and arts and crafts. Counseling and casework are important areas of activity for the staff. A housing registry is maintained in some centers. Every center has developed a visiting committee of members who not only visit their own sick members but are extending this service to agencies in the community to visit shut-in older people.

Meeting the diversity of desires and needs of their members, these centers are planned as a constructive substitute for the loss of the workday. Members come and go freely. Most come all day, every day; some come two or three times a week. The centers are self-governing, with members carrying a considerable part of the responsibility for program planning and management. The centers are sponsored by public welfare agencies, voluntary agencies, interested citizens, or a combination of any of these.

Open opportunities

Industry and unions have an unusual opportunity to contribute to the well-being of the older person and to themselves by establishing day centers for their retired workers. Along with furnishings for the usual activities, these centers should be provided with shop and laboratory equipment, tools and materials. This would stimulate and open up vast opportunities for the retired worker, permitting him to explore and develop some of his ideas that he could not bring to fruition in a busy work life—to invent new tools and make changes in those with which he has worked. He can maintain some of the elements of his job; it can yield a reward that is rich in satisfaction and possibilities for him. His skill, knowledge, and time are tremendous untapped resources that have untold possibilities. The knowledge and the time used in these work-related activities should net innovations and improvements which may make a lasting contribution to our economy.

There is a beginning movement, today, to have homes for the aged open their doors to the nonresident. Old age homes—with physical plants, facilities, and funds for the care of the aged—have a stake in the preventive as well as the custodial care of the older person. Some homes have accepted responsibility for the nonresident, through a home care program. The program is necessarily limited by the number of older people that can be served and the kind of services possible. However, a day center program, as part of the homes for the aged, can give service to additional hundreds in the homes. Multiform activity programs and related services, developed in the day centers, can enrich the lives of the resident and the home-care older person, as well as the nonresident in the community. The resident can continue contact with the community through a contemporary healthier, stronger, more dynamic, day center member. He can be stimulated to join the integrated and less dependent day center members in many activities. Mental health seems contagious and communicable. The day center can bring that to the home. It can participate in the life of the home. The visiting committee program can be extended to include services to the bedridden, visiting, reading to them, writing letters for them, and so forth.

THE DEEPER NEEDS

Golden age clubs and other community programs are a beginning movement of recognition and acceptance of the older person. They enrich the resources in the community for his recreation. His contemporaries in these clubs add to his enjoyment and friendships.

Actually, however, the aging person does not need to seek out contemporaries to find pleasure and entertainment in his leisure time. Loss of employment may separate him from the industrial part of community life, but it need not separate him from the recreational fabric of the community. Neither loss of work nor diminishing physical capacity need change his leisure-time activity much. By and large, he can continue with familiar activity and be part of the community that he knows. Much, if not all, of his leisure time is associated with the evening. He can continue to enjoy movies and go to concerts, lectures, and classes. He can participate in church activity and community center and settlement programs. He can listen to the radio, watch television, read, and visit relatives and friends.

Recreation, no matter how important and no matter how broadly used, is only one aspect of the activity needs of the older person. Occasional and short contacts, inherent in recreation, do not satisfy the deeper need for creative and purposeful activity and do not meet the basic biological and psychological needs of unemployed, unoccupied older persons.

Activity

Activity as a primary human need, expressed physically, mentally, and emotionally, is basic to the older as well as the younger person. It is fundamental in preserving the personality. Basically, the older person needs to fill in his unused day with activity that will continue to use his abilities and his experiences—activity that will give him a feeling of adequacy, accomplishment, and usefulness.

There is belief that continued employment is the answer; it may be for some. Industry may learn to utilize more older people longer, but the greater number of older people will be unemployed. They must experience and resign themselves to unemployment at some time in their life. Nor does em-

ployment take into consideration the women who lose responsibility for the family or household. Together they form the main body, the largest number, of older people. It is this large reservoir of older people that should be the major concern of the community.

Activity-charged preventive programs for this large group will reduce the pressure and the need for custodial and remedial institutions. Dr. MacCurdy, of the New York State Department of Mental Hygiene, sees the investment of taxpayers' money in prevention rather than in building more and bigger institutions for the aged.[1] The steady increase in psychiatric casualties may be an indication of what is in store for us if a positive program of prevention is not developed.

"Retirement to"

Then, there is the other concept that man need not work until he dies; that after contributing forty or fifty years to our industrial well-being, he should have the opportunity to enjoy the contribution he has made—to enjoy our culture, our civilization.

Most people have areas of competency which a busy work life did not permit to develop. With longer life expectancy, with a stronger, less worn body, with a zest for life, with an interest in living and doing and a longer period in which to do nothing, deterioration will follow unless we develop preventive programs.

Most older people have experienced a great deal of frustration in their work life. Retirement could bring some satisfaction and happiness in later life if they could retire to rather than from something. Today, they have no choice.

Dr. E. G. Fried found that motivations for the frequently obsessive desire for work were the need to maintain self-esteem, the wish to escape from self-preoccupation and depression, and the striving to combat inner restlessness.[2] Folsom and Morgan found only a moderate correlation between work and happiness.[3] Conkey found, through interviewing, that the older person considered strong and varied interests and activity most important; economic security and independence were second.[4]

Activity and Motivation

In studies made by J. Landis of 450 persons 65 to 98 years of age, he found that all those who were active and had enough to do, including those even with hobbies, were better adjusted than others.[5] Folsom and Morgan found that hobbies and interesting activities are related to happiness. One-third of the persons studied found time hanging heavy on their hands; the busiest were happiest. Morgan also discusses the opinion of 55 older persons listed in *Who's Who in America*. They, too, emphasize the importance of having plenty to do in order to be happy.

Resources for activity are very limited. Community day centers for older people need to be developed to promote:

[5] J. T. Landis, "Social-Psychological Factors of Aging," *Social Forces*, Vol. 20, No. 4 (May 1942), pp. 468–70.

(1) the social and emotional adjustment of the older person by making it possible for him to find companionship and create an environment that is favorable to his expansion; (2) the rehabilitation of personal efficiency by making it possible for the older person to make the maximum use of the capacities least impaired; and (3) community usefulness by creating a feeling of adequacy and accomplishment through an activity program.

A day center program utilizing the added time, the remaining strength, and the areas of competency of the older person during the hours usually spent at work can provide satisfactions associated with work, such as social usefulness, opportunities for self-expression, recognition, belonging, companionship, an established routine, something to look forward to. The center offers him choices in a climate that is conducive to experience and growth. Choices are fundamental. What the older person does from choice has meaning for him. At the center, activity is not just arts and crafts but motivation to do, movement, participation, and excitement. Time hangs heavy on his personality, particularly between nine and five o'clock, when everyone is busy and he feels separated from the main stream of life. Time can be a corroding factor with little to do, but in a center program on a planned basis, it becomes an added form of energy, replacing diminishing energy and vitality.

Decline does exist for the average, but individuals differ sufficiently to develop opportunities for creative activity for many members, particularly when decline in capacity may really be decline in motivation. Fatigue may easily be a defense mechanism—the result of being bored, useless, or not necessary to anyone. Even orientation or difficulty in accepting people may be due to lack of channels for emotional expression; for when put at ease and encouraged, such persons show unusual improvement and change.

The Group Factor

The center recognizes the importance of group interaction in the life of an individual, and its tendency to be pattern-setting. The center uses the group to support and strengthen the individual; to help develop his talents and experiences or redirect them to find new uses, new goals, new roles of social usefulness. While physical fitness, psychological needs, and acquired habits and attitudes affect the choice of activity, the group can and does modify the motives, habits, and attitudes in continued effective participation.

Physical limitations may not change fundamentally, but changes in adjustment to such limitations are observed in group activity. The center helps the older person to live with his limitations, but, even more, it concentrates on his strengths as it utilizes them in activity programs. It affects his tempo and accomplishment. As he becomes more involved in a group program, his understanding of himself undergoes change. There is less and less effort to rationalize inadequacy and failure on a health level. Instead, there is discovery of skills and talents that he can appreciate and others will accept, and there is recognition of the idea that these skills and talents can grow, increasing his feeling of adequacy and accomplishment. Integrating the older person in group activity enables him to recognize that others around him have equal limitations and are utilizing the strengths they have to achieve and create.

As the individual becomes more integrated in the group, there is noticeable day-to-day expansion which, in itself, is energy created through the group. In a group setting he is helped to de-

velop a definite interest in purposeful activity, which he is stimulated to follow systematically. Energy may be increased by using it. The more the group accept responsibility, the more they participate. The more they participate, the more easily they learn. The more they learn, the more they retain what they learn.

Acceptance, recognition, attention, relationships, make for a steady recovery from fear, loneliness, and frustration. There are members whose chief preoccupation was with their health and visits to clinics, who are now more discriminating in their visits to clinics. In one center there was a drop of 70 per cent in clinic attendance after six months of membership. In a recent study of the visual acuity of sixty members of the Hodson Center by psychologists and ophthalmologists of the United States Public Health Service, it was found impossible for a number of the members to see; yet they have not been limited in their activities. The same was found in a survey of some thirty members who had cardiac conditions. In a number of instances, their physicians insisted that the patients were too sick to be out of bed; yet they attended the center regularly. The obvious conclusion is that the adjustment to decline in capacity or a physical handicap depends on more than strictly organic factors.

CONCLUSION

In a democracy it should be possible for the later years to be less of a struggle and to be filled with some satisfactions in accomplishment and creativity. Given the opportunity, the older members of our society can contribute to our cultural well-being. The Grandma Moses' are not unique; they can be the rule, rather than the exception.

The constructive use of man's later years is possible if we can give him a sense of achievement, lessen failures in his efforts, and develop possibilities compensating for impaired capacity. To do that, we need to evolve an activity program in a day center that will include medical, psychological, and psychiatric facilities, as well as group work, casework, and personal counseling. Such a center can constructively affect the characteristics of the older person. The enormous amount of unused time holds untold possibilities of cultural enrichment for the individual and society. Society must provide the opportunities for the constructive use of time and energy. It must enable all to fulfill the promise of growth and achievement offered in the prolonged life of man.

Harry A. Levine, New York City, is director of the Special Services for the Aged in the New York City Department of Welfare. He is founder of the Hodson Center for older people, and has been in the forefront of the development of the center program for older people in this country. He has given institutes on aging at the New York State Conference of Social Work and the University of California, Berkeley, and is active in numerous organizations dealing with the problems of the aging.

Employment Services for Older Workers

BY CHARLES E. ODELL

DURING the first six months of 1950 the public employment services in five states co-operated with the Bureau of Employment Security of the United States Department of Labor in making a comprehensive study of the employment problems of older workers. Localities in which studies took place were Columbus, Ohio; Houston, Texas; Lancaster, Pennsylvania; Los Angeles, California; and New York City. These localities represented small, medium-sized, and large communities with labor market conditions ranging from relatively high unemployment to virtually full employment. The studies covered a cross section of the labor market, including all occupational and industrial groups.

Local employment offices which participated in the studies selected, over a period of four months, a random sample of all their applicants 45 years of age and over. They divided the total sample into a control group and an experimental group similar in composition with respect to age, sex, occupational distribution, handicapped status, and length of unemployment. The control group received no service they would not have received under any circumstances in the regular course of operations of the employment office. The experimental group received intensive employment counseling and job placement services exploiting every device suggested by the experience or ingenuity of the most capable and best-trained counselors and placement interviewers. The counselors and interviewers analyzed carefully the characteristics and problems of these applicants, and attempted to determine the effectiveness of the services of the local office in improving their employment opportunities and in assisting them to achieve successful job adjustment.

During the course of the studies, participating local offices collected labor market information on 342,000 workers of all ages. They analyzed over 13,000 job openings to plot the pattern of hiring specifications as they relate to age. The more intensive study of the control and experimental groups of workers 45 and over for a period of six months yielded complete counseling and placement information on 4,657 individuals and partial information on 4,070, or significant data on a total of 8,727 older workers.

WHEN IS A WORKER TOO OLD?

Quantitative data of the studies refer only to workers 45 years of age and over. This, however, is merely a statistical convention. The age at which a worker encounters employment problems because of characteristics associated with aging varies widely with his occupation, his industry, and the locality in which he works. A worker in one occupation or industry, such as retail specialty sales, may begin to experience employment difficulties at 35 or younger; while another worker in, for example, the wholesale field, may have no trouble in finding and holding a job at 55 or even 60. In New York City, a floor girl in the needle trades is "old" at 40, but a patternmaker at 65 is often preferred to a younger worker.

Generally, employment problems connected with age arise earlier for women

than for men. Columbus reported that, in the opinion of the counselors, women of 35 meet employment difficulties comparable to those of men at 45 or even 50. In Houston, more than one-third of all women over 45 registered with the local office were clerical or sales workers, but four-fifths of the employers' orders for women in these occupational categories bore age restrictions below 35. Lancaster found that not only in clerical and sales work but also in factory production work, employers placed age restrictions of 18 to 35 on the hiring of women workers.

Evidently, the age at which a worker is considered old industrially depends heavily upon the kind and degree of skill, the industry, the prevailing conditions of the local labor market, the type and strength of unionization, and the personal qualifications of the individual job seeker.

Since it is inaccurate to define the older worker in terms of age brackets, the Bureau of Employment Security has adopted, for the purposes of employment services to older workers, a definition specifically in terms of their employment problems: "An applicant is an older worker only if he is encountering difficulty in getting or keeping a job principally because of his age or of characteristics ordinarily associated with age."

ATTITUDES AND BIASES

Many complex factors affect the difficulty of the older worker in obtaining and retaining employment. Particularly serious are widespread and obstinate attitudes which reflect common biases and the tendency to stereotyped thinking about older people.

One instance is the misconception that chronological age is synonymous with physical and mental aging—despite all experience to the contrary. Case reports in our studies of older workers demonstrate dramatically that some people in their 40's or 50's manifest all the characteristics associated with aging, whereas many people in their 60's or older do not. For example, the New York report describes one applicant of 51 as follows: "His face was haggard, his hands had a discernible tremor, his manner was alternately bold and whiningly timid. . . . He repeated himself endlessly and revealed no growth of insight into his problems." This would strike most people as a description of traits associated with advanced age. On the other hand, the Los Angeles report cites the case of a woman of 63 who was remarkably young-looking and whose "personality was so delightfully youthful that she could not understand why so many women of her age were so drab." She was so ill able to understand that she set herself up in business giving private lessons in "charm" to women over 50. Obviously, this woman was young beyond her years.

Generalizations concerning the comparative productivity and stability of older workers are another example of conclusions unfounded in fact. Employers often give as their reason for not hiring older workers their opinion that such workers have set work habits and are not adaptable; that they cannot get along with younger workers; that they lack physical stamina necessary to keep up with production schedules; or that they do not respond to training. No studies support these opinions.

The typical older worker is a stable and responsible individual who changes jobs less often and has a better record of attendance than younger workers. The Bureau of Labor Statistics, in a study of nearly 18,000 plant workers in a wide variety of industries and occupations, showed that the absenteeism rate fell steadily as the age of the worker increased, and that in every age group over 50, workers lost fewer scheduled work days than those in any age group below 50.[1] Older workers produce as much as do younger workers, and with a more even work pace and less wastage. In a recent survey of 2,794 companies with 2.5 million employees, 22 per cent of employers reported superior work performance, 48 per cent superior attendance, 32 per cent superior safety records, and 48 per cent superior work attitudes on the part of older workers.[2] As to the ability of older workers to work with younger groups, the Lancaster report mentions especially that some employers find the older ones have a steadying influence on younger workers, and therefore prefer to integrate some older workers into each operating unit.

Personnel workers too often fail to consider older people as individuals. They frequently assume that any job change for the older worker must necessarily be a downgrading. They assume that older workers fall perforce into certain limited occupational classifications, for instance, service fields, and that certain jobs are eminently suitable for older workers, such as those of watchman and elevator operator. The employment service studies show that, while about 29 per cent of older workers who obtain employment accepted lower pay than they had formerly received, 16 per cent got jobs at higher pay.

ECONOMIC OBSTACLES

Economic considerations are an important factor in the employment problems of the older workers. Many older workers have incurred financial obligations which require a relatively high income. Such workers are not able to accept job changes or downgrading with significantly lower pay. Even in the absence of other obligations, responsibility for dependents and for a home often limits the older worker's job choices.

For example, jobs in service occupations are less likely than others to carry age restrictions, but they frequently furnish meals as part of their compensation, and many of them require the worker to live on the employer's premises. The Houston report points out that many older workers cannot accept such jobs, because people "want food for their entire families, not just for themselves," and people who have homes do not wish to live on the job. Also, responsibility for a family often limits the mobility of the older worker. The Lancaster report notes that the older worker often cannot consider a job in an area other than that of his home.

Again, older workers, as the Columbus report comments, are not often in a position to engage in long or expensive training, though it might vastly improve their opportunities for employment.

Economic considerations seriously affect, too, the willingness of employers to hire older workers or to retain them in employment. Many employers argue that the older worker's reduced physical activity or production speed raises cost of operation. A great many employers fear rising cost of pension and insurance systems should their pay rolls show any large number of older workers. When the employed older worker actually cannot perform adequately in his usual occupation, employers feel that his shorter work expectancy does not warrant the expense of training or retraining him.

MODERN INDUSTRIAL POLICIES BOTH HELP AND HINDER

Certain practices which modern industry has adopted, and which are generally beneficial to workers, are often complicating factors in the employment of older workers. Seniority, which generally protects the employment of workers until they reach retirement age, affects adversely the unemployed older worker's chance of becoming re-employed at the occupational level and pay rate for which he qualifies.[3]

The practice of promotion from within, or the career policy, is generally beneficial to both workers and employers, because it is an incentive to employees to develop their aptitudes to the maximum extent possible and to maintain high standards of production. This practice, however, may have the same effect as the practice of seniority in limiting employment opportunities for the unemployed older worker.[4]

Insurance and pension plans generally provide protection to workers and their dependents against financial hardship. Compulsory retirement, however, cuts off employment opportunities at arbitrary chronological ages regardless of the worker's need for employment or ability to perform.[5]

Reports from all the employment service study localities cited company policies with regard to seniority, promotion from within, and insurance and pension systems as the reasons which employers most often gave for their applying age restrictions in hiring.

EMPLOYMENT OPPORTUNITIES—SCARCITY AMID ABUNDANCE

The total number of job opportunities is an important factor in the employment problems of older workers. However, the employment service studies conclusively disprove the popular assumption that full, or at least expanding, employment provides a complete solution to the older worker's difficulties in finding employment. The studies provide undeniable evidence that, under any and all circumstances, workers over 45 in every occupational category have fewer employment opportunities than their representation in these categories would warrant.

For example, in Lancaster 46 per cent of the skilled applicants were over 45, but only 19 per cent of the persons placed in skilled trades were over 45; the odds against placement of workers over 45 as a whole were on the average 6 to 1, with odds of 4½ to 1 in clerical and sales occupations, and 5 to 1 even in the semiskilled trades. Houston had had a tight labor market for a long time, yet 52 per cent of employers' orders in the local office carried age restrictions. In Columbus, where the labor market became stringent during the course of the study, four-fifths of the orders were for workers under 45, and two-fifths called for workers under 35.[6] A comparable condition prevailed in placements everywhere.[7] Generally, the odds were greater against women than against men.

In their unequal competition for employment, older workers often have to

[6] "Trained Manpower Going to Waste? Employment Services Survey Job Prospects of Older Applicants," *The Labor Market and Employment Security*, May 1951, pp. 18–19.

[7] Louis H. Ravin, "Live Longer and Like It?" *Employment Security Review*, April 1951, p. 32.

accept work in the less desirable occupations and industries. The study data show that there is a decided increase with advancing age in the proportion of workers in service occupations. In Lancaster, 23 per cent of older men applying for work at the local office were service workers, in contrast to about 4 per cent of those under 45; and in each of the other study areas, the proportion of older men in service occupations represented a similarly sharp increase over the proportion of younger men so classified.[8]

Since service jobs are comparatively low paid and often involve poor working conditions, the availability of opportunities for employment of older workers in the service occupations is really significant of disadvantage rather than advantage.

LONG PERIOD OF UNEMPLOYMENT

One of the gravest aspects of the employment problems of older workers is the long period of unemployment which the majority of them suffer once they lose their jobs. This is a severe hazard both to the worker himself and to society. In all the employment service study localities, a considerably larger proportion of older than younger workers remained unemployed for more than twenty weeks.[9] A high percentage of older workers remain unemployed long enough to exhaust their unemployment insurance benefit[10] and also any personal financial reserves they may have accumulated. Thereafter they must accept private or public assistance, which entails for most people a loss of social status and self-esteem.

[8] *Op. cit.* note 6 *supra*, pp. 15–16.

[9] *Ibid.*, p. 17.

[10] "Older Workers at the Public Employment Office," *The Labor Market*, June 1949, p. 36.

Serious as is the effect of unwonted dependence as concerns the older worker, however, it is even greater with respect to society as a whole. It increases the cost of social security and public assistance programs. It deprives the economy of much potential production. Estimates of the value of production we lose because older people who are willing and able to work are not working run into billions of dollars.[11] The unemployment of older workers eventually lowers the standard of living of both the older workers and employed workers whom they burden.

IMPORTANCE OF PUBLIC EMPLOYMENT SERVICE

The services of the local offices of the public employment service are of pivotal importance to the older worker in his job seeking. An unexpectedly high percentage of the older workers of the study groups who became employed obtained their jobs through the employment service. This was true of the workers in the control groups as well as those in the experimental groups, although those in the control groups received no special services and benefited from no special placement efforts. Employment through relatives, friends, advertisements, private employment agencies, and even unions, was negligible in all groups.

The prominence of the employment service as a source of placement for older workers is remarkable because for the general run of applicants, employment agencies, whether public or private, rank well below other sources of placement. A number of investigations have shown that about 40 per cent of

[11] John D. Durand, *The Labor Force in the United States, 1890–1960* (New York: Social Science Research Council, 1948), pp. 184–85.

all applicants for work secure jobs through their own efforts, while another 25 per cent find employment through relatives and friends, and substantial numbers get work through unions. Generally, only from 15 to 20 per cent secure employment through the public employment service. Among the older workers studied, 39 per cent obtained placement through the employment service.

INTENSIVE INDIVIDUALIZED SERVICE NEEDED

No doubt the employment service ranked so high as a source of placement for older workers in general and those in the experimental group in particular because of the need of large numbers of these applicants for intensive counseling and placement services to assist them in securing and retaining employment. About half of the older workers do not require any special service; but the other half require a great deal of attention in order that they may locate and take advantage of employment opportunities.

It is safe to say that the employment service has better facilities for providing the special services which these latter applicants need than does any other source of placement service open to them. While there are instances of outstanding performance by some private agencies and institutions, nowhere outside the local offices of the employment service can workers obtain the comprehensive information and assistance which the employment service can provide to help them arrive at a realistic appraisal of their own capacities in relation to immediate and prospective employment opportunities, and of the ways in which they can adjust themselves to existing labor market conditions.

The services available to older workers through the public employment service consist of especially careful application taking; technically accurate occupational classification; intensive employment counseling; placement service, including the development of job opportunities by individual job solicitation, where necessary; and an employer promotion and public relations program which encourages understanding of the advisability of employing older workers. The application process and the technique of occupational classification have their bases in the extensive occupational research in which the employment service constantly engages, and which has produced the Dictionary of Occupational Titles, defining 22,028 individual jobs occurring in industry in the United States.

EMPLOYMENT COUNSELING SERVICE

The older worker studies showed that traditional methods of factual recording and classification of past work experience and training of older workers was not an adequate approach to the counseling interview. The employment counselor must often assist the worker to dissect and analyze his employment history, by isolating all the separate skills he has acquired, by recognizing relationships among these skills, and by seeing how various combinations of these might make it possible for him to perform a number of different jobs. After helping the worker to analyze his qualifications for the performance of jobs, the counselor must often assist him to relate this analysis to information regarding the labor market conditions currently surrounding opportunities for employment in specific types of jobs.

Employment counseling services were also found to include special techniques for the placement of the physically handicapped, known as physical capacities–physical demands analysis techniques. These are devices for appraising the abilities of the physically handicapped and matching these abilities to the demands of jobs which they can perform in equal competition with workers who have no disabilities.

These techniques are also used with workers who, though not actually physically handicapped, are undergoing the physical changes of aging, but who do not recognize that these changes are the source of their difficulties in securing or maintaining employment. In such cases the counselor modifies the specific check lists to reflect the effects of decline in capacities rather than loss of capacity. The positive emphasis of the physical capacities approach upon abilities which remain intact usually overcomes the worker's reluctance to acknowledge impairment or slowing down of other capacities. It was found that the use of the physical capacities approach may actually broaden the scope of the worker's search for employment in that he need have no fear of conceding that there are jobs which he can no longer perform, since this approach opens up many possibilities for which he can apply with confidence.

INCIDENCE OF DISABILITY

What has just been said about the use of techniques ordinarily associated with the placement of the disabled should not be misconstrued to mean that all, or even a very significant number, of older job applicants in the studies were physically disabled. The studies indicated that the incidence of physical handicaps among older workers was only slightly higher than among the general applicant population and the younger age groups. The studies show, also, that physical handicaps in older workers are not in themselves a major factor in their problem of finding employment. Proof of this is that the proportion of handicapped older workers who obtained employment was very close to their proportion in the samples.

It was reported that the handicapped older worker has usually made a more satisfactory adjustment to his disability, so that it is no longer a significant factor in his competition for employment. This is, no doubt, because the most prevalent handicaps among older workers are of types which result from gradual deterioration rather than from sudden accident or acute illness. The most common handicaps found in the study groups were impairment of vision or hearing, spinal or abdominal weaknesses, and cadiovascular conditions. In addition to being gradual in development, such handicaps usually do not involve a diminution of strength or agility to levels below those required in most jobs.

ORGANIZATION OF COUNSELING AND PLACEMENT SERVICES

Those who participated in the older worker studies agreed unanimously that adequate service to older workers does not require organizational segregation. In fact, they agreed that the special attention which the older worker needs consists of intensified, individualized treatment frequently involving counseling, employer solicitation, and other services already available to applicants in the public employment service. The methods and processes involved are in many respects similar in technical content to those used in service to youth, the handicapped, and other groups. The total facilities of the local office are necessary for effective service to older workers perhaps to a greater degree than for any other special group. Integration of services to older workers with the regular service to applicants in

the local office was felt to be the best method of providing adequate counseling and placement services to the older worker group.

VOLUNTARY EFFORTS TOWARD EMPLOYMENT OF OLDER WORKERS

Prejudices against older workers are deep-seated and widespread. Efforts to overcome them should be equally widespread, and all agencies and individuals interested in the problem should be encouraged to participate in working toward a solution. Beyond the necessity for full exploitation of limited resources, voluntary efforts toward the placement of older workers have a morale-building value, and help them to help themselves in alleviating their plight.

One example of a voluntary enterprise which assists older workers toward employment is the type of organization known as the Forty-Plus Clubs. These are groups of unemployed older people who have had successful experience as executives in business and industry.[12] They supply to each other their employment histories, and visit employers for the purpose of soliciting employment for each other. That is, the individual does not try to sell himself to the employer, but attempts to persuade the employer to hire another qualified member of the organization. The theory behind this procedure is that workers are sometimes embarrassed in attempting to present to employers their own work histories, whereas a man can often make a very good case for another man. In some communities, the local employment offices have furnished space and facilities to Forty-Plus Clubs and similar enterprises in order to expand the scope of their own limited contacts with employers.

Another type of voluntary effort at employment is self-employment. Instances of this type of effort have developed in Wilmington, Delaware; Erie, Pennsylvania; and Schenectady, New York; where well-qualified technicians, forced into retirement by company policies, have sought and found means of furnishing engineering, designing, accounting, purchasing, and other services to smaller firms which could not afford full-time personnel in such specialties. The employment service in New York cites as an instance a man who, finding it difficult to obtain employment because of his age, developed a miniature golf course for himself, his wife, and another couple. This enterprise provided employment for four older workers, willing and able to work and maintain their independence.

Another type of voluntary effort is reported by the Cleveland Vocational Guidance Bureau and the Federation Employment Service of New York City. These are local community projects. They do both individual and group counseling, and also provide the services of recreational consultants.[13]

PARTICIPATION OF MANAGEMENT AND LABOR

Management and labor can make a significant contribution toward solving the employment problems of older workers. In collective bargaining for pension plans, there should be agreement on permissive retirement age at which those who no longer want to work or are unable to work could retire on full pension. Where pension plans with fixed retirement ages are already in effect, the companies and unions involved should study the possibility of making retirement voluntary at the specified age, with the exception of those certified on the basis of medical examination and other criteria as unable to perform, for reasons of health, on plant.

The development of criteria for such their jobs or other jobs available in the purpose constitutes an important task for management and labor alike. Management and labor should arrive at arrangements for the vesting of pension rights. This would mean that an employee who leaves a job would have retirement rights proportionate to contributions already paid into the pension fund. An older worker with a vested interest in one or more pension funds would have one disadvantage removed in seeking another job. His new employer would not have to look forward to retiring the worker on an inadequate pension based on a limited period of employment. Better still would be some pooling of private plans paralleling the federal old-age insurance system.

Management and labor have, in a number of cases, worked out and adopted flexible wage standards which enable older workers to take less productive jobs at lower hourly rates. Some unions have added to seniority provisions of contracts by agreeing to shift older workers to easier jobs at lower earnings in order to continue employment. Other areas requiring the attention of management and labor in maintaining continuity of employment opportunity for older persons who wish to go on working will be explored at a conference to be held soon under the joint sponsorship of the McGregor Fund of Detroit and the National Social Welfare Assembly, and in the forthcoming report of a survey of management practices in dealing with older workers prepared by Mrs. Elizabeth Breckinridge of the Committee on Human Development of the University of Chicago.

RESEARCH NEEDED

Success in increasing job opportunities for older workers depends heavily upon research findings. We should investigate the attitudes of older workers toward employment, their ability to meet job requirements, their need for jobs, and ways of expanding their employment opportunities. This type of research is being done to some extent at present by individual companies, employer organizations, unions, universities, and private and governmental research agencies. More is needed. Specifically, research programs should investigate some of the following: (1) physical, mental, and social changes typical of various age groups, and the extent of overlap; (2) development of measures of functional capacities particularly significant in employment; (3) employment opportunities and job requirements in particular industries and occupations in relation to changes characteristic of the aging process; (4) pilot studies within industry to test in operation various plans for utilization of older workers; (5) the costs of retraining and rehabilitation programs in relation to the resulting value of production; and (6) analysis in statistical terms of the work capacities and productivity of older persons as compared to their younger fellows.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

CANHAM, ERWIN D., together with members of the staff of the *Christian Science Monitor*. *Awakening: The World at Mid-Century*. Pp. x, 209. New York: Longmans, Green & Co., 1951. $2.75.

This simple, straightforward compilation is held together with hope. It is couched in a constructive journalism which reports, wherever possible from a wide arena of activities, the spirit in confronting "all-powerful materialism." The hope is meant to be a personal challenge. It is difficult to know the precise audience for this volume, but it would be a pity if the volume's simplicity were mistaken for inadequate analysis.

The concluding program of action recommended by the distinguished editor of the *Christian Science Monitor* does not seem impossible after the clues of the preceding chapters. (1) "The free world must continue to strengthen its physical defenses against aggression." (2) "We must preserve the economic soundness of the free world." (3) "We must set forth our program of coexistence and peace alongside the communist powers." Canham adds, "The free nations have not yet thought through and proclaimed the terms on which they are willing to make peace." (4) "We must lift a standard for a more effective, righteous government within the free nations." (5) In addition to improving international organization, we must "proclaim and clarify to ourselves and to the world the spiritual significance of the free systems as the true and liberating revolution of human history." (6) Finally, we must seek to understand the viewpoints, the needs, and the spiritual pride and hunger of other peoples and other races.

After discussing the twilight of materialism, the rise of womanpower, the new frontiers of the natural sciences which can include "compassion," the weakening of the second principle of thermodynamics (entropy), and the theory of the "survival of the fittest," there is a shrewd analysis of the "formidable massed impatience" of the "have-nots." Trygve Lie is quoted: "I believe that the rise of dependent peoples and the human-rights movement will in the long run have far more significance and give rise to greater events in the second half of the twentieth century than will the present ideological struggle." A prescription follows, what Canham calls "free collectivism"—"our whole social structure is crossed and recrossed by lines of individual-based togetherness." He adds, "the free collectivism of our system points the way to progress far beyond Marxian collectivism."

Fairly confident chapters on medicine, education, and theology, and more tentative chapters on art, music, fiction, and drama round out this stimulating volume. If readers of THE ANNALS note that Mr. Canham and his colleagues might well have distilled a chapter of strength from the social sciences, it can be said that some of the insights of these disciplines are sprinkled, without jargon, through the book.

RICHARD H. HEINDEL

Washington, D. C.

MORGENTHAU, HANS J. *In Defense of the National Interest: A Critical Examination of American Foreign Policy*. Pp. xii, 283, viii. New York: Alfred A. Knopf, 1951. $3.50.

Incisively critical of postwar American foreign policy, this brilliant analysis by the author of *Politics Among Nations* is built around an appeal for recognition of the dignity of the national interest. The utopianism that has handicapped American diplomacy since 1900 needs, the author feels, a healthy admixture of realism —of old-style balance-of-power, sphere-of-influence politics.

In the course of his argument Morgenthau touches on a favorite theme—that a major defect in our postwar policy is refusal to compromise or even to negotiate with Russia. This, combined with failure to realize the military realities in Europe, failure to comprehend the genuineness of the revolutions in Asia, a chronic tendency to underestimate Russian power, and a "failure of will" to act even when we understand what is required—has so intensified the present highly charged atmosphere that diplomacy is next to impossible.

Support of a settlement with Russia is not to be confused with appeasement: the author is quite aware that a settlement may be impossible. His point is that it has not been tried, and that it ought to be tried. He cites Winston Churchill in a phrase which puts his own theme quite well: "It is better to have a world united than a world divided; but it is also better to have a world divided than a world destroyed."

The book suffers somewhat from the author's tendency to make too sweeping an indictment. With all its utopianism current American policy contains a hard core of *Realpolitik* never quite acknowledged in the book. In his analysis of the political revolution of our time the author develops the concept of the bipolar world, wherein "the give and take of compromise become a weakness neither side is able to afford," and "the flexibility of the balance of power and its restraining influence . . . have disappeared." Nonetheless much of his condemnation of American policy appears to be aimed at this very uncompromising quality which he asserts is inevitable; much of his case for negotiation is supported by nineteenth-century balance-of-power examples which he elsewhere deems inapplicable.

Despite such occasional inconsistencies the book stands as a major landmark among analytical studies of American policy a stimulating, searching, and often penetrating work which will accomplish that elusive objective of such studies—to make the reader think.

OLIVER BENSON

University of Oklahoma

KENNAN, GEORGE F. *American Diplomacy, 1900–1950*. Pp. viii, 146. Chicago: University of Chicago Press, 1951. $2.75.

This little volume comprises six lectures delivered at the University of Chicago by the man responsible for setting up and for a time directing the Policy Planning Staff of the Department of State, and an appendix of two articles by the same author reprinted from issues of *Foreign Affairs* for July 1947 and April 1951. It may be remarked in passing that in the opinion of this reviewer the articles are better written, more tightly reasoned, and altogether less vulnerable than the preceding addresses. In the latter the author examines our foreign policies of the last fifty years and in general finds that we have slipped badly. It is apparent that he longs for the good old days when diplomacy was accepted as an esoteric art in which trained and experienced "realists" could work unhampered by the distracting intrusions of a prying public.

The greatest concern of the lecturer is apparently aroused by the "impractical

idealism" (p. 69) which has led to serious errors in judgment of our diplomats during this fifty-year period, and to their failure to take account of "power realities" (pp. 45, 51, 53, *et passim*). In particular he deplores the American tendency to venture moral appraisals of the actions of other nations and our habit of "making ourselves slaves of the concepts of international law and morality . . ." (pp. 53–54). He is distressed at our disinclination to admit "the validity and legitimacy of power realities and aspirations, to accept them without feeling the obligation of moral judgment, to take them as existing and inalterable human forces, neither good nor bad, and to seek their point of maximum equilibrium rather than their reform or their repression" (p. 53). Here, then, as well as elsewhere in these lectures, we find in substance a prescription of good old-fashioned *Realpolitik* with perhaps a slight dash of cautious idealism.

The author deplores big wars and long wars and is all in favor of compromises, especially to prevent the balance of power from being upset. One infers that this is regarded as far more important than to prolong a war for the purpose of thwarting the power aspirations (which we should not judge) of law breakers. From all of which it is understandable that the author takes a dim view of the League of Nations experiment, of the United Nations, and of international law except as it may come to be useful as the "gentle civilizer of self-interest . . ." (p. 54). But are not ideals and human aspirations, quite apart from power politics, also "realities" which the practitioners of diplomacy would do well to take into account?

FRANK M. RUSSELL
University of California

MCLAURIN, JOHN. *The United Nations and Power Politics.* Pp. xiii, 468. New York: Harper & Brothers, 1951. $5.00.

This is by all odds the most vital and pungent book yet to appear about the United Nations. It gets in behind the facade of formal debate and constitutional procedure to expose the political motivation of national governments as they have argued and decided the manifold issues which have come before the international organization. In the process, McLaurin (a pen-name) provides a remarkably detailed and factual account of the evolution of United Nation's operations from its inception to the end of 1950 on social and economic, as well as political, questions.

The result is a powerful indictment of national policies within and towards the United Nations—they "would shock our morals and revolt our common sense if we could see them in the light of day"—followed up by a bold, provocative appeal to the people of his own country (Britain) and of the other democracies to demand that their governments "call off the cold war so far as they are concerned, attempt conciliation and honour their pledges under the Charter."

McLaurin's central thesis is that governments, almost without exception, have betrayed the promises they made to their peoples in the Charter of the United Nations to make peace more secure and to advance human rights. On issue after issue, they have used the United Nations simply to pursue their own narrow national political ends. Even if a government appears to take a stand on broad principles of justice, fredom, or peace, the author demonstrates the presence of mixed motives, with the paramount regard being for "power-political" interests. As a result, the United Nations has had to function on the "low level of *Realpolitik*" instead of fulfilling the noble ends for which it was created.

Nevertheless, some positive achievements have been made. The net effect of political pressures, however base their motivation, has afforded a degree of protection to small states and dependent peoples. Even weak support from the United Nations has raised the fighting morale of victims or intended victims of aggressive or oppressive policies. Guilty governments have been exposed and made to feel uncomfortable. Good co-operation has developed between governments and technicians on social and economic problems, up to the point where these questions too came under the lethal hand of cold war politics or special interests. Through the work of the Economic and Social Council and its related agencies McLaurin accurately discerns that "lives have been saved, seeds of social growth sown, technical knowledge and skill have been spread . . . abuses of some human beings by others have been restricted." The most hopeful sign for the future, he believes, lies in the ability of citizens who oppose the wrong policies of their own governments to find "fresh determination and useful ammunition" in the debates and votes at the United Nations. With sympathy for world government as the ultimate answer to international conflict, he insists however that this object must first be earned by "honouring the Charter as it stands."

McLaurin freely admits that he has an "axe to grind." His righteous indignation against what he considers hypocritical, selfish power politics by member governments of the United Nations crackles through his fast-moving pages. He believes that common-sense dictates a primarily moral approach to political problems: "policies which pay heed to moral claims are likely to secure for us all that is legitimate in the concept of 'national interest.'" The onus for corrupting the United Nations is laid heavily on the West, because the author is particularly sensitive to a 'holier than thou' attitude on the part of his fellow-believers in democracy. But the score is also called on the Soviet Union and its satellites for willful, though not necessarily sinister, pursuit of national gain at the expense of human welfare.

While the author allows his moral convictions full play, he does not neglect the canons of objective scholarship demanded by his own profession of education. (He has recently been Visiting Professor of Education at Teachers College, Columbia University, and helped to organize the United Nations-UNESCO Seminar on teaching about the United Nations.) His factual account of United Nations developments is reliable, based upon extensive official documentation and information derived from obviously close personal acquaintance with the Secretariat. Moreover, his exposition of national policies in the United Nations is fair, depending principally upon the direct statements of delegates, selected with a reasonable regard for their context.

The most valuable part of the book is the comprehensive discussion of United Nations action on economic and social questions. This functional phase of the organization has not previously been presented so vividly and with such thoroughness to the layman. The operations of the United Nations International Children's Emergency Fund, the Economic Commission for Europe, the technical assistance program, the Trusteeship System, and the specialized agencies are reviewed sympathetically but with realistic awareness of the political and other obstacles which have blocked their maximum effectiveness. In addition, a blunt and refreshingly candid chapter on "The Veto and Unanimity" dispels much of the fog which has beclouded public discussions of this procedural question. McLaurin convincingly points out that, in fact, the veto has *not* been responsible for the discomfiture of the United Nations on vital political issues, except where the contemplated action might have led to a world war.

PHILIP E. JACOB
University of Pennsylvania

CORBETT, P. E. *Law and Society in the Relations of States.* Pp. xii, 337. New York: Harcourt, Brace and Company, 1951. $4.75

This study of international law, published under the auspices of the Yale Institute of International Studies, establishes a position somewhere between a skeptical radical denial of any binding rule between nations and the claim that nations are subject to a complete system of international legal order. The latter idea, which has guided academic treatment of the subject for centuries, is not even well founded in its own theoretical terms, according to Corbett's searching analysis of the main systems of juristic thought.

He concludes that neither the apostles of natural law nor advocates of the various positivistic consent—theories have suc-

ceeded in furnishing a consistent explanation of international law without having grossly to distort the relevant facts. The same is true of the closely related concept of a society of nations which in many of these theoretical systems figures as an explicit or implicit premise.

The practices of governments can hardly be reconciled with the assumption of a world society. Furthermore, the concept of such a society stands in direct contradiction to the notion of the sovereignty of its "subjects." Nor can we infer the existence of this society from the functioning of international organizations, since the latter are really but associations for specific purposes rather than manifestations of an over-all system. The idea of a society of nations is also constantly refuted when legal "obligations" of states to that alleged society receive second billing behind national statutes in courts which have to decide a conflict between the two systems. In short, there is no international law and no international society, and the effort to classify the usages of nations under these concepts the usages of nations under these concepts "involves wasteful self-deception and misdirection of energy, and leads to false expectations on the part of the public."

Is there then nothing but arbitrariness? Are the cynics right? No, says Corbett, there is a certain degree of social coordination depending on an "active but fluctuating and limited consensus." These conventions are something less than full-fledged legal rules. They are in a constant process of modification by pressure in which the might of the great powers plays a predominant role. This, while not approaching the regularity and predictability of national legal orders, is nevertheless useful. In the light of that thesis, the main body of the book surveys the foci of those conventions (such as territory, nationality, immunity, responsibility, war, and neutrality), showing both their regulating effect and their susceptibility to political forces. The most that can be expected from these "rules" is a slowing down of the pace of adaptation and some assurance against political action for frivolous reasons.

As one might gather, "rules" concerning war and warfare are more than others dependent on political conditions. This realization leads Corbett to the last part of his book in which he deals with international organization which alone, so he says, can remove the causes of armed conflict and thereby prepare the way for a genuine order of world law. With the cool detachment which characterizes most of the book, Corbett appraises the United Nations and finds it "legally powerless (in the case of conflict between the permanent members) to enforce its obligations." He concludes that the United Nations as "a society including the Soviet Union" has but marginal competence "in the sense that it does not reach to the great issues dividing our world."

At this point, Corbett abandons the sober judgment which has guided him so far in the study and proposes to base a more effective organization on "the international protection of the individual," that is, on an international guarantee of human rights. He seems to be unaware of the fact that this is a matter in which even the federal government of this country finds it unwise to assert its might against dissident regional conventions. It is difficult to see how he expects this most sensitive spot in a community's sense of independence to become fertile ground for the growth of international organization. Anyone who, like this reviewer, finds it beyond himself to accept Corbett's proposal as a realistic plan must close the book with the disappointed feeling that the largely negative insights of Corbett's study have not conduced him to the threshold of any rational guidance about where to go from here.

GERHART NIEMEYER

Washington, D. C.

KELSEN, HANS. *Recent Trends in the Law of the United Nations.* (A Supplement to *The Law of the United Nations*). Pp. 909–994 (continuous numbering). New York: Frederick A. Praeger, 1951. $2.50.

The North Atlantic Treaty, the action in Korea, the subsequent adoption of the Uniting for Peace Resolution in the United Nations, and the representation of China are developments of such importance that Kelsen found it necessary to deal with them in a separately published eighty-page supplement to his *Law of the United Nations*. In this, as in the main work, he confines himself to presenting different logical meanings of the documents, prefering not to concern himself with the political overtones which might also be taken into account. Thus, for instance, he finds that it is possible to infer from the Charter that the decisions of the Security Council regarding North Korean aggression were illegal because of the absence of the Soviet delegate, but that it is equally possible to conclude that they were legal, the Charter admitting both interpretations. Here, as elsewhere, Kelsen's preoccupation with formal words detached from the circumstances which give them color and meaningful effect leads him to unrealistic results, since he overlooks the fact that the Security Council itself settled this question. It assumed its right not to be thwarted by an absentee member, and fifty-three nations by their actions honored this assumption.

At one point only does he seem to deviate from this noncommittal attitude. Examining the Uniting for Peace Resolution he states that "it can hardly be denied that the United Nations under this Resolution assumes the character of an international organization very different from that which the framers of the Charter had in mind. The system of collective security established by this Resolution is much nearer to that established by the Government of the League of Nations than to that intended by the framers of the Charter." If this statement is meant to convey doubt as to the legality of the Resolution, it would seem to derive from somewhat vague general notions about the nature of the U.N. and the League rather than from Kelsen's own strictly formal premises. Moreover, it would appear to treat as legally irrelevant the fact that fifty-two nations, in voting for the Resolution, obviously deemed it to be in accord with the Charter.

Kelsen does not incline to attribute a similarly incisive effect to the development of a system of regional defense pacts which he considers an aspect of, rather than an alternative to, a global collective security organization.

GERHART NIEMEYER

Washington, D. C.

ASCHER, CHARLES S. *Program-Making in UNESCO, 1946–1951.* Pp. ix, 84. Chicago: Public Administration Service, 1951. $2.50.

This is an account of program-making in United Nations Educational, Scientific and Cultural Organization during its formative years by one who during a substantial part of the period participated as a staff officer in the actual processes which he describes. Furthermore, the author brought to his work in the Organization and to the analysis which he now gives us an extensive experience in the study and practice of public administration. The result is an exceptionally useful analysis and evaluation of UNESCO experience. The teacher and student of international organization, as well as the practitioner, are greatly in debt to Mr. Ascher for this case study. It can only be hoped that in addition to making this valuable contribution to our understanding of program-making in international organizations, he has also established a pattern of scientific inquiry which will be followed by others with similar, if not equal, competence and opportunity.

Dr. Ascher's account covers the period during which Dr. Julian Huxley was Director-General, from late 1946 through 1948, and in lesser detail, the first two years of the Bodet regime. He covers the work of the first five sessions of the Conference as well as the work of the Executive Board during this period. For the period of the author's active participation in the Secretariat, corresponding roughly to the directorship of Dr. Huxley, he gives in great detail the actual sequence and interrelationship of events. For the remainder of the period the account is less detailed and ceases to be based on first-hand experience. Consequently, one loses somewhat the feeling of participation in a vital process which for the earlier period the author is able to convey.

Mr. Asher's thesis is that the processes of program-making must be evaluated in terms of their success in achieving "balance and harmony in the program," "proper emphasis and concentration of effort," adequate co-ordination, the fixing of responsibility, "manage-ability" as well as economy, and the operation of each organ "on its proper level." His major conclusions with respect to UNESCO are that "only the self-restraint of Member States and better internal organizations of governments for participation in the work of UNESCO can assure balance, harmony, and concentration in the final decisions on program, and that if UNESCO is to develop "a corporate tradition of its own, above rivalry and self-seeking of regionalism or specialism, it must look to the Director-General for leadership." This leadership, Dr. Ascher concludes, must be "responsible, human leadership" which "evokes institutional loyalty."

Dr. Ascher recognizes the special difficulties of the first formative years of UNESCO. He also sees clearly the difficulties arising from the wide range of UNESCO's concerns which require of the Director-General exceptional intellectual qualities combined with administrative skill, besides putting exceptional strains on participating governments. He is nevertheless basically optimistic, in the light of his own experience, regarding the possibilities of making UNESCO an effective working organization.

LELAND M. GOODRICH
Columbia University

BESTERMAN, THEODORE. *UNESCO: Peace in the Minds of Men.* Pp. xi, 133. New York: Frederick A. Praeger, 1951. $2.50.

On the correct assumption that UNESCO should be better understood by the public, Mr. Besterman has detailed his account of its aims and accomplishments in a manner that will be found both readable and informative to the general reader. The book embodies the observations of a man who from 1946 to 1949 held a high position in the organization as head of the Department for the Exchange of Information; it makes no pretense of scholarly research into documentary materials.

Mr. Besterman's description of the work of UNESCO begins with its efforts to promote education up to a fundamental minimum standard, particularly in parts of the world where illiteracy has been common. In later chapters he explains the work of the organization in the fields of science, the social sciences and humanities, reconstruction, mass information, and the exchange of persons. It is not surprising that he has found that "none of the disciplines is better organized on the international level than science," and that the social sciences and humanities have been "much less adequately organized."

The most interesting chapter of the book is the last one (Chapter VI) on criticisms and conclusions. As might be expected, the first point which the author makes in this chapter is UNESCO's lack of funds; its annual income of about $8 million, so he says, is approximately one-twentieth of the amounts spent by the member states on cultural propaganda. Mr. Besterman objects to the strict control now exercised by the annual conference over UNESCO's activities, and he questions the wisdom of the present principle of equal voting rights in the conference. He is critical of the "intellectual narrowness and inertia" of the delegates to the conference, as well as of their "financial niggardliness." The national commissions, he believes, have become too important, acting as the principal agencies by which UNESCO can make formal contact with member states. He is somewhat disturbed at the rapid turnover in the personnel of UNESCO. Although these criticisms seem both numerous and substantial considering that the author asserted in his preface that he did not intend "to pick holes" in the organization, they are presented without rancor.

The usefulness of the book is increased by bibliographies appended to each chapter. The Constitution of UNESCO is provided at the end of the volume. Pictures displaying phases of UNESCO's work will be of interest to some readers.

NORMAN HILL
University of Nebraska

NEWMAN, BERNARD. *Epics of Espionage.* Pp. 270. New York: Philosophical Library, 1951. $4.50.

This book is not a study of the institution of espionage, but a popular account of leading spies; it deals with actions more than motivations, with strategems and techniques to a greater extent than with the organization of spy systems. The time span is from Moses to Klaus Fuchs. The absorbing interest of the material outweighs carelessness as to style and silence as to sources. Newman does not overwrite; he does not gush; he does not romanticize the frequently sinister and sordid figures who crowd his pages.

A well-known British authority on the bizarre world of spydom, Newman is at his best in dealing with pre-Soviet European espionage. Avoiding the overpublicized and rather inept Mata Hari, he concentrates on the *strategic* spies—those whose activity was on a sufficiently grand scale to turn the tide of wars, not merely battles. From Napoleon's Schulmeister, who was "all brains and no heart," he turns to Stieber, the creator of the Bismarckian espionage bureaucracy. There is a succinct treatment of the Dreyfus case. Colonel Alfred Redl, the homosexual who betrayed the Dual Monarchy to the Czar from within the Austrian military counterintelligence, emerges as one of the most resourceful agents in modern history. Newman is also to be commended for giving Tyler Kent the place he deserves in any international gallery of infamy. This minor American diplomatic official betrayed both the "unbreakable" State Department code and the Churchill-Roosevelt cables to the Nazis. Had he remained undetected, he might have won the war for Hitler. The espionage accomplishment of Alger Hiss is minor by comparison.

Lucid and interesting accounts of the gallant Polish underground organization which saved London from V-bomb demolition, of the fantastic Trebitsch Lincoln, of Paul Dukes who served England from inside Lenin's Cheka, and of many others are interspersed with much firsthand information.

A minor weakness of the book is its treatment of the American War Between the States. A major weakness is the routine exposition of Soviet spying. Projecting his vast knowledge of espionage on the new canvas of Soviet Communism, Newman tends to search for identities, rather than significant differences. To be sure, he is aware of the fact that the professional spy is becoming absolete and is giving place to the indoctrinated traitor in high places. The changes brought about by atomic warfare, however, are not analyzed. For the first time in history, subversion of the outstanding scientific minds of a nation—minds which are normally incorruptible—has become the primary target. Technological and other factors may have made espionage most decisive in prewar, rather than in actual combat, conditions.

NATHANIEL WEYL
Washington, D. C.

MOUNTBATTEN OF BURMA, VICE-ADMIRAL THE EARL. *Report to the Combined Chiefs of Staff by the Supreme Allied Commander: South-East Asia 1943–1945.* Pp xi, 280, 47 maps and charts, New York: Philosophical Library, 1951. $12.00.

This is a literarily unadorned, factual official report, generally chronological in make-up and subdivided into: Introduction, Stategy and Operations, Civil Affairs, and Conclusions. Not designed for light reading, it will be a primary source for historians and students of the South-East Asia Theater, the one least known to Americans and one whose priority on troops and supplies was low.

The military student will discover a brilliant ground campaign in almost roadless country planned and executed by General Sir William Slim, now Chief of the British Imperial Staff, against numerically superior Japanese forces possessing better communications. His troops were principally British-led Indian, East African, and West African. Their exploits remind us that good soldiers are limited to no race but are the products of morale, leadership, training, and adequate equipment.

The United States never furnished more than about 6,000 combat troops but had by the end of the war more than 270,000 in the theater. The difference consisted of service personnel mostly engaged in road, railroad, pipe line, and airfield construction and maintenance.

The most valuable lessons are in the field of logistics and organization. "It was air supply alone which made the campaign in Burma a feasible proposition." Air drops supported surrounded units for as much as a fortnight until they achieved victory. Korea is not new in this respect, and it is of interest that our first Air Commander in Korea, General Stratemeyer, was Allied Air Chief in Burma. Of him Mounbatten says he "provided an outstanding example of how an Allied Air Commander should conduct himself."

On the other hand Mountbatten had sharp differences with his first American deputy, General Stilwell, partly due to Stilwell's many hats, including the one he wore as Chief of Staff to Generalissimo Chiang. The comment that "General Stilwell was succeeded by three Lieutenant-Generals, each of whom had at least two entirely separate functions" sum up the organizational enormities and diverse loyalties involved. Disagreements also arose between Mountbatten and Lieutenant General Wedemeyer when the latter replaced Stilwell in China after loyal service as Mountbatten's chief planner.

These disputes came fundamentally from the divergent aims of the Allies. The Americans' principal interest was aid to China. The British primary objective was the reconquest of Burma, Malaya, and Singapore. Mountbatten attempts and achieves a very fair statement of these differences, but one reads more between the lines than appears in the carefully chosen phrases of this official document.

EUSTACE M. PEIXOTTO
Brigadier General, U. S. A. Ret.
Washington, D. C.

LAMONT, CORLISS, *The Independent Mind; Essays of a Humanist Philsopher*. Pp. 187. New York: Horizon Press, 1951. $2.75.

The weaknesses, not less than the strengths of this book, arise from the author's conviction of the duty of independent mindedness, and from his consciousness of the snares and gins set in the path of a humanist, too readily ensnared by carelessness or unwariness. Mr. Lamont's tone is invariably generous and elevated; and the breadth of his sensitivity to nature and to art, and his sympathy toward the dignity and the suffering of persons, both in the abstract and within his own culture, deserves its full meed of praise. Likewise, however much may be said against the possibility of a metaphysics or of an ethics which postulates the ultimacy and the self-sufficiency of man, the attempt to discover and develop a purely humanist philosophy, to draw out its full implications for the social order, is a worthy undertaking in an age when widespread unbelief readily leads to extreme skepticism, to cynicism, and to an ethical postivism which in effect ends with a rejection of values. Similarly, an independence of mind which courageously opposes illiberal intolerance and craven fear as unworthy of the upright individual as, in their unwarranted lack of confidence, they are deleterious to the collective American people, deserves commendation.

To attack herd prejudices and misrepresentations based on inability to face, or refusal to acknowledge, plain facts in our own society, is an insistent job for any critic. Similarly, it is desirable to avoid the folly of misrepresenting and of underestimating our opponent, in this case the Union of Soviet Socialist Republics. It is praiseworthy to possess the magnanimity of sympathetic understanding of institutions and behavior patterns alien to our own, and even abhorrent to us. It is, finally, the part of wisdom to seek to avoid armed conflict, to be prepared and even eager to meet with our opponent, to make every effort consistent with our own integrity to reach temporary accommodations and (if it is in any way possible) lasting understanding.

On the basis of these essays alone, both by reason of their tone and their statement, I am prepared to accept it that Dr. Lamont is a humanist philosopher concerned with the well-being of humanity in *all times* and places and under all conditions; that he desires to be a friendly yet understanding critic of the Soviet Union, not less than of ourselves; that he stresses our own sins because it is us whom he is addressing; and that his insistence that he is not a Communist, or a very close fellow traveler, is a sincere, honest, and true avowal. Yet I am forced thereupon to conclude that his teaching is doubly dangerous by reason of that very sincerity, good will, and noble elevation of tone.

One may readily grant that the Soviet regime must have some appeal, some promise, and some real achievements to its credit, to hold the loyalty of its own people and to win that of others. Mere force alone, even aided by effective propaganda, cannot create loyalty, devotion, and indeed idolatry, even if it could (which is doubtful) keep vast populations subdued and orderly. Had the regime no appeal an no accomplishments, economic or otherwise, the present concern of America, of the Atlantic powers, and of a major portion of the United Nations would be, not simply folly, but quite incomprehensible folly.

Unfortunately, Mr. Lamont's determination to be independent leads him to lean over backward; to deny the full horror of totalitarianism, which includes slave labor camps as well as absence of civil liberties generally; to insist, with a technical correctnes only equalled by its complete lack of perception, that Russia did not intervene in the Korean struggle; to insist that it is consequently pacific and we in essence aggressive; and to argue the need for an honest search on our part for conversations looking toward peace, with a quite fantastic ignoring of the actual record of the U.S.S.R. in conferences at Lake Success, as well as in other negotiations.

Similarly, Mr. Lamont insists that Communist dictatorship must be distinguished from the Fascist brand because of the universalism of its ethical aspirations, as against the insistent and utterly inhumane particularism of, for instance, the Nazis. That its formal doctrine of a classless society and of equality as between men is of this character there is no need to deny. But it is surely error, and an error paradoxically based on the acceptance of national particularism, to fail to observe that the doctrine of class struggle, whatever its end, is also particularist and excludes from genuine consideration all those persons who are, or are defined to be, class enemies.

At root I think Mr. Lamont's error is the naïveté of his nobility, and his deviation in his determination to be independent and humane from the straight and narrow line of upright impartiality.

Behind this error lurks another: a purely naturalist humanist, with his roots in eighteenth century rationalism, he tends in his optimistic search for human emancipation to forget, even as he attacks prejudice and error, the ambivalent character of man, his proneness to sin, and the tragedy and uncertainty of his lot, which is inherent and not external. It is no doubt proper and necessary to attack that despair and resignation which may in some religious viewpoints lead to inactivity, as it is necessary to undermine that excessive sense of sin which prevents joy even as it inhibits the creative release of human energies. But a doctrine which, save for its acknowledgment of the limits of external conditions, is in essence one of perfectability, though it may be used effectively as criticism of actual imperfections, does not lead to the calm, balanced, disinterestedness which is needful for effective judgment and wise action in a world at present bi-polar. There reason itself would seem to indicate that, whatever our real refects which need criticism, we are, alike in ideal and in the proximity of actuality to ideal—however great the distance between—yet on balance right.

It is our duty, as it is our interest, to understand the Soviet regime. It is likewise essential, for purposes of moral sanitation, to perceive our own mote. But theirs is the beam. That its presence and nature make accommodation without surrender hard, and that they make failure of preparedness folly, are evaluations surely not to be rejected by any man who seeks

to further the causes of democracy, freedom, and human dignity.

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

GRIFFITH, ERNEST S. *Congress: Its Contemporary Role.* Pp. vii, 193. New York: New York University Press, 1951. $3.50.

If Congress awarded an Oscar each year for the best book about itself, the present work would be a worthy candidate. This slim volume embodying the James Stokes Lectures on Politics at New York University is a timely contribution to the voluminous literature on our national legislature.

The prevailing impression of Congress is familiar: an unwieldy, undisciplined assembly, overwhelmed by the volume and complexity of modern governmental responsibilities, assailed by the special interests and outgeneraled by the bureaucracy. From his vantage point of ten years' intimate observation, including much personal participation in matters directly linked with the daily work of Congress, the author has a different story to tell. Mr. Griffith asks a practical question: Is Congress discharging its responsibility under the Constitution? His answer, which will come as a surprise to many people including some political scientists, is a definite affirmative.

Congress does not function in accordance with any text book theory of governance. When its pattern of behavior is judged upon the basis of theories of party responsibility the Congressional performance seems chaotic. Yet business is transacted, and the public interest seems to prevail. Running through its complex operations is a definite and consistent logic of procedure.

Leadership is present, recognized, and utilized in both houses, but partisan leadership is only one element. Political party though never absent does not hold the crucial place because in the legislative process party is often collateral and supplementary rather than central. Specialized knowledge of the subject in question rather than party affiliation tends to be the accepted index of influence in legislation which is, in the main, the joint product of bipartisan effort.

By its reluctance to go counter to a committee recommendation, by its tendency to accept the principle of specialization and to look to different people for guidance on different subjects, and by its increasingly systematic use of experts outside its membership but in its employ Congress has recaptured much of its constitutional role as the independent policy determiner.

Mr. Griffith is impressed with the wisdom, honesty, and responsibility of the many independent individuals within Congress who identify the public interest in any particular issue and who work effectively to maintain a general balance in policy. He believes that this tough spirit of independence provides the surest defense against the ubiquitous special interests. Not less important, it serves as a governor when party and executive influence threaten to move too rapidly. His comments upon party responsibility are particularly perceptive and thought provoking. It is to be hoped that they will receive the close attention of those who contend that party responsibility must be built into congressional organization and procedure.

Columbia University

MALONE, DUMAS. *Jefferson and the Rights of Man.* Pp. xxix, 523. Boston: Little, Brown and Company, 1951. $6.00.

This volume is the sequel to *Jefferson the Virginian* in Dumas Malone's "Jefferson and His Times," a work originally projected as a four-volume biography, but one which will be extended to include a fifth. The thoroughness and skill of Dr. Malone probably will make this the most important biography of Thomas Jefferson in our generation.

Jefferson and the Rights of Man covers the years from 1784 to 1793, a period when Jefferson was closely associated with the foreign affairs of the United States—first as minister to France during the preliminaries and early phase of the French Revolution, and then as Secretary of State during the formative stages of the federal executive departments.

In this volume Jefferson is portrayed as a genteel Virginia gentleman with rather expensive tastes, who admired feminine and architectural beauty, possessed a keen, observant mind especially in agriculture and politics, and promoted the liberation of mankind in France unobtrusively without becoming a doctrinaire or neglecting the duties and proprieties of his office. He is described, too, as a minister, who represented all the interests of America without sectional bias, working as hard to secure French markets for New England whale oil as to promote the opening of the Mississippi to American navigation or the development of new European markets for Southern tobacco. In debts, both foreign and domestic, Dr. Malone finds him to be a scruplously honest conservative, opposed to inflation of the currency and repudiation of pre-Revolutionary debts that were owed to British merchants by Southern planters.

Not least among the contributions of this book to an understanding of Jefferson and his times is its interpretation of him not as an immediatist but as a gradualist. A son of the Enlightment, he was certain that mankind would make more progress through open discussion and free education than through social upheaval. This attitude helps to explain his continued friendship for Edmund Pendleton and other avowed moderates and his dislike for Henry, who was often impetuous.

Some other significant conclusions are: that Jefferson's years in France "served only to confirm him in the fundamental philosophy he had already adopted" (p. xxii); that "the traditional picture of Jefferson the politician . . . is largely the creation of Hamilton and his partisans" (p. xxiii); that Jefferson was not led blindly by Hamilton into support of the bill for the assumption of state debts (pp. 297–301); and that Hamilton, "more than any other major American statesman of his time, lusted for personal as well as national power" (p. xxii).

ROBERT LEROY HILLDRUP
The University of Virginia

BELLAMY, FRANCIS RUFUS. *The Private Life of George Washington.* Pp. v, 409. New York: Thomas Y. Crowell Company, 1951. $5.00.

When Mr. Bellamy undertook to produce a popular, one-volume life of George Washington, he assigned himself a most difficult task. There are not enough good secondary works on the subject to enable the amateur historian to write such a book within a relatively short time. To do the work from the sources would require forty years of unremitting labor. Mr. Bellamy's varied career as a dairy farmer, playwright, song writer, Broadway producer, book salesman, and free lance magazine writer has not afforded the time for the extensive research that is required for the study of even a limited phase of the career of the greatest figure in political history.

The title of the volume suggests a limited treatment. But Mr. Bellamy has not confined himself to the private life of Washington. Most of the work deals with the public career. But as an inclusive biography, the result is far from satisfactory. It runs down at the end. After devoting sixty-five pages to Washington's public activities in the 1750's, Mr. Bellamy disposes of the presidency in twenty-four pages.

His failure flows in part from the nature of the subject. Washington's career was one of continuous action in a series of intricate events that covered nearly forty years. He usually acted in complex situations, which must be explained if the reader is to understand what he did, how he did it, and the influence he exerted. Only through such a study can one discover what manner of man he was.

Mr. Bellamy has not gained a mastery of the situations in which Washington acted. He has not used the vast collection of Washington's papers, without which no satisfactory study of this sort is pos-

sible. When isolated from the context of events, Washington appears as suspended in mid-air. He was so much a part of his world that his biographer must have a thorough knowledge of the history of the times. This Mr. Bellamy does not have. He is an intelligent observer; his attitude is admirable; and at some points he displays insight into Washington's character.

Based largely on the biography by Rupert Hughes, which has been carried only to 1781, Mr. Belamy's work is glaringly inadequate for the part of Washington's life after that year. The book has little interest or value to scholars. Nor can it be recommended to lay readers. Mr. Bellamy did not have the sort of mastery of the material that might have enabled him to make intelligible to the uninitiated the many complex episodes of Washington's life.

CURTIS P. NETTELS
Cornell University

MORISON, ELTING E. (Ed.). *The Letters of Theodore Roosevelt.* Vols. III and IV: "The Square Deal, 1901–1905." Pp. xvi, 710; viii, 711–1438. Cambridge, Mass.: Harvard University Press, 1951. $20.00.

This is the second two-volume set of Theodore Roosevelt's letters to appear under the editorship of Morison and his associates. The first set covered *The Years of Preparation,* and the sets to follow will bring us *The Big Stick* and *The Days of Armageddon. The Square Deal* volumes contain over seventeen hundred significant and respresentative letters of some twenty thousand Roosevelt wrote during the four-year period. The editing maintains the same high standard that characterized the first set, editorial comment being held to the minimum and presented with painstaking care. The notations will richly reward the diligent reader.

We have long supposed that Roosevelt's family life was ideal. These letters settle the matter absolutely. He was inordinately proud of "mother" and most considerate of her. As for the children, he talked to them, read to them, played almost every conceivable game with them ("bear" was their favorite), and spanked them when they misbehaved. With equal verve he could "spank some little brigand of a South American republic" (p. 1328), and refer to his critics as asses, jacks (he seldom combined the two), liars, and scoundrels. "Colonel is the title I am proudest of," he wrote (p. 854), and often he proclaimed his joy at being in the White House. He was a stickler for the dignity of his office, wrathfully pronouncing as an "outrageous impertinence" the action of a lawyer in referring to him by a nickname (p. 392).

Even-handedly he could denounce the "hopeless attitude" of capital or management and an "arrogant and domineering" labor union, and in 1902 he achieved a notable succes in bringing about a settlement in the anthracite coal strike. He skillfully used the tariff revision issue in which he was not greatly interested as a basis for a bargain on railroad legislation for which he believed the need was urgent. With about the same skill he succeeded in bringing Russia and Japan to the Portsmouth Peace Conference. Always he was the politician, knowing when to move and how far it was safe to advance.

He corresponded with practically every statesman, politician, or writer of consequence and he "lectured" some of them. He showed great confidence in and admiration for Henry Cabot Lodge, John Hay, Elihu Root, Leonard Wood, Nicholas Murray Butler, William Howard Taft, and a number of less famous persons. "Woodrow Wilson is a perfect trump," he wrote. "I am overjoyed at his election" (p. 275) as President of Princeton University.

Disclaiming genius, he reasoned that his success was achieved by supplementing ordinary ability with "the requisite industry, judgment and foresight" (p. 1282). Why his great popularity? His intelligence, his common sense, and his unyielding moral character hardly explain it. It may be due in part at least to his display, in relatively attractive form, of some popular prejudices, a little intolerance, a certain jingoism, and a marked tendency to see only black or white, traits that numbered him with ordinary men and caused them to see in him a greatly magnified image of themselves.

CLAUDIUS O. JOHNSON
The State College of Washington

HELLER, FRANCIS H. *The Sixth Amendment to the Constitution of the United States: A Study in Constitutional Development.* Pp. 195. Lawrence, Kansas: University of Kansas Press, 1951. $3.50.

This essay of 151 pages of text plus 44 pages of notes and references is an excellent brief discussion of an important part of the Constitution. The Sixth Amendment says: "In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the Assistance of Counsel for his defence."

Chapters I and II deal with the historical background of the amendment in the English and colonial law, respectively. They show that the rights guaranteed by it were, at the time of its adoption, of recent origin, and that expansive statements such as that of Mr. Justice Story that Magna Carta granted trial by jury in any form comparable to that which the draftsmen of the amendment had in mind were mistaken by some centuries. The chapter on "Colonial Experiences" shows that the jury systems of the several states were so different that it would have been impossible for the writers of the amendment to have been specific in describing a jury without jeopardizing the adoption of the amendment. This makes it surprising that the Supreme Court was able to conclude that the amendment required a jury of twelve who must unanimously agree upon their verdict.

Chapter III, "Scope and Application of the Amendment," shows that the Supreme Court has been able to read the words "in all criminal prosecutions" as not applying to petty offenses, though it has had difficulty in defining what are petty offenses. The interesting cases involving the questions whether the amendment imposed the jury system on the Philippines, Puerto Rico, and the Virgin Islands when they became United States territory or whether these territories could continue to use the only systems of trial with which they were familiar are well discussed. They show that a constitutional text can be tempered, in its application, by practical sense. Mr. Justice Brown's statement in the Hawaiian case that trial by jury was not a right that was fundamental in nature is noticed and adverted to later in the book.

The requirement of an impartial jury is discussed principally in connection with the cases tried in the District of Columbia with government employees sitting on juries in which the government was prosecuting.

In Chapter V the requirements of definiteness in the indictment, confrontation by witnesses, and compulsory process are treated. None of these has given rise to extensive litigation. But the subject of Chapter VI, the "Right of Counsel," has taken on new life in recent decades, with the concurrence of all the judges. The applicability of the right to the varied fact situations has, however, split the Supreme Court in numerous cases which are acutely analyzed by the author.

Chapter VII, "Crime and the Ideal of a Fair Trial," is a comment on the whole amendment. It shows how time and circumstances have changed current ideas of the importance of the different rights named in the amendment, increasing some and diminishing others. The author seems to agree with the tendency to diminish the importance of trial by jury, and increase that of the right of counsel. It is hard to imagine that a Fourth of July orator, referring to a Paladium of our liberties, could make as much of the latter as of the former.

This is an excellent book, full of interesting history, intelligent analyses of

decisions, and good philosophy of government.

United States Court of Claims

NYE, RUSSEL B. *Midwestern Progressive Politics: A Historical Study of Its Origins and Development, 1870–1950.* Pp. 422. East Lansing, Mich.: Michigan State College Press, 1951. $5.00.

"When it came to rock bottom, the Midwest farmer wanted, as he always had, a good market with high prices, control of his own government, more currency, easier credit and good times." This is the fundamental explanation, according to the author, of the middlewestern farmer's rather strange political activity in the rocky 1930's, and this is the explanation of the middle border's excursion into the greenback movement, the granger crusade, populism, and twentieth-century progressivism.

In this very well written synthesis, Professor Nye sees the farmer's economic discontent as the almost exclusive driving force of middlewestern reform politics. He also detects a straight-line progression in these reform parties since Civil War days. It was because of his thin pocket book rather than his pinched soul that the middlewestern farmer, according to the author, contributed so much to American "socialized politics" in the last hundred years. And by implication at least, although it is not so explicitly stated, this pinch-penny explanation of reform must account in large part for the bleak political toryism of the Middlewest today. For the once lean, individualistic, democratic, and radical-minded farmer has grown fat with government subsidy, and thus has become a follower of Capehart, Dirksen, McCarthy, and Wherry.

One of the main difficulties with this simple relationship of economics and farm politics is that it leaves so many things, particularly about the twentieth century, unanswered. As Professor Nye has pointed out, it was during the first decade of the twentieth century that most of the reforms urged by the grangers and the populists were actually accomplished. But it was also precisely during those years that the American farmer was enjoying the most prosperous days he had experienced since the Civil War. For an explanation of the seeming paradox one will have to dig a lot deeper along the fault lines of American politics than the author has done.

Professor Nye has, of course, devoted some of his time to a discussion of factors other than economic in the conditioning of the progressive mind. He has a good chapter on the capture of the ivory tower. But it is still rather disappointing to find a professor of English and American literature devoting so little of his time to things of the mind, to literary expression, and to the basic psychological drifts of the American mentality. Apparently the author has not used much, if any, manuscript material nor middlewestern newspapers in his research. It is probably for this reason that his book is strong in areas where Buck, Hicks, Destler, Curti, and others have preceded him with basic research. And this, perhaps, accounts for the fact that there are so few new ideas in the volume. At times the author's sense of chronology and some of his statements on local and state politics are a bit weird.

GEORGE E. MOWRY

Los Angeles

SALOUTOS, THEODORE, and JOHN D. HICKS. *Agricultural Discontent in the Middle West, 1900–1939.* Pp. viii, 581. Madison: University of Wisconsin Press, 1951. $6.75.

Weighed by its content, this is a big book and an important contribution to the knowledge of the politics of agriculture in the United States and the agrarian side of American democracy in action. It offers the key to the secret of how the American farmers gained the extraordinary political power which for the last twenty years has determined to so large an extent the social and economic legislative measures of the nation.

After fourteen years of unprecedented prosperity for American agriculture, the subject of the serious discontent that stirred among the farmers for several generations is still as timely as it is timeless.

As historians, the authors have traced the social unrest among farmers and rural people and the evolution of the farm movement back to the beginnings in the region they call the Western Middle West—Wisconsin and Minnesota, Illinois and Iowa, the two Dakotas and Nebraska, Missouri and Kansas. In their view this has been the critical area in which the resentment of the farmers against their position of inferiority compared with other economic groups took the form of a host of interconnected movements and was progressively transformed into political action.

The authors do not attempt to weigh the political unrest and its active contribution to the shaping of American institutions by comparison with other national regions and their performance. They achieve their purpose by a series of separate monographs on the major individual movements which succeeded the Grangers, Greenbackers, and Populists of the nineteenth century. The reader is made acquainted with the political atmosphere left by populism and the insurgents' concern for institutional assurances that the people could really govern themselves; with their fight for the direct primary, the initiative, and the referendum; and with efforts to capture for the people the machinery of government. The reforms by Robert M. La-Follette in Wisconsin which led to drastic changes in railroad taxation and regulation of public utilities, the reforms by Governor Cummins in Iowa, Governor Johnson in Minnesota, Governor Folk in Missouri, and others in other states, are treated as one major phase of action arising out of discontent.

Two chapters deal with the history of the farmers' co-operative movement as the initiative, motivated by distrust and resentment against the trade and the commodity exchanges, to make farming more profitable. However, three other chapters seem to this reviewer to have been exceptionally well written and illuminating. They deal with the American Society of Equity and the Non-Partisan League—the most spectacular and colorful of all agrarian movements. The discussion lays bare many strands in present-day politics which otherwise would remain obscure and inexplicable. The temporary collaboration between the radical agrarians and the Socialist Party of North Dakota and the attempt to solve the marketing problem by state ownership of nearly all facilities, such as warehouses, elevators, and terminals, is a particularly revealing phase.

Of the League, which reached its peak in 1918, the authors say: "The actual organizing of the farmers was one of the most dramatic aspects of the League, for it had gathered together one of the most artful groups of radical writers and speakers the nation had ever seen. They were thoroughly saturated with radical doctrines, techniques of indoctrination, and large scale organization methods. In knowledge of mass psychology they were unsurpassed."

In five chapters the authors treat the formation of the farm bloc in the United States Congress and its legislative activities from 1920 to 1923, third-party ideologies, the McNary-Haugen movement, Herbert Hoover's Farm Board and its failure, and the Farmers' Holiday Association and its strikes.

Finally it is shown how the New Deal Agricultural Adjustment Administration program attempted to cope with the mass insolvency and the distress and discontent of farmers, who were still most articulate and politically effective in the Western Middle West.

The strength of the book lies in the fact that nowhere does it attempt to appraise the economic situations or the remedies proposed and enacted, but throughout gives a concise and detached review of the political course of events, revealing the ideas and motives which made the movements move. The reader also obtains good portraits of the majority of the men who were decisive as political leaders of the farmers.

This is a most welcome and long needed history of a strategic area and era in politics, government, and agricultural policy.

KARL BRANDT
Stanford University

DAHL, ROBERT A., and RALPH S. BROWN, JR. *Domestic Control of Atomic Energy.* Pp. v, 117. New York: Social Science Research Council, 1951. $1.00.

A condition of semimobilization sometimes comes as a relief when the emergency demands that the familiar nagging questions—the housekeeping problems—be dropped for the time being in order to give full attention to immediate overriding necessities. But when the emergency is over the problems still remain and have to be solved.

The pamphlet entitled "Domestic Control of Atomic Energy" by Messrs. Dahl and Brown poses a whole set of the questions in the field of atomic energy with which this country sooner or later is going to have to deal—questions of a type with which social scientists are familiar and where their assistance can be invaluable in finding answers. Among the topics which are raised for discussion are questions of public control, communication of information, appraisal of results, Commission organization, Commission-owned towns, and, finally, the ultimate role of private enterprise in atomic energy. Atomic energy must eventually work into the main stream of American life. These topics must have intelligent discussion and workable answers before our major problem of how best to control atomic energy can be solved.

The authors feel that they have been hampered somewhat by the air of secrecy which surrounds a good deal of the Commission's operation. As a Commissioner, this reviewer suspects that the handicap has not been as great as the authors suppose. They have put their fingers unerringly on practically all of the questions which we on the Commission know must sooner or later be solved. They have very properly, in most cases, not gone farther than raising the points; in a few cases they have suggested ranges of answers within which probably the eventual solutions will lie.

One of our most troublesome questions, and one to which the authors have given a good deal of attention, is that of communication between people with various degrees of information and differing levels of technical understanding. We are continuously battling to maintain, for instance, fruitful, accurate lines of comunication from the nuclear scientists to the Commission, and from the Commission to the proper committees of the Congress, to the Congress itself, and finally to the citizens of the country. How to keep such a line of communication effectively open without the kind of oversimplification that leads to distortion and misunderstanding is a question which is constantly with us. There have been and will be vivid instances of failure in this respect, but, if the job is not done with reasonable effectiveness, the American people cannot come to a proper appraisal of the effort which is being made in their behalf and for which they are paying.

This pamphlet, which is really a small book, will give background for useful thinking not only among the social scientists but among that great group of interested laymen who are interested, for instance, in the "effects of secrecy on the democratic process." As a case study of an outstanding example of increasing complexity of government, the pamphlet is and will remain a fruitful source of ideas.

SUMNER T. PIKE
Atomic Energy Commission
Washington, D. C.

POLANYI, MICHAEL. *The Logic of Liberty: Reflections and Rejoinders.* Pp. viii, 206. Chicago: University of Chicago Press, 1951. $4.00.

This is unquestionably a remarkable book. It delves into questions concerning liberty which have rarely been discussed; and it is done with rare, analytical skill and great liveliness of style. Paradoxically, its author, Professor Michael Polanyi, is an unconscious positivist who belabors positivism at every turn with positivistic fineness. In part, his opposition may lie in his refusal to accept, as basic, criteria which he constantly uses to test and substantiate his own hypotheses about liberty and planning. For the remainder, it may lie in his love of large words like "truth," "justice," and "reason," which he exploits without giving them the meticulous attention and scrutiny he turns upon other concepts like spontaneous (free) and directed (unfree) order-systems.

A number of chapters in the *Logic of Liberty* deserve careful study by every student of society whatever his political or philosophical bias. Chapter 2, "Scientific Convictions," points out the often forgotten fact that science depends upon a society of scientists and a strong, well-ordered tradition of ideas and practices without which scientific advance is well nigh impossible. Chapters 3, "Foundations of Academic Freedom," and 4, "Self-government of Science," provide the most persuasive arguments I have read anywhere for academic freedom and scientific self-government. The arguments, the theoretical basis of which Professor Polanyi develops is chapters 8 and 9, are essentially two: (a) Certain types of social orders or sub-orders of a social order—for example, scientific and educational institutions—can function only as spontaneous, that is, self-ordering, self-regulating, and self-adjusting systems. To regulate or plan such systems is, in essence, ultimately to destroy them. (2) To obtain maximum utility and good from them, society must permit them to regulate themselves. Chapters 8 and 9, which provide the theoretical framework for these conclusions, especially deserve careful study.

Original and profoundly stimulating as is Professor Polanyi, he is not immune sometimes from obvious contradiction. One example will suffice. Science, he says, is most useful to society when it is left to its own devices. Nevertheless, he adds, it is improper of society to ask, "What is its use?" No matter what science produces, it is and can only be its own justification. Yet he takes great pains to show that the freedom which science enjoys and the income it receives derive from the fact that society recognizes the scope and magnitude of its contributions to human welfare. He even admits that, if science failed to serve society or if important sectors of mankind failed to see any import to science, it might be starved for funds and even totally suppressed. Obviously, then, whatever Professor Polanyi may think, science cannot be its own justification, for it must justify its usefulness to mankind. Certainly the fact that science needs to be free or self-regulatory is not an argument to prove that it need not justify itself; this fact serves only to prove that maximum utility of science to society depends upon maximum self-regulation.

RUBIN GOTESKY
University of Georgia

WINDOLPH, F. LYMAN. *Leviathan and Natural Law.* Pp. ix, 147. Princeton: Princeton University Press, 1951. $2.50.

Not the least useful of the polarities we all nourish in our minds is that which classifies thinkers as disturbers or moderators. If the most striking and "original" books are usually the work of disturbers, mankind could hardly get along without the moderators, the men who take the fighting edge off ideas, the men who accommodate ideas to the complex world of Reality—or of realities.

Mr. Windolph belongs in this latter group. He sets himself the difficult task of moderating between Hobbes and Aquinas, between the positivist and the believer in natural law. He writes the language of law, politics, political theory, and writes it very well indeed. This little book makes most refreshing reading for anyone accustomed, but not wholly reconciled, to current American social-scientese. Mr. Windolph has read widely from Plato to Holmes. Some part of him—one can't be sure whether it is his head or his heart—is drawn to James's tender-mindedness, some part to James's tough-mindedness. But since he is a mediator by temperament, this division is no horrendous civil war in the breast, but a challenge to use his gifts for mediation.

Mr. Windolph's final words sum up his position: "In the sense in which I am using the words, government of the people means a government ordained and established by a democratic sovereign. Government by the people means a government either purely democratic or republican in form. Government for the people means a government conducted in accordance with the developing principles of natural justice. If the last is an illusion, or comes generally to be regarded

as an illusion, the first and second will surely perish from the earth."

The historian in comment must note that Mr. Windolph's book is one more evidence of a shifting climate of opinion. The concept of natural law, so distasteful to positivist, utilitarian notions about the political process, is once more on its way to good repute. The old eighteenth-century alliance betwen democracy and virtue is being revived. This Mr. Windoph sees clearly. He hopes he can convince the positivist, and will not worry greatly over the mere skeptic, who is never convinced, or convincible.

CRANE BRINTON
Harvard University

BROWN, FRANCIS. *Raymond of The Times.* Pp. x, 345. New York: W. W. Norton & Company, 1951. $5.00.

The pre-eminence of the *New York Times* lends to this admirable biography, by Francis Brown of the *Times* staff, of Henry J. Raymond, who founded the *Times* in 1851, an importance it would otherwise lack. If in 1896 the late Adolph S. Ochs had not taken over what little was then left of the *Times* and, by a combination of character and genius, re-created it as it is today under his successor and son-in-law, Arthur H. Sulzberger, Raymond's career would still be interesting—yet an isolated episode.

Mr. Brown has left to another member of the *Times* staff, Meyer Berger, the history of its completed century. Yet the fact which stands out in this biography is that, under the conditions which prevail today, with all the mechanical marvels which serve the collection of the news and the printing of a newspaper, the *Times,* with its literally unrivalled coverage, is a realization of the newspaper ideal which Raymond conceived one hundred years ago. Less colorful than Greeley of the Tribune or Bennett of the Herald, he was free of the whims which exposed Greeley's limitations of judgment and the unprincipled sensationalism which exposed Bennett's limitations of character. Raymond was, moreover, a great reporter himself. His feats, both as a war correspondent and as a political correspondent, conspicuously served that ideal of careful, unspectacular news coverage which could be trusted then, as it is trusted today.

Second to this similarity between what the *Times* tried to do in 1851 and what it so fully accomplished in 1951 is an almost equally significant dissimilarity. The great disaster of Horace Greeley's career (also the great disaster to the liberal, independent movement of that time) was his nomination for the presidency by the reformers who, shocked at corruption under the Grant administration, met at Cincinnati in 1872. Both Greeley's avidity for public office and his unfitness for it were therefore advertised. But too many readers have forgotten that Raymond ran successfully for both the New York legislature and the House of Representatives at Washington and that he acted efficiently as Lincoln's campaign manager in 1864. In those public offices he rendered valuable service. In the columns of the *Times* and in the House he was a more consistent and sounder supporter of Lincoln than Greeley was in the Tribune.

But the dissimilarity is that no editor of the *Times* would today think of being a political candidate. The better tradition, by which journalism protects and strengthens its function in a democracy, and to which the *Times* has, I believe, subscribed ever since Mr. Ochs took over, is that no editor or publisher should cherish political ambitions for himself, and that by disavowing them completely he can wield a greater influence. The fact that this tradition is still too often violated does not affect its soundness.

RICHARD HOOKER
Springfield, Massachusetts

BERGER, MEYER. *The Story of The New York Times, 1851–1891.* Pp. 589. New York: Simon and Schuster, 1951. $5.00.

When Adolph Ochs acquired *The New York Times* in 1896, he was the publisher of a country newspaper burdened by debt. Invading New York City, he acquired a nearly moribund newspaper with a circulation of only 9,000 and a debt of more than $300,000. How he challenged his competitors and what he accomplished with his newspaper is one of the great stories of American enterprise and ingenuity.

Out of the millions of words that flow daily into its editorial offices, *The New York Times* prints an average of 145,000 words. It employs more than 4,000 persons. In paper and payroll alone, its operation amounts to $36,800,000 a year. On occasion, it turns down more advertising than most newspapers accept. Its current daily circulation averages more than 524,000, while the Sunday edition, which sometimes runs more than 414 pages, has a press run of more than 1,146,000.

One can speak of *The Times,* which has earned worldwide respect for American journalism, only in superlatives. No other daily publication in the mid-twentieth century keeps the records of current history so completely. For kings, statesmen, and ordinary citizens it is an indispensable source of unbiased information, for scholars it is the daily medium of contemporary history, for students it is an essential textbook. Working journalists regarded it as the newspaperman's newspaper. More than this, it has become the symbol of a free press and its function in the defense of Western civilization. It is of supreme importance to the free world at a time when the greater part of humanity is exposed to a flood of lies and distortions.

When the present reviewer and Richard B. Morris were compiling *A Treasury of Great Reporting,* which was published two years ago, we were confronted with so great an embarrassment of riches from the columns of *The Times* that we found it to be a very real problem to prevent the book from developing into *A Treasury of Great Reporting From The New York Times.* The task involved a painstaking search through tens of thousands of clippings, but every event of importance in the last century was so beautifully handled by *Times* reporters that it required the hardest kind of work to discover news stories superior to those of *The Times.* Our experience was substantiated by a careful poll of news editors throughout the country. As it was, the number of stories from *The Times* in the anthology far outdistanced those from any other newspaper.

The author of this intimate biography of a great newspaper is Meyer Berger, a newspaperman for the last forty-two years, a *Times* reporter since 1928, one of the twenty-two Pulitzer Prize winners on its staff, and one of the finest craftsmen in the history of journalism. This is one of the best feature stories that has ever appeared under his by-line. It is popular history in the best sense, unburdened by distracting documentation, and written with accuracy and clarity. It is a thoroughly competent job in the best *Times* tradition.

Berger devotes a large part of his attention to the three publishers who made *The Times:* Henry J. Raymond, the aggressive crusader who founded the paper as a conservative organ devoid of sensationalism; Adolph Ochs, who rescued it from financial collapse and gradually built it into an institution of world-wide prestige; and Arthur Hays Sulzberger, the current publisher who lifted the paper to new heights of renown. The author gives an unforgettable picture of the paper's greatest managing editor, Carr Vattel van Anda, whose exploits included catching Albert Einstein in a mathematical mistake, discovering a 4,000-year-old murder from the hieroglyphics on a news picture of Tutankamen's tomb, and climbing on a delivery wagon at dawn to make certain that an extra edition of *The Times* got on its way to its readers.

Berger's book is filled with the stuff of great journalism—the inside stories of *Times* beats, the paper's encouragement of exploration and discovery, the publication of the texts of important historical memoirs and significant documents, and hundreds of other fascinating memorabilia. The swift pace of the story covers most of the social history of the last century. As a proponent of the eyewitness technique, the author always shows the story through the eyes of the reporter.

This book is a mine of information for the *Times* enthusiast and a find for any newspaper reader. Simon and Schuster are to be congratulated on the publication

of a volume handsome in both typography and production.

ECONOMICS AND INDUSTRY

NOURSE, EDWIN G. *The 1950's Come First.* Pp. 184. New York: Henry Holt and Company, 1951. $2.00.

A captious reviewer could point to "inconsistencies" in this book, or to lack of clarity as to whether the author is for or against some important programs which he mentions. But such criticism would tend to be unfair. The author is pragmatic, not dogmatic; and he is stating and illustrating a philosophy rather than making a tabulation.

That philosophy will disappoint those uninformed persons who may have regarded Dr. Nourse as a "reactionary" or even "conservative" economist or political scientist. He is modern and forward looking. He asserts that our economic fate is determined not by impersonal forces but largely by wise or foolish human action; that reasonable economic stability is not only attainable but also preferable to the recurrent depressions which were supposed to "purge" the economy of its weaknesses; that we cannot go back to a simpler or "free market" economy by fragmentizing big private economic organizations or big government; and that competition and co-operation are both useful and dynamic concepts.

He then states the core problem as follows: (a) to achieve the fairly stable progress which technology makes possible (in the United States), the enjoyment of available resources must be so apportioned that production and consumption are kept in workable balance; (b) the greatest threat to this balance arises when powerful economic groups seek to obtain for their own use an excessive share of our total resources; and (c) the problem is compounded when these powerful economic groups seek this excessive share, not only through action on the economic front within the area of private enterprise, but also through action on the political front designed to pressure big government into helping them get more.

This thesis seems sound to this reviewer. There has developed in some quarters an overoptimistic belief in the capacity of government to redress economic deficiencies. Placing more emphasis upon making the general private economy itself function more smoothly would help to avoid such concentration of public power as might be inconsistent with the maintenance of dynamic initiative and of the great personal freedoms.

The incompleteness of Dr. Nourse's book, granted the soundness of its thesis and the excellence of its purpose, seems to me three-fold:

(1) It seems overly pessimistic. It leaves the general impression that trends over the past two decades in big business, big labor, big agriculture, and big government have reflected a disheartening deterioration in matters economic and moral, and that retribution will be certain even if it has not been swift. An equally strong argument might be advanced that, admitting excesses and mistakes, the American economy has become more stable, more just and even more conducive to true initiative than it was two decades ago. The book might be more persuasive if it listed gains as well as losses.

(2) Severe criticism of powerful economic groups is less likely to improve their ways than the assumption that their motivation is good, coupled with concrete proposals about what they should do next. Mere exhortation not to seek too large a share is inadequate, without economic analysis of some measuring rods or patterns for sharing the total output which may be consistent with a well-functioning economy. There is need also for "institutional" exploration of how this process may operate in our kind of economy, with the big economic groups participating and contributing instead of being "told" by some professor or bureaucrat. No one has yet solved this problem; but Dr. Nourse slips into near ridicule of those who suggest possible techniques.

(3) The book applauds the reelection of an outstanding Republican senator, censures the political campaign of a Democratic ex-Undersecretary, and makes some slighting personal references to the President. This gives a flavor of partisanship, although I am sure Dr. Nourse could defend the proposition that he reached these conclusions by a "non-political" process. This reviewer appreciates that the author's most recent government work undoubtedly disclosed some things he found distasteful; that is a common experience of those in public service. Yet many may share my hope that Dr. Nourse's next book, in addition to addressing itself to points (1) and (2) above, will return to the more complete detachment and objectivity which helped to make some of his earlier works—such as his studies on productive and consumption capacity, and of the price system—among the finest contributions to the literature of American economic thought.

LEON H. KEYSERLING
Council of Economic Advisers
Washington, D. C.

NATIONAL BUREAU OF ECONOMIC RESEARCH. *Studies in Income and Wealth.* Vol. XIII, Conference on Research on Income and Wealth. Pp. xiv, 587. New York, 1951. $6.00.

The analysis of income distribution is one of the major ways to find out "who gets what when" in any society. It therefore lies at the heart not only of economics but also of political science and other branches of social science.

One of the most interesting things about people who get the largest share of man's worldly goods is that the more they get the more they want. Statisticians and economists, it seems, are also human beings. This volume demonstrates not only that *Homo Americanus* has more figures on who has what than any other tribe in history, but also that American income distribution experts—far from being satisfied—are eagerly striving to obtain still more and still better data.

With six learned papers by eight outstanding specialists and stimulating comments by eight discussion leaders, this volume provides a truly remarkable picture of the progress that has been made and the improvements under way in the collection and initial handling of data on this subject. It should serve as an invaluable reference volume for economists, a guide to statisticians, and a source of elementary education for political scientists who have generally failed to give sufficient attention to work in this area.

Two of the commentators deserve special quotation. "It is time we gave less attention," writes Milton Friedman of the University of Chicago, "to uniformity, to measuring what we neither understand nor can agree on defining, and more to specific problems, to understanding the facts of income determination, and to the development of theories and hypotheses that would put these facts into a meaningful relation one with another" (p. 56).

"Despite any and all complaints that data are deficient," writes Harold Barger of the National Bureau of Economic Research, "it is obvious that facts about the distribution of income among recipients are piling up and are being compared and summarized at a staggering rate. The contrast in this respect with the poverty of information twenty, not to say ten, years ago is striking indeed. Yet it does not appear that the study of the theoretical distributions, which must underlie the observed data, has made any comparable advance" (p. 260).

One of the first steps toward the improved utilization of income distribution data has already been taken in the Economic Reviews of the Council of Economic Advisers, which appear every six months as supplements of the President's Economic Reports to Congress. Since January 1949, the Council has been including in these Reviews studies on income distribution which pull together the available data and draw broad conclusions concerning shifts and trends.

But to achieve more fully the objectives sought by Friedman and Barger, two additional steps must be taken—steps which are more appropriate to private research organizations. The first is the

analysis of how and why changes in income have really taken place. This involves an adventure into social dynamics —into such questions as how incomes have been affected during the last twenty years by the activities of organized labor, of the "farm bloc," of social welfare programs, and of "progressive" tax legislation. The second is the development of standards in terms both of "equity" and of implications for consumption and investment. This, of course, leads into broad questions of social behavior and moral values.

If the market for income distribution data is more fully exploited by studies along these lines, the work of the Conference on Income and Wealth in designing and producing the data is bound to grow in significance during the coming years.

BERTRAM M. GROSS
Executive Office of the President
Washington, D. C.

HART, ALBERT G., and E. CARY BROWN, assisted by H. F. RASMUSSEN. *Financing Defense: Federal Tax and Expenditure Policies.* Pp. xiv, 161. New York: The Twentieth Century Fund, 1951. $2.00.

This is an excellent analysis of the problems arising in federal finance under the conditions of a garrison state. The study outlines the estimated budget requirements of the "readiness economy" which the nation must maintain over a long period, if necessary, if it is to be prepared for the emergency of another world war. The fervor of patriotism, which flames high during total war, cannot be counted on during this period as the primary urge for popular co-operation in the programs of economic and financial mobilization. If inflation is to be controlled, heavy reliance must be placed upon fiscal controls.

The authors criticize wasteful federal expenditures for defense as well as for non-defense services. But they believe that economy efforts will not suffice to keep the budget from soaring upward and to head off the need for greatly increased taxes. Judiciously employed subsidies to producers may have a limited usefulness in increasing the supply of needed materials and in keeping prices down. They run the risk of political abuse, however, and require additional taxes to meet their costs.

The tax system should be placed in readiness to meet spiraling governmental costs and keep the budget in balance. The main pillar in the tax structure must be the personal income tax. It reaches the great mass of consumers directly, is paid currently, in general, and is reasonably equitable. But it is more likely to be paid with funds that would have been saved than is a sales tax, and in raising a given amount of revenue is likely to be less restrictive of inflation. The pros and cons of different types of general consumption taxes are discussed.

The authors urge heavier profits taxes with the objective of keeping profits after taxes generally at the 1948 level. An excess profits tax is found to be highly complicated and exerting some inflationary pressures but a necessary supplement, politically at least, to wage and other controls. The tax system must have sufficient flexibility to meet the changing requirements of defense financing.

The little volume is clearly written and is balanced in its appraisal of economic and financial problems growing out of the current critical world situation. Limitations of data and analysis are freely admitted. The reader may disagree with the analysis of budget and tax questions at particular points and wish for a more adequate discussion. This is probably inevitable in such a brief study. But the volume will be found to be ably written, stimulating, and constructive by those who are concerned about the dangers of inflation and seek to minimize them.

ALFRED G. BUEHLER
University of Pennsylvania

HAMBERG, D. *Business Cycles.* Pp. xviii, 621. New York: The Macmillan Company, 1951. $5.00.

Cast in the highly technical language of the economic specialist, this is not a book for the general public, though the exhaustive discussion of the application

of business cycle theories in the later chapters is more readable. The author expresses a pious wish that he may write a book rigorous in its analysis of the main theories of business cycles but not so rigorous as to overshoot the intelligence of the undergraduate upperclassman. If the average college senior could come out of this series of lectures with a "C" grade, he would deserve high commendation. The average citizen would most certainly flunk.

But the author must deal perforce with existing theories. He must use their terminology. This he has done with great zeal and keen insight. His analysis is of especial value to the student of business trends. A triple reading of the definitions in Chapter two is recommended.

To speak of business cycles is in itself confusing. We may speak of cycles in weather, in sunspots, in the tides of the sea—all processes in nature—but to describe the vagaries and fluctuations of human attitudes and activity as a cycle is a misnomer. The one constant in the problem is human self-interest: the multitude of other factors are variables, elusive to a high degree—all of which Professor Hamberg fairly recognizes.

His book is of special value in its assembly of the five principal theories of the business cycle. Each is exhaustively taken apart and its weaknesses pointed out. Without presuming in any way to be hypercritical or iconoclastic the author has nevertheless taken these famous writers to task and bumped their heads together with a resulting sound of emptiness. Then follows a chapter on the eclectic theory—a chapter of synthesis—in which values from all approaches to the problem are assembled and cast into a rational answer to the riddle of business change.

The student of this branch of economics will appreciate the author's historical analysis of business cycles in the United States during the 1920's, 1930's, and 1940's. Those who struggled through those troubled decades with two major and five minor depressions and a period of wars and the economic wreckage of wars will derive a greatly clarified view of that vast experience. This book is a major work. The reader who will keep his lexicon handy may profit well by careful reading.

ROBERT W. KELSO
Pleasant Ridge, Michigan

COPELAND, MELVIN T. *The Executive at Work.* Pp. 278. Cambridge, Mass.: Harvard University Press, 1951. $3.75.

This book by the Director of Research and George Baker Professor of Administration, Graduate School of Business Administration, Harvard University, is neither a work of science nor of scholarship; nor is it intended to be. It is addressed primarily to those who have little understanding or perhaps false notions as to what executives have to do and what kind of problems they have to meet. There is little or no definition of terms and no attempt at developing conceptual schemes relating to the subject. The author wishes to speak out of his personal experience and observation rather than to cite the considerable volume of literature on the subject of organization and administration. He succeeds admirably in his purpose. The style is highly personal, chatty, and anecdotal.

The book should be of interest not only to those having no experience or knowledge of the work of executives, but also to those in the lower and intermediate levels of the larger organizations who often wonder what the men in the top offices do and who frequently have quite erroneous views about the matter.

As presenting a good deal of case material in the abbreviated form of anecdotes, the book should also interest experienced executives who have difficulty in selecting illustrative material from their own experiences. This difficulty in part explains the fact, noted by Professor Copeland, that most autobiographical material by those whose chief claim to eminence is their organizing and administrative capacity fails to say anything of importance about this aspect of their work and experience.

One might expect in a book of this kind a great many unwarranted oversimplifications and platitudinous generalizations that are mere expressions of personal opinion. Professor Copeland did not

entirely escape this danger. Here is an example (p. 47): "Integrity, honesty, and sincerity are qualities in which a man must rate 100% or zero. Unless a man can be rated 100%, it is futile to dream of educating him to raise his standards after appointment." To the reviewer this is sheer nonsense.

As stated, Professor Copeland ignores the considerable literature that is available. This, no doubt, makes the book easier reading for those to whom it is primarily directed, but it also limits the usefulness of the book for others. It also makes rather conspicuous a notable exception in that the author cites many times the research studies of the Harvard Business School. To the reviewer this treatment seems to give a lack of balance to the book and the impression that it is a bit of propaganda for Harvard Business School and its research department.

The personal tone maintained throughout the book comes close to the limit toward the end when the author discusses in detail his plans and attitudes with respect to retirement.

CHESTER I. BARNARD
The Rockefeller Foundation
New York City

MOORE, WILBERT E. *Industrialization and Labor: Social Aspects of Economic Development.* Pp. xx, 410. Ithaca: Cornell University Press (for The Institute of World Affairs, New School for Social Research), 1951. $5.00.

The general intent of this scholarly and carefully written book is indicated in the author's preface: "Its focus is not primarily on the historical experience in the industrial West, but on the more recent and contemporary experience in areas commonly called 'undeveloped.' The theoretical justification of this focus is precisely that of the significance of varying social institutions and life patterns for economic development, and the practical justification is that it is precisely in such areas that industrialization is being proposed as a solution to the problems of poverty." It is in a sense a co-operative enterprise, and the author gives credit to several foundations and research organizations that assisted him in his work.

It is difficult to summarize the many conclusions emerging from the book, most of them stated cautiously and tentatively. Among the factors tending to promote the shift to industries in industrially backward regions, the author mentions the following: poverty, arising from overpopulation; debt and modes of inheritance; deterioration of the land; loss of markets for craft skills and products; escape from social pressures of various kinds at home (for example, Chinese women going to the factories to escape the domination of their mothers-in-law); deliberate restriction of agricultural employment; direct coercion of workers through taxes (to force them to earn money), indenture labor recruitment by native chiefs and headmen who have sometimes robbed the workers scandalously; and, in a few instances, patriotism.

Among the many factors hostile to the shift of labor to industry, the following are discussed: hostility to change; unawareness of other patterns of life; loss of security, economic and social, and of family and village connections; loss of freedom as producers; love of the land; loss of status; lack of goods available for purchase with wages earned; opposition to authority and discipline in the factory, and to the time-discipline," the punctuality and steadiness of industrial jobs; and in some cases hostility to foreign control of factories, race discrimination, and lack of any chance of promotion.

The problem of morale and efficiency of workers is discussed with perspicacity. The cycle of poverty and inefficiency is analyzed carefully—"the cycle of poverty, lack of physical vigor, frustration, low productivity, low wages, and further poverty." Absenteeism and rapid turnover are noted as serious evils; the waste involved in race discrimination is clearly indicated, and the notion of race superiority is blasted properly.

Part II of the book gives us a detailed discussion of the history and status of industrialization and labor in Mexico.

To the question whether industrialization promises a remedy for the poverty of industrially backward and overpopulated countries Professor Moore offers no simple answer; but his book should be required reading for all who are optimistic about this.

JOHN ISE
University of Kansas

FRANCE, ROBERT R. and RICHARD A. LESTER. *Compulsory Arbitration of Utility Disputes in New Jersey and Pennsylvania.* Pp. 90. Princeton: Industrial Relations Section, Princeton University, 1951. $2.00.

It should not be inferred that the decision of the United States Supreme Court of February 26, 1951, holding the Wisconsin Compulsory Arbitration Statute unconstitutional makes studies like this one academic. Not only is there doubt that the Court's decree is equally applicable to all compulsory arbitration laws, but the decision itself rests on a doctrine of conflict with Federal law—a conflict easily removed by Congressional action.

Of the seven states with this sort of legislation, these two were selected for study probably because of convenience, although New Jersey possibly has accumulated more experience in the administration of a compulsory arbitration statute than any other state. The inclusion of Pennsylvania adds little to the study because the Pennsylvania experience has been very limited. The Pennsylvania act has ben invoked only 7 times, with the procedure carried as far as an arbitration award in only 3 cases.

The limited use of the Pennsylvania law is not explained by its newness since it has been in operation for virtually the same period of time as the New Jersey statute. The authors speculate that the greater maturity of collective bargaining in Pennsylvania utilities and the undesirable restrictions imposed by the Pennsylvania act on the selection of arbitrators and on the standards they must employ in reaching their decisions are responsible for the meager experience.

The most surprising conclusion advanced is that "the results in both states would seem to indicate that bargaining relationships which were functioning successfully before the enactment of the laws were not disrupted greatly by the statutes" (p. 87). This conclusion is at variance with the results of earlier studies of the New Jersey legislation made by Professor Thomas Kennedy and Professor Lois MacDonald, both of whom found collective bargaining was impaired (Kennedy, The Handling of Emergency Disputes, Industrial Relations Research Association, Proceedings of Second Annual Meeting, 1949, p. 14. MacDonald, Compulsory Arbitration in New Jersey, Graduate Division of Public Service, New York University, 1949).

It is not possible in this brief review carefully to evaluate the evidence on which this very important finding rests. It can be noted that the authors tested the opinions of members of the arbitration boards and of management and union representatives in the utility industries. They also reviewed the experience of each industry and examined the trend of statistics with regard to the percentage of negotiations in which the procedures of the legislation were invoked. Their conclusion is entitled to respect.

Other significant findings are that both states have avoided prolonged stoppages—with one exception—since the laws were adopted; that the procedures of the New Jersey law are more conducive than those of Pennsylvania to workable solutions to labor disputes; and that the entire process of compulsory arbitration is endangered by judicial review of arbitration awards.

The study is a significant contribution to the growing literature on the problem of the emergency strike.

JOHN PERRY HORLACHER
University of Pennsylvania

GINZBERG, ELI, SOL W. GINSBURG, SIDNEY AXELRAD, and JOHN L. HERMAN. *Occupational Choice: An Approach to a General Theory.* Pp. ix, 271. New York: Columbia University Press, 1951. $3.75.

This little book impresses the reviewer as one of the most significant contributions yet made to the literature of vocational guidance. The study it summarizes was financed by the Rockefeller Foundation and the Columbia University Council for Research in the Social Sciences.

On what basis are occupational choices now made? What are the personal and social factors conditioning such choices? Is there a commitment pattern in the psychological process of selecting a vocation or is it a matter of fortuity and chance? Does the pattern change predictably with the maturation of the child through adolescence to young adulthood? How far do the techniques in our present counseling system insure an adequate and intelligent use of our potential manpower resources? What can be done to make our vocational guidance system more effective? These and derivative questions which have long plagued the minds of high school and college counselors are tentatively answered. The answers come out of "several years" of systematic interviewing of children and adolescents from the sixth, eighth, tenth, and twelfth grades, mainly of the Horace Mann School, and of typical undergraduate and graduates in Columbia University and its associated colleges.

The authors stress the point that occupational choice is not an act of simple decision but rather a developmental process—a kind of progressive commitment, irreversible, with compromise always an essential aspect. Normally the child passes through a "fantasy" stage of occupational interest, the adolescent through a "tentative" period, characterized by considerations of interest, capacity, and values. The latter gives place to the maturer "realistic" stage marked by exploration, crystallization, and specification of choice. Deviations from these norms due to economic background, class, sex, emotional and other psychological factors, and parental and social orientation are analyzed and abundantly illustrated by case histories.

In a penetrating chapter on "The Conservation of Human Resources" the authors deal with the problem of how to develop "appropriate methods—in addition to financial support—to help those with capaciety and talent in the lower income groups to pursue additional education and training." They stop far short, however, of advocating a general prolongation of education. They insist that the latter is not necessarily desirable from the standpoint of occupational choice and adjustment. Its value lies rather in "the opportunity for leisurely deliberation concerning an occupational choice and for avoiding premature commitments."

The treatment is lucid, stimulating, and readable throughout. In method of presentation it is direct, objective, and cogent as a syllogism. It contains no discernible element of the pedantic or doctrinaire. Pet theories are conspicuously absent.

With this study as a background a similarly balanced study evaluating the present methods and techniques of vocational counselors would be of inestimable value.

CHARLES W. COULTER
University of New Hampshire

PFIFFNER, JOHN M. *The Supervision of Personnel: Human Relations in the Management of Men.* Pp. viii, 454. New York: Prentice-Hall, 1951. $6.00.

This volume is a successful effort to produce both a text for the teaching of the human relations aspects of management and a useful handbook for supervisors interested in a plain-talk presentation of the findings of human relations research during two decades. The author sets his material within the framework of several controlling premises: that the democratic way of life is desirable and feasible in management; that man is a social animal, influenced by belief-systems in his work habits; that communication, participation, and constructive conflict as well as cooperation and consultation provide the main pattern for supervisory leadership; that adjustment to living and working in large-scale organizations is still a new and difficult problem for most of us, an adjustment with which we have had only a few decades of experience.

The volume is divided into six main parts: the supervisor and human nature; the human relations aspects of organization and management; the social aspects of supervision; motivation; clinical approaches to troubled people; and selection and training of supervisors. These central issues are dealt with mainly at the level of the work unit composed of the supervisor and his rank-and-file subordinates; the larger world of the total organization and its surrounding social environment is seen only incidentally and by implication. The exposition thus profits from intensive analysis of the first-line supervisor and his group, but tends to isolate his intimate world artificially from the powerful influences of the universe of administration in which the work unit lives. In this respect the author faithfully reflects the virtues and the weaknesses of the human relations research upon which his text depends.

The supervision of personnel is seen as having a generic pattern: "people follow a rather uniform pattern of behavior in working relationships." As a consequence, the analysis assumes a common pattern of supervisory problems and maxims in both public and business administration. For political scientists and others interested in the distinctive features of supervision in public agencies, the omission of any emphasis upon the political environment of the supervisor will have special significance. But every reader interested in supervision as a problem in human relations will find this a workmanlike addition to his shelf of useful books.

WALLACE S. SAYRE
The City College of New York

ZALEZNIK, A. *Foreman Training in a Growing Enterprise.* Pp. xv, 232. Boston: Harvard University Graduate School of Business Administration, Division of Research, 1951. $3.50.

As is clearly stated in the foreward by Professor Fritz Roethlisberger, the foreman in a business offers the most fruitful focus for the study of the administrative process in general. The foreman is literally "the man in the middle." He stands between management and employees. He operates in the middle of the abstract and the concrete; in the middle of theory and practice; in the middle of good intentions and practical achievement; in the middle of verbal and nonverbal worlds, and in the middle of a changing technology and time-honored customs. It is he who is expected to bring about an hourly and continuing miracle of integration. In consequence, the author has centered his study on the foreman, with particular reference to his training and the appropriateness of this training to his needs. Dr. Zaleznik is principally concerned with the question: what kind of help do supervisors need from training for more effective action on the job?

To find an answer to this question, the author selected a single, young, and rapidly growing enterprise for study (the book is his doctoral thesis) on the assumption that its management would be more receptive to observation of its practices than would an older and more rigid organization. His research consisted in: (1) the observation of the supervisory training meetings held by the company; (2) the conduct of a series of individual interviews with supervisors to ascertain their problems and their reactions to the training programs; and (3) the observation for five weeks of a single foreman, Tony, at work under the particularly difficult circumstances of starting an assembly line in a new plant. On the basis of these observations, the author draws a number of conclusions relative to the relevancy of the training offered in this particular company, the needs and problems of first line supervision, and the approach and content of the training which will provide the most help to supervision.

His conclusions concerning the relevancy and value of the company's supervisory training program are not only significant but have long needed expression. He points out that the establishment of the program was not the outgrowth of some critical or sharply defined problem. Instead, management merely had a vague "feeling" that supervisory training was needed. It is probable, the author suspects, that this was stimulated to some extent by the fact that as a result of the Training Within Industry programs, such work with supervisors had become something of a "fad." The man selected to do the training, while experienced in the company, was chosen primarily because he had an advanced degree in psychology and had taught in the public schools. In turn, his choice of subject matter was equally fortuitous. He had studied psychology;

it seemed logical that a knowledge of psychology would be helpful to the supervisors, so that is what they got, with particular emphasis on developing a background knowledge of psychological principles, the formation of desirable "attitudes" in the supervisors, the teaching of rules of supervision, and the instilling of confidence in them. The melancholy outcome was the expenditure of much time and effort with few or no practical results. The content and conduct of the training sessions, as reported, would be ludicrous were they not so tragic in their futility—and their representativeness of what is being done in industry generally.

The author's conclusions resulting from his interviews with the foremen are less significant. He finds that their attitudes toward the training are colored by the state of their morale. Furthermore, he discovered that where poor morale (negative attitudes) exists, management tends to be too preoccupied with other and more pressing problems to be too much concerned about it.

A major part of the book is devoted to a detailed exposition of the problems and reactions of Tony, the foreman, in getting his assembly line started, in meeting production goals, in dealing with various staff specialists, and in handling his people. Tony has trouble, almost from the start, and it grows progressively worse. As a result, he becomes increasingly disorganized in his activities, unrealistic in his thinking, and wracked by anxiety. In short, the pressures of his responsibilities and his failures adequately to meet them induce an almost complete state of panic in Tony. His problems mount in geometric progression during the course of the study, so that at the end of the five weeks of observation he is about ready either to break down or to have management replace him. The picture of the disintegration of a supervisor on his job which is provided is a poignant and realistic one—and one which is played out in many plants every day.

The most unfortunate feature of the study—and a critical source of weakness in the book—is the fact that the author has apparently had no training in clinical psychology. The true significance of Tony's disintegration under the cumulative stress of the job has apparently escaped the author completely. He provides a detailed clinical account of Tony's descent into a state of panic without any awareness of the sources and basic nature of his difficulties. With surprising naïveté, he diagnoses Tony's behavior simply as a failure to grow and develop in spite of the fact that in his daily job activities (1) "he did not observe events about him, (2) he did not attend to specific problems, (3) he did not relate himself effectively to people, and (4) he behaved in a frantic manner and was generally apprehensive." Briefly the author does not clearly recognize that Tony's problem is not one that training of any kind can help. Tony's difficulties stem from the fact that he is essentially a weak, dependent (probably not too intelligent) individual who has never learned to think realistically or relate himself practically to his problems. Simply stated, he is not supervisory material and should never have been promoted beyond group leader. Having been made foreman, he begins to regress and become increasingly immature and unrealistic in his responses as he is subjected to greater and greater stresses. The solution, as much for Tony's good as for management's, would be to take him off supervision at the foreman level as soon as his incapacity becomes evident and before he breaks down completely.

By way of conclusion, the author stresses the desirability of focusing training on the supervisors' needs, of diagnosing their problems and understanding their feelings and attitudes, and of addressing training meetings more specifically toward the supervisors' problems, attitudes, and beliefs. He feels that the end goal of such training should be to help all types and levels of line and staff employees to diagnose situations effectively, to act effectively, and to become self-aware. These are undeniably laudable objectives for training; the extent to which they can actually be accomplished by most industrial training departments is open to considerable question. In this respect he follows most professional industrial trainers in substituting a proneness to wishful thinking for a tough-minded appraisal of the limitations of training. Taken as a whole, the book contributes little that is new or original with respect either to methodology or conclusions. It does present one case study in faithful detail which provides the uninitiated with a valid picture of what frequently happens in industry. The interpretations, on the other hand, as already indicated, tend to be rather naïve. The author's recommendations, while undeniably admirable, are probably much more difficult of attainment than he fully recognizes. In short, the study represents a typical research project at the graduate level, but hardly one which makes a major and lasting contribution to human knowledge.

ROBERT N. MCMURRY
Chicago, Illinois

COOK, FRANKLIN H. *Principles of Business and the Federal Law.* Pp. xxi, 563. New York: The Macmillan Company, 1951. $5.50.

This is a combination text and case book purporting to deal with important "legal and economic principles that affect business in its relation with government." Actually, it is a book on constitutional law. The emphasis throughout is on the application of constitutional clauses—impairment, equal protection, privileges and immunities, due process, and commerce—to business and labor practices. There is little economics in it.

In Book I, entitled "Constitutional Law," the material is arranged according to the constitutional framework rather than by subject matter. For example: taxation is treated in five chapters of Book I; labor in four chapters of Book I and in Part V of Book II, consisting of four chapters; monopoly and competition in five chapters of Book I and in four chapters of Book II. Book II, entitled "Federal Statutes," is divided into four parts—"Restraints upon Business," "Labor Legislation," "Security Regulation," and "Regulation of Transportation."

This method results in considerable scatteration of subject matter, repetition, and functional disunity. Whatever its pedagogical value for the elucidation of constitutional principles to prospective lawyers, it is confusing and somewhat frustrating to the lay student who is more concerned with the social philosophy and the consequences of constitutional interpretation than with underlying legal principles. If, for example, one wants to ascertain the constitutional metes and bounds of federal antitrust policy, one does not relish the prospect of searching through nine chapters to find the answer.

The material, except for statutory citations in Book II, consists almost entirely of excerpts from Supreme Court cases. This is far from satisfying to the social scientist. He misses reference to the criticism appearing in learned journals of law, politics, and economics; to notable works on constitutional law; to the contributions of state courts and administrative commissions; to the interplay of social forces which has influenced judicial decisions. These deficiencies are partially offset by textual explanations, but these are generally brief and legalistic.

The Constitution is regarded as a bulwark of individual and property rights vis-a-vis the State. The rationale of the Court is "precedent and its own sense of reasonableness" (p. 5) and its "idea of what is right and what is wrong" (p. 111), which the author equates with "natural" or "higher" law. The necessity for public restraint of private economic power and for flexibility of interpretation is conceded but only within the permissive limits of traditional legal theory. It is a useful case and reference book, but scarcely an adequate guide for social policy.

HORACE M. GRAY
University of Illinois

CLOUGH, SHEPARD B. *The Rise and Fall of Civilization: An Inquiry into the Relationship Between Economic Development and Civilization.* Pp. xiii, 291. New York: McGraw-Hill Book Company, 1951. $4.50.

While it is not written in a bellicose or controversial tone, it may be fairly asserted that this stimulating essay was in-

spired by a desire to combat the conception of the rise and fall of civilizations promulgated by Arnold J. Toynbee in his *A Study of History* and, to a lesser extent, the views of Oswald Spengler on the same topic, as expressed in his *The Decline of the West*.

Toynbee presented an essential spiritual interpretation of history. For example, he held that the rôle of each great civilization has been to fulfill destiny assiged to it by God. Spiritual creativity is the chief dynamic factor in history. Civilizations are rehabiliated by the spiritual etherialization of leaders as they retire into the wilderness to hold communion with God. The chief hope of saving Western civilization today is to be found in a more complete appreciation and utilization of the incarnation of God in Jesus Christ, the only authentic savior.

Professor Clough's book provides a far more realistic approach to the problems of the nature, rise, flowering, and decline of civilizations. He regards economic factors as more potent than spiritual items in creating and supporting human civilization. But economic aspects of life, however essential, are not the highest manifestations of human civilization. According to Professor Clough, civilization is measured by the extent to which "a people produces aesthetic and intellectual works of high merit and provides physical and social security for its members. . . . Of great importance also is the prevention of such a rigid structuring of the culture that the individual has no choice of action."

The production of conditions favorable to a high state of civilization depends, more than anything else, upon the provision of a substantial economic surplus. But this will not, in itself alone, invariably create a rich culture. The controlling ideology is also of great importance. To attain a high type of civilization, and with reasonable rapidity, requires an ideology that, making use of the economic surplus essential for stability and prospertiy, "embraces the idea that great works of art should be created, that knowledge of the universe should be acquired, and that man should extend his control over the human and physical environment."

Building his theory of the rise and fall of civilization upon economic progress and the creation of an economic surplus, Professor Clough sets down the following factors which he regards as exerting a controlling influence over economic progress: (1) natural resources; (2) technology and techniques of production; (3) labor; (4) capital; (5) business leadership and economic institutions; and (6) demand for goods and techniques of distribution. He applies these criteria in the bulk of his book, in the course of which he examines the rise of the earliest cultures, the cultures of the Bronze Age, notably Egypt and Mesopotamia, ancient Greece, Rome, and Western civilization. He holds that "Western culture now has the highest civilization of any culture in the world." Leadership in this is now passing from Western Europe to the United States and Canada. The greatest threat to the dominion and permanence of Western leadership in civilization is to be found "in the threat of war, as well as actual war."

Space does not permit any detailed commentary on Professor Clough's survey of the history of civilization, but it may be said categorically that it is an unusually thoughtful and stimulating work. In the opinion of the reviewer, it is more instructive and fruitful than a library full of such books as those by Toynbee and Sorokin, with their single-track mysticism, or even of books like Brooks Adams' *The Law of Civilization and Decay*, which overworks an equally unilateral materialistic interpretation of history. Professor Clough's broad approach and his theory of multiple causation are more in accord with the facts and more entitled to respect.

HARRY ELMER BARNES
Cooperstown, New York

SOCIOLOGY AND EDUCATION

GREEN, ARNOLD W. *Henry Charles Carey: Nineteenth-Century Sociologist*. Pp. viii, 218. Philadelphia: University of Pennsylvania Press, 1951. $4.00.

Whether or not Henry C. Carey (1793–1879) was or was not "a sociologist" is a question that could be debated endlessly; indeed Mr. Green does not unequivocally claim that designation for Carey in the present volume.

At any rate, Carey published successively, in 1858 and 1860, the three volumes of his *Principles of Social Science*, which thus became one of the earliest works to bear any such title, in any language. To be sure, Vico's *La Scienza Nuova* appeared in 1725, over one hundred years earlier, and there had been a few other works during the interim that can be argued to have something of the character and pretensions of general social science. But for all that, Carey was among the pioneers in this field of endeavor. Though his "social science" was a mixture of economics and miscellaneous items of special pleading for reforms in which he was interested, especially protective tariff, and though, as Green frankly shows, there is ground for believing that his views were not altogether uninfluenced by personal pecuniary interest in the Pennsylvania coal and iron industry, he deserves some credit for his effort to demonstrate that there could be a *general* "social science."

It will, therefore, be of value to those interested in the history of social science to have this competent and compact account of Carey's life, with an analysis of his work, available. Apart from some difficulty in ascertaining, on a rapid reading at Green's first chapter which is primarily biographical, which passages refer to him and which ones to his only slightly less distinguished father, Mathew Carey, I find nothing to criticize in this book.

FLOYD N. HOUSE
University of Virginia

VOLKART, EDMUND H. (Ed.) *Social Behavior and Personality: Contributions of W. I. Thomas to Theory and Social Research*. Pp. ix, 338. New York: Social Science Research Council, 1951. $3.00.

This collection of excerpts from the writing of W. I. Thomas is a timely and most welcome contribution. Dr. Volkart has made a judicious selection of key passages from books and articles written by Thomas (most of which are out of print and hard to come by) and has has shaped them into an integrated whole. Unfortunately, Thomas never wrote a systematic statement of his thoughts. During his entire life he was engaged in the pursuit of fresh knowledge, and the fertile ideas he had he used as guides rather than as subjects of contemplation. Besides, Thomas' ideas were always evolving and changing, and he was reluctant to formalize them. Some of his basic concepts, for example, that of "situation," have never been adequately defined. Dr. Volkart is fully aware of this dynamic character of Thomas' work and has succeeded admirably in organizing the passages he has selected in a manner that conveys a sense of the development and growth of Thomas' thinking about social phenomena. The fact that there was no element of finality in Thomas' thought makes his contributions especially valuable as a living heritage to be elaborated and deepened by future generations of social scientists.

This volume clearly shows that Thomas' contribution to the social sciences has been a major one. In his excellent introduction which summarizes this contribution Dr. Volkart rightly concludes that "in retrospect, Thomas looms as more than a historical figure of importance. Directly and indirectly he has influenced the course of social science development, and his basic conceptions can be discerned in much of contemporary theory and research. If today it is difficult to appreciate his originality and authority, it is because so much of his work has been accepted in the body of social science" (p. 31).

Among these conceptions are the postulate of the situational approach which asserts that behavior is adjustment to existing relationships and that change in them (crisis) is the dynamic element in social development and the postulate of the "definition of the situation" which assumes that subjective factors—the attitudes and valuations of individuals and groups—are an integral part of behavior analysis. Thomas also offers methodological directives concerning the priority

of case studies over statistical investigations; the use of life history material; the employment of control groups; and, above all, the avoidance of limitation of the physical sciences and the recognition of the distinctive qualities of human behavior.

Dr. Volkart has gathered together seventeen selections, slightly abridged to avoid repetition, from Thomas' books and articles. The inclusion of a hitherto unpublished report submitted to the Social Science Research Council which outlines a program for the study of personality and culture and contains the most mature expression of Thomas' position is particularly welcome. Each selection is preceeded by an introduction by the editor which places the selection in historical perspective and relates it to the other materials presented in the volume. The selections are divided into four parts which deal respectively with the nature of social science, with personal dynamics, with cultural dynamics, and with personality and culture. A good bibliography has been compiled by A. Paul Hare, and Donald Young has written a foreword.

A slight flaw in an otherwise excellent volume is the absence of any discussion of the nature of the collaboration between Thomas and Znaniecki and of the possible influence which the latter may have exercised on the shaping of Thomas' approach to the study of social phenomena. For example, the "Methodological Note to the Polish Peasant" is regarded by Volkart simply as a continuation and elaboration of ideas previously set forth by Thomas. Consultation of Znaniecki's "Cultural Reality" which was published at the time he was collaborating with Thomas would have undoubtedly modified this view. Znaniecki is an original thinker in his own right, and he subsequently developed a system of ideas which to some extent diverged in interest and emphasis from the course pursued by Thomas. However, they are fundamentally alike in their approach and both contributed to its elaboration in equal measure during the fortunate period of their collaboration.

THEODORE ABEL
Hunter College

EVANS-PRITCHARD, E. E. *Social Anthropology.* Pp. vii, 134. Glencoe, Illinois: The Free Press, 1951. $2.50.

These six lectures, given on B.B.C.'s famed Third Programme in the winter of 1950, are designated to explain social anthropology to a lay audience. It is hard to believe that the attempt was other than successful. Professor Evans-Pritchard's style is clear and straightforward if a trifle humorless, and his grasp of his subject matter is firm and large, gentled by a candor and a humility that are as rare as they are commendable. There is no hesitation about the theoretical confusions that clutter anthropology in its present state of development just as there is unapologetic pride in the increasing accuracy of ethnographic methods and general field work techniques. The concluding chapter on applied anthropology is an especially neat blend of caution with a rather impressive statement of anthropology's credentials to contribute to such practical affairs as colonial government. (If the chapter deals with little else in the way of applications, it should be forgiven for its excellence as well as its British origin and audience.)

But Evans-Pritchard, like any good professional, has a rather definite point of view toward his work, and that point of view, while it may be rejoiced in by some, is anathema to many. Denying that social anthropology either is or can be a science, Evans-Pritchard (a) classifies his descipline with the humanities, believing its ties to history the most intimate among its intellectual relations, (b) feels that a close linkage between psychology and anthropology is impossible since they study different kinds of phenomena, and (c) refuses to admit the discovery to date of any cultural laws.

Without challenging his assertions about the utility of history in anthropological research and theorizing, it seems hard to understand how Evans-Pritchard can overlook the kind of history that is most garmane to understand how the members of society come to preserve or modify their social structures and to play their culturally determined roles. This kind of history has to do with the socialization process and brings the anthropologist willy-nilly into contact with psychological thought and methods. *See* Mead, Whiting, and Kardiner, among others, on this point. The denial of discoverable lawfulness also is a trifle diffiucult to accept in the light of the recent work by Kroeber, Murdock, and the researchers utilizing Yale's cross-cultural index. It also seems to be inharmonious with Evans-Pritchard's own insistence that anthropologists study "problems and not peoples." Does this not imply regularities in the processes and relationships characterizing cultural behavior, and does this not imply lawfulness?

The approach of science deserves its long day in court if for no other reason that that the disciplines concerned with man have too long been unproductive in their literary and "humanistic" settings. Science may prove as powerful a tool for understanding the social environment as it has for plumbing the physical world. Those who deny it its chance do a real disservice in the sense of impeding the kind of public acceptance that would facilitate what may be a crucial effort at expanding man's knowledge of man.

EDWARD JOSEPH SHOBEN, JR.
Columbia University

MUDD, EMILY HARTSHORNE. *The Practice of Marriage Counseling.* Pp. xix, 336. New York: Association Press, 1951. $4.50.

Association Press makes a valuable contribution to the entire field of marriage and family relations in this latest volume in their family life series. Marriage counseling has developed so rapidly in recent decades that many questions about what and why is marriage counseling, what is professionally sound practice, just what is the process, who uses marriage counseling services, and what good do they do are as inevitable as they are difficult to answer.

Of all the persons who might have been prevailed upon to write a volume on marriage counseling practice, Dr. Emily Mudd is undoubtedly most competent. The marriage Council of Philadelphia with which she has been identified from its beginning is an outstanding model of a well-organized, carefully developed, professionally sound marriage counseling service. That its experiences, standards, and practice through the years form the basis of this volume gives the guide a practical reality that no arm-chair philosopher could possibly emulate.

The purpose of marriage counseling is succinctly stated as "promoting personal and social adjustment within the family by aiding those individuals who feel inadequate to utilize their own strength, and of furthering knowledge concerning the dynamics of relationship between husband and wife" (p. 4). Similar carefully defined terms in context throughout the volume enhance its use as a reference work.

Appendix B, "Reports from Functioning Services as Furnished by Their Executives," is a rich mine of current marriage counseling practice as reported by some thirty-five services in concentrated parallel format covering some seventy pages in the book. Such material suggests itself for courses and seminars dealing with the norms and variables in counseling clientele, settings, philosophy, and practice.

Perhaps the most valuable section of the entire work is Chapter 10, "The Process of Counseling," in which the reader is taken step by step through the process of professionally sound marriage counseling with an ease that only a thoroughly experienced practitioner could pace. Such a guide has been eagerly sought for some time and will be warmly welcomed by the many marriage counselors in service, in training, and in the related professions where marriage counseling is expected even though the professor, physician, or leader may feel inadequate to the task. Seeing the process in sharp focus as Dr. Mudd outlined it here will possibly reassure many a counselor that he or she is on the right track, and send him seeking supervised counseling training and experience to further develop his skills.

The only limitation is one of coverage. One wishes that there were some discussion of group counseling in connection with Table 10 on the group counseling experience of the Marriage Council of Philadelphia. The specific forms and materials developed by the agency are missed too. It

is therefore especially heartening to find a promise of their availability at the source upon request (p. 73).

This volume is an essential tool in the hands of the professionally interested. But further, it has wide implications and use far beyond the field of marriage counseling. For instance, "Current Events Affecting Marriage Counseling" (Chapter 2), treats intimate human interaction through the periods of social change and wartime disruption in far more vivid living terms than do most treatises on the subject: "And while these years were passing, men and women were living together in love and hate, in sickness and health, in poverty and wealth, in war and peace, as they have since the beginning of time. Others, separated by the exigencies of war, were waiting to live together in the hope of fulfilling their dreams, or in the dread of repeating a past replete with conflict and disappointment. . . ." It is this sense of flesh and blood people facing real life situations often just beyond their strength that gives dynamic meaning to the book and challenging purpose to the field.

EVELYN MILLIS DUVALL
Chicago, Illinois

BRAV, STANLEY R (Ed.). *Marriage and the Jewish Tradition: Toward a Modern Philosophy of Family Living.* Pp. xiii, 218. New York: Philosophical Library, 1951. $3.75.

This small book is a collection of essay materials by fifteen authors written at various times from 1916 to the present day. It would seem that the editorial effort by Stanley Brav might be justified by the rich contribution of Jews to the family tradition of Western Europe civilization, directly and through Biblical influence.

Unfortunately the contributions are of uneven value, at least to the non-Jewish reader. The section concerned with Jewish values reveals interesting facets of Jewish thought but is marred by ethnocentrism and somewhat naïve claims for Talmudic wisdom as foreshadowing the best modern scientific thought. In a brief historical section, however, Stanlay Brav gives a straightforward historical survey without reliance on selected evidence.

A philosophical section contains some fine rhetoric by Goldstein and an essay by Felix Alder on "Permanence" which is worth the price of the book. Alder, in lucid prose, makes the case for broad ethical implications of family life, the significance of ideals, fulfillment by self-denial, and tendency for an expectation of permanence to create a broadly satisfying reality. Here is ethical thinking without intellectual compromise.

Concerning education for marriage, a valid point is made by Brickner that facts without values are not enough to motivate and integrate behavior in marriage. Without a hierarchy of values, there is doubt as to the use of knowledge, and there exists the possibility of using knowledge for evil ends. In this section there may be over identification of religion with morality, but there is also a revelation of the broad, tolerant, humanitarian conception of human destiny which flourishes along with religious ethnocentrism in the Jewish tradition.

A final section contains a stimulating new decalogue of family relations which proves that there is a growing eclectic Jewish tradition, sensitive to scientific evidence and not passively rigid in the dead hand of the past. Weinstein argues effectively for love as the rich product of responsible family living and sanely deplores the love fever brand of romanticism.

The book has some merit but fails to render the needed service of giving the full systematic picture of Jewish theory and practice of family life, past and present.

CLIFFORD KIRKPATRICK
Indiana University

POWERS, EDWIN, and HELEN WITMER. *An Experiment in the Prevention of Delinquency: The Cambridge-Somerville Youth Study.* Foreword by Gordon W. Allport. Pp. xliii, 649. New York: Columbia University Press, 1951. $6.00.

This report of an extensive attempt to prevent delinquency through counseling is scrupulously honest in making clear that the project did not meet expectations.

Planned from the beginning to include a comparison of the counseled boys with a group who were not counseled the study reveal no better *average* delinquency record and no better "adjustment" for the counseled group than for the noncounseled. On the other hand, the thirty counseled boys who were most helped had a significantly superior record to their matched controls, and fewer counseled boys committed delinquencies that were classified as "serious."

One significant truth emerges—some boys are "counseling potentials" and will benefit from counseling. Such boys are those (1) whose homes have reasonable social and emotional integration, and (2) whose parents want help for their children. If these conditions are absent, continuous counseling relationships may provide no better results than ordinary social agency contacts. Although the original proposals by the late Dr. Richard Clarke Cabot had stressed the "friendliness" emphasis of counseling, there is some evidence to indicate that counseling is more successful when specific needs are sought and met. Mere good will is not sufficient. There is also evidence that, whereas counseling may not prevent early delinquency, it may be effective in forestalling repeated or serious delinquencies.

The foreword by Gordon Allport is most satisfactory. It includes a complete recapitulation of the study and a searching evaluation—all in the space of twenty-three pages. He—and this reviewer—decries the existence of twenty-two thousand pages of case reports and yet so little objective measurement and so little reporting of the study by professional writers. The evaluations by both Powers and Witmer are honest and searching, and yet somehow the reader is left unsatisfied. Is the reported delinquency record a good criterion when only 1 or 2 per cent of delinquencies ever become a matter of record? Why weren't measurement data used more frequently, and why weren't more of the quantified data treated statistically? Why was such a large variation in type and background of counselor permitted, thereby admitting an uncontrollable variable in the study? Who knows what might have happened had it been possible to carry out the original plan to have all boys under counseling for a ten-year period? (Four and a half years was the average length of counseling for all boys in the study.)

From Dr. Cabot on, great devotion to boys and to human values is seen to be a strong motivating force in the workers of this study. Some of the concepts and procedures used now seem ineffective—case work and counseling have changed and have increased in professional effectiveness since 1935. To friendship must be added knowledge of personality dynamics and skill in dealing with individual need. Although the study lacked a point-by-point evaluation planned from the outset all future studies of this nature will profit greatly from what this study has taught us. It even teaches us to be more hopeful—three times as many boys were predicted to be delinquent as actually became so!

C. GILBERT WRENN
University of Minnesota

MICHIGAN, STATE OF. *Report of the Governor's Study Commission on the Deviated Criminal Sex Offender.* Pp. xi, 245. Detroit, 1951. No price.

In 1949 Governor G. Mennen Williams appointed a commission of twenty-one members to study the problem of the sex offender and to make recommendations for more effectively meeting the problem. This report presents in detail (245 pages) the facts gathered by the commission, the conclusions reached by the various subcommittees, and the final recommendations of the commission as a whole.

The summary and recommendations, forty in all, are wisely placed at the beginning of the volume with the committee reports and statistical data following. The recommendations will receive particular attention since they represent the crystalization of much fact finding and of many hours of discussion. Some are applicable only to the State of Michigan, others are of general interest to scientific workers in this field, to law enforcement agents, and to legislators.

No review can do justice to the mass of information and detail of conclusion which is embodied in this report. However, this reviewer would choose to accentuate certain findings which deserve widespread dissemination. In the report of the subcommittee on fact finding, Paragraph XI calls attention to the fact that sex offenders do not progress from petty offenses to serious crimes but rather remain, with few exceptions, confined to their specific pattern of disturbance. The petty sex offender of today is not the sex fiend of tomorrow. "The rapist and child attackers of tomorrow will come, in the main, not from today's minor sex offenders but today's reserve army of severely traumatized children and youth, many of whom have not yet committed a sexual offense of any kind." Widespread understanding of this point would be effective in preventing local hysteria on the detection of minor offenders.

Most scientific workers are convinced that the problem has been overemphasized to a serious degree. Spurred on by newspaper and magazine publicity, a state of hysteria may be said to exist at the present time. The report very soberly points out that most citizens are prone to react to sex offenses out of proportion to other types of peril which affect women and children even more grievously. The automobile kills 300 victims and injures thousands for every victim of a sex attack. "As for the emotional injury done by sex offenders we must not forget that maladjusted parents and neurotic teachers do incalculable harm to thousands of children every year." The misery and suffering and loss of life resulting from alcohol is many times more seroius that that resulting from the sex offender.

It is difficult to maintain perspective in a field so bound up with conscious and unconscious taboos. A careful reading of this report will assist, however, and will well repay the effort. It is well written, lucid, and well organized. The report should be made widely available, representing as it does a valuable contribution to the subject.

LEWIS H. LOESER
Newark, New Jersey

HAVIGHURST, ROBERT J., and H. GERTHON MORGAN. *The Social History of a War Boom Community*. Pp. xix, 356. New York: Longmans, Green and Co., 1951. $4.00.

This book is deceptively easy to read and could easily slip through the social scientist's hand as a light-weight and ephemeral story of something done and gone, and therefore of little more than antiquarian interest. Of course, boom towns may not be pure history. They may repeat themselves, and if so it is well to have the story of their growth, characteristics, and decline by an objective and competent observer; and it is equally important that that observer have sufficient standing in the field so that the responsible authorities would easily turn to him for the benefit of his observations when the time came to profit by it. But the book in its almost innocently bland story may well be—and seems to this reviewer to be—not only the history of a boom town but also an unusually fortunate laboratory study of community organization. That laboratory could hardly have been made to order, but the study represents an astute utilization of what the accident of wartime boom happened to offer.

Seneca, a small, simple community, suddenly grows fivefold its natural size to take care of an emergency shipbuilding program. Briefly, simply, but exquisitely, its social and economic protrait before the boom is sketched. Then, with the onset of the boom, the observer goes to his post and for some three years observes and records what he sees as the town grows to five times its size; later he sees it dissolve back to roughly its original dimensions. During the boom, tremendous tasks in production and administration are performed in a miraculously short time. Friction, discontent, unwonted prosperity, unnatural mixing of groups, the excitement of sophisticatedly planned propaganda accompany the events. Livelihood, social classes, church, school, politics, prejudices, physical plant, all pass under review and are seen before, during, and after.

What have the authors learned from it all? Much about the problems and difficulties of a boom-town. But far more about the cultural characteristics of a mid-western American small town, and to the reviewer's eye, of the general American pattern. Under laboratory conditions more clearly observable than during normal pace of life, we see the preponderant attitudes about church and dancing, school and movies, cliques, neighbors, and neighboring strangers, social stratifications, anti-minority impulses, in fact daily life of a large segment of the American culture of the day. Many of us had pious hopes and did wishful thinking about community organization under such conditions. Without being any less idealistic, the authors seem able to stick to realities to avoid self-deception.

It seems that under an unpretentious form we have been given an unusually penetrating sociological study, supported on foundations of both quantitative data and qualitative evaluation with scientific objectivity, but without timidity in passing judgment when that seems useful and pertinent. One would wish, perhaps, a bit better use of statistical presentation, but one would not make a fuss. One would perhaps like to have more about method, but it is not too difficult to distill from what is given the details that one might want for similar enterprises.

The book does more and better than the title indicates.

PHILIP KLEIN
New York School of Social Work
Columbia University

CHASE, STUART, in collaboration with MARIAN TYLER CHASE. *Roads to Agreement: Successful Methods in the Science of Human Relations*. Pp. xii, 250. New York: Harper & Brothers, 1951. $2.75.

Stuart Chase is a ubiquitous author. Trenchant volumes from his pen now form a library: *The Tragedy of Waste; Your Money's Worth; Man and Machines; The Road We Are Travelling; Where's the Money Coming From; Rich Land, Poor Land; Idle Money, Idle Men; Government in Business;* and *Men at Work* reveal a rare facility in interpreting for popular consumption a wide economic knowledge, informed by an engineering background. These fine books have helped educate young America realistically. In *Mexico* and *The Tyranny of Words* (reflecting his semantic hobby, now perhaps become well-nigh an obsession) we see how widely Chase can range.

In the present volume under joint authorship with his able wife, the author is deeply concerned, as in the early volume on *Democracy Under Pressure,* with the values and techniques of living together happily in our complex modern society.

How men behave in groups or collectively is, as our authors make fully if laboriously clear, our consuming problem. The 250 pages seem longer than they are, though this interesting volume reads easily and leaves a good flavor. Yet it is hard at times "to see the woods for the trees." There are, frankly, so many instances of the new and diverse community movements which illustrate the innovating intellectual processes of agreeing, that one wonders if it would not have been wiser to select a few. In that case the book could well have lived up to its high promise. For instance, Chapter 6 on the Quaker business meeting as a method of obtaining unanimity is ably and convincingly written just as is Morris Llewellyn Cooke's application of the Friends' method to the corporate or staff meetings of industry some months back in the magazine section of the Sunday *Times*.

Again, "Conditions of Labor Peace," "Maturity in Labor Relations," and "Conciliators and Arbitrators" contain authentic material and hold together well. The conflict background is effective and detailed. The author has a happy way of handling terse words and phrases—"blocked goals," "solid ground," "the in-group and the out," "two worlds in one," "the road is open." All are intriguing. And the new gadget-like procedures—"role playing," "clinics and laboratories," "from the files," "in conference," come up for pertinent review, albeit perhaps for too much praise and too little criticism.

But hobby or predilection are played up, too! Chapter 18, "Danger—Men Talking—Semantics as a Useful Tool," fails to support its good title.

The book should really be three or four separate volumes—each integrated and clarified—each demonstrating the logical or scientific method of the new social science that Chase has so persistently supported and so wordily interpreted. For, we must ask, what are the weighty conclusions from this rather chaotic and therefore largely journalistic review? The main "principles of agreement"—stated, it is true, with engineering definiteness, are still in part high-level abstractions needing analysis and interpretation through illustration; and of course they require acceptance. These principles of agreement are: "participation," "group energy," "clearing," "communication lines," "facts first," "agreement is easier when people feel secure."

Where and whither the roads to agreement? And agreement over what? For agreement, granted all its smooth techniques, is not any more than the semantic cure-all, an end in itself. The book is really a compendium of ideas and methods; and so it lacks the "integration" that is its declared purpose and central, reiterated advocacy.

University of Pittsburgh

HAAR, CHARLES M. *Land Planning Law in a Free Society: a Study of the British Town and Country Planning Act.* Pp. xiii, 213, 16 plates. Cambridge, Mass.: Harvard University Press, 1951. $4.00.

This monograph, the first of a series of Harvard Legal Studies, ranks with John N. Hazard's *Society Housing Law* (1939) as a model presentation of foreign legal material in its administrative, economic, social, and technical setting, with illuminating comparisons to American problems and legislation. While at the Harvard Law School, Mr. Haar found his way across Kirkland Street to the Graduate School of Design, so that he knew what to look for when a Sheldon traveling fellowship took him to Britain—and knew how to interpret what he saw.

Mr. Haar's tightly written volume is the chronicle of a major revolution, little understood in this country because it is embodied in a highly complex and technical act of Parliament, buttressed by a dozen detailed Ministerial Orders supplemented by schedules—all couched in a foreign tongue of such phrases as "betterment," "appointed day," and "notional lease." It is the great merit of Mr. Haar's book that he has explained these provisions lucidly and as simply as their technical content permits.

The revolution is in the concept of land ownership, often considered the ultimate bulwark of free, private property. Henceforth in Britain increases in land value arising from change in use belong to the state. A person wishing to use land more intensively pays the state a "development charge." A fund has been created to compensate owners for the loss of that part of the value of their land that reflects its possible future increase in value growing out of change in use. The only point where I fail to follow Mr. Haar's analysis is when he says that this fund (£300,000-000) "in effect, is the liquidation value of Britain's land" (p. 104). This device frees the state to supervise land use, to control when and where what should be built, without the necessity of public ownership of land through compulsory acquisition, which remains a reserve power. As Mr. Haar makes clear, the desired economic and social results are achieved without the "nationalization" of land; if anything, land is being "municipalized," all of this in a typically British framework of broadly drawn legislation, to be implemented by administrative refinement, relying heavily on such technical criteria as common sense.

Interestingly, Mr. Haar begins with an exposition of the machinery of town and country planning, showing how local government, specially created "regional" bodies, and the national government work together (well or badly). He is conscious that a national plan cannot be evolved by a ministry co-equal with other ministries, since the planning process is essentially co-ordinative and is a task of the executive; but he fumbles in identifying the proper place for planning in the organization of Britain's national government.

Mr. Haar is not content merely to digest the legislation. He is concerned with the dynamics of planning and land development, both politically and in the market place. What will be the motivations of landowners and developers under the act? When and how must public authorities prod, restrain, or intervene? Where will the friction points be? It is to such questions that he addresses himself. One cannot in a brief review present the manifold trains of thought and speculation that will excite Americans in a variety of social sciences if they will accept Mr. Haar's guidance in interpreting this technical material, of such revolutionary import. Both Conservatives and Socialists have contributed to invent these new tools—for the first time truly the tools of the planner, not merely an adjunct to laws for better housing—to make England a green and pleasant land with homes fit for heroes.

CHARLES S. ASCHER
Brooklyn College

HUNTINGTON, EMILY H. *Cost of Medical Care: The Expenditures for Medical Care of 455 Families in the San Francisco Bay Area, 1947–1948.* Pp. xvi, 146. Berkeley: University of California Press, 1951. $2.50.

The Heller Committee for Research in Social Economics of the University of California has presented a study of the expenditures for medical care of 455 moderate-income families in the San Francisco Bay Area in 1947–1948. After extensive analysis of the expenditures for medical care, the composition of the families, the illnesses for which medical care was required, the types of medical care required, and the amount of prepayment coverage, this report concludes that expenditures for medical care can be burdensome and sometimes disastrous and that "the only way that real protection can be accomplished is through a system of compulsory health insurance at least for the low—and moderate—income groups in our population." When this study could have contributed greatly to the available literature on medical costs, it is unfortunate that the author chose to present such a preconceived idea in her final statement rather than a conclusion based on the findings of the study.

The families used for the study generally consisted of a husband, wife, and one or two children; almost two thirds of the wives were at the child-bearing ages of life. The average income of these families was $4,100 Half had incomes between $3,000 and $4,000 and only a few had incomes less than $3,000 or more than $6,000. In the words of the author, they were considered "a well-to-do group of our wage-earning population." On the average, these families spent about $300 for all types of medical and dental care during the year the study was made, or 7½ per cent of their family income. This compares with 4 per cent of income spent annually for medical care by all families in the United States as reported by the Department of Commerce. While the average family medical expenditures in the Heller study were $300, one-half of the families had expenditures of less than $225, 64 per cent had bills less than $300, and 76 per cent bills less than $400. Thus the great majority of these families had expenditures for the entire year that could not be called disastrous in relation to their income.

The most common illnesses were colds and influenza. In approximately 75 per cent of the reported illnesses the bill was less than $50. The high bills were incurred primarily for childbirth. Other conditions for which the bills were large were female disorders, diseases of the heart and circulatory system, cancers and tumors, allergic disorders, and nervous disorders. Childbirth costs were the largest single item of medical expense for the group as a whole as well as for those families in which a child was born during the year. This fact indicates a defect in the author's sample and in her understanding of the data. Every social scientist knows that young families spend heavily on childbearing and that the heavy expenses for clothing, recreation, and education come later when the family income is usually higher.

The study found that a large proportion of the costly illnesses were hospitalized—70 per cent, in contrast with only about 10

per cent of all illnesses. And two-thirds of the families with health insurance were covered for hospitalized illness. The author, however, states that while 60 per cent of the families had some form of health insurance during the year, the insurance was inadequate primarily because its coverage was concentrated on hospitalized illness.

But the hospitalized illnesses are the costly ones for which families want protection. The fact that they are getting protection for these illnesses is indicated in the Heller report which states: "The more expensive illnesses were those which were most likely to receive prepaid care." Furthermore, for those illnesses where the costs were covered by insurance—usually the costly ones—any additional costs were very low, less than $25 in 68 per cent of the cases. Of course, it is desirable that other medical costs be covered, but in something as new as health insurance it is only logical that the first plans introduced would be designed to meet the costs of the most burdensome illnesses—the hospitalized ones. More and more plans offering other types of medical insurance are being introduced.

According to *A Survey of Accidents and Health Coverage in the United States, 1950* (prepared by the Survey Committee of the Health Insurance Council), at the end of 1950, 76,961,000 persons were protected against hospital expense, 54,477,000 against surgical expense, and 21,589 against medical expense. This compares with 60,995,000 persons covered for hospital expense, 34,060,000 for surgical expense, and 12,895,000 for medical expense at the end of 1948—the year used in the Heller study. Thus in the two years since the Heller study was made, hospital expense coverage increased 26 per cent, surgical expense coverage increased 60 per cent, and medical expense coverage, 67 per cent. In fact, since 1947—the first year during which the Heller study was conducted—hospitalization coverage has increased 46 per cent, surgical coverage 108 per cent, and medical coverage 143 per cent. It is obvious, then, that health insurance coverage is increasing at a phenomenal rate and that surgical and medical expense coverage is rapidly catching up with hospitalization coverage. It is likely, however, that hospitalization insurance will continue to be the most popular since it meets the costs of the most burdensome illnesses.

For these reasons I cannot agree with the author that "voluntary health insurance has been tried and found wanting, and that it is not likely in the future to be able to give insurance protection to those who need it most." On the contrary, it has proved to be the most effective method of meeting medical costs and it is rapidly reaching more and more individuals.

American Medical Association
Chicago, Illinois

HOPKINS, C. HOWARD. *History of the Y.M.C.A. in North America.* Pp. xiv, 818. New York: Association Press, 1951. $5.00.

The elaborate detail by which the author has tried to accord fair appraisal to so many local organizations of the Young Men's Christian Association and to the many movements and internal groups has made this history bulky. But the eighty pages of notes and index redeem the work and make it a valuable library edition.

The year 1920 was the watershed of the century. During that year Y.M.C.A. membership reached one million. "The demise of traditional methodology of the Association was illustrated by the dropping of revivalism" (p. 590). Also the adoption of new aims "for the purpose of building Christian personality and a Christian society" marked the period. Strangely, the use of life problems, economic questions, and personal conduct in the Bible class discussions (Bible classes had always been a central activity) produced the top enrollment of young men in Bible classes—250,000. Staff structure also shifted from a list of secretaries classified by function (physical, religious) to one classified by age level.

In the United States there are 1,688 Associations: 1,088 city, 116 transportation, 360 college or university, 96 rural, and 28 with military units. In 1950 one hundred buildings were being built, involving the investment of $37 million (p. 725). The running story is readable. It tells of the Boston and Montreal locals patterned after the George Williams units in London and existing before 1851. It describes the growth of physical training methods and of the modern gymnasiums in major centers throughout America and the Orient. It shows how our athletic codes of honor were helped along by the Clean-Sport Roll of Luther Gulick and how James Naismith, with Stagg, McCurdy, and others, invented basketball specifically to meet indoor needs of the Associations as set for the secretaries in the perspective of creative leaders. The author might have shown but did not that in the campus situation it was the Young Men's Christian Association leaders who introduced orientation week ideas and methods, originated the foreign student services, including the International Houses, set a pattern for the campus pastorates, introduced the intercollegiate and general student conventions, and were virtually the precursors of the deans of students of our era.

The history gives attention to the beginnings of the organization, the separate movements within it, its great leaders, and its experiments.

It was early necessary to declare that the Association was not a church. In 1857 Alexander Campbell, speaking on the philosophy of the Associations, said of the lectures sponsored by them: "they might range from spiritualism to geology," and "religious controversy was scrupulously avoided"; but "the subjects ought not be anti-religious" (p. 31). In 1869 at the Portland convention the "Evangelical Test" for membership was adopted, thus assuring the centrality of religion, favoring Christianity, and establishing the lay basis of the organization and staff leadership.

The will to remain remote from political issues was severely tested on abolition, and the author shows how three enthusiams were interwoven: (1) the national reach of the independent Associations recently become conscious of general strength; (2) an international relation between various young men's organizations —Canadian, British, French, and American; and (3) the two political loyalties, South and North. In the eyes of this historian the action during this period to deny the over-all Y.M.C.A. convention any power over any local Association seemed to have served a genuine service (pp. 80–90).

The student movement had its inception in 1858 when at the two state universities of Michigan and Virginia students and faculty established Christian Associations. Ten years later the Y.M.C.A. officially adopted the purpose "to plant a Christian Association" at each university, college, and seminary in the nation. The first ones established after this declaration of purpose were in 1870 at Lawrence College and the University of Wisconsin.

Apparently women joined the local Associations, but later the sexes were separated organically after college women appeared at conventions.

The educational work emanated from the two centers for the training of secretaries, Springfield in Massachusetts and George Williams College in Chicago. The summer training schools and conferences at Silver Bay, Lake Geneva, Asilomar, Blue Ridge, Estes Park, and Seabeck became centers of inspiration, instruction, and dedication. Through these, able college ment were enlisted for the secretaryship.

The student volunteer drive in the American colleges, led by C. K. Ober, John R. Mott, and later Sherwood Eddy, E. T. Colton, and Robert E. Speer (p. 304), yielded 600 college men and women for posts in Christian Associations in the Orient.

An industrial movement prepared special secretaries for manufacturing centers. An agricultural movement was instituted. And the Army-Navy Associations grew with World War I. The camping movement found able sponsorship in the Associations. The Association Press was organized in 1911 to bring the public literature not available to lay groups on adolescent psychology, camping, recreation, personal adjustment, sex education, and group work.

Chapter 15 describes the Chicago Y.M.C.A. College, the Southern Y.M.C.A. Graduate School, and the contributions of Yale, Oberlin, Princeton, and Cornell.

The record, difficult to present with good perspective, is well drawn, and the facts are alive with human values.

Pacific School of Religion
Berkeley, California

TENENBAUM, SAMUEL. *William Heard Kilpatrick: Trail Blazer in Education.* Pp. xiii, 318. New York: Harper & Brothers, 1951. $4.00.

Every student of modern education knows something, or possibly a great deal, about Professor William H. Kilpatrick, the Columbia University professor of education who celebrated his eightieth birthday in November. His place in twentieth-century education has been equaled by few. He is widely known both as a teacher and as an education theorist. But his claim to greatness rests more on his instructional skill than on his philosophy. His classes at Columbia were the largest ever assembled at the university. Kilpatrick's philosophy followed rather closely the pattern of John Dewey's and that of various other Columbia associates. Although an interpreter of Dewey, Kilpatrick's contributions adhered more closely to strict educational theory, and it was only occasionally that he made brief sorties into the realm of social and economic theory. As teacher, Professor Kilpatrick had few peers. His large classes caused him to develop a new teaching method for handling auditorium-sized groups. His plan involved a panel discussion by students with the instructor furnishing an introduction and summary of the problems under discussion. Used entirely with eager, conscientious graduate students, the plan was highly successful. Emerson once wrote, "an institution is the lengthened shadow of the man." Men such as Kilpatrick have made Columbia the institution that it is.

Samuel Tenebaum, a former student of Professor Kilpatrick, has compiled a timely book about the retired Columbia educator. At times Tenebaum makes broad and sweeping statements concerning the merits of some of Professor Kilpatrick's theories and accomplishments. For example, he says (p. 88) of the *Project Method,* it "probably had more influence on modern American education in changing and modifying classroom practice than any other document yet written." Again, the author compares his subject's blasts against conventional practices with Martin Luther's ninety-five theses and Thomas Paine's *Common Sense.* And, one notes this sentence (p. 156), "The project method is the ideal medium for ensuring wholesome, desirable concomitant learnings, which are so much more important than the ostensible, overt, direct learnings." One wonders if the side show and the main tent shouldn't change places.

This book throws much light on the Essentialist-Progressivist controversy of a dozen years ago. On one side was Bagley, realist philosopher with emergent evolution theories, and on the other Kilpatrick, the champion of the project method and concomitant learning. Loud were the accusations hurled by each side, and the bitterness was apparently great if we are to judge from Kilpatrick's sharp-edged diary notes made at the time of Professor Bagley's death. Unquestionably the project method made a deep imprint on modern school method, but whether it can be blamed for some of the soft pedagogy of today is debatable. Contemporary educators wonder whether the project method philosophy is tough-minded enough to cope with modern school and social problems, problems such as pressure groups interests and tactics and the new media of communications.

Any student who has admired a former professor finds it difficult to write objectively about him. Mr. Tenenbaum says in the preface to his book that he is vexed because he could find so little on which to disagree with his subject. Much of the book is, therefore, a narrative of Kilpatrick's early life, his personal battles, his academic life, and a scant critical evaluation of his philosophy. By reading between the lines, one gathers that Professor Kilpatrick was exceedingly egotistical, probably vain. He fought his university retirement regulations, and glorified in the kudos of a coterie of handpicked students. The author tells us that much of the material for the book came directly from Dr. Kilpatrick, and at times the author employs a direct question and answer technique to bring out a point. Checking facts or bits of theory directly with the originator or with friends and former students has advantages, but the drawbacks of dealing so closely with a dynamic personality are equally noticeable. The author may experience the hot breath of his subject on his neck.

BROWN, FRANCIS J. (Ed.). *National Defense and Higher Education.* The Report of a Conference of Representatives of Member Organizations of the American Council on Education, Washington, D. C., January 19–21, 1951. Pp. vi, 126. Washington: American Council on Education, 1951. $1.00.

As summaries of speeches and commentaries go, this is a particularly lively and informative document. The occasion that gave rise to the remarks reported was the 1951 midwinter conference of the constituent member organizations of the American Council on Education.

The impact of four major national defense problems on higher education was discussed. The problems considered were manpower, economics, civil defense, and veterans' education.

The papers and discussion on emergency manpower problems in general approved the Universal Military Training and Service bill then being debated in the Congress (and subsequently enacted into law with modifications). President Conant, education's chief champion of universal military service, presented the usual arguments favoring his point of view. Contrary to his previous public statements, which seemed to many to simplify the issues with amazing abandon, he recognized a serious difficulty. It is the need "to have a small fraction of each age group selected in some manner and, after a brief period of basic military training, continued in college for their education" in order to accomplish the training of "officers and specialists." Charles Odegaard cogently discussed certain issues relating to the administration of the Selective Service System, to which he has been an adviser. Jesse Bogue, of the American Association of Junior Colleges, condemned the Selective Service College Qualification Test as giving special privilege (deferment) to the intellectually elite and advocated more military training on college campuses. Only one of the speakers whose remarks are recorded opposed universal military service—as a contribution "to the deepening of poverty, disease, and ignorance."

In speaking of education and present-day economics, Leon H. Keyserling, Chairman of the Council of Economic Advisers, told of the difficulties in making people understand the serious implications of the fierce competition for manpower and materials among military, industrial, and civilian components of the nation. He viewed the problem as a major educational responsibility of the government since the government is responsible for most of the basic programs involved. "It is government alone which has access to the range of information required to place before the public what the problem is. . . ." John D. Millett, of the Commission on Financing Higher Education, argued that in light of the current inflation, any reduction in faculty salaries would be disastrous to higher education. The teacher shortage, school construction costs, and uneconomic college curriculums were considered by other speakers.

No holds were barred by the commentators on veterans' education in referring to the administration of the GI bill by the Veterans Administration. The chairman of the House Committee to Investigate the Veterans Education Program led off with a review of the problems besetting the administrators of the program—and they have been many and complex, indeed. Representatives of three universities followed with an animated discussion of some of the unhappy experiences undergone by institutions of higher education in trying to provide an education for veterans of World War II. A representative of the Veterans Administration closed the discussion with a

reading from the federal budget for the fiscal year 1952.

Educators who did not attend the conference summarized in this review will find it interesting reading.

CLAUDE E. HAWLEY
Washington, D. C.

COOK, LLOYD ALLEN. *Intergroup Relations in Teacher Education.* Pp. xiii, 271. Washington: American Council on Education, 1951, $3.75.

Lloyd Allen Cook, professor of educational sociology at Wayne University, was for four years the director of the College Study in Intergroup Relations. Last year he issued the first of a two-volume report in which the various participating colleges describe the programs they developed to reduce prejudice and to teach co-operation attitudes and behavior. The present volume is the final one in the set. It is largely analytical and interpretative.

The volume is divided in four parts. The first deals with the nature of intergroup relations. Professor Cook points out the confusion which exists in this area and concludes that intergroup relations is primarily concerned with the problems of status, or positions of groups of people in our society. While he properly focuses on the social tensions, he stresses the need for a democratic social philosophy which will permeate efforts in this area from policy making to the day-to-day behavior.

In the second and third parts the nature of prejudice and ways of dealing with it are discussed, followed by an application of the conclusions to problems of improving teachers, both trainors and trainees. The main point is that the basic units in society are not individuals but groups of personalities. The problem of intergroup education is to help people see themselves and others "groupwise" and to learn to act democratically on group levels of behavior. "What this viewpoint argues . . . is the obvious need to make changes in the social system that causes so much individual maladjustment" (p. 248).

In the last two chapters, Professor Cook refers to a "confusion corner" where problems were often stored. That he has not successfully cleaned up this corner is no discredit to him. When it is recalled that the College Study in Intergroup Relations included 24 colleges from New York to San Francisco, from Moorhead, Minnesota, to colleges in Alabama and Texas, with a director serving only half time, an associate who changed yearly, and with limited funds, it is not surprising that the results achieved did not go far beyond the exploratory stage. Finally, it must be said that this volume will repay its readers many times because it reveals in unprecedented ways how a democratic leader works with people. Teachers of all kinds will find it helpful; and laymen who have read Stuart Chase's *Roads to Agreement* will find a discussion of group dynamics in action which will sober, yet hearten, them.

MARTIN CHWOROWSKY
University of Pennsylvania

PHILOSOPHY AND RELIGION

MUMFORD, LEWIS. *The Conduct of Life.* Pp. ix, 342. New York: Harcourt, Brace and Company, 1951. $5.00.

This volume is the "preface," so its author indicates, to several volumes that have gone before, namely, *Technics and Civilization, The Culture of Cities, The Condition of Man.* The point of view is that of an architect and student of design with a fair working knowledge of general philosophy and recent trends of thought. No existing philosophy, he finds, is adequate, nor is science or religion equal to our needs. "Personalism," "humanism," "materialism," "idealism," "existentialism," "communism," "Emersonian individualism" are rejected by name. Economics, politics, the social sciences in general, are also weighed and found wanting, or at least found wanting, whether weighed or not.

The main purpose of the author is, by his own declaration, an "axial change" in our system of thinking and in the social order—a quest for an order in which man is no longer a mirror, but an interpreter and director. Sundry applications of the new system are made to religion, to the family, the community, to forms of volunteer service. Various types of mutual aid and love loom large. There is a strong trace of Gandhi in his opposition to the machine as against muscle, and of Kropotkin in mutual aid as a factor in evolution. The values of love go a long, long way.

Between contriving a group or community, always small, and a constitution of the world, the industrious seeker for the new opus pauses to lament the opening of second-class mail, and the using of tobacco and alcohol, although conceding generously the value of piped running water instead of the bucket carried from the spring.

Distinguished thinkers of the type of Einstein, Conant, Keynes, MacIver, Overstreet, Smith, and in general most students of economics, politics, and jurisprudence are not drawn into the discussion. Even Lasswell's brilliant essays on politics are conspicuously passed by. He has no time or space for the United Nations, the cultural work of United Nations Educational, Scientific, and Cultural Organization, the Social Science Research Council, the struggles of many noble men and women in our day and others for a better world. After all, he might say, this is not a work of analysis but of neosynthesis.

In this brief review it is impossible to do more than offer a brief summary of much effort and many words. This work does not rise to the heights of a final neoaxial philosophy—the center of a new order. Yet it has some of the essentials of such a plan—dreaming and daring. After all, this volume, says the courageous author, is only a "preface." We can always hope and pray for the emergence of his new key to the new day.

CHARLES E. MERRIAM
University of Chicago

CASSERLEY, J. V. LANGMEAD. *Morals and Man in the Social Sciences.* Pp. ix, 230. London and New York: Longmans, Green and Co., 1951. 12/6.

Given in part as lectures (at the Ecumenical Institute, near Geneva), this book is calculated to interest the religious more than the scientific. The author, himself "an ordained sociologist" in England, observes that there is more overlap, and so more room for controversy, between theology and social science than between it and natural science. The zone of dispute is marked out by him as "the interpretation of ethics and the evaluation of man." The conflict itself is between "relativism," indigenous in social science, and "absolutism," here treated as imperative in religion.

The author of course deplores the conflict, however natural it may be; and he sets himself to minimize it. The undertow of science is toward determinism and the minimization of the personal; and the glory of religion is its maximization of the personal, even to the elevation of man above the natural order. Already it can be seen what the line of argument is, ending with proper leeway to save both through this end-formulation of the maxim of social science: "There are sociological aspects of human activities. There is no human activity of which the sociological aspect is the only aspect" (p. 218).

Though the outcome of the argument be foregone, apologetics being what it is, nevertheless the intervening means are not without interest and importance. Contrasting not only secularism and religion but also classical and Christian ethics, the author not infrequently by means of biblical texts unfolds a humanism generally acceptable to civilized men today, and that regardless of the theological basis he finds for it. This fact makes translation possible between the religious and the scientific sectors for our division of labor, provided one sees that not secularism but sectarianism is the enemy of religion, as it is of science. Since our author seems relatively free of sectarian motives, we can allow him the "defects of his qualities," seeing that he has the "qualities of his defects." I was particularly interested in his contribution to the history of sociology, and notably in his deference to John Stuart Mill and the honorable place therein which he accords Vico.

By grading relativism up toward absolutism (for what otherwise is it relative to?) and by grading absolutism down

from sheer transcendence (for how could it otherwise be relevant for us?), Christianity emerges not only as the end of our endeavor but as the very precondition of all social science. The "problem" here presented will strike some scientists, especially in America, as trumped up, and the victory over the problem as cheap; but, given the problem, who will not allow this victory to be better than defeat? They also serve who only reduce their own tensions.

T. V. SMITH

Syracuse University

KRONER, RICHARD. *Culture and Faith.* Pp. xvi, 278. Chicago: University of Chicago Press, 1951. $5.00.

This book, by a former German scholar now professor of the philosophy of religion at Union Theological Seminary, is another attempt to deal with the cultural crisis of our epoch. It is tightly reasoned work, persistent and consistent in the movement of its argument, and rich in the scope and quality of its scholarship. It is not a secular treatment in the manner of Mannheim, Kahler, Mumford, and Sorokin; it is rather a religious orientation in the tradition of Reinhold Niebuhr to whom the author admits discipleship. Refuting the conclusion that philosophy and theology are different "sciences," and hoping to achieve a "new synthesis" of them, the author functions both as secular and theological philosopher.

His point of departure is the philosophic quest. The philosopher "is compelled to give an answer to the ultimate questions concerning the meaning of human life." These questions revolve fundamentally about the duality of world and self (or ego), which is the *Urphänomen*, and which poses "the most fundamental and the most astounding of all oppositions." Secular philosophy in itself is inadequate to answer these questions fully. To "civilize" himself, man must also have faith—"biblical faith." The analysis consists of an examination of experience, culture, and faith.

Experience—of man in and with the universe—comes from impressions and not by means of reason. It is the procedure of being "directly acquainted with the object of knowledge"; what we experience is given to us. Scientific or experimental or impersonal experience provides us with but an infinitesimal fraction of the store of knowledge we need, acquire, and use in daily life. Most of our experience is personal. But our "ultimate knowledge" —knowledge of ultimate truth and reality —can only be achieved through the cooperation of all kinds of experience, impersonal and personal, individual and social, private and public, immediate and mediated.

Experience issues in culture or cultural activity, that is, "man's self-civilizing exertions and performances." It also motivates cultural activity in that it contains the tasks or sets the purposes which are carried through in civilization. As far as we know "culture" is confined to the human realm. Man alone has intellect and will, "freedom" (in choices) and self-determination, "history" (his long specific experiences and achievements), ends and purposes, and an "inner" life; above all, he has communication on the language level. Culture provides adjustment through science, art, technology, economy, morality, the state, and so on.

But secular experience and culture are not sufficient. Man never gains paradise by his own effort. Full self-sufficiency, satisfaction, and completion come from outside and beyond culture—from the "giver" himself. Eventually human thought has to embrace divine understanding of men and the world, and yield to divine instruction for the ultimate answers to the "antinomies." Faith thus overcomes the limits of culture and effects the ultimate reconciliation of the polarities of experience. This faith is the articulation or expression of "mystical experience," and is a "mystical reality." It comes, not by reasoning, and not through the mythological religions, but only through the "revelation" of biblical, prophetic religion. Cuture is consummated by such faith.

In the last chapter, Kroner transposes himself completely from the role of systematic philosopher into that of biblical theologian. He seemed to the reviewer to become a dogmatist propounding a special religious faith—a "school" of faith, so to speak.

In addition to a fascinatingly developed thesis, the social scientist will find here excellent treatments of experience, its nature, meaning, and place in the human career, and of culture, especially the analyses of language, science, art and aestheticism, technology, economy, morality, the state, and statism.

While the author doubtless wanted the book to be read as a whole and not for its details, in view of the richness of its scholarship and the wealth of superbly selected and developed concepts, it is a pity that there is no index.

J. O. HERTZLER

University of Nebraska

MOEHLMAN, CONRAD HENRY. *The Wall of Separation Between Church and State: An historical study of recent criticism of the religious clause of the First Amendment.* Pp. xvi, 239. Boston: The Beacon Press, 1951. $3.00.

Two recent decisions of the Supreme Court of the United States, the *Everson v. Board of Education*, popularly known as the New Jersey School Bus case, and the *McCollum v. Board of Education of Champaign, Illinois* case, together with the wide publicity given to the several bills which have been introduced in the United States Congress providing for federal aid to education, have served to highlight the whole question of church-state relations before the American people. Our Roman Catholic friends are undoubtedly on the march, and one of their main objectives is to breach the wall of separation between church and state in order to gain, for their church, government assistance in maintaining their now elaborate parochial school system.

Specifically this book has been prepared by Professor Moehlman to refute the arguments advanced by J. M. O'Neill in his book *Religion and Education under the Constitution* (1949) in support of the Catholic claim for such assistance. The O'Neill book may be accurately described as a diatribe against the Supreme Court decision in the McCollum case, in which the use of public school property to teach sectarianism was delared unconstitutional. O'Neill argues that because the words "separation of church and state" do not appear in the first clause of the First Amendment, therefore our constitutional fathers had no intention of bringing about a separation of church and state, but intended that the states be left free to establish churches as they pleased.

Moehlman convincingly shows that the attitude of the founding fathers was diametrically opposed to such an interpretation of their intentions. In a number of other recent Catholic publications, such as W. Parsons' *The First Freedom* (1948), as well as in numerous pronouncements by Catholic bishops and archbishops, it has now become fairly evident that the Catholic Church has adopted a definite and well thought-out plan of attack against the principle of separation of church and state.

No one in the nation is better prepared to refute these sweeping claims than Professor Conrad H. Moehlman. A life-long student of church history and particularly of American church-state relations, he has to his credit four important books dealing with this question: *The Catholic-Protestant Mind* (1928); *The American Constitutions and Religion* (1938); *School and Church: The American Way* (1944); and the present volume. The author is adept in using the sources. Perhaps the most valuable section of the book is Chapter I, "Historical Background," where Catholic official pronouncements are brought together, clearly showing the Roman Cathloic position through the centuries on the whole matter of church and state.

A Roman Catholic bishop in Illinois has recently proclaimed that the public school is public enemy, number one. The principal argument advanced by the Catholics for such an assertion is the growing secularism that is abroad in this country and thoughout the world. Professor Moehlman refutes this sweeping condemnation of the public school in a splendid chapter entitled "The Splendor of Public Education," a chapter which every public school teacher and every Protestant minister should read. But why recommend one

chapter above the rest! The entire book is a mine of accurate information upon one of the most important issues facing the American people today.

WILLIAM W. SWEET
Southern Methodist University

FICHTER, JOSEPH H. *Dynamics of a City Church.* Vol. I of "Southern Parish." Pp. ix, 283. Chicago: The University of Chicago Press, 1951. $5.00.

Several types of readers will be interested in this book (and the three volumes to follow) on the inner organization of the life of a Catholic parish, written by a Jesuit priest and a group of research associates: (1) Catholics, for it deals candidly with, and documents statistically, such matters as the amount and intensity of daily Catholic observance perhaps rarely faced or discussed openly by Catholic laymen. For instance, it concludes that ". . . the Catholic mind of [40 adult males and 28 females selected as] outstanding parishioners [in beliefs and practices] is about two-thirds Catholic and one-third pagan." (2) Those Protestants who wonder what it is really like to be a Catholic, and will scratch their protesting heads over such concepts as "the pure supernatural culture." (3) Students of the sociology of religion, as here are important beginnings of sorely needed analysis of a hard-to-penetrate area. (4) and those who, like the writer of this review, regard the Catholic Church as the best-organized international power structure operating across the world today and want to study its organization close-in at the American grass roots.

Father Fichter begins with two statements that—together with the *Imprimi Potest,* the *Nihil Obstat,* and the *Imprimatur* of the Catholic hierarchy on the reverse of the title page—suggest how seriously he and his fellow churchmen take this empirical study of "the purposive inner functions of Catholicism":

". . . Roman Catholicism is the institution with the best possible prospect of reintegrating Western culture" (p. 4).

"In so far as the 'order of nature' is employed, Catholicism will succeed or fail in the imperative job of reconstructing and reintegrating modern society mainly on the basis of the strength or weakness of its individual parishes. In other words, a vigorous parochial system not only bespeaks an internally strong Catholic social structure but also promises solidarity for the larger community and the nation in which it exists" (pp. 7–8).

This first volume deals intensively with the religious functions of a single urban parish of nearly 7,000 persons, part of a large city in one of our Southern Mississippi Valley states. (The other three volumes to follow will analyze, respectively, the structure and operation of the network of Catholic societies in this same parish—parochial school and family life and "particular problems of the parish structure.") The organization of the contents is fairly conventional: the nature of the parish; recruitment to the parish; the confessional; the sacraments; Catholic revivalism; "the Catholic mind of the parish"; and so on.

Here one sees a hard-working pastor and two assisting priests at their daily work, rather surprisingly not without friction with adjoining parishers, among a Catholic population in which women outnumber men in all spiritual activities except the occasional week-end retreats by seven to three. Only 51 per cent of the parishioners seven years old and older follow the "minimum obligation" of 100 per cent attendance at mass on Sundays and holy days "imposed by the Church under pain of mortal sin." Parishioners grumble that the priests are too busy to make sick calls. The apparatus of the Church fights a ceaseless battle against "leakages" of members from religious observances and parochial school. ("Making allowances for mortalities, we find that approximately 700 elementary-school children who ought to be members of the parish have 'disappeared' from it since baptism," as compared with 755 in the parochial school.) Particularly interesting are the tensions regarding the marriage ceremony: requests from socially-aspiring members for the performance of the ceremony in a higher-status church in an adjoining parish; requests for home and fashionable outdoor weddings; mixed marriages (29 per cent of all marriages in the parish in the past two decades were mixed marriages, with a low of 17 per cent in 1938, a high of 42.5 in 1932, and each year 1941–46 showing a higher-than-average percentage); and birth control. (The average number of children per marriage, unrefined for age of wife and length of marriage, is 2.25 where both parents are Catholics, 2.10 where only the wife is a Catholic, and 1.54 where only the husband is a Catholic.)

The parish studied was not selected as markedly superior or inferior. A priest warned the research group that it might find the parish "a hollow shell of Catholicism." This judgment the book rejects in its final pages, stating that the parish simply "has not been awakened to its full religious possibilities." These volumes as they appear invite close study. For this is an apparatus, still in its developmental stage in the United States but advancing rapidly, which, unlike the rest of our institutions, works with planned programs definitely envisaged in terms of centuries ahead; an apparatus equipped with international and subordinate national general staffs; which utilizes a stout, though flexible, policy that aims both at advancing Catholicism as a power structure and at enhancing welfare policies consonant with its doctrines in the general society.

COMMONWEALTH OF NATIONS

COLE, G. D. H. *The British Co-operative Movement in a Socialist Society.* Pp. 168. London: George Allen & Unwin (distributed in the U. S. by the Macmillan Company), 1951. $3.00.

This book is written by a Fabian socialist who is reluctant to contemplate either an indefinite continuance of capitalistic enterprise or any important extension of nationalization (pages 15–16). In the preface, Cole makes it clear that this is a personal report to the Fabian Society and the Sara Hull Trust, which perhaps neither of them will like. "The great majority of leading Cooperators will almost certainly dislike it, because they will find the idea of a great competing 'mutual trading' movement under State sponsorship distasteful as well as novel. Nor will most of them like any better the high importance which I attach to the development of Producers' Cooperation."

Cole points out that retail trade in England is divided among the consumer co-operative stores, the small private shopkeepers, and the large-scale capitalist retailers, and that the last of these does the largest share of business. He would have positive steps taken to change this situation and essentially eliminate the large-scale private retailers. His reasons are two, namely, these large concerns engage in wasteful competition for patronage, and the "mutual" type of trading exemplified by the co-operative societies has positive virtues which he believes should be extended (Chapter 5, especially page 75).

Mutualization means nothing, according to Cole, "unless it carries with it a real element of democratic control," and this requires organization of participants into local groups (page 98). Apparently he believes that the co-operative movement should be so organized that it not only will result in a particular distribution of income through patronage dividends, but also so that individual members will have a direct voice in management and in directing the use of resources. He appears to fear that the employees may take over the actual control of the entire co-operative movement in place of the consumers. This point was made some years ago by Carr-Saunders and associates in their classic study of British co-operation.

The basic dilemma in which Cole finds the co-operative movement is that the State now is doing in England many of the things for which co-operation was established. Cole is sure something should be done to protect the position of co-operation as a potent force in the economy, but it seems to this reviewer that no clear-cut remedy for the situation appears in the book.

ROLAND S. VAILE
University of Minnesota

STAHL, KATHLEEN M. *British and Soviet Colonial Systems*. Pp. ix, 114. New York: Frederick A. Praeger, 1951. $2.50.

This little book presents a clear if brief analysis of British colonial administration, but when it attempts to do the same with that of the Soviets it breaks down. It could not well be otherwise in view of the scarcity of information as to what is taking place in Central Asia. Miss Stahl allots but thirty-five pages to the Russian side of her picture, and the scanty material which she does use consists largely of extracts from Stalin's writings and from the Soviet constitution, all of which we have learned by experience is of dubious value. About the only contrast between the British and the Soviet system that is valid is that the former tends to move more and more toward decentralization and greater autonomy, whereas the reverse is true of the latter.

The most useful part of this book has to do with the British Empire and Commonwealth, the framework of which is described with accuracy and in considerable detail, particularly as concerns the thirty-five Crown Colonies, protectorates and areas for which Britain acts as trustee.

The thirty-five are in various stages of development, and all are headed hopefully in the direction of home rule and perhaps ultimate dominion status. Thus, in the various Crown Colonies in the governor's executive council "the proportion of unofficial members in relation to that of official members is increasing," —a fact also true of the legislative councils which are gaining more and more power as the electorate is enlarged. "Imperial control over colonial government is primarily negative in character and operation." Governors appointed by Whitehall still retain veto powers but seldom use them. About 96 per cent of the civil servants in these dependent areas now are native born, and even in the higher echelons of the colonial service the appointment of Africans and Asians is becoming more and more frequent. The constitutional convention which drew up the new constitution of the Gold Coast consisted entirely of Africans and was presided over by an African judge. In Malaya, the West Indies, and East Africa progress in self-government is the rule rather than the exception.

Meanwhile, British interest in the dependent empire is steadily rising. Both the Conservative and Labor parties have standing committees engaged in research on colonial problems, and the hard-pressed British treasury is providing out of its slender resources considerable sums as grants in aid. In both West and East Africa new dominions are now clearly foreshadowed.

WALTER P. HALL
Princeton University

MITCHELL, SYDNEY KNOX. *Taxation in Medieval England*. Edited by Sidney Painter. Yale Historical Publications, Studies, XV. Pp. 413. New Haven: Yale University Press, 1951. $5.00.

When Sydney Knox Mitchell died suddenly in 1948, he left a manuscript upon which he had been working for a long time. It has now been edited by his friend Professor Sidney Painter in the volume under review. Professor Painter has carefully respected the original text; missing references have been supplied and notes recast in a consistent form, but only minor corrections have been made. A posthumous work could harly fail to leave something to be desired; in this case, perhaps, a concluding section that Professor Mitchell would doubtless have given us had he been spared to complete his work.

Professor Mitchell made his first contribution to scholarship in 1914 with his *Studies in Taxation Under John and Henry III*. The present work might at first sight appear to be second edition of the older one, even though the reigns of Henry II and Richard I have been included. Some of the same problems are necessarily dealt with, but *Taxation in Medieval England* is an entirely new book. The amount of fresh material drawn largely from unpublished sources is immense. The point of view adopted is likewise quite different. Topical in arrangement instead of chronological, the work is less a technical study of taxes than an examination of the significance of taxation and of the methods of assessment, authorization, and collection employed therein, for the evolution of twelfth—and thirteenth-century administration.

Difficult as it may be for us to conceive of it, taxation was a new condition for the society of the late twelfth and thirteenth centuries. And, because the men of that age had no definite notion regarding the sources of taxation that could be profitably exploited, there was initiated a struggle between the taxpayer and the state over this question. In the first place, taxes were not strictly owed; with every successive repetition, nevertheless, they tended to become obligatory, hence the persistent opposition. By the close of the reign of Henry III, a solution had been found. It was the tax on movables, which came to be the normal tax and the basis of all future developments.

Professor Mitchell's book covers precisely this period, when society was adjusting itself to a new condition. The definite and striking changes that took place affected the administrative organization, the character of taxation, and the structure and power of the government. None of these changes was anticipated or planned; they grew out of the necessity of adjusting the government to new conditions which it faced.

It was found necessary, for example, to create a central body, a branch of the exchequer, to administer the receipt of and sometimes audit the new levy. The change was not permanent, but the experience acquired in the handling of unusual sums of money probably led to the expansion of the exchequer under Edward I so that it was able to take over this work.

It was also discovered that the existing methods of assessing and collecting revenue were inadequate for the new levy, and a new organization was devised which was a modification of the conventional *missi*. To maintain movable property as the basis of the tax, and with an adequate valuation, was the most arduous task and was not wholly successful, but the attempt led to a great change from the conventionalization that marked all preceding levies.

Authorization is an aspect of the problem which is more familiar because of its connection with the origins of Parliament. The earliest authorization for the new levies was given by the Curia Regis; and this continued to be the case as the aid on movables became more predominant and more frequent, but there is a change in the nature of the consent as it takes on a corporate character, the consent of the present binding the absent, and the majority binding the minority.

The depth of Professor Mitchell's historical insight and the breadth of his perspective make of his book more than a technical treatise on taxation; it will be of interest to all students of medieval England.

G. B. FLAHIFF
Pontifical Institute of Mediaeval Studies
Toronto, Canada

AMERY, JULIAN. *The Life of Joseph Chamberlain*. Vol. IV: "1901–1903: At the Height of His Power." Pp. 533. London: MacMillan and Company (distributed in the U. S. by the MacMillan Company), 1951. $4.50.

Mr. Julian Amery has assumed the task of completing the biography of Joseph Chamberlain left unfinished by the late J. L. Garvin. The third of Garvin's massive volumes, published in 1934, carried the story till the end of the nineteenth century. The one under review ends in February, 1903. Of necessity some of the topics handled by Mr. Emery start in the mid-nineties. Still, in the main he in concerned only with the activities of Chamberlain in the years 1901 and 1902.

These years were crowded with significant actions in British domestic and imperial affairs. Joseph Chamberlain was then at the height of his power—the most dynamic personality in the government headed by Lord Salisbury. Mr. Amery has had full use of the Chamberlain papers and of confidential government documents. He has secured information and advice from members of the Chamberlain family and from persons like his father, Mr. L. S. Amery, who knew Joseph Chamberlain quite well.

As might be expected, the author gives much space to the war, the peace negotia-

tions, and the reconstruction in South Africa. New light is shed on these problems, more particularly on the relations between Chamberlain and Milner. Among general imperial topics, the work of the 1902 colonial conference, the West Indian sugar question, and Chamberlain's colonial development and welfare programs deserve special mention. The section which deals with the Anglo-German negotiations, September 1900–February 1902, is disappointing. Apparently the Chamberlain papers contain little new information on that subject. On the other hand they have interesting items on negotiations leading to the formation of the Anglo-French entente.

Mr. Amery defends Chamberlain's stand on Irish home rule and seeks to explain his waning interest in old age pension and his support of the Education Act of 1902 which conflicted with his earlier views on this issue. In the discussion of imperial affairs, Mr. Amery shows a lack of an intimate knowledge of this vast subject. His Conservative bias stands out quite clearly. But his story is well organized and clearly told. It calls to mind an era which now seems both strange and very remote.

PAUL KNAPLUND
University of Wisconsin

HAYEK, F. A. *John Stuart Mill and Harriet Taylor: Their Friendship and Subsequent Marriage.* Pp. 320. Chicago: University of Chicago Press, 1951. $4.50.

In this work Professor Hayek has collected and edited the correspondence passing between Mill and the woman who, after many years of friendship, became his wife. He has edited the letters, largely found at Yale University Library, added copious notes, and introduced secondary evidence on their relationship, their characters, and their intellectual collaboration.

The editing has a purpose: to throw light on the extent of Mill's intellectual obligation to the woman to whom he ascribed "joint production" of his *Political Economy* and other works, and to whom he dedicated his *Political Economy* alleging he had first learned from her his ideas on social improvement. The blurb goes so far as to say that "Mill's description of Harriet Taylor is not exaggerated," and that here is direct evidence to prove it.

Any evidence that throws a light on an influential philosopher's spiritual evolution is of interest to the world, and so we may be grateful for the additional insights furnished, not least on Mill's interest in music; his thoughts on life and death when he was told by his doctor he had not long to live (he lasted for many years longer!); his cold, indeed callous estrangement from his mother and sisters; life at the India Office; estimates of various contemporaries; and his own philosophic self-doubt.

But whether the main question is cleared up is extremely debatable. A few letters do, indeed, show that Mrs. Taylor made suggestions of ideas and theories and policies to Mill, and that he welcomed them. But they are inconclusive as to anything of importance. There is discernible a desire on the part of the editor to show that such "socialism" as appears in Mill's economic theory is due to his wife's influence.

The suggestion is neither supportable nor destructible by the evidence presented. The letters have been edited, it is true not for thought-suppression, but to prune away the intimately personal. But at critical times there are great voids in the correspondence, as between 1840 to 1847.

If the direct evidence is tenuous and incomplete, we are obliged to fall back on other grounds of judgment of probability. This is when the nature of their intimacy attains crucial importance. What do we know?

Mill could not abide his father, mother, sisters, and brother. He knew no warmth of love till he met the very beautiful young Mrs. Taylor. She loved him deeply, romantically, and possessively. She was a luscious and *highly opionated* Victorian blue-stocking, and of such there were thousands in her England, except that most were unattractive, sex-frustrated frumps. She wrote rationalist and feminist articles and poems. The few samples given in this work demonstrate their poor, adolescent quality, at an age when, if she was anything like Mill swore she was, she would have shown talent, not conventional puerility of mind. She never ceased flattering Mill, who hungered for beauty, affection, assurance, and praise.

The understanding of romantic love of this kind is a key to the understanding of what a man like Mill would do with the ideas presented to him by the one he loved and who showed that she loved him. He may have had the ideas in his own mind before she spoke. He may have already given them to her, and then received them back from her, with the added significance of coming from someone *else* when she rendered them to him. But (a) they would receive importance and consideration because she had mentioned them, and (b) the outflow of his gratitude might even come from his surprise that she, so lovely, shared his thoughts.

The relationship is rather like that between Mill's contemporary, August Comte, deprived of love all his life, and Clothilde de Vaux. Comte was bowled over also. He gave gratitude for love in the form of intellectual acknowledgement. This view of Mill-Taylor is borne out by the fact that when, on the death of Mr. Mill, Mill's home was tended by Mrs. Taylor's daughter Helen, Mill apostrophized the daughter as extravagantly as he did the mother, though the correspondence shows that the girl was far from possessing even a mind that we should grade as a B average.

The verdict must still be "Not proven!" We must be very careful then to avoid the conclusion that Mill's "socialism" stems from an erotic source; or, if it did, that this would be a sin against laissez faire, on the basis that men unaffected by women would be vigorously laissez faire; or that it is wrong that men should be affected by the minds or characters of women—the human race has two sexes, and human nature will not be somehow restored to purity of doctrine by the wishing away of one of them.

What is not clear from the letters, and what is material, is whether Mill and Mrs. Taylor had adulterous relations in the long years of their friendship, when they travelled abroad for long periods unchaperoned. I incline to the view that we should have been given everything that is extant. The truth of nature that is immanent in a blob of penicillin was discovered by accident when the mould was observed, and not excised by an editor. And Karl Marx excluded a vital truth from the theory of value by ignoring the value of a diamond as "an exception."

HERMAN FINER
University of Chicago

SCHUTZ, JOHN A. *Thomas Pownall, British Defender of American Liberty: A Study of Anglo-American Relations in the Eighteenth Century.* Pp. 342. Glendale, Calif.: The Arthur H. Clark Company, 1951. $10.00.

Thomas Pownall was an obscure young Englishman when he came to America in 1753 as secretary of the governor of New York. While he was a student at Cambridge, where his family's financial resources were barely sufficient to support him, his younger brother John got a clerkship in the Board of Trade and began his rapid rise in the civil service. On graduating from the university, Thomas took a post under John to train himself for a political career in colonial administration. His apprenticeship taught him the need for drastic reform. Seeing little chance of breaking into the oligarchic monopoly of power at home, he turned to climb the ladder in America. The first rung broke almost as soon as he mounted it. He had not been in New York a week when the suicide of his chief left him without any position.

Undaunted by this misfortune, Pownall somehow managed to travel up and down the colonies, assiduously improving his already considerable knowledge of them and cultivating the friendship of prominent men who might help him up. His ascent is amazing. In 1757, at the age of thirty-five, he was appointed governor of Massachusetts in succession to Shirley, whom he had helped to remove. After ably piloting the province through the difficult war years, he declined further service in America, not because he disliked the colonies but because he thought he could do more for them and the mother country by returning home and shaping public

policy to solve the imperial problem that loomed ahead. He was confident that the knowledge and experience he had gained in America would win for him a position of authority in England. With this in view, he produced his famous *Administration of the Colonies*, first as a pamphlet of 131 pages and later as a substantial two-volume work; and he secured a seat in Parliament, where he raised his voice on behalf of colonial liberty. But no ministry would invite him to join them or even hearken to his advice. His opinions were too independent; he was not an effective speaker in the House; and his written style was so difficult that it was reputed to have given many a headache to his readers.

Historians have repeatedly lamented the lack of an adequate biography of Governor Pownall. His life by C. A. W. Pownall, which appeared in 1908, was based on little source material. But Mr. Schutz's is built upon extensive research in private and public repositories and is a solid piece of scholarship containing few flaws except in the actual writing, which is sometimes irritatingly careless.

A. L. BURT
University of Minnesota

SLAVIC COUNTRIES

HERLING, ALBERT KONRAD. *The Soviet Slave Empire*. Pp. xx, 230. New York: Wilfred Funk, 1951. $3.75.

Forced labor in a form which deserves to be designated as slave labor exists in all Communist-dominated countries. If there is still a need to prove this, the necessary and sufficient evidence can be found in A. K. Herling's *The Soviet Slave Empire*. Based mainly on the hearings before the Commission of Inquiry into Forced Labor (initiated by the Workers' Defense League), the book is largely a collection of well-selected witness reports about forced labor in the Soviet Union, the Baltic States, Rumania, Hungary, Bulgaria, and Eastern Germany. The authenticity of the reports is indicated by the fact that the reliability of the witnesses has been established beyond doubt.

The first chapter shows that as early as 1927–28 "the idea of forced labor became part of the Soviets' Penal Procedure" and that the characteristic trait of a slave labor system became more pronounced with the passage of time.

Two quotations from the reports illustrate this assertion: A report of a camp near the Pechora River states "the principal incentive used by the MVD builders is hunger, not wages or force. . . . The amount of work performed determines the amount of food that a prisoner receives. . . . Those who refuse to work are put in solitary confinement and receive minimum rations" (p. 15). Regarding another camp it is stated that "anybody who expressed an opinion that his work was too hard, or made any other complaint, was liable to be taken into the forest by the guards and shot, their disappearance being explained by saying that they had tried to get away" (p. 25).

Valuable as are the reliable descriptions of concrete facts, the book has its weak points, particularly the uncritical reproduction of some grossly exaggerated estimates of the number of "slaves" in the Soviet Union and of the economic importance of the slave labor system. For the author "there is no doubt that in the last decade the prison camps and forced labor camps have had a *minimum* of eight million workers, and at various times a maximum of twenty million." The available substantial evidence suggests much more conservative figures. Also, according to the author, "new construction projects alone are estimated to require at least ten million forced laborers." The work on new construction is characterized by the highest degree of mechanization, and the whole number of workers employed will hardly reach even *one* million. A very large number of highly skilled workers, of Stakhanovites, and, for propaganda purposes, of party and Comsomol members are employed; this would seem to preclude the possibility of a large use of forced labor.

Fortunately, these shortcomings take only a small place in an otherwise very useful book.

GEORGE DENICKE
Washington, D. C.

Soviet State Plan for 1941 (Supplements to the Decision of the SNK USSR and TsK VKP(b) N 127 of January 17, 1941), American Council of Learned Societies reprints, Russian Series N. 30. Pp. 746. In Russian. Baltimore: Universal Press, 1951. $12.00.

Everyone wanting to study the Soviet economy thoroughly must be greatly thankful to the American Council of Learned Societies for the reproduction of the so-called Soviet 1941 Plan (actually only statistical supplements to the plan are involved) and, moreover, everybody familiar with the Russian language must own a copy. Library study of this volume of 746 pages will rarely prove enough.

In due time this all-important document was released in the U.S.S.R. with the warning on each table "not to be disclosed." Unfortunately it was so treated in this country for some time. Access was permitted almost exclusively to those who were unable to make proper use of it.

In a monograph devoted to the Soviet price system and a paper analyzing the labor in concentration camps this reviewer made extensive use of the material in the volume. Yet he has used only a fraction of the wealth contained in it. He intends to give it several additional goings-over after he comes into possession of a copy of his own.

The all-important indexes of national income, industrial production, and labor productivity showing fabulous successes of the Soviet planned economy are, or at least were until 1949, based on "unchangeable 1926–27 prices." The phony nature of these prices and the manipulated character of the indexes in them had been clear to a few even before the 1941 Plan became available. The data of the 1941 Plan on industrial production and its production costs in 1941 prices make this obvious to anyone who will take the trouble of comparing these data with the value of the same output in "unchangeable 1926–27 prices." The 1941 Plan wrestles this implement of world-wide propaganda from the Soviets.

The Soviet sources use for comparisons with postwar phenomena the data of 1940 as the basis, although the year was one of feverish preparation for war, with private consumption cut substantially below the level of the preceeding year and several other abnormalities. In a misleading way, 1940 is even commonly referred to as "the prewar 1940 year" in Soviet sources. A further important drawback of the official statistics of this year is that they covered the newly acquired territories to a greatly varying extent, and thus each comparison is between 1940 data for a smaller territory and, say, 1950 data for a larger territory. On top of this, it is the custom of Soviet sources to be discretely silent on the territory to which the 1940 figures used for the comparison pertain. The 1941 Plan unfortunately does not provide data for 1940. Still, the territorial coverage of the 1941 goals permits some conclusions as to the territory covered by the usual official 1940 data.

The evidence of the Soviet concentration camps normally comes from former inmates who are in no position to know the total number of inmates in the camps and naturally are inclined to exaggeration. Such figures as eight, ten, fifteen, and even twenty million persons in the camps are cited. The 1941 Plan permits glances also in the direction of this horrible institution. It does not state the number of inmates, but it provides information on the economic activities planned for the NKVD (People's Commissariat of Internal Affairs), and from this data rough estimations of the numbers of inmates involved can be made.

The first mentioned item, the light the 1941 Plan throws on the fake "unchangeable 1926–27 prices," alone makes the volume invaluable. The evidence on concentration camps is likewise of great interest, if only to show the world of difference between evidence and estimates. (The evidence of the 1941 Plan points to fewer than half as many inmates in concentration camps as in the lowest common estimate.) However, the three mentioned problems for which the 1941 Plan is helpful, are only those for which this reviewer primarily used its evidence. There is an almost endless number of others, for the clarification of which the material in the 1941 Plan is helpful.

While the document was marked "not to be disclosed," several items such as the data on output of gold, nonferrous metals, and rubber were not covered in it. They were considered even greater secrets than the activities of the NKVD, and were incorporated in a special secret attachment or attachments, which are no part of the released volume.

WESTERN CONTINENTAL EUROPE

SCHMIDT, PAUL. *Hitler's Interpreter*. Edited by R. H. C. Steed. Pp. 286. New York: The Macmillan Company, 1951. $4.00.

Dr. Paul Schmidt, with his great flair for the deeper meaning of words and his extraordinary linguistic talents, should have been the first to realize that the English title of his book *Hitler's Interpreter* would expose its greatest weakness. It shows that, while he was eminently suited to translate Hitler's words, he remained an "interpreter" only in the narrowest sense. He joined the Language Division of the German Foreign Office in 1923 and found himself in a world of diplomatic notes, of memoranda and treaties, on which, we hoped, a new German, a new Europe, a new and better world might have been built.

By the time Dr. Schmidt appeared more prominently on the stage of international diplomacy and had become a familiar figure behind a succession of German statesmen, most of these notes, memoranda and treaties had been reduced to "scraps of paper." Angry verbal exchanges, futile conferences replaced the more graceful traditional diplomatic routine. Dr. Schmidt seemed unaffected by these changes. Proudly unpolitical, keeping his views (if any) to himself, he served Hitler as faithfully as he had served his predecessors (and what a pity it is that the first part of his memoirs dealing with Germany's pre-Hitler history has been omitted from the American edition of his book).

At one stage of his narrative he describes the visit which Japan's foreign minister, Mr. Matsuoka, paid to Hermann Göring at Karinhall in 1941: "Do you know that abroad they say that he [Göring] is mad?" Matsuoka asked Mr. Schmidt, adding a little later, "There are many people in Japan who say . . . 'Matsuoka is crazy!'"

It was indeed a crazy set-up into which Dr. Schmidt affords us an intimate insight. He records it with studied, colorless sweet reasonableness which would have been more impressive had he not risen to it only after the event. There is little evidence that Dr. Schmidt was just the "enlightened cosmopolitan German nationalist" as his editor, Mr. R. H. C. Steed, describes him in the introduction. An inflection here, an addition or omission there reveal a surprisingly wide area of agreement with his last German masters, tempered only by *post festum* admissions that he (and they) might have been wrong.

From his account there emerge once more the now-familiar figures of the Nazi government and those who tried to reason with them. Chamberlain and Eden, Molotov and Ciano, the satellite rulers people these pages. We watch them in Hitler's study, hear them at conferences in Berlin or wherever his duties took Dr. Schmidt. To the well-known facts, which we know from the perusal of many other sources, from official documents and the host of memoirs which illuminate the history of the vital ten years under review, Dr. Schmidt adds many interesting snippets and sidelights. Although his account does not quite live up to the subtitle "The Secret History of German Diplomacy 1935–1945" it should be read by all students of the peculiar brand of diplomacy practiced by the Nazis and likely to be emulated by other dictatorships.

Dr. Schmidt's diplomatic career came to an end when he was captured by the United States Counter-Intelligence Corps in Salzburg in 1945 (but his services, we are told, were utilized by the U. S. occupation forces during the Nuuremberg trials). He might, Mr. Steed says, perhaps even more aptly, be described as "Stresemann's Interpreter." We should know more about the shape of things to come if we could correctly guess for whom Dr. Schmidt is going to interpret in the future.

WILLI FRISCHAUER

London, England

PLISCHKE, ELMER, with the assistance of H. J. HILLE. *History of the Allied High Commission for Germany, Its Establishment, Structure, and Procedures*. Research Project No. 107 of the Allied High Commission for Germany. Pp. v, 122. Published: Office of the U. S. High Commission for Germany, APO 757-A, c/o PM, NYC, 1951. No Price.

The development of Germany's political structure has been in a state of constant flux since 1945, particularly in relation to the various forms and phases of Allied military government. The student of contemporary German government and politics finds it none too easy to locate the essential facts and documents, and depends, to a large extent, on the publications of Allied authorities in Germany for basic orientation. Plischke's *History of the Allied High Commission for Germany* is the first of a series of studies written under the auspices of the Historical Division of the Office of the United States High Commissioner for Germany, and future studies will deal with the revision of the Occupation Statute, the relations between the Allied High Commission and the German federal government, and similar subjects.

The first chapter provides the background of the establishment of the Allied High Commission, starting out with the London Deputy Foreign Ministers' Conference (February 23 to June 2, 1948) and ending with the Foreign Ministers' Conferences of Washington (April 1949) and Paris (May 23 to June 20, 1949). The record of these conferences shows that the movement toward integration of the American, British, and French Zones of Occupation into one unit was largely the product of American initiative and leadership. The second chapter outlines the establishment of the Allied High Commission in May 1949, paralleled by the setting up of a German government shortly thereafter. Chapters III and IV describe the committee structure of the Allied High Commission and the Allied General Secretariat; procedures are described in full detail, including, for example, the information that "most committee meetings are preceded by the serving of coffee, tea, and other refreshments" (pp. 74–75). The sixth (and last substantive) chapter covers the relations of the High Commission with the German Government and with foreign powers, and includes data not conveniently assembled elsewhere. The value of the study is greatly enhanced by the reprinting of important documents (Occupation Statute, organization charts, and others) in the appendix.

WILLIAM EBENSTEIN

Princeton University

MILLER, JANE KATHRYN. *Belgian Foreign Policy Between Two Wars, 1919–1940*. Pp. 337. New York: Bookman Associates, 1951. $5.00.

For the scholar and statesman, *Belgian Foreign Policy* is a useful study, but for the average reader it must be virtually incomprehensible. A background chapter attempts to set the stage, but when the chief actor (Belgium) enters, the stage is bare of scenery, and the reader has to suffer through a maze of statistics, negotiations, and crises never tied to the full diplomatic story of the interwar period. It may be that Miss Miller's book is a condensation of a larger work, but as it stands it is more of a footnote than a chapter in the diplomatic history of interwar Eunrope. Almost no effort is made to place Belgium in its proper place in the diplomacy of the day, and the author has presumed a knowledge on the part of her readers that few are likely to have.

Although Miss Miller comments in her preface that Belgium's shift in policy from co-operation with the Allies of 1918 to a completely independent policy had "disastrous" results, she later (p. 259) describes the same shift as "not a blunder." She justifies the latter comment by relating the immediate effects of Leopold's new policy (the Franco-British-German pledges and the closer union of Walloons and Flemings), but not three lines later she re-

fers to that May 10, 1940 which "proved" the impossibility of such a policy for Belgium. I find these statements hard to reconcile.

Occasional but no serious errors of fact occur. In referring to the French Revolution of 1789, the author contends that Belgium followed the French pattern; she makes the same mistakes that Desmoulins had made in 1789. Her interpretation of the importance of Belgium's actions in 1914 is also somewhat outmoded, and I suspect that her reference (p. 131) to Belgium as Poincaré's "satellite" is a misstatement. Her offhand description of Albert's death is also hard to explain.

Despite these faults, *Belgian Foreign Policy* is an excellent volume, with a volumious bibliography, useful footnotes, and a good appendix, although the flow of the story is sometimes marred by the absence of maps and an excessive number of printing errors. Scattered through the book are passages of rare interest and even brilliance, but taken as a whole the book is scholarly dull, especially the accounts of ministerial crises, reparations, and war debts. The later chapters, telling the story of the new "independent" foreign policy and of the invasion and surrender of Belgium, are fascinating.

Montana State University

STRODE, HUDSON. *Denmark Is a Lovely Land.* Pp. xi, 304. New York: Harcourt, Brace and Company, 1951. $4.75.

Travel guides as a class belong to a most ephemeral species of literature. They have appeared in many variants and guises for at least 2,000 years. Among the best known—and the least ephemeral—of ancient descriptive guides is Pausanias' *Description of Greece,* written in the second century of our era. The declared aim of Pausanias was to present "the most famous of the Athenian traditions and sights," and to select from the mass of materials "the really notable." It was his way of saying that topographical features should be seen in their historical setting. Superficial descriptions of man-made phenomena are quite useless until man's memory—history—is levied on to give them perspective depth.

It is, therefore, refreshing to find that a seasoned and observing traveller, Hudson Strode, has produced a book on contemporary Denmark that gives vivid glimpses of land and people, and with these, salient bits of historical information to throw the topics discussed into their proper perspective. *Denmark is a Lovely Land* owes its title to the famous national song by Adam Oehlenschläger. The author's prefatory statements that "What Denmark has achieved for herself is out of all proportion to her tiny size," and "Implicit in Danish democracy is the conception of the independence and nobility of the individual," indicate his approach.

The large number of buildings surviving to bear witness to the restless energy of the royal "architect," Christian IV—structures ranging from his seamen's housing project, the *Nyboder,* to Rosenborg castle—receive deserved attention, as do many other distinguished buildings, museums, promenades, bits of charming coast line, the chalk cliffs of Mön, and physical and architectural scenes from Zealand, Fyn, and nearby islands, and the Jutland mainland.

He included in his itinerary visits to a few estates belonging to Danish noblemen to which ordinary tourists would scarcely have access, and he dwells on the success achieved by them in improving the yield of milk cows. But of the small farmers whose industry and intelligence have made Danish dairy products, bacon and eggs, famous abroad for their uniform quality, the reader gets but faint glimpses. However, the co-operatives which process and distribute these products, and the rural co-operative stores run on the Rochdale plan, are given generous space, as are the Danish folk high schools, which have become models for many similar schools throughout northern Europe.

The proletarian novelist, Martin Andersen Nexö, author of *Pelle the Conqueror,* is discuseed by way of introduction to Denmark's social legislation that dates largely from the Social Democratic ministry of Thorvald Stauning. Here are brief answers as to how Denmark has solved the problem of sickness insurance for all without either endangering the economy of the state or ruining the poor but innocent victim of a disastrously long illness; how children are cared for from the prenatal stage through their school years; how the aged are given adequate shelter in the Old People's Town in Copenhagen; how the state encourages vacations in the country and on the farms for urban children.

For the reader familiar with Isak Dinesen's (pseudonym for Baronness Karen Blixen) *Out of Africa* and *Seven Gothic Tales,* the "Portrait of a Danish Writer" will be rewarding. Apropos a recently suggested idea of Bernard De Voto, is this another case of prolonged stay abroad providing latent literary talent with the needed impetus for self-expression?

A few errors in this otherwise excellent book should be noted for correction in a new edition, should one appear. To say that Christian IV's bourse is "the world's oldest market exchange" (p. 54) is misleading. At least seven such exchanges were established from the early sixteenth century down to 1608—at Bruges, Antwerp, Lyon, Toulouse, Hamburg, London, and Amsterdam. The English bombardment of Copenhagen in 1807 (p. 215) occurred two years after Lord Nelson's death at Trafalgar. Nelson bombarded the city on April 2, 1801. Canute (p. 152) is called the "Great" because of his rule of England, not because he was "this greatest of Denmark's kings." As a preparation for a visit to Denmark or for later reflection after such a visit, this book is to be warmly recommended.

WALDEMAR WESTERGAARD
University of California
Los Angeles, California

PURYEAR, VERNON J. *Napoleon and the Dardanelles.* Pp. 437. Berkeley: University of California Press, 1951. $5.00.

Napoleon and the Dardanelles—I do not think that this title does justice to the wide range of events the book covers. Dr. Puryear's subject is the whole "Eastern Question" in the Napoleonic Era. In any case you cannot divorce the Dardanelles or the Turkish Straits, as they have come to be more commonly known today, from the problems of the Near and the Middle East or as events have proved once again from the political problems of the European Continent.

For serious students of international events, this is a very timely publication. Take out the dates, efface the names, you will find that the problems Dr. Puryear brings to our notice are as fresh as the events of the last ten years. Take, for example, Napoleon's negotiations with the Czar concerning their mutual interests in Ottoman Turkey and in Persia. Dr. Puryear suggests that the final break between the two "would-be masters" of Europe came on this issue. The Nürnberg trials have proved that in the attempt at division of the world between Hitlerite Germany and Soviet Russia, once again the final break came about over the geographic area around Turkey. A more significant parallel in history would be hard to find. For this indicates that atomic age or not, the land mass between the three continents and three seas is of crucial importance in any attempt to intercontinental mastery. Turkey, because of her key position in this area, strengthened by her historical experience in nationhood, is bound to play a major role in any event involving the whole of Europe. Those who seek the true significance of Turkey's incorporation into the Atlantic Defense System will find the answer in Dr. Puryear's narration of another attempt at global domination.

There is abundant material here for students of Ottoman Turkey. The commercial rivalries between France, and Britain in Egypt, the diplomatic intrigues in Istanbul, which were meant to undermine the power of one and against the other but which instead ended with undermining the power of the Ottomans to the profit of the third power in the North, are vividly illustrated.

In these days of great controversy about imperialism these events ought to inspire international co-operation. The big should understand that self-seeking intrigues against each other profit only a third party and the small should know that to play the big against one another ends up with the

small losing their independence and integrity completely.

The book is well documented. Dr. Puryear, the painstaking scholar, has dug well in the archives of the French Foreign Office. But in a scholarly book like this one would have expected a more balanced study of the problem. The author has not gone into the Turkish archives, and this seems to me a deficiency. Take, for example, the incident concerning Napoleon's title. Dr. Puryear tells in detail how relations between France and the Ottoman Turkish Empire were strained because the Ottoman Court would not accord the title of padishar to Napoleon, and he suggests that this problem of protocol made a mountain out of a molehill. For those who know their Ottoman Turkish history this explanation sounds very naïve because in this incident seemingly revolving around a title one finds the core of all the political problems between France and Turkey at the time. But this deficiency, unfortunately, is common to all the books on Ottoman History. Only in the last ten years have scholars begun to dig into Turkish archives. The impact of Turkey on Europe as viewed from the Turkish side of the fence has yet to be written. In the United States Princeton University was among the first to recognize this deficiency, and it has already produced a number of outstanding Turkish scholars. Columbia University with its new Middle Eastern Institute will be a great contributor in the field.

I would recommend Dr. Puryear's *Napoleon and the Dardanelles* not only to those with a historical interest but to every one actively interested in current international affairs. The problems it deals with are timeless—until man learns to treat other peoples and countries as he would like to have his own people and country treated.

NURI EREN

New York City

HERMENS, FERDINAND A. *Europe Between Democracy and Anarchy*. Pp. xix, 291. Notre Dame, Ind.: University of Notre Dame Press, 1951. $4.00.

In the recent British elections the Labour party polled more votes and a higher percentage of the votes than it had the time before. It also polled more votes than any other party. Yet it lost the absolute majority in the House of Commons it had won on a minority vote at the previous election, and its Conservative rivals were given an absolute majority instead.

Thus are the fortunes of nations fashioned by the vagaries of an election system which makes results dependent not merely on numbers of votes but on where the votes are cast and on the number of candidates among whom the votes are divided. The Labour party was given control before a majority of the British people were ready for its far-reaching program of socialization. But when that program gained new recruits and the general conduct of the Labour party in office brought increased popularity, the party was thrown out of power, and its slightly less popular rivals were given power to undo as much of its work as they pleased.

Such distortions of popular wishes seem of minor consequence to Professor Hermens, arch-crusader against proportional or accurate representation. He would prefer to see the largest party come out on top and even suggests (p. 19) that the British Labour party would have been justified in some deliberate gerrymandering to compensate for the wastage of its votes in the districts where it has top-heavy majorities. But the most important thing in his mind is not who governs but that someone shall be in position to govern. He is obsessed with the idea that some party or group must be able to enact its whole program expeditiously, whether the people like the whole program or not. If the people sufficiently dislike parts of it, their recourse should be to rise up and throw the rascals out at the next election, thereby giving some other group unlimited power to do as it will. The thing to be avoided at all costs is a situation where there is no constant parliamentary majority but different majorities on different issues, in the legislative body as among the people themselves.

The title of the book is revealing. Democracy is thought of not as the opposite of dictatorship but as the opposite of anarchy. The emphasis in "rule of the people" is not on "the people" but on "rule." Some distortion of the popular will is regarded as endurable and even desirable in the interests of strong government; but any difficulty in steering the course of government, even in the interest of reflecting more accurately the people's wishes, is to be avoided like the plague. For, just outside the door of parliament lurks the man on horseback ready to ride over if there is any indecision.

Like most of Professor Hermans' writings this book is devoted largely to special pleadings against proportional representation. His thesis is that if you let minorities get their own separate spokesmen in a legislative body in proportion to their numbers, you will be likely to get a conglomerate of discordant elements in which no one party will have a majority to enact its program and in which no group of parties can be found in sufficient agreement to govern without constant turmoil. As a result the people may turn to dictatorship in disgust. If, on the other hand, you have a plurality system of election which gives all the representation in each district to the largest group, people will be forced to forego the preferences which divide them differently on many issues and to choose between the two parties which appear to have the best chance of success. Since the mass of people are not extremists, any party attracting the mass support necessary to win will be forced to be moderate, and extremists of all kinds will tend to be frozen out. The result will be a strong government not too far off center, whichever side wins.

In pursuit of this thesis Professor Hermens scans the whole European scene, and even takes short excursions into Israel, Japan, India, and the United States. Wherever he finds difficulties in a country using proportional representation (P.R.), he bears down on the contribution of accurate representation to the difficulties and speculates on the wholesome effects of a suitable distortion. Wherever he finds things working reasonably well under P.R., as in Ireland, Italy since the war, the Scandinavian countries, Finland, the Netherlands, and Switzerland, he ascribes the success to other factors and gravely shakes his head at portents of future disaster. Conversely he sings the praises of plurality of majority governments in Britain, the United States, and elsewhere and minimizes their difficulties. Where he finds really serious difficulties, as in France before its adoption of P.R. at the end of World War II, he seeks explanations other than the electoral system or blames variations from the straight plurality pattern.

The book contains a vast amount of interesting material. Viewed through glasses of a different color from the author's, much of it supports the feasibility of accurate representation and of making suitable adjustments in government machinery to let people say and get what they really want. Many of the untoward effects he ascribes to proportional systems are not due to proportionality at all, but to the shortcomings of the European party list forms of P.R., which entrench party organization and deny the voters the freedom of choice among individual candidates they enjoy in Hare system P.R. elections in Ireland, Australia, Canada, and the United States. Professor Hermens is an honest and sincere man who makes some careless misstatements but does not deliberately mislead his readers and tries to face all the facts. Consequently if you take all his concessions which he tries to explain away, you have quite a mass of evidence against him.

The one thing he does not do, and never has done, is to explore seriously the possibilities of making real democracy work—not a democracy which forces people to forget many of their real desires and make a choice of evils, but a democracy which invites an honest expression from everybody and condenses the electorate into its chosen leaders in the right proportions to form a body as accurately representative as the old New England town meeting.

There is plenty of evidence, in this book and elsewhere, to indicate that people would often prefer to be represented by a large and powerful party if they can find one to their liking rather than by a small splinter party—for example, the two-party set-ups in Cincinnati and the Australian province of Tasmania, and the succession of stable governments in Ireland under the freest form of P.R., and the moderate one-party parliamentary majorities in Italy, Norway, and Sweden under somewhat inferior but still nearly proportional systems. And there are various expedients, mentioned but not given due credit by Professor Hermens, that have been tried successfully to make government *function when no party has a majority*—coalitions proceeding with the planks on which the governing parties agreed and not resigning if overruled on any but a major issue, minority center governments appealing first to the right and then to the left for known majorities on different issues, all-party governments formed on a more or less proportional basis and bringing forward proposals on which a majority agreed (sometimes with minority dissenting reports), nonpartisan executives ready to carry out on particular issues whatever a majority in parliament might decree. One-party governments have not always been the best governments, and other governments have sometimes given greater popular satisfaction.

Professor Hermens' is essentially a counsel of despair. That there are difficulties and dangers to be overcome in accurate self-government any reasonable person will agree. Professor Hermens thinks the difficulties are so great that we have to sacrifice accuracy and settle for a distorted strong government instead.

It may be doubted whether distortion is even the best way to get strong government. For despite debates and wrangles there is often a popular support of a completely representative legislative process such as exists in Ireland, Winnipeg, Calgary, Cincinnati, and Worcester that is frequently lacking in one-party-machine near-monopolies like those customary in New York, Boston, Philadelphia, and the solid South. Be that as it may, the real challenge of democracy is to do not just something but what the people want done.

GEORGE H. HALLETT, JR.
Citizens Union of the City of New York

OTHERS

WILGUS, A. CURTIS (Ed.). *The Caribbean at Mid-Century*. Pp. xxv, 284. Gainesville, University of Florida Press, 1951. $4.00.

This volume contains, besides a foreword by President J. Hillis Miller and an introduction by A. Curtis Wilgus, twenty lectures given at a conference held at the University of Florida early in December of 1950. As might be expected in volumes of this kind, the topics are of unequal importance and the treatment is of unequal length and value. Four of the speakers spread their discussion beyond the geographical region announced by the title and dealt with Pan-American relations. Aside from these, the major subjects discussed were economic, political, sociological, and literary.

All are presented in satisfactory style and with few typographical errors, and all well worth reading. The contributions which proved most interesting to this reviewer were those by Edward H. Miller, head of the Latin-American Division of the State Department; Harry F. Guggenheim, once United States Ambassador to Cuba; Wilson Popenoe, noted expert in tropical agriculture; Lowry Nelson, Minnesota sociologist just returned from a research sojourn in Cuba; Maynard Phelps, University of Michigan economist; John A. Crow, specialist in Latin-American literature; and J. Lloyd Mecham, political scientist from the University of Texas. The contributions by Nelson and Mecham, the first dealing with rural life in Cuba and the second presenting an appraisal of Mexico's recent revolution, seem to be the most scholarly. Crow's survey of Carribbean literature is couched in impressive language. He makes a persuasive plea for the study of literature as well as statistics.

J. FRED RIPPY
University of Chicago

ALEXANDER, ROBERT J. *The Perón Era*. Pp. x, 239. New York: Columbia University Press, 1951. $3.50.

This little volume contains a clear, straightforward, "blow-by-blow" account of the rise to power of Argentina's president-dictator, Juan Domingo Perón. A minimum of space (nine pages) is devoted to the background of Peronismo, and to a discussion of the factors that made possible the present dictatorship. When, however, the author moves into the current era, he really hits his stride. He includes chapters on each of the major factors in Argentine life, as affecting and affected by Perón. One chapter is entitled "Labor under Perón." Others deal with the army, the church, the universities, the great landowners and their workers. There is even a chapter devoted to Evita, the clever ex-radio actress who has "used her stylishness as a political weapon." Considerable space is devoted to Perón's economic policies and foreign relations, especially with the United States.

Perhaps the chief difficulty with this book is that it seems to aim at no particular group of readers. For the man in the street it seems to lack the flair of the professional journalist. There are no cleverly turned phrases to capture the imagination. Facts are presented simply as facts, with no attempt to emphasize the picturesque. But for the specialist the book has other defects. The story that it presents is already well known to students of Latin American affairs. Moreover, there is an almost complete lack of documentation. Footnotes are conspicuous by their absence, and the only bibliography is an inadequate "bibliographical note" at the end of the volume.

The weakest part of the book is probably the short and entirely unnecessary "postscriptum," which has apparently been added for the purpose of enabling the author to end with a flourish. The thesis of this final chapter is that Perón is a dangerous demagogue—which can readily be domonstrated; and that the United States should therefore ignore him as completely as possible. The book ends with these words: "Unless the United States is careful, she will one day wake up to find a united front of totalitarian military dictatorships among the nations to the South, proudly headed and dominated by El Líder—Su Excelencia Señor Presidente de la República Argentina, General Juan Domingo Perón."

Now that is sheer nonsense, as the author of this book, who is an economist, ought to know. Economic factors have always been far more important than political ideologies in inter-American relations. Argentina was a leader of the anti-United States bloc, even in its democratic days, and the answer is to be found in beef and wheat. Dictators like Somoza and Trujillo have demonstrated their friendship for the United States, and will continue to do so as long as their welfare depends on such a course.

AUSTIN F. MACDONALD
University of California
Berkeley

THOMAS, LEWIS V. and RICHARD N. FRYE. *The United States and Turkey and Iran*. Pp. xii, 291. Cambridge, Mass.: Harvard University Press (in "The American Foreign Policy Library," edited by Sumner Welles), 1951. $4.25.

The latest volume published in the American Foreign Policy Library series is a very timely and important book. It is the work of two young students of the Middle East. Mr. Thomas, who teaches at Princeton, knows Turkey well and writes in the first half of the book on "the United States and Turkey," while Mr. Frye of Harvard, whose knowledge and understanding of Iran and the Iranians is remarkable, writes on "the United States and Iran" in the second half of the book.

In his part Mr. Thomas properly emphasizes the strategic importance of Turkey and of the Turks in the current bitter East-West rivalry. He stresses the role of the Turk as a rugged and brave fighter, as a friend of the West, and as such a definite asset on the side of democracies. His historical treatment is informative, but his inordinate liking for things Turkish blinds him to some of their shortcomings. He gives the impression of viewing every event as seen with the eye of an Ataturk or his successor. In this respect his por-

tion of the book would have gained considerably if he were half as critical of his Turks as he seems to be toward many who have known the Turks and have written about them.

In the opinion of this reviewer Mr. Frye's portion of the book is more balanced and better written. His historical sketch of Iran is just as detailed, but he never loses his critical sense. He knows modern Iran, with its tribes and minorities and numerous sects, exceedingly well, and he shows warm sympathy toward the Persians. His analysis and exposition of Iran's political, social, economic, and religious problems emphasize the mature judgment in this youthful teacher and writer.

Both Mr. Thomas and Mr. Frye treat our relations with each country rather briefly, devoting to them exactly fourteen pages in each case. They both add useful appendixes containing population and financial statistics, the fundamental laws of these countries, and lists of "suggested reading."

A. O. SARKISSIAN
Library of Congress
Washington, D. C.

PANKHURST, E. SYLVIA. *Ex-Italian Somaliland*. Pp. 460. New York: Philosophical Library, 1951. $7.50.

Comparatively little in English is written on those parts of Africa which are not or have not been under British rule. The voluminous Italian writings about their former holdings in the East African horn, including that part of Somaliland which they now govern under a United Nations trusteeship, have not been distinguished by their political objectivity.

E. Sylvia Pankhurst has assembled an enormous amount of material on the political development of Italian Somaliland with an emphasis on those years following the rapacious Italian invasion of Ethiopia down through the period of British military control and the beginning of Italian trusteeship. In the process, she touches intermittently upon administration, agriculture, physical geography, land tenure, treaties, and the difficulties of economic development. Unfortunately, for social scientists, these thin slices of meat are sandwiched between large slabs of polemics.

Miss Pankhurst, editor of the *New Times and Ethiopia News*, makes a strong case for Ethiopian, or at least non-Italian, control of the territory, but many people who may agree with her conclusions will find her argument disorganized and emotional.

Politics or not, *Ex-Italian Somaliland* is an indispensable source for students of eastern Africa and for those concerned with the pros and cons of U.N. trusteeships.

EDWIN S. MUNGER
University of Chicago

MALCOLM, GEORGE A. *First Malayan Republic: The Story of the Philippines*. Pp. 460. Boston: Christopher Publishing House, 1951. $5.00.

The author, a former justice of the Supreme Court of the Philippines, was in the Islands in various official capacities from 1906 to 1940, and he went back to Manila in 1948–49. His career spanned almost the whole period of American control, and he knew personally the leading Americans and Filipinos of the past half century. He was thus in an unusually favorable position for writing an account of the establishment of self-government. He has written a well documented history, which is based on his personal knowledge as well as on a careful study of other authorities on the Islands. It gives a clear picture of political, constitutional, military, and economic developments, and of the serious problems which face the young republic. Unlike many authoritative works it has an interesting and readable style, and it is enlivened by character sketches and appraisals of the leading actors on the Filipino political stage.

The most valuable part of the book describes the form of government in theory and—a somewhat different matter—in actual practice. The constitution adopted in 1935 was in general similar to its American model. It attempted to divide authority between the executive, the legislature, and the Supreme Court; but at the same time it conferred very extensive powers upon the first named. The result has been that "everyone realises that executive power in the person of the President outranks the other two powers," and that a forceful and ambitious leader like the late President Quézon can infringe the spirit if not the letter of the constitution. The author is careful to point out that this does not arouse the same reaction as in the United States, since "the psychology of the masses reacts more favorably to a government dominated by one person than to more democratic direction." Another reason for this popular acquiescence is that "the Philippine Government may in theory be one of laws, but in practice the Government is pretty much one of men."

The author frankly indicates the serious shortcomings in the government of the Republic; but he believes that it is as democratic as can reasonably be expected. This book can be recommended to anyone who wishes to understand the present situation in the Philippines.

GRUNDER, GAREL A., and WILLIAM E. LIVEZEY. *The Philippines and the United States*. Pp. xii, 315. Norman: University of Oklahoma Press, 1951. $4.00.

This is a competent account of the political relations between the United States and the Philippines. Its authors have used official documents such as Congressional hearings and reports, as well as the rather scanty secondary literature. Apart from some purple patches (one of which appears on page 50 and in a diluted form on page 70) and some straining after literary allusion—as in the phrase "gilded over with the pale cast of goodwill and paternalism" (page 60)—the writing is clear and straightforward.

The story is told from the expedition which brought the Philippines under American control up to the achievement of independence. McKinley's hesitancy and Theodore Roosevelt's intransigence and the work of successive proconsuls are surveyed. Adequate emphasis is given to the economic pressures within the United States for getting rid of Filipino competition by the grant of independence. Not much is said about the motives actuating the Filipinos themselves and generally one has the impression that the emphasis in the book ought to be reflected by changing the title to read "The United States and the Philippines." It is in fact a study of American policy largely from American sources.

There is a curious insistence that in the final grant of independence the United States was motivated in part by a desire to expose the islands to exploitation by American capital. The attempt to stabilize a free peso by linking it with the dollar is stigmatized also. It is possible perhaps to regard the imposition of maximum export quotas to the United States as prompted by a shortsighted protection to American primary producers, though the quotas have proved adequate so far. The facts do not indicate any great desire of United States industrialists to invest in the Philippines. It is indeed difficult to arouse their interest on any significant scale. And it is hard for an economist to believe that the Philippine economy would have profited from an unstable peso. When the pinch came, the United States acquiesced in exchange control and even in a tax collected by the central bank on exchange receipts. The economic troubles of the Philippines, which are the root cause of the present threat to its political stability, do not stem from American imperialism. They should be sought in analysis from the Filipino side of the weaknesses both of political and of economic organization in the islands themselves.

J. B. CONDLIFFE

Berkeley

DOBBY, E. H. G. *Southeast Asia*. Pp. 415. New York: John Wiley & Sons, 1951. $5.00.

Professor Dobby calls his volume "one of the first studies of locational perspectives in Southeast Asia." But his work is of more general interest than this technical description might suggest. What he has done essentially is to assemble in clear, compact, and well-organized form a mass

of useful data about the geography and economic life of the region. This result is a work that students of Asia will find valuable in many contexts.

The volume is divided into three broad sections. The first part, on the natural landscape, discusses the geologic structure, climate, drainage patterns, and soils of the region. In the second part, comprising about two-thirds of the text, the author takes up the separate political units in succession, dealing not only with their physical features, but especially with many aspects of their economic life. The chapters on Malaya, for example, range in content from an analysis of the main rock formations and a description of the atmosphere of a rubber plantation to a listing of Malaya's chief edible fish and a discussion of the evolution of the life of the peninsula. In the final part of the book the author again considers the region as a whole, devoting separate chapters to agriculture, fisheries, industry and trade, and the general politics and prospects of Southeast Asia.

Professor Dobby's precise, lean style, hardly involving a wasted word, has a literary quality that breaks through the technical barriers of his subject matter, especially since his personal familiarity with the territory he is writing about subtly flavors many descriptions. The book is notable for its emphasis on detail, including not only the main facts about the countries of the area, but also a wealth of specific material not readily available elsewhere. From this material a picture emerges of a region of unparalleled diversity in stages of development and people—a region whose economic life has been shaped to a striking degree by the impact of the West and its demands for minerals and agricultural products. In the final chapter on general politics and prospects there are some weaknesses, such as the suggestion (with regard to the people of Southeast Asia) that "a congenial poverty may ultimately prove the normal and agreeable thing for them, as it was in the 16th century." Nothing seems less likely than that in modern Asia poverty will prove "congenial" and "agreeable." Fortunately, the author's viewpoint on this question does not vitiate the main content of a valuable geographical work.

LAWRENCE K. ROSINGER
New York City

ISAACS, HAROLD R. *The Tragedy of the Chinese Revolution.* Pp. xv, 382. Rev. ed. Stanford: Stanford University Press, 1951. $5.00.

This famous history of Chinese events in 1925–27 was first published in England in 1938. Now, with numerous revisions, it appears under an American imprint. In the process of revision it has lost nothing of its bitter bite and highly polemical tone, although on issues and questions relatively minor to the principal argument it reflects some change of viewpoint. The original edition was uniformly labelled "Trotskyist," a conclusion induced by Trotsky's Introduction to it—which is now deleted. As Isaacs puts it, the revision "no longer accepts his [Trotsky's] conclusions and cannot be characterized as Trotskyist" (p. xii). But whether Trotskyist or not, the book remains sharply anti-Stalinist in slant.

To Isaacs, "the tragedy of the Chinese revolution of 1925–27 lay precisely in the fact that it took place within the same period of years during which the Russian national dictatorship was coming into being" (p. 51). This "Russian-made debacle . . . [not only] imposed upon China the heavy burden of the Kuomintang regime" (p. xi); it exacted tremendous toll of the revolutionary forces of China, and it developed for the present leaders of the Chinese Communist party concepts of bureaucratic power modeled more closely upon those of the Stalin machine than upon those of the nascent native Communism of earlier years in China. Writing as a self-styled "democratic socialist," apparently sympathetic to less adulterated forms of Marxism than now prevail in the Stalinite world, Isaacs is brought to this condemnation:

"The Russian Communist party under Stalin had taken many years to divest itself of its proletarian roots and ideology and to become a power machine rooted in the new ruling bureaucratic caste. [In consequence of the Stalinite heritage derived from the catastrophe of 1927,] the Chinese Communist party came to power already equipped to play this role, already fashioned into a power mechanism with an almost unique capacity to balance itself among and above the classes of the population" (p. 309). In both cases, proletarian revolution had been subverted by bureaucratic power.

Because they plunged with their Russian associates down the "blind alley of totalitarianism," the Chinese Communists become targets for Isaacs' pointful analysis and scornful derision. None of the analysis, however, offers comfort for the Kuomintang, from whom nothing but duplicity and treachery—to the proletarian cause—could ever have been expected. The Western democracies also come under attack for the shortsightedness of their China policies, although Isaacs infers that enlightened Western statesmanship may yet save the day. This, perhaps, is the point where Isaacs departs basically from the Trotskyist position. But however the arguments are weighed, *The Tragedy of the Chinese Revolution* reminds us of the impact of nearly-forgotten historic events, and remains a work of primary historic significance. So far as it incorporates Isaacs' conversations with leading participants it is actually source material.

WEBER, MAX. *The Religion of China: Confucianism and Taoism.* Translated and edited by Hans H. Gerth. Pp. xi, 308. Glencoe, Ill.: The Free Press, 1951. $4.50.

Max Weber, the great German scholar, has contributed many ideas to the social sciences. There are writers who have taken, without acknowledgement, some of his concepts, and called them original. His *The Protestant Ethic and the Spirit of Capitalism* is the thesis of an American school of economics. His *Theory of Social and Economic Organization* has widespread influence. His *General Economic History,* containing the brilliant chapter, "Evolution of the Capitalistic Spirit," is a standard work. His *The Religion of China: Confucianism and Taoism,* as translated and edited by Professor Hans H. Gerth, will appeal to all interested in world cultures.

The Religion of China contains three parts. Part One considers Chinese money, central government and local officialdom, feudal and fiscal organization, and the general features of capitalism. Part Two will delight the sinologue with its discussions of the literati, the development of the educational system, the examination techniques, the "gentleman" ideal, the prestige of officialdom, views on economic policies, and sultanism and the eunuchs as political opponents of the literati. This section also contains a brilliant interpretation of the Confucian life orientation, constructed on a foundation composed of myriad-colored designs Weber has characterized as bureaucracy and hierocracy, absence of natural law and formal logic of legal thought, indifference to the natural sciences, the inner-worldly nature of Confucianism, the central concept of propriety, piety, the Confucian attitude toward the economy and rejection of the professional expert, the significance of the Chinese classics, the "pathos" of early Confucianism, and its pacifist character.

Part Three considers Taoism, a portion of the book which will appeal mainly to the student of comparative religions. There are pages devoted to doctrine and ritual in China, anchoritism and Lao-tzu, Tao and mysticism, the contrast between the orthodox and heterodox schools, the Taoist hierocracy, the general position of Buddhism, the systematic rationalization of magic, the ethic of Taoism, and sects and the persecution of heresies in China.

The conclusions of this study, entitled "Confucianism and Puritanism," are Weber at his best. "Confucianism hallowed alone those human obligations of piety created by inter-human relations, such as prince and servant, higher and lower official, father and son, brother and brother, teacher and pupil, friend and friend. Puri-

tan ethic, however, rather suspected these purely personal relationships as pertaining to the creatural; but Puritanism, of course, did allow for their existence and ethically controlled them so far as they were not against God" (p. 241).

FOREWORD

SELDOM in history have political institutions been subjected to greater scrutiny than at the present time. In a world where widely divergent theories of government are competing for acceptance, the fidelity and effectiveness of their institutions have become a matter of great concern to the adherents of each particular pattern. To those who hold to the democratic form, the matter assumes special importance. Since democratic institutions are an inseparable part of the democratic way of life, the preservation of their basic character is essential. But more than an acceptable form is necessary; democracy must also provide responsible government, particularly so in times of stress. To the United States as the leader of the Western world, with major responsibility for the future course of events, effective government has become a matter of paramount importance. The problem is one of many facets. This symposium is concerned with only one—honesty among public servants as an essential factor in effective government. In our volume *The Crisis of Democracy* in September 1933 we considered ethical standards in public life as one in many problems of government; today it seems an appropriate subject for wider and more particular attention.

The American system was born as an experiment; it is still an experiment. But it has grown up, and maturity brings greater responsibilities. No longer may we condone our indiscretions as those of infancy or adolescence. Maturity means placing greater responsibilities on public officials and holding them to their trust. It means greater recognition for faithful public servants and a willingness to back them up. It means an abandonment of the fatuous stereotype of many thoughtless Americans that the public service is an inferior occupation and that honesty among public servants is not generally to be expected. On the contrary, maturity means giving to the faithful public servant as high esteem as Americans have traditionally bestowed upon the successful businessman. Political maturity connotes a high standard of ethics in government regardless of what the level may be in business or private life, and the community is entitled to insist that all public servants accept the fact. Again, political maturity involves acceptance of the principle that, although the prevention of unethical practices is a nonpartisan matter, the party in power must assume primary responsibility for what goes on under its auspices, and that it is no defense that revelations of skulduggery by the opposition are politically motivated. (But it does mean that criticism must be honest, that it must not be unfounded character assassination.) Finally, political maturity requires that we re-examine and reappraise public attitudes concerning standards for the public service. With what degree of insistence does public opinion demand honest government? What, first, is the attitude of the electorate? Again, how effectively do the press, the radio, the pulpit, and the educational institutions promote higher standards? To what degree do the pressures of self-seeking groups inhibit legislation in the public interest and corrupt public administration? These are some of the pressing questions which an adult community attempts to answer.

Difficult tasks have been assigned to our contributors. Theirs is the delicate undertaking of interpreting the civic conscience. Then there is the difficulty of recognizing the public interest amid the welter of conflicting private interests, and

of preserving a balanced judgment in the midst of fierce partisan attitudes. Furthermore, there are few absolute ethical standards by which to appraise much that goes on in public life. Although it is easy to recognize the ethical deviations involved in embezzlement and bribery, it is sometimes difficult to assess the moral aspects of campaign contributions, lobbying, and the use of personal influence in public affairs.

We have not attempted to present opposing points of view on the various topics discussed by our contributors. Instead, we have chosen to invite one spokesman on each of a wide range of subjects having ethical implications, and to leave to readers the pleasures of entertaining divergent points of view. If the articles prove as stimulating to others as they have proved to the editors, we shall be content.

CLARENCE N. CALLENDER
JAMES C. CHARLESWORTH

Past and Present Standards of Public Ethics in America: Are We Improving?

By ESTES KEFAUVER

THE problem of public ethics is merely a phase of the problem of general ethics. At the bottom of the ethical problem, for both the individual and society, is the conflict between the self-interest of the individual and the more or less collective interest of society as a whole; and the essential problem of conduct can be expressed in the question: To what extent should the purely selfish ends of the individual be sacrificed to or limited by the ends of the society he lives in? Philosophically the conflict is between selfishness and altruism; politically, between self-interest and public welfare.

The standards of public ethics have accordingly reflected and mirrored the standards of private ethics; and the different standards have expressed every philosophical point of view from the cynical to the idealistic. Like that of our culture itself, the behavior pattern of our public life has traced a serpentine course veering between the easy tolerance of cynicism and the inflexible propriety of idealism. Cynicism may have exerted the greater pull, but generally our course has nevertheless tended toward the standards of idealism more and more.

Our standards of public ethics in the United States have been conditioned by certain considerations which, whether or not they have counterparts in personal ethics, have provided certain limitations on our idealism.

The first is the fact that, especially in a crisis, a people's government like our American democracy must act. A democratic government can never leave the battlefield of action, not even to retire to contemplation. At times when the citizens as individuals cannot solve their own problems, ethical or practical, they turn to the government for solution. The people's government cannot abdicate in such a situation; it is forced to cope with the problems its citizens find individually insoluble. This forces a certain need for expediency which drives our thinking on public ethics toward a pragmatic philosophy even more strongly than is the case in our individual thinking.

Secondly, here in the United States we appear to be committed to the basic concept that not only our own progress but the *summum bonum* itself is more likely not only of attainment but of better attainment through the expression of the individual character and will than through the expression of collective wills and characters. This tends to keep us sympathetic to self-interest and also to define general welfare not as the state in which the welfare of the mass of society is greatest, but as the state in which the opportunity for the nobler types of individual self-expression is greatest. This idea obviously leaves much more room for individual interpretation of both ends and means, and therefore for individual interpretations of public ethics; it also tends toward an easier identification of public welfare with self-interest.

DOUBLE STANDARD FOR PUBLIC AND PRIVATE ETHICS

Moreover, our consideration of public ethics has been and still is conditioned by the existence of a double standard of ethics. Although our public ethics mirror the ethics of our private lives, they are by no means identi-

cal. For one thing, there is a greater contradiction in the ends we establish for public than in those for private ethics. I have already pointed out that to some degree the realities of our American democracy drive us into a pragmatic concept of the behavior of the government. But, on the other hand, we have tended to expect much higher ethical standards of public servants than of private citizens, particularly than of citizens in business.

Indeed this trend leads us into a peculiarly one-sided view of public probity. On the one hand, we deny our public servants the right of behavior which is a perfectly normal part of business and private life. On the other hand, when they fail in ethics we tend to place the full blame on them alone. Thus, we excoriate and scorn the public servant who takes a bribe, but we overlook and even forgive the tenderer of the bribe. This tendency led one historian of our corruption to say: "In politics alone, the pimp enjoys a higher moral standing than the prostitute." [1] Moreover, because of this duality it is much more difficult to attain high ethical performance in public life than in private life.

EVOLUTION OF STANDARDS

With these considerations in view, we can examine the evolution of the standards of public ethics in our own past and try to arrive at an answer to the question: Have we improved?

Before the War of Independence the concept of public ethics as we know it today simply did not exist for the simple reason that the concept of general welfare was almost completely nonexistent. In pre-Victorian days England's public servants operated on the principle that a public office was a means to wealth, and this principle was not only accepted by the rulers but encouraged by the fact that few offices carried with them anything but a nominal salary. Bluntly but quite accurately the system of public service could be described as that of selling the bounty of the government for the best obtainable price. Even seats in Parliament were available at a standing price of £4,000 sterling. "Official dishonesty in the Colonial period attained the static and convincing quality of a known science, like arithmetic or geometry." [2]

Graft and bribery of the public servants were an economic factor which every businessman took into consideration, the more so since the scale of values was well known. In a sense the whole populace engaged in the profitable process of mulcting the government —which was after all a hated tyrant— of every possible penny. Indeed, public opinion did not begin to be outraged until the process of graft and bribery began to be pointed at mulcting the populace itself, not so much for the benefit of the king, for he received a pitifully small proportion of even the legal taxes, but for the benefit of the grafters. The taxes themselves were to some extent, one suspects, an early example of "nuisance laws" enacted by the grafters to provide an opportunity for them to sell immunity or amelioration at a price.

The general welfare in the concept of public ethics

The Revolution was to an extent at least a revolt against the corruption and dishonesty of British public service. Moreover, the Revolution not only transferred sovereignty from the king to the people, but also the property of the government from the king to the people. Public servants were no longer custodians for a faraway and hated king, but custodians for the people; and the people no longer had cause for complacency about the theft of that property. The Revolution also established the idea of general welfare as a foil and opposing force to self-interest and self-aggrandizement. Thus the improvement in the *concepts* of public ethics after the Revolution was in itself a small revolution.

However, the habits of a heritage and a lifetime are not easily put away, and though we now had a concept of public ethics the standards of conformance to it were still low. Even during the revolt itself officers had to be cashiered for "drawing more provisions and pay than they had men in their company," to use Washington's own words, or for "seeking by dirty and base means the promotion of their own dishonest gain." A stalwart and hot patriot like Samuel Chase while a member of Congress could try to corner the supply of flour during the war. And Robert Morris was investigated on charges, largely supported by facts, that he used his position of public trust for private gain. At one point Washington was driven to say:

> Such a dearth of public spirit and want of virtue, such stock-jobbing and fertility in all the low arts to obtain advantage of one kind or another, I never saw before and pray to God I may never be a witness to again. I tremble at the prospect. Such a dirty, mercenary spirit pervades the whole that I should not be surprised at any disaster that may happen.

But there was a difference. Where such behavior had formerly been deplored by the virtuous only as a *personal* defect in character it was now being deplored as a sin against a larger interest or ideal—the general welfare. Despite his previous, unquestioned patriotism Samuel Chase was ostracized and refused reappointment to the Congress. And Morris was absolved only because the patriots, as realists, appeared to believe that his contributions to the general welfare were greater than the personal profit he made through his position.

The disposition of these cases produced the first criterion of public ethics. Private profit by public servants at the expense of the general welfare was corrupt; but private profit by public servants obtained as a *concomitant* to service in the general welfare was quite proper. The principle remained the basic criterion of our public morals until a few years ago. Indeed, it was used to justify the conduct of Andrew Mellon as secretary of the Treasury as late as the 1920's; and vestiges of it are still found in our practical approach to the problem.

Realism in public ethics

There ensued a period of what we might call realism in public ethics. The fathers of the Revolution were idealists and radicals; the fathers of our Constitution and the republic it established were realists and conservatives, at least in comparison with the former. It is always easy to identify self-interest with general welfare. In the first years of the constitutional republic the tendency was expedited by the fact that most of the influential fathers of the republic were men of firm convictions, and by the fact that their first concern was naturally to make the government work. So far as public ethics were concerned, the problem of the first sixty or seventy years of the republic was to establish definitions of general welfare rather than standards of ethical performance. The problem resolved itself into a struggle between two groups each claiming that its own self-interest coincided with the general welfare.

On the one hand, there were the conservative mercantile interests whose prophet was Hamilton; on the other, the liberal agrarian interests whose

[1] David Loth, *Public Plunder, A History of Graft in America*, New York: Carrick & Evans, 1938.

[2] William E. Woodward, *A New American History*, New York: Farrar and Rinehart, 1936.

prophet was Jefferson. Since this was not simply an academic contest aimed at arriving at philosophical answers but a matter of real and earnest life aimed at arriving at a working government, neither side, though motivated by highly principled conviction and ideals, was inclined to be very choosy about means. Moreover, although the criterion of public ethics frowned at public servants placing their self-interest above general welfare, it placed no such limitations on private citizens. The contrary was true.

The war had not been fought for any abstract concept of general welfare. It is probably a fair statement that it was fought for the principle that the power of government should be used not to forward the self-interest of the rulers, but to forward the self-interest of the people. The immediate aim of our founding fathers was to make our republic work in this sense. Finally, the people themselves were a product of a society in which the perversion of public service to private ends was the norm. Considering all this, it is a high tribute to the basic integrity of the founding fathers that the standards of public ethics were realistic rather than downright cynical. But their realism made precedent for cynicism, as John Adams, in a remarkable anticipation of the basic presumption of Marxism, foresaw when he wrote:

> In every society where property exists there will ever be a struggle between rich and poor. Mixed in one assembly equal laws can never be expected; they will either be made by the numbers to plunder the few who are rich, or by influence to fleece the many who are poor.

He concluded that government by either faction could therefore only be sustained by "the cohesive power of public plunder."

Since in our early days the power of government was largely concentrated in the legislative branch, it was here that problems of public ethics first occurred. The disillusioned, who do not believe we have made at least some progress in our standards of public ethics, might consider this instance:

Early examples of public ethics

As part of the program of establishing the financial integrity of the new government, the first secretary of the Treasury, Alexander Hamilton, pressed for and received Congressional approval for the assumption by the federal government of the largely defaulted debts of the states and also for the redemption of the nearly worthless Continental currency at face value. Although this was no doubt a measure in the public interest, it was also in the self-interest of the moneyed classes. Moreover, historians are inclined to agree that the members of Congress who voted for redemption at face value made a personal profit out of the scheme. A suspiciously convenient fire in the Treasury destroyed records before the Jefferson administration could seize them; but what was left of them indicates that at least 16 of the 26 Senators and 29 of 64 Congressmen had acquired more than nominal quantities of state securities or Continental currency, and accordingly that they profited personally from their vote in favor of redemption at face value.

On the other hand, Jonathan Dayton, Speaker of the House (1798–1800), was driven from office for embezzling some $15,000 from the pay and traveling allowance of members. Thus embezzlement of government funds, widespread in colonial times, became a sin against public ethics. For a half-century Jefferson and his agrarian liberals kept the Congress and federal government from becoming a self-profiting servant of the moneyed interests. They insisted that most of the favors the moneyed interests wanted were the prerogative of the states rather than of the federal government. This turned the attention of those who sought these favors to the state legislatures. The corruption, bribery, graft, and incredible lack of ethics in the state legislatures which followed are too well known to require any mention here. But the interests had their friends in Congress too, and many of our national heroes had feet of clay when seen from today's perspective.

In 1837 Congress was concerned with renewing the charter of the Bank of the United States. A large number of Congressmen and government executives had loans, largely unsecured, from the Bank, among them Vice-President John C. Calhoun, Henry Clay, and Daniel Webster.

Members of Congress had large and lucrative private practices, and among their clients were persons vitally concerned with bills before Congress. Both Webster and Clay were counsel for the Bank of the United States at the time when its charter came up for renewal. Webster represented New England businessmen, and once he received from them a "memorial" of $37,000 with, so it was said, no strings attached. While in Congress and even as Secretary of State Webster represented Danish, French, and Spanish claimants for damage by American shipping during the War of 1812. Though these facts were quite well known, they caused little furor except among his political enemies.

The spoils system and cynicism

A landmark in setting the pattern of our public ethics appeared in the administration of Jackson and Van Buren with the establishment of the so-called spoils system. Actually, we know today that Jackson has been considerably libeled in our popular views of his responsibility for and belief in the system. But this administration set a precedent by establishing Burke's principle of party responsibility without clearly defining party obligations to the general welfare. Moreover, by reducing the security of tenure, it discouraged the entrance of men of integrity and honorable ambition into the government and encouraged the lesser men who did enter government service to seek security of tenure by subservience to the party in power and its friends. The consequences can still be discerned in public life.

The realism of pre-Jacksonian days began to ripen into outright cynicism. The Civil War eliminated for a few years the checks presented by the conflicting self-interests of an opposition, and there followed the shabby profiteering during the Civil War itself, the corruption of the Grant regime, and the nearly complete capture of both Congress and the executive branch by the robber barons of the 1880's and 1890's. The judgment of Henry Adams that "one might search the whole list of Congress, Judiciary and Executive during the twenty-five years, 1870 to 1895, and find little but damaged reputations," might be extreme, but it was not entirely unmerited.

Certainly those years represented a low in our standards of ethics and the peak in our tolerance for corruption and in our subversion of the machinery of government, both state and local, to the purposes of private profit rather than general welfare. The general welfare became completely identified with the most selfish self-interest of one group only—the money makers. Moreover, the interests which captured the government not only manned it with their own men but furnished their own ethics—or, rather, their contempt for ethics.

John Adams may or may not have been right in his idea that a conflict of self-interests could produce effective government only through the cohesive power of graft. But events appeared to have proved once more—as they have

in all Western history—that a government committed only to the self-interest of one group breeds corruption as carrion exposed to summer heat breeds flies.

Reform and revolt

The very completeness of the cynicism and hypocrisy however served a purpose. It moved us from reform to revolt. In the last fifty years we found and threw out the corrupt wherever we could; we established laws and machinery to encourage probity and integrity; but we also re-examined and revised the philosophy behind our public ethics.

Since by our peculiar double standard the taker of the bribe is considered more blameful than the giver, we attacked in that direction first. We became more effectively critical about corruption in government. We not only threw out the corrupt wherever we found them, but we discerned corruption in actions which previously had caused no furor. Where the criterion of public ethics established by the First Congress was that private profit by public servants at the expense of the general welfare was corrupt but that private profit by public servants obtained as a concomitant to service in the general welfare was quite proper, today, I think, the qualifying clause has been eliminated. Today, I am sure, most of us agree that the criterion should be: "Private profit by public servants at the expense of the general welfare is corrupt, period."

To make it possible to obtain and hold men of sufficient ability and integrity to live up to this criterion, we have offered them security in the form of Civil Service tenure, and on the whole a scale of pay which, though not comparable with that of private life, is at least sufficient to eliminate excuses for graft.

Until quite recently these measures were highly effective in the federal government, though much less so in our local governments. Perhaps the best measure of their success was the fact that although World War I produced 18,000 new millionaires, not one of them was a career public servant in the federal government. It is all the more dismaying to discover, as we recently have in the Bureau of Internal Revenue scandals, that not only the political appointees, or amateur public servants, but also some civil or professional servants have been involved in highly unethical conduct. This grievous fact points a moral which, though obvious, is often overlooked in practice, that is, that it is not sufficient merely to establish high standards of ethics and a system of civil service but that we must also have public servants whose personal ethics and private probity are high.

PUBLIC ETHICS AND GENERAL ETHICS

Further improvements in our public ethics had to wait for improvement in our general ethics, and these, too, evolved in time. The individual's right to foster his self-interest at the expense of the general welfare began to be more and more circumscribed both by law and by public opinion. The process led first to the period of "enlightened self-interest" which characterized the first quarter of this century. The moneyed interests acquired, partly by their own perception and partly by forced feeding, a standard of ethics of their own in which their own self-interest made some concessions to the general welfare. The public would no longer countenance and capital could no longer afford—either in money or in damaged public esteem—outward bribery and graft. Capitalists learned the trick of capturing public opinion and the machinery of election and found such methods cheaper and more effective, as well as less obviously corrupt and base. Other special interest groups adopted similar techniques.

This less direct approach of the special interests has raised a whole new area of ethical problems and a corresponding set of new sins of corruption. We have in the federal government, at least, reduced the possibility and, to a less extent, the incidence of outright bribery and graft. We appear also to have pretty well reduced the possibility of any further outright capture of our government by a single special interest group. But we have seen grow up, in place of these obvious direct methods, a whole new family of subtle, indirect influences whose purposes are on the one hand to capture the minds and the loyalty of public servants and on the other hand to ensure the election of sympathetic legislators.

We cannot control these indirect corruptions by imposing ethics on our public servants only. We can perhaps, as we seem to be tending to do, make our criterion of public ethics more stringent—make it read: "Private profit by public servants, whether or not it is achieved at the expense of the public welfare, is corrupt." Perhaps, too, as has been suggested, we can spell out the ethics by codifying the particulars in a code of conduct. But these alone will not suffice. Moreover, we cannot go very far in controlling these indirect methods without running into the dilemma that by so doing we may be infringing on the Constitutional rights of freedom of speech, freedom of the press, freedom to petition, and other freedoms. We have legislated some limitations, and perhaps we can legislate a few more without endangering our Constitutional rights. For the rest, however, we shall, I fear, have to await a higher ethical standard among the general citizenry.

Benjamin Franklin once commented: "There is no kind of dishonesty into which otherwise good people more easily and frequently fall than that of defrauding the government." We have done fairly well in finding a remedy for Franklin's complaint so far as it concerns our public servants, but we will not achieve really honest and moral government until the comment loses its point when applied to the private citizen. As long as the citizen continues to place his own self-interest so far above the general welfare that he feels justified in employing almost any means of obtaining government favor for his selfish ends, we shall continue to have a climate in which corruption can flourish. Until the citizen's own moral code prevents him from debasing himself by procuring corruption of public servants, the problem of corruption and morality in public life will remain very real and earnest.

INTERPRETATIONS OF THE GENERAL WELFARE

No adequate public ethics is possible without a clear and accepted definition of general welfare. A public servant cannot be expected to do a good job of protecting the general welfare against the selfish interests of individuals if he does not know what the general welfare is. On the other hand, if the general welfare is regarded as synonymous with the self-interest of one group, he cannot be blamed unduly for doing what he can—short of graft—to forward that self-interest.

Unfortunately, a definition of general welfare is extremely difficult in our American life because of our rightful acceptance of, and even dependence on, individualism. Indeed, to my mind this is the reason why such nations as England and Germany were able to precede us to the achievement of reasonably ethical governments. They have had a much more social concept of the general welfare than we have had. In

both of these countries the relatively easy and simple utilitarian definition of public welfare as the state in which the material welfare of the mass of society is satisfactory was early accepted and established. On the other hand, in America, such a definition would find great resistance, and not from conservatives alone.

However, in the last twenty years we have been slowly evolving a concept of general welfare which, though not yet really defined and certainly far from clear, is finding acceptance and gives some promise of being sufficient to give us a working pattern of public ethics. So far the concept is more negative than positive. Although we may not be able to agree on what the general welfare is we do appear to agree that it is not the welfare of any single self-interest. And we are arriving at a picture, rather than a definition, of the general welfare as a synthesis or community of nonsubservient self-interests. Just how this sort of thing can be attained in practice few of us have a clear idea; but the vision, however vague and blurred, offers us some guidance, not only in our effort to establish standards of public ethics, but also in taking part in the arena of legislative and executive action. Some day, no doubt, the picture will be replaced by definitions clear enough to be used in syllogisms; and when this point is reached we shall have more logic and less mysticism in our standards of public ethics. Meanwhile, the new concept is sufficient to establish the idea in our public ethics that the government, and especially its servants, must protect the general welfare—leaving the nourishment of self-interest to individual citizens, who have thoroughly proved their ability to look after it.

RISE IN STANDARDS OF PUBLIC ETHICS

So, all in all, our *standards* of public ethics are unquestionably much clearer and much higher today than ever before. Indeed this fact is evidenced by the very intensity of our horror at each new instance of failure of our public servants to live up to them. Unfortunately—and here is the rub—our performance and enforcement of our standards fall far short of them. Indeed, in some respects, like the entrance of the criminal gangster into politics, our position is more serious than it has ever been before; the threat to our basic institutions is more menacing than ever. Moreover, it is naturally disheartening to discover that, while we have been closing the doors to the success of the old methods of corruption and influence, our antagonists have been discovering and employing more insidious methods of ingress against which we have not yet established adequate bars.

CITIZEN RESPONSIBILITIES

We have gone a long way since colonial days and even since the start of the twentieth century; but we are still far from any semblance of the millennium. It will take continued vigilance and energy to keep moving. And, if our history shows anything, it shows that we cannot delegate the job entirely to the government. The vigilance at least, and certainly the insistence on high standards of performance as well as high standards of concept, will have to be supplied in the future as in the past by the citizens themselves.

Estes Kefauver, LL.B., Washington, D. C., and Chattanooga, Tennessee, is United States Senator from Tennessee and an aspirant for the Democratic nomination for President of the United States. He was chairman of the Senate Committee to Investigate Organized Crime in Interstate Commerce. He is co-author of Twentieth Century Congress (1947) and author of Crime in America (1951), and he has contributed to numerous journals.

The Voter's Natural Bent

BY J. T. SALTER

THE subject of this paper is *the voter*. That is like saying that my subject is American civilization. For politics may be equated with life. It is not a detail; it *is* life. And voting, or failing to vote, is an expression of that life. To know the reasons why an individual marks his ballot as he does is to have an insight into the innermost recesses of that individual. Voting tends to make a man thoughtful; it challenges him to examine the record, to get the facts, to put two and two together, to take a stand—and that means to stand off in the privacy of a polling booth and tell what the facts mean.

Election day itself is only an official interruption of an endless process. This interval of several minutes is for the purpose of letting a voter make a record of his opinions on the candidates and the issues that he has been listening to and thinking about for a long time and relating them to a sense of himself and the community he lives in. The official ritual of standing within the isolated polling booth helps the citizen focus his impressions and makes him give them direction. To do this he must think of something beyond his own skin and bones; he is reminded that he is not living alone. He uses his vote for the state, the public—not for a private interest. Grover Cleveland well said: "Your every voter, as surely as your chief magistrate, exercises a public trust."

DIGNITY OF VOTING

In one way or another on election day the American voter considers the old question—Am I my brother's keeper? Thus voting has both a civic and a spiritual significance. It is a process that nourishes the human being and helps him behave like a free man in a free society.

To mark a ballot is to belong to the society of which one is a part. To mark a ballot is twice important. It helps the government to know what the people are thinking: it helps the individual to feel that he is important and a part of the government; the consensus is then one that he accepts. To keep a citizen from voting is a crime against personality. Such action thwarts the development of personality and weakens the government—weakens the social structure. The South, for example, is weaker because fewer people vote. There is something healthy about numbers in politics. Thomas Jefferson once remarked that that government is strongest of which every man feels himself a part. One cannot feel himself a part if his opinion is not asked. He may not vote, but no man wants to be unfairly denied the freedom to decide. That is what freedom is.

In 1947, while waiting at a rural bus stop in a Southern state, I asked a young colored man and woman if they intended to vote for Truman in 1948. They remained silent, and as the bus came, I repeated my question. The woman partly turned as she was getting on the bus and softly said, "You see we are kinda delicate about politics." When one set of Americans makes another set of Americans "kinda delicate about politics," all America suffers.

Voting is a substantial part of a man's freedom. It is more than a symbol; it is the idea and the personality focused

at pencil point on a small square on a ballot in a polling booth; it is democracy's badge of knighthood that carries with it the *noblesse oblige* of study and participation; it is the voter's membership in the body politic. The vote is to the individual in this interdependent day what his stone axe was to his ancestor twenty thousand or more years ago. It is the political arrangement, or weapon, or voice, that gets the citizen what he wants. It is at least the twentieth-century approach to what the individual wants.

NEED FOR ENLIGHTENED CITIZENRY

The voting that I am thinking of—wise voting—has varied facets. Most appropriately it is based on the idea that facts, facts, facts are needed plus the individual background against which to place these facts. For a fact is useless unless one sees its significance.[1]

The basic evil today is not so much greed and selfishness as it is ignorance; ignorance of the pertinent facts and their meaning. "Where there is no vision, the people perish." What can be plainer than that?

This means that education is needed. It means a chance to get all the facts, not merely an authorized version. It assumes that spiritual values are, and are recognized as being, as real as any other values. Law, justice, fair play, freedom, truth, the sacredness of human personality, as well as wheat, electric power, coal, cotton, statistics, and money, are staples of our politics and voting.

Finally, not only the community's attitude toward the voter, but the individual's attitude toward the ballot and elections is a descriptive fact of great significance. To know the voter is to know the individual, and to know the individual is to know the civilization.

Let us consider the nature of politics, the election, and the voter. Each, of course, is fashioned by the other and by the civilization, and, in turn, has much to do with the fashioning of our civilization. One answer to the perennial question about the value of our politicians and voters is to ask: What of our American civilization? What is it worth to the individual and to the world?

COMPLEXITY OF VOTING

Voting is relatively new, and because the mechanics of the ballot is so difficult to understand in the United States, it is likely to seem remote, unsubstantial, and difficult to get at. That is partially because we have a check and balance system, an unnecessarily long ballot and frequent elections.

The long ballot can be, and is being, shortened. But there is a problem independent of the number and kinds of offices to be filled at the polls. Suppose the last Presidential election is considered. Let us even assume that the citizen had been asked to mark *only* one "X"—Dewey or Truman. That would have been a very short ballot, but it would have been as difficult as it was short for a great many people; for I believe that unknown numbers of people did not relish voting for either candidate. And so it may be with every election for a varying number of individuals.

Our Presidential system of checks and balances,[2] bicameral legislature, and federalism has made it impossible, save

[1] The English author Frederic Harrison expressed the opinion that "what you want in a body of electors is a rough, shrewd eye for men of character, honesty, and purpose. Very plain men know who wish them well and the sort of thing which will bring them good." See John Morley, *Oracles on Man and Government* (London, 1923), p. 92.

[2] Our constitutional checks are minimized by unofficial party pressures and connections that make the government run.

in times of stress, for a victorious party to enact its program into law. Politics in America is uniquely American. I think it was Bryce who once said that the special genius of the Americans is their ability to make badly devised governmental machinery work well, rather than to create perfect machinery. Because our political parties cannot carry out the mandate of the people, the people view the parties with a variety of emotions, including those of skepticism and hostility. If the majority party cannot enact the public's program into law, the public is less likely to think in terms of program and issue. For more than a century, from the beginning for many voters, attention is focused on *personality* ("I vote for my friend"), *party name* ("I never have voted for a Democrat. My father said, Don't vote for a damn Democrat; they will get you into debt; they will get you into war"), *nationality* (the three top offices in New York City are held by men of Irish, Italian, and Jewish descent), *religion* (a sheriff said that in the rural towns where the German Catholics predominate, he got every vote but seven; but in the Protestant towns his opponent got the votes), and *personal service*[3] (Congressman ———— says that nine-tenths of his letter mail is from people that ask him to do something. "I try to do it").

THE VOTER HIMSELF

Who is the voter? He is the one who votes. For example, Mr. C. A. Hanan, former chairman of the Dane County (Wisconsin) board has just died in his ninety-second year. He had long been a civic leader, sometimes called a politician, and was a member of his local drainage district committee when he died. Furthermore, "he was proud of the fact that he never missed voting in an election."[4] He was a voter; a rare one, for most of them do not live so long or express themselves at the polls so regularly.

There is one qualification for voting that is not stated in the statutes, but exists nonetheless because of the nature of things. Grover Cleveland said that "before we have a citizen we must first have a man." I add that before we have a voter we must first have a man. A voter is a man that can do two things: he can earn his own living and he can govern himself.

There are millions of voters in the United States but there is no such thing as The Voter, a generalized voter. No two voters are alike, just as no two fingerprints are the same. As far as function and purpose are concerned, however, all fingers are the same (they can all pick up things). Similarly, all voters are the same voter.[4a]

[3] It is also true today that more and more people, when they mark their ballots in national elections, are thinking of the issue—the probable effect of the legislation upon themselves and upon the country. Tony's letter that follows on page 13 is pertinent. See Chapter IV, "Personal Attention," in J. T. Salter, *The Pattern of Politics*, New York, 1940.

[4] *Wisconsin State Journal*, October 12, 1951.

[4a] The voter, even as the rest of mankind, is not immune from flattery. He likes attention of a personal sort. A greeting, kind words, or a smile may count as well as logic in a discussion of the issue. Much depends on the traditions and climate of opinion in the constituency where the election is held. That flattery, though, is a staple in the art of politics is suggested by the stereotype of the word—politician—one who smiles. But the people wanted something besides a smile in 1948. Boswell's Dr. Johnson reminds us that kings as well as commoners like flattery. "It has always been formular to flatter kings and queens; so much so, that even in our church-service we have 'our most religious king,' used indiscriminately whoever is king. Nay, they even flatter themselves;—'we have been graciously pleased to grant.' No modern flattery, however, is so gross as that of the Augustan age, where the emperor was deified;—'*Praesens Divus habebitur Augus-*

THE VOTER'S ETHICS

What are the ethics of the voter—what is the state of one's own ethics? How can this question be answered? Statistics will not give the answer. It is a difficult matter to investigate satisfactorily. One hears about evil politicians; some are promptly thrown out like bad apples, but others continue for term after term. I have found, however, that when an individual is once convicted in a court of law, he is not elected again. (Curley of Boston is an exception.) Regarding other men in politics, men who are denounced in newspapers, in magazines, and over the radio, yet continue to be re-elected, I find that their supporters may be as honest as are their opponents. Their supporters are likely to think that they are doing the right thing. Maybe the political climate where they live is different. A man can vote as he will. And as Bryce once remarked, "A certain bias of mind is not incompatible with virtue." A voter's wisdom may be suspect, even though his ethics is not.

There are different ways, however, of approaching this ethical question. One is to observe what is happening on all sides all the time, or one can learn much by asking the voter himself, or the politician, the voter's alter ego, or just by observing them. I have attempted a combination of these methods.

For a lifetime I have read the papers of my university students on the guest politician who had just addressed our class. Two or three times each term I invite some well-known politician to speak to us about his life in politics. The students then write a brief paper of analysis and evaluation.

The great majority of students in Wisconsin, Pennsylvania, Oklahoma, or California that write these papers write about sincerity. I do not ask them to do so. I give them a list of more than fifteen probable personality traits that does not emphasize sincerity. It is the one, however, that is interesting to the student. Reading these papers makes me think that if the public man is sincere he has a vital element for success at the polls; at least, if he is not sincere he is not in favor, regardless of what other traits he possesses.

This quality, sincerity, is likely to be associated in the student's mind with such other qualities as hard work, down-to-earth manner of speaking, not too great smoothness of looks, humility, forthrightness, and a sort of old-shoe quality of friendliness. But the student calls it sincerity; or these other attributes are meaningless without it.

Some years ago the Hon. Sol Levitan spoke to my students. He had little or no schooling, he spoke English with difficulty, he had a foreign-Jewish look, he also had much native wit and ability, much personality and individual color, and he was honest. Each class of Wisconsin students loved this man. Ninety-nine students out of one hundred enthusiastically wrote that he had color and sincerity. The parents of these students must have thought the same thing about Mr. Levitan, for six times they elected him State Treasurer of Wisconsin.

This innocent student testimony throughout the years gives a clue to the ethics of the voter. For the student qua voter differs from his parents mainly in that his parents are older and more experienced. The elected politician that pleases the voters of Wisconsin, for example, usually pleases the students in the classroom.

POLITICIANS' VIEWS OF THE VOTER

What does the politician himself think of the voter's ethics? A politician must be something of a specialist if not an authority on this matter; for he would not be elected once or more times if he did not have some intuition about the voter more subtle than that held by the generality of people. I have asked some local politicians and some outstanding members of the House whom I know. I quote a few representative responses.

About fifteen years ago Dr. Harold Groves, a State Senator of Wisconsin who was my neighbor and a professor of economics, told me that honesty in politics was smart politics. The professor served in the Assembly and in the Senate and for a year was a member of the State Tax Commission. Recently I asked him what he thought of the voter's ethics today. He agreed with his earlier declaration and added that, like Churchill, he has yet to find a system of government that is not worse than democracy. One votes both his own interest and the public's interest. The simple virtues constitute good politics. A good character generally wins more than smart techniques.[5] Attlee is "terribly honest but he cannot make a speech."

The Hon. Sam Rayburn, Speaker of the House for more years than any predecessor, is a rewarding and refreshing man to talk to. I believe he has served with three thousand members of the House; only Adolph Sabath and Robert L. Doughton have served with more members. Mr. Rayburn gives me the idea that there is something glorious and noble about the profession of politics. He said in an unforgettable way that it was an honor to be elected to any public office. Now I find that Mr. Rayburn thinks that the average voter is a good juror and will usually come up with the right verdict when the facts are fully presented. Voters are not to be spoken down to. They have a high degree of native intelligence. They want the best arguments that can be made on both sides of the question. All this is conditioned by the fact that when the man in politics once gets the voter's full confidence, the man in politics must destroy that confidence himself—no one else can.[6] Is not this true of all the ethical relationships of life that are built on trust?

Voters—new style

From Philadelphia I received a letter from Tony Nicollo (fictitious name), who is a lifelong Republican ward politician and an honest man. Tony's division is in the river ward that was once the home of all the Vares—George, Ed, and Bill. It is an organization ward. I shall quote Tony's letter at some length because it gives an interpretation of the voter since Roosevelt. It seems that Tony does not like the new voter because he is trying to act like a voter and mark his own ballot. He writes:

> What is the Voter like?
>
> Without a doubt in my mind, the greatest question, since Hoover. This question has been bothering me for some time. I have thought about it over and over again. I have disgust this with friends and with political workers, with business men. Yes, it is the question that should be very important to all.
>
> I first would like to take you back, to the days to Bill Vare, when I first got my start the voter was a more grateful person, he was more satisfied with everything in general. He went about his work, or his business, he made a living, he was happy. He appreciated every little thing. A favor, some little remembrance or just your friendship . . . . Then came Roosevelt, well things began to change. People started to get the better things in life, cars, radio's, later two cars to a house, television, better

tus.'" James Boswell, *The Life of Samuel Johnson* (London, 1844), Vol. III, p. 277.

[5] One must be able to sense the feeling and opinion of the people and be able to communicate with them.

[6] Letter from Speaker Rayburn to the writer, August 18, 1951.

working conditions, more money. People started to live and try to keep up with the Jones's, then came the second world war, and boys started to go away to war. Many were just kids satisfied to just get along.

They went into the service and many became sergeants, and other officers, many became hero's, well when they came home you had a different boy to contend with. One little example. A family who were very friendly to me in the division, the parents respected me and I was a sort of a little tin God to them their children had to respect Mr. [Tony], or they would get their pants slapped. The boys all thought a lot of me, they came to me for everything, then two of them went away, they kept in touch with me by letters, and I in turn kept up with them. Then they came home, what a difference, one of the boys came to see me one day and after a lot of glad your back and so on, we sat down, and he began to tell me that he was now used to giving orders and he did not think he could let me have him do as before that he knew the score now and that he was going to do what he thought was right, well if ever I was set back, well here it was, the kid who I could almost make do anything for me now telling me where I stood, I took it in stride and it wasn't long that I learned that this sort of thing had effected a good number of other boys almost in the same boat. So you can see we are dealing with a different voter today, yes we can say because of the good time, the war and lets not forget, the average boy today is far more educated and a good deal more independent. So much so, that today, he doesn't know his own relations, does not chum with his neighbor, but plays it big, he goes out sees things goes places, parents have trouble, they won't even listen to them. They have their own set ideas. Telivision keeps people home, they see educating programs, listen to all the news going on and so is more up to date on everything I am amazed the way the people in my own division have changed. Over and over again, they tell me of the great improvements that have happened to them, their children and how they feel about conditions, where in years oh say about in the twenties, they never looked at all the stuff that they do today.[7]

Good in the long run

The Hon. James W. Wadsworth of Geneseo, New York was known in the House Office Building as the Congressmen's Congressman. When he spoke the other members were most likely to listen with attention and approval. He served twelve years in the Senate before he was elected to the House. He served there for eight years and retired at the beginning of the Eighty-second Congress.

Mr. Wadsworth characteristically remarked that he did not think he was competent to add much to my investigation, but then he continued:

> I am willing to state, however, that my experience in public life, commencing back in 1904 when I was first elected to the Legislature in New York and continuing down to the present day, persuades me that for a long-long pull the voter puts up a pretty good performance. True, upon occasion, large numbers of voters have been carried away in an atmosphere of hysteria. In many instances they have followed an hysterical or demogogic leader but I have noticed that they are very apt to recognize the error considerably in advance of some of the leaders they have been following and that eventually, having learned the lesson settled down to a calm and thoughtful consideration of the issues which confronted them. Such a performance indicates to me the correctness of the old adage—to wit: "Truth Must Prevail!" or words to that effect.
>
> Another thing I have noticed with respect to voters is that a lot of them are very apt to forgive a public office holder for doing things contrary to their wishes, providing they are convinced that the public office holder is absolutely honest in the stand he has taken. Indeed I think it may be said that a goodly portion of the voters are tolerant so long as the atmosphere in which they do their thinking is free from hysteria.
>
> These are general observations and I am convinced they are reasonably correct. But if the voter is persuaded that Government owes him a living and will make him secure from the cradle to the grave then he will surrender his control to an all-powerful Government and his reactions thereafter will not depend upon depth of conviction.[8]

[7] Letter to the writer, August 27, 1951.

PUBLIC EVALUATION OF VOTING PERFORMANCE

On the first day of the new term I asked my class in Political Parties and Citizenship how well the students thought the voter is doing his job. Nine out of ten students said that he was doing his job poorly. Five students thought that he was doing well, or fairly well; fifty-one thought he was doing poorly. One girl expressed the tenor of opinion in the class when she said that not enough people vote, and "on the whole I do not believe that the voter is well enough informed, nor makes much of an effort to become well informed."

The student's reaction to the voter's performance or to the politician and his works is likely to be the same as the public's; both are generally bad. This is strange in a country that loves democracy. William Hazlitt once remarked that "no reader of history can be a lover of kings." That is one reason why the people prefer to govern themselves. The people can do for themselves better than another can do for them. The people are the voters and the politicians. The people, though, criticize voters, politicians, and politics with gusto. They are criticizing themselves; they consciously or semiconsciously know it. And they know that Jesus said that none is perfect. By criticizing politicians and voters (by wearing a hair shirt as it were), democratic man, illogical as he may be, finds comfort.

[8] Letter to the writer, August 14, 1951.

VOTER PARTICIPATION

The voter is criticized because he does not vote or because he votes only half the time. Half of the qualified people vote in Presidential elections, and if there is an issue, as in 1928, 1932, 1936, 1940, or 1944, more than half of the electorate goes to the polls. The voting record varies greatly from state to state and from election to election within the same state.

What is the optimum percentage of voter participation? Truly not 100 per cent. For if 100 per cent of the people voted, we would probably be on the brink of revolution. There would certainly be a fever in the body politic. Everyone entitled to the privilege should be urged to mark his ballot on election day, but in a free society enjoying domestic tranquillity and stability it is not entirely surprising that half of the people or more stay away from the polls. They do this for various reasons. Some may be willing to see either candidate elected, or nominated. Others may be undecided as to how to vote. Or people may believe their vote to be futile under the circumstances. This is an unfortunate viewpoint in a land where other people believe that anything can be accomplished in politics that the people will set out to accomplish.

There is, however, a difference between politics and elections. Politics is life, and an election is one approach to that life. It may be the significant approach, but there is talk, and more talk; and there are letters and petitions and editorials and other approaches of the individual, ranging all the way from an effective public address to a bang on the head.

There is a pertinent cartoon in the *Saturday Evening Post* of December 8, 1951. An irate householder with his arm in a sling, his left eye blackened, and a bandage around his head is explaining to a friend who has just called: "All I can say is, for a guy who never bothers to vote, he certainly takes politics seriously." Any reader is likely to number among his acquaintances a person or two (or he may be such a person himself) who studies the issue and often talks about some political personality or question but may not vote, or may not vote in every election.

Only 13.6 per cent of the adult people in South Carolina voted in the 1948 Presidential election.[9] This is not the first time that South Carolina has had a smaller percentage of its adult population voting than has any other state. Does this mean that the people in the Palmetto State of John C. Calhoun are not interested in politics?

I quote Howard P. Cooper, the editor of the *Beaufort Gazette*. "I doubt," he writes, "if there is another state in the union that could claim to talk as much politics and vote as little politics as South Carolina. It is not because South Carolinians are not politically conscious. They are—very." [10]

An outstanding public servant in a country in the tropical Orient told me that her people did not have the right idea about politics. They do not see it as the organization of social goods for the people; they see it as a cockfight, a lot of treats, a friendly smile or word of recognition. All can agree that this is not a mature or helpful way in which to consider politics. The same can probably be said for the attitude of the people in South Carolina and in any other state where only a small fraction of the people vote.

LIMITATIONS OF POLITICS

If politics is the great servant of the people, the question may well be asked, Why, at so many points, is life still "short, nasty and brutish"?

The ways of government are mysterious, and ballots are not simple. Through politics, however, the people are refashioning their environment. This does not mean, though, that the citizen can vote poverty, disease, ignorance, and crime out of existence today. When, for example, has the individual had a chance to vote slums out and modern housing units in? Before some needs of the voter can be met, spadework must be carried on in the form of study, discussion, and organization.

Man is not logical; he is a frail reed, but as Pascal declared, he is the toughest reed in the world. To charge the voter with neglect for the evils that exist in our civilization is like holding the public school and the universities responsible for the crime in our society. The voters and the schools are responsible; we are all responsible; none is perfect.

The goal is improvement—more people voting and more attention to the issue and the roll call. If the citizen does not know his congressman, whose failure is that? If the legislator provides leadership in his constituency and instructs the people on the why of the issue, the people will know who he is and what he amounts to. The task of the politician includes the job of the teacher.[11]

[9] Voting statistics prepared by Library of Congress. Reported by Senator Humphrey in *Congressional Record*, 82d Cong., 1st sess. (June 25, 1951), pp. 7192–7194.

[10] Letter to Mr. George Black Rea, July 4, 1947.

[11] Lincoln, the politician, was a teacher; he has been buried for nearly a century, but he is still teaching the people. He once said that his opponent, Douglas, was a man with tens of thousands of *blind* followers. Lincoln added, "It's my business to make some of those blind followers *see*."

Voters may be debauched through the wrongful use of public money. Old-age pension plans may be socially useful, or they may be disastrous. The same may be said about the veterans bonus, farm parity prices, special tariff legislation, for any interest. The leadership of the eager group as well as the political leadership must show the members that in the long run any special interest group is most favored when its objectives are brought into harmony with the public interest.

If my definitions are less conclusive than I should wish, that is partly because in pondering the voter one is reminded of Bismarck's observation: "In politics the influence of imponderables is often greater than that of either military power or money." Yet, in spite of the merit of this valued insight, the voter is usually, when the facts are known, an understandable person. He wants to know whom his party is serving, and whether his party is meeting the urgent problems of the day.

POPULAR GOVERNMENT PREFERRED

The voter seems to have a nose for smelling out dictators—a natural bent for candidates that believe in government by the people as well as for the people. Authoritarian candidates, whether fascist or communist, are foreign to the voter's taste. He goes home when he marks his ballot; he votes on the principle of "blood of my blood and bone of my bone." He is more tolerant of an incompetent than he is of one who hates democracy. Abraham Lincoln is his greatest hero, and Abraham Lincoln is the best spokesman popular government ever had.

J. T. Salter, Ph.D., Madison, Wisconsin, is associate professor of political science at the University of Wisconsin. He has taught at the universities of Pennsylvania, Oklahoma, and the Philippines, Stanford and American universities, and Ursinus College. He has been editor of the Oklahoma Municipal Review, and has received two fellowships from the Social Science Research Council for the study of the political process in Philadelphia. He is author of Boss Rule (1935) and The Pattern of Politics (1940), and editor of The American Politician (1938) and Public Men (1946). He has been assistant editor of THE ANNALS *and edited its March 1923 issue on The Direct Primary.*

Political Parties and the Public Interest

By E. E. Schattschneider

SINCE politics deals with the attempts of people to live together peaceably and well, it is obvious that ethical questions are close to the essence of politics at all times. This is especially true of the management of the largest and most powerful political organizations produced in our civilization, the political parties. The fact that the future of the American people and perhaps the future of the greater part of the human race may depend on the work of these political organizations inevitably implicates our whole value system in most of the great controversies developed by the parties.

To say that the conduct of people engaged in party politics is to be judged by the moral standards commonly accepted by the community in nonpolitical matters is to make an assumption about politics, however. To speak of morals in connection with party politics is to assume that the parties are deliberate, purposeful, and responsible forms of social activity carried on by people who know what they want to achieve and are able to act accordingly; for there can be no ethical basis of politics if we suppose that political behavior is irrational and uncontrollable, or if we assume that parties are what they are because they must be. In this article we assume, therefore, that the parties are what we make them and that we are responsible for the parties we produce, because we can create any kind of party system we have the intelligence and the energy to create.

Questions of morals in politics can be defined very largely in terms of the public interest. If the party system serves the public interest broadly, it is reasonable to suppose that it can be defended on moral grounds. For this reason it is proper to discuss the relations between political parties and the public interest in this symposium. Party politics deals with conflict. Whether or not any conflict is good or evil depends on what it is about and how it is carried on. It is necessary therefore to see, first, what kinds of conflicts lend themselves to exploitation by the party system.

Conflict and Unity

All politics consists of attempts to organize and exploit the conflicts and agreements in our society for some purpose considered good or desirable by the manipulators of the system. Ideas about conflict and unity are inherent, for example, in all concepts of democracy, in all ideas about liberty, and in majority rule, all of which assume that there will always be differences of opinion and conflicts of interest in the community.

It is not always equally well understood, however, that every conflict necessarily implies unity within the antagonistic and conflicting groups, interests, minorities, and majorities. This is true because conflicts become possible only when each of the contending factions can mobilize and consolidate its own supporters. Without such unification no faction could function as an instrument of conflict, and no conflict could be developed beyond its most rudimentary forms as a disorganized and amorphous brawl. Therefore every cleavage or alignment necessarily unites people while it divides them, and the

unifying aspect of the process is as important as is the dividing aspect.

In a complex society the potential number of conflicts of interest and opinion is certainly very large; theoretically, it approaches infinity. At first glance, therefore, politics in a free and complex society seems to consist of an expanding universe of conflicts in which people divide and divide and divide endlessly. A little reflection, however, will satisfy most people that any political system that emphasized and exploited all conflicts and tensions would simply explode.

Conflicts Among Conflicts

It is necessary to understand something about the relations among conflicts to understand why a free system of politics in a democratic society is possible. The multiplication of conflicts in a free society is restricted by the fact that conflicts interfere with each other, because the lines of cleavage never or rarely coincide. In an extreme case, lines of cleavage may cross each other at right angles, and may tend therefore to neutralize each other completely or to subordinate one conflict to the other. If the conflicts in this case are of equal intensity, they will tend strongly to immobilize everyone. On the other hand, if they are of unequal intensity, the more intense will blot out the less intense conflict.

An extension of the logic of the foregoing argument leads to the conclusion that the conflict among conflicts is so great that an indefinite multiplication of conflicts is extremely unlikely even in a free political system. Not only do conflicts compete with each other, but the more intense conflicts suppress or subordinate or blot out the less intense.

The very fact that people must close ranks in order to engage effectively in any conflict compels them to subordinate a great multitude of inconsistent antagonisms, which are then neglected, disapproved of, explained away, and forgotten. The point of this discussion is that it is conflict itself that forces people to unite, that unity is a function of conflict, and that as a consequence the number of conflicts that can be developed in a free society at any one time is limited.

The history of American politics is full of examples of the conflict among conflicts. Thus sectionalism tends to suppress class conflict, and vice versa; international conflict tends to repress domestic conflict (though sometimes class conflict may become international in scope and may therefore interfere with nationalistic conflicts). American politics is today profoundly influenced by the way in which cleavages related to the social structure are tending to interfere with traditional sectional alignments, and by the tendency of foreign policy cleavages to be incompatible with domestic policy cleavages. The Solid South for a considerable period of American history was "solid" because all other conflicts were subordinated to the requirements of a sectional racial policy. Thus also there has been a tendency in American politics in recent decades to subordinate local issues to national issues.

The very fact that conflicts interfere with each other and that there is therefore a sort of hierarchy of dominant and subordinate conflicts in which one may be used to destroy another makes it possible to manipulate the political system.

Achieving Unity Within Factions

How is unity within the factions produced? It is chiefly the more or less spontaneous consequence of conflict. The greater the conflict, the greater the unity. It follows that unity is not produced primarily by a precarious negotiation among great numbers of conflicting

minorities and interests within the alignment. Primarily, it is the result of the consciousness of the overriding conflict and the realization by all who find themselves on one side or the other that they must stand together.

Once the conflict is well exploited, therefore, the members of the alignment discover for themselves with relatively little assistance why it is important that they work together. When this happens, there is a transvaluation of goals, internal conflicts are deflated, there is a shift of emphasis from what once seemed important to what now seems important, people who were once hostile discover new virtues and attractions in each other, and old causes of conflict are forgotten. In these circumstances people merely rediscover the truth of the Oriental proverb that the enemies of their enemies are their friends.

This process can be accelerated by political leaders who invent generalizations and rationalizations useful for this purpose and promote better relations and a more co-operative attitude by a number of familiar processes; but principally people unite for common action because once the line is drawn and conflict is in the air, people want allies with whom they can combine against a common antagonist. Cohesion is part of the process of conflict, and it is as strong and as vigorous as is the conflict itself.

The upshot of this process is that the greater part of the total tension in the community, like an iceberg, is submerged. As long as this tension remains at a subpolitical level, it cannot be exploited.

Leadership and Democracy Use Conflicts

Moreover, the only interests and alignments that count in politics are those that are *actually exploited.* It follows that we always have some kind of choice among the bases of conflict (considering conflict and agreement as instruments of power). This is an application of the formula of "divide and rule" not exactly in the original sense of the phrase. Politics is not simply a process of divide and divide and divide; neither is it a question of getting everyone to agree about everything to produce a new kind of concurrent mapority. Leadership and power in a democratic society imply a willingness to draw a dividing line and to exploit the division so underlined in order to create a majority with the power and will to govern. At the same time, the greatest of all democratic rights is the right to "take sides" in the controversies so produced.

The kinds of cleavages we are likely to prefer and therefore to exploit are closely related to what we want to accomplish. Whoever is able to make prevail his concept of how the nation should be divided for political purposes is likely also to run the country. For this reason, people who have discovered that one kind of alignment works well for them are likely to be alarmed at any attempt to shift the basis of conflict. As long as any given cleavage can be perpetuated, the majority produced by that cleavage will be kept in power. Conversely, a new majority can be produced only by drawing a new dividing line which brings about a new set of alignments.

Every conceivable kind of division can be made to serve some purpose. Thus, the Marxian class struggle is a concept of conflict designed to produce a revolution. Theories of interests such as "government by pressure groups," which now have a certain vogue in the United States, are designed to implement the power of the business community, the segment of society most intensively organized in pressure groups and most strategically based for this kind of politics. Sectional alignments serve certain interests extremely well while they frustrate others; alignments based on the social structure are likely to produce a social policy that could not be sustained in any other kind of alignment.

Diagnosis of Alignments

Since the conflict of conflicts forces us to choose among a variety of bases of division and unity as a means to power, what criteria can we apply to the competing claims of the proponents of the various and incompatible alignments that are offered to us for support?

In the first place, *all* divisions are dangerous to some extent. Certainly all concepts of conflict become dangerous if they are pushed too far. It is worth remembering that the form of alignment which produced the greatest of all political disasters in American history (the Civil War) was sectionalism, which is now sometimes admired as a "safe" basis of politics. The overemphasis on the development of special interest pressure groups in American politics has produced a political base for inflation and war that may yet involve the country in a great catastrophe.

On the other hand, alignments that were satisfactory at a time when local questions seemed most urgent are not likely to satisfy the demands now made on the political system. Moreover, all cleavages look bad to the people who find themselves excluded from power by them. In the last analysis, the kind of cleavage we prefer is likely to be determined by what we think is most important.

Two Kinds of Politics

For the purpose of distinguishing between cleavages that are likely to seem desirable or undesirable, it is possible to differentiate roughly two different kinds of politics.

There is, first, the kind of politics that is likely to develop when no one is greatly concerned about the future of the community. When the stability and permanence of the community are assumed with sufficient confidence, it is possible for individuals and factions within the community to pursue their special ends as if the larger questions did not exist.

This was the nature of American politics for two generations before the beginning of World War I. Even as recently as the middle 1920's, politics seemed to be very much like some extremely individualistic system of economics in which the stability of the system was assumed and each individual pursued his own private aims with no other thought than his own private gain. The parallelism between the economic theories and the political theories of that period is remarkable.

The political theories of Arthur Holcombe, an ex-economist, illustrate this kind of thinking. He treats politics essentially as a private matter based almost altogether on private and special interests acting very much as they act in the economic system. The political process therefore becomes a kind of capillary activity in which very many independent private decisions at widely scattered times and places may produce a statistical tendency but in which nothing like a conscious national decision is ever reached.

Although Professor Holcombe sometimes refers to the public interest, he has no clear and comprehensive concept of the subject. Throughout his writings, he shows that he does not distinguish sharply between the functions of the political system and those of the economic system; nor does he see that the alternatives and choices in the economic system develop differently from the way in which they develop in the political system. The theory and analy-

sis developed by Professor Holcombe are more appropriate, therefore, to the Coolidge era than they are to American politics in the 1950's.

On the other hand, instability or revolutionary change, war, and international tensions and crises tend to produce the politics of survival, in which private and special interest conflicts are strongly subordinated to a dominant concern for the preservation of the great common interests of the nation. These interests may have seemed remote or unreal when the stability of the community was taken for granted, but there is no doubt about their overwhelming force when the time comes to balance the lesser against the greater interests.

The difference between the two varieties of politics described in the foregoing discussion (roughly the shift of emphasis and the change of feeling and point of view Americans have experienced in the twenty-eight years since the election of Calvin Coolidge) is sufficient to invalidate a host of political generalizations made a generation ago. Contemporary politics cannot be understood in terms of private and special interests exclusively. The situation calls for a clear concept of the public interest.

PUBLIC AND PRIVATE INTERESTS

The public interest may be described as the aggregate of common interests, including the common interest in seeing that there is fair play among private interests. The public interest is not the mere sum of the special interests, and it is certainly not the sum of the *organized* special interests. Nor is it an automatic consequence of the struggle of the special interests (a struggle in which everyone demands too much and feels entitled to it).

It is a serious misconception to regard the special interests as selfish and the public interest as unselfish. This is not the distinction. Each of the members of the crew of a ship at sea in a storm may have an individual selfish interest in survival, but only a very stupid person can fail to see that all will perish or survive together.

To understand the relations between the public and special interests it is necessary only to remember that if the community is threatened, all special and private interests are equally jeopardized. All property, all privileges, all security, all tenures, all expectations, all commitments, priorities, and values, become extinct if the society which established them is destroyed. Every crisis in the life of the community illuminates the social nature of all private and special interests.

As a political matter there is no doubt about the overwhelming power of the public interest once circumstances make it possible to draw the line and once the issue has been defined. No special interest could demand of people the sacrifice of money involved in modern taxation or the incomparable sacrifice implied in military service. The war mobilization now going on is not accounted for in terms of the pressures of special interests. As far as business is concerned, the defense mobilization of the economy produces a tremendous dislocation in which industry loses the initiative in the economy and is no longer master of its own house.

As far as the general public is concerned, it is impossible to imagine any combination of special interests able to provide a political base for compulsory military service. For that matter, what combination of special interests exerted sufficient pressure on the government to bring about the adoption of the Marshall plan? In view of the extreme weakness of consumer organizations, is there any adequate explanation of price controls in terms of *pressures?*

The truth is that the pressure concept simply does not explain what is now going on in American government.

POWER OF PUBLIC INTEREST

Indeed, Lasswell's famous definition of politics as who gets what, when, and how has very little relation to the realities of 1951. The function of politics is now very largely to explain to people why they must make greater and greater sacrifices. Austerity is not so harsh in the United States as it is in England, but only a very obtuse person would suppose that he could now promise the American people less harsh taxation or less drastic military service or relief from priorities and allocations and price controls and a less burdensome prospect of very heavy public expenditures, and be taken seriously. The truth is that it is politically possible to make great demands on people because the public interest is extremely powerful.

One consequence of this situation is that the men and the parties responsible for the making of policy decisions are forced to resist the demands of special interests because they know that unwise decisions, however great the pressure may be at the moment, will involve them in disaster a few months hence. It was never less true than it is now that public policy may be permitted to be the mere resultant of the pressures of the special interests.

The nature of modern public policy (economic stabilization, control of inflation, war mobilization of the economy, the integration of defense and foreign policy) creates a new kind of politics. The *dominant anxieties* in the community are neither local nor special. Whether we like it or not, we share these anxieties with most of our fellow citizens because the ultimate question involved in them is the future of the community and all that that implies. The scramble of private and special interests for concessions and advantages at a time when the whole community is involved in a struggle to continue its existence as a community is reminiscent of what Abraham Lincoln once said about people who try to rent rooms in burning houses.

CONFLICTS ABOUT PUBLIC INTEREST

The distinguishing characteristic of modern politics is that it is based on conflicts about the public interest rather than on conflicts among special interests. It is the principal function of politics to defend the public interest. The fact that both sides are concerned with the public interest conditions the conflicts tremendously, but it does not produce unanimity. Conflicts about public policy are real because there are real differences of opinion about what the best public interest in any given situation may be, but there is likely to be a broad base of agreement about the ultimate objectives of public policy among all who participate in this kind of politics. Therefore, controversies about the public interest are the least dangerous kind of conflict.

The circumstances of contemporary public affairs give controversies about conflicting interpretations of the public interest a dominant place in politics. As long as politics was a private matter dealing primarily with special interests, the tendency was to divide people into relatively small groups. On the other hand, the cleavages produced by differing interpretations of the general interest necessarily divide people broadly, because the alternatives are so defined as to appeal to the widest possible public support. That is, people who are defending their own concepts of the public interest are bound to believe that everyone ought to think as they do, and they are likely to address their appeals to the whole nation. The more successfully controversies about the public in-

terest are exploited, and the greater the ascendancy of these conflicts, the greater is the subordination of a great multitude of lesser conflicts.

General Policies Necessary

The dominance of conflicts of opinion about the public interest is made greater by another circumstance. Modern public policy involves general measures and general control of the government at its highest levels. There is no *local* defense against inflation, and no special interest can find a special remedy for instability in the economy, just as no locality or interest can hope to survive untouched if the community as a whole is destroyed. General control of the government and its operations implies several things, however.

First, it means that public affairs must be discussed in terms of public policies. This is necessary because the operations of the government are so large that they can be understood only in terms of general policies; this is true of people in the government and outside of it. The process of generalization, the simplification of alternatives, the establishment of general rules and classifications within the system, are therefore essential instruments of democratic government under modern conditions.

It does not seem likely that the country can survive if it does not develop a capacity to take charge of its own affairs. At one time it was possible to let the course of public affairs be determined by an accumulation of detailed and relatively minute decisions made at widely scattered times and places by individuals who treated each decision as substantially a private matter. Speculation about the future of American politics now is based on the realization that capillary political processes are not adequate to deal with the situations in which we find ourselves today. It is necessary for the community to take conscious control of its affairs by making deliberate high-level decisions.

Importance of Majorities

Another consequence of the situation described here is that majorities (as a part of the process of making decisions about matters of public concern) assume a much greater importance than they did under the older system. The only satisfactory political base for general policies concerning the public interest is a majority. As long as politics was treated as a private matter, it was possible to conceive of the political process in the framework of concurrent majorities (in modern terms this means government by the unanimous consent of all special interests). But once it becomes necessary to make any great decisions, the community is forced to use the oldest and best-understood device for making decisions—*the majority*. The numerical majority has a role to play in modern government because we can no longer wait for the vegetative processes of an infinitely disintegrated system to solve our problems.

It follows that it is the function of political leaders to seek decisions on the greatest issues of public policy in terms that produce the majorities which alone can give any body of political leaders general control of the government and provide a stable base for public policy. The state of public affairs calls for the development of general alternatives by which the principle of majority rule can be exploited. At a time in which the nation needs to give direction to its affairs, a period in which public business must be discussed in terms of general policies, at a time when the greatest decisions must be made and broad policies require stable support, the failure to produce a numerical majority and the failure to use the principle of majority rule may be fatal to the survival of the whole regime.

Majoritarian Politics and Public and Private Interests

There is some danger that the whole concept of the majority may be destroyed by political theorists who think of politics exclusively in terms of private and special interests. These theorists describe a majority as a mere aggregate of special interest groups. From this they conclude either that the majority is oppressive and dangerous or that the majority is necessarily so divided as to be ineffective. The difficulty is that these theorists have no concept of the public interest. A majority is conceivable only terms of controversies and differences of opinion about the public interest because as a practical matter it is impossible to combine enough special interests to form any numerical majority.[1]

Why is it impossible to create a majority by forming a combination of special interest groups? First, because the special interest groups are usually very small and the accumulation of a majority by a process of trading with these groups one at a time would involve political leaders in an impossible task. This is doubly true because it is rarely possible to win the whole of any group by this process. Moreover, if the groups can be appealed to only on the grounds of their special interests, the complexities and conflicts within any possible majority become so great that it is inconceivable that the majority could ever take any decisive position on any question. It is not surprising, therefore, that Professor Holcombe, who thinks almost exclusively in terms of special interest groups is led to write about the natural limits on the power of majorities.

Second, the *organized* special interests probably amount to substantially less than a majority of the people in the country, even if all of them could be brought into one combination.

There is no historical basis for the notion that anyone ever has produced a majority merely by forming a combination of special interests. Majorities are produced by general controversies about the public interest. It is not surprising that political theorists who have no theory of the public interest should end by denying the validity and usefulness of the whole idea of the majority.

Public Interest and the Party System

As long as majoritarian politics is pursued in terms of controversies over the public interest, it may be carried on with great vigor without endangering the stability of the regime, because the public interest is best defended when competition for power is conducted on these terms. If the purpose is to exploit as fully and as effectively as possible the potentialities of general divisions about public interests, it follows that the form of political organization best adapted to this use is the political party. The parties are the only political organization established on a scale sufficiently extensive to mobilize a country-wide majority. However inadequate the traditional party structure may have been for these purposes, it is obvious that no other form of political organization can begin to compete successfully with it in a general conflict about broad policies for the control of the government at its highest levels. Therefore,

[1] Professor A. N. Holcombe's *Our More Perfect Union* (Cambridge, Mass.: Harvard University Press, 1950) is the best single statement of the political theories here criticized. I am indebted to Stephen K. Bailey for calling to my attention G. D. H. Cole's illuminating introduction to Rousseau's *Social Contract*, Everyman's Library Edition, in which he discusses this point.

it is not unreasonable to suppose that the party system is likely to feel increasingly the impact of the modern development of public policy.

A political party is merely an arrangement in which a large number of people co-operate for the accomplishment of certain common purposes which they could not achieve acting alone or in smaller groups. As such, the parties are simply what we make of them. The party system is shaped, therefore, by the answer we make to the question, What at any given period in our history is politics about?

Whatever the functions of the party system may have been a generation ago, it seems likely that the future development of the system will reflect the dominance of general conflicts of opinion about the public interest resulting from the new world situation of the United States.

It is unreasonable to expect the parties to be moral for us or to expect the system to produce a high moral order by some automatic process. All that we have a right to expect of any political system is that it will give us a reasonable opportunity to do something effective to protect the great public interests of the community. About all that can be said for the parties is that they are the kind of political organization best adapted for these purposes, or are more adaptable to these purposes than any other political organization now available to us.

Elmer E. Schattschneider, Ph.D., Middletown, Connecticut, is professor of government at Wesleyan University, and director of the Long Lane School for Girls and of the Rockfall Corporation. He is author of Politics, Pressures, and the Tariff (1935), Party Government (1942), and The Struggle for Party Government (1948).

International Ideals and the National Interest

By FREDERICK L. SCHUMAN

IF all men were saints and all women angels, the Marxist ideal of the "withering away of the state" could doubtless be readily realized. All government is a reflection of sin, at least in its coercive and enforcement functions. Conscience keeps most mortals virtuous and assures conformity to the mores. But the weaker vessels among us are ever tempted to transgress and must be deterred from ways of vice through fear of force and prospect of punishment—and, if vicious, kept confined—by the organized power of the community. Ethics, as translated into law, are thus buttressed by policeman, jury, judge, and jailer to the end that all decent citizens may go about their business in peace, free of the evils of anarchy and lawlessness.

These truisms are universally accepted in all ordered societies and are peculiarly sacred in the Anglo-American tradition. They admit of application to the problem of "morality" and of "law and order" in the society of nations. The problem itself, however, is the product of a paradox. Moreover, the customary application of the generalizations or "principles" already referred to is the fruit of an analogy which is ancient, revered, and all but unanimously embraced by the present generation, but nevertheless so false (it will here be argued) as to be misleading and dangerous in the highest degree. The paradox has never been more striking, nor has the analogy ever been more fanciful and hazardous, than in our own time. Both are deserving of the closest scrutiny on the part of all who strive for straight thinking about the confusing interrelationships of ethics and power in the tangled fabric of motives and acts comprising the community of states.

PRIVATE AND PUBLIC INTERESTS

An initial instance of sin in international conduct may be briefly disposed of at the outset—not because it is rare but because it is usually self-evident and always tangential to our central problem. Few would dispute the proposition that when public power is used to serve the selfish interests of some section of society rather than the safety and welfare of society as a whole, the result is at once bad morals and bad politics. Charles A. Beard, in his still notable study of *The Idea of National Interest* (1934), suggested that the American "national interest" has often been identified with, or defined in terms of, the aspirations or demands of particular sections, classes, or aggregations of private wealth or enterprise. An extreme case is represented by Major General Smedley D. Butler's bitter comment in *Common Sense,* November 1935:

> I spent thirty-three years and four months in active service as a member of our country's most agile military force—the Marine Corps. I served in all commissioned ranks from second lieutenant to major general. And during that period I spent most of my time being a high-class muscle man for Big Business, for Wall Street, and for the bankers. In short, I was a racketeer for capitalism. . . . Thus, I helped make Mexico and especially Tampico safe for American oil interests in 1914. I helped make Haiti and Cuba a decent place for the National City Bank to collect revenues in. . . . I helped purify Nicaragua for the international banking house of Brown Brothers in 1909–1912. I

brought light to the Dominican Republic for American sugar interests in 1916. I helped make Honduras "right" for American fruit companies in 1903. In China in 1927 I helped see to it that Standard Oil went its way unmolested.

To the degree to which this harsh judgment is warranted by the facts (a matter with respect to which no opinion need here be ventured), the pattern of policy thus described would be deemed by all to be a flagrant example of abuse of power, and of the corruption of the national interest by private profit seekers. The Mexican and Spanish-American wars have often been characterized in these terms by commentators of the more cynical sort. The memory of "dollar diplomacy" is still fresh. If it could be demonstrated (as is not the case, despite the weighty work of the Nye Committee in the mid-1930's) that American intervention in World War I was dictated less by the national welfare than by the influence of banking houses and munition makers, greedy for blood money, the moral sense of all good citizens would obviously be outraged by the fact.

The same sentiment is sought to be evoked in efforts by the Communist press and by *The Chicago Tribune* to denigrate the Marshall plan by reference to the profits of Will Clayton's cotton company and of various Manhattan banks, and to discredit the American rearmament program by reference to the allotment of defense orders to General Motors, General Electric, Ford, and other giant corporations.

Authentic instances of the corruption of diplomats and strategists, within or without the law, by private business interests come readily enough to hand in almost all countries. They need not here be reviewed, for they do not differ, save in their locus, from other cases of skulduggery on other levels of government discussed elsewhere in these pages. In our epoch the use of private business interests, with suitable profit to those used, to serve the purposes of diplomacy and strategy is a more common pattern. But this relationship is almost never regarded as unethical or "corrupt"—apparently because the use of business by government to serve allegedly public purposes is morally distinguishable from the use of government by business to serve obviously private purposes. Yet neither of these relationships, however worthy of careful analysis, cuts to the core of the dilemma of right versus might in the international community.

ETHICS AND RAISONS D'ÉTAT

The problem of international ethics lies in a different dimension. In all politics those who acquire power, wield it, and seek to retain it, have from time immemorial been judged to occupy a position with respect to moral standards which is not quite the same as that of ordinary citizens or private entrepreneurs. Some have demanded from statesmen, as from clergymen, a higher level of integrity and probity than it is reasonable to expect from laymen. Others, and these more numerous, have perceived that the statesman, precisely because he is responsible to his state—and to his dynasty, party, cabinet, parliament, or some other incarnation of the commonwealth—must base his decisions not merely on the superiority of virtue to vice, but on a shrewd calculation of the probable political consequences of his acts.

Politics seldom offers choices between good and evil, but only between greater evils and lesser evils. No one willingly admits that the end justifies the means. But when the end is envisaged as the security and well-being of all the members of the community, the means appropriate thereto offer a wider ethical latitude than is generally regarded as acceptable in the service of private purposes. Raisons d'état are often invoked

to excuse crimes and to transmute sin into virtue. "If we did for ourselves what we do for our country," Count Cavour once remarked, "what rascals we should all be!"

This relative flexibility of moral norms, allowed to all politicians, is most marked in matters having to do with foreign relations. This is the case precisely because the society of sovereign states is not a united community or an ordered and organized polity possessed of a government capable of enforcing a code of law. International organization does not have these attributes, nor is international law anything more than a set of rules which sovereigns habitually observe out of calculations of convenience and expediency. The society of sovereignties, lacking effective government and enforceable law, is a society in anarchy, wherein, as Hobbes put it, life tends to be "poor, solitary, nasty, brutish, and short," and wherein force, rather than fraud or favors, is the ultimate determinant of the distribution of influence, indulgences, and deprivations.

It is therefore the obligation of every statesman to pursue power rather than virtue. Under anarchy the virtuous who lack power succumb, while the powerful who lack virtue often survive. For states no less than for individuals, survival is the first law of life. The resultant paradox is well stated in the words which W. Somerset Maugham, in his charming novel *Then and Now*,[1] puts into the mouth of Niccolò Machiavelli:

> In this world it is only necessary to seize power and hold it and the means you have used will be judged honorable and will be praised by all. If Cesare Borgia is regarded as a scoundrel it is only because he didn't succeed. . . . In this world of sin and sorrow if virtue triumphs over vice, it is not because it is virtuous, but because it has better and bigger guns; if honesty prevails over double-dealing, it is not because it is honest, but because it has a stronger army more ably led; and if good overcomes evil, it is not because it is good, but because it has a well-lined purse. It is well to have right on our side, but it is madness to forget that unless we have might as well it will avail us nothing. We must believe that God loves men of good will, but there is no evidence to show that He will save fools from the result of their folly.

[1] Garden City, N. Y.: Doubleday & Co., 1946.

THE FALSE ANALOGUE

All politics is "power politics" in a community lacking a common government able to enforce order and law. Since power politics makes might rather than right the test of success and survival, its devices often involve deceit and violence. Its imperatives appear morally outrageous to those—for example, most Americans during most of our history—who assume that sovereign states ought to be guided by the same ethical precepts binding upon nonsovereign individuals in societies ruled by governments.

The customary remedy proposed for this sad condition of affairs is based on an equation of the society of sovereignties with a society of individuals. Six centuries ago Pierre Dubois elaborated an approach to the problem which has been followed ever since and is even more popular in the twentieth century than in the fourteenth. He proposed a Council of Europe and a court, whereby peace would be preserved through the excommunication and military coercion of any lawbreaking and peacebreaking sovereignty by the combined body of all law-abiding and peace-loving sovereignties. This conception was reiterated, with only minor variations, by George of Poděbrad, Émeric Crucé, the Duc de Sully, William Penn, the Abbé Saint-Pierre, Jean Jacques Rousseau, Immanuel Kant, Jeremy Bentham, Count Metternich, William Ladd, Woodrow Wilson, Maxim Litvinoff, Franklin D.

Roosevelt, Harry S. Truman, and innumerable others.

If the test of truth is the capacity of an idea to fascinate the minds of men and to secure the approbation of the most respected philosophers and statesmen of Christendom, then the notion that peace and morality among nations are best served by the formula here suggested is indubitably "true." But if the criteria of validity are derived from the pragmatic consequences of hypotheses in action, then this conception is, unhappily, nonsensical if not altogether irrational.

In every system of sovereignties, states act to protect and promote their interests—not to defend or vindicate ethical ideals. When the two conflict, the former invariably prevail over the latter, save where statesmen assume the role of Don Quixote to the embarrassment or ruination of their states. The distribution of power, moreover, among the seventy-odd sovereignties of our state system bears no resemblance to the distribution of power among individuals in a civil society. The so-called "community of states," acting collectively, can conceivably enforce "law" and "morality" on such sovereignties as Monaco, Denmark, El Salvador, or Luxembourg—though the problem never arises, for obvious reasons. But no aggregation of the "virtuous" against the "wicked" can coerce such sovereignties as America, Russia, China, or India without a world war resulting. Sovereignties, furthermore, are not permanently divisible into categories of "peace-loving" and "aggressive," since incentives, necessities, and opportunities for aggrandizement or defense are constantly changing.

Effects of international policing

It may finally be noticed here that the "burglar-policeman" or "cops-and-robbers" conception of international relations is operationally unworkable because the risks and costs are as great to those who undertake the "police action" as to the "criminals." In Walter Lippmann's words (January 15, 1951), this conception

> proposes to achieve peace through law by calling upon great masses of innocent people to stand ready to exterminate great masses of innocent people. No world order can be founded upon such a principle; it cannot command the support of civilized men, least of all democratic men, who respect the individual and consider it the very essence of justice to distinguish between the guilty and the innocent, the responsible and the irresponsible.

Despite these considerations, which have only to be stated to become self-evident, most civilized men have in fact embraced, often with passionate conviction, the idea that morality among nations can best be promoted by envisaging the society of sovereignties as a community of individuals and by organizing the "good" to "enforce law"—that is, to wage war—on the "bad." The actual nature of international society is suggested, albeit unwittingly, by Lawrence Frank, as quoted by Hubert H. Wilson in *The Nation* of November 24, 1951 ("Cynics and Feeble Good Men"): "So long as our society has no clear aims or purposes but to grant individuals opportunity for self-aggrandizement, there is no reasonable basis for deprecating racketeering." In the face of the facts, so perceptive and sensitive an observer and so able a political scientist as Senator Estes Kefauver can yet write:

> As the leading nation in the world today, it is not enough for us to control the domestic criminal at home; we must lead in controlling the international gangster abroad in the world. . . . There is a parallel between the code of the domestic criminal and the social philosophy of the totalitarian state. Both are predatory. Both have the same insolent disregard for man's freedom.[2]

DESIGN FOR MURDER

The contemporary confusion in the minds of men over problems of right and might in international relations has sources so various and complex that it seems unlikely to be resolved in what time remains to Western mankind to avoid another and final orgy of mutual murder and suicide. Its roots are enmeshed in the fallacious analogy already noted. Its branches are entangled in three wholly different sets of motivations which have become hopelessly ensnarled one with another.

The first is the familiar principle of the balance of power according to which every state, if it is to survive as a sovereignty, must join forces with others by diplomacy and by arms to prevent any other state from attaining such a preponderance as to jeopardize the independence of all the rest. This principle, plainly, has nothing whatever to do with morality but has to do exclusively with calculations of power.

The second is the moral injunction to resist evil, to fight evil, and to suppress evil—an imperative which, in its pure form, denies all calculations of power as "dishonorable" and directs its disciples exclusively to the vindication of ethical precepts. (We must leave to the chroniclers of the intellectual and spiritual history of Christendom the problem of why Western mankind has ever been so addicted to ferocious inquisitions and armed crusades against sin in the name of Him who urged His followers to forgive their enemies, turn the other cheek, and resist not evil.)

The third is the delusion of "collective security," according to which, contrary to all reason and experience, all sovereignties are to be made "moral" by solemn covenants of self-abnegation and by arrangements whereby all sovereignties will jointly punish each sovereignty that breaks the peace.

The first of these guides to action is, or ought to be, elementary wisdom for all statesmen. The second is a madman's formula for what Charles A. Beard once called "perpetual war for perpetual peace"—since the wicked, like the poor, are with us always, and all efforts at their forcible reform or extermination can have no result other than wholesale slaughter and devastation. The third is a hallucination (as demonstrated anew in Korea), with its actual as distinct from its anticipated results comparable to the second imperative. The mingling of all three into a murky mélange of public attitudes and policies is productive of consequences which can be regarded as conducive to the vindication of moral values or to the promotion of national interest only by those wholly hypnotized by their own semantic devices of self-deception.

In our century Woodrow Wilson was the most eloquent moralist in politics to give voice to the theses that "any war anywhere is everybody's business" and that peace was to be had by agreement of all states to wage war on any state taking the sword. The tragic futility of this endeavor in the 1930's has not prevented most Americans from embracing it with redoubled fervor in the 1950's. Thus the American Association for the United Nations asserted in April 1951 that

> the principle of collective security is as sound today as when the United Nations took action to repel the aggression against the Republic of Korea on June 25. The nations must profit by experience. The experience in Korea clearly demonstrates the necessity for improvement in collective security action.

[2] *Freedom and Union*, October 1951.

Thus Secretary Acheson reported to the Senate Committees on Armed Services and Foreign Relations, June 1, 1951:

> The operation in Korea has been a success. . . . It has been charged that the American and Allied forces fighting in Korea are engaged in a pointless and inconclusive struggle. Nothing could be farther from the fact. . . . [Yet] no one can predict when the fighting will stop and when the aggression will end.

And thus Warren Austin, speaking at Georgetown University, June 11, 1951:

> I end where I began: with the apparently paradoxical thought that the way to peace may sometimes lie through bloody battlefields. . . . The forces of the United Nations are fighting for a principle beyond mere rational advantage: the principle of world order. . . .

WAR FOR PEACE

The degree to which modern mankind, in its ambivalent pursuit of morality, security, and power within the context of a system of rival sovereignties, has entrapped itself in an apparently insoluble dilemma is amply demonstrated, for all with eyes to see, in the frustrations of American foreign policy in the twentieth century. World War I, fought as "a war to end war" and "to make the world safe for democracy," delivered Russia and then Italy, Germany, Japan, and Spain to totalitarian dictatorships and paved the way for a far more disastrous conflict. World War II, fought in the name of the "Four Freedoms" and enduring peace, eventuated in the extension of new tyrannies over much of Europe and Asia and in frenzied preparations five years after "victory" for another and greater war in the name of peace. In both cases, the aspirants to global hegemony were smashed, but all other fruits of victory were lost in the sequel.

In making ready for the next round, the rulers of the Scarlet Empire have relentlessly waged war in the name of peace, while American spokesmen have repeatedly championed peace to be achieved by war—as when Secretary of the Navy Matthews in August 1950 urged Americans to launch a "preventive war" and thus become "an aggressor for peace," and Senator Patrick McCarran a year later opined that "the United States should make it clear to all the world by everything we say and do, that our objective is the overthrow of the Soviet dictatorship by all means at our disposal."

Under these circumstances, principles of ethics in international relations have no operational function save as devices to rationalize the quest for aggrandizement (or for the diminution or destruction of the dangerous power of others) and thus to persuade the gullible that the dictates of *Realpolitik* are equivalent to the injunctions of morality. Georg Schwarzenberger, in the monumental second edition of his *Power Politics*,[8] observes:

> The primary task of international morality, as actually applied between states, is to reinforce state policy. If states are in search of territorial expansion, they do not normally justify their demands on grounds of the economic or strategic assets they wish to acquire. They refer to the need for "natural" frontiers or to a "natural" right of access to the sea. Allies, who band themselves together against a third power, do so in the interest of peace and security, if not of mankind at large. . . . Gestures of this kind are addressed primarily to public opinion at home and abroad. . . . As compared with an appeal to public opinion on legal grounds, a case based on principles of international morality has a special appeal. . . . The ideological use of international morality reaches its highest pitch when public opinion has to be prepared for war or to be sustained in a prolonged struggle. Then every conflict between the powers is elevated into a struggle for the highest moral principles which each side has equally at heart—until the stage of peacemaking is reached. Thus, within a system of power politics, the chief function of international morality does not consist in controlling one's own behavior, but in the use of morality as a powerful weapon against potential or actual enemies (pp. 225–27).

[8] New York: Frederick A. Praeger, 1951.

DANGERS IN EQUATING ETHICAL IDEALS WITH NATIONAL INTEREST

Sober reflection on human fortunes suggests an addenda to this contention. Efforts to equate "national interests" with ethical ideals as a means of eliciting public support sometimes eventuate in equation of the "ethical ideals" with national interests in the minds and acts of policy makers. When this transposition fosters prudence, moderation, and forbearance in foreign policy, its results may be happy rather than disastrous.

But more commonly the consequence of this confusion is a firm resolve to fight sin, by force if need be, in order that virtue may be vindicated—in a spirit of rashness, self-righteousness, and fanatical intolerance. The customary result is exemplified in "Holy Wars," the so-called "Wars of Religion," and the increasingly frenzied ideological "crusades" of our own times—for "democracy" or "Greater East Asia" or "liberty" or "Aryan race purity" or "the dictatorship of the proletariat" or "freedom" or "anti-imperialism" or some other abstraction having no practical relevance to the concrete interests of nations or the actual lives of men, but capable of stirring them to mighty exertions in mutual butchery.

The point, though obvious, is forever ignored or hotly resented by those who mistake symbols for realities. Yet it need not here be labored. All of us live in a world wholly dedicated to this pathetic misconception of the relationship between the ends and means of ethics and politics. In his essay on "War," William Graham Sumner in 1903 said all that needs to be said on this score. He was writing of the Monroe Doctrine. The process he describes is equally applicable to the Truman Doctrine, the Molotov doctrine, or any other doctrine whatever, once it becomes a guide to foreign policy.

> If you want war, nourish a doctrine. Doctrines are the most frightful tyrants to which men ever are subject, because doctrines get inside of a man's own reason and betray him against himself. Civilized men have done their fiercest fighting for doctrines. . . . What are they all? Nothing but rhetoric and phantasms. Doctrines are always vague; it would ruin a doctrine to define it, because then it could be analyzed, tested, criticized, and verified; but nothing ought to be tolerated which cannot be so tested. . . . A policy in a state we can understand. . . . A doctrine is an abstract principle; it is necessarily absolute in its scope and abstruse in its terms; it is a metaphysical assertion. It is never true, because it is absolute, and the affairs of men are all conditioned and relative. . . . Any politician or editor can, at any moment, put a new extension on it. The people acquiesce in the doctrine and applaud it because they hear the politicians repeat it, and the politicians and editors repeat it because they think it is popular. So it grows. . . . It may mean anything or nothing, at any moment, and no one knows how it will be. You accede to it now, within the vague limits of what you suppose it to be; therefore you will have to accede to it tomorrow when the same name is made to cover something which you never have heard or thought of. If you allow a political catchword to go on and grow, you will awaken someday to find it standing over you, the arbiter of your destiny, against which you are powerless, as men are powerless against delusions. . . .
>
> The President of the United States talks about it and he tells us solemnly that it is true and sacred, whatever it is. . . . He says that, on account of the doctrine, what-

ever it may be, we must have a big navy. In this, at least, he is plainly in the right; if we have the doctrine, we shall need a big navy. . . . [And] if you prepare a big army and navy and are all ready for war, it will be easy to go to war; the military and naval men will have a lot of new machines and they will be eager to see what they can do with them. . . . A wiser rule would be to make up your mind soberly what you want, peace or war, and then to get ready for what you want; for what we prepare for is what we shall get.

EXITS FROM CHAOS

In revulsion against the monstrous consequences of basing foreign policy upon ethical abstractions which are the first casualties of the wars to which they lead, a growing host of American thinkers and writers, despite the unpopularity of their position, have sought in their several ways to persuade their fellow citizens to return to the precepts of Alexander Hamilton and Thomas Jefferson (and of Hume, Gladstone, Disraeli, Talleyrand, Churchill, and others), according to which diplomacy and strategy should serve the "national interest," pragmatically defined, rather than moral ideals which are incapable of realization in a system of separate sovereignties. Space is lacking for a survey of such pleas. They include the writings of the late Edwin M. Borchard, Harry Elmer Barnes, Walter Lippmann, Lawrence Dennis in his weekly analysis *The Appeal To Reason,* and sundry other authors. Two current instances will suggest the flavor of the whole.

Hans J. Morgenthau of the University of Chicago has long decried the folly of moralistic crusading in international relations and urged the prudent practice of *Realpolitik.* His recent book, *In Defense of the National Interest,*[4] is an eloquent defense of this conception. His central contention is a puzzling, yet persuasive, contradiction: a "selfish" foreign policy is more "moral" than a "moralistic" foreign policy, which is in fact "immoral" when tested by results. He writes:

> Self-preservation for the individual as well as for societies is not only a biological and psychological necessity, but in the absence of an overriding moral obligation a moral duty as well. . . . The antithesis between moral principles and the national interest is not only intellectually mistaken but also morally pernicious. A foreign policy derived from the national interest is in fact morally superior to a foreign policy inspired by universal moral principles.[5]

More recently George F. Kennan, in *American Diplomacy, 1900–1950,*[6] states much the same position as follows:

> I cannot resist the thought that if . . . instead of making ourselves slaves of the concepts of international law and morality, we would confine these concepts to the unobtrusive, almost feminine, function of the gentle civilizer of national self-interest in which they find their true value—if we were able to do these things in our dealings with the peoples of the East, then, I think, posterity might look back upon our efforts with fewer and less troubled questions (pp. 53–54).
>
> I see the most serious faults of our past policy formulation to lie in something that I might call the legalistic-moralistic approach to international problems. This approach runs like a red skein through our foreign policy of the last fifty years. . . . It is the belief that it should be possible to suppress the chaotic and dangerous aspirations of governments in the international field by the acceptance of some system of legal rules and restraints. This belief undoubtedly represents in part an attempt to transpose the Anglo-Saxon concept of individual law into the international field and to make it applicable to governments as it is applicable here at home to individuals. . . . It is the essence of this belief that, instead of taking the awkward conflicts of national interest and dealing with them on their merits with a view to finding the solutions least unsettling to the stability of international life, it would be better to find some formal criteria of a juridical nature by which the permissible behavior of states could be defined (pp. 95–96).
>
> This legalistic approach to international relations is faulty in its assumptions concerning the possibility of sanctions against offenses and violations. In general, it looks to collective action to provide such sanction against the bad behavior of states. In doing so, it forgets the limitations on the effectiveness of military coalition. . . . We see that the legalistic approach is closely identified with the concept of total war and total victory, and the manifestations of the one spill over only too easily into the manifestations of the other. And the concept of total war is something we would all do well to think about a little in these troubled times. . . . It is not only a question now of the desirability of this concept; it is a question of its feasibility. . . . In a sense, there is not total victory short of genocide, unless it be a victory over the minds of men. But the total military victories are rarely victories over the minds of men. . . . I am frank to say that I think there is no more dangerous delusion, none that has done us a greater disservice in the past or that threatens to do us a greater disservice in the future than the concept of total victory (pp. 99–102).

The dichotomy between "international morality" and "national interest" is not the fruit of moral or mental confusion. It is an inescapable imperative of effective political action in every system of sovereignties in which statesmen must be concerned with calculations of power while moralists and laymen, bewitched with the legal fiction that "states" are "persons," are no less concerned with the precepts of ethics. Since other powers feeling themselves threatened by an expanding power will at some point resist its further aggrandizement, relentless pursuit of power spells war—which is the ultimate negation of all morality. But relentless pursuit of ethical ideals, in the usual form of fighting sin, also spells war, since we live in a world of inescapable diversity in which populous nations and formidable powers can always be counted upon to reject, to the death if need be, any particular definition of virtue sought to be imposed upon them by the power of others.

Secretary of State Acheson in an address to publishers on June 29, 1951 sought to bridge these gaps in an utterance remarkable for its political and ethical ambivalence:

> Korea's significance is not the final crusade. It is not finally making valid the idea of collective security. It is important, perhaps, for the inverse reason that, in Korea, we prevented the invalidation of collective security. . . . What we must do is to be conscious of our national interests. A commitment is a national vital interest of which we have become conscious and for which we have made provision, but we may have national interests, which are just as valid, of which we have not become conscious and for which we have not made provision—about which we should immediately become conscious and about which we should immediately make provision. . . . I have no doubt there is a point beyond which the United States cannot go, but I am equally sure that we are not anywhere near that point.

Ethical ideals and propaganda

Kennan, Morgenthau, and other like-minded analysts of the human scene are contending that under present and foreseeable circumstances a prudent concern with "national interest," reasonably defined, is likely to be less conducive to wholesale violence and global catastrophe than an impassioned solicitude for the messianic and millenarian vindication of moral values. With this

view the present writer finds himself in full agreement—but without conviction that its propagation in the public prints will necessarily alter the determination of policy makers in Washington and Moscow to "save the world." This fatuous and foredoomed enterprise has enormous popular appeal and is a weapon of politics which policy makers are always reluctant to abandon.

We are faced, then, with the probability (not yet the inevitability) that the loftiest ethical standards—mistakenly applied to world politics where they can in the nature of the case have no meaning and no possibility of effective implementation—may become the slogans of symbol manipulators whose task it is to rally public support for Gargantuan adventures in mutual murder and destruction. In this melancholy event, it may confidently be forecast that all ethical norms will vanish in a prolonged holocaust of devastation in which the victors, if any, will hang the surviving leaders of the vanquished, in the best traditions of savagery disguised as civilization, and most of mankind will sink into an anomy and barbarism wherein moral values, as hitherto understood, will become as inconsequential in national and private affairs as in international relations.

World government and moral precepts

Temporary escape from this prospect may conceivably be found in a sagacious return to *Realpolitik* in East and West alike, with a concomitant abandonment of all "crusades" of the virtuous against the wicked. Permanent surcease from irreparable calamity is possible only through a revolutionary transformation of the society of nations in the direction of world government. This goal is not attainable in our epoch through the military subjugation of one group of powers by another. Whether it may become attainable through voluntary agreement among all powers depends upon the imaginations of men and upon their willingness and capacity to translate the ancient dream of human unity into a functioning political reality. Only on this condition can moral precepts have instrumental meaning in international affairs. For the condition presupposes that some minimal code of ethics and law for the entire world community will be accepted by, and can therefore be enforced upon, all mankind—not through the coercion of states by states, which always means war, but through the effective application of rules of law to individuals, which sometimes means peace, order, and justice.

In the absence of such a revolution in attitudes, policies, and institutional arrangements, all national action in world affairs dictated by "morals" rather than by "interest" threatens the betrayal of the interests which are thus ignored and the destruction of the morals which are thus sought to be vindicated.

Frederick L. Schuman, Ph.D., Williamstown, Massachusetts, is Woodrow Wilson Professor of Government at Williams College and has taught at Harvard, Cornell, Columbia, University of Chicago, and University of California. During World War II he served as principal political analyst of the Foreign Broadcast Intelligence Service of the Federal Communications Commission. During 1951 he traveled and studied abroad on a grant from the Foundation for World Government. He is the author of International Politics (4th ed., 1948), The Nazi Dictatorship (1935), Europe on the Eve (1939), Night Over Europe (1941), Soviet Politics (1946), The Commonwealth of Man: An Inquiry Into Power Politics and World Government (forthcoming), and other books on international affairs.

The Presidency as Moral Leadership

By ERIC F. GOLDMAN

EVERY so often the big black limousine would roll out of the White House, and Mrs. Harding, the empty whisky bottles tucked under the lap robe, would give instructions to head for a remote ravine. It was all right for Warren Harding, the businessman and editor, even the Senator, to be casual about his habits. It was decidedly wrong for Warren Harding, President of the United States.

There is something very special about the Presidential office, no doubt, and that something has often produced notable changes in its occupants. Sometimes the change has been toward a mere surface respectability, as in the case of Harding; more often, it has represented a growth in courage, breadth of thinking, and vision. Men of considerable dimensions take on an awesome bigness once they assume the office. The biography of Abraham Lincoln, for example, is essentially the story of a somewhat aimless, shifty politician who became a President of iron purpose and profound humanity. Average men discover unexpected wisdom and strength within themselves. The classically mediocre Chester Arthur, for years a routine politician who was little disturbed by grafting, suddenly emerged a stanch champion of clean government. The most inadequate men find at least the discernment to recognize their inadequacy. "I am not fit for this office . . . ," Warren Harding would tell intimates as he roamed the house where Abraham Lincoln had lived.[1]

The feeling that the Presidency is a post far removed from workaday thought and action has been so fixed in the public mind that millions have demanded of the Chief Executive standards which they never would have thought of exacting from themselves or from their own circle. An acutely snobbish eighteenth century never quite forgave John Adams for allegedly suggesting that the President be called "His Excellency." A generation which winked when businessmen said "Nothing is lost save honor" wondered darkly why Ulysses Grant accepted the gift of an expensive home. And thousands were so shocked by Harry Truman's reference to an "s.o.b." columnist that they announced the country should get "that s.o.b" out of the White House.

American Presidents have often tried to define this peculiar aspect of their office. "The White House," said Theodore Roosevelt, "is a bully pulpit." The Chief Executive, Woodrow Wilson put it, "is at liberty, both in law and conscience, to be as big a man as he can." Probably Franklin Roosevelt came closest to the heart of the matter. The Presidency, Roosevelt declared shortly after his original election, "is not merely an administrative office. That is the least part of it. It is preeminently a place of moral leadership."[2]

[1] Quoted in Arthur M. Schlesinger, *Paths to the Present* (New York: Macmillan, 1949), p. 99.

[2] *New York Times*, Nov. 13, 1932. The Theodore Roosevelt quotation is from Edward S. Corwin, *The President, Office and Powers* (New York: New York University Press, 1941), p. 267; the Wilson quotation, from Woodrow Wilson, *The President of the United States* (New York: Harper & Bros., 1926), p. 43.

DEFENDER OF THE FAITH

Roosevelt, who was no man for the intricacies of definition, left the phrase "moral leadership" dangling without much explanation, but nevertheless he had pointed to a real and important aspect of the Presidency. Every society has certain values which it considers essential beyond the self-interest of any individual or group of individuals, and it seeks in some one human being the symbol and ultimate guardian of these values. For Americans, that one human being is the man whom they choose to call, with all the grave dignity of the title, "Mr. President."

The essential values of most Americans have been an amalgam of patriotism, religion, and democratic aspirations. The patriotism has insisted that the Republic be preserved intact against all enemies, foreign and domestic. The patriotism and democratic aspirations have combined to identify the American way with freedom, justice, and abundant opportunity for all citizens. Patriotism, democratic aspirations, and religion have joined to maintain a bedrock emphasis on the home, family life, and honesty, forthrightness, and decency in human relations.

For considerable periods during the history of the United States, most Americans have felt that their basic values were reasonably secure. At such times, they have sought no fire-burning crusading from the White House. They have given their respect, even their enthusiasm, to Chief Executives whose moral leadership amounted to little more than keeping an ample lap robe over any personal peccadilloes and uttering the proper sentiments concerning the Union, Opportunity and Motherhood. At other times, the general public, either gradually or in a sudden surge of apprehension, has come to feel that some fundamental of the American ethos was in peril, and then they have turned to the White House for rousing and exacting moral leadership. If the leadership was forthcoming, the country as a whole followed, even if thousands grumbled about "dictatorship" all the while. When it was not forthcoming, the American people felt their way through another election, sometimes through a series of elections, until the devious processes of their electoral machinery placed in the Presidency a strong man with a cause.

FOR THE HOUR, THE MAN

The United States was born in the midst of its first moral crisis. The Republic itself was in question. Would it really work—this bold attempt to combine great freedom and practical organization under the Constitution? No other nation had ever tried it; Europe was openly skeptical, often derisive. At this point the country found the firm moral leadership of George Washington, who kept reminding his fellow citizens that something more important than their private concerns was at stake. "The preservation of the sacred fire of liberty, and the destiny of the Republican model of Government," Washington declared in his first statement as President, "are justly considered as *deeply*, perhaps as *finally*, staked, on the experiment entrusted to the hands of the American people."[3]

The country responded; the experiment worked. Then, welling up out of the facts of everyday living, came a second great issue. It was all very well to assume that American freedom gave every man an equal chance to enjoy the delights of success. But as a practical fact, how equal was opportunity when seaboard commercial interests were

[3] John C. Fitzpatrick (Ed.), *The Writings of George Washington* (Washington: Government Printing Office, 1939), Vol. XXX, pp. 294–95. The italics are in the original.

steadily bending the activities of the federal government to their own advantage? First under Jefferson, then two decades later under Jackson, the American people found a Chief Executive who resummoned them to the ideal that government should exercise itself to keep the avenues of opportunity open for everyone.

By the mid-nineteenth century, the issue posed by George Washington pressed for attention again. Could this extraordinary experiment of union and freedom really be kept going, now that the powerful slave domain was tugging in the opposite direction? The frantically careering North tried to brush the issue aside, compromised its way through administration after administration, then, prodding and being prodded by Abraham Lincoln, took its moral stand. The Union, above and beyond any region's special interests or desires, had to be preserved.

For almost three decades after the Civil War, the United States had all the appearances of a nation that had suddenly and irrevocably relegated honesty to the Sunday schools. Callous adventurers flung together economic empires to the plaudits of ministers, professors, and the corner groceryman. Politicians ravaged the public resources with only flurries of protest. The "smart man," the businessman and the public official who could maneuver, bludgeon, or steal his way to a fortune, had become the glamour figure, to be excused his frailties as a later generation was to forgive movie stars their divorces. Thinking back to his boyhood in a Delaware town of that period, one social commentator has recalled that if A-B-C marks had been given, the ratings would have run something like this: a radical thinker, E; a lover of the arts, D; an inventor or a scientist, C; a good parent, B; a good salesman, retail B, wholesale A; and a "first-rate businessman," with all that implied, A++. The civic-minded rated the same dim C that was given to that stereotype of the drunken ne'er-do-well, the newspaperman, or the disgraceful waster of opportunity to rise in the world, the man who cultivated the arts of love.[4]

Delicate choice

Slowly, in two stages, the reaction came. In its most obliviously careering moments, the United States has never been entirely free of the disturbing tap on the shoulder from its Puritan tradition. Mounting hard times in the agrarian areas and an increasing frustration of ambition in the cities made the ways of Washington less and less easy to dismiss. In the election of 1884, for the first time in the history of the country, the major issue was corruption in the federal service, and the Democrats presented as their candidate Grover Cleveland, apostle of the doctrine that "public office is a public trust."

One incident of the campaign illustrates, in a way that has never quite been paralleled, the process of the American people feeling their way toward significant moral leadership. The United States has always assumed that the sexual habits of its Chief Executive would be proper beyond the severest scrutiny of the ladies' clubs; the President is to have only one wife, and he is to confine his amorous activities to her. (As late as 1940, Franklin Roosevelt, reckoning the Presidential possibilities of his friend, Harry Hopkins, made Hopkins' divorce the No. 1 of his "handicaps."[5]) In the middle of the campaign of 1884, the *Buffalo Evening*

[4] Henry S. Canby, *The Age of Confidence* (New York: Farrar and Rinehart, 1934), p. 241.

[5] Robert E. Sherwood, *Roosevelt and Hopkins* (New York: Harper & Bros., 1948), pp. 95–97.

Telegraph flatly accused Cleveland of being the father of an illegitimate son, and the Presidential candidate could reply only: "Tell the truth." The Cleveland forces reeled in consternation. Gleefully, the Republicans chanted:

> Ma! Ma! Where's my pa?
> Gone to the White House
> *Ha! Ha! Ha!*[6]

But Cleveland's opponent, James G. Blaine, was bespattered by accusations that he had used his senatorial post to line his pockets. When the votes were in, the country had found its way through all the issues of the campaign, even through the distracting moral question involved in bastardy, to a decision on the overarching moral issue of restoring honesty to the democratic process. To adopt the language of one Cleveland supporter, the voters made the nice distinction of sending Cleveland to the White House, where he could exercise his moral leadership against public graft, and of remanding Blaine to private life, which he adorned.[7]

The cycle of moral issues

Cleveland had not left the White House when a second reaction was making itself felt to the roar of crumbling political dynasties. The Cleveland years marked a high point in the transition from an agrarian, small-town America to an industrialized, urbanized society, and the transition left millions sure that America as the land of wide-open freedom and opportunity was more in danger than it had ever been before. A large part of the public was soon joining in President Theodore Roosevelt's crusade against "malefactors of great wealth." The country tried Roosevelt's suggestion for a successor, William Howard Taft, quickly found him too amiable for moral leadership, and responded to the cathedral summonings of Woodrow Wilson.

The moral leadership established by Wilson as a domestic reformer was soon transferred to his wartime Presidency, when the issue of the security of the Republic asserted itself once again. In the early 1920's the Harding scandals almost created the type of major moral crisis that Cleveland had met; but the situation was easily handled by the Coolidge administration and was passed over without requiring of Coolidge any crusading beyond a kind of picklish honesty. After the respite of the later 1920's, Hoover's boggling before the depression storm opened the way for Franklin D. Roosevelt's call to the faith that, stock crashes and bread lines notwithstanding, the American dream of freedom and opportunity would endure. Then Roosevelt, like Wilson, passed over to the moral leadership of the defense of the Republic.

The two Roosevelts, Washington, Jefferson, Jackson, Lincoln, Cleveland, and Wilson—these are the eight Presidents who, by summoning their countrymen to look beyond selfish interests at a time when a large part of the population felt that essential values were at stake, have provided effective moral leadership. Since moral leadership is the ultimate test of the Presidential office, it is not surprising that the whole group are also among the most highly esteemed of all American Chief Executives.[8]

[6] Allan Nevins, *Grover Cleveland, A Study in Courage* (New York: Dodd, Mead & Company, 1947), pp. 162–69.

[7] M. A. DeWolfe Howe, *Portrait of an Independent, Moorfield Storey* (Boston: Houghton Mifflin, 1932), p. 151.

[8] One of the most interesting surveys of the esteem in which American Presidents are held was undertaken by Professor Arthur M. Schlesinger several years ago. He asked fifty-five historians or political scientists throughout the country to rate the Chief Executives (excluding William Henry Harrison and Garfield, who served only short periods, and President Truman, whose record was just in the making). The consensus called Washington, Jefferson, Jackson, Lincoln, Wilson, and Franklin D. Roosevelt "great" Presidents, and placed Cleveland and Theodore Roosevelt (along with John Adams and Polk) in the "near great" category. See note 1 *supra*, pp. 95–96.

WHERE THEY CAME FROM

These eight men came from exceedingly varied backgrounds, ranging from Lincoln's rail-splitting youth to F.D.R.'s boyhood at Groton; but their origins are not without a pattern. All the essential values of the United States were formed in a society that was fundamentally agrarian. Consequently, the values are part of a powerful national tradition which tended to assume that the urban businessman was a slick conniver at dishonest government, the chief blockage in the way of sweeping freedom and opportunity for everyone, a schemer with his eye so fixed on material gain that he might even hurt the defense of the Republic for profit. Over the years the country rapidly urbanized, and all sections of the population dropped a good deal of their hostility to the man of industry and commerce; but in times of moral crisis, the suspicion of the businessman has never entirely disappeared. Not a single one of the Presidents in whom the American people found important moral leadership came from a predominantly business background.

Four of the eight Chief Executives were not particularly associated with practical politics—General Washington, Thomas Jefferson, a jack-of-all-gentlemen's-trades, the planter-soldier Jackson, and Wilson, only a few years removed from Princeton University. If the remaining four had spent most of their mature lives thinking about or practicing the art of getting office, they were politicians whose careers, at least to some extent, were connected with battles against the regular organizations. Lincoln was first elected President as the candidate of a maverick third party. Cleveland had risen to the governorship of New York as the hero of the anti-organization Democrats. Both Roosevelts first gained public attention by opposing established leaders within their parties.

This disassociation of the outstanding moral leaders from old-line politics is no accident. The American depreciation of the mere politician is as old as the country, and it was driven deep into the public mind by the events of the post–Civil War era, when going along with the organization was likely to mean serving as part of a cabal that was engaged in a cynical looting of the public interest. Historically, the man with a predominantly political stamp has not been the type to whom Americans have been willing to entrust their more anxious moments.

The nonpolitician who was also a military hero has a confused place in the story of moral leadership. Throughout American history, war heroes have often been boomed for the Presidency on the grounds that they would be magnificent moral leaders, scourges of corruption, and totally aloof to political or class concerns. Some of these heroes fizzled in the course of becoming candidates—most notably Admiral George Dewey of Spanish-American War fame, who embarrassed his most ardent supporters by virtually drawing up a blueprint for the house which was being given him by public subscription and then proceeding to deed it over to his bride as a wedding gift. William Henry Harrison, victor at Tippecanoe, so exhausted himself winning the Presidency that pneumonia struck him down a month after he took office. "Old Rough and Ready" Zachary Taylor, hero of Buena Vista, managed to leave a White House record that historians are still arguing about, and General Grant, entering the Presidency at a time when

there was little demand for moral leadership, certainly did nothing to create one. On the other hand, two men among the eight successful moral leaders, Presidents Washington and Jackson, were military heroes. The evidence ends up in a snarl of meaning.

The importance of sniffishness

More clear-cut is the role of the aristocracy. The whole 156 years up to the death of Franklin Roosevelt produced only four Chief Executives who came from the unquestioned aristocracy of their periods, and all four of these men—Washington, Jefferson, and the two Roosevelts—appear on the list of outstanding moral leaders. In any civilization, the patrician group, freed from the pressure of economic and social striving, is likely to include a number of men of ability who concentrate on idealistic values, and the nature of the American credo has peculiarly qualified the aristocrat for moral leadership.[9]

Two types which so many Americans have seen as menaces to their essential values—the rapacious businessman and the boodling politician—have been especial anathemas of the patrician with social values. He has not only opposed them as dangers to the American ethos; he has despised them as vulgarians of little cultivation and less manners, men who operated with no sense of *noblesse oblige* toward the victims of business and politics, opportunists who constantly threatened to stir up revolution by insisting on going too far. "Of all forms of tyranny," Theodore Roosevelt once expressed the feeling, "the least attractive and the most vulgar is the tyranny of mere wealth. . . ."[10] The patrician reformer brought to moral leadership a sniffishness toward parvenu men of power that was reassuring to a country which had too often seen its Chief Executives overawed by millionaires or by bosses with states in their pockets.

If the aristocratic Presidents have played so important a role in the history of moral leadership, the obverse of the coin also has its significance. Probably the most flagrant instances of unrequited yearning for moral leadership occurred during the administrations immediately preceding those of Lincoln and Franklin Roosevelt. As the secession issue grew acute, the President was James Buchanan, the son of a small-town storekeeper. Roosevelt's predecessor, Herbert Hoover, an orphan at ten, was out earning his living as a chore boy by his fifteenth year. In times when Americans have felt a need to be summoned to a larger destiny, they have rarely been satisfied with a man of the people. He reminds them too much of themselves.

THE KNOW-HOW

Whatever their origins, all eight Presidents who proved important moral leaders shared certain ways of carrying out their leadership. The essential technique, of course, was not to need any technique; the President had to be, in his own self, the morality incarnate—not all the values which made up the American credo, but the one which was foremost as an issue at the time. A good many Americans may well have doubted how much the stiff-backed George Washington was concerned with the economic and social strivings of farmers and mechanics, but the public could and did see in the architect of victory against the British Empire the new nation incarnate. If Grover Cleveland, who had paid a substitute to fight for him during the Civil War, was hardly a symbol of the Union, the immediate and continuing impression he left was one of burly honesty. Franklin Roosevelt's warmest admirers did not deny that he was quite capable of shrugging off political skulduggery, but to millions his very voice, rich and friendly, bespoke concern over ambitions frustrated by depression.

There is a story that a devoted follower of Jackson, asked whether his hero was going to Heaven, snorted in reply: "He will if he wants to."[11] The successful moral leader has not only been the ideal incarnate; he has been, or appeared to be, a man who could do something about it. In their most conscience-lashed moments, the American people, raised in a tradition of getting things done and getting them done quickly, have shown little interest in the ineffectual saint. With the exception of Washington, whose administrations closed just as political parties were forming, the moral leaders have been men who demonstrated that they could lead, manipulate, and if necessary, hammer their own political parties into line while simultaneously outwitting the opposition. They were all able to convince powerful segments of the population that they had foreseen the next curve in the road of history and were surely, adeptly preparing for it.

The individual touch

Once beyond these fundamentals, each exerted effective moral leadership in his own special way, with the aid of traits of mind and personality suitable to the age. At a time when dignity was akin to godliness, George Washington gave the idea of the Republic all the aloofness of his own impeccable serenity. In an era when the frontier was feeling its power but was a bit ashamed of its uncouthness, Jackson was Opportunity in a buckskin coat and a tall silk hat. Theodore Roosevelt, coming in the midst of the great expansion of communications, turned the White House into a spectacular advertising agency for reform. In the churchist early twentieth century, Wilson managed to make some of his most expedient political moves sound moral. And a generation later, when slickness was *de rigueur*, Franklin Roosevelt gave some of his most genuinely moral moves the glamour of seeming expedient.

Perhaps the most interesting additions to the arsenal of moral leadership were made by those notable innovators, Theodore and Franklin Roosevelt. As the twentieth century whirled ahead, with its farms and factories where the boss was as remote as a feudal lord, its shaking of family cohesion and of old, comforting standards, its harsh anonymity and impersonality, millions were feeling alone, frighteningly alone. Seeking some secure anchor, they turned back to religion or ahead to Freud or into and around a dozen movements. With the kind of moral leadership the Roosevelts gave, these people could turn, as no previous generation had been able to do, to the President of the United States. For the two Roosevelts permeated all of their leadership with the suggestion that they were not only some ideal incarnate, not simply able and colorful personalities, but fathers—fathers who would preserve essential American values with the personalized concern that a family expects from its head. "Steward" of the nation, T.R. used to call the President in his more portentous moments.[12] With a flick of

[9] The words "aristocrat" and "patrician" are here used in what seems to me the most useful American sense. The men came from the group with the highest status in their communities; they were, if not independently wealthy, at least removed from the wage or salaried class; and their means of livelihood brought no intimate involvement with the industrial or commercial world.

[10] Quoted in Eric F. Goldman, *Charles J. Bonaparte* (Baltimore: Johns Hopkins Press, 1943), p. 5.

[11] See note 1 *supra*, p. 105.

[12] Henry F. Pringle, *Theodore Roosevelt* (New York: Harcourt, Brace & Company, 1931), p. 543.

the long cigarette holder, F.D.R. put it: "They want Poppa to tell them." [13]

THE TECHNIQUE OF FAILURE

The day after Franklin Roosevelt's death, the new President paused for a chat with some newspapermen. "I don't know," Harry Truman said, "whether you fellows ever had a load of hay or a bull fall on you. But last night the moon, the stars and all the planets fell on me. If you fellows ever pray, pray for me." [14]

The new President was only beginning to realize the magnitude of his task. A number of previous generations may have sought moral leadership against dangers to the Republic, to America as opportunity, or to basic honesty; and sometimes concern over a second of these values, most notably during the administrations of Jackson, Lincoln, Cleveland, and Theodore Roosevelt, played an obbligato to the issue that was foremost. But never before has the situation equaled the 1950's. Gradually, over the two administrations of Truman, the President has come to face a moral crisis in which large sections of the American public feel that all three of its essential values are seriously menaced, two of them more gravely than ever before.

This is a generation made jittery by the depression; it is, more importantly, a generation which remembers the boom and bust that followed World War I. During all the Truman years, despite the general prosperity, concern over continued opportunity has equaled, or come close to equaling, the apprehension of the periods of Jefferson, Jackson, and the two Roosevelts. The forebodings of World War III are graver than any previous worry over the safety of the Republic because war with communism is not simply war against troops, but against a pervasive doctrine; not simply against a great power or even two, but against an agglomeration of forces that could amount to more than half the population of the world. Similarly, the indignation over scandals in the federal service contains elements unparalleled in the history of American crusading against graft.

The elements of additional gravity were described by Senator J. William Fulbright in one of the most widely discussed and applauded speeches of the decade. "Scandals in our Government," Senator Fulbright conceded, "are not new phenomena in our history." But during both previous periods when they became conspicuous, in the Cleveland era and during the early 1920's, the country was at peace, and governmental activities were relatively limited. Now, in the 1950's, the East-West tension means that

> this question of the moral strength of our people is not just an internal domestic matter. It has grave implications in our international relations. Without confidence in their Government, the people will not make the sacrifices necessary to oppose Russia successfully.

Moreover, Senator Fulbright pointed out,

> the growing size and complexity of our Government, much as we may deplore it, only emphasizes the need for a clarification, a restatement of the moral standards of governmental conduct. When our Government was small, when it took only 10 per cent of our earnings in taxes, we could afford a certain amount of official boodling. Today, it has become important. We simply can no longer afford moral obtuseness in our public officials.[15]

[13] Quoted from an interview with one of the late President's intimates, who prefers not to be identified at this time.

The Truman way

To provide the unprecedented moral leadership being demanded on all sides, President Truman came from a background which, if the past is any judge, is just about as unfortunate as it could be. This is no patrician, no politico with an antipolitician air. This is the loyal protégé of Boss Tom Pendergast, haberdasher and farmer, deacon of the Second Baptist Church, Shriner, Legionnaire, Elk, Lion, Moose, Eagle, and devotee of the Society for the Preservation and Encouragement of Barber Shop Singing in America, Inc.

The President's methods of leading cut contrary to almost every practice that has marked the successful moral leader. The grayish little man in the screaming sport shirts is neither the Republic nor Opportunity nor Honesty incarnate. He jerks and pushes and never exalts; he calls for action and then seems to forget the call; he manages to taint everything he does by a highly developed talent for acting too late, and with an air of peevish reluctance, when the mink coats appear. The President's usual moves, far from bespeaking a mastery of party, smack of a wheel horse working with the boys, and any sense that he controls the total situation is frequently jolted by a White House press release which explains that the President of the United States did not really mean what he said an hour before. As for the father concept which the Roosevelts added to moral leadership, any man who is so exclusively and so articulately Margaret's father can hardly be Poppa to a nation.

ONCE MORE, THE PROCESS

The results add up to an intriguing political phenomenon. History will probably record that on some critical occasions Harry Truman has acted with a courage, a farsightedness, and a disregard of petty advantage which were unexcelled by any of the great moral leaders of the past. At a time when experts freely told him that the move meant political suicide, shortly before the election of 1948, he demanded a sweeping program to meet the acid test of American opportunity—Negro rights. Risking the awful responsibility for World War III, he boldly ordered American troops into Korea to protect ultimate American security. Facing squarely into a gale of McCarthyism, he repeatedly summoned the country to recognize that character assassination could not be made compatible with honesty and decency.

But moral leadership from the White House has never been a matter of specific actions. It has come from an amalgam of actions and tone, of personality and program, of the special worries of the hour and the total impact of the man. So the nation, restive and troubled, goes on feeling its way, as it has done so many times before, toward a leader it cannot describe except by saying that with him it will feel that all its essential values are safe.

Governors, Mayors, and Community Ethics

By William H. Young

LIFE is just a bowl of Seaburys," quipped debonair Jimmie Walker after spending several difficult days under the searching and relentless cross-examining of the judge who sought to restore some sense of righteousness to the government of the greatest city of America. The New Yorkers, although far gone in the nation's worst slump and smitten by a succession of shocking revelations about the kind of government the Mayor's friends had been providing, applauded their playboy idol. Even after the experience of several years of a very different kind of rule by the upright, although flamboyant, "Little Flower," a poll by one of the New York papers showed that Walker's popularity still exceeded that of La Guardia and of the man who next became mayor, William O'Dwyer.

The ethics of the officials of our cities and states is rarely far removed from that of the communities which they are elected to direct. Lincoln Steffens, probably the most searching analyst of the morals of local government that this nation has produced, concluded after firsthand studies of the major cities that the politics of "boodle" was not the result of the wicked machinations of a few soulless bosses, but rather the reflection of the mores of the community or at least the "better" part thereof. It is the price we pay, he implied, for our individualistic, self-centered, and competitive society.

Lest this be interpreted as the counsel of lofty indifference or of cynical despair, let me hasten to add that our cities and states are for the most part incomparably better governed and more honestly governed today than when Steffens wrote or even than when Jimmie Walker charmed New York's millions. It is nevertheless true that the development and recognition of standards of public propriety have been a slow and difficult task in a country which is as highly individualistic as the United States and which at least since 1830 has been so imbued with the identity of private and public interest. Our current preoccupation with the ethics of public administration is a convincing demonstration that we are no longer willing to rely on "the invisible hand" to promote public welfare. We now expect our public officials to perform this office.

Effect of Public Officials on Public Ethics

Although political leaders at the state and local levels, in their conceptions of public right, usually reflect the conceptions of their respective constituencies, they are never perfect mirrors. What is more, it lies within their power to mold the popular notions and to add something, however small, to them. In this sense, governors and mayors may be grouped into three classes: (1) those who by exhortation and precept raise the general level of community ethics; (2) those who by consorting with men of easy virtue and by rewarding them seem to dignify misconduct and thus lower the general standards of the community; and (3) those who so completely reflect prevailing sentiment and whose careers are so undistinguished for either good or ill that they leave no impression whatever either on the government or on the community. The last two categories need not detain us long. To the second belong mayors like Oakey Hall, the Tweed Mayor of New York City, Van Wyck, Boss Croker's selection for the same office, "Doc" Ames of Minneapolis, Kline of Pittsburgh, Ashbridge of Philadelphia, and Curley of Boston, and governors like Ferguson of Texas and Huey Long of Louisiana. Each of us could suggest candidates for the third classification, but history has silently closed its pages to searchers after mediocrity.

Judgment in these matters is personal and subjective. Statistical demonstration is impossible. It is, nevertheless, my considered conviction that relatively few of those thousands who throughout our history have governed our states or our cities belong in either of the two categories under consideration. Most governors and many mayors have left their communities and their governments a bit better because of their administration. I attribute this result to the effect of the office on the man. Certainly the voters have elected countless hundreds of undistinguished individuals whose practicing ethics was no whit superior to that of the men and women who chose them.

The contributions to good conduct of a few governors and mayors have been outstanding—more, I am certain, than historians have recorded or journalists described. These recorders of the passing scene have largely selected for meritorious acclaim those with tangible achievements in the physical betterment of their peoples. The contributions of statesmen to the spiritual life of the country have typically been unnoticed. This is dangerous ground on which to journey, and the lack of notice is understandable. How can one be sure that community ethics has been improved? In practice, ethical conceptions are more likely to be influential in the day-to-day routine of executive direction. What goes on behind the closed doors of the mayor's office? Virtually all popularly elected executives profess high-sounding ethical principles when their organizations are assailed by wrathful "muckrakers." All judgments, therefore, must be hesitant and tentative.

Records of governors and mayors

Among those governors and mayors about whose conduct of office some records are preserved, a handful stand out for their dedication to righteousness. John Purroy Mitchel provided New York City with probably the most honest and efficient administration of its affairs in the long annals of that great metropolis. He was defeated in great part because he insisted that certain private philanthropic and religious institutions be operated on the basis of minimum standards of decency, safety, and health. He said:

> For two years and a half, as the representative of the people of the City, I have been endeavoring to secure humane treatment and proper care for the 22,000 homeless and dependent children committed as city wards to private charitable institutions. I have been endeavoring to secure proper administration of public funds annually disbursed to these institutions for the care of the City's wards. That is the cause I am fighting for and I shall continue to fight for it, no matter what damage it may bring to me, for it is a matter of public duty and personal conscience.[1]

Percy Jones, Mayor of Minneapolis, held firm in his determination to rid that city of the worst abuses of organized gambling and crime despite pressure, in the form of a manufactured

[1] Quoted from Cleveland Rodgers and Rebecca B. Rankin, *New York: The World's Capital City* (New York, 1948), p. 107.

"crime wave," from the leaders of the gambling syndicate.[2]

The rugged honesty and courageous righteousness of Grover Cleveland as mayor, governor, and president have been equaled only by George Washington, Abraham Lincoln, and Woodrow Wilson among those who have ascended to the highest office in the land. As governor, Cleveland repeatedly defied Tammany Hall, which was believed to control the largest block of votes in his own party, and appointed fit men to public office. As president, he vetoed more than six hundred veterans pension bills as a matter of principle, although no one of them was expensive, and thousands of such pensions were then being paid. Any bill with the word "veteran" in it was just as popular then as it is today. He clung stubbornly to his sense of fiduciary virtue in the matter of the gold standard although he knew it would probably cost him the nomination and the leadership of his party—which it did.

The Presbyterian conscience of Woodrow Wilson dominated most, if not all, of his decisions as governor of New Jersey and president of the United States. Like Cleveland, he defied the leaders of the New Jersey Democracy. The New Jersey leaders further had supported him for office in the hope of continuing their plutocratic behavior behind the platitudinous administration of a respectable but naïve professor. Wilson battled his primary election law through the legislature against the wishes—even against the orders—of the leaders of his own party who had helped to elect him. Wilson even ordered the most powerful of the Democratic leaders out of his office for what he considered an improper suggestion. Wilson claimed no great merit in the courage of his conduct. Strongly held views of civic right make such a course easy to the owner, although it may appear courageous to the outsider. It took courage, Wilson once said, to deviate from the dictates of his conscience, not to follow them.

Charles Evans Hughes gave New York State an unusual example of honest and forthright conduct of the chief magistracy, and Mayor Seth Low gave New York City the same kind of conduct under even more difficult circumstances. The list might be continued indefinitely: the elder La Follette in Wisconsin, Altgeld and Lowden in Illinois, Johnson in California, Hoan in Milwaukee, Tom Johnson in Cleveland, Blankenburg in Philadelphia.

EFFECT OF PUBLIC ETHICS ON PUBLIC OFFICIALS

In the case of most mayors and governors, the office makes the man. This is to say that the standards set by the community through predecessors, journalists, historians, oaths of office, and all the other subtle and intangible ways that tradition is established, recognized, and transmitted to each incumbent press upon him so strongly that his conduct is enriched and strengthened beyond his previous experience.

Whatever the motivations or the egocentric ambitions that drive men to seek public office, most of those who reach the highest executive posts are, in my experience, powerfully moved by the awesome responsibilities which they face and by the high expectations of their families, friends, and disinterested supporters, and the community at large. Compelled by the press of affairs, the importunities of their advisers, and the profound implications of their decisions to cultivate a broad view of their obligations, they soon come to look at things differently than when they were not in office. Previous experiences, even in other public offices, rarely prepare a man for the weight with which responsibility bears upon his conscience once he seats himself in the chair of chief executive. Governors and mayors in my acquaintance have been concerned with the propriety of their official conduct far more than with that of their private conduct or their conduct before entering high office.

While one may question the validity of the reasoning which may be used on this or that occasion, chief executives usually try to convince themselves that what they propose to do is "right." They may listen to and sometimes enunciate justifications for courses of action which are essentially expediential or "practical" or politic, but they want also to be persuaded of the ethical soundness of the proposals.

The widespread assumption that publicly elected executives are indifferent to ethical considerations and have regard only for "political" motives is largely unfounded in my experience. The inadequacies in this regard which are frequently revealed stem in part from the imperfections of human character and in part from the absence of well-defined and carefully elaborated standards of public ethics in this country. Precedent and articulated public opinion do not point clearly to the proper response in many of the decisions which executives must make. What inhibitions, for example, should restrain a governor in dealing with members of the legislature? How far is it proper for him to go in urging a course of action? Is the occupancy of administrative post a fit subject for bargaining? Is official entertainment extended to legislators proper? The American constitutional system of checks, balances, and the fractionalization of power places a high premium on personal dealings between the executive and the legislature, and yet we have no recognized rules of etiquette or manuals of style to instruct an executive in good conduct. This aspect of political science is neither well-documented nor well-delineated.

EXECUTIVE MACHINERY FOR INFLUENCING COMMUNITY ETHICS

If we assume that, on the whole, the influence of governors and mayors has been beneficent in the field of community ethics, how is this brought about? What is the machinery by which this influence permeates a city or a state?

Among the traditional methods by which executives make their influence felt in a community, I would assign the least important role to public exhortation. Public professions of official rectitude or exhortations to better behavior are typically unconvincing and are probably ineffectual. Usually they are cast in platitudinous form designed to elicit a favorable emotional response toward the speaker, rather than to change the conduct of the listener. The American public is long habituated to political preachment, and probably is utterly indifferent to it.

Confucius long ago declared that the example which the governor of a province sets is far more important than his official acts or utterances. Of the highest importance in impressing his constituents is the way an executive treats those who come to him soliciting his favor. For good or ill, word of his reception spreads from mouth to mouth in ever widening circles through the community. Obviously, no chief executive could long occupy his chair if he received every solicitation with an injured, "How-dare-you!" attitude. On the other hand, the slightest hint of self-interest or of party aggrandizement has significant repercussions. Not only does the executive weaken any concern which such solicitors or their confidants

may harbor for the public weal, but he also invites upon himself new and more importunate solicitations until he has little peace. It is well to remember that not all the persons to whom a suitor repeats the details of his reception will regard it in the same way that he does. By the questions he asks, by the form in which he casts his response, and by the tone of his address, the executive can inculcate into his audience, and into the far larger audience that will hear of the interview, conceptions of public righteousness which will be incomparably more influential than anything he might say or do on the public platform.

Next in importance to the executive's dealings with his constituents are his dealings with his subordinates. No typical executive of any sizable public establishment can hope to give to the conduct of his employees the detailed scrutiny that he has habitually given to that of his business or professional subordinates theretofore. Some of his "subordinates" have been in office much longer than he has; many are independent of some of his most impressive sanctions. All of them together form an army too vast for personal direction. Example is the most effective method he has for inspiring proper conduct. Fortunately, few of a public executive's departmental subordinates really appreciate how little time and attention he can afford to give to their affairs. Ignorance of just which of all the many things they do may become the object of executive review, if coupled with certainty that some things they do will be scrutinized, tends to make subordinates more thoughtful and more circumspect in their decisions.

If the executive indicates his concern for the propriety of administrative behavior, if some of his decisions or instructions turn on the ethics of the issue rather than on its legality or expedience, his subordinates will be encouraged to exercise their ethical principles, and they in turn will encourage their subordinates in the same way, until the whole mass is brought to a little higher level of virtue.

To be most influential in raising the level of public ethics, positive exertion is, of course, indispensable. It is not enough to react only to the matters which come to the executive's desk. It is easy and occasionally even wise to be ignorant of things that cannot readily be corrected. Those who make the smallest imprint on society normally follow this course. Executives, however, who in addition to using the other methods discussed seek out weaknesses in conduct and deal with them decisively are the enduring architects of the edifice of public righteousness. Sound ethical administration is much easier in some positions and departments of government than in others. The ethical principles of the public servants in these posts are not harassed by temptations. In other posts, however, such as those of tax assessor, inspector, policeman, investigator, the price of virtue is high. A governor or mayor does not fully live up to his office if he does not inform himself about the soft spots. By strengthening the good, by punishing the bad, by asking no favors for himself or his friends, he creates an atmosphere in which the government itself lifts up the community to a higher and nobler plane of conduct.

William H. Young, Ph.D., Madison, Wisconsin, is professor of political science at the University of Wisconsin. He formerly taught at the University of Pennsylvania, served as procedures analyst in the Adjutant General's Office, served in the Army during World War II, and has been connected with the executive office of the State of Wisconsin.

Ethical Standards in American Legislative Chambers

By HUBERT H. HUMPHREY

A MEDIEVAL English quatrain, brought to the attention of our Subcommittee on Ethics by Senator Douglas, has real meaning for our times. Commenting on the way in which the common lands were enclosed and taken over by the nobility of England, the poet wrote:

The law locks up both man and woman
Who steals the goose from off the common
But lets the greater felon loose
Who steals the common from the goose.

Politics is not practiced in a vacuum; and the activities of politicians reflect, albeit with some distortion, the prevailing standards of American society, particularly of American business. Nevertheless, transgressions or practices that might be overlooked in business life assume far greater importance in public life because of the greater magnitude of the consequences. For instance, the businessman who uses pull to "get it wholesale" for a friend is regarded as doing a favor; but a Congressman who uses pull to get a contract for a constituent is often regarded as having committed a crime. If the businessman is rewarded, few eyebrows are raised; the Congressman who accepts gifts is regarded as having compromised himself.

AMERICAN ATTITUDE TOWARD POLITICS

It has become almost a truism today to equate politics with corruption. Nor is this a new phenomenon in our society. A member of the Continental Congress joined in an attempt to corner the market on flour, despite the rigors being suffered at Valley Forge. Artemus Ward amused Lincoln by saying: "I am no politician, and my other habits are good." More recently, the National Opinion Research Center discovered that five out of every seven Americans believed it impossible for a professional politician to be honest, and only 18 per cent of America's parents were willing to let their sons enter political careers. This is a revealing if startling commentary on the public attitude toward politics.

American public office has little tradition of honor behind it. In part, this can be traced back to the axiom: "That government is best which governs least." Americans have habitually ignored the government as much as possible and too frequently left office-seeking to those who stood to gain personally from it. Too many people still cherish this early, idyllic concept of the government—or act as if it were still attainable. At bottom, the solution to the problem of corruption in legislative bodies lies in an alert, participating and interested citizenry. Public opinion must not wait for the disclosure of glaring transgressions before rousing itself to action: it must constantly support men of integrity, ability, and candor. Only the active participation of a large proportion of the electorate in political activity—through the medium of political parties—can supplant the power of organized pressure groups on the one hand and backroom politics and personal favoritism on the other. When the people leave politics to be the plaything or special interest of a few, the public can expect that it will be played with and serve the special economic and political interests of the participants. Democratic or representative government is

everyone's business if it is to be an honorable pursuit. If the people want clean and honest government, the minimum price is an active and continuing interest in political parties and political processes.

Legislative responsibility

Blaming the public for complacency does not solve our problems. Legislative bodies have all too often tolerated corruption in their midst. Even where flagrant violations of law have been proved and the miscreants jailed, too frequently no disciplinary measures have been taken. In this vein it should be pointed out that men who stoop to smear tactics, demagoguery, and general confusion of the issues in order to gain public office cannot be expected to change suddenly once they are sworn in. They cannot be trusted with the government of this country or any of its states. While most of the responsibility for correcting such abuses is up to the public, legislative bodies themselves should also act. Callous disregard of the intelligence of the public and the integrity of political office should be punished by voters and legislators alike.

With this background in mind, let us turn now to the problems which face the legislator who attempts to abide by a "code of ethics" in his conduct. Unfortunately, there are no clear-cut criteria or solutions in this field. Certain practices are obviously unethical—but the honest legislator is tormented by a twilight zone into which many of his actions unavoidably fall. I shall set forth the problems as I see them, suggest some solutions, but give no final answer.

FINANCIAL PROBLEMS

One of the major danger zones in legislative ethics is centered on finance. The costs of waging political campaigns have become exorbitant and the salary and allowances of office are usually insufficient to cover the expenditures required.

Mounting costs of campaigns

Twenty-nine years ago a senator from Michigan was forced to resign because of public pressure after a Congressional investigating committee publicized the fact that he had spent $195,000 on his campaign. In 1950, the national committee of one of the parties is said to have spent $100,000 for one half hour on television and radio. According to the *Congressional Quarterly*, $10,000,000 was spent to elect the Eighty-second Congress. Even so, loopholes in the law enabled many expenditures to go unreported. Two of the successful candidates are each said to have had spent in their behalf campaign contributions amounting to more than $2,000,000. This is $1,925,000 more than either will be paid during his six-year term.

The chief cause of this tremendous rise in costs is the importance of radio and television time. A good TV personality is a must for successful campaigning in many sections of the country today. For liberal candidates the importance of radio and television is emphasized by the conservatism of the national press. In 1948, for example, thirteen states were without a single daily paper supporting Truman.

The expense of campaign headquarters, posters, advertisements in the press and by special campaign sheets; the cost of staging rallies and public meetings; the innumerable special projects carried out in a state-wide campaign—these total to a staggering figure.

Obligations incurred

It is obvious from the foregoing figures that conscientious candidates often face the dilemma of either accepting disproportionate contributions from particular groups or persons or of not having enough money to make an effective and successful campaign. Many questions arise. Where can the candidate solicit funds? What is his obligation to special interests or groups which help him? What degree of personal independence can he maintain? Should he limit the amount he will accept from one individual or group? How much of a claim on his time has a firm whose president has contributed heavily to his campaign? Do his supporters believe in his policies or are they expecting something concrete in return?

Thus the matter of campaign funds is central to the whole issue of ethics. Present laws place a $3,000,000 ceiling on the amount any one national committee can spend during a calendar year and a $5,000 limit on individual contributions. These figures are totally unrealistic. There are dozens of devices used to get around the law—in fact, it is almost impossible accurately to estimate the cost of a national campaign. Evasions of the law through the formation of separate committees and by splitting donations among the members of a family are common. Often the statutes are not enforced. In many cases, the bulk of the expenditures is never reported, nor are the sources of much of the money. The result has been a very unwholesome atmosphere.

Totalitarians, both of the left and of the right, attack democracy as a farce and fraud where special interests govern. It is perhaps unrealistic to expect successful candidates not to feel a certain responsibility to their financial angels. But we can at least demand a full disclosure of who—and how angelic—they are. I am therefore unequivocably for requiring publication of all campaign contributions right down to the last dollar. This would include not only donations to candidates, but also those to all participating committees.

Possible remedies

To supplement this essential first step; study should be given to other methods of dealing with the problem. Persuasive evidence was received by the Senate Subcommittee on Ethics in favor of direct public support for political campaigns. The difficulties in working out such a policy are not insurmountable. It has been proposed that the government could pay for legitimate campaign expenses. This is not as revolutionary as it may sound. Theodore Roosevelt recommended that the Congress provide "an appropriation for the proper and legitimate expenses of each of the great national parties." In the 1920 campaign William Gibbs McAdoo stated: "If the National Government paid the expenses of the national campaigns and specified the legitimate objects for which expenditures might be made, politics would be purified enormously."

Similar to direct subsidy is the proposal to set up a public corporation—or trust fund—to aid in providing all bona fide candidates with access to the public eye and ear. Safeguards would assure emphasis on rationality and limitation to legitimate expenses. In addition to public funds, the corporation might also receive and administer private contributions. Many persons who do not give directly to parties or candidates might be willing to contribute to such a public corporation. Such a public corporation or trust fund is now being sponsored by a group of interested citizens in Minnesota. It will be interesting to watch the response such a project receives. This is an experiment in American politics—and a worthy one.

In any case, efforts should be made

to broaden the base of the campaign structure. Some have suggested that the tax laws should be amended to allow deduction of small contributions, perhaps up to $100, for income-tax purposes. It is argued that government, by not permitting such deductions, is discriminating against its own vital processes and undermining its support. Another step to help candidates which could be undertaken with only minor disruption would be a qualified extension of the franking privilege. A further proposal would make free radio and television time available at stated periods during the campaigns. Since ownership of the airways is vested in the public, such a requirement in the licensing of broadcasting stations would be perfectly valid. Should this prove too great a burden on them, stations might be asked to denote a stated proportion of the total time contracted for. Both Canada and Great Britain provide free radio time to candidates, while in the Netherlands, prior to the Nazi invasion, radio stations were owned by the parties.

All of the above proposals, of course, require elaboration and further study. I mention them, not necessarily as an advocate, but to stimulate thinking and discussions.

Expenses of office

Unfortunately, financial problems do not end with the election. The Congressman also has abnormal expenses after he takes office. He must maintain a residence in Washington without losing touch with his constituency. This means frequent short visits home. Many members of Congress maintain two residences—one in their state and another in Washington. Travel expenses are high, and the government pays for only one trip per session. As a public figure, a Congressman has pressing social obligations. He is fair game for solicitors for all worthy causes—and even small contributions add up. Office budgets have not kept pace with the ever increasing volume of mail, to say nothing of providing adequate professional assistance. To do a conscientious job, the legislator must dig into his own pocket. The high cost of political campaigns plus the ever increasing cost of living in Washington, along with added office expenses, may well serve to make Congressional service a special prerogative for the rich. Surely a person of moderate means finds it increasingly difficult to make ends meet.

Supplementary income

There is little likelihood of forthright action to meet these problems. The fear of public opinion recently forced repeal of the tax exemption on the $2500 expense allowance Congress voted itself in 1946. Congress is therefore not likely to vote salary increases. Hence, many legislators seek outside means of supplementing their income. Except for the independently wealthy, important ethical problems arise.

Lawyers may resort to fees or legal retainers. This raises the question of influence. Similarly, it comes up when business connections are not severed, since frequently members have access to confidential information from which they can gain financially.

Many Congressmen accept fees for speaking engagements. In a sense, this is in line with their duty to keep the public informed about important issues —but it is also an important drain on their time and energy. I have often been criticized for going out and making talks here and there. Certainly I have no desire to travel around the country on week ends and leave my family and my job. But I am the father of four children, I must maintain property in two places, I must be able to meet hospital bills and similar

emergencies, I must make frequent trips back to Minnesota, costing a minimum of $200 each, and I must pay additional expenses of office. This would be impossible if I had no outside income. My choice is either to make the speeches and earn the money or to leave the Senate.

Acceptance of additional income cannot, at present, be outlawed. But one simple step would be a strong deterrent to shady or undercover dealings: full disclosure of all sources of income. I am now co-sponsoring legislation which would require all members of Congress to disclose their incomes, assets, and all dealings in securities and commodities. These reports should be made generally available. Then, I believe, it would become politically unhealthy for legislators to handle matters from which they stood to gain personally.

THE OBLIGATIONS OF OFFICE

A Representative or Senator is not merely a legislator. He is, increasingly, an investigator. And he has always been errand boy and helper for his constituents. Let us explore the problems arising from each of these functions in turn.

The major problems connected with legislation deal with determination of values, personal and political obligations, and lobbying. The scope of this article permits only a suggestive listing. To start with, should a legislator vote as he thinks best for the country, even though he knows that it will be contrary to the wishes of the majority of his constituents? Democratic theorists have reached no consensus on this problem of representation. To say that the people know what is best does not provide us with a rule of action.

Even more puzzling, perhaps, is the problem presented by legislation where what is best for the country as a whole affects particular constituencies adversely. Take, for example, the question of reciprocal trade. I have had to face the fur farmers of my state who have stood to lose as a result of my votes in support of the program. I can sympathize with the representatives of some of the states whose industries have suffered from the low tariff rates. They are really in a dilemma.

Party loyalty

Turning now to political obligation, what loyalty does a Congressman owe his party? Political independence, though long cherished as a virtue, has had disastrous consequences in the past. For instance, our failure to enter the League of Nations, despite clear commitments by both parties, led to twenty years of isolationism and abetted the rise to totalitarianism abroad. The traditional vagueness of party platforms obscures substantial differences, and elections have seldom provided mandates for action. Lack of party discipline often makes even clearly recognized objectives impossible to attain. The need for greater responsibility is manifest in the present refusal of a nominally Democratic Congress to carry out the President's domestic program.

Pressure groups

Intimately connected with the issue of party responsibility is the problem of lobbies and organized pressure groups. These have, in part, usurped traditional party functions in the field of policy determination. Yet the present hue and cry about lobbies largely neglects this basic issue. It is focused not on the root but on the results. We are concerned not with increasing party responsibility, but with regulating lobbies. The shortcomings of this approach are obvious, though understandable.

Since 1946, expenditures or contributions designed to "influence directly or

indirectly the passage or defeat of any legislation by the Congress of the United States" were to have been reported to the Clerk of the House and the Secretary of the Senate. A compilation based on their records from July 1, 1946 to June 30, 1951 showed that $71,000,000 had been contributed and $34,000,000 had been spent for lobbying purposes. The House Committee on Lobbying judged, however, that only a small fraction was actually reported. Because of the stigma attached to lobbies, many people are uncomfortable at calling themselves lobbyists. The House Committee found that some individuals did not register because they said the purpose of a lobbying organization was to bring pressure on Congress for a special interest and they represented the common good. Moreover, many organizations, the CIO for example, have varied purposes, of which lobbying is a minor one. Nor are lobbying activities confined to Washington. "Grass roots lobbying" gets the people back home to put on the pressure. And, as already mentioned, they are important contributors to campaigns.

Lobbies, despite their well-known evils, perform useful functions in political life. I like to know how proposed legislation affects the needs of people—the lobbies tell me. I like to hear about conditions which need correcting—the lobbies tell me that too. But I also want to know just whom these lobbies represent: how many people, where they get their funds, how they make their policy decisions, and what their other activities are. Therefore, I should like to see tighter, better-enforced laws, which would trace funds back to their sources. I have introduced a bill which would help tighten one of the loopholes. Then the public, as well as responsible legislators, could make decisions with better understanding of what is involved.

Investigative function

The investigative function of Congress, although firmly established for some years, has recently threatened to overshadow the legislative function. Members have taken advantage of Congressional immunity to make spectacular charges on the floor, and probing committees have made sweeping revelations. While much good has been accomplished, the reputations of honest and able men have sometimes been irreparably and irresponsibly damaged and the perstige of the government has been considerably lowered.

Administrative officials attacked on the floor of either house should have protection equal to that afforded congressional members; and agency heads who are subject to personal attack on the floor should be given an opportunity to make an immediate or early reply. Similarly, private citizens should have the right to reply in the *Congressional Record*. Immunity from suit rewards irresponsibility with protection, and prevents recourse for damaged reputations. Three current proposals deal with this problem: a proposed Constitutional amendment withdrawing this immunity entirely; a statute making it clear that immunity does not extend to defamatory statements inserted in the *Congressional Record* but not actually made in the chamber; and a proposal to make the Federal Government liable in damage for defamatory statements.

Congress also needs a code of fair procedure governing committee investigations and reports. Recommendations here include withholding publicity regarding accusations against individuals until there is evidence to support the charges, giving advance notice to individuals wherever possible if they are to be attacked in public hearings, giving such individuals an opportunity to be present to cross-examine and to reply, and avoiding the intimidation or browbeating of witnesses. Such standards of fairness would not interfere with effective committee investigations. Congress, as the representative branch of government, should take the lead in respecting the rights of individuals and ensuring the validity of its findings.

Assistance to constituents

Members of Congress receive a large number of requests from constituents asking for assistance in dealing with federal departments and agencies. These come from various sources: job-hunters, contractors and would-be contractors, businessmen with requests for loans from the RFC, applications for privilege, men who want to get into the armed forces as officers, or those who want to get out, veterans with claims, people with naturalization problems, and many others. Congressmen are also expected to see that business interests at home do not suffer; that their area is not discriminated against; that hotel reservations are made for visitors; and that worried parents and wives are told about servicemen and how they are getting along.

There is nothing wrong with using members of Congress to perform these traditional functions. Government today is so complex that many people do not know how to get what they need. My constituents tend to look upon me as an ambassador. Most of them don't want any pressure brought to bear; they just want to know where to start and what to do.

I have exercised and will continue to exercise the right to go to any agency in the government to plead a case for my constituents and to do so vigorously. I consider it to be one of my responsibilities as a representative of the people of Minnesota. Most recently, for example, I urged the Secretary of the Interior and the Bureau of the Budget to include in their budgets an item for the construction of public power transmission lines for the western part of my state. I did not succeed, but it was not for want of trying.

In the past businessmen have sometimes come to my office accompanied by five percenters or attorneys. They have wanted me to arrange for them to see high government officials. If their case merited it, I helped them. In one instance, I learned that the attorney alleged he knew me personally and thus received a retainer fee on the basis of his self-proclaimed "personal friendship with the Senator." I have since insisted that I will help constituents only if they come to me directly and unencumbered.

It occasionally happens that a man in the Senate or House will get a letter saying in effect: "I contributed to your campaign. I am coming down Wednesday and I want an appointment to see so-and-so." After the appointment is made, the Congressman is expected to follow up and see that desired action is taken. He runs the risk of alienating support if he does not do so. But relatively few requests are of this nature. In the last Minnesota election, there were 1,350,000 votes cast. Fewer than one per cent of these voters ever write to me in a manner suggesting some special favor.

Ethics of using influence

If a Congressman desires to assist a constituent, he can express personal interest in three ways. The first will merely ask that the constituent be given every consideration and that the matter in which he is interested be expedited. The second kind of pressure is stronger and may say: "I know Mr. X and I can vouch for his integrity. He is honest, able, and fulfills certain requirements. Anything you can do for him will be appreciated." The third, and rarely used, kind of pressure says: "I

know everything about this case. If I were in your spot I would grant the request, and I think you ought to do it." It is the last that gives rise to the ethical questions, particularly when it is accompanied by the implicit threat of an appropriation cut or legislative reprisal.

Whenever a legislator uses pressure in a case, he cannot help having some effect upon the responsible officials. The extent of his influence depends upon both the Congressman and the administrator. It is reported that at one time in TVA whenever a job applicant had a letter in his behalf from a Senator or Congressman, that job application was turned down. This may be exaggerated, but it does happen. Other administrators find it difficult to say no. A part of the influence of the legislator will depend on his committee assignment. If he deals with legislation or appropriations touching the department concerned, he has, of course, a power which may be abused.

The responsibility of the legislator is to act as an inspection or screening committee with regard to requests that come into his office. He must make sure in his own heart and conscience that he is seeking to advance cases only on their merits and that he has no personal economic interest. This is more difficult, however, where political considerations are involved. How can he draw the line between proper and improper personal interests when those interests are essentially political in character?

RAISING ETHICAL STANDARDS

The foregoing treatment has been suggestive rather than comprehensive in nature. I have skirted flagrant violations of ethics which have already been brought to public attention in favor of noting some of the causes of legislative corruption and bringing into focus some of the problems which face those legislators who honestly try to serve their country. The usual American remedy is "there ought to be a law." Yet the law cannot deal effectively with every range of human activity. Many of the ethical questions cannot be solved by legislation—remedies must instead be sought in a new consciousness of the dignity of public office and a higher sense of civic duty. All of us, as citizens, can achieve this through awareness of the difficulties and active support of all efforts to raise legislative standards. We can require, as the price of our support, declarations similar to the following code of "Ten Congressional Commandments" which Senator Benton presented in his testimony before the Subcommittee on Ethics, and to which I fully subscribe:

1. In the same sense in which a judge debars himself from decisions in which he has a direct personal financial stake, so I shall debar myself from legislative decisions, or, if I take action or choose to vote I shall fully disclose the nature of my interest.
2. I shall never use my office to exert extra-legal pressure over the decisions of executive or administrative agencies.
3. I shall treat witnesses who testify before committees on which I sit with courtesy and fairness, following self-imposed limitations which for centuries have been the hallmark of the judicial process.
4. I shall not abuse my privilege of Congressional immunity; I shall not say things on the floors of Congress that I am not prepared to say outside, nor shall I betray the official confidence of the Congress, or of any committee thereof.
5. I shall not indulge in personal vilification of any kind, but I shall not hesitate to criticize public figures and public policies with determination and courage whenever facts of public nature justify such criticism.
6. I shall not vote on any issue without an attempt to consider the voiceless interest of the unorganized in our society.

7. I shall strive constantly to interpret interests of my constituents in the perspective of the total national interest.
8. I shall try to be loyal to the promises of my political party, and thus to strengthen party teamwork and party responsibility in the Congress.
9. I shall not waste my own or my colleagues' time with irrelevant and inconsequential talk in committee or on the floor.
10. Whether as a member of the majority or minority, I shall attempt in my actions and words to educate and clarify, never to obscure or confuse.

Hubert H. Humphrey, Washington, D. C., was elected United States Senator from Minnesota in 1948. He has been, among other things, a registered pharmacist, an instructor in political science at the University of Minnesota, and professor of political science at Macalester College, St. Paul. In 1944 he was state campaign manager for Roosevelt and Truman. From 1945 to 1948 he served as mayor of Minneapolis. He was a member of the recent Subcommittee on Ethics of which Senator Douglas was chairman.

Is Justice Blind?

By J. Warren Madden

The Ethics of Judges

THE statue of the blindfolded goddess suggests that the ideal court should decide its cases as if the parties involved were anonymous and unseen. It should consider the facts and the law and arrive at its judgment in the way in which a law student in an examination decides as to the rights and liabilities of A and B, given certain facts, and applying the law he is supposed to know. Thus any consideration of whether the parties are rich or poor, young or old, charming or repellant, would be eliminated. In this respect, justice, as administered by judges and leaving out juries, is, in general, as close to the ideal of the goddess as it should be. But as to whether judges are blind in another respect, in the sense of being ignorant of economic and social facts and trends about which they should know in order to decide their cases wisely, there is much room for argument.

The honesty and integrity of most judges is beyond question. The scandalous occasional lapses properly cause great public resentment, and the culprit is heaped with obloquy, as he should be. But in general, a party may go into court with confidence that the judge will do his best to decide the case according to the facts and the law, as he is able to understand them. The pressures upon him to do so are very heavy. His decisions are immediately the subject of the scrutiny and criticism of acute lawyers, articulate in pointing out their defects. The judge knows that for any departure from honesty he will be held in disrespect, even by the lawyer who has won the case. In the relative isolation of the bench, he covets above all things the respect of the bar, who are his link with his community. Whether the judge gets his place by appointment or by popular election, and even though his past has not been particularly distinguished for integrity, all the pressures upon him after his elevation to the bench tend to make and keep him upright.

There is a code of ethics for judges, drafted by the American Bar Association. It contains little which would not naturally occur to practically all judges, even if it had never been written into a code. But it contains wise suggestions about the ethics of some kinds of conduct, which suggestions may be helpful to a judge when in doubt.

The dishonest judge

It is probable that in the occasional case when a judge is dishonest, the dishonesty is not investigated and exposed as promptly as it would be in the case of other kinds of public officers, or of private persons. There is a customary respect, amounting almost to obsequiousness, in the attitude of lawyers toward judges, which makes a lawyer slow to suspect wrongdoing on their part, and slow to believe that any accusation which he might make would persuade his brother lawyers and the prosecuting authorities. If the judge is dishonest, as the lawyer may suspect, an accusation which did not result in his removal from the bench would put the lawyer in the position where no one would hire him, for fear of the prejudice which the judge would naturally harbor against him. So it is probable

that the occasional dishonest judge does not get his just deserts until his conduct has become quite intolerable. Some system should be devised whereby prompt investigations would be made by lawyers from other communities, or officers who are not dependent upon the accused judge for a living, when there is any substantial reason to doubt a judge's integrity.

Lack of knowledge

Of the other kind of blindness referred to above, which certainly is not an ideal of the goddess of justice, there is, naturally, a great deal among judges. In a court of general jurisdiction, lawsuits may involve absolutely anything within the range of human activity. Medicine, mechanics, psychology, explosives, or any other subject may confront the judge. The lawyers and the witnesses must teach him as much as they can, and hope for the best in the way of an intelligent decision. Since judges must be human beings, and no human being can, nowadays, "take all knowledge for his province," there is no help for this kind of blindness except the doubtful help of establishing a variety of special courts.

The blindness that is more commonly, and with more reason, complained of is the asserted lack of awareness on the part of judges of what I have above called economic and social forces. These are not specialized fields of knowledge which no judge or other nonexpert could be expected to know, but are things which are known or sensed by large segments of the community, but are not known to the judges because of their origins and training and experience.

Some years ago this was a serious problem. Courts were holding unconstitutional attempted social legislation such as workmen's compensation statutes and those regulating hours of labor, on the basis of the indefinite constitutional standards of due process of law, freedom of contract, and so forth. The Constitution did not really forbid this legislation; society was ripe for it and it was necessary. But many judges, having learned the common law of no liability without fault, regarded a change in that law as revolutionary, and debased the Constitution by finding in it a prohibition of legislation regarded as necessary by many then and by practically everyone now. The tendency of judges in those days to regard all the law as they knew it to be constitutional law, the fact that as lawyers, usually prosperous lawyers, they had had little contact with laboring people and knew little of the social forces which were on the move, really disqualified them for the task of deciding such questions wisely. A sort of running battle between the legislatures and the courts went on, and Congress, having the power to define the jurisdiction of the lower federal courts, in effect voted no confidence in them as to certain subjects by removing those subjects from their jurisdiction.

The situation described above is not likely to recur in an extreme form. Judges of more varied background have attained the bench; the bar as a whole has, by the events of recent decades, been educated to a broader outlook on current affairs; and, in particular, the law schools are and have been for some years giving their students an excellent initiation into the things which, in addition to technical law, they need to know to be intelligent lawyers and citizens. Justice is being cured of this kind of blindness.

The Ethics of Lawyers

The "ethics" of the trial lawyer is hard to discuss in normal terms of ethics. It is not ethics at all in the sense of right conduct, in the sense of

determining what is the right side of a controverted problem, and taking one's position on that side. It resembles rather the rules of games of skill and chance, or a combination of both, in which there is no right side or wrong side, but only an effort to outplay the adversary and win the game. The rules of most games permit almost any conceivable feint or false start, made for the purpose of deceiving the adversary. If one in his social or business life should so misrepresent his intentions for the purpose of misleading his friends or fellow traders, he would be branded as untrustworthy and unethical. But the trial lawyer is not condemned for using substantially the same kind of tactics that is used by the earnest player of bridge or tennis.

No trial lawyer would contend that the objective of his advocacy is to assist in seeing that justice is done, regardless of the consequences to his client. Is this because he thinks there is no such thing as justice as regards the outcome of a lawsuit, any more than there is as regards the outcome of a game? The lawyer is no doubt as much disturbed as his neighbor at the prevalence of crime or fraud or dangerous negligence, and at the danger to the community and to his family and himself that results from that prevalence. But that normal feeling as to lawbreaking in general does not prevent him from using all his skills to prevent the punishment or detention of the particular lawbreaker who employs him. And in doing what he does, he may, and usually does, keep strictly within the code of ethics, the book of rules, of his profession. He receives the adulation of his community, not because the community is pleased that his lawbreaking client has escaped justice, but because it is willing to give credit to the accomplished player, even though he plays on the enemy's team.

Evolution of the practice

What manner of profession is this, then, whose members are licensed by the state to carry on war against the state, and give aid and comfort to its enemies; to prevent the enforcement of its laws; to subvert its elaborate efforts to do justice as between man and man, and man and society? What sort of tradition or superstition is it that causes society to tolerate and even encourage such activity? The tendency of the state in earlier times to oppress the citizen, and the natural desire of the citizen to resist oppression, led to the demand that the citizen who could not effectively speak in his own defense should be allowed to have a spokesman. The spokesman, to be effective, had to be permitted to be bold and independent, unawed by the power of the state; to question the state's witnesses, bringing out by cross-examination the falsities or inconsistencies in their testimony. And, since the decision had to be made by human beings, judges or jurymen, the spokesman was permitted to argue to those who were to decide what their conclusion should be. All this was natural and proper.

What has come out of the practice is, however, that the lawyer, with a complete lack of responsibility for the just decision of the case, cross-examines the adverse witnesses not only to bring out flaws in their testimony but to confuse and discredit them so that whatever is true in their testimony may be disbelieved or discounted. He questions the witnesses for his client only in such a way as to bring out what may be favorable to his client, thus leaving a misleading impression unless his adversary is well enough informed to bring out the rest of the story. In his argument he marshals the evidence in a completely one-sided fashion, and asks for a verdict based upon that false representation of what has been proved. By these activities he may, and often does, defeat justice and win a verdict for his client. He goes to his home and his luncheon club and his church and is congratulated upon his victory. If the businessman who sits next to him at the luncheon club had engaged in such a succession of sharp practices and had thereby made a profitable deal, his associates would consider ejecting him from the club, and the prosecuting attorney would consider seeking an indictment.

The "ethics" of the trial lawyer is, then, something wholly apart from the ethics which we demand of other members of the community in their serious affairs. This condition has existed for centuries. It is a part of our mores. Is it necessary, or tolerable? Is our freedom from oppression dependent upon its perpetuation?

What might be

Let us suppose a wholly different code of ethics for the trial lawyer. Like the witnesses, he is sworn, either upon the trial of each case or upon his admission to the bar, to use his best efforts to bring out "the truth, the whole truth, and nothing but the truth"; that he will, in his examination of witnesses, leave nothing undisclosed which might shed light upon the case; that in cross-examination he will not seek to confuse a witness or discredit his testimony unless he sincerely believes that it is false or mistaken; that he will not urge upon the jury or judge a decision unless he honestly believes that that decision would be in accord with the facts. Would such a code of ethics, effectively enforced by the courts and bar associations, leave sufficient play for the lawyer to be useful in the trial of cases?

If the trial lawyer had such a code of ethics, his role in the trial would be to help the court, and the opposing lawyer who would be similarly motivated, to bring out all the facts in the case, no matter which party they helped or hurt. He would warn his client and his client's witnesses that if their testimony seemed to him to be incomplete or false or mistaken, he would question them until he got to the truth of the thing. If he honestly thought that the facts as they really existed and as proved showed that his client was not guilty of negligence or of contributory negligence, he could urge that thought upon the jury or the judge with all his eloquence. But if the evidence showed that his client was at fault, and legally liable, he would limit his argument to the question of the amount of harm done to the other party, and what would be fair compensation for it. The trial would become a search for the truth, and would lose much of its adversary and gladiatorial character. The result would be that many trials which now occur, with their expense and annoyance and bitterness, would not be held at all, since the truth could be arrived at by frank informal discussion.

Rationalizations

It may be urged that the jury trial and the traditional lawyers' tactics are a necessary safety valve to humanize the law and make it tolerable. The prohibition law became unenforceable in many communities long before it was repealed, because public opinion in those communities had no respect for it, and juries would not convict. The defense lawyer's task was to try to eliminate from the jury any citizen who might feel bound by his oath to convict; to let the accused and his friends testify to an alibi; to urge subtly upon the jury that the law was a mistaken and oppressive one which should not be enforced. The consequences were that jurors violated their oaths, lawbreakers went free, and law enforcement as a whole suffered a demoralizing blow from

which it has never recovered. To whatever extent freedom was enhanced by this episode of disregarding the law instead of repealing it, a heavy price was paid and is still being paid for the experience.

Another important instance of a supposedly beneficial result of the lawyer's traditional privilege of subverting the law is that of injuries caused by automobiles, streetcars, and railroads. It is said that the privilege of plaintiffs' lawyers to induce juries so to find the facts as to create liability when the true facts do not legally create liability is merely a step in the development of the law toward the more beneficent doctrine that absolute liability, regardless of fault, should be imposed upon those most able to pay, that is, the automobile owner's insurance carrier, the streetcar company, or the railroad. It is said that in the course of time the habits of juries, induced by skillful lawyers, will become the law, and the burden of injuries will be spread, through insurance rates and public conveyance fares, over the public, instead of being left to be borne by the victim of the accident. Perhaps this extension of the workmen's compensation idea would be a desirable change in the law. Surely our society is mature enough to face the question of whether or not the change should be made, and if it is desirable, make it, rather than continue the demoralizing practice of having judges solemnly instruct juries as to the law, which instructions the juries, at the urging of the plaintiffs' lawyers, disregard.

A case in point

The writer had an interesting discussion the other day with a young lawyer of fine character, a graduate of one of the best law schools, as to his practice. In a middle-sized county-seat town, he has had some ten cases involving charges of drunken driving within the last couple of years. He has secured acquittals in all the cases, and his services are now sought by persons so accused. He says that he succeeds in eliminating from juries the occasional person who comes from the country and probably would be opposed to any drinking; that he concentrates upon some one juror who seems to be responding to his argument that the police are taking too seriously what is, after all, a trivial and personal thing, and that the hardship of having a recorded conviction and losing one's driver's license is very severe. The young man said that none of his cases had involved damage to persons or property. I asked him whether it might not be expected that if, due to his services, persons could with impunity drive while drunk, they would not ultimately hurt someone. He said that their arrest and trial would deter them from repetition, because he charged them a flat fee of $500 for each case.

Here, then, is a well-educated, otherwise high-minded young man devoting his efforts to defeating the purposes of the law and the law enforcement authorities, and justifying himself by thinking that the fine which he imposes on the lawbreaker in the way of a fee has substantially the same effect as would the enforcement of the law.

The ethical lawyers

What I have said relates to lawyers who engage in the trial of cases, particularly before juries. The trial lawyer's work is an art and a craft, rather than a task of research. Not many lawyers nowadays become adept at jury trial work, or are willing to do it. For many, especially those who represent accused persons in criminal cases or injured persons in civil cases, the strain is very great, because their clients are, whether guilty or not guilty, whether entitled to compensation or not, unfortunate persons and objects of sympathy.

But probably another reason why most lawyers prefer the relative humdrum of office work is that it does not put such a strain on one's conscience. The writing of contracts, deeds, and wills, the searching of titles in the record offices, the drafting of corporation charters, the giving of advice to businessmen, usually involve no deception, no palpable feints and tricks. They require a knowledge or a finding out of what the law requires or permits, and an understandable presentation of the results to the client. And so it seems to turn out that the ethical members of the bar, by the ethical standards of other good people, are the office type of lawyers. They also make the most money, and are the least known in their communities.

It is an unfortunate result of the practices of trial lawyers that many excellent lawyers and law firms shun jury trial work, not only because it is relatively unprofitable, but because it offends their sense of dignity and of right and wrong. They are not willing to get down on the level on which such work is done. The consequence is that on the occasions when an innocent person is in the toils of the law, or a real case of oppression by the government in violation of the Constitution arises, the kind of lawyer who ought to be engaged in such a case is not available, and might not be very adept at handling it if he should undertake it.

The ethics of lawyers is an absorbing problem, which deserves constant study. The present status of legal ethics, though not essentially different from what it has been for some centuries, ought not to be the final answer.

THE ETHICS OF LITIGANTS

I cannot write with much assurance about the ethics of the litigant, never having engaged extensively in trial practice. Perhaps the fact that one is in litigation indicates, per se, that he may be below the normal ethical standard, since somehow he has found it necessary to go to law. Certainly the general run of defendants in criminal cases are below that standard, as it is rare indeed that one finds himself on trial without being guilty, or close to guilty, of some crime, since the case must have been investigated by the police and approved by the prosecutor and the grand jury before the accused is brought to trial. I should say that as far as defendants in criminal litigation are concerned, there is an absence of ethics, they being who they are, and having the normal instinct of self-preservation. Their objective is to "beat the rap" and get off with as little punishment as possible.

The civil litigant

In civil litigation the situation is quite different. The party to an automobile collision, the person who reads a contract or other writing as more favorable to himself than his adversary does, the corporation executive who is alleged to have oppressed the corporation's competitors in violation of the antitrust laws, may not, as a person, be deficient in ethics. The case may be, and probably is, a doubtful one, which, or some features of which, might be decided either way. In such cases the litigant gives way to the lawyer, as far as ethics is concerned. The battle is on, and it all becomes a matter of tactical maneuvering.

As I have already said, the trial lawyer's ethics is, for the duration of the trial, of a different sort from that of the rest of the world. The litigant sits by and hears his injuries and his virtues exaggerated, his carelessness minimized to the vanishing point, his grasping aggressiveness as an entrepreneur represented as a benefit to the community.

What should the litigant do? He is not familiar with this game and did not make the rules. It is being played between the lawyers, both respected citizens, and he assumes that it is being played according to the rules. If his champion wins he pockets his winnings, and vice versa, somewhat as if he had bet on a horse or a hand of poker. So, as far as trials are concerned, I do not see that the litigant has much ethical responsibility. If the ethical tone of trials is to be improved, the judges and the lawyers will have to do the improving.

The judge's limitations

The judge, who is not a party to the exaggerations and misrepresentations which occur during a trial, and who, after some experience, is little affected by them, could do more than he usually does to neutralize their effects on the jury. But in most states he cannot do much without danger of being reversed, for the jury trial in its conventional form is regarded as sacred, and a litigant is deemed to have a right to have the jury led, within limits, to a mistake in his favor. The whole process is not very logical, and the ethics of trials would be greatly improved by giving the presiding judge more freedom to control the proceedings and make the search for the facts and the application of the law a more rational one. But centuries-old fears of oppression will have to be dispelled before much progress can be made.

J. Warren Madden, J.D., Washington, D. C., is judge, United States Court of Claims. He has been professor of law at the University of Oklahoma, Ohio State University, University of Pittsburgh, Stanford University, University of Chicago, University of North Carolina, and Yale University, and dean of the West Virginia University School of Law. He has practiced law. He has served as chairman of the National Labor Relations Board, as director of and legal adviser to the Legal Division, United States Military Government of Germany, and as special assistant in the office of the United States Attorney General. He is author of Treatise on the Law of Domestic Relations and Persons (1931) and co-editor of Introduction to Real Property (2nd ed., 1934), Cases on Rights in Land (1934), and Cases on Persons and Domestic Relations, Including Marriage and Divorce (1940).

Public Administration and Private Interest

By WESLEY C. CLARK

PUBLIC administrators at every level operate in an atmosphere generated by special interest groups. In fact, in the Federal Government, where many policy decisions have been delegated by law to the administrators, much of the business of public administration consists of reconciling the competing demands of these pressure groups in what may be conceived to be the public interest.

In a society such as ours it is inevitable that the great majority of these groups which have found the climate of Washington so favorable to their growth represent private business. Increasingly, however, government bureaus, government employees, political partisans, and labor groups are represented.

It is unavoidable that some policy decisions of administrators shall favor one group as against another. In many cases the question as to which group shall be favored hinges on the specific facts and pressures brought to bear upon the administrator charged with the decision. Or to put it another way, some of the pressures which might be centered upon a particular point are not brought to bear, chiefly because there are no vehicles for their expression. In this category are the interests of such large unorganized groups as consumers.

ELEMENTS OF THE ADMINISTRATIVE CLIMATE

But over and above the special pressures and the particularized arguments which are used to secure special and sometimes illegal concessions is the pressure of the general administrative climate which exists at all times in Washington. This climate is not a constant; it varies from time to time. Depending upon many factors, it may favor administration in the public interest, and again it may favor administration in the private interest. In this variation is to be found the answer to many of the ills which beset the federal administration today. An examination of the factors which compose and condition this administrative climate reveals the reason.

Five major factors contribute to this administrative climate, and there are a multitude of subdivisions of these factors. First there is the moral tone of the nation, second the machinery of administration, third the staff of administration, fourth—and perhaps most important—the leadership which guides the staff and controls the machinery of administration, and fifth the news spotlight in which administrative activities are conducted.

Moral tone of the nation

The basic attitudes of federal administrators cannot be expected to differ greatly from the attitudes of the nation as a whole. It is axiomatic that Washington in any area cannot lag far behind or run far ahead of the thinking of the people of the nation. This is just as true in respect to moral standards as in respect to defense or tax measures. Thus, if the moral standards of the nation are lax, if there is a negligent attitude toward other people's money, this attitude will be reflected in administrative Washington, as well as in legislative and judicial Washington.

The moral tone of any nation may be likened to a great river into which hundreds of tributaries pour their waters.

From time to time, depending on what may be called localized incidents or even cyclical changes in the climate, the importance of these tributaries varies. While it is difficult to determine the importance or to single out the effects of any particular tributary, it seems clear that the great contributors to the present lowering of the moral tone of the nation are two.

The first of these is the wars which have engaged this nation in the last three decades. Even those who recognize the necessity for war do not deny that war is an uncivilized and uncivilizing operation. Of necessity, wars for survival must be fought with deceit, trickery, and treachery, and there is unavoidably some transference of this kind of operation into the arena of civilian life and administration. In the limited area of governmental action, any war generates a tendency to praise the administrator who gets things done without reference to the means by which he achieves these ends; and part of the aftermath of any war is that the same attitude is largely applied to civilian administrators. Yet in any civilization there is no need for the public administrator to ape the warrior. The canons of society and the rules of orderly civilian administration demand that those who bring the tactics of warfare into civilized intercourse ought to be penalized, not praised.

Second, for almost three generations the people of this nation have been taught by example and by experience to believe that the mass mind can be so manipulated as to deny reality. A whole generation has grown up watching the efforts of Hitler, Mussolini, and Stalin to condition the thinking of whole nations. The rise of the public relations and public opinion research industries in the country bears witness to the impact of these examples of mass persuasion. This doctrine is an outgrowth of the findings on conditioned reflexes by Pavlov and others. It attacks the very philosophical foundations of the American system, but it has nurtured a generation of administrators concerned with the manipulation of the minds of people in the mass. These administrators, many of them ill educated or half educated, have discarded, if they ever knew, the qualifications which give validity to these psychological theories. They are a little like Humpty Dumpty in *Alice in Wonderland* who maintained that words meant what he said they meant, even when he said that black was white. As a matter of fact, these administrators seem to have taken one step further into the realm of fantasy than Humpty Dumpty dared to. They have now promulgated security regulations which seem designed to make it difficult, if not impossible, for anyone to prove that black *is not* white if the administrator has already said that black *is* white.

Once a man believes that he can manipulate public opinion and that he can manipulate it forever, there is no compulsion to be honest; there is only the compulsion to be a more clever manipulator than his competitors or those who would find him out. If he no longer believes that truth will ultimately find a buyer in the market place of our civilization, but that the untruth made palatable will be bought in preference to it, then his be-all and end-all is not the finding of the truth, but the covering of that truth which will hurt him, and the sugar coating of the fact which will oust him from office.

Machinery of administration

The second major factor in determining the administrative climate of the Federal Government is the administrative machinery itself. The tremendous growth of the Federal Government in the last two decades, not only in the number of people employed but also in the scope and magnitude of its operations, has created an administrative leviathan. It seems apparent that the means of controlling the leviathan have not grown as fast as the beast itself. Evidence to this effect is to be found in the countless reorganization plans which have been brought forth, the most recent of these being the report of the Hoover Commission.

Almost all these reorganization proposals have been directed at simplifying the federal organization, largely to erect lines of administrative control leading directly to the Cabinet and thence to the President. There have, however, been some attempts to develop common techniques of administrative control within departments or agencies. At present, in no two departments or agencies, not even within departments, are administrative responsibilities of like importance or worth handled in precisely the same manner. This flexibility probably has some advantages, but there are certain fundamentals of good administration which ought to be common to all federal agencies.

There is, for instance, one great difference between the well-run and orderly department and the poorly run one. In the poorly run department, complaints are referred immediately to the bureau concerned, and the bureau handles the complaint in its own way. Thus, for instance, if an employee writes the secretary of a department complaining about ill treatment, the letter is referred to the employee's immediate superior for reply. This, of course, stultifies complaints. In well-ordered departments the secretary's office, after an investigation of its own, prepares a reply. Thus a more thorough review of the case is assured, without the opportunity for the bureau concerned to cover up its errors.

Staff of administration

The staff of administration in Washington is another of the great barrier reefs upon which the best of administrative intentions often founder. The machinery which has been set up to provide the multitude of safeguards without which government cannot properly function, creates a kind of friction, or braking action, that slows down operations until the whole mass of government seems to move at a lava-like pace. And, like lava, administrative procedure continually has a tendency to slow down to a stop and to congeal into a hard basaltic rock which can be moved only by blasting.

In this situation the bureaucrat tends to lose his initiative. Many of the best minds find the slow pace of government unsuited to their temperaments, and they leave for private enterprise where they can get things done and done quickly. The comparative ease with which good men can secure jobs in private industry and the difficulty under civil service regulations of ousting the inefficient make for a general downgrading of the caliber of civil servants over the years. Thus, for instance, with the advent of the New Deal and again with the advent of World War II numerous new agencies were set up and staffed. Frequently the caliber of the staff was excitingly good. But after the initial job of setting up the programs was done, the excitement wore off and these newcomers to government looked for new worlds to conquer. Time has decimated their ranks, until now, some ten years after the advent of the war, comparatively few of the better men remain; but there are great numbers of people whose sole consideration is not the public interest but private interest, usually their own.

These people, concerned with making sure of their jobs, continually use the

cumbersome machinery of public administration to avoid work, to sabotage programs which require the drive of imagination. In short, they drag their feet. The infusion of new blood into administration from time to time is a necessity; otherwise, over the years the bureaucrat tends to identify the public interest with the bureau interest, and the bureau interest with his own private interest. This divergence becomes so great that only a major political earthquake can change it.

Qualities of leadership

In this circumstance, where the administrative staff is so susceptible of stagnation, in fact almost pushed into quiescence by the machinery of bureaucracy, dynamic leadership in the public interest is a necessity. Civil servants must be pushed and hauled into confronting new problems imaginatively and constructively. They must be goaded and led, cajoled and driven. It is not that there is not in them a willingness to do things in the public interest; it is only that they must be shown the close relation between the continuance of their jobs and the operation of the administrative machinery in the public interest.

Energy

To achieve the kind of leadership required to administer any federal program requires certain special skills above and beyond that required in private industry. First and foremost is, of course, a willingness to work, far greater than that required in many areas of human endeavor. The operation of a department with perhaps as many as thirty or forty thousand people, weighted down with a host of civil service regulations and staffed with civil servants none too eager to work, requires a tremendous amount of drive. Second, while it is true that there are only twenty-four hours in a day and only seven days in a week, the span of attention can be greatly extended within limits; but a willingness to put in a fourteen- or sixteen-hour day, instead of a seven- or eight-hour day, is necessary.

Sense of history

A third and important requisite which the good administrator must bring to his job is a sense of history. Perhaps this can best be illustrated with an anecdote taken from *Franklin D. Roosevelt's Own Story*, edited by Donald Day.[1]

The story (a quotation from F.D.R.) concerns the time when Roosevelt, then Assistant Secretary of the Navy, called upon President Wilson to urge him to direct that the American fleet, then based in Cuba, return to the States to be refitted for the war which Roosevelt felt was about to break out between the United States and Germany.

President Wilson told him "No" and then after a minute gave him an explanation. Wilson said: "I am going to tell you something I cannot tell the public. I owe you an explanation. I don't want to do anything, I do not want the United States to do anything in a military way, by way of war preparations, that would allow the definitive historian in later days to say that the United States had committed an unfriendly act against the Central Powers."

Roosevelt said, "The definitive historian of the future?"

Wilson said, "Yes. Probably he won't write until about the year 1990 and when he writes the history of this World War, he may be a German, he may be a Russian, he may be a Bulgarian—we cannot tell—but I do not want to do anything that would lead him to misjudge our American attitude sixty or seventy years from now."

[1] Boston: Little, Brown & Co., 1951, pp. 38–39.

This anecdote reveals not one but two of the qualities which make for great administrative leadership. First there is the obvious evidence that Wilson had a very deep sense of historical perspective, a sense which he imparted to Roosevelt. But more important, the anecdote reveals that Wilson had a deep fundamental belief in the doctrine that the truth will always find a buyer in the market place; that "murder will out," so to speak. Further, it seems apparent from this and other evidence that President Wilson and President Roosevelt both had the feeling that death would not wipe clean the slate of their deeds, but that these actions would be up for review and judgment long after they were dead.

The lack of historical perspective seems more prevalent today among administrators than ever before. Now the administrator seems to think in terms of immediate goals. He seems to wear graven in his mind a slogan: "Hurry, it is later than you think." He seems beset with the fear that he is building on a kind of shifting sand which must be temporarily solidified somehow or other, until he gets out of sight. He seems to have no faith in his works or in the works of the men who may follow him. In this circumstance, the immediate goal justifies almost any means, and consequently leads to a general lowering of the ethics of administration.

Correction of errors

Another quality implicit in good administrative leadership can be described as adherence to the doctrine of fallibility. There must be at the very top level a willingness to admit errors. To throw an aura of infallibility over a whole department is to raise the eyebrows of all the rest of us who are human. But more than that, it discourages those who have justifiable complaints, an investigation of which would lead to the correction of administrative malpractice.

In this connection, one of the charges against newspapers and other publications is that they seldom, if ever, admit their mistakes. Yet this very same fault, and it is a fault, is to be found in the operations of almost any bureau or department. In this administration it extends clear up to and includes the President of the United States. Such an attitude on the part of administrators leads to a situation in which the average citizen doubts the government and doubts the words of government officials, just as many citizens nowadays have some doubts about the accuracy of everything that appears in their daily newspapers. But there is a more serious danger. Will the citizen bring his complaints to the bureau? Will the bureau have a chance to rectify the wrongs it is perpetrating if the citizen feels that his charges will be dealt with summarily and against a knowledge that the bureau thinks that it is infallible?

This is a serious danger in a democracy in a time of crisis. For one of the great advantages that a democracy has over a dictatorship is that the democracy provides a slow but generally reasonable way in which wrongs and injustices may be rectified. There are wrongs within dictatorships which are and have been rectified, but in the totalitarian state the process by which these wrongs are righted is more tortuous, more devious. In them the problem is to reach the ear of the top man at a moment when he is sympathetic.

Openness

Finally, all of these qualities of leadership must be capped by an administrative determination to conduct the

public's business in a public way. While there may be some excuse in the field of foreign affairs for not adhering to the proposition of "open covenants openly arrived at," the arguments which apply to the field of foreign affairs have no comparable application in the field of domestic affairs.

Publicity

Closely connected with the last quality of leadership is the fifth factor which composes and conditions the administrative climate in Washington. This factor can be described as the publicity factor. Particularly at the cabinet level, the federal administration in Washington operates in a pitiless glare of publicity. The mere presence of the great corps of Washington correspondents tends to make action by high level administrators conform to the moral standards of the nation. In contrast to this is the comparative news blackout which curtains executive action in the field of private enterprise. This is not to say that the administrators of private enterprise are any less moral than the administrators of public enterprise, but in private enterprise the chances of being found out are considerably less.

It is, however, also true that while the spotlight of news interest always plays upon public officials in high places and the men immediately around them, the same spotlight finds little time to probe the murky depths of officialdom, except on those occasions when it is apparent or suspect that something is wrong. It is this fact that accounts for the failure of the press to bring out earlier the unsavory mess in the Bureau of Internal Revenue. In the nation's capital, with its many cabinet officers, independent agency heads, directors of emergency boards, and the host of their immediate assistants, the span of attention of the newspapers and the reporters is not great enough, nor their reportorial resources large enough, to cover thoroughly all of the governmental areas in which wrongdoing may occur.

Even this brief survey of the factors of the administrative climate in which the Federal Government operates indicates that some tend toward promoting higher ethical standards while others operate to reduce the moral standards of the operation of the government. Thus the moral tone of the nation at this time seems to have a degenerative effect upon ethical standards in Washington. As an opposite effect the glare of publicity thrown upon Washington tends to keep the moral standards of top administrators at a high level. On the negative side, again, is the tremendous growth of government without a comparable growth in the reportorial resources of the nation's press—a situation which makes more difficult the uncovering of malpractice in the lower administrative levels. But this whole survey also indicates that the crux of the problem of governmental morals lies largely in the kind of leadership that is supplied at the top levels of government.

HISTORY OF PRESENT POLICIES

The bell was tolled for the kind of administrative leadership this nation needs—which it had during the early years of President Roosevelt's administration—when, early in February 1946, President Truman told a press conference that he would continue to support Ed Pauley for the job of Under Secretary of the Navy. Secretary of the Interior Harold L. Ickes had already testified under oath that Mr. Pauley had asked him to delay action on the Tidelands oil question so that he, Pauley, could raise moneys from the oil companies for the Democratic campaign fund. The President may have thought he was merely standing up for a friend.

Actually, however, he was making it impossible for the Secretary of the Interior to remain in office. Secretary Ickes construed the President's statement as a rebuff of one of two kinds. The President's statement suggested to him either that the President did not believe Ickes, even under oath; or that if he believed Ickes, he still preferred to have people of Mr. Pauley's caliber in the government. In either case, Ickes felt that he must resign, and he did so, saying that he felt he "saw a small dark cloud on the horizon which might grow into a major scandal." Since at the cabinet level Secretary Ickes was admittedly one of the truly great administrators of the New Deal, President Truman's rejection of him and his preference for Mr. Pauley was a signal to every administrator in the government that good administration was no longer enough. As a matter of fact, it was not wanted. The era of administration by crony had definitely arrived.

The blow to administrative leadership given by the resignation of Secretary Ickes has had its effect throughout the government. With one or two exceptions, leadership at the cabinet level is definitely of a low order. If anything, the weight of the leadership factor in the administrative climate has shifted from favoring administration in the public interest—as it did in the Roosevelt administration—to favoring administration in the private, the special, and the partisan interest.

The tremendous gulf which separates the present generation of top level administrators in Washington from the kind of administration supplied by Secretary Ickes is perhaps best exemplified by Secretary Ickes' willingness to conduct the public business in a public way in contrast to the repeated attempts of the present administration to curtain its manifold activities.

Secretary Ickes, operating on the fundamental assumption that in the long run the truth would out, welcomed the press. He enjoyed the press conferences and the reporters enjoyed him. But he got far more out of the press conferences than the excitement of matching wits with some of the keenest minds in Washington. Press conference days were days of stock taking in the department. Bureau chiefs, assistant secretaries, deputy administrators hurried into the Secretary's office to warn him of questions that might be asked and to brief him on the answers. It was an unhappy bureau chief who tried to mislead the Secretary, for the latter's questions were often sharper than those which were asked by the reporters later. Bureau chiefs soon learned that the best policy was a complete—well, almost complete—frankness. Bureau chiefs soon learned that while they were expected to attend the press conferences they were seldom given the ball. The Secretary answered the questions and it was on his shoulders that the onus for poor answers fell. When he could not answer a question, he made it a point to call in the bureau chief as soon as the conference was over to find out why he had not been briefed and, moreover, what the bureau chief had to hide.

FUNCTIONS OF THE PRESS CONFERENCE

Thus in a very real sense the press conference operated as a tool of administration. It kept the bureau chiefs on their toes and kept the Secretary informed as well as informing the press and the people. Further, it was a means of communication between the Secretary and the staff of the department, for anyone who could get away from his work could attend.

It brought home to each man who attended it a sense of responsibility in that his bureau or his operation was

not just a little kingdom for him to run without interference except as he owed occasional deference to the emperor in the figure of the secretary of the department. It brought home to each bureau chief, and in fact to each member of the department, that it was to his interest so to conduct himself that his operations could safely stand the light of publicity at any time.

The function of the press conference as a means of internal communication as well as of external communication—with the departmental staff as well as with the press and the public—has been too long neglected. The public trust of public office in the case of administrators of large organizations rests on more than their just being honest. They must *appear* to be honest in their dealings with the public. While each cabinet officer must be a politician, he need not consort with politicians of the lowest type. To do so creates situations like the Merl Young and John Maragon affairs, where access to the White House lent an aura of importance to their activities. It was this very aura of importance that permitted them to secure favors from underlings in various departments. Much of what is done in Washington is done by little people, not because they are ordered to do it, but because they do not know how their superiors feel about this or that subject. With a good deal of logic, the lower echelons of government can say: "Since men like this can frequent the White House, it would be well not to incur their enmity, for who knows what the White House might do to me, personally?"

The whole of Washington and the Federal Government—and this is true also of the larger state governments and of course of many large private organizations—operates in a kind of miasmal fog of distrust. There is so little communication from the top side down through the lower echelons that lower case civil servants operate by guess and by God. They hunt for signs and portents everywhere as indications as to how their superiors want them to conduct their jobs. All of this underscores the imperative need for communication between those of secretarial rank and the lower echelons of their departments. It also makes clear the importance of a press conference as a means of providing this communication as well as of presenting clearly visible evidence that the department head is willing to do public business in public as far as possible. Both of these things are important to the underling in government. The first lets him know what is going on. The second brings home to him the necessity of giving the public access to what is going on.

In contrast to the modus operandi of Secretary Ickes is the present operation of the government, in which the press conference has been less and less frequently used by cabinet officials. Part of this is due to the Korean war, part to security regulations, but as the *New York Times* suggested at the end of 1951, part seems due to a very real dislike of the press conference by officials holding cabinet posts and positions of like importance.

SECRETARY ICKES

A willingness to conduct the public business in public was not the only characteristic that made Secretary Ickes stand out above the present generation of administrators. He had an integrity, a sense of history, and a sense of fallibility which made him distinguished even in the Roosevelt cabinets. Ickes' sense of history manifested itself in many ways—his keeping of a diary, his fussiness about the letters he signed (the Department of the Interior contains many a graying stenographer whose nightmares still consist of typing letters for the Secretary's signature over and over and over again to conform to his style). But perhaps the best evidence of his sense of history as well as of his sense of fallibility is to be found in his treatment of the Ballinger case. During his early years as a Bull Mooser Ickes was sympathetic to the aims of Gifford Pinchot and raised no outcry when Pinchot spearheaded a drive to oust Ballinger, then Secretary of the Interior, from office. Later, after Ickes became Secretary, his curiosity led him to have the records of the case reviewed. He came to the conclusion that Ballinger had been wronged. He wrote an article for the *Saturday Evening Post* admitting that he had been wrong in thinking Ballinger guilty, and the whole article was a complete exoneration of Ballinger.

In terms of public administration the importance of the article lay not in the fact that it exonerated a public servant from any wrongdoing; its importance lay in the fact that even a dozen years in a cabinet post had not dulled Ickes' willingness to admit error.

These evidences of the kind of administrative leadership provided by Secretary Ickes are, of course, merely small threads in the fabric of his administration. Yet they make abundantly clear how different is the pattern of administration now being woven by so many of the top ranking administrators in the government today. And the evidence seems strong that the pattern of administration in the public interest sought after and fought for by Secretary Ickes and others is not the pattern of today.

PROSPECTS FOR THE FUTURE

A consideration of the other factors of the administrative climate in Washington provides little excuse for dancing in the streets. There seems little to cheer about in respect to the staff of government, the machinery of government, the publicity attendant upon the operation of government, and the moral tone of the nation. It is, however, not yet time to abandon all hope.

There are and there will continue to be attempts at reorganization of the administrative machinery. If they continue to be of the kind which have been proposed in the past, they will aim at providing more orderly lines of administrative control. The assumption is that once these agencies are brought within the lines of executive responsibility, they will become more responsible to the public interest and more responsive to it. But this assumes that the leader of the organization into which these independent agencies are brought is himself responsive, or has a staff which is responsive, to the public interest. If they are not, what then? It may be argued that in such a case the President would remove the offending administrator, or that the Congress would act. The evidence of our day seems to indicate that there are times when the President may not act, and that the Congress cannot or will not act. When the interests of the United States, of the Federal Government, were comparatively few, public attention could be focused upon the problems continually. Now with the interests of the government so varied, it is comparatively easy to divert the attention of the public from an unsavory governmental mess and far easier to make it impossible for the Congress to act. In these circumstances it seems we must begin to look for new devices of control over administrators, not for the purpose of stultifying the administrator concerned with the public interest, but for effectively controlling the administrator who is several levels removed from the top and who may be favoring some private interest.

We may expect further attempts to

enlarge the civil service to cover many positions not now covered. If this is done without a comparable effort to revise the civil service rules so that it is made easier to get rid of the inefficient and incompetent, the net gain will be little, if anything.

A grass-roots revival leading to a moral regeneration of the nation is hardly to be expected in view of the war in Korea and the continuing cold war with Russia. Rather a continued downward sagging of the moral fiber of the nation may be expected. Again, the wars will make it easier to give substance to the idea that the minds of men can be manipulated. The psychology of battle will make more and more difficult the job of the press in turning the light upon the operations of administration. As the cold war becomes warmer, more and more civilian operations will find justification for seeking the haven of security regulations.

The marshaling of the evidence seems to portend a gradual lowering of the standard of ethics in Washington as elsewhere. This could be checked, momentarily at least, and perhaps reversed entirely by a strong dynamic moral leadership of the nation. But as long as the President remains obstinate in his insistence upon party loyalty as the criterion of good administration, as long as he pays only lip service to the idea of administrative reorganization, as long as he gives sanction to the closed door policy in respect to the press, the nation may expect a continuation of the kind of administration which leans toward the special interest and the party interest as against the public interest.

Wesley C. Clark, Ph.D., is acting dean of the School of Journalism at Syracuse University. He was formerly a reporter for the Philadelphia Evening Bulletin and taught at the University of Pennsylvania. He also served as assistant to the Secretary of the Interior, Harold L. Ickes, and as research director for Mr. Ickes; and as special assistant to the chancellor of Syracuse University, and public relations consultant for the Caribbean Commission.

The Public Service as a Springboard for Private Profit

By CARL W. MCCARDLE

THE events in Washington during a good part of the past year could justify the notion that consideration of the public service as a springboard for private profit was a shamelessly academic question. In a mounting roll of cases one did not have to "spring" off the board at all to receive private profit. All one had to do was stay where one was and let the chips fall where they would; it was sheer monotony how the chips seemed to fall into one's pocket. Without any sense of neurotic introspection, the governmental employee could ask himself, "Why leave, when I can stay on here and get rich too?" The outbreak of Washington scandals in 1951 gave a morbid answer to the question.

The outbreak was signalized by the rush of internal revenue collectors in city after city to quit their public offices, with or without a fire being built under them. Their exodus was comparable in speed, if not in circumstances, to that of Republican stalwarts departing the scene of the party conventions during the Democratic surety of the New Deal era of Roosevelt II when someone happened to mention them as a vice-presidential possibility on the G.O.P. ticket.

There can be no doubt that public service can be and is a springboard to private profit and one that can carry a man into lush, green fields of pay dirt.

A quick study of the matter indicates that by and large there are two types of candidates who capitalize on their government experience in the field of private business—that is, for money. One type is the honest public servant who of course is motivated in leaving the government by the attractive sheen and supply of the gold to be found in the field of private business. But in his new career he retains, or tries to retain, the same sense of public responsibility that he had while in government. The other type is the out-and-out "fixer," on the alert for a fast dollar, with no nonsense about standards of public trust.

EX-PUBLIC OFFICIALS WITH SENSE OF PUBLIC RESPONSIBILITY

An example of the first type could be Clark Clifford, a very able man, who was President Truman's chief counselor at the White House. Clifford, as handsome as a Hollywood movie actor, but with brains, had been in a St. Louis law firm before going into the Navy and later doing service at the White House. Clifford wrote many of the smashing assaults upon "special interests" for Mr. Truman to regale and arouse the voting citizenry at the whistlestops in his surprisingly victorious campaign in 1948. With Mr. Truman solidly ensconced by the electorate in the White House on his own, Clifford felt that in fairness to his family he should return to the practice of law and make some money. From his vantage point of a place near the President's desk at the White House he could realize that Washington is a trackless jungle.

The government went into big business under the New Deal and the Fair Deal—not only in the public utility area, as with TVA, but elsewhere. And the government has dragged business into government. Both government and business now have a feeling of being "lost" in this blind morass full of

drop-away cliffs and unmarked curves and very soft shoulders on the road. It is a fearsome development that makes the relationship between government and business of McKinley's day—or even of Cal Coolidge's day—a Sunday school picnic by comparison.

Industry, looking on the Washington jungle from the outside, was filled with all kinds of horrors. It didn't want to brave it with its own untried "company" lawyers as guides. It wanted someone who knew his way around the jungle. Clifford, having occupied a position on the right hand of the President, obviously did know his way.

Clifford soon found, as others have, that there is a kind of underground that seeks to ascertain if a man newly out of a lofty position in the government can be "had."

It is said that in the first few months after he had set himself up in law practice in Washington several men, obviously well heeled, who had got themselves into serious tax difficulties came to see him. He advised them that he wasn't taking that sort of case. Apparently the word gets around, for since those initial months as a practicing lawyer he hasn't been approached in that way by anyone.

Also in the opening months, there were people coming in to see Clifford wanting him to work out an arrangement whereby they would give him a juicy fee if he would only lend himself to the abracadabra of getting them government contracts. Clifford informed them he was running a law office and that he did not take that type of work at all. That intelligence seems likewise to have got around in the underworld of influence peddlers, for he has not been bothered by such applicants since.

His accepted clients have not sought influence, but merely aid in getting them through the jungle. Shortly after he hung out his shingle in Washington, the boss-man of a big industry—the kind that Clifford in political campaigns for the President had hauled over the coals with abandon—is said to have come in to see him. Clifford was curious to know why this man, obviously a Republican, and all bruised by the clinically sharp Clifford prose, was seeking his legal services. "All that I want you to do," the tycoon said in effect, "is to give me the same kind of service that you gave Harry Truman."

To a great extent, government and business now have the same kind of problems. The government, for the most part, is just as anxious to find a solution as is industry. There becomes apparent a vast area of similarity in the perplexities of business and government as the running of this nation becomes more complicated, and the government-business interrelationships more complex. That is one of the principal reasons why governmental experience brings in trade for those who go into private life, especially lawyers.

Such ethical practitioners appear to render a genuine service, not only to their business clients but to government. Naturally business wants to hack its way, legally, through the jungle of Washington, and it wants lawyers who can do the job; the man endowed with the necessary inside background can feel justifiably that he is doing both the government and his clients some good. But that is not all. The industrialist, however top level he may be, does not seek out a person of Clifford's unquestionably brainy caliber just because he is a bright boy. And, on Clifford's part, he clearly did not leave the high prestige of the White House because he thought there was more altruistic work for him to do as a lawyer for business dealing with the government. There was lucre in substantial

quantity awaiting him, and he knew it. He and his clients each know what they are getting. And there is nothing wrong about it. It is eminently right, all parties agree. It is one of the few opportunities open to man where he can be high-minded and at the same time well paid for it.

Thomas G. Corcoran, the famous "Tommy the Cork," who was as close to Franklin Roosevelt as Clifford has been to Truman, has for some time been doing very well for himself as a practicing lawyer. He has been quoted, without verification, as saying that he was going to make a million dollars which certainly is neither hay nor a crime. It is unlikely that he'd take a case for less than $5,000.

Clifford has not made any public pronouncement as to how much he is making or expects to make. Jokingly, he has said to friends, "Oh, I've had a few $10 and $15 cases and some little ones."

Another good man eminently qualified to bridge the gap between government and business is David Lilienthal, who has left the government to be a consultant to private industry and to do some writing at which he has a natural talent.

It is ironical that Lilienthal, who as head of the Tennessee Valley Authority and later as chairman of the Atomic Energy Commission was one of the most controversial figures in public life—especially under attack from the right wing—has now set up shop in Wall Street. The TVA did as much as anything to put government in business, and so Lilienthal now recognizes the fact that business and the government are having to cope with the same perplexities. He sees that the nature of things in government has changed during the New Deal and Fair Deal era, becoming more similar to that in business. And he sees also that in business a degree of public responsibility has been voluntarily accepted or forced by the times. Some business executives, as he sees it, are glad to have this responsibility; others are not—but all, whether they like it or not, realize that it is there. And that is where such men as Lilienthal come in.

Lilienthal is now in business. His clients (it can be assumed they are mostly of the top rung of industry) vary in kind and in the sort of advice they seek from him. One man, for example, reportedly came to him with the hottest problem of our times. He wanted help on building an atom-proof shelter. And, moreover, he wanted it at a place which would be outside of metropolitan New York and thus not in the pathway of the hordes of refugees who would presumably be choking all roads out of New York. The client, it is said, came with map in hand, and Lilienthal went over it with him and advised him on what looked like a safe spot for a shelter in an unsafe world.

THE FIXER TYPE OF EX-PUBLIC OFFICIAL

As for the "fixer" type, especially if one is looking for notorious success, recent events almost of their own volition cast up the name of E. Merl Young. If it hadn't been for E. Merl Young and his activities, only a very few in the uppermost brackets would know about pastel mink coats. Now even the lowliest housewife knows about them, even if she does not possess one. And Washington's wealthiest ladies who went out and bought their mink coats legitimately in the old days—even as other women would buy calico dresses—have put their minks away in moth balls. They are afraid to wear them for fear of being wrongly accused in some way of influence peddling, or of

at least being taunted by their cynical and suspicious acquaintances.

Young's rise to riches would outdo the rise of a Horatio Alger hero in almost every way. He was once a grocery clerk in Kansas City. In 1940 he and his wife came to Washington. He got a job as messenger in private industry at a salary of $1,080 a year, and Mrs. Young got a job as a member of the office staff of the then Senator Harry S. Truman. When Mr. Truman moved to the White House as President in 1945, Mrs. Young became a White House stenographer. Young himself was appointed an examiner for the Reconstruction Finance Corporation, a post paying at the time around $5,000 a year. He held that post in 1947 when the Lustron Corporation of Columbus, Ohio, manufacturers of prefabricated houses, got the first of a series of RFC loans that eventually totaled $37.5 million. In 1948 Young quit the RFC and became a vice-president of Lustron at $18,000 a year. At the same time, the erstwhile grocery clerk and messenger became a vice-president, at $10,000 a year, of the F. L. Jacobs Co., of Detroit, a company that had received $3 million in RFC loans.

After he left the government, Young was involved in transactions connected with RFC activity. He worked with the Washington attorney, Joseph Rosenbaum, who it appeared was quite a specialist in RFC matters. Rosenbaum at least seemed adept in getting RFC loans for his clients. And thus the mink coat inadvertently got to be a household word, and a kind of symbol of influence peddling. For Rosenbaum bought for Mrs. Young, the White House stenographer, a $9,500 pastel mink coat, and that fact came out in Congressional hearings. Mrs. Young has long since quit her job at the White House—after the mink coat publicity. And Young himself and Rosenbaum have been indicted for committing perjury before a Senate committee.

THE LOBBYIST

The story of how, when, and where to spring from public service to private profit, whatever the amount, does not include only the Clifford-Lilienthal type and the E. Merl Young type. There is still another great area of profit, and that is called "lobbying." It is almost a truism, as certain as that there exist the Capitol dome and the pork barrel and that politicians never hit a prospective voter over the pocketbook with taxes in an election year, that a Senator or Congressman rejected at the polls by his constituents seldom leaves Washington until he is carried out with appropriate ceremonies at the end of his distinguished span. He stays on—practicing law, if he is a lawyer, or doing some other job less easily classified. Lobbying is a major function of many of these jobs and consists primarily of saying the right word at the right place at the right time on behalf of or against legislation for a client at what must certainly be a right price.

In the off-year Congressional elections of 1950, for instance, a number of administration Senators and Congressmen were defeated back home. Number one of these was Senator Scott Lucas of Illinois, who had been the Democratic floor leader of the Senate. As such his task had been to get the administration bills passed, and he labored long and hard hours to get that done. But, beaten at the polls, he stayed on in Washington, established himself in a law firm, and before long was registering, according to the *Congressional Quarterly*, as a lobbyist. The fees listed as received or anticipated were quite handsome, and the Lucas firm set itself on record as being "interested in advising and counselling" particular corporations regarding credit control legislation as well as tax legislation. It can be imagined that Lucas as a lobbyist would not always be taking the same view that Senator Lucas, the Democratic floor chieftain in the Senate, took in regard to the same topics of legislation.

PUBLIC EMPLOYEES WHO PROFIT A SMALL MINORITY

It must be said, in sum, however, that the big majority of government workers are in Washington not because it produces a livelihood, for the compensation is generally small. They are in government service because they want to serve the public welfare, and they do it effectively, self-effacingly, year in and year out. Those who take the leap off the springboard to private profit are relatively in a minority, such as the "tax experts" who go to work in the internal revenue bureau for the studied purpose of learning the ropes, and then rush out to hang out a sign and collect the fees for their "advice" on how to cut corners.

All in all, one need not be graceful or able to do a swan dive to get off the springboard from public service into the gleaming waters of private profit. He can simply fall in, and come up clutching gold in both fists.

Carl W. McCardle, LL.B., Washington, D. C., is chief of the Washington Bureau of the Philadelphia Bulletin, with which paper he was previously feature writer, diplomatic correspondent, and European correspondent. In 1950 he received the sixth annual award for meritorious achievement in journalism from the University of Pennsylvania. He is co-author of These Are the Generals (1943).

How Public Spirited Is American Business?

By Howard R. Bowen

In attempting to answer the question posed by the title of this article, I shall refer to the several hundred large corporations which we think of collectively as "big business." This restriction of the subject is made only in the interests of clarity and brevity. A discussion of the public spirit of our several million smaller enterprises would be both useful and important, but it would require special treatment beyond the scope of this paper. Thus in the following paragraphs, when such words as "business," "businessman," "business leader," are used without qualifying adjectives, they refer exclusively to *big* business.[1]

Many of the leaders of America's large corporations are deeply concerned about their obligations to society. This is not an entirely new phenomenon. The concepts of "stewardship" and "the gospel of wealth" are, of course, old ideas dating back perhaps several centuries. And for at least fifty years, a growing number of businessmen have seriously pondered their role in modern society and have earnestly considered how this role might be integrated more fully into the total social structure.

Only within the past few years, however, and particularly since World War II, have large numbers of business leaders actively preached the doctrine that they are servants of society and proclaimed their obligations not only toward stockholders but also toward workers, consumers, suppliers, the government, and the general public. Today, discussion of "the social responsibility of business" has become both acceptable and commonplace in leading business circles.

The increasing interest in social responsibility has introduced a positive and constructive note into the social thinking, the public utterances, and the policies of businessmen. Traditionally much of their thinking and action was negative and defeatist. It was directed toward maintaining the freedom and the power of private business. Frequently it consisted of little more than attacks against organized labor and against whatever governmental measures were being considered from time to time for the regulation of business.

But thoughtful businessmen have learned from depression, war, inflation, and social unrest, and from world-wide tendencies toward public ownership and public control of industry. They have been forced by the revolutionary events of past decades to think carefully about the conditions that must be met if the private enterprise system is to remain the basic economic organization of this country. They have seen clearly that private enterprise will be accepted, and can retain its freedom of action, only if it demonstrably serves society better than alternative systems. From this line of thinking has emerged a new emphasis on the social responsibilities of business.

Environment Control and Adaptation

The heightened concern of businessmen for their social responsibilities can be explained in terms of the changing environment within which business is conducted and in terms of the efforts of businessmen to control that environment and to adapt to it.

The environment of business firms may be divided somewhat arbitrarily into two parts, the operational and the social. The operational environment includes the physical supplies of productive resources (labor, capital, and natural resources), the known technology, the wants of consumers, and the competition of other firms. The social environment consists of the socially accepted laws, customs, attitudes, and values which govern business in the acquisition and use of productive resources, which influence its selection of technical methods of production, which affect the demand for its products, and which guide its competitive relations.

Although the response of business firms to both their operational and social environments is primarily adaptive, they do characteristically attempt to control these environments as well. They attempt to control their operational environment, for example, through such activities as prospecting for new sources of raw materials, scientific research and development, product differentiation, advertising, and efforts to allay competition. And they attempt to control their social environment through such activities as fostering favorable public attitudes toward their individual companies or toward the free enterprise system, influencing legislation, seeking favorable judicial and administrative decisions, and attempting to guide or curb labor organization.

Limited power to control

In general, the power of a single business firm to control its social environment is narrowly limited. Any one firm, however large it may be, is a relatively small part of the total economy and of the total society. Its single voice can hardly wield much influence in the shaping of the laws, the customs, the attitudes, and the values of a people. It may on occasion affect detailed legislative, administrative, or judicial actions of government, it may influence public sentiment a little, and it may even on occasion control a city council or a state legislature; but it can hardly exert a major influence on the essential quality of its social environment. Hence, in this respect, a firm is essentially an adaptive organization which takes its social milieu as given, and attempts to adjust to it as best it can.

The single business firm can, and often does, act in concert with other firms in its efforts to influence the social environment. When this happens—whether or not as a result of conscious collaboration—the combined influence of many firms becomes appreciably greater than that of any one firm acting singly.

In this connection it should be noted that deliberate organization is not a necessary condition for business firms to act in concert. Because businessmen have common experiences, face common problems, and communicate with one another frequently, their attitudes, mode of thought, semantic orientation, and world outlook tend to be molded into fairly uniform patterns. Accordingly, businessmen tend to think and act alike on social questions—even when they have not organized or reached conscious agreement. For example, a large majority of businessmen would ordinarily exert their influence against an increase in income tax rates or the strengthening of labor unions or the socialization of coal mines, even though they had neither organized nor met together to agree on their position. But if they organize—as they commonly do—their influence then becomes focused and strengthened.[2]

[1] Much of this article is in the form of a description and analysis of the attitudes of businessmen. It is based on the following sources: speeches and publications of businessmen, public opinion studies, mail questionnaires, and interviews. Because of space limitations, documentation has been omitted. Full reference to sources and methods will be included in my forthcoming book on the social responsibilities of business.

[2] However, organization sometimes reduces their effectiveness if their organizations come

Yet, in spite of their common interests and their tendency to organize, the power of businessmen, either individually or collectively, to control their social environment is limited by two important and almost inevitable facts: (1) successes on the part of businessmen in influencing the social environment will give rise to counterinfluences on the part of other groups having interests opposed to those of business; and (2) the laws, customs, attitudes, and values of a society—rooted as they are in the habits and beliefs of people—cannot readily be shaped according to the will of any group. Therefore, the problem of businessmen is primarily that of adapting to the given social environment, and only secondarily that of controlling it—despite the popular view that "Business" or "Wall Street" really runs the country, and despite the many instances when business influence has apparently been successful in winning detailed concessions.

SOCIAL CHANGE AND BUSINESS REACTIONS

The social environment to which businessmen must adapt has changed dramatically in the past fifty or seventy-five years. The most important change has been, of course, the marked transformation of American social ideals toward humanitarian concern for the welfare of the common man. After centuries of struggle against social inferiority, injustice, tyranny, poverty, and insecurity, the masses of people have come to hope and believe that through the powers of science, technology, education, and democracy a new and better life for them is possible. They have come to believe that a high standard of living—including comforts and luxuries—need not be the exclusive right of the privileged few. Moreover, they have become conscious of their power to achieve these things through political and collective action.

Accordingly a long series of economic reforms—many of them involving controls over the operations of businessmen—have been enacted. These have included the regulation of railroads and public utilities, antitrust legislation, labor legislation, social security, regulation of bank credit and financial transactions, public ownership of forests, and many others. The speed of reform was, of course, greatly accelerated by events surrounding the Great Depression, and in other countries the reforms were carried considerably further than in the United States.

As a result of these developments, businessmen today find themselves in a climate of opinion in which the interests of the common man have precedence over the traditional rights, powers, and freedoms of private property and private enterprise, and in which increased public regulation, or even public ownership, is an ever present threat. At the same time, business has been confronted with relentless pressure from a labor movement which has gained power and status only within the past generation, and which is concerned not only with wages, hours, and working conditions, but also with other aspects of business operations.

During much of the past half-century when social control over business operations was on the increase, businessmen as a whole failed to sense the larger significance of these historic processes, and adapted to them only reluctantly and imperfectly. Their characteristic response was to attempt to prevent, or at least slow up, the evolution of their social environment by opposing each detailed change as it was proposed or threatened. Thus, businessmen tended to dissipate their influence in relatively ineffective rearguard actions designed to prevent particular regulatory measures and to curb the growing strength of organized labor. Business, individually or collectively, was found in opposition to practically every reform measure enacted, including the factory laws, railroad and public utility regulation, antitrust legislation, conservation, the Federal Reserve Act, banking reform, the Securities and Exchange Commission, the personal and corporate income taxes, social security, labor legislation, fiscal policy, and many others.

The opposition of businessmen usually consisted of attacks on these measures as infringements on the "rights" of private property, as interference with the "right" of management, and as unnecessary modifications of laissez faire capitalism which they argued was, prima facie, the most desirable form of economic organization. And when these various reform measures were carried over the opposition of businessmen, their further response was to try to weaken these measures by influencing administrative or judicial interpretation of them.

But eventually the reforms became part of the established social environment, and businessmen succeeded in accommodating to them. This entire history is, in effect, a demonstration of the weakness of business in its effort to control the social environment. On the whole, it was a demoralizing experience for businessmen, who emerged from the 1930's with attitudes of defeatism, disillusionment, and inferiority.

PRESENT ATTITUDES TOWARD BUSINESS

During World War II, public attitudes toward American business and its political fortunes changed perceptibly. The long period in which business was constantly on the defensive against general social hostility and against a steady stream of social reforms came to an end. Just as the Great Depression had apparently demonstrated, for all to see, certain crucial and almost fatal weaknesses in the system of private enterprise, World War II demonstrated with equal clarity that business, if given adequate demand, could perform miracles in producing goods and services. The magnificent wartime record of American business restored much of its former prestige, and with the continued prosperity following the war, businessmen have again been able to hold their heads high and to proclaim that the system of private enterprise is neither moribund nor antisocial. And since World War II, business has had at least a partial and temporary respite from social criticism and from additional social controls (except those relating to the defense program).

It cannot be said, of course, that past suspicions and past antagonisms toward business are entirely dormant. The memories of past abuses and of the Great Depression have been engraved indelibly upon the mind of the American public. There is much apprehension that the present prosperity, based on government spending for defense, is artificial and ephemeral, and that one day the old problems of depression, unemployment, poverty, and insecurity will return. Nevertheless, public attitudes toward business are distinctly more favorable than they have been for many years, and the drive for economic reform has been at least temporarily abated. In this atmosphere, businessmen are carefully taking stock of their social assets and liabilities and pondering their future in the American scene.

Many of them have reached the conclusion that if they are to avoid further infringement of their power and their

into public disfavor. For an interesting discussion of this problem with reference to the National Association of Manufacturers, see Alfred S. Cleveland, "NAM: Spokesman for Industry?" *Harvard Business Review*, May 1948, pp. 353–71.

freedom of action, they must conduct their businesses in reasonable conformity to the new standards and aspirations of the American people. Thus, the shaping of business policies in accordance with socially accepted standards has become an imperative from the point of view of the businessman's own long-run self-interest.

But businessmen do not live in a vacuum. They are members of their society, and—despite biases resulting from their group orientation—they inevitably assimilate many of its values and attitudes. Thus, the evolution of American social ideals has had a double effect on businsesmen. On the one hand it has created a new social environment to which they must adapt if they are to retain their power and freedom. On the other hand it has influenced their own thinking as to their proper role in society, and has changed their own conception of themselves. They have begun to see that a business firm is more than an impersonal instrument for making profit. They recognize more clearly than before that it is a human organization which touches the lives and welfare of many people and which must be conducted with the welfare of these people in view. Society has spoken to the businessman in two languages. It has spoken in the language of controls and threatened controls, and it has spoken also in the language of persuasion. Businessmen have received the message in both languages, and are attempting to follow society's instructions as they understand them.[8]

[8] Certain supplementary factors, aside from the changes in the general social environment, are also partly responsible for the increasing concern of businessmen for their social responsibilities. Among these are: the increasing maturity and security of our large corporations, the perspective which businessmen have acquired in their frequent contacts with government and its problems, the rise of university education for business, the separation of ownership and control in the large corporation, the professionalization of management, and the subdivision of the managerial function and the resulting broader participation in business decision-making.

EDUCATING THE AMERICAN PUBLIC

Despite their notable lack of success in influencing the social environment in the past fifty years, businessmen have by no means decided that they must supinely accept the present social environment and adjust to it.

A great majority of leading businessmen agree that one of their first responsibilities, not only to themselves but to society as well, is to attempt to control the social environment by "selling" the American system of free enterprise and the philosophy on which it is based. They believe that the public has been indoctrinated with mistaken economic ideas which underrate the importance of production and of incentives to production. They feel that business has been subjected to unfair and unsound attack by demogogues and that it has had a bad "press." They believe that the public is in danger of being led astray by enticing but deceptive theories of socialism and state planning. And so they believe that the idea of free enterprise must be attractively and convincingly presented to the American public. They believe, perhaps naïvely, that if only other people knew what they know, and had access to facts they are aware of, all sections of the public would stand shoulder to shoulder with them in defense of free enterprise. And so they conclude that a persistent and large-scale educational campaign is required—a campaign that will convey economic literacy to stockholders, workers, consumers, citizens of the communities in which business operates, government officials, teachers, and the general public.

On the question of how the educational job should be done, businessmen are not in complete agreement, or they place emphasis on different techniques. A large group apparently believe that the methods used in selling soap or television sets will be equally effective in selling free enterprise and in purveying economic literacy. In statements of businessmen, one finds frequent references such as the following: "it is a continuous selling job"; "we must merchandise certain simple facts"; "we should take people by their mental hands."

Other businessmen are less confident that the traditional methods of advertising and public relations are suited to the job of winning the public over to the businessman's economic ideas. They feel that persuasion must be based on deed and example—that public relations are of little value unless they are founded on high ethical standards in business and on the conduct of enterprises with a regard for the social interest. Some of them feel that business should be less secretive about its activities and disclose full information to workers and the public. Others feel that public relations begin at home in the sense that each company must pursue sound and ethical policies and must then concentrate on communicating its own accomplishments to the public, rather than harp on abstractions like "the free enterprise system" or "the American Way." Some feel that a useful approach is "to make every man a capitalist" by promoting widely diffused ownership of corporate securities. Others feel that economic education must be based on enlightened research and sound facts. Only a few businessmen decry such efforts to win popular approval.

THE SOCIAL INTEREST AS A FACTOR IN BUSINESS POLICY

The attempts of businessmen to adapt their policies and practices to the changing social environment are perhaps of more interest and more importance than their efforts to control that environment. A comparison of the policies and practices of American business in 1900, let us say, with those of today will be impressive evidence of the extent to which business has adapted to changing social standards. This is true of financial practices, product quality, labor relations, working conditions, community relations, competitive practices, use of natural resources, research, productive efficiency, relations with government, and almost every other aspect of business operations.

Here are some examples of actual achievements by businessmen in their efforts to make their businesses work better from the social point of view:

1. They have co-operated magnificently with government in war and defense production.

2. Many companies have deliberately held prices below the market level during the postwar inflation, and some have even reduced prices in the face of inflationary demands.

3. Many businesses have worked out effective codes of ethics designed to improve their business practices and have developed and strengthened these codes over the years.

4. Great progress has occurred in overcoming misrepresentation and adulteration of products, short weights, and other sharp practices.

5. Individual companies have made great efforts to improve working conditions, to reduce hours, to give vacations, and to provide greater security to workers against old age, sickness, and unemployment.

6. Unions have been recognized, and the right of workers to organize and bargain collectively has been widely accepted.

7. Individual companies have shown increasing tendency to be concerned about the human problems of workers, to regard the workers as persons, to treat them with dignity and respect, and

to consult with them on the affairs of the enterprise.

8. Discrimination among workers on the basis of sex, race, and religion has been reduced.

9. The atmosphere of secrecy in business has been changed to one of fuller reporting and accounting to workers and to the public.

10. Businesses have actively supported community activities such as education, welfare programs, and recreation.

11. Business has become more actively interested in the conservation of natural resources and has improved methods in the use of these resources.

12. Many companies have considered social factors in the location of new plants and the abandonment of old plants.

13. Definite and constructive efforts have been made to smooth out seasonal and other variations in the rate of production and employment and to provide guaranteed annual employment or wages.

14. Many companies have tried to avoid speculative accumulation of inventories.

15. Important efforts have been made to smooth out variations in the rate of investment in new plant and equipment and in the maintenance of existing plant and equipment.

16. Business practices in the field of consumer credit, insurance, and mortgage lending have been greatly improved.

17. Business practices relating to the flotation of securities and reorganization and promotion of companies have improved.

18. Commercial bankers and other lenders have co-operated in voluntary credit control.

19. Business leaders have organized the Committee for Economic Development for the objective study of public policy.

These are solid accomplishments. To appreciate their significance, it is only necessary to read the literature about the attitudes and practices of business during the muckraking period at the beginning of the century and to read some of the more discerning writings of the 1920's.

Achievement through compulsion

The realist, of course, will say that these accomplishments have been achieved only with great reluctance on the part of businessmen and only under extreme pressure exerted by public opinion and by a government reflecting that opinion. He will point out the many companies which have been laggard in these developments. He will mention the many aspects of business operations where improvement is still urgent. And he will suspect that any relaxation of pressure on business will bring a reversion to former acquisitive and antisocial tendencies.

It is true that businessmen were bludgeoned into improvement in many cases by government regulation, by the pressure of organized labor, by the demands of outraged public opinion. But in the process they gradually realized that many of the reforms imposed upon them were, after all, socially justified, and did not result in disaster for them. Moreover, they found that at least some of the demands made upon them turned out to be good business in that they promoted stability, increased productivity, lowered costs, helped avoid unfavorable public attitudes, or improved human relations.

Thus, businessmen on the whole no longer actively oppose such reforms as the Federal Reserve, the Securities and Exchange Commission, pure food and drug laws, factory laws, social security, the income tax, or the right of labor to organize. They may oppose specific aspects of these reforms, or they may wistfully look back to the good old days before the reforms were adopted; but on the whole they accept these things as part of the basic environment. Similarly, their attitudes toward tariff reductions, antitrust legislation, and fiscal policy have been tempered through experience and greater understanding of social implications.

Most important, businessmen recognize that future reforms and future whittling away of their freedoms can be forestalled only to the extent that business voluntarily pursues policies that conform to the evolving needs and aspirations and standards of the American people. Businessmen may try to change public sentiment, they may influence legislation, they may retard the growth of labor power, but they cannot expect to shape the environment to their own desires. In the last analysis, they must adapt to it—either voluntarily or under compulsion.

Thus, when businessmen become concerned about their social responsibilities, they are acting in their own long-run interest which they have defined after a careful and realistic appraisal of what society is likely to demand of them. They are searching for the conditions that must be met if they are to remain in good standing in American society.

ALTRUISM?

It would perhaps be idle to debate whether, or how much, the growing social responsiveness of businessmen rests on selfish or altruistic motives. To declare that it is based entirely on cold calculation of normal business interest would hardly be fair to the many businessmen who consistently try to modify their policies in light of social requirements. On the other hand, to ascribe this behavior entirely to benevolence would be totally unrealistic. Unquestionably, selfish and altruistic motives are blended. However, the fact that self-interest (interpreted broadly and for the long run) is so important gives one some confidence that trends toward greater social responsiveness of business may persist into the future.

Senator Ralph E. Flanders, a former businessman, ably summed up the situation when he said:

> Our system is based on the faith announced by Adam Smith that, in the sum total, selfish interests work together for the general good. The time has come when that doctrine is no longer tenable in its historic form. If, however, we learn to distinguish between short-sighted selfish interests and long-range selfish interests, then the whole formula still applies and still will work with this simple readjustment of one of its elements. We may still be selfish, but let us be selfish in the long-range view. What harm will there be if the disinterested observer finds it difficult to distinguish our selfishness from old-fashioned virtue? [4]

Howard R. Bowen, Ph.D., Urbana, Illinois, is professor of economics at the University of Illinois. He has served on the faculty of the University of Iowa; as chief of the Business Structure Unit, United States Department of Commerce; as chief economist of the Joint Congressional Committee on Internal Revenue Taxation; and as economist with the Irving Trust Company of New York. He is currently serving as economic consultant to the National Council of the Churches of Christ in the United States of America in connection with a three-year study of "Ethics and Economic Life," and as part of this study he is writing a book on the social responsibilities of businessmen. He is also author of English Grants in Aid (1938), Toward Social Economy (1948), and other publications.

How Public Spirited Is American Labor?[1]

By Joseph A. Loftus

AMERICAN workmen who combined to raise their own wages were prosecuted for criminal conspiracy *at one time*. We did not officially jettison *that doctrine* until little more than a century ago. As late as 1917 the Supreme Court of the United States was giving positive support to the "yellow dog" contract, in which workers agreed, as a condition of getting and keeping their jobs, not to join or support a union. The court held that union leaders might not encourage these workers to join a union.[2] Twenty years ago the labor movement in America could claim only three and one-quarter million members. Fifteen years ago labor's statutory protection of the right to organize freely was challenged by employers in the Supreme Court on constitutional grounds. Today we ask how public spirited American labor is.

No doubt about it, labor has come a long way. The question implies that it has come to a place of power, perhaps even to maturity.

How Powerful?

Labor union membership totals about fifteen million. This is less than one-fourth of the total work force. The more important fact economically is the concentration in coal, steel, transportation, and mass manufacturing. This is a powerful striking force. A prolonged shutdown in one of these areas at this time would disrupt the economy of the country. The whole world would feel the tremors.

The labor leaders are conscious of this power. Perhaps that is what leads them into a certain bombast in the political area—that and their successes in the New Deal days. When their threats in political campaigns are contrasted with the achievements, one wonders if the labor leaders have not made the error of thinking their political influence has the same dimensions as their economic power.

Aldric Revell, who is a political writer and columnist for the *Madison* (Wisconsin) *Capital Times*, as well as a leader in state and local CIO activities, found that only 52 per cent of organized labor in Madison was registered after a two-year registration campaign by labor. Mr. Revell concluded: "On the basis of the record in Madison—certainly a more politically conscious city than many others—the labor vote is a myth."[3]

Mr. Revell's flat conclusion needs some modification. Labor's power is measured not only in the registration of its members in a given year or in its enrolled membership totals or in their strategic location in the economy. Consider, for example, the concept of the "labor community," embracing the unorganized as well as the organized employees. This is the base of labor's power. That is not to say that labor speaks for all American workers at all times; labor cannot speak for itself with a unified voice on many questions. But on broad economic and social issues

[1] For purposes of this article, "labor" and "organized labor" are used interchangeably and refer particularly to the AFL (American Federation of Labor) and the CIO (Congress of Industrial Organizations).

[2] Hitchman Coal & Coke Co. v. Marshall, 245 U.S. 229 (1917).

[3] Aldric Revell, "Labor's Mightiest Myth," *The Progressive*, Vol. 15, No. 9 (Sept. 1941), p. 21.

—a wage and hour law, for example, or government action to aid the unemployed in a depression—labor is spokesman for the mass of American workers. Its demands and its protests over the years have impressed themselves on the laws of the land—the Clayton Act (labor is not a commodity); maximum hour laws for women and minors; workmen's compensation; the Railway Labor Act, which adopted existing collective bargaining practices in detail; the Norris-LaGuardia Act, which curbed the use of injunctions against labor.

These are some of the achievements that have entrenched labor in American life. On such issues there is such a thing as a labor vote, and that vote is articulate and effective because of unions.

Self-Interest Approach

More frequently labor operates on a narrower base, as in the case of the Taft-Hartley Act. This law has made life more difficult for union leaders; it has raised the cost of organizing and staying organized for most unions. But it has yet to be shown that the whole labor community has been seriously hurt by this law. The labor leaders thought they could arouse the community on this issue. Obviously it did not inspire employees in general to abandon their traditional or local political loyalties or their lethargy.

Labor spokesmen often speak of the movement as if it were a holy crusade. "What's good for labor is good for the country," is a phrase often heard. Other groups employ similar themes. The phrase can be defined in a way that gives it validity, but labor often uses it loosely to support a narrow position. Almost any group would be acting in the public interest most of the time if it lifted its eyes to the long run. But labor, with its scarcity conditioning, is still confined to short-run goals.

In fact, organized labor is not very well organized. The carpenters are well organized. Their union looks after the interests of carpenters. The steelworkers' union looks after the interests of steelworkers. But are they looking after the interests of labor? The opportunity for economic and social uplift in the farm labor and southern textile areas is still great. AFL and CIO unions struggle along in those areas on scarcity budgets with little or no help from the better-entrenched unions with millions in their treasuries. Dogged fights for supremacy go on between unions within the AFL and within the CIO and between the two big groups. Some unions still discriminate against Negroes. The closed union, high initiation fees, and the like, antagonize some members of the labor community.

When these practices persist, it is no wonder that labor's appeals to the crusading spirit or the humanitarian instincts of the American people often miss their mark, political campaigns miss fire, or legislatures write restrictive labor statutes. Where labor can clearly identify itself with the interests of the masses of employees—as it often can—it has tremendous power. Where its interests are narrow, labor is a pressure group that sometimes has its way, sometimes not.

Labor's power and external relations have been weakened by the split in the labor movement. Much of its energy has been drained away through that gap. Example: If one textile union, instead of two rivals, had tried to organize the southern branch of the industry, the effort surely would have been less costly. The division intensifies rivalries and makes labor leaders more insecure. Given these conditions, labor statesmanship has difficulty in developing and expressing itself. Legislators who want to be friendly to labor are often confused by the conflicting

demands and have to move cautiously or not at all to avoid offending one group or the other.

INFLUENCE IN GOVERNMENT

It seems hardly necessary to state that unions must engage in political activity if they are to perform a successful economic function for their members. (The writers of the Taft-Hartley law saw the connection between the economic and political areas; they not only restricted the labor leader's freedom of action in the labor-management area, but inhibited him from retaliating politically, by writing into the law restrictions on the use of union funds).

When it comes to organizing workers and conducting strikes, the attitude of the local political officials, the use of the police power, often means the difference between success and failure for labor. This is a down-to-earth reason why labor dares not shun politics.

The extent to which unions should use or rely on government to advance their economic aims has long been an issue in the labor movement. The decline of the Knights of Labor was a product, in part, of the conflict between those who favored processes of collective bargaining as a primary tool and those committed to basic change through political power.

"What the government gives the government can take away" was the tradition of the Gompers era. Gompers wanted a minimum of statutory compulsion and a maximum of voluntaryism. The Clayton and Norris-LaGuardia acts did not violate the Gompers philosophy, in that they protected the rights of the unions to pursue their ends; but Gompers probably would have quarreled with the Wagner Act's compulsion on the employer to bargain, because it meant, as the Taft-Hartley Act now spells out, compelling the employees to bargain.

AN EXPEDIENT APPROACH

The unions' principal legislative effort of the last four years has been directed toward repeal of the Taft-Hartley law, or substantial dilution of its restrictive features. A few unions, which dominate their jurisdictions and feel strong enough to maintain their positions, would also throw out the Wagner Act (which someone remarked has been interred in Taft-Hartley); but for the most part the unions want their right to organize protected by a statute like the Wagner Act. That is the kind of government intervention they want. They want nonintervention by the conspiracy and injunctions laws. They object vigorously when government interferes with the terms of the bargain, as in the ban on the closed shop, but they accept government intervention in individual disputes on an opportunistic basis. That is, there is little objection to government fact-finding boards in principle; the unions accept them—even seek them—when it is expedient to do so.

It is clear from history that American labor's political activity is not aimed at taking over the government or revolutionizing the economic and social system. The AFL, under the strong leadership of Samuel Gompers, always sought to defeat "labor's enemies" in government, but at the same time rejected the ideology of the socialists and other radical groups in the movement. The newer industrial unions are more politically minded; their problems are often political problems. Yet they, with minor exceptions, have rejected the communist ideology and techniques. The evidence still strongly supports the Commons-Perlman theory[4] that the primary object of the American labor union is job control. Political power and influence are outposts to protect and strengthen control over the job.

[4] This refers to John R. Commons and Selig Perlman.

LABOR AND THE PUBLIC INTEREST

What is the public interest? Nearly everyone thinks he knows; but ask a man to identify it, and see how far he gets, or where he goes with relation to self. The most passionate, articulate, and moralistic devotees of the "public interest" often speak matter-of-factly as if there were one public. Is the public interested in lower prices? The inclination is to answer Yes. Actually, that answer applies only to the buying public. What of the selling public? It is axiomatic in our society that people want lower prices for the things they buy and higher prices for the things they sell.

Most persons would agree that a good school system, with competent, satisfied teachers, is not only desirable but essential to build a better society or even to preserve today's cultural levels. What public is doing anything about the public interest in that case? Competent teachers quit because of low pay and take jobs in business; but they are not therefore condemned as antipublic, even though their action is selfish and hurts education. Who is hurting education more—the teachers who are demanding more money so they can continue to teach and maintain standards, or the taxpayers (public) who refuse to pay?

One wonders at times whether even Congress always acts in the public interest, or in what public's interest. Two rollbacks of beef prices ordered by the Office of Price Stabilization in 1951 were blocked by Congress. Was Congress then acting in the public interest? I believe not, but perhaps that is because my primary interest in beef is that of a buyer.

It is a common failing that we identify the public interest as a simple concept, usually something that harmonizes with our own interests. There are many publics, not just one. They overlap. Some publics are sanctioned and supported; others, like the crime public, are not. Labor is one of many groups, or publics, competing for approval of the whole. We cannot assume that because the wage earner organizes against the employer to raise wages he is against the public interest, any more than we can assume that the employer, in wanting to keep wages down, is *for* the public interest.

Early in 1951 the labor organizations waged a two-month campaign for greater representation in defense agencies, more liberal wage policies, and tighter price control. In the price area labor identified itself as coextensive with the consumer public. This was an assumption of leadership that many persons objected to, because they were critical of labor's wage demands.

Whether they were justified or not in speaking for more than their own members, the labor leaders' assumption of that role was quite indicative of their image of themselves. One of these leaders said at the time:

> Our job is to educate our own people, and let us not forget that our own people are all the workers of America, not just the people that pay dues to our union. We must educate our people. The people who do not belong in the union must be educated to know that whether they will it or not, they are represented by the people who do belong to the union. . . .[5]

Certainly labor *believes* its objectives accord with the public interest.

LABOR'S DEFENSIVENESS

The union came into being as a response to a need; it was a device of

[5] George Meany, in "Equal Sacrifice for the Defense of America" (a collection of addresses at the United Labor Conference, Washington, D. C., March 21, 1951), p. 17.

self-defense for oppressed employees. Much of the defensiveness remains, despite labor's growth to a position of great power. The reasons for that may be deeply psychological. Because of the influence labor leaders wield in our society, they are expected to behave maturely. Yet sometimes they seem to overplay the underdog role.

That may be a deliberate device to further selfish ends. Still, there is evidence that the labor leaders really feel that they have not been fully accepted as the respectable, equal partners of other powerful groups in our society.[6] That was their theme when they withdrew from defense agency posts in the spring of 1951 to dramatize their demand for still greater recognition, alongside businessmen, in the defense agencies.

The labor leader's power is a relatively new thing, and he can point to some signs that this power is not stable or secure. A feeling of security is an essential element of maturity. Organizing and staying organized is still a costly business to unions. The commercial press and radio seldom give labor's cause understanding and support; it is more common to find them hostile. Today's middle-aged labor leader can recall the mass unemployment, the struggle for existence, and the attitude of the national administration in the bleak 1929–33 period. The older labor leaders are conditioned by the open-shop battles that followed World War I, and some are old enough to feel the lash of still earlier days. It is not astonishing, in the light of the not-so-remote past, that the word "injunction" today induces some violent reflexes in the older labor leaders. White House collaboration is not so ancient that labor leaders can assume it is here to stay. If the executive branch in postwar days had shared the philosophy of the Eightieth Congress, which passed the Taft-Hartley Act over a veto, labor might have been in deep trouble.

[6] Evidence that such feelings are not necessarily fanciful can be found in C. Wright Mills, *The New Men of Power* (New York, 1948), pp. 31–46.

ROLE IN STABILIZATION

Let us look at a concrete situation—labor's position on economic stabilization, for example. Labor contends, with justification I think, that in writing the Defense Production Acts of 1950 and 1951 Congress was better attuned to the needs of business than to the needs of labor or the labor community. The executive branch then devised a wage policy that permitted labor to get wage increases commensurate with changes in the consumers' price index, plus certain other concessions in the wage and nonwage areas. In other words, labor was being assured that its real standard of living would not suffer; indeed, it might even improve through correction of inequities and through health and welfare insurance. There was no interference with higher earnings achieved through overtime work at premium rates; merit increases, promotions, upgrading, and so on were permitted under the regulations.

In the fall of 1951, labor embarked on a determined campaign to get more. Labor's charge that there was no price control could not support its demand for still higher wages, even if the charge were true, because the wage policy permitted wage increases to follow price increases; labor's short-run position was thus protected. In fact, from the Korean base of June 1950, wages kept a little ahead of prices.[7]

[7] From June 1950, when the Korean war started, to September 1951, average hourly earnings in manufacturing, excluding overtime, rose 10.6 per cent. The consumers' price index in the same period rose 9.6 per cent. Source: Bureau of Labor Statistics, Department of Labor.

Labor was free to denounce wage controls as such, and withdraw from the Wage Stabilization Board. Instead, the labor leaders accepted wage controls in principle—accepted positions on a government policy-making board. From these public positions they continued to operate as labor leaders, seeking more, feeling no doubt that the presence of employers on the same board, pushing in the opposite direction, justified their demands. The CIO publicly attacked the wage board policies and announced its intention to break through them. Labor was unwilling to reject controls outright, yet was willing to weaken them as long as government could bear, or share, responsibility or guilt for that weakening.

This is pressure government in a public guise; labor used the cloak of government to further private interests. Labor has no monopoly on this practice. Administrative agencies in every area encounter pressures that would make them the tool of private government.

The question raised here is whether labor's wage objectives coincided with the public interest. Labor would argue that they did coincide; that labor was advancing the interests of all except those they identified with predatory capital. Every action of labor is related to the employer, to the corporation, to profits, as if there were only two publics, labor and the employer. That is labor's normal orientation operating in an abnormal situation. (Labor no doubt would say here that business insists on normal profits.) It overlooks not only other publics but also the long-range interests of labor itself, which would be harmed if economic values were destroyed.

OTHER PUBLICS

In a readiness economy there are other publics immediately concerned with labor's activities. Wage controls were geared in a way that gave labor short-run advantages over some other groups. Public employees, even those who are organized, lag in a race between wages and prices, to say nothing of the unorganized employees of private business, annuitants, professional people, and one-man entrepreneurs. Labor is unsympathetic with the unorganized, and says they should join up—a line of argument that negates labor's claim to speak for more than its own members in matters of economic stabilization.

Automatic wage escalation is a perfect expression of the dichotomy of the employee group. The fact that many unions do not have these automatic cost-of-living clauses does not blunt the point; they are doing just as well with other techniques. The point is that unions with pre-emergency escalator clauses were allowed to keep them, and that set the tone and pace of wage stabilization. Legally, escalation was made available to everybody. In reality, it is special-group protection.

This does not exhaust the store of evidence that labor functions primarily for its own members, and that some of its activities do not advance the welfare of all in our society.

Nor is it possible in this space to list all the labor activities that coincide with, or are designed to advance, the public welfare. Some instances may be given. It is an easily supportable thesis, for example, that without unions, wages in an overemployment economy would have risen faster and higher than they did; that the resulting instability in money values and manpower distribution would have impaired the efficiency of our production machine and jeopardized the economic structure.

Unions more and more are taking roles in community activities. Unions bring democracy to industry, even when the union is not internally democratic.

The union provided some of the necessary elements of a satisfying life that the industrial revolution had taken away, and thereby lifted the tone of the whole community. The public interest was served.

The public hears a good deal about "featherbedding" and union practices that retard technological advance; it is less well informed of the technological adaptability of such unions as the United Mine Workers and the United Automobile Workers, CIO.

Business fears communism, but gives little credit to American labor for rejecting communism at home and for using its own funds to fight communism abroad. Despite its attacks on capitalists, labor is pro-capitalism.

SUMMARY

Labor is strategically organized to exercise great economic power. Its influence extends into the political field in varying degrees. As a legislative lobby it has been effective, on balance, for several decades, although this power has waned since the war. It has successfully adopted the tactics of other interest groups in putting pressure on administrative agencies. At the polls, labor's organization is young, weak, and inexperienced; it has failed to perceive fully that, in the absence of a political machine, patronage, and so on, its appeal lies in issues that cut through narrow union lines, and in convincing nonunion as well as union people that labor has long-range goals that are good for the country.

Labor has no pretensions to power as a political party, but seeks to defend and advance the job interests of its members. It seeks the protection and help of government in organizing and staying organized, but guards its right to say the government shall not go beyond that point.

Labor unions are not public-interest organizations. That is not to say they are against public interest. Labor is essentially a protest group, born and bred that way in the hard realities of the business world. It seeks primarily to satisfy its own needs, as many other groups in our society do.

Public and private interests can and do have common points, especially when a group, such as labor, is representative of a large economic element in our society. But there are deviations, too.

"Labor versus capital" describes labor's conditioning. Operating in that area of conflict, how shall labor identify "the public"? By dividing a complex society into two simple parts, labor and capital, labor can easily identify itself with the overwhelming number of people and thus rationalize much of its behavior as consonant with the public interest.

This is an approach loaded with danger when the economic pie (for civilian consumption) is not expanding but contracting; when more pie for one group means not only less for another, but perhaps less for all beyond the short run. This is where labor's lack of long-range interest shows up as a lack of public interest.

Labor's objectives are often summarized in one word: More. It means not only more pie, but more security, more recognition, more of the intangibles that make a human being human. None of these is inimical to the public interest per se, not even the quest for more pie, so long as it contributes to a bigger pie. By and large, labor has made the contribution. What it needs are long-run goals and philosophy. Perhaps it will get them if it feels secure in the short run.

Joseph A. Loftus is a Washington correspondent of The New York Times, specializing in labor and economic news.

Professional Patriots and Ethical Levels

By BARENT TEN EYCK

WHEN space limitations enjoin brevity, the essayist on an assigned subject cannot waste words. The subject of this essay, as limited by its very title, is a special and vitally topical one; but it lies pinpointed within a very general field, which a host of earnest and powerful thinkers have cultivated for many centuries. That field consists of the area where a broad and historic line of philosophical thought, on the subject of ethics, crosses the historic development of man's devotion to his own native land, known as patriotism.

This suggests that the shortest way to the formulation of any well-considered conclusions on the subject of "professional" patriots, viewed with reference to ethical levels, will be to define the essential terms. More explicitly, it is necessary, before saying anything useful about professional patriots and ethical levels, to do some pondering both upon the nature and meaning of patriotism and upon the meaning of man's persistent striving to make himself an ethical being.

THE MEANING OF ETHICS

I believe that the elucidation of the terms "patriotism" and "ethics" will be best accomplished, for the purposes of this essay, by seeking first to define "ethics." Of the two terms, it has the longer history and the broader scope. Usage as recorded in dictionaries and linguistic history as discoverable from etymology agree in fixing the meaning of the word. Ethics relates to *morals*, moral questions. It is that part of philosophy dealing with moral conduct and judgment. It aims at establishing standards of right and wrong. In its practical application, for example, it determines what a professional man may or may not properly do. The word is derived, of course, from the Greek *ēthos*, meaning custom or moral nature.

The ethical, or moral, problem is a problem of the individual, in virtue of the fact that he is born, grows up, and is obliged to live within a society requiring his adjustment with his fellow men. Professor Warner Fite has said that to be moral (or ethical) is to be thoughtful, or self-conscious: that is, conscientious and responsible.[1] In so saying he has only repeated two famous sayings of Socrates: "Virtue is knowledge," and "Know thyself."

In the same study on ethics, Professor Fite has also suggested that, if the moral ideas governing international relations were those which govern the relations of decent individuals, if national honor meant what individual honor means "to a man of intelligence and a gentleman," and if the expression of contempt for what the citizens of other nations hold dear "could cease to be regarded as an evidence of patriotism," the necessary adjustments between nations might easily come, producing peace on earth and good will to men.

THE NATURE OF PATRIOTISM

But what is patriotism? Mr. Justice Holmes has said: "A word is not a crystal, transparent and unchanged; it is the skin of a living thought and may vary greatly in color and content ac-

[1] Warner Fite, *An Adventure in Moral Philosophy*, London: Methuen & Co., Ltd., 1926.

cording to the circumstances and the time in which it is used." [2]

If this be true (and I think it is), the "color and content" of the term "patriotism" cannot be apprehended merely from dictionary definitions. This word is, indeed, "the skin of a living thought." It has been, and is, more: a symbol and a rallying cry. What, then, is the nature of this living thought? How does it function, and what are the proper limits of its use?

The difficulty is that patriotism, being the love of one's country, and in its absolute form being the love of one's country right or wrong, *tends* to replace the individual's ethical judgment by an objective and unexamined standard. Moreover, that standard consists, to a very considerable degree, of the hard deposit of years of dead history. It is not wholly the crystallization of responsible, conscientious judgment of any kind—even that sort of composite judgment which is deducible from the taking of a poll or from the choice between alternatives that is presented in a political election.

In another, but very relevant context, Roger Williams saw this when he said (using the terms of reform Puritanism) that the true Church is spiritual in nature, and as such does not need the civil magistrate to maintain its proper position but should use "the breastplate of righteousness, the helmet of salvation and the sword of the Spirit." [3] Milton, too, saw the dreadful danger of man's abdicating the responsibilities of individual ethical judgment when he wrote: "Give me the liberty to know, to utter, and to argue freely according to conscience, above all other liberties. . . ." [4]

[2] Towne v. Eisner, 245 U. S. 418 (1918).

[3] Roger Williams, *The Bloudy Tenent of Persecution for Cause of Conscience* (1644), Ch. XLV.

[4] John Milton, *Areopagitica*, 1644.

Patriotism, like other concepts connoting conformity, represents a standard which can readily be stated in extreme form, and which those who are perhaps neither responsible nor self-conscious individuals, in the ethical and moral sense, can readily exploit for their selfish ends. G. E. Lessing, the great German leader of the Enlightenment, wished there might be men in every land "who had advanced beyond the prejudices of the populace, and knew exactly when patriotism ceased to be a virtue." [5]

Voltaire found the condition of the human race such "that to wish the greatness of one's own country is to wish ill to its neighbors." [6] Goethe, probing into the question what it means to love one's country and the question what it means to be a patriot, stated his conclusions in a rhetorical question: "If a poet is busy all his life fighting evil prejudices, removing narrow views, enlightening the mind of his people, purifying their taste and ennobling their opinions and thoughts, how could he do better or be more patriotic?" [7] Two years previously, this enlightened man and lover of justice had written: "National hatreds are peculiar things. You will always find them strongest and most vigorous among the lowest stages of culture." [8]

THE DEVELOPMENT OF PROFESSIONAL PATRIOTISM

Critics of the tendency to enshrine patriotism as an absolute and unconditional virtue, to which even conscience must make obeisance, have themselves been rather extreme in their strictures.

[5] Quoted in T. Ziegler, *Die Geistigen und socialen Strömungen des Neunzehnten Jahrhunderts in Deutschland*, Berlin: G. Bondi, 1899.

[6] *Dictionnaire Philosophique*, art. "Patrie."

[7] Conversations with Eckermann, March 1832.

[8] *Ibid.*, March 14, 1830.

Leo Tolstoy, Christian and pacifist that he was, wrote:

> If patriotism is good, then Christianity, which gives peace, is an idle term, and the sooner this teaching is eradicated, the better. But if Christianity really gives peace, and we really want peace, patriotism is a survival from barbarous times, which must not only be evoked and educated, as we now do, but which must be eradicated by all means. . . .[9]

Our own bold American thinker, Thorstein Veblen, poured out his phials of wrath in the following statement, explicitly recognizing the social and economic developments that characterize the world we live in today:

> Into the cultural and technological system of the modern world, the patriotic spirit fits like dust in the eyes and sand in the bearings. Its net contribution to the outcome is obscuration, distrust, and retardation at every point where it touches the fortunes of modern mankind. Yet it is forever present in the counsels of the statesman and in the affections of the common man, and it never ceases to command the regard of all men as the prime attribute of manhood and the final test of the desirable citizen. It is scarcely an exaggeration to say that no other consideration is allowed in abatement of the claims of patriotic loyalty, and that such loyalty will be allowed to cover any multitude of sins.[10]

The choleric Dr. Samuel Johnson, irascible and dogmatic as always and lacking the patience for fine discrimination, made short work of the whole matter when he exploded with his celebrated dictum: "Patriotism is the last refuge of a scoundrel." One need not agree that this is *all* that patriotism is, or properly conceived can be; but it is hardly deniable that all too often patriotism has been conceived of, and preached as, an absolute—indeed almost as a religion, in the sense that Fascism, National Socialism, Soviet Communism, and Falangism have been quasi religions.

Such a view, or one might say perversion, of the patriotic ideal makes it irreconcilable with *any* defensible ethical ideal. Indeed, patriotism so conceived is not a rational ideal at all. Its appeal is not to the mind, or to the ethical sense and judgment of individuals, but wholly and powerfully to their emotions. Its roots are in the dim prehistoric past, when men were pitifully terrified of nature, and even more terrified of other men; when their hunger for security aroused the herd instinct and drove them together into mutually hostile tribes.

The *effect* of patriotism upon the individual's emotions, as well as its appeal to emotion, is intensely powerful; and this is equally true whether we speak of true patriotism, with its ethical ideal of sacrificing the individual's selfish interest for the sake of the broader good of his country, or of patriotism in the perverted caricature the professional makes of it, distrusting and hating all who are different. The trumpet call of patriotism can easily lull the individual's moral sense to sleep. Regarded as an instrument of policy it has been of great use to the virtuoso "professional patriot," whether he was (or is) called Napoleon, Mussolini, Hitler, Stalin, Franco, Senator Whoever-it-is, Publisher Jones, the master of a great chain of newspapers, or anyone else.

THE ANTIQUITY AND STEADY PERSISTENCE OF PROFESSIONAL PATRIOTISM

The professional patriot is nothing new. Conspicuous examples from earliest history suggest themselves without effort. One need go no further back than the captivity of the ancient Jews

[9] Leo Tolstoy, Letter to Manson, 1896, *Patriotism or Peace.*

[10] Thorstein Veblen, *The Nature of Peace*, New York: The Viking Press, 1919.

in Egypt: Pharaoh was a professional patriot. The ancient Hellenes were not yet a Greek nation, belonging as they did to prenational city-states like Athens and Sparta. Yet, as professional patriots they hated and distrusted not only their non-Hellenic neighbors but also each other. It may be said that (apart from the shifting alliances and confederacies which even professional patriots, chameleonlike, have to this day always countenanced) their only common political ground was in their sharing the professional patriot's xenophobia. It was the *Greeks*, not the Athenians merely or the Spartans, who had this word for it.

The Romans started down the same path, with Cato's *"delenda est Carthago."* Later, with their political talent and institutional adaptability, they matured to the point of conceiving the Pax Romana; while the unifying and civilizing impact of early Christianity helped in opening Roman citizenship to rank outsiders, clearing the way even to imperial place for rude barbarians—natives of Illyria, Germany, and other countries which to the Italian were not only crude but alien.

The story has been the same through the centuries since antiquity. Even before the development of the modern nation-state there was really no hiatus. Early in the game the Moors burst out of their homeland in the name of a superpatriotism called Islam. Sure of their righteousness and scornful of those who professed another faith and other ideals, they swept all before them through North Africa and Spain, drunk with success until they were stopped at Tours.

Christendom, on its side and in its turn, became a superfatherland. The motivation of the Crusades was, of course, an emotional drive not dissimilar in kind and effect to the emotional drive of patriotism, though nobler because broader and derived from a generous spiritual ideal. Originally pure in conception, the Crusades soon attracted such figures as Richard the Lion-Hearted—professional soldiers rather than spiritual men; and the logical development was a new wave of bloodshed and conquest in the Mediterranean.

One reaction begot another. Suleiman the Magnificent, Sultan of the Osmanli Turks, ruled his heterogeneous empire in a way that set an example for western Europe as to tolerance of ethnic minorities and cultural dissidence. But, we are told, he was repelled by the princes of Europe, who were nominally if not genuinely Christian, when he sought admission to their circle and wished to participate in the forging of a harmonious Europe where peoples of differing stocks, cultures, and customs could dwell together in peace and amity. Thereupon, the Turk embarked on his own headlong course of aggression, embracing xenophobia with a vengeance, so successfully that the phrase, "the Terrible Turk," has become part of the languages of all Europe.

After the Reformation, during the long years of religious wars, the witches' Sabbath of professional patriotism mounted to what must have seemed a climax of frenzy. Throughout that sad period each side, without discrimination, was more notable when dominant for its fanaticism than for anything one could regard as ethics. But even this apparent climax was attained, and surpassed, again and again in the furious clashes after the full development of nation-states when professional patriotism had grown aware of itself as well as self-righteous. Successive new crescendos were achieved upon the discovery of the New World, when the Old World's great maritime powers, each holding aloft a banner of patriotism, fought each other tooth and nail for the prizes of colonial empire.

Professional patriots and minorities

But the violence of these wars has been outlasted by the smoldering fanaticism with which all the European conquering powers have treated the natives of the lands they conquered—whether their skins were black, brown, yellow, or red. This has been a continuing manifestation of that kind of professional patriotism which battens on racial antipathy, enduring unabated down to our own times. Rousseau's pleasing picture of "the noble savage" has never been more than a picture, for the delectation of philosophers, writers, and bookish stay-at-homes. The statesmen who have prepared the ground for the wars, the demagogues who have nurtured the distrust and hatred, and the men of action who have carried out the conquests seem never to have seen his picture at all.

Likewise, the bullies who have suppressed and scourged minorities have never been true patriots in any ethical sense, but only professional patriots. They have debased true patriotism, a conception originally ethical, which inspired the individual, exercising a moral judgment, to sacrifice his selfish interests in favor of the broader interests of his country and his fellow citizens. They have made of patriotism a golden calf, a blasphemous idol before which the hypnotized unthinking and the timorously unethical have been made to dance.

The history of English-Irish relations over a shockingly long period of time is but one sorry illustration of this, out of many that might be chosen. The reflection of that history in the treatment, still remembered by living Americans, that good patriotic American Bostonians once accorded to Irish immigrants in their city is a striking illustration of the power of such perverted patriotism to endure, and even to cross an ocean. The persistence of anti-Semitism in Europe and its revival by Nazi professional patriots when the memory of older pogroms had almost faded out is another example; and the transference of anti-Semitism to the United States is still another, and a grim one to think about with the memory of Dachau and the Nazi gas chambers still haunting our minds.

PROFESSIONAL PATRIOTISM IN AMERICA TODAY

It would be easy to catalogue our own present-day private organizations of professional patriots, of one kind and another, starting in either direction from a certain organization of female xenophobes who not long ago denied to a great woman singer, because she was Negro, the use of their auditorium, but who nevertheless call themselves Daughters of the American Revolution. The shades of Locke, Jefferson, and Franklin, among others, must (after quailing) have concluded that the patriotism of these ladies was a professional kind of dilute; and it seems clear, at least to me, that their only connection with the ethical ideals of the American Revolution is one of distant family descent. But it would be tedious, and unprofitable for present purposes, to construct a list of even the best-known private organizations.

The professional patriotism that flowers like deadly nightshade out of distrust and fear of those whose color, national origin, or religious faith is different is certainly widespread enough. Everyone knows this, and everyone admits it, except with respect to the particular form of professional patriotism which reflects his own fears and his own insecurity. Such blossoms of perverted patriotism may wilt, but like other weeds they revive and seem to be al-

ways with us. Our nativist "Know-Nothing" party of the 1840's and 1850's was not the first of these organizations, and we have certainly not yet seen the last.

THE INFILTRATION OF PROFESSIONAL PATRIOTISM INTO GOVERNMENT

Today, however, we are witnessing a renewal of another, and ostensibly ideological, form of professional patriotism. It slyly attaches itself to something that properly commands the devotion of all Americans, which is the welfare and security of the United States. It holds itself out as wanting to do no more than shield our country from the malevolent assaults of Communist Russia and her satellites. It has many instruments. On occasion it seems to have affected the policy and the functioning of an immensely potent agency of our government—the Committee on Un-American Activities of the House of Representatives.

That Committee was created as a standing committee by the Legislative Reorganization Act of 1946. It is the successor to a select committee first called the Dies Committee, which was authorized in 1939 by a simple resolution of the House of Representatives. At that time our immediate ideological (and immediately menacing) enemy was Nazi Germany, supported by her allies—not Soviet Russia or international Communism. The Dies Committee was continued from session to session under a series of chairmen, each of whom gave it his name during the period of his chairmanship, until its existence and powers received the more permanent form they now have.

The present Committee, like its predecessors, is authorized to conduct investigations, from time to time, of:

(i) the extent, character, and objects of un-American propaganda activities in the United States, (ii) the diffusion within the United States of subversive and un-American propaganda that is instigated from foreign countries or of a domestic origin and attacks the principle of the form of government as guaranteed by our Constitution, and (iii) all other questions in relation thereto that would aid Congress in any necessary remedial legislation.

The key terms in this charter of powers, of course, are the words "un-American" and "subversive," with respect to propaganda activities and their diffusion within the United States; and the phrase "propaganda that . . . attacks the principle of the form of government as guaranteed by our Constitution."

But what is "un-American"? And what is "subversive"? And what is "the principle" (the *single* principle) of our form of government as guaranteed by the Constitution?

It seems clear that "un-American" is an indefinable term that may be used as an epithet to characterize whatever it is one does not happen to like. To Abolitionists slavery once seemed un-American, while the Abolitionists' drive to free the slaves seemed to the South equally un-American, as an unwarrantable invasion of the property rights of Americans. Similarly, capital has considered trade unionism in this country un-American, and trade unionism has returned the compliment with regard to what it has seen as excesses of capitalism.

"Subversive," clearly enough, is whatever tends to subvert, overturn, or undermine something already established. One who advocates a change, in ideas or in institutions, is certainly attempting to subvert existing ideas or institutions. When Democrats throw Republican rascals out of office, that is subversive; and when the converse happens, that is equally subversive. It is undeniable that when a privately owned rapid transit system is taken over by a municipality, that is subversive to a certain extent of the whole institution of private property.

What of attacks upon "the principle" of our form of government as guaranteed by the Constitution? It need only be recalled that good Americans have over the years constantly advocated the most far-reaching changes in our governmental form and have successfully carried through many of them. It is hardly arguable that they were any the less good Americans for having done so.

In *Schneiderman v. United States*,[11] the Supreme Court of the United States, after noting the many changes in our Constitution since 1787, held that these "refute the idea that attachment to any particular provision or provisions is essential, or that one who advocates radical changes is necessarily not attached to the Constitution." The Court suggested, in fact, that if any one principle was essential it was freedom of thought. It may be observed, parenthetically, that freedom of thought is ethical, or moral, since it implies the individual's right and responsibility to judge what is right and what is wrong.

Dangers involved

Serious heed must be paid, I think, to the voices of those who tell us there is danger—if not unconstitutionality—in the granting of so vague and ambiguous an investigative authority to a committee armed with the immense powers of the House Committee on Un-American Activities. There is no guarantee that all members of the Committee will always be men of moderation, ethical and truly patriotic men, who will zealously avoid abuse of their power to hurt and even to destroy those whose ideas they happen to dislike.

To many it appears that the activities of the present Committee and of its predecessors, which operated under an exactly identical grant of powers, have sometimes been tainted with professional patriotism rather than with true patriotism, which is an exemplification of ethics. Among the organizations which have been investigated are the American Civil Liberties Union, the Congress of Industrial Organizations, the National Catholic Welfare Conference, the Farmer-Labor Party, the Federal Theatre Project, various consumers' organizations, publications as diverse as *The Daily Worker* and *Time*, and a whole series of private industries. These were certainly not *all* members of an international conspiracy, either Fascist or Communist, against American security.

WHAT STAND SHALL WE TAKE?

To many it appears that our country's best way to strength and security lies in being true to itself and to its own traditions and that there is poison for the body politic in the heady potion of character blackening for mere difference of opinion, on no matter what subject. Ample means exist to deal with *actions*, or even words that are used in such circumstances "as to create a clear and present danger" to our safety.

I am unconvinced that the menace of Communist Soviet Russia has anything to do with communism as an economic system, or with sovietism as a pattern of government. The Oneida Community of the last century in upstate New York, and many other Utopian experimental communities that have briefly flourished in our country from time to time, were communist in their economics and their political form; but no one has suggested that their existence, or the possibility that others might emulate them, ever threatened the security of the United States. Most observers believe that Soviet Russia is not a truly communist community, but

[11] 320 U. S. 118 (1943).

rather the ultimate development of state capitalism. Yet she and her satellites are now seen, and with reason, as a source of danger to the whole free world.

The characteristics of the world behind the Iron Curtain that create danger are precisely those which are abhorrent to ethical men, and probably abhorrent even to the submerged mass of ordinary Russians who (many believe) are more truly patriotic Russians than their masters in the Kremlin. Such Russians there must still be if there remain any Russians who even in secret make their own moral judgments as individuals, exercising freedom to think for themselves though dreading to express what they think. What has made the danger is dictatorship, irresponsible power over fellow men, the suppression of dissent—in a word the marks of the totalitarian police state, which treats individual men and women merely as pawns in a game played for power and national aggrandizement. These things are not ethical; but they are, and through history always have been, quite acceptable to the professional patriot.

Let us forswear the professional patriotism of Pharaoh, Genghis Khan, Napoleon, and Hitler. Let us hold to our own time-honored Western ethical ideals. Let us leave the laurels of professional patriotism, indicating world championship in that field, upon the brows of Marshal Stalin and his principal pawns in and out of the Kremlin. That is where the laurels now rest, despite the efforts to compete, as yet rather amateurish, of some of our own professional patriots.

Let us as Americans be ethical in our patriotism: truly loving our country as individual conscience tells us is right, and respecting the conscientious scruples of all the men and women in it who are our fellow Americans. Patriotism, in that sense, will unify us. It will make us strong, as strength needs an ethical foundation; and it will keep us so.

Barent Ten Eyck, LL.B., New York City, is a practicing lawyer. He formerly served as one of Thomas E. Dewey's chief assistants in his 1935–38 investigation of organized crime and racketeering, as an Assistant United States Attorney, and as an Assistant Corporation Counsel of New York City. He has translated from the Norwegian two novels: Andreas Haukland's The Norns Are Spinning (1928) and Hans E. Kinck's A Young People (1929).

Good and Evil from the Press

By WILLIAM ALBIG

Responsibility—The right of a newspaper to attract and hold readers is restricted by nothing but considerations of public welfare. The use a newspaper makes of the share of public attention it gains serves to determine its sense of responsibility, which it shares with every member of its staff. A journalist who uses his power for any selfish or otherwise unworthy purpose is faithless to a high trust.

Independence—Freedom from all obligations except that of fidelity to the public interest is vital.

Promotion of any private interest contrary to the general welfare, for whatever reason, is not compatible with honest journalism.[1]

THIS quotation from the editors' code of ethics well states the principle of the responsibility of the commercial press for the public welfare, which I presume implies also the advocacy of generally diffused economic well-being as a basis for the maintenance of a public capable of judicious, democratic decision making. It would seem that the editors also assume responsibility for supplying the readers' minds with such fare as will admit of a rational, balanced mind life, to the extent that the readers' abilities and potential abilities permit. The editors' statement appears to consider as unethical the exploitation, agitation, or degeneration of the readers' mind life in the pursuit of any journalist's objective, including circulations and income. This is, indeed, a statement of high principles, but somehow much current practice appears to deviate from the editors' ideal.

[1] From the Canons of Journalism of the American Society of Newspaper Editors.

In the topic assigned to me, good and evil from the press, the term "evil" has a connotation which I would not choose to emphasize in this discussion. Evil has an implication of purposely unethical behavior which does not properly characterize the fundamental attitudes of the newspaper publishers and editors of the United States. Yet much that is evil in terms of the general welfare, in terms of the progress of cultural values, and in terms of the general mental well-being of the readers, does emanate from the daily newspaper.

There have been myriad discussions of the specific evils and shortcomings of the contemporary newspaper. And because of the resentment of publishers and the frequent emotional animus of the critic, the discussions are usually acrimonious. A fresher view may be possible if we are not engaged in the subservience of contradiction, the restrictions of controversy.

PERSONAL AND IMPERSONAL FORCES

Analysis of the evolving anatomy of the press has frequently overemphasized the power of the dominant figures in the history of journalism to innovate and has overstated their responsibility for change. Again, impersonal influences have been stressed. The press today is largely the product of impersonal forces—the economics of publishing, the over-all competition, and the markets for diverse kinds of news and information. But the imprint of the decisions of the great journalists, past and present, is also found in today's newspaper. And although the impersonal pressures are stronger today than

ever before in determining the patterns of the press, the powerful publishers of the United States have some remaining areas of choice and decision. Therefore, it may not be quite futile to ascribe some measure of praise and blame and to discuss possibilities of changes, some of which could be introduced by publishers and editors who had a heightened sense of responsibility.

To some extent, change in the quality of the press could result from changing attitudes and values of the present and next generation of newspaper publishers and editors. It may be that in the not too distant future, self-interest will dictate a quest for popular leadership and power over the readers' opinions on public issues which is not now enjoyed by large sections of the daily newspaper press.

GROWTH OF THE PRESS

The ephemeral, limited-circulation papers of the Colonial period, with their emphasis on foreign news, shipping, and business news, were essentially of interest to the business and governing classes concerned with public affairs. In 1833 no paper had as many as 5,000 subscribers. In the thirties and forties the penny newspapers began to seek mass circulation, and added popular features, and by 1860 the *New York Herald* could claim to be the world's largest newspaper, with a circulation of 77,000. However, the period from 1890 to the present is the time of newspapers of mass circulation, with the now enormous coverage of 53 million daily copies.

This period covers the entire history of modern advertising in its often intricate relations to press policy. It is during this period that almost all the features and special sections of the modern newspaper have been developed. The press has been popularized for a growing literate public. It disseminates organized gossip as well as more serious news. During the first two decades of the period great circulations were achieved, in part through the espousal of popular causes and in part through the growing general interest in special features.

LOSS OF LEADERSHIP

During the past two decades public confidence in the press as a source of guidance on public affairs has waned, while the exploration of circulation-building through the servicing of public tastes for features has been enormously successful. The gap has widened between press and people, especially on issues relating to welfare legislation, popular democracy, economic issues, and the proper locus of power. In the report of the nine Nieman Fellows of 1946, professional newsmen all, it was stated:

> The American popular press reached a peak of public leadership, for better or worse, at the turn of the century. That was a period when William Randolph Hearst's newspapers could boast that they had led the nation into war with Spain. It was a period when the press gained great prestige by exposure of political corruption. Led by vigorous newspapers that took an active part in trust-busting campaigns and in championing Woodrow Wilson's idealistic conception of democracy, the press maintained its great influence through the first World War.
>
> Today the newspapers, while still powerful, have lost their leadership. Readers no longer look to them for advice and wisdom in making great decisions. The newspapers are held suspect by millions of Americans. Beginning in 1919 and 1920, two years of industrial strife and suffering for many people in the United States, underlying rifts which had always existed between the press and many readers widened into a deep gulf. There was a wave of postwar disillusionment and skepticism. The hostility of the newspapers against the reviving labor movement, their one-sided stories about the efforts of bewildered workers to raise their standards of living, their bias against social legislation, made millions feel that most of the papers were far from sympathetic to the large numbers of Americans who passed their lives on the edge of economic disaster.[2]

EVIDENCE OF WANING INFLUENCE

Evidence of the waning influence of at least the sections of the paper in which the publishers' avowed positions appear is to be noted in the general commentary to that effect by many astute observers who are professional journalists, in the repudiation of the political position of about 80 per cent of the press by a majority of voters in the past five national elections, and in the type of answers which have been collected by the pollers during the past fifteen years. Here are a number of poll results which illustrate widespread beliefs concerning the press. Even if there are doubts concerning the validity of some of the polls, the cumulative evidence is considerable.

"Do you feel that the press has abused its freedom in any way?" asked a *Fortune* poll in August 1939, and 21.3 per cent of the answers were Yes. "In what way has the press abused its freedom?" "Prejudice in general and in politics," answered 36 per cent, while 30.8 per cent declared there was too much distortion, exaggeration, and sensationalism.

"Are the newspapers you read fair in their treatment of labor news?" asked Gallup in July 1937, and 40 per cent said No.

"Are the newspapers you read fair in their treatment of political news?" asked the American Institute of Public Opinion on at least three national polls, and 45 per cent answered No in July 1937, 47 per cent said No in March 1939, and 59 per cent said No in April 1939.

"Do you think the advertisers in the newspapers you read influence the treatment of news?" asked the American Institute of Public Opinion in December 1938, and 65 per cent of the answers were Yes.

A national sample of readers appeared to be more suspicious of publishers' partiality than of unions' distortion, for when *Fortune* asked in August 1939 "Do you think a reporter's impartiality is apt to be affected by membership in a newspaper union?" some 34.6 per cent thought that it would, but 55.6 per cent declared that "fear of displeasing the boss" would destroy the reporter's impartiality. The same poll included the question "Do you believe that newspapers furnish fair and unprejudiced news about politics and politicians, about labor and labor leaders, about business and business men, about foreign affairs, about religious and racial problems?" and the answers were as shown in the accompanying tabulation.

	Yes (Per cent)	Not always, depends (Per cent)	No (Per cent)	Don't know (Per cent)
Politics and politicians	33.1	3.7	45.9	17.3
Labor and labor leaders	41.8	2.2	31.4	24.6
Business and business men	51.6	2.3	25.9	20.2
Foreign affairs	50.1	1.3	20.1	28.5
Religious and racial problems	59.3	1.1	15.5	24.1

Most of these polls were taken some years ago, but I very much doubt that the answers would be very different today. All of which would appear to add

[2] L. Svirsky (Ed.), *Your Newspaper* (New York: The Macmillan Co., 1947), p. 8.

up to something less than trusting public confidence in publishers' attitudes and behavior.

In spite of the doubts, questions, reservations, and at times animosities of readers, the newspaper has certainly not lost its customers. And the prudent publishers, secure in present prosperity, and perhaps psychologically secure in confident belief in the ultimate validity of economic conservatism, evidence little concern as to the suspicions and doubts of what they may view as the mentally and financially less stable 25 to 50 per cent of their readers.

This is not an indirect way of saying that the press should regularly agree with majority opinion. A principle that the press should always be in accord with majority opinion would represent intolerable restriction on the basic function of criticism. Yet a belief that the positions of publishers on public issues is motivated by interest in the general welfare is necessary for healthy confidence. It is the responsibility of publishers and editors to create such assurance. This is best done when it is in fact true.

SOME OF THE GOOD POINTS

Much that is good in the American newspaper is quite evident. It is free from government restraint, in contrast to the press of all the authoritarian states of the world. In this mid-twentieth-century world, this is a fact to be more cherished every year. The press is broadly based on advertising income and is therefore not dependent upon the subsidized support of faction, class, party, or group. And while there are pressures upon the press by particular advertisers, direct pressure by individual advertisers is less influential today than has ever before been true in American journalism, because of the diversity of advertisers supporting the now fewer but more financially secure dailies.

Objective reporting of news, the strengthening of the journalistic tradition of objective news reporting, has made considerable gains in the United States. In a large city daily, preeminently conservative on economic issues, certainly not evidencing zeal for a greater diffusion of the national income by redistribution, I read a large front page headline today: "TOP FIFTH GETS 47 PCT. OF MONEY; ONLY 3 PCT. GOES TO BOTTOM FIFTH. HIGHEST GROUP IN SOUTH RECEIVES 50 PCT., CENSUS ANALYSIS SHOWS." Regarding political news, Herbert Brucker has recently written:

> It is often argued, too, that in 1936 and 1940 and 1944 most of our newspapers were defeated at the polls by Franklin Roosevelt. So they were, in so far as their editorial pages were concerned. ***But they elected him by means of the objectivity of their news pages.*** For, no matter what bias in reporting may remain, our anti-Roosevelt and pro-Roosevelt papers hardly differed in that for a dozen years they covered their front pages with substantially accurate accounts of everything the President said and did. This, and not the fulminations on their editorial pages, is what they really told their readers; and this is what elected him, as he used to say, again and again and again.[3]

In comparison to papers anywhere else in the world, the press of the United States provides an amazing variety of news in the better large city dailies, though such is usually not the case in dailies in cities of 50,000. The quantity of materials in the larger papers is enormous, obviously beyond complete reading by anyone. It has been estimated that it would take an average reader 72 hours to read the Sunday edition of the *New York Times*, exclusive of advertising.

[3] Herbert Brucker, *Freedom of Information* (New York: The Macmillan Co., 1949), p. 272.

The press services commerce through providing a regular daily medium for advertising. Advertising is an inevitable and necessary concomitant of the American economic system with its wide distribution of consumers' goods. The large city dailies contain about 50 per cent advertising, about 25 per cent news, and about 25 per cent entertainment features.

The newspapers of the United States are themselves a large industry and an important part of the economy. They provide regular and speedy news, although the factor of speed is not so significant now as it was before the development of radio.

The newspapers do bulwark against encroachments on civil liberty by governments. Although it is true that perfervid screams from the press about freedom of the press must usually be interpreted in terms of motivations other than abstract dedication to freedom, this fact must not depreciate the press contribution to freedom.

The press provides a very great deal of entertainment to engage some of the increasing leisure of the readers.

These are among the impressive contributions of the newspapers in the United States which have made our readers the most enlightened and best informed in the world.

CONTROLLING POSITION OF COMMERCIAL PRESS

As the significant press of the United States has been the commercial press, there is every indication that commercial newspapers will remain in almost exclusive control. Alternative backing is suggested from time to time. The idea of a labor daily, proposed occasionally by the unions, is not implemented. Of the church papers, the most powerful, the *Christian Science Monitor*, excellent though it is, requires church subsidy for survival. The adless papers, a suggestion cherished by reformers for decades, had an ambitious trial run for six years in *P. M.*

So it is evident that the decisions of the powerful and prudent publishers of the commercial press will determine the content of the newspaper of tomorrow. Therefore, the attitudes of publishers and editors, agreements by publishers for standards of self-regulation, and the assumption of responsibilities for additional services to readers are crucial.

CHARGES OF IRRESPONSIBILITY

Publishers and editors may believe that they are assuming full measure of responsibility of press to public. Yet many have noted a growing lack of responsibility in newspapers. Erwin Canham, editor of the *Christian Science Monitor*, has said: "The gravest fault in all of us is a kind of irresponsibility. That is one word which spells to me the greatest need in the American Press."[4] Most frequently, lack of responsibility is charged regarding sensationalism, overrepresentation of economic conservatism, careless printing of false or inaccurate information, invasion of private rights in news accounts and pictures, overemphasis on conflict and violence, cheap entertainment, whipping up of unjustified hysteria, and the like. But there are more fundamental responsibilities of the press to which specific charges relate. A more ideal press must assume responsibility for the maintenance of: (1) a decent respect for the opinions of mankind, (2) instruction and education of the reader, (3) an open forum, (4) freedom of

[4] L. Svirsky (Ed.), *op. cit.* note 2 *supra*, p. 13.

communication, and (5) interpretation and guidance amidst the glut of news.

RESPECT FOR PUBLIC OPINION

It is possible to combine respect for the matured opinions of large publics, especially on matters of principle and of sentiment, with a slight regard for transient, ephemeral, ill-founded, uninformed popular expressions. It is also possible to concentrate on the foibles of popular mind life so that respect for the opinions and judgment of the common members of large publics decreases. Such disrespect may be theoretically sincere or practically cynical. For five decades, the newspapers have been purveying human interest materials, comics, features, and organized gossip. In our day, much of the contents of periodicals, radio, and motion pictures, as well as of most newspapers, evidences something less than a pristine belief in the rationality of the common man.

It is an occupational hazard of the opinion industries that success in manipulation corrodes faith in the quality of the mind life of the large publics. To some extent the traditions of journalism have saved the practitioners from the extremes of disrespect to be found in radio. Interestingly enough, the professional pollers, dealing regularly and directly with the opinion responses of their subjects, develop a respect for the significance of popular opinion.

> Men by their constitution are naturally divided into two parties. 1. Those who fear and distrust the people and wish to draw all power from them into the hands of the higher classes. 2. Those who identify themselves with the people, have confidence in them and consider them as the most honest and most safe, although not the most wise, depository of the public interests. In every country these two parties exist—and they will declare themselves.

The fundamental issue of his day, as thus succintly and clearly stated by Thomas Jefferson, remains a central and intensified issue today. It is more difficult to discern man's faith or disdain for the opinions of his fellows than in the days of the Jeffersonians and Hamiltonians. But nonetheless it remains an issue on which men sharply divide as to their fundamental attitudes, now as then. In our day the attitudes are more often hidden. A fundamental faith in the efficacy of popular opinion may be partially concealed in an age when much has been done to make the common man appear irrational and even silly; and a disdain for popular opinion may be hidden in an age when there are goods to be sold, electorates to be wooed, publics to be cajoled, and personal legends to be built. In the United States, in the middle of the twentieth century, these attitudes must often be discerned through a cloud of protestations of faith in the opinions of large publics.

A climate of opinion unfavorable to confidence in popular opinion frequently exists among men most eminent in the fields of publicity, advertising, propaganda, and the managers of mass media. Believers in their own superior judgment, in moral relativism, and in the rights of the mentally alert, they may underestimate the significance of meaningful popular opinions at crises. These attitudes are understandable in terms of the experience of the directors of mass media in seeking appeals to ever larger audiences with ever lower common denominators. But the standards of intelligence, taste, and ethics of the larger publics are also, in part, a product of mass media. Here is the obvious dilemma. However, responsibility rests on those who would assume power over opinion. What the managers believe about the intelligence of common men is a prime factor in their decisions as to whether the minds of the readers or listeners should be propagandized and manipulated or developed and informed.

Defense of collective judgment

Today the forces arrayed against the liberal assertion of the worth, the dignity, and the significance of the opinions of the individual personality are more formidable than at any time in the past two centuries. A great deal of modern psychological theory has tended to remove much of the dignity and significance of human life. Much anti-rationalist evidence appears convincing. Romantic idealization of the common man has been cut down in the cross fire of modern realist descriptions. Political ideologists of various authoritarian types elsewhere in the world are busily engaged in churning publics into masses. Communist and fascist ideologies alike reject belief in the significance of the common man and in democracy. Yet, withal, respect for collective judgments can be defended. "What we need is the belief that the mass of common men are, in the long run, less likely to be wrong than the individual judgment of any superman, or the limited judgment of any self-appointed elite." [5]

And it may be argued that the reason for that ultimate superior judgment is to be found less in wholly rational analysis than in sentiment.

> The common people, as a rule, live more in the central current of human experience than men of wealth or distinction. Domestic morality, religious sentiment, faith in man and God, loyalty to country and the like, are the fruit of the human heart growing in homely conditions, and they easily wither when these conditions are lost. . . . The originality of the masses is to be found not so much in formulated idea as in sentiment. In capacity to feel and to trust those sentiments which it is the proper aim of social development to express, they are, perhaps, commonly superior to the more distinguished or privileged classes.[6]

Therefore, a proper respect for the opinions of mankind forbids the editor to cheapen and corrupt the sentiments. The sentiments can be burlesqued into absurdity or cultivated into a sound basis for democratic political action.

INSTRUCTION AND EDUCATION OF THE READER

Generalizations about the inadequacy of newspaper content for the instruction and education of the reader are vulnerable to denial, for the press ranges from the superficiality of fragmentary items in the most fugitive tabloid to the rich fare of the *New York Times*. However, the papers providing a quite rich fare have total daily circulations of not more than a million, about 2 per cent of the national circulation. It is true that since Jefferson wrote "The press is also the best instrument for enlightening the mind of man, and improving him as a rational, moral and social being," other means of mass communication have come to share the responsibility. Yet, as the principal dispenser of mass communication, the newspaper publisher must accept a larger responsibility for popular education. The motion pictures have long proclaimed their role as entertainment, and the radio is immature and laggard in public service programs.

The immediate rejoinder is that a commercial press will provide the content demanded by the readers; that, as the British Royal Commission on the Press states, "If a newspaper does not

[5] C. J. Friedrich, *The New Belief in the Common Man* (Boston: Little, Brown & Co., 1942), p. 31.

[6] C. H. Cooley, *Social Disorganisation* (New York: Charles Scribner's Sons, 1909), pp. 135–36.

reflect the limitations and prejudices of at least a considerable section of the public, it will soon cease to exist, for it will find no buyers." But to what extent does the press itself modify the demands of the readers, and what are the variables of influence and the degree of responsibility now assumed by publishers at each level of the press from tabloid to *Times?* Certainly the methods of instruction must vary with the reader group, but the editors' continuing responsibility is constant. Not all newspapers can maintain the same standards, but must adjust to their publics. And very large sections of the public, in part encouraged by the press, have become preoccupied with entertainment, confused amid the political charges and countercharges, and inadequately concentrated on facts essential to rational decisions on public affairs. Dr. George Gallup has recently reported on some astoundingly widespread areas of ignorance concerning foreign and domestic affairs.

What about the role of the newspaper in this situation? The historical function of the newspaper has been to keep the public informed about issues of the day. It is, in a very real sense, "the schoolmaster of the people." But have the newspapers of the country lost a sense of mission in this respect? Have they begun to worry too much about having the most popular comic strips and the most complete sports pages, and too little about keeping their readers interested in, and informed about, the important problems of the day? [7]

In another poll of copy-desk chiefs, concerning the quality of presentation of news of foreign affairs, which may be part of the reason for the astonishing ignorance of so many readers, these working newspapermen rated the readability of such news lower than that of any other type of news. Vastly concerned with the readability of popular features of newspaper content, editors may give scant attention to the quality of news writing on such public affairs as interest but a small proportion of readers. Concerned with the interests of the maximum audience,

When a journalist says that a certain event is news, he does not mean it is important in itself, often it is; but about as often it is not. The journalist means by news something that has happened within the last few hours which will attract the interest of the customers. The criteria of interest are recency or firstness, proximity, combat, human interest, and novelty. Such criteria limit accuracy and significance.[8]

Again we come to the attitudes and values of publisher and editor. It is exasperating to publisher and editor, amidst busy lives, to be charged with such diffused responsibility; but the increased education of readers can occur only as publishers seriously review their papers' contents and exert steady pressure for the gradual improvement in the instruction of readers.

MAINTENANCE OF AN OPEN FORUM

The newspaper as a quasi-public agency has the responsibility of maintaining a reasonably open forum for the discussion of significant public issues. Obviously, this does not mean responsibility for publishing everyone's ideas on all topics, regardless of importance of the subject or regardless of the market for the ideas in the readers' interests. It does mean the duty to present important topics of general interest, and to indicate significant ideas which may be contrary to those of the publisher.

It is often claimed that the fundamental restriction on diversity of expressed viewpoints is the fact that there

[7] George H. Gallup, "What We Don't Know *Can* Hurt Us," *The New York Times Magazine,* November 4, 1951, p. 51.

[8] Commission on Freedom of the Press, *A Free and Responsible Press* (Chicago: University of Chicago Press, 1947), p. 55.

are a diminishing number of papers and that the remaining dailies are largely controlled by individuals who share the same points of view on matters of economics and on the appropriate locus of power. But, as Raymond Nixon has ably argued, an increase in numbers of competing commercial newspapers does not guarantee diversity and quality of content. Nixon notes that the number of competitive daily newspapers will continue to decline, but that the one-publisher town is not an evil in itself—it all depends on the publisher.[9] Moreover, concentration is likely to be carried further because local businessmen, who contribute 40 to 50 per cent of the gross income of newspapers, rather like newspaper monopoly, as they believe that the job of advertising is done more economically that way.

In any case, the important issue is not solely the need for competition. Nixon declares, "What is needed, above all, is a higher quality of content, coupled with a journalistic effectiveness that will assure this content being read and understood." [10] And he believes that well-founded criticism by specialists, based on a more exact science of communication, will have an impact on publishers which past criticism has not had; and that the increasing suspicions of the general public will engender an extensive critical spirit which will have results on all the mass media. Let us hope so. In any case, for any foreseeable innovations we come back once more to the attitudes of publishers and editors.

They must therefore themselves be hospitable to ideas and attitudes different from their own, and they must present them to the public as meriting its attention. In no other way can the danger to the mind of democracy which is inherent in the present concentration be avoided.[11]

RESPONSIBILITY AND FREEDOM

The newspaper for entertainment had not developed when the theorists of democracy were establishing the legal basis of freedom of the press. Certainly they could not envisage the newspaper in its gossip activities, the emotional sensationalism, the cameraman prowling among faces contorted by grief, terror, horror, vacuousness, and fear, the world of the comics, columnists as name-callers, the concentrated power of great publishers. The Founding Fathers' concept of freedom was essentially that of freedom from governmental restraint. This was protected. Beyond this essential protection, their theory was based on the self-righting process, that truth would emerge from competition, that excess would call into being the answer or antidote. They could not envisage the need to relate freedom to responsibility. Yet today the dilemma is how to achieve responsibility while protecting the essential freedom. The issues were brilliantly examined by W. E. Hocking.

As with all freedom, press freedom means freedom from and also freedom for.

A free press is free from compulsions from whatever source, governmental or social, external or internal. From compulsions, not from pressures; for no press can be free from pressures except in a moribund society empty of contending forces and beliefs. . . . The free press must be free to all who have something worth saying to the public, since the essential object for which a free press is valued is that ideas deserving a public hearing shall have a public hearing. . . . There is an antithesis between the current conception of the freedom of the press and the accountability of the press. Accountability, like subjection to law, is not necessarily a net subtraction from liberty; the affirmative fac-

[9] R. B. Nixon, *Communications in Modern Society* (Urbana: University of Illinois Press, 1948), p. 51.

[10] *Ibid.,* p. 53.

[11] *Op. cit.* note 8 *supra,* p. 93.

tor of freedom, freedom for, may be enhanced. . . . The situation approaches a dilemma. The press must remain private and free, *ergo* human and fallible; but the press dare no longer indulge in fallibility—it must supply the public need.[12]

This basic issue must now be left on a note of query.

INTERPRETATION AND GUIDANCE

The first American newspaper stated, "It is designed that the Country shall be furnished once a month (or if any glut of occurrences happen, oftener) with an account of such considerable things as have arrived unto our notice." The glut of occurrences of the past thirty years has brought not only daily and almost hourly news, but also great public confusion and inability to clarify and interpret the news. The newspapers' contribution to clarification has been the editorials, the columns, the magazine sections, and special interpretive features. Amidst the confusion of mind life and values which characterizes contemporary intellectuals, academicians, men of politics and action, and the general public, we cannot properly demand that publishers and their employees single-handedly chart the road to clarity and culture integration. But they have a responsibility to provide a good quality of simplifiers, explainers, and popular interpreters.

A great many of our columnists, cherished by publishers as the name-callers and hatchetmen, the *condottiere* of attack on individuals and of permanent regular barrage against innovation and reform, can hardly be classified as clarifiers. True, they are the creatures of their faithful publics, which cherish the epithets of the masters. And so I suppose, in some degree, supplying the market for specialists in personal attack is inevitable. So, too, with the providers of gossip, the advisers of the harried, and the specialists in interests and entertainment. But where are our popular clarifiers, dominated by concern for the public interest, devoted to rationality, wary of special interest, determined to expose fundamental relationships? A few intermittently sincere attempts are evident, but superficiality is a most evident defect. High-quality explanations by specialists are provided in the features sections of a few of our great newspapers. For the rest, there is neither current market nor supply. It is not surprising that a matured profession of columnist-clarifier has not developed. The great need for such is recent; the necessary qualities of training are ill defined, and public response untested.

TO BRIDGE THE GAP

At the time of publication of the report entitled *A Free and Responsible Press,* Mr. Wilbur Forrest, president of the American Society of Newspaper Editors, wrote: "Are we to sit quietly by and permit people who have very little knowledge of the working of newspaper publishing or editing to preach so-called reformation blindly and without the slightest responsibility?" It is not intellectual remoteness, presumption, or irresponsibility to note some responsibilities of the press which are not adequately met, though one cannot implement the analysis with concrete, detailed proposals for specific reform. Certainly I have no plans for the improvement of the press, no particularistic reforms, no practical suggestions as to how to make more income while increasing responsibility for the readers' interest. Only the professionals can properly implement reforms.

The pattern of the commercial press in the United States has changed a great deal during the past 150 years.

[12] W. E. Hocking, *Freedom of the Press* (Chicago: University of Chicago Press, 1947), pp. 228–30.

There is no reason to assume that it is now static. The press is too public an institution to sustain a permanent schism between reader and publisher. If at least the large proportion of readers now alienated do not reform from what so many publishers currently assume to be erroneous beliefs and the following of false economic and political doctrines, it is likely that another generation of publishers will seek for leadership in espousing the popular causes.

It is also possible that economic changes based not on the preferences of publishers but on objective realities of a rapidly changing economy may make obsolete the present discrepancies between publishers and the opinions, views, and interests of many readers. At some point there will be a cleavage between the roles of the publisher as representative of conservative economic views and the publisher as publisher in quest of reader following, not only for his comic strips and features but also for power over opinion, for deference and public status. Then, once more, publishers will campaign for what the public believes to be in the public interest.

Montaigne once wrote: "I speak truth, not so much as I would, but as much as I dare; and I dare a little more as I grow older." Is this one's cautious mood engendered by the almost invariably violent attack by the newspapers on critics from without the fold and depreciation of critics from within? Since writing this article I have reflected on my attitudes to ascertain the conditions of its writing. Was it written with even an unconscious impulse to depreciate the evil and laud the good from the press? I think not. I feel I had no especial compulsions from within or without. However, I am not a professional journalist, but have my life in an institution which cherishes freedom of expression. It would be a significant evidence of a responsible press if the professional pressmen, wayward and otherwise, without fear but without venom, made regular, responsible public criticisms of their handiwork.

Radio and Television and Ethical Standards

By Frederick C. Gruber

SINCE the Radio Act of 1912 the Federal Government through its various agencies has been attempting, within the framework of the American economic system, to regulate the radio industry so that the air waves are used for the public good. Such regulations are predicated on the proposition that the air waves belong to the people, that their number is limited by the nature of the radio spectrum itself, and that the use of these air waves by an individual or group for commercial broadcasting should be looked upon as a public trust and should be continued only as long as the daily schedule of broadcasts can show that the welfare of the general public is being served. The Radio Act of 1912 merely denied the right of any person to operate a radio station without a license from the Secretary of Commerce.

The tremendous increase in the number of radio stations, the overlapping of radio signals, and adverse court decisions denying the Secretary of Commerce the right to assign frequencies, to regulate hours of broadcasting, to restrict the number of licenses issued, or even to prevent one station from using a frequency assigned to another station caused such confusion that in 1926 President Coolidge appealed to Congress to enact a comprehensive radio law.

The Radio Act of 1927

. . . proclaimed that the air waves belonged to the people of the United States and were to be used by individuals only with the authority of short-term licenses granted by the government when the "public interest, convenience, or necessity" would be served thereby. A temporary Federal Radio Commission was created to administer the law.

Advertising abuses also engaged the attention of the new Commission which stated as its policy that: "Advertising must be accepted for the present as the sole means of support for broadcasting and regulation must be relied upon to prevent the abuse and over-use of the privilege." The Commission decided not to renew the license of one station in 1928 because a large part of its program service "was distinctly commercial in character consisting of advertisers' announcements and direct advertising, including the quoting of prices."

Despite the Commission's moves to control advertising, and the efforts of responsible broadcasting leaders to eliminate abuses, public reaction against overcommercialization of the air was apparently so great that in 1932 the United States Senate passed a formal resolution calling for a survey to be made of plans that "might be adopted to reduce, to limit, to control, and perhaps, to eliminate the use of radio facilities for commercial advertising purposes."

In 1934, after reviewing seven years of federal radio regulation, Congress was ready to write a permanent law embodying the "public interest, convenience, or necessity" approach which has been tried and found successful. The Communications Act of 1934 created the Federal Communications Commission with substantially the same powers and responsibilities as the earlier Radio Commission except that it was given jurisdiction over wire communication too. The 1934 statute with certain amendments remains on the books as the governing law of modern broadcasting.[1]

Self-Regulating Agencies

Responsible radio officials have recognized their duty to the general public and have developed codes or operational procedures. Each network and each station has developed its own code applicable to its specific situation, and practically all stations subscribe to the *Standards of Practice* as set forth by the National Association of Broadcasters (NAB) to which most network stations and many independent stations belong. The *Standards of Practice* is an eight-page pamphlet which sets standards covering almost every phase of radio broadcasting. A similar set of standards is now being prepared for the television industry. The general tone of the *Standards of Practice* is well set in "The Broadcasters' Creed," which is here quoted in full.

We believe

That American Broadcasting is a living symbol of democracy; a significant and necessary instrument for maintaining freedom of expression, as established by the First Amendment to the Constitution of the United States;

That its influence in the arts, in science, in education, in commerce and upon the public welfare, generally, is of such magnitude that the only proper measure of its responsibility is the common good of the whole people;

That it is our obligation to serve the people in such manner as to reflect credit upon our profession and to encourage aspiration towards a better estate for all mankind; by making available to every person in America such programs as will perpetuate the traditional leadership of the United States in all phases of the broadcasting art;

That we should make full and ingenious use of man's store of knowledge, his talents and his skills and exercise critical and discerning judgment concerning all broadcasting operations to the end that we may, intelligently and sympathetically:

Observe the proprieties and customs of civilized society;

Respect the rights and sensitivities of all people;

Honor the sanctity of marriage and the home;

Protect and uphold the dignity and brotherhood of all mankind;

Enrich the daily life of the people through the factual reporting and analysis of the news, and through programs of education, entertainment and information;

Provide for the fair discussion of matters of general public concern; engage in works directed toward the common good; and volunteer our aid and comfort in times of stress and emergency;

Contribute to the economic welfare of all, by expanding the channels of trade; by encouraging the development and conservation of natural resources; and bringing together the buyer and seller through the broadcasting of information pertaining to goods and services.[2]

Theory versus practice

From the foregoing quotation there can be little doubt as to the high intent of the radio industry. But there seems to be considerable discrepancy between theory and practice. Many radio executives are devoted to the high ideals set forth in the Broadcasters' Creed, but their devotion does not appear to be great enough to overcome the pressures that they frequently meet from competition, Hooperatings, advertising agencies, mounting costs of operation, and the demands of stockholders for sizable profits. There is also no clear definition of what constitutes good taste. High aims seem to be implemented with wishful thinking—with inadequate and mild restrictions.

While much has been done by radio stations to promote civic projects, to uncover vice and corruption, and to keep the American public informed re-

[2] *Standards of Practice for American Broadcasters* (Washington: The National Association of Broadcasters, 1948), pp. 1–2.

garding current events with a fair degree of accuracy, the approach of many radio executives toward current issues is timid and fearful. They seem to be afraid to offend anybody, especially the potential customer and those with large accounts. "Radio is not in business for its health" is a familiar phrase among financial vice presidents. To take an extreme example, "in 1935 . . . Alexander Woollcott's 'Town Crier' broadcasts were discontinued when the sponsor complained Mr. Woollcott had criticized Hitler and Mussolini, and might thus offend some listeners." [3]

RADIO AND THE SPONSOR

American radio is supported for the most part by revenue from advertising, of which there are two types: network advertising and local advertising. About twenty-five agencies handle most of the 200 million dollars spent annually for big network advertisers. Of the 241 national advertisers on the four national networks in 1949, five major advertising groups accounted for almost three-quarters of the total network time sales. They were (1) Food and Food Products, (2) Toilet Goods, (3) Smoking Materials, (4) Drugs and Remedies, and (5) Soaps and Cleaners. Procter and Gamble spent over 17 million dollars, which represents almost twice as much as the next two advertisers combined.

When advertisers spend such sizable sums for advertising, it is not surprising that they tend to exercise considerable control over the content of the programs they sponsor. Advertisers are out for sales. They are interested that their message be carried to the largest number of potential buyers possible. The whole program is built around the commercial, the entertainment being calculated to induce the listener to stay with the program until the next commercial announcement. Advertisers by and large are not interested in the welfare or interests of minority groups or in the advancement of American culture or taste. One radio executive described "good taste" by saying: "We don't want anything that would be offensive. We don't want anything improper, that couldn't be heard in the home." [4]

Such a point of view makes radio programming entirely subservient to the undiscriminating taste of the general public, with very little chance for improvement. Procter and Gamble probably has more to say about what the American public will hear than any other single organization in America.

Sponsors often use their commercial time to promote their own particular views with regard to social, economic, and even political questions rather than to use the time for a description of their product.

In 1944 the du Pont Company used its commercial advertising period on "Cavalcade of America" to explain its side of a suit filed against it by the United States Department of Justice. Other examples of the misuse of air time to propagandize in the interest of individuals and groups are cited in the publication of the Federal Communications Commission.[5]

In 1946 the trade magazine *Broadcasting* queried radio station managers throughout the nation to determine what factors or agencies had most retarded the improvement of broadcasting. The station managers overwhelmingly laid the blame at the doors of the advertising agencies and the sponsors. "Yet by law, the licensees, not the advertisers who buy time, are entrusted with the responsibility of determining what we shall hear." [6]

Attempted improvements

In order to correct these abuses the radio industry has drawn up a great many restrictive rules. For example, the NAB *Standards of Practice* suggests how much advertising time should be allowed for each broadcast period, that no advertising copy should be approved without positive proof of the truth of its statements, that the word "cure" should never be used in drug advertisements, that advertising copy should never be so placed that it could be mistaken for a news item, and that whereever possible the newscaster should not read the commercials. These suggestions, however, are negative in their approach, and many of them are constantly violated.

Bad as radio commercials may be, it must be said for the industry that they are generally of higher quality and veracity than the type of advertising permitted in the tabloid newspaper and the pulp magazine. Any comparison of press and radio advertising would show that considerably more care is used in the investigation of the claims of the product by radio program departments than is exercised by some types of publications.

It is not so much the commercials as the cheap quality of the fill-ins that offends the listeners. One step in the right direction, it seems, is the building of a balanced program by the network programming departments and the development by the networks and their affiliated stations of package shows which are offered for sale to sponsors at such times as fit into the program pattern. Such a practice will return the responsibility for programming to the broadcasters, where it legally belongs.

NEWS AND FREE SPEECH

In a lengthy discussion of censorship and free speech, Robinson concludes: "In the traditional sense there is no such thing as free speech in radio today. Furthermore it is unlikely that there ever can be. . . . What is there then, if there is no free speech in radio? Free hearing." [7]

These statements seem to imply that the *only* defense the American public has against current radio and television fare is to turn it off—a truly negative point of view, especially considering the fine phrases of the Broadcasters' Creed.

Any thoughtful person will realize how news is slanted by news analysts and even by newscasters and news commentators.[8] The danger of such news slanting becomes especially acute when both press and radio in the same area are controlled by the same interests. Then, too, large corporations have been known to keep commentators on the air even when their Hooperatings have fallen far below those of other commentators whom they have dismissed, because the former express the political and economic point of view of the sponsor.

In a searching discussion of "Freedom of Speech on the Air," Siepmann cites a survey of radio news reporters in an issue of *Variety Magazine* dated July 25, 1945, to the effect that of 30 reporters studied, 12 were conservative

[8] Mr. Kaltenborn is a news analyst. Lowell Thomas is a news commentator. A newscaster merely reads the news as it is assembled from the wires of the Associated Press or the United Press.

(5 extreme reactionaries), 8 liberal (mildly so), 6 middle-of-the-roaders, 1 independently liberal, none extremely liberal, and the rest defying classification.[9] Were the survey to be made today, it is likely that the proportion of conservatives would have increased.

In order to avoid criticism, the Columbia Network has declared that it has no editorial policy. Another suggestion is that each network should have a battery of news reporters representing different points of view. This latter suggestion is more positive, in theory at least. It would appear, however, that many radio stations are so afraid of being accused of being biased that they become ineffectual in the performance of their duty to the public. When the station has no editorial policy it leaves its air waves wide open to the sponsors, who usually have a very definite one. There is no harm in a station's having a point of view, openly acknowledged and openly expressed, provided that listeners in its service area have an opportunity to hear opposite points of view sincerely expressed at times convenient to them. Radio stations that have taken definite stands on public issues, especially on the local scene, have earned the gratitude of the communities they serve.

A type of program once popular but now losing its appeal, perhaps rightly, is the forum discussion of topics of current interest. Of course these programs are forums and town meetings in name only. A few chosen individuals, scarcely ever equally matched in ability or background but allegedly so, discuss a topic (often stated so that it begs the question) either among themselves, oblivious of the radio audience, or with a period for questions from the floor. Most of the forums, both sponsored and sustaining, produced in commercial stations are looked upon as entertainment. The show was "terrific" if the participants lost their heads, yelled at each other, and generated enough heat to melt the microphones. The program director of one of the nation's largest stations has a motto: "Never let your speakers agree." Conclusions are seldom reached. The moderator usually remarks that the speakers have "explored the subject and the decision is left up to the listeners"—which of course they have already made, usually before they tuned in the program. In all fairness it should be said that many universities do a better if less spectacular job. The Chicago Round Table is a notable example, but its Hooperating is quite low.

[9] Charles A. Siepmann, *Radio's Second Chance* (Boston: Little, Brown and Company, 1946), p. 100, also Chap. IV, pp. 80–133.

Access to the air

Access to the air is by no means everywhere the same. Minority groups, racial, religious, and political, are frequently denied time on the ground that radio as a mass medium must appeal to the majority. But the success of democracy depends upon the encouragement and protection of the minority, for it is often within the minority groups that the seeds of progress are sown and nurtured. Even large groups are often denied free access to the air. Until recently, labor found it very difficult to secure air time. Fortunately this situation has been remedied.

According to Robinson, the networks, in order to handle this difficult problem, base their policy on five premises:

(1) that since frequencies and broadcasting time are limited and since the chains have been granted a public franchise within this scarce supply they should have no editorial opinions; (2) that, except in political campaigns, time should not be sold for the primary purpose of opinion expression on matters of national import because of the great disparity among individuals and groups in their ability to purchase such time; (3) that when editorial opinions on important issues are expressed during a commercial program the advertiser should provide an equal opportunity for an answer; (4) that only bona fide representatives of substantial groups should be given the privilege of speaking on the network; and (5) that in the event time is accorded free, both sides of controversial subjects should be represented.[10]

There is, of course, a point here, because, unlike the public square where the supply of soapboxes for orators is practically limitless, in radio and television there are comparatively few available channels; so broadcasting over them is a responsibility that cannot be lightly granted by the station or assumed by the broadcasters. Fortunately the bulk of the time of American radio is devoted to entertainment, and the large number of independent stations prevents the control and systematic limitation of free speech by a small group. Then, too, it must be remembered that radio is not the only tool for molding public opinion.

[10] Thomas Porter Robinson, *op. cit.* note 4 *supra*, pp. 83–84.

[11] *Reader's Digest*, Vol. 59, No. 356 (December 1951), p. 59.

CHILDREN'S PROGRAMS

One of the weakest spots in radio-TV today is programming for children. Except for a few notable examples ("Let's Pretend" is one), the network entertainment for children consists of a schedule of horror on the one hand and saccharine condescension on the other. A survey of television offerings in the Los Angeles area during the first week of May 1951 revealed a total of almost 700 crimes, 82 per cent of which were committed before 9:00 P.M.—that is, before bedtime for most children.[11]

It is not because of lack of standards that this is so. In 1942 the Federal Radio Educational Committee published a notable pamphlet in which the basic purposes served by children's programs were reported as follows:

1. Radio programs should convey to children, or reinforce among them, the commonly accepted moral, social, and ethical ideals characteristic of American life.
2. Radio programs should contribute definitely and specifically to healthy personality development in children.
3. Radio programs should, by excellent showmanship, provide children with opportunities for relaxation, entertainment, and pure enjoyment.[12]

The pamphlet then continues to set forth specific criteria under each category. These criteria are repeated in slightly modified form in the *Standards of Practice* of the NAB.[13]

All the networks have extended codes for children's programs, that of N.B.C. being most worthy of comment for its implementation of these standards; but here again, many of the regulations are stated in the negative. The Mutual Broadcasting System, with its series of adventure programs for children, has been under greatest fire, and deservedly so. M.B.S. contends that right always triumphs; but it is to be doubted whether the thirty seconds wherein the criminal is brought to justice at the end of the program has much effect after the twelve, and in some cases twenty-five, minutes of exciting carnage and mayhem which precedes it. Such programs as "Superman" are now supposed to be purified because the hero now devotes himself to solving modern social problems. But it is rather dangerous for youngsters to get the notion that

[12] Howard Rowland, I. Keith Tyler, and Norman Woelfel, *Criteria for Children's Radio Programs* (Washington: Federal Radio Education Committee, 1942), p. 9.

[13] *Op. cit.* note 2 *supra*, p. 4.

one can set the world straight by liquidating all one's enemies.

Here again it seems that the radio networks realize their responsibility on paper but do very little about it. This is not true of the local stations, especially those commercial stations which work closely with local school systems, or of the educational stations operated by colleges, universities, and school boards. The problem is an acute one, not to be dismissed lightly. As Reinsch writes:

> Juvenile programs present an interesting challenge to the local radio station. It is well to remember that the adult audience in the years to come will be developed from the juvenile listeners of today.[14]

A Positive Approach

It would seem from the above discussion that radio and television broadcasters have been regulated almost to the point of impotence not only by the Federal Government but also by themselves, and that by surrendering in large measure to the sponsor and advertising agencies they have neglected their duty to the general public whom they are licensed to serve. In order to keep radio and television up to American cultural and ethical standards, two things are needed: a positive policy and vigilant, vocal critics.

Dr. Franklin Dunham, chief of radio and television of the Office of Education, has submitted a manuscript which he calls "A First Draft of a Declaration of People's Rights in Radio and Television," which is herewith quoted in full.

> Radio and television enter American homes and classrooms as the greatest potential for good that the world has ever seen or heard. In order to realize this potential, fundamental rights of the American people must be maintained. These rights include:
>
> 1. The right to free communication with the world as it exists.
> 2. The right to receive news, clear and free from color or bias.
> 3. The right to hear as many sides as there are within a question discussed with utmost freedom.
> 4. The right to the information, education, and entertainment being sent over the air.
> 5. The right to wholesome entertainment as an escape from the problems of the workaday world.
> 6. The right of every citizen to find satisfactory radio and television fare, appealing to some legitimate interest whenever he wishes.
> 7. The right of all levels of taste, within the standards of decency, to be served through the medium of radio and television.
>
> In order to secure these rights in a democracy it is incumbent upon those who render such service not only to consider "what the people want" but also what they would want if they knew about it. The responsibility for serving the American people rests upon those who operate our stations and is regulated by the Federal Communications Commission. Not only educational stations operated by school-systems, colleges, and universities have this responsibility but also commercial stations which operate in the public interest, convenience, or necessity. Radio and television as an educational force deserve the wholehearted and generous support of everyone engaged in the educational task in our country. These media should be the ally of good government and all healthy forms of recreation.
>
> Erecting the structure of our service to the American people upon this basis, our country can assume its rightful place among the civilized nations of the world, gaining from the old the strength of their many cultures and intermingling it with the vigor and the progress of the new.
>
> So shall we, through the media of communications, share our ideas, our thoughts, and the results of our labors, with those willing to share with us. Thus radio and television will reach their highest affirmation in bringing about a world citizenship in a community of like minded and equally responsible nations.
>
> To these ends and purposes we devotedly pledge our hearts, our minds, and all the resources of our human natures.

[14] J. Leonard Reinsch, *Radio Station Management* (New York: Harper and Brothers, 1948), p. 53.

Dr. Dunham's "Declaration," with its crusading spirit, is a step in the right direction. It deserves wide circulation. It should instigate a rethinking of radio programming by American broadcasters, in line with the trust which they have assumed, to use the air waves "in the public interest, convenience, or necessity." This implies a devotion to the continuing improvement of American cultural and ethical standards. The British Broadcasting Corporation has such a positive policy and provides three separate networks to care for the diversified tastes of the British public, from music hall quips to the reading of Milton's *Paradise Lost*.

Radio and television need competent and vigilant critics. Fortunately such critics exist. John Crosby and Jack Gould delight thousands with their searching, though humorous, comments on radio and television. Leading magazines frequently carry critical articles on the subject. Various national organizations publish lists of things to view and to listen to. Notable is the little publication, *Lookables and Listenables*, of the National Council of Teachers of English. Listener groups are springing up throughout the country. Among the most effective are the Radio Council of Greater Cleveland, the Wisconsin Association for Better Radio Listening, and the Radio Listeners of Northern California. These groups develop standards, audition and criticize radio-TV programs, publish lists of recommended ones, encourage study and discussion of radio-TV offerings, and exert whatever influence they can to improve program content. There should be an organization for radio-TV listening in every community. Public schools of the more progressive type are developing courses in radio-TV program appreciation and discrimination.

Responsibility of the Industry

But the main responsibility for the improvement of broadcasting lies with the industry itself. Radio-TV stations virtually monopolize the nation's air waves. These admittedly belong to the people; yet the American public can express itself on the air only in conformity with the interests and policies of the broadcasters, who are motivated all too often by a desire for large profits. Each of the major networks has its own characteristics and excellencies which should be developed to serve the various interests and needs of all the people. But the tendency is toward competitive simultaneous broadcasting of similar programs. What the public gets on the air is what the broadcasters want to give them. Ratings merely show the listeners' choice of what is offered.

To view programs as entertainment is not conducive to building a national culture. Many a good public service program has lost its character and effectiveness after it has become sponsored and has been gone over by the professionals.

Occasionally radio-TV stations promote the general welfare by coming out for pure water (who wouldn't approve of that?) or announcing stray dogs. Such programs are under the direction of the promotion or public relations department and are looked upon as publicity stunts to catch more listeners.

In many commercial stations the educational director is almost impotent. He often has little to say about what goes on the air under his direction. His programs can be swept aside at any time

by the sales department. All too frequently the station does not even attempt to secure a professionally trained educator for this post. He is subject to the public relations department and appears before many educational and other community groups to promote good will and to defend the station's policies. Yet a properly qualified individual should be one of the most valuable members of the policy-making and program-making group.

There are some notable exceptions. A few stations devote their programs to good music and straight news reporting. One station reports a documentary about a reformatory that brought about needed changes. Another vigorously promotes a safety campaign. The Junior Town Meeting League annually chooses a topic of wide interest, such as juvenile delinquency, for discussion throughout the nation.

While highly commendable, these scattered programs are not enough. Radio-TV stations and networks must develop positive policies for the advancement of American life in all its desirable phases. Broadcasters should free themselves from the advertising agencies and control their own programs. They should have enough backbone to impose their own voluntary codes upon themselves. Their editorial policies should be their own, unhampered and uncontrolled by outside pressures.

And above all, broadcasters should develop a broad, positive, progressive, national program in the public interest. Under the pressure of the national emergency, the radio stations did much to develop American unity and to promote the war effort. Now they should work just as enthusiastically and cooperatively to serve the peace effort and to safeguard American liberty in the face of growing world tensions. The nation looks to the radio-television industry for leadership. Instead, it gets a singing commercial.

Frederick C. Gruber, Ph.D., Philadelphia, Pennsylvania, is assistant professor of education, chairman of the Radio Committee, and adviser of graduate majors in radio education, at the University of Pennsylvania. His articles on radio education appear frequently in national professional magazines.

Do Churches Exert Significant Influence on Public Morality?

BY F. ERNEST JOHNSON

LET it be granted at once that the question propounded in my title admits of no categorical answer. The causes of human conduct and of social phenomena are multiple, and an appraisal of any one factor must be based on broad inference, not on conclusive proof. My interest in the topic is not forensic, but exploratory. I should like to indicate some of the areas in which the churches may be assumed to be influential in developing sanctions for public conduct and to make some appraisal of the quality of such influence as they exert. To this end it is important to consider from a sociological viewpoint the nature and the limits of the influence of organized religion on social standards. Although the generalizations offered will have primary reference to Protestant Christianity, I believe they are susceptible of wider application.

SCOPE OF PUBLIC MORALITY

I am asuming that the term "public morality" is to be taken as meaning more than *the morality of the public.* It is, to be sure, related to the sum of the personal morals of the citizenry of the nation. But public morality denotes the quality of all conduct that is public in character, conduct in which the community has a recognized stake. Indeed, it is basic to this discussion that public morality is much more than a projection of the standards of private conduct. Those who see in the contemporary "wave of corruption" merely the reflection of a degradation of personal standards are, it seems to me, missing the central fact, namely, that a cultural crisis is upon us in which no clear picture of what public responsibility means can be discerned. I doubt that there is any such phenomenon as a *general* moral disintegration. What confronts all our institutions, especially those of education and religion, is the necessity of making our heritage of beliefs and loyalties relevant to a rapidly changing social structure.

The temptation to explain our present situation in terms of a character debacle is a natural one, but the explanation is too facile. It is a melancholy fact that standards of personal morals do not always reflect comparable standards of public behavior. Men who keep their pledged word and pay their debts may participate without compunction in oppressive political practices. Generous persons who readily give to charity are sometimes insensitive to the antisocial consequences of business policies that are maintained by their own proxies in stockholders' meetings. Rackets are carried on by men who seem to be exemplary in their private lives. All this means that it is not enough to teach conventional morals if we are seeking to raise the level of community life. To the extent, therefore, that the churches and synagogues fail in their *educational programs to direct* their attention to public morality as such, they may be assumed to have little influence on its standards.

It follows that, reluctant as we of the churches may be to acknowledge it, the churches have not been conspicuously successful in raising the standards of public morality; for the prevailing preoccupation of the churches

has been with individual behavior patterns rather than with group behavior. This has been notably the case where politics is concerned. The churches have no doubt been an important factor in maintaining the respectability of public office, particularly in local communities, where "clean government" is often the aim of "Christian citizenship" campaigns. But it is probably safe to say that beyond enforcing standards of common decency, the churches have on the whole played relatively little direct part in the continual building of social-moral standards. That process is the result of stresses and conflicts from which the churches tend to remain aloof. In other words, the ethical significance of the churches' ministry has been socially conservative rather than regenerative. The churches have effected the regeneration of individuals and have given them new resources for living in accord with common sanctions, but they have not, it seems to me, conspicuously influenced those sanctions themselves.

CHURCH AND COMMUNITY IDENTIFIED

There is a fundamental reason why religion is in general a conservative force. Profoundly social in cultus and ritual, institutional religion has sanctified the universal values of human experience. Viewed in the perspective of history, it has therefore been a steadying rather than a reconstructive force. In primitive society, and indeed until modern times, religious organization and expression tended to be coextensive with the community. Even today in many countries religion goes with nationality and the church is the "community on its knees." The church furnishes a powerful support for a common ethos, but it cannot be expected to be socially regenerative in any profound sense.

This is why, when attention is focused on spiritual and moral faults that have deep cultural roots, such as racial and other group antagonisms, the churches often take such a severe beating. They follow the patterns of social stratification and practice race segregation to such an extent that secular societies and agencies often put them to shame. Thus a strange paradox emerges: the very fact of the church's authentic identification with the "community" it represents tends to fasten upon it the limitations and the faults of that community.

I am speaking here, of course, of the typical church, which includes in its membership the people who come in contact with each other in secular life. It has within its fellowship "some of everybody." It is not a group observing a special moral discipline. Unlike the small "sect," which in addition to a common body of religious beliefs has a way of life all its own, the "church" is held together chiefly by an impulse to worship—supplemented, of course, by certan social and cultural attractions. The church teaches an ethic, but its organizing principle is religious rather than ethical. Its moral standards are shared with the community in which it lives.

It is in the relatively small sects—groups characterized by a discipline that is in contrast to common practice—that the prophetic, reconstructive genius of religion most vigorously expresses itself. Thus we have "peace" churches which defy the community at the point of its greatest sensitiveness—patriotism and self-defense. We have sects whose austere way of life sets at naught the prevailing cultural standards in the interest of what they believe to be "a more excellent way." But the minuteness of the small sects renders their impact on the total social conscience inconsiderable. What the large, representative church body lacks the disposition to do in the way of social regeneration, the small religious group lacks the capacity to do.

This is the great dilemma of religion as a social-moral force in the community. An appreciation of it will prevent us from expecting too much of the church in the way of a direct impact on public morality. After all, the frequent impatient query why the church does not do this or that is really a complaint about the majority of the people, who are responsible for the church's policy.

COST OF GROWTH

The loss of crusading power that accompanies increase in size is strikingly evident in the history of the evangelical sects as they have grown into great churches. This has been impressively documented in a recent book by Dr. Wade Crawford Barclay, entitled *To Reform the Nation.*[1] One of a series on early American Methodism, the book is a major contribution to the history of evangelical Christianity in America. There was great social dynamic in that movement, but the church paid for its rapid growth in the weakening of its testimony. In particular, the account of the church's witness and discipline with reference to the liquor traffic and to slavery is instructive; for in both cases a policy that was initially courageous and uncompromising became watered down as the growing religious body adjusted itself to a secular environment. The temperance movement was "strongly religious" in motivation, and the Methodists gave to it a crusading zeal expressed in "the original Wesleyan rule" which condemned "drunkenness, buying or selling spirituous liquors, or drinking them, unless in cases of extreme necessity." But the "buying and selling" interdict was eliminated about 1790.

Concerning the slavery issue, the author points out that "during the early post-Revolutionary period Methodism as a whole was practically a unit in its anti-slavery attitude." By means of disciplinary regulations the church undertook to accomplish the manumission of slaves; but the rules were subsequently suspended. The argument was a typically secular one: "compromise was necessary that the church might grow." The economic determinant was at work, for the economic importance of slave labor was increasing. Finally, the voice of the church was raised in definite opposition to the abolition movement.

One is inclined, of course, to read into this a severe condemnation of organized religion. But reflection will furnish a corrective of such a judgment. No more than individuals, can institutions eat their cake and have it, too. As the church becomes broadly inclusive and representative, it inevitably takes on the character of the community as a whole. To the extent that it is "of the people, by the people, and for the people," it will faithfully reflect their imperfections and their deep involvement in the total human situation. Again, this is the moral dilemma of religion, especially in its democratic forms.

PROPHETIC GROUPS WITHIN CHURCHES

The most fruitful approach to a resolution of this dilemma is through the growth of small prophetic groups within the conventional churches. Such groups maintain vital contact with the religious fellowships of which they are a part, but persistently challenge the prevailing public morality. The church, which in the performance of its true religious function keeps its doors open to every human being who is following a spiritual gleam, cannot bear a strong, cru-

[1] *Early American Methodism 1769–1844,* in two volumes, Vol. II, *To Reform the Nation.* New York: Board of Missions and Church Extension of the Methodist Church, 1950.

sading testimony in the name of its entire membership. Its people mostly fall far short of being saints; they are seekers, at best. Again and again I recall the remark of Dr. Vida Scudder: "The church is loaf, not leaven." But within the churches there are groups of restless, prophetic spirits inspired by a hereditary faith, purified by a voluntary discipline, who are continually extending the boundaries of the Christian testimony and giving leadership in social-moral reconstruction. They are the leaven!

The groups I am speaking of are autonomous in character. They may appear in the local church or at any level of ecclesiastical organization. They may be confessional or interconfessional. Their autonomous character consists in the fact that they are accorded status as recognized elements within the membership of the church and are valued for their prophetic character, while at the same time they understand that they speak for themselves and not for the church at large.

Concern groups

Broadly speaking, there are two types of organization of this autonomous character. The first is in the nature of an "interest group." A number of people who have a special "concern," to use a Quaker term, devote themselves unitedly to thought, prayer, and consecrated effort to realize what they conceive to be the divine will in some significant area of human relationships. The particular concern may be the existence of group antagonisms within the community, the persistence of racial segregation within the church, industrial strife, child labor, juvenile delinquency, drug addiction, or any one of a large number of matters that press upon the Christian conscience. Or the objectives may cover a wide range of social education and action.

The members of these groups are "second-milers." They are always doing what theologians call works of supererogation, extending their efforts beyond what is required, seeking to widen the areas within which Christian sanctions operate.

A number of the larger Protestant denominations have encouraged the formation of "concern" groups of this sort. Recently an organization was formed within the Protestant communions known as "Christian Action." It differs from many previously organized groups in that it seeks to find all its social-moral imperatives in Biblical religion and in the authentic stream of Christian testimony. It is politically liberal and theologically conservative. It will have no party line, but will seek to bring to bear the most exacting of Christian sanctions upon personal living and public morality.

The limitations under which such small groups operate were suggested earlier in discussing the religious sect. In a sense, these groups are themselves sects organized within the churches. The fact that they belong to the religious community gives them a purchase which a small dissident group standing by itself does not have. They make pronouncements and formulate programs which are seldom implemented in their entirety and which are more often respectfully listened to than followed. At the same time, there is good reason to think that the criticism and the stimulation which such groups bring to bear upon their parent religious bodies contribute much toward maintaining and increasing the sensitiveness of the Christian conscience.

Vocational groups

The second type of organization is the vocational group. The recovery of the idea of Christian vocation is one of the most significant religious developments of our time. The concept is by no means limited to Protestantism, though it received much emphasis in the Reformation. The central proposition is that all work is a "calling"; that every occupation should be considered just as truly a sacred vocation as is the ministry. The idea is, of course, related to the Protestant conception of the "priesthood of all believers." But this obviously potent idea has been too little in evidence since it was developed by the Reformers. Today many people are coming to see in it the greatest single instrumentality for bringing the common, everyday life of men and women under Christian ethical sanctions. A new imperative in this direction seems to be emerging, particularly in the European churches. The tragic experiences of the war served to illumine the chasm between the world as it is and the verbal professions of religious men and women who are so largely responsible for the state of the world.

In this country, perhaps the most striking manifestation of the religious vocational conscience at work has been the activity of Quaker businessmen who endeavored to bring the Friends' testimony to bear upon their business responsibilities. The pattern for this was set by a group of British Quaker employers who, during the First World War, felt impelled to discover the relation between their vocational responsibility and the fact that they were Christian men, bearers of the Quaker witness. The book they produced, *Quakerism in Industry*, has long been out of circulation, but they lighted a lamp which was not to be put out. One of the main present emphases of the World Council of Churches, and of the National Council of the Churches of Christ in this country, is the exploration of this concept of Christian vocation and the realization of its potentialities for building a better world.

CHURCHES RAISE THE MORAL LEVEL

What I have said thus far might be taken to indicate that the church *as a whole* has relatively little function in relation to the improvement of public morality. It was necessary to stress the limitation of the large religious body in order that the conditions of prophetic activity might be made clear. It is by no means true, however, that great church bodies cannot and do not influence the standards of public morality in a significant way. Even though they are too big and too representative of the whole community to be a crusading force—except in isolated instances—they play their part in lifting the level of the common life. I wish to devote the remainder of this article to a discussion of the way in which church bodies, even the most inclusive and representative of them, function in raising the moral level of society.

MORAL SENSITIVENESS

To begin with, there is the function of creating moral awareness. Nothing is more evident than the ambivalence of the human mind with reference to questions concerning values. It is of the essence of human nature that men censure themselves for unworthy acts, that they recognize obligations that they fail to live up to, that they have a reach that exceeds their grasp. A major function of religious worship and religious education is to focus attention on the imperfections evident in human behavior. To many psychologists and psychiatrists these may be fighting words. It is the fashion today to deplore a sense of guilt and unworthiness as unhealthy and as tending to impair the normal functioning of human beings. It may be granted at once that a morbid sense of guilt is an evil thing. But far more dangerous than an excessive feeling of guilt is the absence

of it when the guilt is an objective fact.

Undoubtedly evangelical Christianity has often erred in the fostering of spiritual agony, especially in the minds of the young. But to be nihilistic about a sense of guilt is to cut the nerve of moral regeneration. One never feels a high imperative except as it cuts across the existing pattern of his behavior. When I hear psychiatrists deploring the sense of guilt, I find myself wishing they would be much more discriminating about it. To make use of an economic analogy, I am much less concerned about the production of a sense of guilt than about its distribution! In a very true sense it may be said that the level of moral life in individuals and in a community is indicated by the things people feel guilty about. A major problem of social-moral regeneration is to increase the incidence of guilt where there are grievous unrecognized consequences of men's habitual actions.

DIVISIVE FACTORS

Now, how can this task of increasing moral sensitiveness be accomplished in a widely representative religious communion—let us say in a congregation of a thousand persons among whom are rich and poor, liberals and conservatives—people who react in very different ways to the issues with which they, as citizens, are being continually confronted? Obviously, the minister who wants to commit such a church to a specific political reform, however well conceived, will get nowhere. Even an effort to deliver the church on the "right" side of a controversy that looks like an open-and-shut case may result in cleavages growing out of a great variety of considerations. As suggested earlier, the more the issues arising affect deeply laid cultural patterns, the harder it will be to achieve unity of judgment and purpose. It is for this reason that the churches, for the most part, cannot participate in movements for legislative reforms. Agreement on the ultimate objective may be obscured by the many divisive factors which arise.

An illustration of this is furnished in the effort to abolish lynching. The scandalous neglect of duty on the part of state officials has led church people to declare that it is an obvious duty of the church to champion a federal anti-lynching law. But adverse political factors immediately intrude themselves. Men of equal intelligence and equally sensitive conscience will divide on the relative responsibilities of federal and state governments. The same is true of the problem of meeting perfectly evident and appalling needs for social and educational services.

Again, purely technical questions arise to plague those who are seeking a clear application of ethical principles under religious sanctions. Many a lusty and wholesome impulse has been quenched by the experts' admonition, "You can't do that!" It is no easy matter to separate questions that present authentic moral issues from questions that are of a technical character. On the other hand, in the effort to avoid debatable specifics and partisan formulations, a sound principle easily becomes lost in vague generalities.

An approach to a solution of this problem has been made in Protestant circles during recent years through appeal to what is called the "middle axiom." By this is meant an ethical proposition which is sufficiently definite to avoid being smothered in generalities but which at the same time has a universal quality that cannot be strangled by particular practical or technical difficulties. The document known in American Protestantism as "The Social Ideals of the Churches" consists, in the main, of such middle axioms. Take, for example, the following principles: "the right of all to the opportunity for self-maintenance; a wider and fairer distribution of wealth; a living wage, as a minimum, and above this a just share for the worker in the product of industry and agriculture." Here is a proposition which is not vitiated by specifics that people may endlessly argue about. To be sure, there is plenty of room for difference of opinion as to what a "just share" is, but the imperatives here stated can be insisted upon in every situation where a demand for economic justice arises. A major task of the church is to create an atmosphere that calls forth a response to these universal imperatives.

MORAL JUDGMENT AND INTERNAL DISCIPLINE

It should be noted that in the very nature of the case, the churches' influence on ethical standards often has to be exercised in negative fashion. The prophetic function is one of pronouncing judgment rather than one of social engineering. It is the business of the specialist and the technician to devise expedients, but it is the business of the common conscience to announce the imperatives which the technician undertakes to implement. It has been well said that the church has a "searchlight" function, a responsibility for illumining dark areas where the first requirement is the moral judgment: "These things ought not so to be."

However, if the church is to function in constructive fashion with reference to public morality, it must have *an internal discipline corresponding to its external testimony.* The remarkable demonstration of political power on the part of the Protestant churches which culminated in the adoption of national prohibition calls forth, in the perspective of history, conflicting judgments. Misgivings as to the wisdom of that crusade, however, should not be allowed to obscure a striking illustration of effective political action that began in the application of a discipline. The churches were able to strike a forceful blow at the liquor traffic only because they had, by and large, settled the issue in their own household.

On the other hand, the impact on the public conscience of church pronouncements during the 1920's with reference to war was a demonstration of abortive action. A corporate repudiation of war and a refusal to sanction it on the part of church bodies which had not made pacifism a part of their own internal discipline proved quite ineffectual when the showdown came.

Likewise, the vigorous testimony called forth by the social gospel movement with reference to the economic order often ran far beyond the discipline practiced by the church people on whose behalf pronouncements were presumably made. Church bodies sometimes issued statements which were in effect socialistic declarations. This did not mean that they were un-Christian, but the fact remains that the membership of the churches had never personally repudiated the profit system. When church bodies and agencies expressed adverse judgments concerning the economic order they were quite without a supporting discipline in the personal lives of their own people. The condition requisite to a corporate moral influence on the part of the church is a conviction shared by the membership which is so clearly supported by common religious testimony that it is a cohesive rather than a divisive force.

IMPLEMENTING SOCIAL CONVICTIONS

One thing more. The awakening of the lay conscience, and particularly the emphasis on religious vocation, make it possible to implement social-moral pronouncements through research and prac-

tical demonstration. I will end this discussion with a description which I wrote several years ago of an event which to my mind admirably illustrates the possibility of bringing the influence of organized religion to bear upon a grievous social problem:

In the year 1923, national Catholic, Protestant, and Jewish bodies undertook to secure the abolition of the twelve-hour day in the steel industry. Three years earlier the Interchurch World Movement, a Protestant enterprise, had published its report on the great steel strike of 1919, a document that attracted country-wide attention. President Harding had requested the chairman of the Iron and Steel Institute to consider the elimination of the long shift. After a year's deliberation the Steel Institute's committee appointed to study the matter brought in a negative report. In the meantime, the research department of the Federal Council of Churches had been gathering data for a fresh presentation of the matter to the public. It was learned that the Steel Institute's inquiry had elicited a letter from the president of the Colorado Fuel and Iron Company reporting the successful establishment of an eight-hour shift but that this had not been disclosed by the committee. A threefold strategy was devised.

First, a statement was issued by the appropriate departments of the Federal Council of Churches, the National Catholic Welfare Conference, and the Central Conference of American Rabbis, declaring that "this morally indefensible regime of the twelve-hour day must come to an end." A week later the factual report, in which working conditions were described and the social consequences of the long shift were depicted, was released. The following week a letter from the president of the Colorado Fuel and Iron Company, similar in content to the one that had been withheld by its recipient prepared expressly for our use, was given to the press. It was a devastating sequence—moral pronouncement, factual documentation, and demonstrated practicability of a reform. A few weeks later, in dog days, the Iron and Steel Institute was assembled and in deference to public opinion formally instituted the change.[2]

Retelling this story here could not be justified on the ground that it is in any sense a typical achievement, for unfortunately it is not. Such illustrations are not numerous. But this account indicates a pattern of successful action in raising the level of effective public morality. If it should be objected that the twelve-hour working day was a scandal which common decency should have outlawed without any crusading, I can only repeat that it is precisely in girding the citizenry for action in accord with its unimplemented convictions that a great church body makes its most significant moral contribution to society. The church has its roots too deep in the culture to admit of radical moral crusading, but it is an incalculably great potential force in making convictions articulate and in mobilizing moral resources on issues where action lags behind social conscience.

F. Ernest Johnson, D.D., New York City, is executive director of the Central Department of Research and Survey, National Council of the Churches of Christ in the United States of America (formerly Federal Council of the Churches of Christ in America), and is professor emeritus of education at Teachers College, Columbia University. He has engaged in various activities in the religious and educational fields. He is author or editor of numerous works, among which are The Church and Society (1935), The Social Gospel Re-examined (1940), Religion and the World Order (1944), and Foundations of Democracy (1947).

The Colleges, Ethics, and the Public

By RALPH E. HIMSTEAD

IN the discussion of any subject, definition of terms is important. In this discussion the terms which need definition are college, ethics, and public.

A college has been defined as "a society of scholars, or friends of learning, incorporated for study or instruction, especially in the higher branches of knowledge." The basic concept is a community of scholars. This, at least, is the basic concept of what a college should be. Later in this article there will be discussed in some detail what a college is and what a college is not, in relation to what its ethical functions may be.

Ethics is concerned with morality, with the ideals of morality, with ideal human character, and with ideal human action. The questions with which ethics deals concern the nature of the *summum bonum* and the validity of the criteria of its achievement. Ethics has been defined as "a system of moral principles." Thus, we have individual ethics, social ethics, professional ethics, and other kinds of ethics, which govern the moral actions of individuals in their personal relationships and in their social and professional relationships. There have been, and are, various theories of ethics—the egoistic, the altruistic, and the perfectionistic; and two conceptions of its nature—absolute and relative. Those who view ethics as absolute affirm an unchanging moral code. Those who view it as relative regard the standards of moral conduct as subject to change with human development. With these theories and views of ethics, this article is not concerned. The term "ethics" as used in this article means those principles the observance of which contribute to the highest good.

The term "public" as used in this article means the whole of the population of a nation, state, or community and not merely those portions of the public directly related to our colleges—students, parents, alumni, benefactors—with which the college has special and direct relationships and which may be regarded as having special claims on the services of colleges.

RELATIONSHIPS BETWEEN COLLEGES AND PUBLIC

This article is concerned with the relationship of the work of colleges to the public with special reference to the principles conducive to the highest good of the public. That the work of our colleges affects the public cannot be questioned. Through the process of educating successive generations of youth, our colleges have contributed, and are contributing, greatly to the welfare of the public by helping to lift the level of enlightenment of our citizenry. Indeed, it may be said that the state of the public is in large part determined by the state of our colleges.

Is the work of our colleges affected by the public? The answer is clearly in the affirmative. It may, therefore, also be said that the state of our colleges depends on the state of the public. This has always been true, but is more so today than ever before, when we have so many lay spokesmen for education who hold themselves out as specialists in higher education and who speak with certitude concerning what our colleges should teach and how they should teach it. These self-appointed

spokesmen are frequently influential in forming public opinion, and our colleges are influenced by public opinion.

Our colleges are also not infrequently influenced by pressures from representatives of special interests, or segments of the public, in reference to what is taught, how it is taught, and by whom it is taught. Those who bring such pressures on colleges either do not understand what a college is or, possessing this understanding, disregard it. What such pressure groups wish of our colleges is not education but indoctrination. They would have our colleges become agencies of propaganda for certain views and beliefs—economic, political, social, or religious. They would subvert our colleges. Because most colleges are in need of money, and the pressures to influence their work are frequently made by prospective donors or by persons thought to be prospective donors, or by influential legislators or by persons influential with legislators, such pressures are frequently successful. To the extent that they are successful, our institutions of higher education are corrupted, and the institution concerned is no longer worthy of the name college or university.

WHAT IS THE ETHICAL RESPONSIBILITY OF COLLEGES?

Concern about ethics and morals is not new, nor are the conditions which justify such concern new. Both are familiar phenomena. Efforts to lift the level of the standards of ethics and morals have always been regarded as necessary and desirable and should always be so regarded. This does not mean that every individual should become a "reformer," or that all of our institutions—educational, governmental, and commercial—should become ethical societies, seeking reform. It does mean, however, that individuals, as individuals, and those who administer and are a part of our institutions should be aware of the ethical implications of their work, in relation to the general welfare.

As regards our institutions of higher education, it is the thesis of this article that the greatest contribution they can make to the ethics and the morals of the public is to maintain their integrity as institutions of higher education and to adhere faithfully to their purpose, namely, the pursuit of scholarship and the instruction of youth. Those whose profession is the education of youth at the higher levels should also seek at all times to "educate" the public concerning the nature of an institution of higher education and concerning the values to the public of maintaining the integrity of these institutions and of their adhering faithfully to their functions.

While there is general verbal concurrence in the conception of a college defined above, experience has made it clear that in the day-to-day work of our colleges this conception is frequently more honored in the breach than in the observance; that what educators permit to be done to our colleges, without protest, belies what they say they believe a college should be. The reason may be an imperfect understanding of what a college is or the lack of courage to speak and act in accordance with their understanding and convictions.

It is sometimes helpful to an understanding of what something is to note with some particularity what it is not. Experience has shown this to be so in defining institutions of higher education. Organizationally speaking, institutions of higher education have many things in common with other institutions. They are incorporated; they have governing boards; they have administrative officers; they have employees, for, legally speaking, their faculties are employees. Boot and shoe factories and other commercial corporations have similar organization. They are incorporated, have governing boards, administrative officers, and employees. Because our colleges and universities have organizational aspects in common with commercial corporations, they are frequently regarded as analogous in other respects to commercial corporations. This confusion is serious as regards the welfare of higher education and of the public, for attitudes toward, and actions taken in reference to, institutions of higher education resulting from this confusion are of a kind likely to impair the integrity and subvert the purpose of these institutions. It is pertinent, therefore, to note and to emphasize what an institution of higher education is not.

An institution of higher education is not a commercial enterprise. It is not in the business of manufacturing, processing, or selling commodities. It is not a proprietary institution. Its character is eleemosynary, strictly eleemosynary. An institution of higher education, even though state supported, is not an arm or branch of the state government and should not be so regarded or administered. An institution of higher education is not a political party. It is not an ethical society. It is not a church. It is an educational institution, and as such is *sui generis*. Its purpose is scholarship, which means research and reflection, and the education of youth. Its concern is with the life of the mind, with the attainment of intellectual excellence. This fact is basic in the thesis of this article.

EDUCATIONAL GOALS CONDUCIVE TO MORALITY

Intellectual excellence is not unrelated to ethics and morals. In one of the most familiar passages in John Henry Newman's series of lectures in 1852 on "The Idea of a University," he said,

> Liberal Education . . . makes not the Christian, not the Catholic but the gentleman. It is well to be a gentleman; it is well to have a cultivated intellect, a delicate taste, a candid, equitable, dispassionate mind, a noble and courteous bearing in the conduct of life;—these are the connatural qualities of a large knowledge; they are the objects of a university.

Concerning the values of liberal education to the student, he said,

> He profits by an intellectual tradition, which is independent of particular teachers, which guides him in his choice of subjects, and duly interprets for him those which he chooses. He apprehends the great outlines of knowledge, the principles on which it rests, the scale of its parts, its lights and its shades, its great points and its little, as he otherwise cannot apprehend them. Hence it is that his education is called "liberal." A habit of mind is formed which lasts through life, of which the attributes are, freedom, equitableness, calmness, moderation, and wisdom; or what in a former discourse I have ventured to call a philosophical habit. This then I would assign as the special fruit of the education furnished at a university, as contrasted with other places of teaching or modes of teaching. This is the main purpose of a university in its treatment of its students.

An institution of higher education administered in accordance with Cardinal Newman's conception of a university would be unique in the United States today—unique in many desirable ways. Such an institution would never be imperiled as many of our institutions of higher education are today imperiled by anti-intellectualism, evidenced in part, but only in part, by the overemphasis on intercollegiate athletics and the resultant practice of subsidizing and professionalizing football and basketball in the guise of scholarships. This practice has given many of our

students a sense of values which, educationally speaking, are false. These false values explain the susceptibility of some students to the kind of corruption currently revealed at a number of colleges and universities. These students are the victims of an immoral anti-intellectualism, for the development of which educators are in large part responsible.

While the attributes of an educated person—devotion to freedom, equitableness, calmness, moderation, wisdom, cultivated intellect and dispassionate mind—do not guarantee morality, since they are themselves attributes of ideal human character they are conducive to morality. The truly educated person seeks freedom, has a sense of moral and ethical values, and has respect for truth and justice—the greatest of our moral virtues.

Institutions of higher education in the United States are usually governed by lay boards which are the ultimate repositories of power. The institution's governing board appoints the institution's chief administrative officer and has the legal responsibility for all the other appointments to the staff of the institution—administrative, instructional, and research. The work for which the institution was created—instruction and research—is carried on by the teachers and investigators who constitute the institution's faculty.

For this work, these men and women have been carefully prepared, and presumably they are qualified to deal at first hand with the sources of knowledge, and to impart to their students and to the public the results of their own and their colleagues' research and reflections. Presumably they are more than trained specialists; they are educated men and women and, as such, are aware that in their calling intellectual freedom is essential. They will, therefore, wish to inquire and to teach without fear and without favor. Their work, if the institution of which they are a part is to fulfill its purpose and to meet its obligations to its students and to the public, must be uninhibited by repressive directives from the administrative officers of the institution, the institution's governing board, or any of its members, or by outside interference—economic, political, social, or religious. Robert Maynard Hutchins had this thought in mind when he said, "Freedom of inquiry, freedom of expression, and freedom of teaching—without these a university cannot exist. Without these a university becomes a political party or an agency of propaganda."

Freedom is a moral proposition

That our institutions of higher education must be free is a moral proposition, and those whose life work is the education of youth at the higher levels have a moral obligation, not only to their profession but also to the public, to insist on this freedom. This moral obligation, of course, is not confined to those of the academic profession. It is the obligation of all who are devoted to the American way of life, for freedom is inherent in the American way of life. It is the moral obligation particularly of those whose work molds public opinion, notably journalists, the basic principle of whose profession is freedom of the press, the rationale of which is the common good. Indeed, both freedom of the press and academic freedom are founded on the democratic faith that freedom is wholesome and essential to the achievement of the highest good in society.

The representatives of the American Association of University Professors and of the Association of American Colleges, in a series of joint conferences from 1934 to 1940 relating to the principles of academic freedom and tenure, formulated a restatement of these principles, now known to the academic profession as the 1940 Statement of Principles on Academic Freedom and Tenure. They were unanimous in the conclusion that these principles are of public concern; that they are essential not only to institutions of higher education, but essential also to the common good. Thus, in the preamble of the Statement of Principles agreed upon, they spoke as follows:

> The purpose of this statement is to promote public understanding and support of academic freedom and tenure and agreement upon procedures to assure them in colleges and universities. Institutions of higher education are conducted for the common good and not to further the interest of either the individual teacher [1] or the institution as a whole. The common good depends upon the free search for truth and its free exposition.
>
> Academic freedom is essential to these purposes and applies to both teaching and research. Freedom in research is fundamental to the advancement of truth. Academic freedom in its teaching aspect is fundamental for the protection of the rights of the teacher in teaching and of the student to freedom in learning. It carries with it duties correlative with rights.
>
> Tenure is a means to certain ends; specifically: (1) Freedom of teaching and research and of extramural activities, and (2) A sufficient degree of economic security to make the profession attractive to men and women of ability. Freedom and economic security, hence tenure, are indispensable to the success of an institution in fulfilling its obligations to its students and to society.

In the case of education, the relation of freedom to morality is direct. While our colleges are not character-building institutions in the usual acceptance of the meaning of character building, the work of our colleges contributes greatly to the development of character. Character depends upon choice. To make intelligent choices requires some excellence of intellect and knowledge. A college worthy of the name seeks intellectual excellence and encourages the quest for knowledge. Knowledge provides perspective, without which intelligent choices are impossible. Our colleges seek to encourage in students a habit of inquiry, a continuous quest for knowledge; and no quest for knowledge can be honest without freedom.

Since the public is the sum total of its individual members, the standards of the ethics and morals of the public are determined by the standards of the ethics and the morals of its members. We cannot, therefore, expect the standards of the ethics and morals of the public to be higher than the level of the standards of the ethics and the morals of its members. Occasionally they are. But when they are, it is because of the effect of a currently dominant leadership of an individual or individuals of high ethical and moral standards. Occasionally they are lower, because of the influence of a currently dominant leadership of an individual or individuals of lower ethical and moral standards.

WHAT IS ACADEMIC FREEDOM?

What is academic freedom? Academic freedom is the freedom to inquire, the freedom to learn and the freedom to teach in institutions of higher education. It also means that teachers shall have the freedom of all other citizens. By definition, it does not mean license. Thus, the 1940 Statement of Principles on Academic Freedom and Tenure provides:

> The teacher is entitled to freedom in the classroom in discussing his subject, but he should be careful not to introduce into his teaching controversial matter which has no relation to his subject. Limitations of aca-

[1] The word "teacher" as used in this document is understood to include the investigator who is attached to an academic institution without teaching duties.

demic freedom because of religious or other aims of the institution should be clearly stated in writing at the time of the appointment.

The college or university teacher is a citizen, a member of a learned profession, and an officer of an educational institution. When he speaks or writes as a citizen, he should be free from institutional censorship or discipline, but his special position in the community imposes special obligations. As a man of learning and an educational officer, he should remember that the public may judge his profession and his institution by his utterances. Hence he should at all times be accurate, should exercise appropriate restraints, should show respect for the opinions of others, and should make every effort to indicate that he is not an institutional spokesman.

The history of the development of the principles of academic freedom is not unlike the history of the development of our constitutional freedoms. The principles of both academic freedom and constitutional freedom were developed to subserve a purpose. In the case of our constitutional freedoms, the purpose was to ensure the integrity of the institutions of government created for a free people. In the case of academic freedom, the purpose was to ensure the integrity of our institutions of scholarship. Basic in the principles of both constitutional freedom and academic freedom is the freedom of the individual, for without freedom for the individual, there is no freedom. Thus, in our constitutional system there are certain rights accorded the individual in the exercise of which he is protected against actions by the government, even when it acts in accordance with the will of the majority. Only by such protection to the individual can we achieve the kind of government envisioned by the founders of the Republic. The same is true of academic freedom. Only by the protection of the freedom of the individual scholar can we have freedom of scholarship, for scholarship is the work of individuals.

LOYALTY—TO FREEDOM OR CONFORMITY?

In the light of current developments evidenced by the widespread use of disclaimer loyalty oaths in our institutions of higher education and kindred measures of repression, it would seem that intellectual excellence and intellectual integrity are no longer regarded as essential qualifications for a college or university professorship. Apparently, what is desired above everything else in the academic profession is conformity. As regards politics, apparently only those are regarded by the oath-promoters as acceptable on college faculties who are conservative Republicans or right-wing Democrats, that is, anti-Fair Deal Democrats.

I have stressed the moral obligation of those of the profession of journalism to concern themselves with the integrity of our institutions of higher education, and specifically with the values of academic freedom. In this connection, it is gratifying to quote the words of Alan Barth of the Editorial Staff of the *Washington Post,* in an address to the Thirty-seventh Annual Meeting of the American Association of University Professors in March 1951, entitled "The Loyalty of Free Men." In reference to nondisloyalty oaths, Mr. Barth spoke as follows:

> It is no accident that non-disloyalty oaths and inquiry into political opinions are directed in large part at our schools and universities. They are devices for compelling conformity. And the men responsible for them are men who distrust diversity and fear ideas. They are in revolt against rationality. Their attack is directed in the first instance at schools and universities precisely because these are centers of ideas.

Professor Chafee has called this attack, aptly, "a barbarian invasion." It is just that. It is another manifestation of the age-old assault of ignorance upon learning, of bigotry upon reason. It is the thrust of the lowered brow upon what it cannot understand. The men who launch it here are one with their spiritual kinfolk in Germany and Russia who prefer to think with the blood and who despise everything that concerns the intellect. If we do not ward off their attack, we shall descend into a new dark age.

Universities are the citadels of intellectual freedom. And it is against these citadels that the attack is launched because its aim is nothing less than the extinction of intellectual freedom. You of the academic profession are, therefore, its first targets—and the first defenders of the whole great tradition of diversity. In a period of profound anxiety, when fear can be exploited and unreason flourishes, the danger of this attack must not be underestimated. The attackers will have their way, as their counterparts had it in Germany and Italy before the war and have it today behind the iron curtain, unless you, as men of learning, close your ranks, recognize the deadly peril to your independence, and fight resolutely, with every resource at your command, to repel the barbarians. You have a responsibility in this that goes beyond your own interest as teachers. You are the trustees of a cultural heritage.

If you defend freedom for your profession, you defend the whole of human freedom. And it is to this, more than to any other value, that Americans owe allegiance. The loyalty of free men is, above all, a loyalty to the illimitable freedom of the human mind.

FREEDOM OF THOUGHT A REQUISITE OF MORALITY

Freedom of the human mind is not only essential to scholarship as we of the Western world understand scholarship, it is also essential to the morality of our social order created by and for a free people. Freedom assures independent thought and the right of criticism. The repression of independent thought and of criticism is the salient characteristic of totalitarian regimes which enslave the minds and the souls of their people. Loyalty to the freedom of the human mind is, therefore, a moral attribute of the highest order. Freedom of thought and of expression for the individual assures us of the most effective means of achieving the highest standards of ethics and morals of the public, because it gives us the only practical way of protecting the public against a misuse of power by those who hold public office and of protecting the public against practices which are inimical to the welfare of the public, morally or otherwise.

In this country, with its great tradition of freedom, it should be unnecessary at this juncture to emphasize the values of freedom in relation to the welfare of the public. But freedom is not easily understood, and is not readily accepted as a way of life, for freedom requires tolerance and restraint on the part of the individual. Freedom today is in danger, in great danger. Many have come to fear it, or to say that they fear it, which may mean that they prefer repression. Be that as it may, the critical world situation resulting from the threat to the free nations of the world by the aggressive, imperialistic government of Soviet Russia gives plausibility to the spurious arguments of those who advocate limitations on our freedom.

There are, of course, some risks to freedom, but these risks are as nothing compared with the risks of repression. This is the moral of the history of repression. Repressive measures have never contributed to the ultimate security of a nation. Repressive governments may achieve stability for a time —for a long time—but repression leads to disaffection among the people, which leads to instability. The reason is clear.

Repression ignores the values of freedom, which conduce to stability, and ignores the salient fact that the desire for freedom is strong and is widespread even in countries whose people are thought to be habituated to repression. Repression creates conflict which ultimately becomes irrepressible.

What are the resultants of freedom and of repression as regards social stability? Freedom encourages individual responsibility; repression, irresponsibility. Freedom creates an atmosphere conducive to the development of wholesome character and normal personality; repression warps character and personality. Freedom encourages forthrightness and confidence in justice; repression invites conspiracy and deceit. Individual responsibility, wholesome character, normal personality, forthrightness and confidence in justice—all of these are moral attributes and are essential to the achievement of social stability. The road to freedom is the road to stability; it is the road away from revolution. This at least is the theory of our constitutional system, and it is well to remind ourselves that our constitutional system is one of the oldest and the strongest in the world. American institutions were founded upon and have been developed in accordance with the philosophy of freedom. Repression is alien to our institutions. It is at home only in lands governed by autocratic or totalitarian regimes. Its only advocates are the conscious or the unwitting votaries of the philosophy of dictatorship.

SAFEGUARDS AGAINST MISUSE OF FREEDOM

In developing our constitutional system the Founding Fathers were fully aware of the risks of freedom; they were students of history. They chose freedom because of their awareness of the greater risks of repression. Their objective was not only to create a government based on freedom but also to create an enduring government. In choosing freedom they provided appropriate safeguards against the misuse of freedom, and the safeguards they provided evidence their respect for the individual to the end that he might have the maximum of freedom, for these safeguards assure to the individual whose actions may be called in question the protection of due process of law.

In higher education, in addition to the legal and constitutional safeguards against a misuse of freedom—safeguards applicable to all citizens—there are the safeguards provided in the principles of academic freedom which have been developed by the custom and usage of the academic world, principles which have the support of a responsible profession prepared to apply appropriate restraint to a misuse of freedom.

THE COLLEGES AND MORAL CRUSADES

Since the principles of intellectual freedom are moral principles and the observance of these principles is essential to the general welfare, the proposition is frequently made that our colleges should concern themselves directly with the ethics and the morals of the public, and should embark on moral crusades. It is the conviction of this writer that for our colleges to do so would impair their integrity as institutions of higher education to such a degree that they would cease to be institutions of higher education. Proposals that our colleges embark on moral crusades, or on any other kind of crusade, are wholly unrealistic because they are based on a false conception of what a college is or, more specifically, *who* a college is. A college is not a legal entity separate and distinct from its component parts—its trustees, its administrative officers, its teachers and investigators. Trustees, administrative officers, and teachers are the college.

While a college should be regarded as a community of scholars, it should never be regarded as a community of like-minded scholars, because it can never be that kind of community. In one sense, a college is an institution which provides for intellectual anarchy. The basis of the unity of scholars is the belief in intellectual freedom—the freedom to seek the truth and to teach the truth as the individual scholar sees it. Therefore, aside from the consideration of the wisdom of our colleges' embarking on moral crusades, few colleges could ever do it because it is highly improbable that the groups which constitute a college could ever reach a consensus with reference to the moral nature of a proposed crusade.

It is recognized that what is said above in reference to the wisdom of a college's embarking on a moral crusade may be regarded as in support of the ivory tower concept of a college. It is. The ivory tower concept of a college must not, however, be confused with a teacher's ivory tower concept of his individual responsibilities in a free society. The college teacher is a citizen, and, if he is to meet the obligations of citizenship, he must be free to participate in the activities of citizenship.

But the role of a college as such, in public affairs, is very different from the role of an individual member of the faculty of a college. If our colleges, as such, were to embark on moral crusades, one result would be that they would be under even greater pressure than now in reference to what is taught, how it is taught, and by whom it is taught. Their role would come to be regarded as socially utilitarian. In this connection, it is interesting to note that the social utilitarian conception of the role of a college is the conception of a college which prevails in Soviet Russia today. The Soviet government wants no research without social utility and denounces pure scholarship and the kind of research which an individual conducts out of intellectual curiosity wherever it may lead, leaving it to time to discover utility in his findings. The insistence on the immediate practical social utility of the work of our colleges is but another instance of the lack of understanding, or of imperfect understanding, of the nature of an institution of higher education, and of the lack of awareness, or of insufficient awareness, of fundamental presuppositions in our social order.

MORAL OBLIGATION TO PUBLIC

We of the academic profession have the privilege of helping to educate young men and women for life in a free society. In our special academic disciplines we must, if our colleges are to make the greatest moral contributions to the public, insist upon intellectual integrity, intellectual excellence, and basic knowledge. We must do more. We must also be specialists in freedom and instruct our students in the values of freedom. To do less is to be unworthy of our calling; to do less is to fail to meet a clear moral obligation to the public.

Ralph E. Himstead, M.A., S.J.D., Washington, D. C., is general secretary of the American Association of University Professors and editor of the Bulletin of the American Association of University Professors. He was professor of public speaking, Cornell College, 1919–23; professor of political science, Cornell College, 1923–24; and professor of law, Syracuse University, 1924–36.

What Is the Civic Conscience?

By Charles P. Taft

THE operation of the civic conscience depends in considerable part on the political community in which it is called upon to set a standard for public life. There are many kinds and sizes of communities, and, different as they are, each sheds light on the ethical problems of the others. Here are some typical situations. They are of course colored by the author's experience, but Ohio is a fairly typical American state.

In the Counties

We have some counties near the large metropolitan areas, well within close automobile range, which, if not rural in the strict sense of being agricultural, have only a few incorporated villages, none over a few thousand people. In the unincorporated areas professional gamblers sometimes set up shop with a glamorous night club that may well include other illicit activities. The sheriff and prosecuting attorney of the county, the township constable, and the justice of the peace may conveniently look the other way. There are good citizens in the neighborhood, but none of them wants to run for sheriff, and getting evidence and convicting before a jury at the county seat is a slow and far from certain process. Besides, these gamblers are tough, they have connections, and if a man disturbed them there is no telling what might happen to his business in town or even to his children in the country.

There are other counties, mainly agricultural, with a county seat town of ten or fifteen thousand people, rather self-contained, with a fine little home-owned industrial plant or two. Sometimes for ten years or so the county is dominated by a courthouse gang. Its members get the jobs and the contracts, and manage a few "rackets" besides. The minority party gets enough recognition to discourage any vigorous competition. The officeholders are hand picked in a primary, so the good citizen has little choice. Open scandal is avoided. Organizing to get people to vote in a primary is just too much trouble, and "things aren't so bad, anyhow."

In the Large City

The large city is different. The machine of the old days (and sometimes today) worked like this: The city and county together employ say six thousand people. There are six hundred election precincts, and, curiously enough, the six thousand employees seem to reside about ten in each precinct. The condition of holding each job is to produce the jobholder's vote and four or five more *in a primary*. Twenty-five thousand votes in the primary will usually control it, and in a contest a little more work will double that controlled vote. The "Committee" or perhaps one or two men on it, who keep careful track of what goes on, have the say about the jobs, and therefore about what candidate is to be nominated. There are always a certain number of bipartisan operations and a few more jobs or favors that can be handed to the minority party to keep it in line. The theoretically democratic process in these cities is in the election of each precinct committeeman by his own constituents in the precinct. But as a practical matter, the democratic

process has often been thus turned into a dictatorship. The corruption that can develop in this situation is so familiar that it need not be described here.

When the large city is just the core of a metropolitan area from 150 per cent to several times the size of the city, with all the overlapping jurisdictions and even state lines through the middle that are so prevalent in this country, we have the conditions that permitted what the television audience saw and heard in the Kefauver investigation. That perhaps disclosed a national scandal; but to speak accurately, it showed a total failure in the United States metropolitan local government. Until the new federal gambler's stamp, we in Cincinnati had the central headquarters of our gambling in Newport, a city of 30,000 across the river in Kentucky, and in Elmwood Place, a city of about 5,000 in Ohio completely surrounded by Cincinnati. There cannot be annexation across state lines, and annexation has been made nearly impossible anyhow except in Virginia and Missouri. The core city is the heart without which the satellites could not live, but it is attacked by blight at the center, loses revenue to the suburbs, and pays for many services whose benefits are shared by nearly all the outsiders around its fringes.

Each of these different kinds of community is relatively integrated geographically, with the possibility of considerable acquaintance, familiarity, and common experience across artificial lines even in the largest.

In the Capitals

But in the state capital, and even more in Washington, the factors of distance and of wide differences in experience and economic interest become dominant. For much of his term the governor is on his own in the absence of the legislature, and the dispatches of half a dozen big city newspapers plus the wire services furnish the only contact for all but those in the capital city. Legislators, very much part-time and frequently new to their work, have to rely on lobbyists for much of their information. The setup lends itself to manipulation, especially because there is seldom a leadership for the party government of the state constituting an effective team for the administration of state business. The state party organization is far more likely to be a part-time team for the election of a ticket, whose actual power is considerably weakened by the fairly complete independence of each of the many county chairmen.

Washington is Washington, with honest and effective bureaucrats frequently frustrated by political department heads, and with such a degree of regulation of business as to make the stakes high for any business seeking either justice or a preferred position. The links of business and politics with the White House and major departments and agencies disclosed in the Fulbright investigation of the Reconstruction Finance Corporation and in the current probes of the tax scandals of the Bureau of Internal Revenue have centered the spotlight on the question, What and where is the civic conscience?

"One [Question] Indivisible"

This brief survey of communities has shown, I trust, that despite the differences in locale and complexity, the same question arises in each community, and the failures in Washington may well be due to a want of character originating in the home districts. The banker who goes on the RFC board and assumes that the honest principles by which he ran his bank in the metropolitan city are not applicable in high Washington politics may well have looked the other way when his local party bosses dealt

under the table at his own city hall or even out in the pleasant suburban county where he lived. The failures of integrity in the political headquarters in Washington reflect any and all failures of integrity right down the party line to the precinct.

THE NIEBUHR THESIS

This essay having apparently reached a low point of pessimism, it is appropriate to suggest as one basic philosophical explanation the general thesis of Reinhold Niebuhr's *Moral Man and Immoral Society*. That thesis may be summarized (rather unfairly) thus: Sin is inevitable in the human heart, especially for a man in a position of power. Power is poison, and the man with power is always a beast of prey. Yet coercive power is essential to avoid anarchy, so the Christian conscience can never be reconciled with the government and public life of our communities.

That is a hard saying, hard for Americans to take, with our confidence in progress of righteousness and good will. The trouble with that philosophy of pessimism, notwithstanding the kernel of truth and sound theology in it, is, as William Temple, Archbishop of Canterbury, said about it, that it is almost an encouragement to continue in one's pet sins. It is something of an excuse for Machiavelli.

THE OLIVER THESIS

The spirit of Machiavelli is still alive. Twenty years ago that extraordinary dry goods merchant F. S. Oliver began publishing his essay on politicians, political thought, and political action, which purports to be a modern application of Machiavelli to this basic problem of political ethics. I say "purports" because Oliver's conclusion is that politics is the noblest career any man can choose. That is not the conclusion to be drawn from Machiavelli. Hear Nicholas Murray Butler's summary of Oliver:

> Mr. Oliver makes it plain that it is not merely the business of the politician to govern, but that it is his duty to do so. Therefore his acts must be judged with constant and due reference to the limitations under which the government of men is, of necessity, carried on. Too often the politician is tested by ideal and quite impractical standards of accomplishment. His power is the product of human consent and human approval, and that power must be exercised from day to day within the limitations which human nature itself sets.[1]

Besides the factor of carrying public favor along with him on pain of losing power, the politician has another objective. This is how Oliver himself describes it:

> The most complete victory does not make him the possessor, but only the custodian, of that strange monster which he calls his country. His first duty is to keep his charge in health, and, if possible, in good humour. He loves his monster, and this love, which assumes many odd forms, is what we mean by patriotism. Of the motives that urge him on, self-interest (in the pecuniary sense) is usually one of the slightest.[2]

This is better than a bare theological realism. This patriotism leaves no place for the kind of miscellaneous favors and shoddy ethics we have read about and seen on television and heard on the radio. Oliver goes on:

> It has never yet been decided . . . how far a politician may stretch, and when he may break the rules of private morality. . . . If he can and does control [the circumstances of each particular case], so as to benefit his country, much will be forgiven him. But as there is no code to guide him, it follows that he is often tempted to plead necessity when there is no real necessity. . . . Yet it is not the greatest characters, as a rule, but the little frightened ones, that most freely help themselves to dispensations.[3]

[2] *Ibid.*, p. 80.

A PESSIMISTIC VIEW

Both Niebuhr and Machiavelli take a pretty pessimistic view of human nature, especially in leaders of men, though from slightly different points of view, to be sure. The logic of Hobbes, Rousseau, and Ricardo gives results that are equally pessimistic for the idealist and reformer. Man in his natural state is "solitary, poor, nasty, brutish," and his life is short. He lives by certain logical rules based on the scarcity of the things he wants. Self-interest in making these relative choices is the dominant motive of men and of their leaders.

This assumption underlies only too much of our current thinking. Even the preachers constantly talk as if the dollar sign were what drove most men; businessmen think so much in terms of price that they assume that money wages are the main incentive of workers; and labor leaders know no program today in their own contact with employees except more pay, fringe benefits, and material security. All of them, from the preachers to the union leaders, talk "co-operation," but few of them understand how the co-operative systems in which we all live are organized and operated.

GROUP FUNCTIONING

On the political side, even while the ordinary person exercises his right to damn the government, local, state, or national, it is very easy, especially for the long-time public servant and even for the political leader, to think of the state as something apart which operates on the rabble as its instrument. Elton Mayo, of the Harvard Business School, describes the idea this way:

> We have an economics that postulates a disorganized rabble of individuals competing for scarce goods; and a politics that postulates a community of individuals ruled by a sovereign state. Both these theories foreclose on and discourage any investigation of the facts of social organization.[4]

Actually, there is no rabble and there is no sovereign state except in one instance—the crisis of emergency.

> If extreme emergency shatters the routines of co-operation in a specific social group, if no leader appears providentially to devise co-operative means of meeting the crisis, then the society will disintegrate temporarily into a horde of individuals each seeking desperately the means of self-preservation.[5]

Mayo goes on to demonstrate by actual investigation that it is only in those abnormal circumstances that the "laws of economics" really apply and that the people look to a powerful government to save.

All the rest of the time we each live in several kinds of groups—families, clubs, colleges, plants, unions, associations—each group related to each other in the most complex relations, in a kind of ascending hierarchy. We develop only in society, and each begins as a member of something. Each as a distinctive individual can function only in the groups to which he belongs. The strongest incentive, for which in many instances persons will sacrifice as for nothing else, is the instinct of human association, with a purpose in the small group close to our daily living, and a general purpose in some larger group of which the small is a part.

[3] *Ibid.*, p. 81.
[4] Elton Mayo, *Social Problems of an Industrial Civilization* (Cambridge, Mass.: Harvard University Press, 1945), p. 54.
[5] *Ibid.*, p. 41.

All of this analysis is essential to the understanding of the way the civic conscience operates. For any individual public servant, it can operate effectively only within the little groups to which he belongs, and in the larger groups of which each of his own personal little ones is a part.

The last seventy-five years has made these considerations even more important, because the extraordinary growth of organization in our life has multiplied the pressures or the release of pressures. This expansion of organization began in labor, with now one-third of the working force, and in the farms, with over half of the farm population. Corporations (the United States itself not the least), trade associations, professional associations, and special interest groups take in nearly every inhabitant. There are even organizations for those left out of organizations.

COLLECTIVE CONSCIENCE—OR LACK

The strongest of these become the conscience of their members. They may give weight to what our Ohio Constitution calls the public or general interest, but the shouter for the immediate concern usually gets the votes, however shortsighted. Each group has its pet symbol or taboo. Here is a list:

Labor—union label; crossing a picket line
Farm—reapportionment
Religious groups
  Jewish—Zionism
  Protestant—Church and state
  Catholic—Spain or birth control
Business—tariff; closed shop
Political party—independents

Dissent from those or other party lines brings social and economic pressures that few persons can resist. Again, membership may undermine standards fully established or accepted in other groups to which the person also belongs. If there is one job which the churches must undertake, it is to strengthen moral fiber so that the members of pressure groups will insist on full and free discussion within their respective groups and fight for what they believe is right.

The very size of organizations drives us into representative systems. Here, too, the party line may force acquiescence or undermine standards. The public interest and the moral or ethical consideration are not always assured by a favorable majority among the constituency. Public hearings on controversial issues before a city council can produce the most shortsighted view in opposition to nearly any major proposal for improvement, and its proponents will seldom face the hostile crowd, as their representatives must.

PERSUADING THE CONSTITUENCY

So the conscientious public official faces the necessity of hard, thankless work in gradually persuading his constituency as to what is the right course. In that effort he needs organized help, and it ought to begin with his party. Unfortunately, the form of our party organization frequently does not produce such active support. It is easier not to stir up the animals. On the other hand, the reformer tries to move too fast. The test of political judgment is in the rate of possible progress.

Most of us, especially those in state or national government, have to conduct our persuasive operations in the media open to us—the newspapers, the radio, television (if one can get on it without a bank roll), and addresses to the pressure groups and the civic organizations (if there is any difference). There are house and trade and group organs, but there the party line almost excludes reason and persuasion. So the newspapers of general circulation become the principal medium of persuasion, either to adopt a particular public policy or to observe standards of integrity. One has to learn how each operates, and the relation of the publisher, the editor, the city desk, and the political correspondent. If an important paper can be induced to start a crusade, it may be extremely effective.

THE ROLE OF THE SCHOOLS

I have not said anything about our educational system as part of the civic conscience, probably because its contribution is much like a delayed action bomb that will not explode for half a generation. What is being taught now will not solve the problem posed today by the Kefauver or Fulbright or Williams investigation. It is, of course, worth talking about and working on.

The fact is that dishonesty among school children is a very common affair. What school is not plagued with a pest of pilfering every so often? One good reason for that condition is that the effort to separate the public school (as "state") from the church has led to a curriculum of many colors with no harmonizing thread of moral theory. It is most encouraging that the Educational Policies Commission of the National Education Association has spoken in no uncertain terms in its report, *Moral and Spiritual Values in the Public Schools*, in February 1951. These values are essential for the decisions every child must make, and the schools must teach them. But the "how" and the extension of the "how" into every community school is the task of a generation—not a single year.

LEADERSHIP AND TEAM PLAY

Perhaps the only answer is leadership, strength, independence, and character in public life, and intelligent support of those qualities by the organizations, such as the churches, which stand for moral foundations of life.

I am not describing or advocating lone-wolf operation, however successful temporarily. Political life is a team operation. I would not wish to detract for a moment from the success of Fiorello La Guardia, for whom I had great admiration; but the City Charter Committee in Cincinnati has left a more permanent impress on the moral and ethical standards of my city than La Guardia left on New York.

In many ways those great political figures, now forgotten, who created the five boroughs in one city of New York at the turn of the century, have really left the stamp of their integrity upon their community as it should be done. But the leader must have flare (*élan*) and vitality, as did La Guardia and Theodore Roosevelt and Lincoln. He cannot be one who appeals to a stolid orthodoxy whom he invites to come out from among the evil ones. For the stolid orthodoxy has no majority, any more than the extremes of the left. Twenty-five per cent or more make up the fluid center, and the truly great leader, who likes and understands people because he has true humility and a listening ear, can give to that group an eagerness to support the right.

Such a leader gets much of his support from women. There are many women in politics who are simply echoes of the male, but there are many in and out of politics who are not. He gives to them and to the independents a representation of conscience. His operations, political in the best sense, demonstrates that conscience has the casting vote, that politics is not just sound and fury, but signifies everything for community life.

Obviously, no such result can come from last-minute conversions, especially when associated with long-standing adherence to the party line. But on the other hand, the most effective operation of this kind of independent conscience is associated with skillful operation of

the party machinery, as in the cases of Lincoln and Theodore Roosevelt. The only qualification is that the party machinery and the forms of government should permit the success and survival of the men of independent mind and character, as long as they are also team players. There is nothing necessarily dishonest in politics, any more than there is in business or in professional or church organization. The promotion of clean politics is a question of ways to deal with people, to help them participate in their own public affairs, and to convince them that only solid moral and ethical foundations can win the battle, whatever the political community, from precinct to nation.

Charles P. Taft, LL.D., D.C.L., Cincinnati, Ohio, is a lawyer and an aspirant for the Republican nomination for Governor of Ohio at the May 6, 1952 primary. He has served as prosecuting attorney of Hamilton County, Ohio, 1927–28; as a Cincinnati city councilman, 1938–42 and 1948–51; and as president of the Federal Council of the Churches of Christ in America, 1947–48. In 1946 he received the medal for merit in wartime service. He is author of City Management—the Cincinnati Experiment (1933), Democracy in Politics and Economics (1950), and other books.

Improvement of Ethical Standards in the Federal Government: Problems and Proposals

By PAUL H. DOUGLAS

PURSUANT to a referral to it by the Senate of a proposed resolution (introduced by Senator Fulbright of Arkansas) to establish a Commission on Ethics in the Federal Government, a subcommittee [1] of the Committee on Labor and Public Welfare in 1951 held hearings and took extensive testimony from a broadly representative group of distinguished witnesses. These hearings have been published and a summary report with recommendations has been issued.

THE MAGNITUDE OF THE PROBLEM

As summarized by the subcommittee, the factors contributing to the over-all problem may be stated in this way:

(1) In this day of big government, there is much at stake in public policies which directly affects the income and welfare of individuals, industries, and groups.

(2) Members of Congress have almost free discretion in making these policies, and administrative officials have great discretion in administering them.

(3) The great authority vested in elected officials is justified by the principle that they, as representatives of the public, will exercise their authority in the public interest and for public purposes; similarly, the discretionary authority delegated to administrators is based on the assumption that they will exercise it reasonably in accordance with public policies, and for the furtherance of public purposes.

(4) Although the importance of the issues, the breadth of discretion involved, and the basic nature of responsible government make it necessary that as far as humanly possible issues shall be decided on their merits, interested parties are not willing to let the wheels of government turn unassisted, but in a great variety of ways bring pressure to bear upon legislators and administrators in order to secure favorable decisions.

From these basic factors emerge special problems, most of which, in the opinion of the witnesses, call for affirmative and corrective action by the government.

PROBLEMS OF PRIOR EMPLOYMENT

One of the most pressing problems is that the government is employing mature, well-established businessmen, especially in numerous positions in defense agencies which deal directly with the very industries from which they recently came. These men are needed, and their work for the government, like that of every other public servant, must be considered a patriotic service. The employment of these men in defense agencies, nevertheless, creates ethical problems and hazards. Can they be perfectly fair if cases come before them which directly or indirectly involve the company from which they came? Can

[1] The members of the subcommittee were Matthew M. Neely, Hubert H. Humphrey, George D. Aiken, Wayne Morse, and the present author, who was chairman.

they be completely objective in decisions which affect their industry—for example, where the industry favors a policy divergent from public policy or from proposed public policy? Can these men be completely detached in determining what the public interest requires?

The basis of their employment may affect the perspective of ex-businessmen. Are they employed without compensation (WOC) or at a dollar a year, continuing to draw a corporation salary while on leave for public service? Some believe that these men should be as dependent on the government as salary can make them, and that a WOC status is improper. Others say, however, that many able businessmen of middle age without accumulated savings, and with heavy fixed obligations for insurance, house payments, education of children, etc., cannot afford to come into the government (short of an all-out emergency) if they have to drop from the industrial to the governmental scale of compensation for executives.

PROBLEMS OF SUBSEQUENT EMPLOYMENT

Another situation fraught with danger is the later affiliation of government servants with business concerns with which they have had official dealings. Public employees who place or settle contracts, recommend loans, award subsidies, or make similar decisions directly touching persons or firms which do business with the government and then leave the government to take positions with these same firms inevitably raise doubts as to how impartial they were when they decided these issues while in the government. If their new salary is out of line with the old (after allowing for differences in the business scale), this doubt is further strengthened. These circumstances are in fact inherently so suspicious that a public employee who values his reputation for integrity should feel himself disqualified for employment with a firm to which he has made valuable awards until a considerable period (e.g., two years) has elapsed after that business has been completed. Governmental employers should discourage such transfers by all possible means.

Coming events cast their shadows before, and if the possibility of lucrative employment with a private concern should be raised in any way, directly or indirectly, while the public servant is negotiating or doing business with that concern, it also casts doubts on the merits of the pending business. If public employees were under a standing order to report such improprieties and to ask to be relieved of the assignment in question, it might help to avert untimely offers.

Even when direct monetary payments or similar valuable privileges are not involved, a public employee who enters the employ of a concern which regularly does business with his former governmental employer creates an ethical problem. All agree that in this new employment, he should not handle specific matters for which he was formerly responsible or which he officially knew about. The consensus of opinion is for disqualification in all such cases, and agency regulations more or less approximate this rule. The problem arises most frequently in the tax and regulatory functions where public servants become expert in the law and the economics of the taxed or regulated industries; and their services are then demanded by business concerns.

PROBLEMS OF BECOMING UNDULY INVOLVED THROUGH INVESTMENTS, GIFTS, AND ENTERTAINMENT

A recognized problem of long standing is that of public officials becoming unduly involved with persons, concerns, or industries which are affected by their decisions. There is a strong presumption that a substantial economic involvement will create either a bias or an emotional problem through fear of bias. It is generally agreed, therefore, that any such involvement should be avoided. This is the purpose of the conflict-of-interest statutes, and of the law of incompatible offices.

Involvements which it is generally agreed must be avoided include salaries, fees, and other compensation from business concerns, direct or indirect ownership of concerns doing business with the government, speculation in securities or commodities in a field touching that in which the public servant has official functions. Somewhat less clear but also coming under the taboo for administrators is substantial investment in an industry affected by his official functions. How much is "substantial"? That probably depends in part on its ratio to the individual's total investments. On these points there is not much disagreement. There is some feeling that public officials should be permitted to own businesses which do not concern their official function in any way and which they can operate through an agent or employee. But this, too, is frequently forbidden by law, perhaps to make sure that his official duties will have a public servant's full attention.

The recent disclosures have also shown that one of the most common ways in which interested parties seduce public officials is through costly gifts and expensive entertainment. Many men profess to see nothing wrong in this and state that it will not affect the attitude of the official. This is excessively naïve. What frequently happens is that the loyalties of the public official are shifted gradually from single-minded devotion to the public interest to a friendship for and loyalty towards the donor and patron. Then when decisions are made, it is easy for the official to be influenced by considerations of friendship and personal obligation. Many public officials have gone wrong in this fashion and have shifted their loyalties so slowly and imperceptibly that they were not fully conscious of what was happening.

PROBLEMS OF ECONOMIC INVOLVEMENT: CONGRESS

The pressures on members of Congress which create ethical problems are of several varieties. One is financial pressure. Campaigning is costly. Where shall the candidate seek funds to help with his primary or his final campaign? Politics is not classifiable as philanthropy for tax purposes, and the average voters, including those who are most harsh in their judgment of politicians, do not contribute to campaign funds. The normal candidate's only recourse is to the more actively interested persons or groups which are in politics to protect their interests. From which of these shall a candidate seek funds and support? Is it possible for him to retain some degree of independence if he does so? How much dare he obligate himself to a single group? Diversification is a good principle, as in investments, but frequently it is not possible.

Being the nominee of his party places the candidate under some obligation to the party; but who has a right to define its policy? The candidate, or the professional workers below decks who run the "machine"? Assuming that some consideration of each for the other is normal, how far shall a successful candidate go in honoring obligations which the machine has assumed? In a complex industrial society these questions get rather complex. No wonder the old system of finding a financial "angel" and then of sending him on a flight to the embassy in Graustark

has its attractions, even from an ethical point of view. It had its advantages even though it still pains the foreign service officers who would like these posts for themselves.

The financial pressure does not end with the campaign. The senator or representative has abnormal expenses. Maintaining a residence in Washington, in addition to keeping his roots in his home soil, is expensive. To keep in touch also, he generally needs to come home frequently for short visits. Travel is costly, and the government pays only for one trip per session. A senator or representative is a public figure and fair game for solicitors for all worthy causes. Even small contributions add up. Some members, particularly from the more populous states, find the allowances for clerk hire insufficient to cover the cost of maintaining their offices.

The upshot is that a majority of the members of Congress find it necessary to supplement their salary in some way. Were Congress meeting but six months or less a year, as it once did, there would be no serious difficulty, but membership is now practically a year-round activity, which, with the duties of campaigning, leaves little time to engage in business or professional activities. Members who are lawyers may accept fees or retainers for giving advice and counsel or for other legal services. But they have little time for very extensive service and if their duties become perfunctory, the question always arises, are they being paid for their influence and to influence their perspective? Men who pay legal retainers expect to get something for their money.

Members who are not lawyers have no device as well established as the legal retainer, but fortunately many of them are quite articulate and enjoy speaking. Since their function is one of educating the public, as well as themselves, on public issues, a good many public speeches can be considered to be in the line of duty. But there are other questions. To what groups should one speak? At what point does a large fee become payment for something more than the speech? How can adequate diversification be maintained?

Men of property in Congress, as well as the impecunious, also have their problems. If their investments are concentrated in one or a few industries, how can they avoid becoming protagonists of those industries, at the expense of a genuinely public perspective on issues of policy? What steps can they take to protect the public from their own bias?

ECONOMIC INVOLVEMENT VERSUS VENALITY

Differences of degree, usually accompanied by differences in motivation, change the character of improprieties. Gifts and favors which may begin as entirely innocent practices become improper when they begin to affect the public servant's ability to act for the public as agent or representative, fairly and objectively. They are improper as subtle influences upon his point of view.

If carried further, they become ends in themselves, a way of increasing the public servant's income. At some point, the receiver becomes venal. He is, in effect, taking bribes and graft to enrich himself. This has been recognized to be wrong as long as "western" civilization has existed. One can find it vividly depicted and scornfully denounced in the pages of the Old Testament. It is always a problem, but it is a less important problem today in its effect upon the conduct of public affairs than subtle economic involvement.

When gifts, favors, and lavish entertainment begin to be evident in the relations of contractors with the government, it is prima facie evidence of something wrong, and time for corrective action.

PROBLEMS OF POLITICAL INVOLVEMENTS

Politics itself can give rise to embarrassing conflicts of interest. When men are appointed to important administrative positions, often with the clearance and approval of county and state political organizations, or national committees, or members of the Senate and House of Representatives, should they feel especially obligated to their political sponsors? If so, to what extent? Is there any obligation touching specific administrative decisions? If there is no obligation to the sponsor which can affect handling of administrative issues strictly on their merits, how can political sponsors be induced to accept this role of impartiality? Often political sponsors take a proprietary interest in departments or agencies in which they have helped to place men in key positions, and if their interest is pushed aggressively, it creates serious ethical problems for the administrator.

PROBLEMS OF "REFERENCE"

The so-called function of reference is well established in the Federal Government. Members of Congress receive a large number of requests from constituents asking for their assistance in dealing with federal departments and agencies. Job hunters, contractors and would-be contractors, applicants for loans, applicants for privileges in the public domain, men who want to get into the armed forces usually as commissioned officers, and others who want to get out, veterans whose benefits have been delayed or denied, and many others such as those seeking naturalization, come to their senator or congressman or write to him for help in getting a favorable decision from administrators. There is so much of this business that a member of Congress could spend his entire time on it.

It is, indeed, desirable that legislators should perform this function provided they observe proper restraints in doing so. For civil servants frequently become perfunctory in their work and careless of the people whom they are presumed to serve. Legislators can, therefore, legitimately serve as an informal board of inspectors. They can prevent the administrators from flagging in their zeal and can detect and check abuses in the conduct of public business. From another point of view, legislators can serve as informal ambassadors for their states, which often seem to constituents to be rather far removed from the center of power in Washington.

PROBLEMS OF EXECUTIVE APPOINTMENTS

One of the most obvious influences upon the conduct of public business is the selection of persons for top administrative posts. The President in his nominations, the Senate in its votes on confirmation, citizens who are invited to accept key positions, and the groups which seek to influence the selection or approval of nominees have great power to raise or lower the levels of public service.

Despite government's difficulties in competing with more remunerative or more peaceful occupations for top-grade talent, their enlistment must be a constant aim of every administration.

Refusal of able citizens to accept the responsibilities of public life, nomination of mediocre persons or those who are subservient to private interests, denial of confirmation to nominees who have been outspoken champions of the public interest, and sniping, unsupported attacks on various public officials are bound to result in depressing the

morale and the practices of various government agencies.

On the other hand, the zeal to protect the public interest and the competence that is brought to government work at all levels are greatly strengthened when persons of high caliber receive appointments to leading positions and when able officers have the full support of the President, the Congress, and the people.

ADMINISTRATIVE FAULTS

Certain institutional tendencies or failures of administration tend to defeat public policies. One is the tendency of independent regulatory agencies to surrender their regulatory zeal as they age, and to become more and more the protagonists of a clientele industry, and less and less the vigilant defenders of the welfare of consumers or the general public. All too often, those who are supposedly being regulated, actually regulate their nominal regulators.

A related fault in public administration is "tiredness" and a routine performance of public duties. This generally becomes worse as the agency grows older and as it tends to lose its initial zeal. It is unfortunately characteristic of all too many government departments at the present time.

Criticisms are also heard that the administrative interpretation and enforcement of statutes are unduly flexible and variable. Heads of agencies commonly turn to legal officers whom they appoint for rulings as to whether or not they can proceed in a given manner. The resulting opinions are not unbiased. They commonly tell the administrators what they want to hear. Undoubtedly they are leading to an undue expansion of administrative power under which administrators are changing or creating law, and hence usurping legislative functions. Administrators argue in their defense, however, that in addition to the language of substantive acts of Congress, they receive instructions from the appropriation acts, the two appropriations committees and at least two legislative committees in each house, and sometimes also from individual committee members. They say that part of the problem is that these instructions are not always consistent. In those circumstances, any interpretation of public policy may seem to some to be improper. In any case, the consistent and equal application of the law is an objective that seems not yet fully attained.

CAMPAIGN METHODS

Just as serious as the problem of campaign finance is that of campaign methods. Here the root of the problem is a tendency in campaigning to disregard the truth. The worth of the election system in representative government depends upon its being an extension of the legislative discussion of issues and policies. This is intended to be a process of revealing and of weighing the facts. If mendacity, misrepresentation, and irresponsible statements characterize electioneering, the mind and emotions of the public are immediately exploited, and in the long run, the whole electoral process is discredited. These facts are apparent to members of Congress, and from the testimony we received, it is evident that the public is also beginning to be aware of and concerned about the trend of campaigning. The level of responsibility and truth-telling is below that which the public in its heart approves. The fact that violators of reasonable standards may win an election is not evidence to the contrary. The European dictators demonstrated that it is possible to exploit the democratic tradition—a tradition of responsibility and reasonableness—by ruthless methods. As with monetary inflation, those who deliberately depreciate the currency of language can keep one step ahead of the rate of exchange. Cheating is unethical in any system, and cheating the public is more serious than cheating a rival.

The problem of equitable electioneering is complicated by the subtle campaigning which can be undertaken by advertisers, business sales organizations, labor organizations, and farm organizations. Thorough exploration of the problem will doubtless lead also to the reconsideration of tax allowances, and the political activity of organized groups.

SUMMARY OF RECOMMENDATIONS

As a result of these complaints and disclosures, the subcommittee concluded that:

1. A Commission on Ethics in Government

A Commission on Ethics in Government should be established by joint resolution of Congress. The commission's function should be twofold. First, it would investigate and report to the President and to the Congress on the moral standards of the official conduct of persons and groups doing business with the government or seeking to influence public policy and administration. And second, it would report on the moral standards generally prevailing in society which condition the conduct of public affairs or which affect the strength and unity of the nation. The commission's inquiry should focus primarily on the legislative and executive branches, but should not exclude the administration of justice, federally supported activities of the states, and such ideas, attitudes, habits, practices, and standards of American society as are relevant to the commission's functions.

The second function of the commission should be to recommend measures to improve and maintain at a high level moral standards of official conduct in the Federal Government and of all persons who participate in or are responsible for the conduct of public affairs. It should be noted that the commission would not be concerned with the morals of individuals—governmental personnel or private citizens—except as they are involved in the conduct of public affairs.

The commission should consist of fifteen members, five appointed by the President, five by the President of the Senate (i.e., the Vice President), and five by the Speaker of the House. All members should be persons of recognized integrity, judgment, and experience in public or civic affairs. Of the members appointed by the President, two should be public employees, one a career civil servant holding a position not above GS-16, and one holding an office of higher rank. Of the members appointed by the President of the Senate and Speaker of the House, in each case two should be members of the respective legislative body of the appointing officer, one a Democrat and one a Republican.

The commission should have power to hold hearings and secure testimony and evidence, authority to employ staff, and funds to carry on its work. It should have two years in which to complete its investigation and report, but should place its major recommendations before the President and Congress during the first session of the Eighty-third Congress. It should terminate thirty days after submitting its final report.

2. Amendments to Administrative Procedure Act

The Administrative Procedure Act should be amended to provide that the following practices shall be improper

for federal officials and employees and shall be grounds for summary dismissal from the federal service:

(a) Engaging in any personal business transaction or private arrangement for personal profit which accrues from or is based upon the official position, authority, or confidential information of the official or employee.

(b) Accepting any valuable gift, favor, or service directly or indirectly from any person or organization with which the official or employee transacts business for the government.

(c) Discussing future employment outside the government with a person or organization with which there is pending official business.

(d) Divulging valuable commercial or economic information of a confidential character to unauthorized persons or releasing such information in advance of its authorized release date.

(e) Becoming unduly involved, for example, through frequent luncheons, dinners, parties, or other expensive social engagements with persons outside the government with whom they do official business.

The Administrative Procedure Act should be amended also to prohibit federal officials who participate in the making of loans, granting of subsidies, negotiation of contracts, fixing of rates, or the issuance of valuable permits or certificates from acting in any official transaction or decision which chiefly concerns a person or organization by which they have been employed previously in the preceding two years or with which they have a valuable economic interest. Any violation of this prohibition should be grounds for summary dismissal.

The Administrative Procedure Act should be further amended:

(a) To provide that former federal officials and employees shall not appear before agencies in which they were formerly employed in cases which they previously handled or of which they had some direct knowledge as federal officials or employees and that they shall not participate in the preparation of such cases.

(b) To provide that for a period of two years following the termination of their employment, federal officials and employees of the ranks GS-15 and above, that is, those in policy-making posts, who leave the government shall not appear before the federal agencies in which they were formerly employed as the representative of a person or organization doing business with the government.

The penalties of disbarment from practice before a federal agency and of cancellation of contract in appropriate cases should be authorized to discourage those who would corrupt as well as those who allow themselves to be corrupted. Publicity for findings of improper practices would serve as a further deterrent.

3. Mandatory disclosure of income, etc.

Legislation should be enacted requiring all members of Congress, all federal officials receiving a salary of $10,000 or more, or who are in positions of GS-15 and above, or of equivalent rank, and the principal officials of national political parties to disclose their incomes, assets, and all dealings in securities and commodities. The disclosures should be made by filing reports with the Comptroller General on forms provided by him to show income by source and amounts and to identify assets and show their value. These reports should be annual.

The revelation of such information will tend to deter individuals from accepting any income, holding any assets, or making any transactions which they believe are questionable. It will encourage public officials and political leaders to judge their own conduct with greater care. It will also provide for the public and for the great majority of such public servants and party officials whose actions and motives rise above personal considerations, the strong ground of truth on which to stand against unfair charges and innuendo.

4. Thorough study of proposed changes in criminal law

The laws governing conflicts of interest and bribery should be amended to correct inconsistencies, close loopholes, and extend their coverage. The proposed amendments, which the subcommittee recommends for thorough study by executive agencies and appropriate congressional committees, would if enacted effect changes which can be made quickly and which are obviously needed. This action should not preclude a more exhaustive examination of the law governing illegal practices by the Commission on Ethics in Government and more extensive revision which the commission may recommend.

5. Creation of a citizens' organization to work for better government on the national level

Congress should encourage private citizens to establish a nonpartisan, national citizens' organization to formulate suggestions and support affirmative programs for the improvement of government service. The successes of many reforms in local and national government stem from the activity of well-organized citizens' groups. To win public understanding of the recommendations of a commission on ethics and to serve as an effective watchdog over the administration of approved measures, such a national organization can be a most effective force.

In addition, the subcommittee recommended that certain other measures receive further study looking to further positive action. These measures include corrupt practices acts, financing of election campaigns, voluntary ethical codes for functional and professional groups, enforcement of existing ethical standards and codes, rewards for high standards of conduct, the strengthening of personnel administration, improvement of departmental management, clarification of the purposes of public policies, questioning of department heads on the Senate floor, fair play toward administrators and private citizens in congressional debates, and fair treatment of committee witnesses.

Inasmuch as ethical standards in public life are likely to become the subject of political disputation in the forthcoming campaign, it is not unlikely that the Eighty-third Congress—or even the second session of the Eighty-second—may enact some of these proposals into law. In any event, public discussion and consideration of them is invited.

Paul H. Douglas, Ph.D., is United States Senator from Illinois. He was formerly professor of economics at the University of Chicago. During World War II he enlisted in the Marine Corps as a private and advanced to lieutenant colonel after having been twice wounded in action and decorated for bravery. He recently served as chairman of a subcommittee of the Committee on Labor and Public Welfare to consider the establishment of a Commission on Ethics in the Federal Government.

Report of the Board of Directors to the Members of The American Academy of Political and Social Science for the Year 1951

SINCE the depression of some twenty years ago the Academy has steadily grown in membership. From fewer than 8,880 our members have increased until at the end of 1951 the total was 16,806.

Meetings

On January 26, 1951 a meeting of the Academy was addressed by Mr. Thomas B. McCabe, chairman of the Board of Governors of the Federal Reserve System, and by Professor Lester V. Chandler of Princeton University, the topic being "Financial Controls During Crisis."

On April 6 and 7, 1951 there was held the Fifty-fifth Annual Meeting. During the six sessions of the two days the addresses and the discussion were on the topic "Lessons from Asia." Conditions in the Far East were the reason for the choice of the topic and explained the special interest shown in the meeting and in the July 1951 issue of THE ANNALS which contained the addresses.

Publications

Last year attention was drawn to rising costs. These increases affect all or nearly all phases of our work. The steady increase in membership brings larger receipts, and there is a gain also from the sale of copies of THE ANNALS in addition to the copies which go to members. During 1951 special efforts were made to sell earlier issues still on hand. The results were gratifying, the total of these special sales of pamphlets, indexes, and copies of THE ANNALS amounting to 9,708 copies.

Since each issue of THE ANNALS is a symposium of from fifteen to twenty-five articles on a topic of current public interest, many teachers use THE ANNALS as a text or as required supplementary reading. It is difficult to forecast this demand, and frequently we find that we must have extra copies printed. Also it is worth noting that our material has interest and value for years after its original appearance. Recently we publicized a number of issues that have been published during the last ten years or so, and as a result received a gratifying number of orders.

During 1951 the titles of the six issues were:

January	*Medical Care for Americans*
March	*Labor in the American Economy*
May	*Civil Rights in America*
July	*Lessons from Asia*
September	*Report on China*
November	*The Search for National Security*

Membership

We enrolled 3,473 new members in 1951. This may be compared with 3,538 in 1950 and 3,549 in 1949. Each year there are a considerable number of losses, but we closed 1951 with a membership of 16,806, which is a net gain of 730 over 1950.

Finances

Members of the Academy presumably understand that it is a self-supporting organization and meets its expenses out of its own activities. Gifts are few and small. This calls for a persistent effort to maintain or increase memberships and sales. The results for 1951 are shown in the report of our Treasurer which will be presented at this meeting.

Emphasis should be placed on the fact that thus far we have maintained dues at $5.00 per year although most organizations have increased them. We have even lowered our dues to $4.50 for Canadian members and to $4.00 to members in other foreign countries. Also, we have some 1,300 student and military service members who pay only $3.00 per year. The only increase that has been made is to those who wish clothbound copies of THE ANNALS. They are now charged $10.00 per year instead of the $7.50 which we charged a few years ago.

Respectfully submitted,
THE BOARD OF DIRECTORS

Ernest Minor Patterson, *President*
C. A. Kulp, *Vice President*
J. P. Lichtenberger, *Secretary*
Charles J. Rhoads, *Treasurer*
Jerome J. Rothschild, *Counsel*

REPORT OF AUDITORS

January 22, 1952

CHARLES J. RHOADS, ESQ., *Treasurer,*
American Academy of Political & Social Science,
Philadelphia, Penna.

Dear Sir:

We herewith report that we have audited the books and accounts of the *American Academy of Political and Social Science* for its Fiscal Year ended *December 31, 1951.*

We have prepared and submit herewith Statement of Receipts and Disbursements for the year ended December 31, 1951.

The Receipts from all sources were verified by a comparison of the entries for same appearing in the Treasurer's Cash Book with the records of bank deposits and were found to be in accord therewith.

The Disbursements, as shown by the Cash Book, were supported by the proper vouchers in the form of cancelled paid checks or receipts for moneys expended. These were examined by us and confirmed the correctness of the payments made.

As the result of our audit and examination, made in the manner above indicated, we certify that, in our opinion, the accompanying Statement sets forth the results of its operating activities for the period under review.

Yours respectfully,

(Signed) EDWARD P. MOXEY & Co.
Certified Public Accountants

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

SCHWARZENBERGER, GEORG. *Power Politics: A Study of International Society.* Pp. xxii, 898. Second rev. ed. New York: Frederick A. Praeger, 1951. $12.75.

What can be said within the confines of a single volume about international relations that is useful and meaningful—to college students or laymen or the mythical "general reader"? Many have been intrigued with the question and have sought to answer it, this reviewer among them. Machiavelli achieved exceptional brevity and clarity in the enterprise more than four centuries ago. More recent endeavors have been less succinct, from the late Raymond Leslie Buell's *International Relations* (1925) to the present work. Yet the project is worth pursuing. Every effort to see the world steadily and to see it whole contributes something to our understanding of the global system of sovereignties in which we live. Such understanding may in turn contribute something (in ways devious, obscure, and ill understood) toward making life in such a system conducive to survival rather than to death.

The present hefty tome is a notable addition to this type of literature. Dr. Schwarzenberger is Reader in International Law at the University of London, Vice-Dean of the Faculty of Laws of University College, and Director of Studies at the London Institute of World Affairs, under whose auspices this work is published—originally by Stevens and Sons, Ltd. Among other useful works, he published the first edition of the present book in 1941. Its importance on both sides of the Atlantic was then somewhat obscured by the flames and smoke of war. This second edition is longer, more diffuse, more analytical, less well documented (a defect redeemed by an admirable bibliography of 16 pages), but more exciting in its lucid and highly readable commentary on the shape of things, past, present, and future, in relations among sovereignties.

Despite the impressive bulk of this volume, it is short on factual data—a characteristic which may be deemed a virtue rather than a vice for all I can discover to the contrary in the distribution of similar works among American readers. There are no tables of statistics, nor any maps beyond two end-papers. There are no illustrations save the frontispiece, "The Tower of Babel" by Peter Breughel the Elder. Schwarzenberger obviously believes, and rightly so, that "facts" without interpretation are worthless, and therefore concentrates on interpretation. The result is

always interesting, frequently provocative, and occasionally brilliant.

For all the author's professional preoccupation with international law, this analysis is not at all afflicted with "legalistic" illusions. International law, he avers (p. 213), is "emphatically a law of power" and little more than "a body of mutually advantageous rules of social conduct" (p. 217). In thirty-six chapters, Dr. Schwarzenberger undertakes, with animation of spirit and success in accomplishment, to depict and analyze the moving human factors and forces in the Western State System. Particularly suggestive are his comments on "The International Aristocracy" (the sovereignties of the System), "The International Oligarchy" (the Great Powers), "Strategies" and "Tactics" of politics, "The Functions of International Morality," and the chapters on the League of Nations and the United Nations.

The author prudently takes pains to document his detestation of Soviet Communism (a precaution unnecessary in England but essential in the American market), but is not misled thereby into any advocacy of Holy War. He hopes for a resumption of diplomacy and has much to say, genially or acidly, on the loss of freedom of choice by European States and on the pretenses, hypocrisies, and delusions of policy-makers in both halves of One World. He concluded his first edition with a plea, akin to Toynbee's, for a return to God. He concludes this stimulating revision, more modestly, with a plea for Atlantic Union—not as a weapon of war but as a possible nucleus of world federation.

This long and challenging essay deserves wide reading. Unhappily, since academicians on fixed incomes are hard pressed by the "war-for-peace" inflation, *Power Politics* at $12.75 is unlikely to be widely bought by professors or generally adopted for class use. A wiser publisher would have priced it at a more available figure, even though publishers, no less than writers, are victims of the constantly rising prices which accompany the world's muddle and drift toward a final and fatal Armageddon. Dr. Schwarzenberger has analyzed many aspects of this process with acumen and insight. His work will at least be accessible in good libraries. May it find many readers!

FREDERICK L. SCHUMAN
Williams College

MAURER, HERRYMON. *Collision of East and West.* Pp. xvi, 352. Chicago: Henry Regnery Co., 1951. $4.50.

The writing of history has been profoundly affected by the striking successes of the experimental sciences. Historians have spared no effort in marshaling available sources, in analyzing, weighing, and testing evidence, and in documenting conclusions so as to facilitate verification.

This methodology has produced excellent accounts describing and explaining *how* events occurred. Motivation and the logic of historical evolution, however, have proved more difficult of demonstration. *Why* people act as they do, and *why* certain results ensue are either ignored entirely or explained in accord with premises and hypotheses that do not yield readily to verification.

The volume under review seeks to determine fundamental causation in the troubled area of the Far East during the cataclysmic decade of 1937–1947. The author is fully conversant with the sequence of events of this "moment" in history, and he surveys the unfolding panorama, indicating valleys of indecision and peaks of crises. The primary purpose, however, is to explain rather than to describe the collision between East and West, and understanding, he warns us, must be sought in terms of the past—"the total immense bulk of the past, eternally inherent in the present." A study of the past reveals a clash of minds, cultures, and ways of life which a century of contact failed to bridge.

Mr. Maurer argues that the primary factors in China's tragedy were not feudalism, landlordism, or illiteracy, but a cultural malaise resulting from the pressure of the dynamic West upon a static society which did not desire change and could not find the means of harmonizing tradition with the modern techniques that were forced upon the country. The mental roots were lacking for the acceptance or understanding of the Westerner's drive to control nature or to subordinate personal and family

relationships to the molding of an abundant life. The West, equally incapable of comprehending the scale of values of the East, saw only poverty and confusion, and made little effort to conceal its contempt for a society which tolerated such evils. Had the West resorted to total conquest in the manner of the Soviets, the gap might have been bridged by force, but that too proved impossible because of the accepted mores of the West.

The relationship, cemented neither by peaceable interchange nor by complete domination, proved irritating and perplexing, and, under the strain of the late war and its aftermath, it broke down completely. The necessary understanding and confidence were wanting in the West to render possible adequate aid from abroad. The sources of native strength, weakened by the long process of cultural attrition, were completely exhausted by the economic and political dislocations and confusions of war. China, *therefore*, fell easy prey to a determined and unscrupulous conqueror.

The author's hypothesis is especially convincing when applied to the East-West relationships in Japan. The latter was indeed "Westernized" with astonishing rapidity, but true interchange between East and West was lacking. Changes were effected by edict, preserving the aristocratic code of loyalty to superiors, duty, oppression, and self-restraint. Thus, modern technology and armaments only reinforced totalitarian government and the war cult, the most dangerous pillars of Japanese traditionalism. Moreover, the attempt to preserve intact the ancient ways in an industrialized society added to the strains and frustrations of the Japanese way of life. An explosion was inevitable.

One need hardly add that Mr. Maurer regards recent American policy in the Far East as a ghastly failure. But one must be careful not to identify him with the critics whose views of the State Department are darkened by the shadow of the forthcoming elections. The author's analysis provides historical perspective for our failure, and he is careful to point out that the mistakes in China were inherent in the historical situation and must be laid at the door, not of a small group of government officials, but of the American people as a whole.

Indeed, Mr. Maurer's criticism of our Far Eastern policy stems from a conception which is altogether outside the sphere of present political discussions. He believes that our policy was morally wrong and inevitably invited disaster because it failed to treat other nations and cultures as ends in themselves. From that point of view, our occupation policies in Japan and Korea could hardly succeed because these have been subordinated to our global foreign policy.

This high purpose merits unstinting praise. Yet, the dilemma of our age remains in all its baffling perplexity. Assuming that our occupation policy in South Korea had been flawless and had won the full approbation of all unfettered Koreans, would that of itself have prevailed against the blandishments of Soviet imperialism? Even full understanding between East and West in South Korea would hardly have met the challenge of an army of 100,000 trained and indoctrinated North Koreans. Realistic statesmanship would have required the conscription of an army of equal strength, and it is doubtful if that could have been accomplished without dictation and control. Democracy and high moral purpose have not yet found the answer, short of force, to the challenge of the unscrupulous and violent messianism of the Soviets.

OSCAR I. JANOWSKY
The City College of New York

PERLO, VICTOR. *American Imperialism.* Pp. 256. New York: International Publishers, 1951. $2.75.

Take the technique of the Big Lie (the bigger, the more readily believed, said Hitler). Mix in a proper proportion of history from which the real substance has been wrung and into which a prearranged spurious substitute has been injected. Load it heavily with "fitting" documentation to give weight to the resultant peace-is-war gobbledegook. The product is Kremlin double talk, of which the rantings of Malik and Vishinsky before the United Nations are examples. Another example is

the present work, written (be it noted) by a former employee of the United States Treasury, the War Production Board, the Office of Price Administration, and the Commerce Department.

When Miss E. T. Bentley, confessed former Soviet agent, on July 30, 1948, at a meeting of the House Committee on Un-American Activities, identified an espionage ring as the "Perlo Group" and its "ostensible leader" as Victor Perlo, and when shortly thereafter another former Soviet agent, Whittaker Chambers, confirmed this testimony, Victor Perlo vigorously denied the charges. *American Imperialism* gives the strong impression that Perlo is a Communist. The book faithfully and consistently follows the Kremlin propaganda line.

In the light of what has happened in recent years to the previously independent Baltic States, to Rumania, Bulgaria, Hungary, Poland, and Czechoslovakia, it would seem a simple matter to find the culprit fitting the following description:

"Imperialism is military, political, and economic domination of subject nations. The forms of domination include incorporation into the home territory of the conqueror, establishment of colonies, and establishment in the subject country of nominally independent governments actually controlled by the imperialist power."

No, you are quite wrong, says Perlo (p. 15). This description does not apply to Russia. These Baltic and other peoples "destroyed imperialist rule in their lands," and then voluntarily (shall we say?) "joined 200 million Soviet people in the world of Socialist construction" (p. 29). For the first time they are now "liberated" and "independent"!

In fact, says Perlo with every variety of "illustration," the foregoing description of imperialism applies pre-eminently to the U. S. A. This is the essence of his white-is-black front regarding "imperialism."

Take the Marshall Plan, the Truman Doctrine, and the North Atlantic Pact. Are the objectives here to feed hungry people and to save free institutions and nations? No, the objectives are "the political and economic domination of Europe, the taking over of European colonies, and the preparation of bases for war against the U.S.S.R." (p. 135). By whom? By the U. S. government as a "tool of Wall Street," doing the bidding of its "imperialist masters."

The steps involved in this alleged conquest and domination of Europe include: (1) arrangements in every transaction "to provide immediate profits to specific American monopolies"; (2) the weakening and undermining of European economies, the elimination of "barriers to Wall Street ownership of European industry, and the superexploitation of European labor"; (3) the ultimate "establishment of Western European industry as a Wall-Street-controlled arsenal"; and (4) "goods are shipped not because Europe needs them, but because American monopolies have to get rid of them" (pp. 150–52).

"The American People were stunned by the Truman Doctrine. The atrocities of the British soldiers and of Greek fascist forces against the Greek people had evoked wide-spread disgust" (p. 176)!

What are the "real" goals of the Atlantic Pact? They are: (1) "to permit the actual invasion of Western Europe by U. S. armed forces, to complete the colonization of that area, and to subjugate other peoples to American imperialism"; (2) to prepare for "war against the U.S.S.R., the People's Democracies, and the People's Republic of China" (pp. 205, 212).

"The Pentagon strategists plan a war of annihilation against at least one third of the earth's people" (p. 217).

As for Korea: This constituted "the beginning of open American aggression in Asia," but it "resulted in a political defeat of the first magnitude for Wall Street. Its military results completely shattered the myth of white superiority which still serves as a vehicle of chauvinist incitement. . . . MacArthur won temporary military victories by pouring virtually all the combat troops of the United States Army and Marines into Korea" (p. 195).

These are but a few of the many examples of the type of pattern-in-reverse followed throughout Perlo's travesty. Beginning with the Revolution, through the Civil War, the War of 1898, World Wars I and II, the "Wall Street imperialist masters" and their government and military "tools" have pursued a consistent and set plan to dominate the world and to consolidate the "Wall Street Empire."

There is an interesting resemblance here, which would hardly seem to be coincidence, to the caricature of America we get from behind the Iron Curtain, from the Soviet press, plays, movies, and school books, recently pictured in "As the Russians See Us," published in *Reader's Digest*, December, 1951.

Is it too much to assume that the Kremlin is systematically culling, from newspapers, periodicals, and books, every derogatory remark that has ever been made about the United States, classifying these tidbits, and making them available to its agents of slander, double-talk, and intimidation for most effective propaganda use, whether behind the iron curtain or on this side of it? At any rate, Perlo's work and Russian propaganda by and large are all of a piece.

Who will read Perlo's caricature? We may just as well get acquainted with it, in order to be prepared for what the Kremlin will continue to dish up for us until its evil power is finally destroyed.

JOSEPH MAYER

Miami University

DENNETT, RAYMOND, and JOSEPH E. JOHNSON (Eds.). *Negotiating with the Russians*. Pp. xi, 310. Boston: World Peace Foundation, 1951. $3.50.

It is difficult to praise this volume too highly. The materials contained in it should be extremely useful not only to specialists on Soviet affairs, international relations, and comparative government, but also to all responsible officials concerned with American foreign policy. Editors and journalists, and, perhaps most of all, members of Congress might also do well to study this volume.

The reviewer has one minor but not unimportant criticism of this collection. It would have been more accurate to have entitled it "Negotiating With The Kremlin" than with the "Russians." Choice of the latter word carries unnecessary and undesirable implications, particularly with regard to the identification of Kremlin policies with popular aspirations in the U.S.S.R.

The lesson of this book is that the most highly skilled and patient negotiation with the Kremlin's representatives is absolutely necessary, but that this is a kind of negotiation which can be expected to produce very few results. This is because the Kremlin has never, even during its alliance with the West during the war, regarded diplomacy as anything but as an instrument of political war against the states with which it was negotiating. This fact places its agents in a situation in which they cannot establish frank communication with their foreign counterparts. A minor but important corollary of this is the fact that American negotiators dealing with the Soviets feel personally hurt and indignant because of the treatment accorded them by Soviet negotiators.

Within the above framework, there are many individual variations of tone, emphasis, and interpretation among the contributions to this volume. While each of its ten distinguished authors qualified for participation in the enterprise by considerable experience in high-level negotiation with Soviet representatives, their backgrounds are sufficiently varied to account for considerable differences of approach. Parenthetically, regret must be expressed that no top-level State Department professionals contributed to the collection, although as the editors, Raymond Dennett and Joseph E. Johnson, point out, pressure of public business rendered such participation impossible.

All of the authors strove earnestly for objectivity. Only occasionally do notes of irritation obtrude. On the other side, the contributions, almost without exception, are realistic in spirit. Professor Mosely's concluding chapter, entitled "Some Soviet Techniques of Negotiation," achieves a remarkable combination of hard-headed critical realism and sympathetic objectivity. His contribution is particularly noteworthy for the valuable suggestions which it offers for facilitating successful negotiation with Soviet diplomats. While this contrbiution is far more than merely "technical" it is at the same time technical in the best sense of the term. Virtually

all of the authors are agreed on the important point that Soviet lawyers, economists, traders, and diplomats are able, hardworking, and tenacious. To these formidable individual qualities is added the power they derive from working as cogs in a highly organized mechanism.

FREDERICK C. BARGHOORN
Yale University

BROOKINGS INSTITUTION, International Studies Group. *Major Problems of United States Foreign Policy 1951–1952.* Pp. xiv, 479. Washington, D. C.: Brookings Institution, 1951. $1.50 paper; $3.00 cloth.

The first four volumes published annually in the Brookings series of problems in American foreign policy endeavored primarily to "inform" the American citizen. The fifth and present volume strives, however consciously, to increase his "wisdom and understanding" of the timeless rules and principles of foreign policy in general. This marks a departure, at least in emphasis, from earlier postwar writings which were purely descriptive, as has been the tradition in histories of American foreign policy. Whereas the preceding volume in this series conceived the broad aims of American foreign policy as "the maintenance of enduring peace," this volume systematically reviews the main outlines of American "national interest." In so doing, it takes a leaf from the wise pages of prudent diplomats like George F. Kennan and profound scholars like Hans J. Morgenthau. But it remains an open question whether these concepts which have become respectable so painfully and tardily can be widely appropriated in time to help us avoid a third perhaps final world tragedy. Unless public opinion schooled by its academic and political mentors in utopianism can relearn the enduring truths of realism, no popular administration can be sure of its ground. Lacking this confidence, it must become a prisoner of domestic critics from the political extremes.

The arrangement of topics in this useful volume follows the conventional and not unsuccessful Brookings pattern. Part I surveys the present position of the United States in world politics. The quality of this section, particularly Chapters III and IV, is worthy of special note. Part II is a survey of contemporary problems which is thorough if uneven. Part III employs the heralded Brookings technique of isolating a particular problem for policy analysis. The value of this approach, so common in public service, has been successfully tested in classroom experiments and in public seminars conducted by the Institution. The plan of the volume is beyond criticism.

Not so for parts of its content, however, for if much is realistically grounded, the reader should expect to discover as well pious phrases solemnly intoned which even to the writers must ring hollow at this critical time. A section entitled "The Political Field" becomes profoundly unpolitical when nations are admonished to follow the United States in renouncing war, intervention, and any further territorial ambitions. Even for the greatest of world empires these preconditions of peace have become elusive, for since the "Cold War" we have intervened by supporting old and encouraging new regimes literally around the globe and today find ourselves deep in a tragic struggle for influence and control. *Major Problems* is an invaluable addition to the field, but one would hope that the institution through its seminars would strive to bolster these theoretical weaknesses by the same steadfast pursuit of truth here as has been evident in its discussions of area problems.

KENNETH W. THOMPSON
University of Chicago

LEONARD, L. LARRY. *International Organization.* Pp. xv, 630. New York: McGraw-Hill Book Company, 1951. $6.00.

This volume, the latest contribution to the list of first-rate textbooks in the McGraw-Hill Series in Political Science, is based not only on the author's teaching experience, but also on his substantial contact with international organizations while in the service of the United Nations Relief and Rehabilitation Administration, the United States Government, and the United Nations. Divided into four major parts, it surveys in turn the framework and the political, economic and social, and colonial aspects of international organization. Part IV, made up of three chapters on colonial activities written by Lawrence S. Finkelstein, is a real contribution to the volume. It presents a thoughtful and temperate assessment of the problems, achievements, and failures of international supervision of trusteeship and other non-self-government territories. Perhaps even more to be applauded is the fact that these chapters have a freshness and readability that is too often lacking in textbooks in the field of international organization.

As for the book as a whole, it should serve as a sound and useful introduction to put into the hands of students. It seems weakest in its handling of certain of the theoretical—perhaps it is permissible to say philosophical—aspects of international organization. For the reviewer, the most unsatisfactory parts were the first two chapters, which survey the general problems posed in organizing the relations of sovereign states and sketch in the history of the development of international organizations. The chapter on the genesis of international machinery and arrangements in particular could have been more carefully and systematically developed to indicate more fully the importance of the past in molding the international institutions of the present.

In contrast, the major portion of this textbook is a solid, competent presentation of the materials. Professor Leonard outlines and explains in considerable detail the structure, functions, and procedures of the United Nations and other international bodies. He has set himself the task of viewing international organization through the study of the actual practice of governments. In so doing, he has provided the student with a mature and accurate insight into how things are done in the various international bodies.

The approach, however, has its dangers. In chapter 10, for example, the author describes the handling of a number of disputes by the Security Council, in order to illustrate the nature of the security system of the UN. The description is at times so spare and sketchy that it contributes inadequately to an understanding of the issues involved. As a result, there is room for question whether the brief account of procedures followed illuminates the "practice of governments" to any noticeable degree. More to the point, perhaps, is the fact that this chapter precedes rather than follows an outline of the actual organization of the Security Council, a peculiarity of sequence which may have some purpose, but which may also result in a measure of confusion among students using the volume as an introduction to international organization.

These comments are not intended as a major criticism of Professor Leonard's study. For the most part, the matters criticized seem to be outgrowths of what the reviewer would guess was hurry and pressure in getting the work to press. They can be remedied in a future edition. Meanwhile, this is a useful text and should fulfill its primary purpose in meeting the needs of college students of international organization. As in the case of other textbooks, however, there is unfortunately little reason to anticipate that the author's hope for a broader reading public will be realized.

HENRY R. WINKLER
Rutgers University

HAVILAND, H. FIELD, JR. *The Political Role of the General Assembly.* Pp. x, 190. New York: Carnegie Endowment for International Peace, 1951. $2.75.

In this monograph the author has made an original and invaluable contribution to the literature on the United Nations. After a careful study of the documents and a vigilant observation of the General Assembly in action, Professor Haviland presents us with a critical analysis of its organs and procedures, both in theory and in practice, evaluating with admirable objectivity their defects and virtues and their potentialities for the future. He compares the work of the General Assembly with that of the League of Nations Assembly, describes the role of the General Assembly as anticipated at San Francisco, traces the truly remarkable changes in this role brought about in practice, and analyzes the forces which have produced these changes.

Of course the most significant of these changes has been the gradual acquisition by the General Assembly of a major role in the handling of international crises, notably those occurring in Greece, Palestine, and Korea. While this development may be justified legally, it is hardly in accord with the original spirit and purpose of the Charter, according to which the Security Council was to be the organ responsible for the maintenance of peace, especially when collective force was to be brought into operation. But, as the author remarks, "Constitutions that do not bend are very apt to break . . . and as long as that change does not inflict undue violence upon the language of the constitution, the change would seem not only feasible but desirable."

As effective action in the Security Council was blocked by the operation of the Big-Power veto, there was no alternative between complete frustration on the one hand, and, on the other, an enlargement of the political role of the General Assembly. But the Russian veto was not the only force at work in this direction. As a matter of fact, Soviet Russia itself aided in extending the powers of the General Assembly. "It was the Soviet Union which urged the Assembly to take extraordinarily strong measures regarding Spain, the Soviet complaint of United States aggression against China, the status of the former Italian colonies, Palestine and other similar questions."

Certain criticisms offered by the author are worthy of emphasis. The Secretariat, he believes, has failed to furnish adequate documentation to help the Assembly deal effectively with the crises which have come before it, with the possible exception of the Palestine case. Also, he deplores the tendency of members to speak too often and too long. Furthermore, the caliber of those chosen to serve on Assembly commissions leaves much to be desired. Investigations are too often of a superficial nature. The potentialities of judicial settlement have been almost completely neglected. Finally, an inordinate amount of time has been given to the preparations and discussions of draft conventions such as the Genocide Treaty.

Despite these defects, the General Assembly, through the formulation of substantive recommendations, has taken a significant step beyond mere inquiries or even pacific settlement, and this may turn out to be the groundwork for a true international government. Furthermore, as its action in Korea demonstrates, the Assembly is moving ever closer toward providing "teeth" for its recommendations. Finally, it has played a leading role in actually establishing new political regimes and has been one of the principal factors in channeling and directing "revolutionary forces so as to avoid a political inundation that might engulf the entire world."

CHEN, TI-CHIANG. *The International Law of Recognition, With Special Reference to Practice in Great Britain and the United States.* Edited by L. C. Green. Pp. xxvii, 461. New York: Frederick A. Praeger, 1951. $15.50. Published under the auspices of the London Institute of World Affairs.

This book, with a foreword by Professor J. L. Brierly of Oxford, is a comprehensive exposition and analysis of the law of recognition. It includes parts dealing with the recognition of states, of governments, and of belligerency and insurgency; the consequences of recognition; the modes of recognition; qualified recognition; and the doctrine of nonrecognition. The cases and voluminous literature of the subject are cited in footnotes, and fourteen pages are devoted to a listing of the cases and the literature.

Dr. Chen espouses the "declaratory" as opposed to the "constitutive" theory of recognition, believing that the latter rests upon a legal "positivism" which would tend to reduce all international law to a nullity. He believes that states and governments which exist in fact have by virtue of that fact rights and duties under international law.

This theory assumes that the interpretation of "facts" is self-evident in a degree hardly justified by experience. Homicide, for example, committed with malice aforethought, is doubtless murder, at the moment committed, yet none of the legal consequences of murder follow until a court has given judgment. Until that judgment the individual is presumed to be innocent, although once judgment is given it has "retroactive" effect in the sense that the accused is to be regarded as a murderer from the time he committed the act. The judgment is "declaratory" but nevertheless legally important. To consider another illustration, an organized group may have characteristics of social unity apart from any act of law, but it is not generally regarded as a "corporation" with legal personality until the moment it has complied with the legal formalities of incorporation. There have been a few judicial decisions attributing some corporate characteristics to organizations which have not complied with those formalities, but in general the legal recognition of corporate character is "constitutive." United States courts have dated the title of the United States to all the territory accorded it by the Treaty of Peace (1783) from the Declaration of Independence (1776) although it was not generally recognized by other states in the community of nations until a number of years later. On the other hand the Permanent Court of International Justice held that Poland lacked title to the former German territory it claimed until the Treaty of Versailles went into effect, although Poland had been given some recognition by the Allies prior to that time.

These illustrations suggest that "facts" of sociology and history are not usually "facts" in law until the legal community has "recognized" them as such. The issue as between the "declaratory" and "constitutive" theory concerns the extent to which "recognition" of a given situation operates retroactively, and courts of different competence may decide differently in the same situation, and the same court may decide differently in different situations. Retroactivity is actually determined by the extent to which recognition is a "juridical" or a "political" act. It is difficult, therefore, to formulate any absolute rule. The problem is one of evidence rather than of argument. In some circumstances recognition is a "juridical act" implying a duty to recognize *vel non* and in others it is a "political act" exercisable at discretion. Dr. Chen properly indicates "the multifarious aspects of international life in which recognition comes into play" (p. 13). This complexity of the subject militates against a dogmatic attitude. The impression of such an attitude, suggested by Dr. Chen's brief statement of theory at the beginning, is happily reduced by his and his editor's (L. C. Green) careful weighing of the sources in considering the varied aspects of the problem in the body of the book.

INTERNATIONAL LABOUR OFFICE. *Payment by Results.* Pp. viii, 204. Geneva and Washington, 1951. $1.25.

There is growing interest in incentive wage systems as a method of increasing production and raising living standards throughout the world. Under the Technical Assistance Program of the United Nations, the International Labor Organization has offered its expert services, and this report is an indication of ILO activity in the field of payment by results. The term is defined to cover all systems under which wages are directly related to some measurement of the work done by the individual worker or group of workers. Consequently, it does not include such schemes as profit sharing or workers' stock participation.

The first seven chapters of the study and the appendix were prepared by the International Labor Office mainly on the basis of information supplied by governments, employer organizations, and unions. Chapter 8 contains a significant statement of general principles concerning the use of payment by results which was unanimously adopted by experts drawn from employers', workers', and independent groups of different countries at a meeting in Geneva held in April 1951 under ILO auspices. The experts recognized that the successful operation of piece rate and standard hour systems depends upon good industrial relations and whenever possible should be the subject of collective bargaining. The authors of the report do not argue for or

against payment by results as such arguments must ultimately be based on value judgments.

Although the majority of workers in most countries are paid by time, substantial numbers in many countries are paid by results. Thus, the estimated percentage of total hours worked on piece rates in industries surveyed in 1949 was approximately 70 in Hungary, 58 in Sweden, and 37 in Western Germany. In the United States a Bureau of Labor Statistics Study indicated that 30 per cent of plant workers were paid by results in 1945–1946. The ILO survey shows that in most countries, such systems are extensively applied in the textiles, clothing, and metal trades, and to a moderate extent in leather, rubber, mining, and commerce.

While much of the material explaining these systems is found in the standard texts on wage incentive methods, the information on the extent and use of the various systems of payment by results in the different countries is a notable contribution. However, since the data were furnished to the ILO by organizations in the various countries, they should be carefully evaluated by the reader. The International Labor Office prepared this report to provide governments, employers, and other interested parties with information on the various systems now in use. Among the interested parties will be experts and teachers in the area of personnel management.

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

SMITH, LOUIS. *American Democracy and Military Power: A Study of Civil Control of the Military Power in the United States.* Pp. xv, 370. Chicago: The University of Chicago Press, 1951. $5.00.

If the United States is to remain free, it must continue its traditional policy of subordinating military might to civilian control. So argues the dean of Berea College, a political science teacher of the Leonard D. White school of thought, in a comprehensive analysis of the history of this country with particular attention to the wartime conduct of its civil authorities. He examines the strain imposed upon accepted structures and patterns by the heavy military expenditures and expanding armed forces incident to the current drive for security. Have our international involvements become so extensive since 1898, he asks, that a garrison state with autocratic rule may ensue?

Dr. Smith holds that this menace, while real, can be checked by a proper understanding and application of constitutional procedures. The Constitution is a remarkably able document; its proper operation assures civilian domination and public liberty. Under it in time of war, presidents —especially Franklin D. Roosevelt—have wielded great authority, but in such manner that military power never became an implicit threat. Cabinet officers and bureau and agency chiefs, even those who exercised wide influence after Pearl Harbor, were not subordinated to the military in policy or action. The most delicate of all operations, the one which the author considers most badly conceived—the removal from the Pacific coast of citizens and aliens of Japanese ancestry—was performed under civil authorization.

Congress and its committees, the records of which are analyzed in one-third of this study, have served as checks upon the armed forces and upon executives who might otherwise tend to go too far, especially upon officials who have held military commissions. Federal courts from the post-Civil War case *Ex parte Milligan* onward have restrained military agents and their civilian principals from injurious actions against civil rights. At present mid-century, American civilian pre-eminence is threatened by pressures from outside the democratic world, but "it is vital that civil control remain lest free men should lose their liberties at home in the very process of defending them abroad."

The volume is a model of accurate scholarship, careful documentation, and fine writing. Events since its compilation, including the deepening of the Korean War and the recall of General MacArthur, have tended to substantiate the author's thesis.

EARL CRANSTON
University of Southern California

JONES, JESSE H., with EDWARD ANGLY. *Fifty Billion Dollars: My Thirteen Years with the RFC (1932–1945).* Pp. xvi, 631. New York: The Macmillan Company, 1951. $6.00.

This book presents the history of the Reconstruction Finance Corporation through the years 1932–1945, covering the period during which Jesse H. Jones was chairman, directing the policies of the corporation. Part I, consisting of 25 chapters, describes the antidepression measures of the thirties. Separate chapters are devoted to a discussion of advances to banks, railroads, insurance companies, building and loan associations, business and industry, states and cities. Other chapters discuss the steps taken to aid agriculture, to revive the real estate market, to further rural electrification, to stimulate foreign trade, and to bring relief to the victims of the Ohio flood in 1937, the New England hurricane in 1938, and the great drought in the South in 1939.

These chapters give summary figures of the advances made in each field, but they are enlivened by the selection of individual loans for detailed consideration, with their attendant personal and human incidents and relationships. As would be expected, the author vigorously defends the actions of the corporation in certain matters which were the subject of public criticism at the time; for example, the loan of $90,000,000 to the Central Republic Bank, of which General Charles G. Dawes was chairman. This loan was made to the bank shortly after General Dawes had resigned as President of the Reconstruction Finance Corporation, to return and take charge of his own bank. The author also defends the policy of giving publicity to the loans made, although there was a strong feeling at the time that such publicity might imperil the institutions to which advances had been made, by advertising the weaknesses which had made the loans necessary.

No one can read this section of the book without being convinced of the vast services rendered by the corporation in combatting the depression. The author makes occasional mention of losses taken on loans, but the overwhelming bulk of the advances made were repaid in full with interest. A proper distinction is drawn between the loans made on a business basis, and the use made by Congress of the corporation as an agency for the advances of relief funds which were not intended to be repaid.

The lengthy 21st chapter ignores the R.F.C. to a considerable extent, and is a critical discussion of the political scene in Washington during the Roosevelt administrations and the early months of Mr. Truman's regime. It is entertaining, being as it is the impressions of a competent observer and participant, but some of the comments are matters of personal opinion only, and of doubtful validity as, for example, that President Roosevelt was anxious to "get into the fighting since that would insure a third term."

Part II of the book is devoted to the services rendered by the corporation in preparing the country for war and in fighting the war itself. Chapters are devoted to certain subsidiary corporations set up for preparedness and war purposes such as the Defense Plant Corporation, the Defense Supplies Corporation, the Metals Reserve Company, the War Damage Corporation, etc. Much attention is given to the rubber program and the development of the synthetic rubber industry. The author answers the Baruch Committee report which had condemned the slowness of our steps in that direction. Certain "friction and interagency troubles over rubber in 1942 and 1943 were directly attributable to . . . Vice-President Henry Wallace's Board of Economic Warfare." Throughout the book the author's clashes in viewpoint and policy with Henry Wallace, Franklin D. Roosevelt, and others of the inner circle of the New Deal are forcibly set forth.

Only occasional instances of attempted influence to sway the actions of the corporation are cited, for example, the suggestion of President Roosevelt that the corporation should purchase The Empire State Building. In most cases the sug-

gestions were not followed. The recent disclosures, or at least allegations, of such improper influence in the granting of corporation loans, which have received such publicity in the press, apparently do not date back to the Jesse Jones regime.

The final chapter is a tribute to the author's associates and employees in the corporation. The book is well worth careful reading, particularly at the present time, when the R.F.C. is under fire and its future life and powers are problematical.

HOOVER, HERBERT. *The Memoirs of Herbert Hoover: Years of Adventure, 1874–1920.* Pp. xi, 496. New York: The Macmillan Company, 1951. $4.00.

Here is an autobiography constituting a real-life Horatio Alger story. Herbert lost his father at six and his mother at nine years of age whereupon he was sent to be reared by Oregon relatives. He entered Stanford University the first day it opened and evidently got a good start on a mining engineering education while organizing the "barbarians" and managing athletic finances. Summers he built up a tough physique on geological surveys. Then, in the hard times of the nineties, he learned firsthand the lot of the unemployed, tramping endlessly in search of a job.

Luck turned as the young specialist was employed by a great English mining firm. It was no tenderfoot that penetrated the wilds of Australia seeking and developing mines. In China he became involved in litigation that was garbled into smears in the 1932 presidential campaign. Taken into partnership he traveled to and fro over the planet on mining missions.

On long voyages he read omnivorously. "It seemed at times I would exhaust all the books in the world." In 1909 he completed a text book on mining engineering still used in schools. It was no mean intellectual feat for him and his wife to translate *De Re Metallica,* a folio of 1556 hitherto untranslated because of its obsolete mining nomenclature.

The role of the "Great Humanitarian" seemed forecast in repeated expressions of deep concern over the poverty and suffering he witnessed. So deep-seated in him were the American democratic folkways that long residence in Britain could not reconcile him to its social stratification despite his admiration for individual Englishmen.

Then there is the profound faith in his profession. "The more men of engineering background who become public officials, the better for representative government." But who does not feel thus concerning his own vocation?

From his home in England we get a close-up of the outbreak of World War I; and soon he was busy efficiently managing Belgian relief. He broke down obstacles by scaring British, French, and even German ministries into reluctant cooperation by dangling before their eyes the threatened wrath of neutral public opinion if his relief were not permitted.

But why did this supermanager who moved from one gigantic achievement to another, with scarce a frustration, have to be so frustrated during four years as President? A later volume may throw light on that.

WILFRED E. BINKLEY
Ohio Northern University

PUSEY, MERLO J. *Charles Evans Hughes.* 2 vols. Pp. xvi, 410; vii, 411–829. New York: The Macmillan Company, 1951. $15.00.

Since the appointment of Mr. Pusey as the official biographer of Charles Evans Hughes several years ago, students of the recent American scene have awaited the publication of these volumes with considerable skepticism. They will, however, be pleasantly surprised. The author, now an associate editor of the *Washington Post,* has written a warm and perceptive biography of a great and kindly man. More important to scholars, however, is the fact that he has written the history of an important era and filled in some of the large gaps in our knowledge of American history since the early 1900's.

A few examples will suffice to indicate the significance of some of Mr. Pusey's revelations. His account of Hughes's service as investigator of the utilities ring and of the great insurance companies and next as a crusading governor of New York is original and practically definitive. His chapters on the campaign of 1916, in which Hughes was the unsuccessful Republican candidate against Woodrow Wilson, shed much new light on that episode. Moreover, Mr. Pusey's discussion of Hughes as Secretary of State from 1921 to 1925 is full and immensely revealing. Here, for the first time, the story of the Washington Disarmament Conference is told from the inside.

Of greatest interest to contemporary scholars, however, is the author's well-documented and thoughtful account of the great battle over Franklin Roosevelt's proposal to reorganize the Supreme Court. Mr. Pusey squarely meets the charge that the Court deliberately set about to undo the New Deal program and shows that it simply was not true. In addition, he demonstrates convincingly that the Court's so-called shift in constitutional interpretation in 1937 was in no way related to the President's attack, but was rather the logical outcome of the broad liberal interpretation of constitutional powers that Hughes and some of his colleagues had been urging. There is not space enough to go into this matter further. It suffices to say that no student of recent constitutional law or history can afford to ignore Mr. Pusey's thesis.

This biography, excellent though it is in many respects, has important limitations that this reviewer cannot let pass without comment. Its chief fault stems from Mr. Pusey's complete lack of the critical faculty. He admits that Hughes made two, perhaps three, minor errors of judgment during a public career lasting nearly sixty years. On all other occasions, however, Hughes acted from high motives and was right. The author may have given us a fair estimate of the man, but this reviewer was on occasion dubious. This reviewer, for example, was not convinced that the chapters on the campaign of 1916 did full justice to Wilson or presented the real reasons for Hughes's defeat. Nor was he convinced by Mr. Pusey's explanation of Hughes's failure to live up to his promise, given during the campaign of 1920, to work for the entry of the United States into the League of Nations should the Republicans return to power.

The author's unfailing loyalty to his hero, therefore, had a serious impact on his judgment of men and events of twentieth century America. The final, definitive estimate of Hughes will have to be given by some one not blinded by the amplitude of the great man's virtues.

ARTHUR S. LINK
Northwestern University

FREEMAN, DOUGLAS SOUTHALL. *George Washington, A Biography.* Volume III: *Planter and Patriot.* Pp. xxxviii, 600. Volume IV: *Leader of the Revolution.* Pp. viii, 736. New York: Charles Scribner's Sons, 1951. 2 vol. $15.00.

The predictions of a definitive biography of Washington, recorded by many of the reviewers of Mr. Freeman's first two volumes on the Young Washington, which were published in 1948, are fully justified by these successive volumes. However, the significant years between 1759 and 1778 have absorbed so much attention and space that the original limit of six volumes for the entire biography seems to be hopelessly lost. It is to be hoped that a basic work, so valuable as is this one to all who teach or study, will be made available in a later edition within the financial reach of all libraries and schools. The need is real for a standard and generally available analysis of Washington. A surprising number of libraries today list nothing more adequate than the century-old edition of *The Writings of George Washington* by Jared Sparks. Mr. Freeman's skill at research and presentation, his scholarship, and his easily readable style are at their best in these volumes which librarians will probably find adequate for the needs of students and general readers for the next hundred years.

In these two volumes the author gives almost a third of his attention to Washington, the Planter, and two-thirds to the Patriot and the Leader of the Revolution. The value of Mr. Freeman's thorough reanalysis of well-known sources is especially evident in the chapters dealing with the administration of Mount Vernon and the Custis plantations. Washington's reputa-

tion as one of the most progressive farmers in colonial Virginia is confirmed, but sometimes his naïveté is surprising. For example, he could write seriously to his English agent in 1759 asking for a definite statement of the price at which Mount Vernon tobacco would be selling months later in England, and could ignore the effect of differences in soil on the quality of tobacco. Most surprising is Mr. Freeman's carefully documented conclusion that Washington's hitherto highly respected system of plantation bookkeeping actually was so inadequate that no accurate profit and loss balances could be determined. In a generally declining plantation economy, only speculation in western lands maintained the family fortune.

Washington, the Patriot, remains unblemished in these volumes. His attendance at the meetings of the Virginia House of Burgesses, each of his campaigns for re-election, his services as local justice, warden, and town trustee, all are traced and described. These years of training in public affairs served him well when broader responsibilities were placed upon him. It is again evident that his statesmanship and his unswerving devotion to principles were the bases for his strength and for his sound reputation. Washington's ability as a general must be questioned. Each battle and campaign is analyzed thoroughly and impartially.

Mr. Freeman's suggestions on potentially fruitful fields for further research are especially valuable to investigators interested in related aspects of the Colonial and Revolutionary periods. The items in the general bibliographical note on the resources of state and local historical archives are supplemented by frequent comments in the footnotes on subjects warranting full-scale development.

CHARLES M. THOMAS
The Air University
Maxwell Air Force Base, Alabama

SMITH, MORTIMER. *William Jay Gaynor: Mayor of New York.* Pp. xiii, 192. Chicago: Henry Regnery Company, 1951. $2.50.

William Jay Gaynor, the reform mayor who is reputed to have swallowed the Tammany tiger instead of having it swallow him, is a little remembered figure today. An upstate New York farm boy who became a successful Brooklyn lawyer, Gaynor entered public office by way of the bench at the age of forty-five. As a judge he was unusual and refreshing. He sped through his calendar, castigated pompous, turgid, and lazy lawyers, and belabored the highest appellate court when it infrequently reversed him. Although he was ambitious, higher political office long eluded him. In 1908, when Gaynor was sixty, Charles F. Murphy, then leader of Tammany, decided to make Gaynor, a onetime Catholic and a divorcee to boot, the next mayor. Once elected, Gaynor ungratefully struck out on his own and accomplished a series of important reforms in city administration. New Yorkers found too that their mayor was entirely uninhibited in expressing acid views on issues and personalities, especially reformers.

In August 1910, he was shot by a crazed ex-city employee and never really recovered. When his administration came under heavy fire during the remainder of his term, ill health further strained his cooperativeness and good temper, never very strong qualities in him at best. In 1913 he was sidetracked by the Democrats and found himself with little organized support. He died before the election.

Mr. Smith calls Gaynor a "libertarian, the last thoroughgoing primitive Jeffersonian in our public life." Certainly he was an uncompromising individualist, and Mr. Smith demonstrates that these qualities ill fit a man for survival in urban politics. Gaynor's career also shows that an official who pursues without deviation what he believes is the public interest is likely to lose the support of all except the inarticulate, unorganized multitude who may dimly realize that somehow this beleaguered figure is basically on their side. It is clear that our system gains vigor from the Gaynors who come along, but we are probably more comfortable without too many of them.

Although this book reveals little that is new about Gaynor, it is written with distinction and maturity. There are many insights which catch the spirit and issues of Gaynor's day and hold them up in the perspective of our own times. There are not as many studies of American mayors as there might be. This is a good and useful contribution to that literature.

JAMES R. DONOGHUE
University of Wisconsin

TEN BROEK, JACOBUS. *The Antislavery Origins of the Fourteenth Amendment.* Pp. vi, 232. Berkeley: University of California Press, 1951. $3.00.

The author's fundamental view is that the Fourteenth Amendment was not, as generally assumed, the result of spontaneous action by Congress after December 1865, but that it was the result of a sequential chain of developments that originated with the abolitionists during the early 1830's. The aim of this group was to liberate the slaves and confer upon them and other free Negroes the rights of citizenship. After their failure, through a reasonable program of persuasion, to effect abolition, they found it necessary to appeal to constitutional safeguards to protect their persons and the right of free speech. The next step consisted of the claim that under certain provisions of the Constitution—the Preamble, the comity clause, and the First, Fourth, and Fifth Amendments—the slave had personal rights denied him. It is pointed out that history did not always validate these contentions. The Southern counterargument, emphasizing the slave as property, is explained.

Gradually, through political channels, the abolitionist constitutional arguments gained ground until, by 1860, the Republicans were determined to destroy slavery. All the antislavery steps during wartime which culminated in the Thirteenth Amendment were motivated by this fundamental purpose. The Thirteenth Amendment meant far more than the breaking of the bond between master and slave; the power to enforce it meant the conferring of those civil rights which many abolitionists, in the 1830's, had contended appertained to slaves. The Civil Rights Act of 1866 and the first clause of the Fourteenth Amendment completed the cycle.

The author probes significant constitutional history, and does establish a connection between the Fourteenth Amendment and the constitutional theories of the abolitionists. He, however, drives so straight to his goal as to give an unbalanced view of the complex sectional controversy. He claims that the South forced the abolitionists to adopt a political program because the persuasive appeals of the latter were not heeded, but there is no reference to the fact that the "persuasive appeals" were surcharged with violent abuse. There is no more than an allusion to the political and economic factors involved in the slavery controversy. The conclusion that the Republicans would not compromise in 1860 because they were resolved to destroy slavery is based upon a very superficial examination of the evidence touching this matter. The author acquits the Republicans as a group of any political motive (enfranchisement of the Negroes) in connection with their emancipation program, but he does not discuss those political clauses of the Fourteenth Amendment that weighed heavily upon the South.

HENRY H. SIMMS
Ohio State University

CLINE, RAY S. *Washington Command Post: The Operations Division.* Second in the 90-volume series "The U. S. Army in World War II." Pp. xvi, 413. Washington: Office of the Chief of Military History, Department of the Army, 1951. $3.25.

"Some of the greatest generals of World War II, far from striking the posture of the man on horseback, issued their military orders from the quiet of their desks and fought their decisive battles at conference tables." So starts this institutional biography which describes the birth, development, and activities at maturity of the Operations Division of the War Department General Staff during World War II.

At the time Hitler's army marched into Poland in 1939, there existed under the Chief of Staff, General Marshall, an extraordinarily complex structure completely unsuited for close control and direction of the various parts of the Army. The Chief of Staff supervised and administered this

unwieldy, far-flung, growing Army with the aid of a small War Department General Staff and his numerous chiefs of arms and services. The General Staff formulated plans and issued orders to all organizations under Chief of Staff control, but enjoyed no responsibility in the execution of plans or policies. It exercised little or no control over procurement and distribution of equipment and supplies, over the training of officers and specialized units, or over the administration and management of the bulk of Army affairs. Of greatest importance, there was no tightly controlled machinery through which a directing brain could control and co-ordinate expeditiously the actions of the gigantic United States military machine to be developed for fighting World War II.

By virtue of necessity, as world crises occurred and General Marshall was faced with one unique major problem after another, he began to lean more and more heavily upon one of the staff divisions, the War Plans Division. Originally, its functions had been those of drawing up strategic plans in peace time, with a view toward going into the field and executing them in time of war. As the international situation became worse, however, War Plans Division, commonly known as WPD, assumed all functions not specifically delegated to the other staff divisions. With the attack on Pearl Harbor, this role of WPD was enlarged and an Operations Section was set up in the division. By January 1942, it had become the operating agency of the Chief of Staff. It received reports from overseas theaters, from all other General Staff agencies, and from the Air Force; and it reported daily on the operational decisions and actions of the entire War Department. Thus, the division assumed a dominant position, directing and checking the actions of all other staff agencies.

Meanwhile, the deficiencies of the War Department organization had been thoroughly recognized and had been, for a long time, the subject of intensive study. As of 9 March 1942, reorganization was formally effected. With the reorganization, each staff division, other than War Plans Division, was reduced to a strength of from 12 to 16 officers, with functions curtailed accordingly. War Plans Division, on the other hand, was expanded to 107 officers and officially assigned the function of strategic direction and control of operations under the Chief of Staff. Except for basic decisions to be made by the Chief of Staff on recommendation by the General Staff, mobilization and preparation of the forces for war became the responsibility of three separate and autonomous Zone of the Interior commands: the Army Air Forces, the Army Ground Forces, and the Services of Supply. With respect to activities in the field, War Plans Division, later renamed the Operations Division and referred to as OPD, became the directing nucleus of the General Staff through which the Chief of Staff planned, supervised, and directed operations.

Against the background of international events of the period and the major problems that faced the Army until after the surrender of Japan, the authors of *Washington Command Post: The Operations Division* describe the manner in which the officers of OPD shouldered unlimited responsibilities and directed the war efforts of the Army. The book relates how they maintained personal liaison and continuous communication with overseas commanders, providing immediate War Department response to field requirements and insuring high command familiarity with operational problems; how they were instrumental in developing and defending before allied councils U. S. views on the allied strategy for conduct of the war; how they developed plans on the basis of which theater commanders advanced toward ultimate victory; how they furnished guidance and assistance to our military and political representatives in international relations; and how they "stuck their necks out" daily in the making of basic decisions necessary to the expeditious prosecution of the war. Difficulties created by instances of inadequate co-ordination between the State Department and the military services, and by lack of close liaison between the President and his military agencies, are revealed in comparisons between the loosely woven U. S. war cabinet and the tightly woven British system.

The book provides a prolific source of information for historians and a fertile field of study for military men seeking the optimum form of organization for our armed services in time of war. It contains a great deal of detail and a certain amount of repetition; nevertheless this book is of extreme value in pointing out necessary and desirable characteristics of military high command organization.

Last, but not least, it is a tribute to the efforts of those unsung individuals who manned the Washington Command Post during one of the most critical periods in the history of our nation.

REUBEN E. JENKINS
Major General, GSC, USA
Washington, D. C.

DICKERSON, OLIVER M. *The Navigation Acts and the American Revolution.* Pp. xvi, 344. Philadelphia: University of Pennsylvania Press, 1951. $6.00.

In the first half of this book Mr. Dickerson has demolished the myth that the Navigation Acts were a cause of the American Revolution, and he has done it so thoroughly that one might say that he has pulverized the pieces. Having devoted many years of painstaking research into the operation of these laws and the colonial reaction to them, he presents an enormous mass of convincing evidence that the old Navigation Acts, far from being oppressive to the colonies, were of great benefit to them and were accepted by them as such.

New England shipping throve mightily on the restriction of British trade to British bottoms, and the consequent colonial prosperity "was shared by every colony." The principle of enumeration, a proverbial sin of mercantilism, imposed no burden on the planters. Their best market was in the mother country; and after the Revolution, which deprived them of advantages they had there enjoyed, their industries slumped. As for the general evasion of the old laws of trade and navigation, reducing them to a dead letter, this too is part of the myth. The only body of eighteenth century evidence to support it applies to trading with the enemy in time of war, which is another matter, or to resistance to new laws, from 1764, that taxed colonial trade for revenue purposes, which is likewise irrelevant.

Tucked away at the end of the volume as an introduction to the lengthy bibliography—like a light hidden under a bushel—is an illuminating note on the history of the myth. It is scarcely more than a hundred years old in America, where it first appeared in George Bancroft's classic *History of the United States.* A generation later Mellen Chamberlain, writing the chapter on the causes of the Revolution in Justin Winsor's *Narrative and Critical History of America,* observed the discrepancy between Bancroft's thesis and his own discovery that the old commercial regulations had not worked badly or been condemned by contemporary Americans; and he reconciled the conflict by asserting, without any supporting evidence, that the laws in question were generally evaded. But where did Bancroft get his idea? Dickerson says from the free trade atmosphere of the 1840's in England and the United States. He does not seem to know that the myth was manufactured in England and became current there in the 1820's as a powerful argument for the fiscal reforms that Huskisson championed.

The second half of this volume contains some excellent material on the British attempt to tax the colonies and their resistance to it. Here, however, the hand that has just struck down one myth builds up another—that there was a conscious and widespread conspiracy in Britain to destroy American liberties and set up a centralized system of colonial "control patterned more or less on the French and Spanish models." Mr. Dickerson ignores the baffling complications of the imperial problem of the 1760's and 1770's, and obviously he is not at home in the intricacies of British politics of that period. But the defects of this part of his book do not affect the value of the first half, which is a capital piece of work long overdue.

A. L. BURT

PAUL, JAMES C. N. *Rift in the Democracy.* Pp. xiv, 200. Philadelphia: University of Pennsylvania Press, 1951. $4.00.

One of the most intricate processes of American democracy is the manner of nominating candidates for the presidency. Machinery for this purpose was long in the making, and it was not really achieved until 1844 after more than a half century of effort. It was in this year that the techniques now so well recognized as belonging to national party conventions were first really exploited.

Prior to 1844 there had not been much controversy over nominations. In the days of the Virginia dynasty Jefferson, Washington, and Monroe had been chosen as candidates by Congressional conferences. In the days of Jackson, he and Van Buren had exercised the controlling voice. Then a series of unexpected events upset the routine. The Panic of 1837, the defeat of Van Buren for re-election, the immediate death of President Harrison, and the peculiar set-up developed by the accession of John Tyler, the first Vice-President to achieve the chief magistracy, all combined to scrap the existing controls.

The chaotic politics of the Tyler administration gave opportunity for new developments hitherto undreamed of, made possible not only by the demoralization of the Whigs but also by the schisms within the Democratic party—the inevitable consequences of its years of power. Within the latter party many were tired of Van Buren and distrustful of his ability to lead the party back to power. There resulted a series of political maneuvers to prevent him from receiving the third nomination which the party leaders expected to offer him.

Various candidates and their friends now began to seek combinations and understandings not only within the Democratic party but also among the Whigs. Here the hope was to reclaim Tyler and his faction, a group of former Democratic believers in states rights who had opposed Jackson's centralizing tendencies. Calhoun and his followers were the first leaders. When they failed to stop Van Buren's drive for delegates others like Lewis Cass, Richard M. Johnson, and James Buchanan joined in the task.

Then opportunely the battered Tyler administration tried to gain political capital by seeking to annex Texas. This raised sectional, antislavery prejudices and offered an opportunity which opponents of Van Buren cleverly manipulated. Their strategy was successful, and by a complex series of maneuvers Van Buren was deprived of the nomination, and James K. Polk became first the Democratic candidate and then President of the United States.

Mr. Paul has made a very careful study of a complicated and scattered mass of evidence and has skilfully constructed the story, climaxing it with a very vigorous and exciting account of the Democratic National Convention of 1844. The great value of the book is its expert analysis of political maneuvering; its fault is that it claims too much for the Texas issue. The key to the situation was not the introduction of the Texas question but the fact that no organization even when built around Jackson could be free from the inevitable tendency to fall apart with the aging of its leaders. The rift of the 1840's in the ranks of the Democrats was as much a product of the rapid growth of the nation, the Panic of 1837, the growing sectional tension, and the rise of a new generation eager for power as it was of the Texas annexation question.

ROY F. NICHOLS
University of Pennsylvania

TAYLOR, GEORGE ROGERS. *The Transportation Revolution, 1815–1860.* Pp. xv, 490. New York: Rinehart & Company, 1951. $4.50.

This is the fourth volume in a series of nine on the economic history of the United States. Therefore this detailed treatment of the rather short period is to be expected.

Professor Taylor does not confine himself to a treatment of transportation as the title of his book might suggest. He discusses foreign and domestic trade, manufacturing, labor, prices, financial institutions, and the role of government—as well as canals, turnpikes, steamboats, railroads, and the merchant marine.

It appeared to Professor Taylor that "transportation developments were so revolutionary and were so fundamental to the economic growth of the country that, in [his] judgment, they seemed to require the central position they have been given." He avoids, however, stating that transportation developments are the explanation of all economic development during the period. One expects such an interpretation in view of the attention given to transportation. But it is wanting, and this is well.

The era was one of prenational markets, and the development of transportation had to occur before national markets could exist. Consequently every segment of the economy was aware of the importance of improved transportation. The states and the federal government subsidized it, private capital invested in it, and farmers and manufacturers agitated for it. But it is to the developments in the market that one should turn for an interpretation of the economic development of the time. Transportation developments were but an aspect of the more fundamental development that was occurring.

Professor Taylor was necessarily writing within the framework of the other volumes of the series, and this placed restrictions upon him. Therefore he describes and leaves any general interpretation of the period to the reader.

This book is useful to anyone who desires a more detailed treatment of the period than is found in the general economic histories that are available, but agriculture is not covered since it is to be covered in another volume of the series. The tariff is given less space than might be anticipated, but from the present point of view the treatment of the tariff is sufficient.

Professor Taylor has done a workmanlike job. His book is adequately documented, and a classified and annotated bibliography is included. Newer literature as well as the standard primary and secondary sources for the period is included. The illustrations are well selected for providing the atmosphere of the period.

FRED M. JONES
University of Illinois

MILLER, JOHN C. *Crisis in Freedom: The Alien and Sedition Acts.* Pp. 253. Boston: Atlantic–Little, Brown, 1951. $3.50.

Probably there exist no more carefully studied episodes in all American history than the Alien and Sedition Acts and their sequels, the Kentucky and Virginia Resolutions. And yet this little book admirably justifies the research that has gone into it. By a meticulous examination of primary sources, particularly the newspapers of the period, Mr. Miller has made clear the tremendous influence that public opinion played in all these proceedings. To read the book is to renew one's faith in democracy. According to the Federalist concept, "democracy always destroyed itself —consumed in the fires of vice and ignorance it generated. Like a volcano, said Ames, it contained the fiery materials of its own destruction" (p. 15). But the "crisis in freedom" that the Federalists precipitated seems to show that the exact reverse more nearly approximates the truth. It was the authoritarian regime of the Federalists, the rule of "the good, the wise and the rich" (p. 17), that went down; and it was the more democratic regime of the Republicans, which recognized "that dissension, discord and parties were inevitable," that won out. Fisher Ames was much sounder when he said: "A monarchy is like a merchantman. You get on board and ride the wind and tide in safety and elation but, by and by, you strike a reef and go down. But democracy is like a raft. You never sink, but, damn it, your feet are always in the water."

Most of the Federalists, to be sure, did not want a monarchy, but their leaders, at least, did want an oligarchy. The purpose of the legislation they sponsored in 1798 was to destroy their opponents and to consolidate and perpetuate the Federalist system. But they soon discovered that it was only war psychology which made their policy of suppression feasible. With the war scare over, the people refused to be coerced. The Alien Acts fell of their own weight. The Sedition Act served only "to multiply Republican newspapers and to increase vastly their circulation" (p. 221). The people managed even to view the Virginia and Kentucky Resolves with the suspicion they merited and to turn for a remedy, not to nullification, but to the dismissal of the Federalists from power. Even good Federalists saw eventually the error of their way. "There is danger of proscribing, under imputations of democ-

racy," said John Adams, "some of the ablest, most influential, and best characters of the Union" (p. 225).

This is not a particularly objective study. There is no question as to where the author's sympathies lie. He enjoys ridiculing the Federalists, and does it with skill and aplomb. "They induced hysteria," he points out, "then turned it to party purposes" (p. 22). But this reviewer, at least, shares the author's opinions too fully to play the role of faultfinder. The lesson of the book is that the Federalists got what was coming to them, and they got it rather sooner than even the most pessimistic among them had anticipated. Something of the same kind might even happen again.

WHITE, LEONARD D. *The Jeffersonians: A Study in Administrative History, 1801–1829.* Pp. xiv, 572. New York: The Macmillan Company, 1951. $6.00.

The second volume of Prof. Leonard D. White's "Study in Administrative History" covers the period of the Jeffersonians, as the first volume covered the Federalist decade. The practical business judgment and organizing capacity of the Federalists rendered services of permanent value in the organization of the purely administrative side of government. The purport of this volume is to show that the Jeffersonians did not depart radically from the system they found.

It was Jefferson, however, not the Federalists, who laid down, and carried out, the essential administrative plan for the State Department. And where the Federalists' administrative plan was changed by the Jeffersonians, as in the case of the Treasury Department, it was infinitely improved. The Hamiltonian theory that the Secretary handed down money bills to Congress merely to be passed blindly was certainly rejected by the Jeffersonians who insisted on the constitutional stipulation that such measures must originate in the House of Representatives. It was Gallatin, the Jeffersonian, who brought into being the Ways and Means Committee of the House. The Jeffersonians, led by Gallatin, put an end to the dictatorial control over the use of congressional appropriations and established the rule, never to be put aside, that the appropriations should be made specific and beyond the power of the Secretary of the Treasury to shift at will.

The author is eminently fair to the Jeffersonians. He makes the point that both political groups sought and found men generally of high caliber. Certainly no Federalists approached Jefferson in the State Department, or Calhoun in the War Department, or McLean in the direction of the post office; and Gallatin in the Treasury was fully as great a genius in finance as Hamilton. No Cabinet of the Federalist period approached that of Monroe in the uniform greatness of its members.

The author truly says that the political differences between Jefferson and Hamilton were "much more profound and significant than their differences in the manner and spirit of conducting public business." The Federalists shared Hamilton's contempt for democracy, and Jefferson was its greatest philosopher and molder. The twelve years struggle of the Federalists and Jeffersonians revolved around the issue of democracy and the freedoms guaranteed by the Bill of Rights which Federalism attacked through the Sedition Law. Never was there a truer statement than that of Lodge, in his biography of Hamilton, that the triumph of the Jeffersonians in 1800 "definitely determined that ours should be democratic republic."

The author has rendered a long needed service in his history of the purely administrative side in the formative days. His book is scholarly and sound, but equally interesting and entertaining—a fine achievement.

CLAUDE G. BOWERS
U. S. Embassy
Santiago, Chile

ROBERTS, OWEN J. *The Court and the Constitution.* Pp. 102. Cambridge, Mass.: Harvard University Press, 1951. $2.00.

This book comprises the Oliver Wendell Holmes Lectures for 1951 in the Harvard Law School. The three lectures constitute the reflections of Mr. Justice Roberts, after fifteen years on the Supreme Court and six years of "retirement" into tremendous activity as a public-spirited citizen and as a law professor and dean, on the functioning of the Supreme Court as an interpreter of the Constitution. More strictly speaking, Justice Roberts examines the role of the Court in relation to the federal system, since it was out of the federal system that conflicts of jurisdiction were anticipated and the resolution of these conflicts relegated to the Supreme Court. The general theme of the lectures is well suggested by Justice Roberts in these words: "In the performance of the function so conferred upon it, the Court has repeatedly found itself called upon to announce propositions nowhere expressly stated in the Constitution. It has had to formulate rules deduced from the fundamental nature of our dual system." With this task in mind, the lectures deal, respectively, with "Sovereignty and the Power to Tax" (the problem of reciprocal taxation), "Conflicts of Police Power" (the problem of regulation in the public interest), and "The Fourteenth Amendment" (the problem of due process).

In respect to the problem of reciprocal taxation, Justice Roberts points out that *McCulloch* v. *Maryland,* enunciating the doctrine of immunity because the power to tax is the power to destroy, was "the forerunner of some eighty cases of major importance dealing with state taxation of federal activities and federal taxation of state activities," that about one-fourth of these were expressly or tacitly "overruled, modified, or ignored" in later cases, principally because the Court was called upon "to exercise statesmanship in an uncharted region" rather than to interpret the text of the Constitution, or, in other words, "to implement policy rather than law." He also seems to think the Court has performed this function rather badly, or, at the best, in a very confusing way, referring particularly to *U. S.* v. *County of Allegheny* (1944) in respect to the immunity of a war contractor's real estate, as "the capstone of confusion"; and, although he considers that the steady progress toward the abolition of reciprocal immunities has been beneficial, he is severely critical of several of the Court's conclusions (pp. 29–35). For example, the doctrine that neither state nor nation may tax the other's property he considers unjust to the states, and the doctrine that neither may tax the other's securities or the interest on those securities he thinks produces an "unhealthy" effect.

With respect to the police power, Justice Roberts is again critical of many particular decisions, but concludes that the resulting expansion of federal power at the expense of the states "probably has been inevitable," and that the Court was wise in allowing Congress to regulate matters not intended to be within its jurisdiction through the "subterfuge" of its powers over taxation, commerce, and the general welfare, since resistance to the popular demands for such federal regulation might have produced "even more radical changes in our federal system." Similarly, the developments in respect to due process and the Fourteenth Amendment are analyzed in such a way as to lead up to Justice Roberts' conclusion "that the Court's decisions represent an alternation between expansion of federal power and an effort to protect state sovereignty." He is extremely critical of the view that the due process clause of the Fourteenth Amendment somehow gave the Supreme Court power over state legislation, state judicial procedure, and state executive power—it "was not intended to put the states in tutelage to the Supreme Court in any such fashion." Neither does he appear sympathetic with the doctrine, in connection with the recent applications of the Fourteenth Amendment to the national Bill of Rights, that due process should be considered as "shorthand for the first eight amendments."

In general, Justice Roberts is critical of, although apparently reconciled to, the way in which the Supreme Court "has limited and surrendered the role the Constitution was intended to confer on it." That is, the Supreme Court has not actually preserved the federal system, but has permitted the "sharp division of powers" between states and nation to become "blurred," and Justice Roberts thinks that

this may have been a beneficial development, although he is not sure. In making this appraisal and in coming to these conclusions, he examines or notices 225 cases, and essentially nothing but decided cases. An article by Charles Fairman of Stanford University is conspicuous for being mentioned in a footnote. Although Robert Cushman, Thomas Reed Powell, and many others have made most significant contributions of which notice might well have been taken, it was the role of the Supreme Court that Justice Roberts set out to examine, and that he has done rather neatly in this little volume.

CLARENCE A. BERDAHL
University of Illinois

HOPKINS, VINCENT C. *Dred Scott's Case.* Pp. ix, 204. New York: Fordham University Press, 1951. $4.00.

Students of American legal history and constitutional law will applaud the publication of this full-length study of the Dred Scott Case. In fact, this book suggests the hope that we may have comparable analyses of other celebrated and important litigation, such as the Legal Tender Cases (1871), the Slaughter-House Cases (1873), Munn v. Illinois (1876), or the Civil Rights Cases (1883), to cite only a few obvious examples. There is much that we want to know about these great cases that is not now readily available. Of course, the opinions of the justices can be found quickly enough in the austere pages of the Court Reports. But they tell only a very small part of the story.

We want to know who the parties were, and how they happened to get involved in the litigation. (As to Dred Scott, Mr. Hopkins is not yet certain that he can explain this aspect of his case, though he ventures a guess.) We want to know who the lawyers were, how they got into the case, what kinds of evidence they thought were important, and what legal arguments they presented. We want to know a great deal about the general social and political milieu within which the problems that eventually matured as legal issues took form. It is also necessary to know how the case was handled in the trial court, what kind of a record was made, precisely which questions survived for the appeal, how the appeal was taken and presented. When the case finally reaches the highest appellate court, the briefs and oral arguments of counsel must be examined with great care. Only then are we prepared to study the opinions of the justices; and with regard to these opinions we want to know the sources of their principal ideas, and an explanation for the divergence of views expressed. This means also that we have to be told a great deal about the judges themselves, their careers in public life, their legal experience, their social and economic predilections. Finally, as a minimum, we should also want to know what happened to the parties after the litigation was concluded, and above all, the subsequent history of the legal doctrines upon which the outcome turned.

This is, of course, a tall order, and I am not sure that Mr. Hopkins has filled it entirely, although I think he has done very well. This book is a work of very careful scholarship; the original sources are cited properly for all statements of fact, and the author has been diligent in studying a wide variety of sources—the opinions, briefs, court records, contemporary newspapers, diaries, legislative records, and various collections of papers of leading actors in this great drama. And he is careful not to push his inferences beyond the limits of his evidence.

Mr. Hopkins devotes three chapters to an account of how the case got under way, its Missouri phases, and its disposition by the United States Circuit Court. The next two chapters describe how the case was presented to the Supreme Court, by Montgomery Blair and George Ticknor Curtis in behalf of Scott, and by Senator George S. Geyer of Missouri and Reverdy Johnson of Maryland, formerly U. S. Attorney General, in behalf of Sanford. The arguments advanced in the opinions of each of the justices are summarized in very great detail in the following two chapters. The next three chapters are devoted to an historical analysis of the three main legal issues of the case: the question of Negro citizenship, the question of the power of Congress to prohibit slavery in the territories, and the conflict of laws issue, that is, the matter of Missouri's obligation to recognize the force of Illinois law. In a general way, this historical survey suggests that as to the citizenship and territorial issues there were available juridical and historical precedents to support both the majority and minority views of the justices. A final chapter recounts briefly the reactions of the country to the decision, as expressed by politicians, newspapermen, clergymen, and other makers of opinion.

As Jefferson once said about the Constitution, which in the large he approved, "I will now tell you what I do not like." The legal issues of this case were extremely technical and complicated, each justice wrote his own opinion, and most of them wrote at great length. All of the views of the justices are summarized with meticulous care by Mr. Hopkins, but the net result is that the reader is overwhelmed with detail. The author should have made a greater effort to summarize and synthesize, so that the points of agreement and disagreement among the justices would stand out more clearly, and so that the reader could grasp the total picture with less effort. Furthermore, I think Mr. Hopkins should have given much more information about the nine men who sat on the Court at this time. He does give a little, but not nearly enough to describe them adequately. Most literate Americans have a pretty good idea who Roger Taney was, but such men as Grier, Nelson, and Catron are quite unknown except to highly specialized scholars.

Perhaps the most unsatisfactory part of this book is the uncritical way in which Mr. Hopkins explains why the Court blew up a case which could have turned on an issue of jurisdiction alone into one involving such fiercely debated questions as the constitutional scope of congressional power over the territories. He offers the customary explanation that Nelson was originally selected to write a minimum opinion not touching upon such cosmic issues as the Missouri Compromise, but that because the two dissenters, McLean and Curtis, insisted on discussing everything, Justice Wayne "quite abruptly" (p. 55) moved that Taney write an opinion on all questions that had been argued.

It is unlikely that this is what ocurred. On the contrary, the evidence strongly supports the opposite view, that the issues were broadened at the insistence of the Southern justices and certain Democratic politicians. This explanation is advanced with great persuasiveness by Professor Allan Nevins in his recent book, *The Emergence of Lincoln* (Vol. I, Chap. 4, and Vol. II, Appendix I). I am not prepared to say that the position taken by Nevins is entirely correct, though it may well be, but the point is that Mr. Hopkins does not seem to be aware of the fact that on this important question there is a difference of opinion.

DAVID FELLMAN
University of Wisconsin

LERNER, DANIEL, and HAROLD D. LASSWELL (Eds.). *The Policy Sciences: Recent Developments in Scope and Method.* Pp. xiv, 344. Stanford, Calif.: Stanford University Press, 1951. $7.50.

"The word 'policy' is commonly used to designate the most important choices made in organized or private life. . . . The expression 'policy sciences' is not in general use." In making policy, "it is important to consider the entire context of events which may have an impact."

These quotations from coeditor Harold D. Lasswell define the scope of this volume. There are sixteen essays by sixteen authors. In 180,000 words they describe the methods and findings of the many disciplines which may help mankind in making its "most important choices."

The fact that "the entire context of events" is never available in human affairs is no bar to the development of a science. Hans Reichenbach uses meteorology as an illustration of that point in his excellent chapter on "Probability Methods." In meteorology "the physicist faces problems in which it is not the statistical totality but the statistical elements that are given in immediate observation. It took a long time to define what a weather situation is: such concepts as the path of a barometric minimum, or the location of a front, had to be elaborated from a multitude of individual data which do not indicate, in their immediate aspect, any structural grouping.

Had it been possible to watch the surface of the earth from some distance—say, from a vantage point on a space ship—it might have been possible to see a traveling storm center or a front in the way we see the eddies in a river. There is no such vantage point possible for the social scientist."

The "policy sciences" range beyond the social sciences as Douglas Whitaker's excellent chapter on "The Natural Sciences in Policy Formation" will testify. Natural science set the policy for Columbus even though his facts were faulty. The policy need for natural science data sent Darwin voyaging on the "Beagle," and Captain Bligh was an implement of a policy dictated by an official theory about botany and biology.

Those who are familiar with the works of Elton Mayo, Chester Barnard, Margaret Mead, Clyde Kluckhorn, Harold Lasswell, Paul Lazarsfeld, and Rensis Likert, some of whom are among the authors and all of whom are extensively cited, will have some clue to the character and scope of this useful volume.

As one reads Harold Lasswell's comments on the processes of the garrison state he cannot help but note that these comprehensive and expensive tools have had their most highly developed application in the military. Social science appropriations are hard to come by in a civilian democratic society; private donors seek a relative safety from political attack and from internal revenue criticism such is afforded by the physical and medical sciences. It would be regrettable, indeed, if democracy should lose out because the world had mastered, through research in national military services, the techniques of government command authority, but had left democracy trudging behind the wooden plow.

PHILIP S. BROUGHTON

Pittsburgh, Pennsylvania

SPAIN, AUGUST O. *The Political Theory of John C. Calhoun.* Pp. 306. New York: Bookman Associates, 1951. $3.50.

Shocking though Calhoun's justification of exploitation may be to twentieth century America, the South Carolinian is probably the only one of our statesmen, not even John Adams being excepted, who has thought through to a systematic political philosophy; and here is a comprehensive and clarifying study of his political theory, with due attention to the life of its creator, its historical origins, its leading ideas, its relation to earlier and contemporary state rights doctrine, its use by von Seydel in Germany, and its possible applications to present-day problems. The author, who took his doctorate at Yale in 1937, is now Professor of Government at Texas Christian University.

To the reviewer it is one of Calhoun's merits that he realized that the concept *sovereignty* is useful only for purely juristic purposes. To talk about political sovereignty is to change the subject to what Woodrow Wilson once called a catalogue of influences, and to confuse our thinking about that catalogue to boot.

While, however, Calhoun rejected as a *contradictio in adjecto* Madison's idea of divided sovereignty, and insisted upon its indivisibility, he failed to see that its inalienability rests upon precisely the same logic.

No change of sovereignty, therefore, can have a legal explanation. It is a *historical* fact that we simply ceased to think in terms of the Articles and began to think in terms of the Constitution. The character of the new order was a question of *legal* fact. Would it so operate that the states or the Union would have the last word on the division of powers? The amending clause and Supreme Court decisions under the 25th section of the Judiciary Act of 1789 went far to refute Calhoun's claims for the position of the states *in* the Union. But might they withdraw *from* the Union? When conventions in some of them passed ordinances of secession, the theory that these ordinances were void, and that resistence to Union authority on the part of combinations of individuals must be put down as unlawful, was successfully maintained. That the legal fact of the existence of the states only as nonsovereign member-commonwealths of the Union has not since been disputed is the result of the *sociological* fact of the postwar emergence of an all-sectional national unity. The author is

referred to W. W. Willoughby's *The American Constitutional System,* which his excellent bibliography does not mention, though it lists two other books by Willoughby.

Calhoun's concurrent-majority idea is, in the reviewer's opinion, normally most fruitful when it is not formalized, as in the compromising of sectional and group interests produced by our magnificent electoral and two-party arrangements. It is also still in formalized existence, as in the Senate's cloture rule, while Southern politicians would restore the two-thirds rule for Democratic presidential nominations.

JAMES HART

University of Virginia

WILCOX, CLAIR (Ed.). *Civil Liberties Under Attack.* By Henry Steele Commager, Robert K. Carr, Zechariah Chafee, Jr., Walter Gellhorn, Curtis Bok, and James P. Baxter III. Pp. xi, 155. Philadelphia: University of Pennsylvania Press, 1951. $3.50.

Arnold Toynbee has recently reminded a wide public in the United States that nations and civilizations may rise, flourish, decline, and, sometimes, disappear altogether. The cycle, however, does not result from fate but rather from the decisions and choices of men who are, in large measure, masters of their fate.

The evidence presented by the authors of *Civil Liberties Under Attack* suggests that decline threatens the republic established by Washington and Jefferson. "We Americans are having the jitters again," remarks Clair Wilcox in his foreword, and are shaking, curiously enough, in spite of the fact that in the present century we have emerged victorious from two mighty wars and are possessed of the greatest productive capacity and the most powerful armament in the world. "We are afraid," continues Mr. Wilcox, "afraid, for one thing, that communism will overthrow our government by resort to force and violence." The Communists and their sympathizers compose an insignificant fraction of 1 per cent of our population. We have dealt with the principals in the Communist party. Yet, if the ground swell of suspicion of teachers, writers, organizations, and officials still moving across the nation is any evidence, we are still scared. There is a possibility that the country that produced Stonewall Jackson and Sergeant York may come to look to the free world, which it has undertaken to lead, like the rodent-haunted Aunt Nora on the kitchen chair.

The authors of the present volume have pointed out some of the things we have already learned from the road tests through which we have put our new models for combating subversive activity. They assume, perhaps naïvely, that we are a practical people and believe in road tests. We have indulged in smear campaigns in the Congress of the United States against experts who, on request, have given honest and considered, but unpopular, advice to the government. "By denouncing as Communists or traitors those who gave us unpalatable advice, we have in a sense cut ourselves off from unpalatable advice."

We, who are so self-righteous in our abhorrence of the Lattimores and the Jessups, might well ask ourselves why a citizen should stick out his neck in answering a question put to him even by the President. By our interpretation of "loyalty" as conformity to "Americanism" as we privately understand it, we are killing the seed from which free enterprise grows, namely free enterprise in ideas. From the beginning of our history as a nation the two important types of institutions that have made free enterprise in ideas the life-giving sap of our civilization have been our colleges and universities and the voluntary associations that millions of our citizens have joined for the discussion or the propagation of ideas. In California we have imitated the practice of the Nazis and the Kremlin by attempting to impose the authority of the man in power on the scholar in the university who is attempting to follow Ralph Waldo Emerson's exhortation to seek the truth. The result is that the scholar who does not want a rough time is tempted to turn his canoe out of the hazardous main current of civilized life and to paddle quietly in stagnant bayous. In voluntary associations outside the universities we have borrowed the invention of the authoritarian despots called "guilt by as-

sociation" and in so doing have tended to persuade the ordinary citizen that the philosophy of Mr. Milquetoast, who refused to join the P. T. A. because some of its members might have advanced ideas, is the shrewd counsel of security.

In a world of change the civilization that stifles criticism and discourages free enterprise in ideas has topped its crest and is moving toward slavery. As for America, the future is still uncertain. The present volume is evidence that the convictions and the determination that characterized the men who signed the Declaration of Independence still exist after a century and three-quarters. It should be read by every citizen who has children who will have to live in tomorrow's world.

RALPH HENRY GABRIEL
Yale University

MACLEISH, ARCHIBALD. *Freedom Is the Right to Choose: An Inquiry Into the Battle for the American Future.* Pp. ix, 186. Boston: Beacon Press, 1951. $2.50.

In this collection of essays Archibald MacLeish offers an eloquent statement of the liberal analysis of the crisis of our time—a highly useful statement for helping us understand the strength and weakness of that position.

His thesis is this: Things have gone to pot in America since 1945. We are drifting into an avoidable war. Our foreign policy is so obsessed with anti-Communism that we are acting only *against* something and not working *for* our real national purposes. McCarthyism, teacher loyalty oaths, and the like are bringing us dangerously close to thought control. Why have things gone wrong? Because, says MacLeish, we have failed to perceive that the real contest of our time lies not between communism and capitalism but rather between the age-old authoritarianism of church, state, party, *and popular majorities* over the minds of men and the rebellion against authoritarianism so gloriously expressed in the Declaration of Independence and the Bill of Rights. We have abandoned "the American Proposition," which inspired us in the past and made us great—"the proposition that if men are free . . . to believe as they think and to say as they believe . . . the world in which they live will be a better world."

Much of MacLeish's analysis is convincing—particularly his description of the negativeness of our foreign policy; and no one will dispute his observation that classical liberalism is in low esteem in America today. But when one asks *why* Americans have abandoned "the American Proposition," the weakness of MacLeish's position becomes apparent; for he, like most of his fellow liberals, makes no serious attempt to answer that question. Thus the burden of MacLeish's message to his countrymen is: "I know it's tough for a nation to practice liberalism; but you did it in the good old days and you can do it again if you'll only try!"

The American people today are acting as though they believed that Communists should be persecuted at home and battled abroad. Do their actions result, as MacLeish says, from an absence of belief produced by the abandoning of what they used to believe? Or do they result instead from a very real popular conviction about the kind of society we want and the relative rights of majorities and minorities in that society? MacLeish has carried the former explanation as far as it can be carried and has shown us its futility. Intellectuals might well ask themselves what the American people do believe that makes them reject MacLeish's liberalism as too feeble a barrier against the onslaught of communism.

WORMSER, MARGOT HAAS, and CLAIRE SELLTIZ. *How to Conduct a Community Self-Survey of Civil Rights.* Foreword by Gordon W. Allport. Pp. xiv, 271. New York: Association Press, 1951. $3.75.

This book represents one more of a long series of very valuable books dealing with methods and procedures for making community self-surveys. The recognition of this approach began in the early part of the nineteenth century. Following the experience of the monumental London survey and later the Pittsburgh survey smaller surveys were undertaken by groups of individuals from the outside. The Russell Sage Foundation under the direction of Shelby Harrison began encouraging self-surveys, and there appeared a number of specific pamphlets, manuals, and books based upon actual experience which presented the techniques and procedures for making community social surveys.

From 1912 to 1917 several valuable studies of this kind appeared with which the names of A. B. Taft, Nat Frame, Carol Aronovici, Margaret Byington, E. W. Burgess, M. C. Elmer, C. J. Galpin, J. L. Gillin, and many others are well known. During this period basic principles, methodology, and techniques were established.

From 1918 to the late 1920's specific application of these principles was made to more particularized studies such as race relations, industrial situations, public health, education, and human ecology. The emphasis on methods of conducting such self-surveys was brought out in monographs and books by Emory Bogardus, E. W. Burgess, F. S. Chapin, M. C. Elmer, R. D. McKenzie, B. McClennahan, and Robert Parks with many others.

From 1930 up to the present time general principles of research have been prepared presenting many approaches including the social survey, as illustrated by the books of Wilson Gee, Mildred Partin, Pauline Young, M. C. Elmer, and George Lundberg.

This book by Wormser and Selltiz reemphasizes the principles established in the first period, with special concentration on civil rights as applied to certain minority ethnic groups. The book is composed of five major sections. Section One deals with "information which might be gathered in a community self-survey of civil rights." Included within this are suggestions concerning assembling data on employment, housing, education, public schools, private schools, community services and organizations including health and welfare, recreation, public accommodation, and community organizations. Section Two deals with the organization and planning of the survey and includes resources such as manpower, time and cost, community support, as well as describing the setting up of the survey organization and the making of the over-all plan and determining working procedure. In Section Three there is discussion about preparing interview schedules, selecting the samples, recruiting and training interviewers, interviewing, analyzing the data, and reporting the survey findings. Section Four is a brief chapter of about seven pages discussing what should follow after the survey is completed. Section Five is devoted to work materials, including such items as time chart, principles of sampling, selection of samples, the need for credentials for interviewers, and respondence.

The book should prove of much value to persons interested in making a study of civil rights. It will do much to keep the persons active in the study, who will be principally untrained persons, from allowing their emotional interest in the subject to divert them from a true evaluation.

ECONOMICS AND INDUSTRY

HARRIS, SEYMOUR E. *The Economics of Mobilization and Inflation.* Pp. xii, 308. New York: W. W. Norton & Co., 1951. $4.50.

One of the most sensational revelations by Professor Harris in this volume occurs in the preface: "This book, my twenty-fourth, I hope is the last in a long series of (ten) books dealing exclusively or in substantial part with problems of mobilization and war." In view of his literary propensities and in view of the merits of this book, we expect and hope that his forecast is wrong.

It has been customary to comment concerning prolific authors that they contribute little that is new, and in a sense this is valid as a description of this latest Harris product. But what is new anyway? If one means by it a contribution to economic theory, he need not look for it here. However, newness (and I accept a reorientation of existing thought and data in a current context as comprised by the term) may well be overlooked by the too many economists today who are overly concerned

with price-cost or income-flow analysis. Fortunately Professor Harris has the breadth to provide something new by relating fact and theory to current political and social problems. In this book he does it admirably for those who know some economics (not the general reader).

Stating first the major economic problems of mobilization, he proceeds in turn to analyze the resources for mobilization, the relationships of money to inflation in mobilization, the issues involved in taxation, expenditure, and saving, the rate of interest and the national debt, the problems of various direct and indirect controls, the burdens inflicted by inflation, and inflation's effects upon welfare programs.

In general he takes the position that fiscal and income control must be relied upon more heavily in the present defense period than in World War II. He assumes a firm liberal stand in favor of an excess profits tax, the maintenance of welfare expenditures and the adoption of overall price control based on ceilings as opposed to price-cost formulas.

My one major quarrel with the author concerns his general point of view regarding fiscal policy. I consider it somewhat unrealistic to admit the impracticality of the level of taxes he proposes to curb inflation, to describe the success of the Roosevelt Administration in preventing inflation from 1942 to 1945 through price controls, and then to insist that fiscal policy is the major answer to our present difficulties. An unconscious prejudice against price control would seem to underlie his reasoning. Barring that, however, the whole matter may be one of opinion since we cannot necessarily assume that what was effective from 1942 to 1945 will be effective from 1951 onwards.

WILLIAM WITHERS
Queens College

SIMMONS, FREDERIC L. *Mobilization and Inflation.* Pp. xiii, 98. Claremont, Calif.: Claremont College, 1951. $2.75.

This little book contains much pertinent information and sound interpretation on problems central to our present economic situation and the outlook for the future. It embraces three lectures, the first two of which were presented at Claremont Men's College last spring, and the third at Los Angeles under auspices of the College.

The central theme of the discussion is the danger of a drift into socialism. This drift is, by many people, explained either as an aftermath of war or as a consequence of inflation. The author, however, rightly argues that there "were economic and political trends which would have given us considerable changes even without the disruption of world wars." Mr. Simmons, therefore, devotes his first lecture to "The Broader Issues." One of the noteworthy phases of this lecture is the author's concern to reconcile—in a democracy—subjective demands of fairness with objective requirements of economic workability. "It should not be too much to hope that, in discussion of legislation to redistribute income and ownership, the probable effects on our rate of economic growth will be considered. There can be long time lags between causes and effects in economics." The author does not dodge the political aspects of economic problems. He ends this first lecture with the observation that "our economic system operates within a political and social framework."

In the second lecture, it is argued that the requirements of defense are not so great as to preclude the maintenance of high standards of civilian consumption, but that the attainment of guns *and* butter depends on "the psychological forces." "Even a small reduction in the standard of living during full employment may be so unpleasant for organized groups as to create new political problems" and demands a leader of Churchillian stature.

The author's analysis of inflation (the third lecture) is distinctive in that he gives the full weight and significance to market forces and practices along with fiscal and monetary influences—unlike those who are so preoccupied with the latter that they give a lopsided treatment of the inflation process in its entirety.

"It is essential," he says, "to make a distinction between what might be called the initiating factor and the sustaining condition. . . . Within recent years we have had a number of price increases of manufactured products where the initiating cause obviously had been wage increases previously granted. There is a connection, of course, between money supply and wage rates. . . . Three possible ways in which an increase in prices can start were designated—quotation mark-ups, increased unit sales, and increased costs. Regardless of the initial cause, there must be a sustaining condition for the higher price to be maintained. . . . The significance of an increase in interest rates is that they result from credit restriction and that it is the restriction of credit which is significant in limiting spending and price increase rather than the accompanying increase in interest rates." Finally, he observes: "More production of goods wanted by the public or needed for defense is always desirable, but it will not stop the price rise if costs of production also increase." But the idea of eating our cake and having it too is so alluring!

EDWIN G. NOURSE
Washington, D. C.

HARRIS, SEYMOUR E. (Ed.). *Schumpeter: Social Scientist.* Pp. viii, 142. Cambridge, Mass.: Harvard University Press, 1951. $4.00.

With the passing of Keynes and Schumpeter the world has lost its two greatest recent economists. While Keynes has found his Boswell, Schumpeter's memory is being honored chiefly in the form of memorial articles, and of these the present volume contains an outstanding collection. It is, in substance, a bound copy of the May 1951 issue of the *Review of Economics and Statistics,* enriched by five additional essays. As the May 1951 issue was sold only to the subscribers of the *Review,* the publication of the present book will meet the needs of a wider public desirous of having available between two covers a collection of essays interpretive of Schumpeter's work and serving a purpose similar to that fulfilled by *The New Economics,* also edited by Harris, in the case of Keynes.

Since the appraisers of Schumpeter's work, whose contributions are included in this volume, are distinguished scientists in their own right, the reader will learn not only of Schumpeter's economics but in addition will find himself in a position where he can trace the reflection of the work of a towering figure in the minds of other outstanding thinkers. This is indeed the principal advantage of a symposium such as the present. It shows the effect and impact of a great man on his peers, opening up to the reader new facets of a scintillating personality and bringing to light a wealth of fascinating perspectives.

Schumpeter represented the flower of a generation of European economists who have found a new home in the United States. His achievements stand out in the field of economics, and have left their mark on the neighboring disciplines of politics and sociology. He was a thinker characterized by highly complex attitudes. Faithful to the tradition of the Austrian school, as he was, his antisocialist attitude is unmistakable, but so is his fascination by Marx. He was deeply attached to capitalism, but capitalism's very successes made him despair of its future. Throughout his life, he placed the entrepreneur, a true *homo oeconomicus,* in the center of his analysis, but he also was a most understanding interpreter of extraeconomic wellsprings of human action. And, most important, perhaps: few influential economists did more than Schumpeter to make mathematical economics palatable to their colleagues, but this master of the abstract-generalizing method of investigation left a record of historical-descriptive writing unparalleled in our time. For the interpretation of such complex attitudes the symposium method of appraisal does not seem as adequate as a full-fledged biography, and it is to be hoped that the present collection of appraisals will be followed by a "Life of Schumpeter," just as *The New Economics* was followed by Harrod's *The Life of John Maynard Keynes.*

HENRY WILLIAM SPIEGEL
The Catholic University of America

MCCLOSKEY, ROBERT GREEN. *American Conservatism in the Age of Enterprise: A Study of William Graham Sumner, Stephen J. Field, and Andrew Carnegie.* Pp. xiii, 193. Cambridge, Mass.: Harvard University Press, 1951. $3.25.

To Professor McCloskey, democracy was identified properly in the early decades of the republic with human rights. However, after the Civil War attention began to be focused more and more upon the economic freedoms, and eventually the symbols of democracy became identified with the rights of property, and the rights of property in turn presupposed an unregulated economic order.

The conflict between human rights and property rights is hardly a fresh subject, but this little book does put it in an unusual setting. The emergence of the new conservatism is pictured in terms of the careers and ideas of three quite different men, William Graham Sumner, Stephen J. Field, and Andrew Carnegie. Sumner is seen as the scholar who rigorously insisted on a social ethic which is utilitarian in the narrowest possible sense. His social evaluations all rested upon material well-being as the primary criterion. Capital and the capitalist became manifestations of the highest good. The new social hero was the rising entrepreneur.

Field, through his opinions delivered in the Supreme Court, gradually converted the body of prevailing legal doctrine to the new materialism. Under his years of prompting with of course some help from the spirit of the times, economic liberty was exalted in the law on the basis of that inspiration rather than demonstration, which once led the Supreme Court Building to be known as Mount Sinai.

Carnegie was of course the epitome of the new conservatism, the "self-made" economic man appropriate for hero worship. Pictured as a man with more inner conflict than either of the others, he nevertheless is seen to resolve his ideal conflict in terms of materialism. After all, his success in accumulation would in the long run be best for society as well as for himself.

The descriptions of the lives and ideas of these three men are stimulating reading. It is still not entirely clear as to just why the new conservatism emerged when it did, and perhaps the very type of approach gives an unintended impression of oversimplification in the historical process. However, clearly Professor McCloskey is not writing history, but using history to make the point that democracy is concerned primarily with humanity and not with business, that democracy need not be identified with an unregulated economic order.

It is interesting to note that the current Communist interpretation of the United States is based in large part upon the assumption that we are still dedicated to the unmitigated materialism which is described in this book. The fact of course is that, as Professor McCloskey points out, nineteenth-century conservatism began to die a little even before it had fully matured. And this is half a century later.

Washington, D. C.

TINBERGEN, J. *Econometrics*. Translated from the Dutch by H. Rijken van Olst. Pp. xii, 258. Philadelphia: The Blakiston Company, 1951. $4.50.

Research in econometrics has grown rapidly in the last twenty years, particularly as a result of the increasing availability of long-term economic data. Professor Tinbergen has rendered a useful service in showing the relationship of econometrics to economics and statistics and in presenting the highlights of recent advances in methods, applications, and pitfalls of the econometric approach.

The work consists of four parts and an appendix. Part I is brief, defining econometrics in relation to the older fields of economics and statistics. His definition of econometrics as "statistical observation of theoretically-founded concepts" gives the clue to the tools of analysis which must be increasingly applied in order eventually to develop economics as a science on a par with the physical sciences.

Part II describes the technique of econometric analysis, the various steps from the theoretical formulation of the variables involved, through the selection of the form of relationship, to the quantitative determination of the coefficients in the formula.

This part leaves something to be desired. For those unfamiliar with econometrics the exposition is quite inadequate for four major reasons: (1) the treatment is too brief to be useful to a beginner; (2) it fails to cover adequately the refinements necessary in applications to specific problems; (3) it does not sufficiently emphasize and illustrate the necessity for having an intimate knowledge of the specific field of application; and (4) many important principles could have been clarified by the use of detailed illustrations from actual experience.

Part III develops some of the results of econometric research, particularly demand relations for agricultural, industrial, and other products. Here again, the author has omitted mention of the many new results developed in recent years, particularly in the field of consumer durable goods and in connection with business forecasting.

Part IV gives an example of the use of econometrics for purposes of guiding economic policy. The author analyzes the influence of wages, taxes, price policy, and productivity on the balance of payments and on employment in The Netherlands. It is a good example of the translation and quantification of economic theory through the econometrics approach.

The appendix is valuable in giving some of the principles involved in the correlation techniques and providing examples.

Since one of the basic end results of the use of the econometrics technique is to furnish the basis for business and economic forecasts, it is strange that so little reference has been made by Professor Tinbergen to this increasing application.

LOUIS J. PARADISO
Washington, D. C.

BEZANSON, ANNE, assisted by BLANCH DALEY, MARJORIE C. DENISON, and MIRIAM HUSSEY. *Prices and Inflation During the American Revolution, Pennsylvania, 1770–1790*. Pp. xvi, 362. Industrial Research Department, Wharton School of Finance and Commerce, Research Studies XXXV. Philadelphia: University of Pennsylvania Press, 1951. $6.75.

Through the efforts of the late Professor Edwin F. Gay of Harvard and others here and abroad the International Scientific Committee on Price History was organized in 1929 with funds provided by the Rockefeller Foundation. Under the auspices of this Committee Professor Arthur H. Cole of Harvard directed the six studies which made up the volume that first gave us an adequate picture of price trends in eighteenth century America. This was *Wholesale Commodity Prices in the United States, 1700–1861*, published in 1938. Anne Bezanson prepared the study on Philadelphia prices. Her study and two of the others starting before the Revolution broke off for the period, 1775–1781, the era of continental dollar inflation. This book now fills that important gap.

Wholesale price data for the period are based chiefly on the price behavior of some fifteen commodities, such as beef, corn, bar iron, molasses, sugar, tea, and wheat. Miss Bezanson and her assistants collected the prices for these commodities by consulting the correspondence and journals of various Philadelphia merchants and the reports of contemporary newspapers. They found these in seventeen libraries. The task of gathering, sifting, and organizing these price data was a long and tedious one. They were able to compare their findings of currency depreciation with two contemporary scales of depreciation, those of the Pennsylvania Assembly and of Pelatiah Webster. Webster's scale begins in 1777, for many contemporaries "viewed the rise in prices as normal" in 1776 (p. 24). They also kept an eye on Amsterdam prices to compare the world trend with the American.

Miss Bezanson begins her price study in 1770, five years before Lexington and Concord, and she carries it to 1790. Thus she is able to point out long-run trends in the general price level and in the prices of particular commodities. Continental Congress first issued the continental dollars in 1775. In early 1778 it took five paper dollars to buy one of specie; by 1779 the rate was climbing fast, reaching 38 at the year's end. Early in 1781 it was 100 and still mounting. The state legislature removed their legal tender quality, and most merchants ceased using them, turning to state notes and specie instead.

Most of the book is devoted to a detailed examination of the price behavior of the individual commodities. Their

prices rose unevenly because of temporary shortages. In 1778 Samuel Ogden remarked that though coal cost "six times as much as formerly, carting hath cost me eight times as much, my workmen's wages about five times as much, provisions about four times, rum about twenty times as much" (p. 315). The author says of the shortages, "That they were not persistent, except in the case of salt and specialized military equipment, because the channels were kept open for the flow of goods, must be rated as one of the crowning achievements of the period" (p. 323). She describes a few of the methods used by merchants and others to carry on despite the difficulties caused by a serious inflation.

Miss Bezanson and her assistants deserve the gratitude of all American economic historians for this important contribution to price level history.

DONALD L. KEMMERER
University of Illinois

MUDGETT, BRUCE D. *Index Numbers.* Pp. x, 135. New York: John Wiley & Sons, 1951. $3.00.

Dr. Mudgett's book on index numbers is bound to arouse considerable controversy among those interested in the field, and this reviewer predicts that few will accept his conclusions without reservations.

Although the title suggests a consideration of index numbers in general, the emphasis of the book is clearly on price indexes, both wholesale and retail, in terms of their adequacy for specific uses, namely, (1) to measure P in the equation of exchange, (2) to measure changes in the cost of living, and (3) to measure the magnitude of price change over long intervals of time.

The pattern for the ensuing discussion is set in the opening chapters by outlining some of the economic problems that have led to the use of index numbers. From this point on, the analysis of index number formulas follows fairly conventional lines, though the development of the concept of "homogeneity error" is both new and interesting.

The conclusions resulting from this analysis, except for one, are less conventional. Probably very few will disagree with the conclusion that the measurement of the magnitude of price changes over long time intervals is of very doubtful accuracy. On the other hand, there will be less wide spread acceptance of the proposal for a chain index number series, the link relatives of which to be computed by the Laspeyres formula. One cannot object to the use of the Laspeyres formula for the calculation of the link relatives, but dispute over the legitimacy of chaining these link relatives to a fixed base is inevitable. In a chain index so calculated, there is the inescapable difficulty that both price and quantity are allowed to vary, and hence the precise meaning of the index becomes obscure.

Dr. Mudgett completes his discussion with a brief history of the Wholesale Price Index and the Consumers' Price Index prepared by the Bureau of Labor Statistics and concludes, on the basis of his earlier analysis, that both of these indexes are good but not good enough.

J. PARKER BURSK
University of Pennsylvania

GOLDENWEISER, E. A. *American Monetary Policy.* Pp. xvi, 391. New York: McGraw-Hill Book Company, 1951. $4.50.

Monetary policy and its relation to a stable progress for our economy has become a matter of great public interest. Much of the recent literature about money, because it has been either too technical or too theoretical, has discouraged many who seek a better understanding of the subject. This book on American monetary policy in the past thirty-five years is written in nontechnical language which makes for enjoyable as well as instructive reading. At the same time, it is grounded in sound theory and comprehensive knowledge about the technical aspects of monetary organization. Sponsored by the Committee for Economic Development, its primary purpose is to contribute to a better understanding of the Federal Reserve System and its role in the American life. It deserves to be read widely by those who wish to gain insight into the historical and contemporary factors shaping present-day monetary policy.

The author is uniquely qualified to write on American monetary policy. For most of the past three and a half decades he was Director of Research and Statistics for the Federal Reserve Board and in that capacity was an active participant in American monetary management. He knows, perhaps better than anyone else, the facts whereof he writes.

Of special interest is Dr. Goldenweiser's review of policy actions taken by the System since its inception and his evaluation of the effectiveness of these actions. Here he draws upon his first-hand knowledge of System history. His most critical comments concern the postwar period through the end of 1950. He was not in sympathy with the System policy of maintaining marketable government securities at par and felt that this policy was basically inconsistent with a monetary policy geared to restraint of inflationary trends in the economy. In this period, he argues, Federal Reserve action was neither adequately prompt nor sufficiently vigorous. This was due to the overwhelming size of the public debt and to the System's failure to define clearly the limits of its responsibility to this debt.

A significant contribution to an understanding of the System's policy actions is the chapter on economic intelligence, which describes the types of economic information developed by the System for the use of its policy-making authorities and as a service to the public. The System's policy of maximum publicity, Dr. Goldenweiser concludes, while sometimes overdone, has nevertheless contributed greatly to the public's understanding of monetary problems and to the esteem in which the System is held.

The discussion of the international operations of the Federal Reserve brings together considerable material not readily available elsewhere. Changes in the manner in which the System has carried on international relations over the years, the types of transactions engaged in, and the scope of operations form an interesting though less well known part of the System's activities. Closely related is the discussion of gold and its influence on monetary policy.

A number of suggestions for changes in the organization and operation of the System are made throughout the book. Dr. Goldenweiser concludes that, while the System is capable of discharging its responsibilities adequately under existing law, the entire financial and monetary organization of the United States should be reviewed at an early date. He feels that a careful review is needed of the structure of the Board itself and suggests that the present Board of Governors might well be replaced by one Governor and by two deputy Governors. Whether this suggestion has fundamental merit is a moot question. The author does not, in this reviewer's opinion, develop fully the arguments which weigh against it.

RALPH A. YOUNG
Washington, D. C.

WEISSMAN, RUDOLPH L. *The Investment Company and the Investor.* Pp. xxi, 217. New York: Harper & Brothers, 1951. $3.50.

This volume undertakes to describe and to appraise the American investment company. The book is addressed to the reading public in general, and to the small investor in particular. With that market in mind, the writing style is unusually simple and clear, and the text is relatively free of technical terminology and detailed analysis. Aside from the author's evident predilection for his subject, the book was inspired by the remarkable increase in popularity of investment company shares which has occurred since 1943.

The first portion of the book provides historical background, tracing the development of the investment company from its beginning in Scotland through the unfortunate American experience of the late 1920's. The mistakes and excesses of that latter period placed investment companies in the United States under a cloud of distrust and laid the ground work for remedial legislation which took form in the Investment Company Act of 1940. The author believes that this Act was largely responsible for the restoration of public confidence in the investment company and for its subsequent growth in popularity.

Then follows a survey of the investment company "industry" as of 1950 and four case studies of individual companies. A chapter is devoted to investment funds in general, stressing diversification and the timing of purchases and sales, and another chapter discusses objectives, policies, and performance, with some little emphasis on the research aspect of fund management. Separate chapters are devoted to closed-end and open-end investment companies, and, although the author does not specifically say so, he leaves the impression that his preference is for the latter. The concluding chapter discusses the role of the investment company in stimulating savings and providing equity capital.

Although the author's approach is objective, it is clearly evident that he has a very high regard for investment company shares as investment media. He stresses repeatedly the advantages of diversification and expert management. With reference to the latter, he recognizes that, thus far at least, expert management has seldom been able to better the stock market average in the matter of capital appreciation. However, he believes that continuing emphasis on research will gradually produce better results in this area. Meanwhile, diversification and management together have been able, in the case of the larger companies, to return an average annual yield of 4 to 4½ per cent on invested capital. He concludes quite correctly that steadiness and continuity of income return is more important to the investor than capital appreciation. The author's over-all appraisal might be summed up in his own words: "Investment companies have come of age. Maturity should bring with it renewed dedication to move from doing a good job to doing a better job."

JAMES C. DOLLEY
University of Texas

MYERS, CHARLES A., and GEORGE P. SHULTZ. *The Dynamics of a Labor Market*. Pp. x, 219. New York: Prentice-Hall, 1951. $3.00.

This work is accurately subtitled "a study of employment changes on labor mobility, job satisfactions, and company union policies." Statistical materials on this case study of a partial mill shutdown in a New England community of 35,000 are presented in 36 tables. The method of obtaining data was primarily through interviews with both employers and displaced workers. The study is balanced by an emphasis upon the dynamics of the situation, such as the impact on the displaced workers, on the firms, and on the unions. An interesting verbatim account of an interview with a displaced worker is given in the appendix, and quotations of remarks of workers and others enliven the pages. Among the experiences studied were those growing out of job hunting—where the workers went, unemployment policies, union-management relationships, and collective bargaining relationships. The book is of interest and value not only to the economist but to other social scientists, to management, and to labor. A summary at the end of each chapter helps the reader to keep the theme of the study in perspective.

A few of the many findings may be noted as illustrative of the conclusions drawn from the study. The large majority of workers interviewed were unwilling to make any change of residence, and there was very little movement out of manufacturing into other positions. Most workers were soon able to find other jobs, but few of them located jobs through the formal placement channels of the state employment service, actual employer solicitation, or "help wanted" ads. Information on jobs came mainly from acquaintances and relatives working in the factories, illustrating "the great informality characteristic of human contacts in the labor market." Manufacturers likewise made little use of the employment service for active recruitment.

Unemployment had an impact on the behavior of the workers and employers with a shift in emphasis toward security of employment and wages on the part of the former and an ability of the latter to follow a more selective hiring policy. Employers were able to undermine the bargaining position of the union "by using the pool of unemployed as a way to increase the workers' dependence on the employer." Displaced workers showed a surprising knowledge of wages and working conditions. The authors employ their data to make a creditable case for using the "labor market concept" to explain worker and employer behavior and for the contributions that economic analysis can make toward explaining behavior. They hasten to add, however, that they have no intention of asserting the "economic man" theory.

HUGH A. BONE
University of Washington

JAFFE, A. J., and CHARLES D. STEWART. *Manpower Resources and Utilization: Principles of Working Force Analysis*. Pp. xii, 532. New York: John Wiley and Sons, 1951. $6.50.

The present volume, appearing at a time when manpower problems are again in flux, has much of interest for the many who now require a broad understanding of the working force and of its work behavior.

The primary purpose of the authors is stated to be a study of the working force of the United States; while venturing into many other fields, the book's more instructive chapters all conduce to the principal objective.

The book develops the practical importance of working force data, especially bearing on public policies of the United States: methods of collecting factual data during more than a century and extensive analyses of trends and present aspects of labor force characteristics. In these analyses much useful data is contributed, a good part of its original work by the authors. The effects on the working force of such economic phenomena as migration and technological changes are discussed in their special significance.

The authors are at their best on working force measurement and in analyzing trends discernible from decades of statistics on the United States scene, though sometimes reservations are made on the accuracy of earlier statistics. The writers are enthusiastically impressed by the advance in methodology represented by the United States Bureau of the Census monthly sample survey of the labor force, to which many pages are devoted. Admitting fully the improvement in available statistics, one wonders whether the accumulation of information will render so easily possible the solution of future manpower problems as the authors seem to think.

But the book is by no means restricted to factual or statistical presentation, for it carries the authors' views on a broad variety of topics. Many of these opinions rest on adduced facts, but not a few others will strike the reader as oversimplifications. Two typical illustrations may be cited. It is stated that manpower resources today set the ultimate strength of military might; surely this statement would require lengthy examination and qualification. Then in reference to underdeveloped areas it is stated that aid toward industrialization, if effective must be applied all around and rapidly, while the prime need is outside capital; many expert in such endeavors will doubt the practicability in many areas of such an assistance program—and even an African development quoted in the volume shows the slow pace of results.

But readers will be mindful of the pervasiveness of working force ramifications, and hence will realize the difficulties of treating at deserved length more than a few of these ramifications in a single volume. This the writers offer in explanation of limited attention given unemployment. No doubt it accounts also for nonexploration of such matters as natural resources and world trade in their relevance to manpower, particularly as background for valid international comparisons.

Ottawa, Canada

SCITOVSKY, TIBOR. *Welfare and Competition: The Economics of a Fully Employed Economy*. Pp. xv, 457. Chicago: Richard D. Irwin, 1951. $7.35.

Economists have been waiting a long time for this book, and it proves itself to have been worth waiting for.

The focal point of the book is a deeper and more penetrating examination of the nature of competition. The idea of competition contributed so much to the foundation of modern economics that it came to be sanctified and elevated from a means

for achieving socially desirable ends to an object of adoration as a good in itself. It has consequently tended to obscure rather than to enlighten many aspects of our understanding of the economy. In recent years this has been somewhat corrected by the tendency of economists to look behind perfect competition to see what are the socially desirable objectives which perfect competition may or may not be able to help to attain. Professor Scitovsky does this perhaps a little more carefully than anyone else, but his primary contribution lies in looking more deeply into the conditions which make competition possible and in emerging with some startling insights into the nature of markets and bargaining.

No less brilliant than these initial ideas is the way in which they have been integrated into a study of welfare economics. Under the main headings of "Perfect Competition," "Free Competition," and "Restricted Competition," different kinds of social organization are carefully examined to see the degree to which they satisfy carefully worked out criteria of efficiency and equity. Pure economic theory is thus brought several important steps nearer to the actual world in which we live.

In the course of doing this, many parts of economics are given a new and unsurpassed clearness and lucidity of treatment. Perhaps the most striking and most satisfying of these is the treatment of capital and investment, but also outstanding is the presentation of the indifference curve analysis and the treatment of monopoly and oligopoly. Throughout the book there are many original and exciting developments—the primary idea of distinguishing between price-makers and price-takers; the clarification of the importance of expert knowledge in providing any approach to a perfect market; and some fascinating results of nonprice competition.

This reviewer is a little disappointed to find Professor Scitovsky fashionably reluctant to assume the minimum of human rationality from which would follow the diminishing marginal utility of income. However like other writers he is quite ready to make such an assumption in supposing that the indifference curve analysis has relevance for human welfare—that is, in supposing that consumers choose "rationally" in allocating their resources between different consumers' goods. But this is a mild and perhaps questionable blemish in a distinguished performance which will contribute very greatly to the serious teaching and understanding of economics.

ABBA P. LERNER

Roosevelt College

WRIGHT, DAVID MCCORD (Ed.). *The Impact of the Labor Union.* Pp. ix, 405, New York: Harcourt, Brace and Company, 1951. $4.00.

The volume consists of a symposium by eight outstanding economic theorists. The purpose of the book is, according to the editor, to contribute toward a workable and democratic solution of some vital labor problems. The organizers of the conference hoped that general theorists would consider the all-pervasive labor problems within the complete economic framework and thus present the most fruitful discussion of these problems.

Clark deals with criteria for a sound wage policy. He asserts that unions, in order to survive, have to demand wages higher than increased productivity warrants. Haberler contends that union wage policies are not compatible with full employment and stable prices. Knight examines some ethical aspects of union wage policies. Boulding presents a technical discussion of wages as a share of national income. Chamberlain invokes the spirits of Taussig and Simonds and displays particular concern over alleged socially harmful monopoly powers of unions. Friedman explores the role of unions in setting wage rates and concludes that the influence of unions in this field may have been exaggerated. Walter Reuther might be surprised to note that the wage rates of auto workers would have been higher during the last few years had there been no union in the industry! Wright, the editor of the volume, contributes two papers dealing with aggregate wage problems. Finally, Samuelson presents an historical review of leading wage theories over the last two hundred years.

The title of the volume is somewhat misleading. As the above summary of the subject matter would indicate, *The Impact of the Labor Union* is limited to the economic aspects of union activities and fails to deal with their socio-political effects.

It is difficult to find a central thesis for the nine separate and independent contributions by the eight participants, but throughout the volume there is dominant, as one of the contributors recognizes, an unfriendly or at least a "querulous attitude toward the labor movement" (p. 371). It would appear that unions have undermined the well-established economic theories, and the economists are trying to settle scores. The negative aspects of union policies are accentuated, but the positive contributions are ignored. Thus, the inflationary evils resulting from pressures for wage increases are stressed over and over, but the positive contributions of unions toward increased productivity are not even mentioned.

In spite of the eminence of the eight contributors, two of them past presidents of the American Economic Association, the reader will find few new ideas in the present symposium. It consists of a stimulating restatement of received economic theory as applied to modern wage problems, but it falls short of its announced purpose in presenting a workable solution to these problems. The authors are apparently interested more in expounding their controversial views than in presenting solutions that might be acceptable to the parties involved in labor-management conflicts. It is doubtful whether realistic policy makers would find any guides for action in this volume.

GULICK, LUTHER HALSEY. *American Forest Policy.* Pp. 252. New York: Duell, Sloan and Pearce, 1951. $3.50.

Luther Gulick takes a critical look at fifty years of public forestry. He finds much to praise, little to blame.

The Institute of Public Administration had five objectives in mind in studying the effect of governmental action in forestry. These were: (1) Does the public get what it seeks by government regulation of forestry practices and management of forest lands? (2) Does such government action stifle private forestry enterprise? (3) Does public action spread a smothering blanket over technologic advance? (4) What administrative problems are created and with what degree of constructive imagination are they met? (5) What new political problems are created?

Gulick concludes that the American people have found what they sought, a sound forest conservation program, and that they would not have achieved this without public intervention. Management of publicly owned timberland and regulations of private operations by the public have tended greatly to strengthen rather than to suppress private forestry. Government and privately sponsored research have been mutually stimulating in furthering technologic advance. Administrative problems have been met by an imaginative system of decentralization and delegation of responsibility backed by broad policy directives and informative inspections. On the final question, government intervention has tended to intensify rather than solve political problems. It does, however, focus attention on these problems.

Gulick's analysis of timber growth and requirements may leave the informed reader unconvinced that an ample future timber supply will result from present forestry programs. Gulick admits that future production at an adequate level is by no means assured on 56 per cent of the commercial forest land that is held in small tracts averaging only 62 acres in size. A federal program of regulating cutting practices on these holdings such as is advocated by the United States Forest Service where there is no state program would, Gulick believes, encounter insuperable difficulties. Gulick places heavy reliance on the foresters themselves. Because of common educational background and indoctrination, he finds these men to have a high sense of duty and public responsibility. Thereby forestry has gained substantial momentum in the right direction. He foresees minor shortages in the future but no major timber famine.

MIGHELL, RONALD L., and JOHN D. BLACK. *Interregional Competition in Agriculture, With Special Reference to Dairy Farming in the Lake States and New England.* Pp. xiv, 320. Cambridge, Mass.: Harvard University Press, 1951. $5.00.

Since the days of John Stuart Mill, the principles of comparative advantage and of diminishing returns have occupied an important place in economic theory, but as is true with so many other such principles in the social sciences, they have been tested by altogether too sparing an amount of empirical research. Following the passage of the Bankhead Jones Act of 1935, which provided that 20 per cent of the funds it made available were to be devoted to research in the sciences fundamental to agriculture, the Committee on Agriculture and Forestry of the Social Science Research Council sought to have the United States Department of Agriculture set up two major projects which would serve to give objectivity and quantification to these economic principles. One outcome of these representations was a joint project on interregional competition which was jointly financed and directed by the Bureau of Agricultural Economics of the United States Department of Agriculture and the Harvard Committee on Research in the Social Sciences in co-operation with a number of agricultural experiment stations in the Lake States and New England.

The actual quantitative research of the project was concerned mainly with the supply responses of milk production to milk prices in five sample areas in New England and five in the Lake States of the Midwest. A considerable number of technical United States Department of Agriculture monographs, experiment station bulletins, and journal articles have appeared at various times since the studies were initiated in 1936. The book with which this review is concerned "presents for the first time a full summarization of the results of these various area studies on the supply side made in 1936–38 and of the results of a resurvey of these same areas in 1946 in order to check actual supply responses with those estimated ten years earlier."

The discussion in the volume includes a chapter on the theoretical framework of the concept of interregional competition and considers briefly, in an over-all manner, other patterns of its operation besides dairy products—for example, eggs, citrus fruits, potatoes, and vegetable oil crops—but the analysis is confined principally to dairy products, and specifically to that portion of them which is produced in New England and the Lake States mainly for consumption in the population centers of the northeast quarter of the United States. According to the authors, the study is designed to be used mainly by the following groups of economists: (1) those working the general field of international and interregional trade; (2) those whose interests are in the methodology of economic research; (3) those interested in location theory and economic geography; and (4) teachers and students in the economics of agriculture.

Those who have followed the various monographs, bulletins, and journal articles which have resulted from the regional competition project will find little that is new in this book. The relatively uninformed person in this regard will discover a wealth of significant material but he will have to pay the price of reading a good many pages of highly technical and detailed subject matter.

WILSON GEE

University of Virginia

CLAWSON, MARION. *Uncle Sam's Acres.* Pp. xvi, 414. Illustrated. New York: Dodd, Mead & Company, 1951. $5.00.

Despite its juvenile-book title, this is in every respect an adult work, the reflection of a well-grounded mind and a mature, objective spirit. It is all too common for the textbook writer to express the hope that his book may appeal to the intelligent layman. Of this volume it can more truly be said that it is an excellent introduction for the intelligent layman to one of the basic concerns of American life, that may also prove useful in the classroom.

It is fitting that this book should appear in a year during which the United Nations has put land reform high upon its agenda and during which the head of public administration in the Technical Assistance Administration of the United Nations has asserted that land administration is the Number One problem of underdeveloped countries.

This is the story of our federal public lands, their role in the national life, how we got them, how we got rid of most of them, what we have left, how we can use it while conserving it, how to manage it, and how the uses of land and water are linked. A final chapter deals with "Policies and Politics." As the author says, "Larger books have been written about relatively small parts of the subject matter"; he has notably accomplished his purposes of "comprehensiveness of scope" and "balance between the treatment of one subject and another."

Mr. Clawson is Director of the Bureau of Land Management in the Department of the Interior. He could easily have written a paean about his bureau with covert insinuations or open blasts against the Forest Service, the Army Engineers, or the Bureau of Reclamation. He has not. He has high praise for the Forest Service; he shows how the conflicts between the Army and the Reclamation Bureau stem from conflicting emphases among the many possible uses of land and water, each supported by strong economic and political forces, so that knocking heads together by an administrative union would hardly resolve the issues. He may be forgiven if, even while acknowledging his virtues, he gives Gifford Pinchot the back of his hand.

Mr. Clawson as a scholar understands the place of the public lands in the larger panorama of American history and economics: the frequent reference to these broader movements lends depth to his chronicle. As a scientist, he sees what happens when the law disregards the basic requirements of geology. As a bureau chief in the federal government, he shows a sensitive understanding of the matrix in which an administrator operates when he deals with concerns that are the subject of strong economic pressures charged with high political voltage. His comments on leadership, co-ordination, communication are sapient.

While Mr. Clawson never strives for the flamboyant (one reason why the title does the book an injustice), his objectivity is not passionless. His writing is controlled but fluent, free of jargon. The book is not only a picture of our public lands but a self-portrait of the kind of man we should cherish as a responsible public servant, endowed with vision and hard-headedness.

CHARLES S. ASCHER

Brooklyn College

SMITH, LINCOLN. *The Power Policy of Maine.* Pp. vii, 344. Berkeley: University of California Press, 1951. $5.00.

Lord Bryce was perhaps the first to point out the value of the American states as laboratories in which political devices and policies can be tested. Maine has for a number of years conducted a unique experiment in the field of power policy, which Dr. Smith reports in a competent and well documented study. The study reviews the political and legal history of Maine's power policy and considers its economic aspects. The principal tenets of Maine's power policy are summarized: (1) major lakes or ponds are owned by the state and controlled by the state legislature, (2) the riparian proprietor may, to store water for mills, flood land belonging to another by paying just compensation, (3) waterpower law is based on the fundamental principle of *private* ownership of the bed of the river and the flow of the water, (4) development and distribution of power should generally be under private initiative, (5) Maine hydroelectricity shall be kept at home to industrialize Maine, and (6) Maine power shall be controlled by Maine.

Students of regional development will be especially interested in the doctrine, "Maine power for Maine people," embodied in the Fernald law of 1909. This statute, which provides that corporations may not transmit hydroelectric power outside of the state without legislative consent, represents an attempt to induce industries to come to Maine for cheap power. The present situation, however, is characterized by the underdevelopment of hydroelectric power in Maine and by the in-

creasing utilization of steam and of marginal waterpower sites throughout Southern New England. The study poses the question, "Can a single state retain strict economic isolation in a world of increased planning?" Based on the power experience of Maine, a negative answer is suggested.

The book contains a good chapter on the Passamaquoddy Tidal Power Project. What has and has not happened at Quoddy becomes more meaningful when considered in the light of Maine politico-economic policy. Dr. Smith likes neither the Fernald law nor public power. He recognizes, however, that private capital cannot undertake some multiple purpose projects essential both to the national economy and grassroots welfare, and he believes that regionalism offers a middle way between national and state control. Dr. Smith observes in this connection: "The real problem is not so much one of authority but of administration, because central or regional concentration of authority, when properly and conscientiously administered, has actually strengthened local units of government."

This review was written on the day the Atomic Energy Commission opened the door of what may prove to be a new era with an announcement that nuclear energy had been harnessed to produce electric power for everyday uses. The chapter on the new technologies of power production and distribution in Dr. Smith's book, of course, does not consider the impact of such a development on Maine's power policy. The chief importance of the study, however, is not found in the attention it gives to problems of power supply for New England or to the problem of utilization of Maine's hydro potential. Rather, the study is significant because of the light it sheds on more basic and enduring issues of economic particularism, interstate cooperation, regionalism, and federalism.

LAWRENCE L. DURISCH
Tennessee Valley Authority

DURISCH, LAWRENCE L., and HERSHAL L. MACON. *Upon Its Own Resources: Conservation and State Administration.* Pp. xiii, 136. University, Ala.: University of Alabama Press (co-operatively with University of Georgia Press, University of Mississippi Bureau of Public Administration, University of South Carolina Press, and University of Tennessee Press), 1951. $3.00.

This study of the administration of agencies dealing with the natural resources of the eight southeastern states is notable on several counts. It is the final product of the combined research activities of six state universities and the Tennessee Valley Authority and demonstrates, as a consequence, the possibility of interstate cooperation in the appraisal of regional problems. It is specific in its suggestions for improvement in the administration of agencies dealing with natural resources. It is not unreasonably biased toward the federal authority as against state and local agencies in the solution of natural resource problems, and finally it is miraculously brief.

This last quality cannot, in the opinion of this reviewer, be overemphasized. In years when every mechanical agency has been concentrated on devices for the economy of time, neither sociologists, economists, nor students of government have as a class shown the least awareness of the necessity for concise statement. As a consequence much—perhaps most—of the valuable, painstaking, and costly research in these fields yields little tangible benefit. Whatever oasis of fact has been discovered is merely lost again, and permanently, behind the sandhills of statistics, the mirages of chart and diagram, and the vast deserts of jargon. This little book (136 pages) has the outstanding merit that it says something and does not waste words.

It faces up to the fact that in the conservation of natural resources government is dealing with a problem demanding a unified approach, yet in no other field have the operations of government been more peacemeal, departmentalized, and competitive, and consequently more ineffective. At one time we were so rich that this blundering seemed unimportant, but today after two great wars and in the face of a third, it has become supremely important that we do everything in our power to save our forests, our soil, our minerals, and our water for their best use before we find ourselves too poor to defend our freedom, or to maintain our way of life.

Though this book deals specifically with the Tennessee Valley area its implications are more general. The confusion of conservation agencies is analyzed, state by state. The conflicts between state and federal authority are not minimized. An effective argument is presented for a unified attack on the problem through strengthened state agencies and through a higher degree of co-operation between state and federal authorities in this field. The study suggests the formation in each state of a state advisory resource committee, the adoption of a consolidated state resource program and budget, the formation in each state of a joint legislative committee on conservation, and the granting of increased state authority in the administration of federally supported programs.

ROY HELTON
State Planning Board
Harrisburg, Pennsylvania

GREENE, LEE S., and RENE DEVISME WILLIAMSON (Eds.). *Resources and Policy: Curent Issues in Conservation.* A symposium reprinted from *The Journal of Politics,* Vol. 13, No. 3, August 1951. Pp. 313–481. Gainesville, Fla.: Kallman Publishing Company, 1951. $2.00.

This is series of essays dealing with our natural resources and the various techniques we are evolving for their development and conservation.

The first of these, by Stanley Cain, an ecologist, is on "Food and People: A Second Look at Malthus. . . ." He points out that measures to improve health and to increase the food supply are receiving much more support than efforts to control population growth. This leads him to fear that these efforts will trigger "a population growth that will consume all the increased production . . . and leave the people, except for the gougers who always manage to do quite well for themselves, no better off than before." He pleads for an integrated approach to the problem, with population control securing its due share of attention. The "Opportunities for World Abundance," as discussed by Charles E. Kellogg, Chief of our National Soil Survey, are very great, with achievements much more likely to be restricted by social, economic, and political impedimenta than by shortages of natural resources of soil, water, or minerals.

The "Administration of Federal Lands" is discussed by Marion Clawson of the Department of the Interior and "Education and Demonstration in American Forestry" by Earle H. Clapp, formerly of the Forestry Service.

Three papers are devoted to critical analyses of the river basin approach to resource development and conservation. One, by Norman Wengert, deals enthusiastically with the Tennessee Valley Authority approach, another, by Henry Hart, reviews the efforts made to date to bring the unruly Missouri under control, and the third, by Roy F. Bessey, deals similarly with the Columbia basin. All seem to agree that there is a "pressing need for a well-coordinated and well balanced program of development to meet regional needs." In spite of the fact that TVA has not developed as broadly as its early champions visualized, it seems to be the most promising approach to the problems to date.

The last paper, by Charles M. Hardin, deals with "The Politics of Conservation" and is based largely on a study of the operations of the Soil Conservation Service and the Production and Marketing Administration's conservation program in this area. The differences in philosophy and techniques among the land grant colleges, the SCS, and the PMA and the conflicts resulting from their overlapping interests and responsibilities are clearly presented and the need for a more efficient administrative set-up made obvious.

RICHARD BRADFIELD
Cornell University

BURNET, JEAN. *Next-Year Country: A Study of Rural Social Organization in Alberta.* Pp. xv, 188. Toronto: University of Toronto Press, 1951. $4.00.

A nonplainsman might suspect from the title that the author is describing a land of promise; to the contrary this dry wheat-growing country around Hanna, Alberta, the author concludes, after reviewing the experience of the wheat farmers from 1909 to 1946, can have "no permanent self-sustaining population." The title is derived from the recurrent hope of the settlers that they will make a killing "next year."

The account is a well-written, sociologically sound historical analysis of the social and economic aspects of rural life in a representative area of the semiarid plains —a story that is no less true of the Hanna community than of great areas of the United States stretching from Montana to Texas, which natives also describe as "good next-year country."

With the extension of the railroads into the Plains, Anglo-Saxon peoples tried to superimpose their culture, developed in eastern Canada and the United States, on the dry land area by settling small tracts during the cycle of high rainfall and by transplanting all their old rural institutions. Then came the ever-recurrent drought bringing destitution to families, decline to schools, churches, farmer organizations, and informal group activities, and the abandonment of farms.

The German-Russian group came in numbers during the 1920's. Its background in peasant culture, with its familism and ascetic ideals, proved to be better adapted than was that of the Anglo-Saxons. But the high birth rate, combined with expanded farm operation due to mechanization, is bringing pressure on the land, and the migration of youth, as it acquires more schooling, threatens to break the integrity of the ascetic ways of the old generation and lead to disruption of the native culture.

The conflict between town and country over such issues as the mail order catalogue, the lack of a rest room for farm women in the towns, and consolidated schools is characteristically American, as is the lack of effective rural leadership in the farm trade centers.

The study, financed by the Canadian Social Science Research Council through a Rockefeller Foundation grant, is one of the series bearing on the background and development of the Social Credit movement in Alberta. It does not, however, deal directly with this movement as such.

One distant hope is held out for the Hanna community—much of it is potentially irrigable. The reported success of rain making—which has come since this book was published—leads one to wonder if it may not also offer hope.

PAUL H. LANDIS

State College of Washington

BAUMHOFF, RICHARD G. *The Dammed Missouri Valley*. Pp. xi, 291, vi. New York: Alfred A. Knopf, 1951. $3.75.

MAASS, ARTHUR. *Muddy Waters: The Army Engineers and the Nation's Rivers*. Foreword by Harold L. Ickes. Pp. xiv, 306. Cambridge, Mass.: Harvard University Press, 1951. $4.75.

Both these books add significantly to the growing literature on resource problems, programs, and practices. The one focuses upon a single river basin; the other upon the work of the federal agency primarily concerned with river engineering. The relation between the two books is apparent, though in purpose, methodology, and scope they are in sharp contrast.

The Dammed Missouri Valley is a frankly journalistic description of the physical resources of the region, of some of its cultural history, and of the programs currently underway to develop the river. It is pitched to the layman's ear, and should provide timely background for understanding the work of the newly created presidential Missouri Basin study commission. But, with the exception of a very incisive chapter on the role of radio and the press in the Basin, Baumhoff's work suffers from a pseudo-objectivity, typical of much American journalism. The sophisticated reader would be more inclined to identify the author with the tepid Scripps-Howard press than with the crusading St. Louis Post-Dispatch with which he has been associated since 1918.

The situation in the Missouri Valley requires more than a mere review of what

this person or group advocates and what another person or group alleges. The formation of informed public opinion requires incisive analysis, appraisal, and evaluation. This the author fails generally to give, although his coverage of conflicting interests and points of view is comprehensive. One example may illustrate. The discussion of the Missouri Basin Inter-Agency Committee presents a good description of how it works and what it does. But whether it is worth the candle, what its weaknesses and limitations may be, or how it compares with alternative co-ordinating devices is not suggested.

In contrast to Baumhoff, Professor Maass is deeply concerned with normative questions, especially as related to problems of governmental responsibility. Against his own clearly stated standards of administration, which he calls "working biases," he reviews the activities of the Army Engineers and finds them grossly deficient. One might wish that Professor Maass had indicated more fully what he thinks is to be done to remove or arrest this "cancer in the body politic."

Muddy Waters is unquestionably an outstanding contribution to the study of public administration and public policy, and it is very provocative of thought and discussion. Unfortunately, space prevents suggesting more than a few of the stimulating problems presented. The aroused reader would, for example, like to examine with the author the implications and perhaps the validity of his working biases. One of these states: "An administrative agency should be responsible to pressure groups so far as necessary to equalize opportunities for safeguarding interests, to acquire specialized knowledge, and to secure consent for its own program." Again, the reader would like to ask what are the root causes for the irresponsibility which the Army Engineers evidence? The people working for the Corps (including the Generals and the Colonels) are typical public servants. The communities and individuals benefited by Army "pork" projects are likewise not exceptions to the American pattern. Malorganization or maladministration may be a part of the answer, but mere organizational shuffling will not get at the heart of the problem of irresponsibility.

Muddy Waters poses this problem well. It only begins to suggest the answer. It is at this point where it points to the need for a great deal more thought and analysis if some of the crucial problems of our society are to be solved.

NORMAN WENGERT

The City College of New York

GATES, WILLIAM B., JR. *Michigan Copper and Boston Dollars: An Economic History of the Michigan Copper Mining Industry*. Pp. xiv, 301. Cambridge, Mass.: Harvard University Press, 1951. $5.00.

This scholarly and yet interesting book is an economic history of copper mining in Michigan from its beginning in 1843 or 1844 down to the end of the Second World War. In it the author traces the speculative beginning, the rise, the maturity, and the decline of the industry; the development of mining technology; the consolidation and integration movement among the producers; and the organization of pools and other monopolistic combines among domestic and foreign producers, in some cases fostered by tariffs. He finds that management, controlled by Boston capitalists, was usually fairly conservative, with relatively few speculative scandals. Labor relations were marked by benevolent paternalism, strong hostility to labor organization, and by generally lower wages than were paid in the Western copper mines. The gyrations in costs and prices and their effects on output, dividends, and expansion, and at times on the waste of the resource, are discussed with care.

Throughout this book the author, who streses the fact that he is an economist, traces economic relationships and economic interpretations of events. There is a rather extensive appendix, with graphs and tables, and a bibliography. Footnotes, unfortunately, are not at the foot of the pages but bunched together at the end of the book, where they are as hard to find as possible. Why do some publishers thus misplace footnotes?

JOHN ISE

University of Kansas

SOCIOLOGY AND EDUCATION

ODUM, HOWARD W. ***American Sociology: the Story of Sociology in the United States Through 1950***. Pp. vi, 501. New York: Longmans Green and Co., 1951. $5.00.

Those who have expected this book to be merely a reworking of Odum's earlier studies in the history of sociology are in for a surprise. Although it here and there bears traces of its predecessors, it is in all essentials a new work.

The amount of hard, grinding effort that has gone into the 500 pages can be adequately estmiated only by similar toilers in the vineyard; Odum has placed American sociologists permanently in his debt. Words similarly appreciative cannot be bestowed, however, on the publishers. To have forced Odum to eliminate 300 pages, presumably with an eye to textbook sales, means that Odum hmiself has suffered through inadequate presentation of his views and that every instructor and student using the book will suffer with him. More of this later; just now the reviewer merely wants to say that it is this cutting-to-fit-the-textbook-bedstead that in the long run will result in the vanquishing of the big-publisher Procrustes by the small-publisher Theseus. Is it not clear that venturesome little organizations such as the Free Press of Glencoe, Illinois, the Harren Press of Washington, D. C., the Norman Paul Press of Gary, Indiana, and the Beacon Press of Boston, to name only a few, could not have won the acclaim (*and* sales figures!) already attained had it not been for the crassly commercial attitude of the larger houses? It is high time that sociologists ask every "bookman" who pays them a visit this question: "What is your concern doing to advance the science of sociology —or are you merely peddling textbooks?"

But within the space limits imposed on him, Odum has done a remarkable job. With the utmost catholocity and kindliness, he has given a remarkably detailed and, on the whole, accurate survey of American sociology from its earliest period to mid-twentieth century. Few important figures are slighted, although the device of dealing with all the presidents of the American Sociological Society has forced him to give relatively more attention to a scattering of unimporant writers than is perhaps warranted. The missing three hundred pages probably account for what now seems excessively egalitarian procedure.

Also understandable is the apparently undue attention to authors of textbooks; Odum had to do something to bring in a collection of writers who lacked political appeal but who were and are widely read. Once one starts cataloguing texts, there is no good place to stop. Further, the big publishers' policy, above noted, has made American sociology, in altogether unhealthy ways, textbook sociology; to get a treatise published, it usually has to be disguised as a text.

The situation has been partially saved, in Odum's book, by Parts I, IV, and V; here Odum moved with more freedom. Part V, in particular, entitled "Toward Inventory," is a stimulating treatment of major trends in American instruction and research, commendably free from the sectarianism of some recent surveys. It reflects his generosity, optimism, and readiness to offer appreciation and encouragement; one can only imagine, alas, what the caustic E. B. Reuter would have said on the same themes. The contrast, although at times distressing, would have been most instructive.

The lists of authors, journals, institutions, and the like are exceedingly valuable, as are also the bibliographies. No one can hereafter write about American sociology without liberal use of Odum's work; it is literally indispensable.

And now, in spite of, or perhaps because of, what has been said about publishers, comes the sixty-four-dollar question, "Is this book usable as a text?" The answer, where the reviewer is concerned, is "Yes and no." "Yes" for junior-senior courses, or better still, at the graduate level, where the instructor is prepared to provide the necessary selection, exposition, and critical comment that the missing three hundred pages might have made available, and in addition where he is willing to require a very considerable amount of reading in the primary sources (when they *are* primary sources). "No" if these demands cannot be met, or where the instructor is inclined to try to cover everything merely because "It's in the book," or where the textbook gullibility discussed by Hobbs in *The Claims of Sociology* is too much in evidence. In the latter case, however, not even a book superior to Odum's would remedy matters. Moreover, for American sociology, no such book exists.

If you can agree with the reviewer's "Yes," then put into practice the old slogan of the MacGregors, "E'en do, and spare not." It is highly unlikely that you will find a better book for your purpose today, or in the future now foreseeable.

HOWARD BECKER

University of Wisconsin

PARSONS, TALCOTT. ***The Social System***. Pp. xviii, 575. Glencoe, Ill.: The Free Press, 1951. $6.00.

The present volume sustains the verdict that Parsons conceives the fundamental objective of sociological theory as the logical conceptualization of theoretical systems. Since Parsons is still committed to the action frame of reference, he is obliged to relate the other two subsystems of action, personality and culture, to the social system—the major object of theoretical construction. The personality subsystem is manifestly interpreted with the aid of Sigmund Freud's views, and, perhaps as a consequence of the collaboration with E. A. Shils, culture is construed in terms of George H. Mead's theory of symbolism.

In defining the subject of the volume as "the exposition and illustration of a conceptual scheme for the analysis of social systems in terms of the action frame of reference," Parsons indicates his adherence to the same conceptions of science and methodology and social behavior implicit in his earlier works. Basically antiempiricist, these conceptions fundamentally derive from a theory of human nature.

By its use in *The Social System* science is still rendered contingent upon "bodies of logically interdependent generalized concepts of empirical reference." Only if these theoretical (a priori) constructs are employed is scientific observation, problem formulation, and explanation possible (p. 327). This notion of science is indifferent to empirical facts because it was originated to circumvent cultural relativity. To make knowledge certain, Kant lodged the a priori categories of perception and understanding in human nature as bases for a logical system of knowledge. The basic categories for Parsons' system construction are similarly contained in the units of the action frame of reference, the "actor-situation." The theory of social systems is necessarily certain because it is logically deduced from these premises. Implicating only logically interrelated categories, the system excludes all relationships other than logical ones. Social relationships in time can, therefore, be included only by distorting their empirical character, by introducing them as categories. Although Parsons accepts such misconstruction of the empirical world, he professes to desire knowledge about that empirical world.

The theory of human nature underpinning this logico-deductive conception of science is also assumed in the action frame of reference from which the theory of social systems is derived. The characterization of action as teleological, volitional, or voluntaristic stems from the notion of the nature of man whose activity has historically been distinguished from natural phenomena by endowment with morality or the exercise of choice. However, the closed, deductive system proposed by Parsons requires that the alternative choices of the actor in a situation be known and derivable from the action frame of reference. Accordingly, Parsons argues that within a situation—comprised of physical, social, or cultural "objects of orientation" —an actor is constrained to orient himself by one of the three "modes of motivational orientation,"—the cognitive, cathectic, or evaluative. These three basic modes are the orientational manifestations of the "need-disposition" system common to all human beings. As determinants of the classification of value-orientations, these motivational orientational modes ultimately prescribe the nature of the differentiation of roles minimally required in a social

system and delimit the range of possible institutional variation from one social system to another. The structuring of human nature is reflected thus in the social system itself.

This volitional conception of human nature is obviously incompatible with Parsons' methodology which commits him to complete knowledge of the alternatives of action. Parsons therefore excludes a part of the cathectic mode of orientation from the influence of symbolic conditioning. While the available choices are cultural, the basis of choice-making itself remains a unique and private aspect of human nature.

Both the related antiempiricist notions of science and methodology and the purposive conception of human nature are assumed in this "essay" on the theory of social systems. To hope that such a theory will discover how the empirical world works is inconsistent with all its assumptions.

ROSCOE C. HINKLE, JR.
University of Maine

KINGDON-WARD, F. *Footsteps in Civilization.* Illustrations by Erna Pinner. Pp. 240. Boston: The Beacon Press, 1951. $3.00.

The author, a British geographer and naturalist with a better than ordinary flair for popularization, in the best sense of that word, has given us a highly readable account of the principal material achievements in the development of culture. Many an educated layman, interested in the general story of man's progress over the long span of cultural history from the Stone Ages to civilization, will find in Mr. Kingdon-Ward's little book an adventurous, sometimes exciting account. Moreover, it is happily unfreighted with the mass of technical details that so frequently turns the nonspecialist from standard anthropological works in dismay or boredom. And if the author is occasionally given to speculation about the events he discusses, the reader knows that it is speculation and that the author so regards it.

In an opening chapter called "The Film of Life" we are reminded of the narrow physical limits within which life exists on earth. "Thus life is a rare phenomenon, not only in the universe, but even on the one tiny planet where it is found at all. Life exists as a mere film because the conditions under which it is able to sustain itself occur only within a film, varying in thickness, but nowhere more than a few miles thick" (pp. 17–18).

After a brief discussion of the "invention of civilization" and a setting forth of an evolutionary time perspective, the author discusses, in turn, such major developments as fire, the domestication of plants and animals, the evolution of tools from stone axes to power machines, the invention of writing, and the discovery of time. These chapters constitute the solid core of the book and represent a skillful distillation, in intelligible language, of a large and complex body of knowledge.

In his closing chapters Mr. Kingdon-Ward relates man's achievements, sketched in the bulk of his book, to the modern world. He points out what has been said so often as almost to become trite: that discoveries and inventions are in themselves neither good nor bad, but that it is their "ill use" which leads to "frustration and disaster." Equally true and perhaps not sufficiently appreciated is the statement that the highest achievements of man's technological evolution have benefited only a very small portion of the human race so far. But such truisms merely constitute background for posing the enormous problems—economic, social, and political—that rack the modern world and threaten it with disaster.

For whatever reason, Mr. Kingdon-Ward does not pose these problems. Instead, we are offered a small dose of what might be termed the optimism of the naturalist's long view of things. *Homo sapiens* alone of the genus *homo* has survived the vicissitudes of his environment because he was fit to survive; therefore, he will continue to survive. So we are told, in comfortingly optimistic terms, that because "Man has, during a span of 8,000 years more or less, taken those forward steps which are the theme of this book, there is no reason why he should not take another. . . . In fact, *it is certain that he will"* (p. 223, reviewer's italics). This reviewer's guess is that few social scientists, soberly reflecting upon the modern scene, with its arms races and "atomic diplomacy," would be disposed to share either the optimism or the certainty of Mr. Kingdon-Ward concerning future progress.

Having decided that man will continue the march to ever greater mastery of nature, the author turns to a discussion of atomic energy. He tells us that thus far nobody has benefited from atomic energy and that it will be a long time before anyone does. But not only is the constructive use of atomic energy in the distant future; the vast majority of mankind *"will have to do without it,* and will continue to do things in the good old way, even to wearing out their bodies with hard labor" (p. 225, reviewer's italics). Thus excluding the mass of humanity from the benefits of constructive use of atomic energy, Mr. Kingdon-Ward proceeds to the conclusion that atomic energy is not a fundamental step, such as fire, because "the real point is: who benefits?" (p. 225).

From this conservative outlook it is but a step for our author to decide that civilization is not mechanization, nor any of the steps in technological evolution, nor all of them put together, nor, yet, a higher standard of living. For him these are merely *means* to an end, which is—civilization. We are told, further, that higher living standards do not bring about "a new vision of life" and that "many luxuries are merely nuisances" (p. 227). Thus prepared for a rather etherealized conception of civilization, we are given his definition of it as "a sense of responsibility; responsibility towards oneself, towards mankind, and towards God" (p. 227).

What Mr. Kingdon-Ward may have left out of his equation is the pervasive determination of vast sections of humanity throughout the world not to be bypassed either by the existing technological achievements of western civilization or by future productive utilization of atomic energy. Indeed, many observers of today's world scene would argue that a point has now come in the evolution of culture when its fruits will be tasted either by all or by none.

CHARLES S. BRANT
Colgate University

WEAVER, W. WALLACE. *Social Problems.* Pp. viii, 792. New York: William Sloane Associates, 1951. $5.00.

To write a good book on social problems is a difficult task. It must deal with a great mass of factual material, yet must not be a "World Almanac." It must be based on sound theory, yet not be too theoretical throughout. The "pure theorists" must be very unhappy over books on social problems, for to admit that a social phenomenon is a "problem" is to use a "value judgment," and that is taboo. (One cannot but wonder how they can even declare anything taboo without using a value judgment!) But fortunately most sociologists are broader minded than this, and are therefore on familiar speaking terms with social problems.

Weaver divides his analysis into six parts, most of which are logical, though it is difficult to see a clear distinction between Part II (Personal Crises) and Part III (Family Discord). "Prostitution," in Part II, requires *two* people who flout social standards as surely as does "Illegitimacy," in Part III. One is no more *personal* than the other. Likewise divorce, under "Family Tension" in Part III, is often as much of a "Personal Crisis" as are many of the items under that label in Part II. Also, in Part I, on "The Nature and Scope of Social Problems," it is doubtful whether a whole chapter on "Disaster" is justifiable. One paragraph could show the usual five successive phases of disasters, which after all are sporadic affairs and not subject to the same degree of social control as are the "normal" social problems.

In the first chapter the concept of the social problem is fairly well stated, providing a basis for the discussion of specific problems. But the closing chapter, "Social Problems and Social Policy," is better. It is an excellent bit of social philosophy—clear, analytical, and broad in scope of

thought. The main body of the book—the twenty-five chapters on specific social problems—is well done. It covers, for the most part, the usual list of topics, but there is an excellent chapter on "Old Age," not always found in similar books. The current emphasis on this topic, the country over, makes this chapter especially timely. Some of the statistics in a number of chapters are older than necessary, but others are up to the minute. In general, the numerous problems are dealt with satisfactorily, the factual material being adequate, the viewpoint hard-headed and objective, and the conclusions well taken. The writing throughout is admirable, with very clear expression of thought and many a well-turned phrase. All in all, the book will be found a very useful text.

RAY E. BABER
Pomona College

JOHNS, RAY, and DAVID F. DEMARCHE. *Community Organization and Agency Responsibility*. Pp. xiv, 214. New York: Association Press, 1951. $3.75.

For those who are looking for a good, panoramic view of social welfare with highlights on community organization this book will be helpful. Its moving camera covers the field of social work from the history of Social Security in America to methods of conducting community surveys.

A most interesting and helpful section presents the findings of an original study made by the authors of interagency relationships. This material lends strong support to the thesis that social agencies providing direct social services have a responsibility for community planning.

It is disappointing to this reviewer that the book fails to emphasize social planning as a process whereby people—all people—evolve, through orderly and conscientious effort, more fruitful and efficient ways of solving their social problems. By implication, the material seems to adhere to the doctrine that it is the community organization *worker* who makes it possible for communities to effect social progress. The book seems to stress the indispensable role of the "expert" in community organization, who weighs community problems, evolves solutions and then through "citizen participation" tries to put these solutions into effect.

A larger number of "experts" than ever now agree that community organization is not just a method used by social workers to help solve social problems, but rather it is democracy's own peculiar way of *organizing itself* into a more satisfactory way of life. Experts do smooth the way for this democratic process, but they neither originate nor control it. Community organization goes on apace whether professional workers are available or not. The contribution of the experts is to help determine how "good" or "bad" the process shall be.

In one quotation, apparently endorsed by the authors, the "elements of democracy" in social planning are said to consist of a "hospitality" by the *community organization worker* "to all positive and creative ideas" and "careful consideration of them after they are in form to be considered." Democracy, which is making remarkable strides in building a better America through the use of community organization in one form or another, may be puzzled to hear that social workers are willing merely to give "hospitality" to democratically generated ideas.

A. DAVID BOUTERSE
Philadelphia, Pa.

TAPPAN, PAUL W. (Ed.). *Contemporary Correction*. Pp. xvii, 434. New York: McGraw-Hill Book Company, 1951. $5.50.

This book attempts the ambitious project of discussing all pertinent aspects of contemporary correction by having different "authorities" contribute separate chapters dealing with specialties in which they are expert. Thus a chapter on "The Federal Prison System" by James V. Bennett, director of the Federal Bureau of Prisons, is a natural; likewise the one on "Classification in the Prison System" by Frank Loveland, now an asssitant director of the Federal Bureau of Prisons, but formerly Director of Classification for the Federal Bureau of Prisons, or the one on "State Organization for Correctional Administration" by Richard A. McGee, director, Department of Corrections, State of California. Many other well-known names are included in the list of contributors. In justification of the effort, the editor says, "This volume is predicated upon the importance of understanding the total task, as seen through the experience of outstanding authorities in each of the varied fields of correctional practice" (Preface, p. ix).

There are 26 chapters by 32 different authors (some chapters involve more than one author), grouped under five principal headings, namely: Part I, "Correction: Preliminary Considerations"; Part II, "Administrative Organization and Classification"; Part III, "Programs in the Correctional Institution"; Part IV, "Types of Correctional Institutions"; Part V, "Extramural Treatment." Very brief editorial explanations precede each part, and there is a reasonably comprehensive index. The book carries a foreword by Sanford Bates, and there is a full listing of authors with identification information and an indication of why they may be taken to be experts in their several specialties.

As is inevitable in a book of this type, there is considerable unevenness in presentation as well as some overlapping and redundancy in treatment, but on the whole, the editorial job has been sufficiently well done to eliminate most of the objections to this procedure. As is to be expected, the authorities frequently give their opinions and interpretations in connection with many problems about which there is little or no factual information. The emphasis is on contemporary practice, or on what is believed to be desirable practice at the present time. There is very little reference to historical materials, or to the problem of how we have come to advocate or to practice procedures now assumed to be "better" than those similarly approved in earlier times.

As a treatise outlining current ideas and ideals of the "new penology," this book is a welcome addition to the field. Correctional workers will find it a challenging barometer against which to compare their own efforts, and students and professional people generally will be equally thankful for this compilation. It is a "must" book on the list of anyone professionally interested in the field of correctional work.

GEORGE B. VOLD
University of Minnesota

ANDERSON, MARY, as told to MARY N. WINSLOW. *Woman at Work: The Autobiography of Mary Anderson*. Pp. xii, 266. Minneapolis: University of Minnesota Press, 1951. $3.50.

"Now I am working for a federal law requiring equal pay for women. After we get that I know there will be something more to do. . . ." With these words, Mary Anderson, woman at work, ends her autobiography, which she calls the story of a "fine, full life."

In 1889 a Swedish girl of sixteen immigrated to this country, with little education, no knowledge of English, nothing but her own strong hands and active mind. From 1920 to 1944 she was director of the Women's Bureau of the Department of Labor. It is with fifty-five years of hard, uncompromising work that Mary Anderson's story deals.

Mary Anderson was a student of life, not of books. She describes her early years as a casual worker—ten jobs in the first six years; then as a factory worker, progressing from a skilled job in the shoe industry to trade union leadership; finally, as a government employee, with the working conditions of women her one concern. From her experiences in the harsh reality of the working world, she distilled the practical wisdom that stood her in good stead when she had reached a position of high responsibility, with a major role to play in determining the standards and needed regulations of women in industry. Slack time, unemployment, night work, the ill effects of the ten-hour work day were no academic matters to her. Of her experience in the shoe factory and her work in trade unions she says, "I learned that it was not always necessary to change jobs to get better working conditions."

The generation that remembers Jane Addams of Hull House, Florence Kelly of the National Consumers League, and Mrs. Raymond Robbins, President of the Women's Trade Union League, will retrace

with deep interest the hard road over which these and other great leaders led the working women in the first half of the twentieth century. But younger workers, who today reap the fruits of past labors, will profit most by reading this book. The battles against the inequities that have barred the progress of working women make dramatic reading, and those battles are not yet over.

Mary Anderson disposes effectively of the hoary clichés about working women. The "pin money" theory, for example, was exploded through factual evidence that most women work for their own living, and for their dependents. She describes her persistent struggle to ensure appointment of women to important governmental committees, to get consideration for such matters as hours and wages of women in the war industries. Then there were the unions themselves, with all too little interest in the unionization of women, opposed to equal pay for equal work, yet afraid of low-paid women as competitors who were undercutting men. There were also to be faced, of course, those employers who welcomed a mass of unskilled, unorganized women workers. And finally, there were the women themselves; "the only security women could see was in marriage and that made it difficult to get many of them into the trade union movement."

The book is a simple, personal narrative by a woman whose life was her work. Many paragraphs begin "I said" or "I think" and go on to describe how her words and her thoughts were translated into action. Her opinions are salty and realistic; "day care centers," for example, she regards as only a "stop-gap . . . the wear and tear on the mother is something to be thought of . . . she cannot be a very good mother if she is so tired she is ready to drop. . . ."

Miss Anderson served under five Presidents, and various Secretaries of Labor. The Presidents and Secretaries of Labor were just people to her, but powerful people, who could further or impede the progress of the working women in the world of today. On that basis, she judged them. While her book is a story of a single life with a single theme, the role she played was against the changing scenes and great movements of our times.

HELEN GLENN TYSON

Pittsburgh, Pennsylvania

NATIONAL CONFERENCE ON AGING. *Man and His Years:* an account of the first National Conference on Aging. Pp. viii, 311. Raleigh, N. C.: Health Publications Institute, 1951. $3.25 cloth; $1.75 paper.

This is a summary account of the first National Conference on Aging sponsored by the Federal Security Agency. The book is framed with brief introductory statements by Oscar R. Ewing, Federal Security Administrator, and John L. Thurston, Deputy Administrator, and a concluding chapter forecasting the "next steps" by Clark Tibbitts, the conference director. In between are eleven chapters dealing with population changes, income, employment and rehabilitation, health, education, family life, creative and recreational activities, religious programs, professional personnel, research on the aging, and community organization. These chapters are condensed, unsigned statements prepared by the eleven separate planning committees and represent the leading ideas, formulations, and proposals for private or public action with respect to the interests and welfare of the aging population.

The conference was apparently an outstanding success and provides a fine demonstration of democratic action in planned discussion groups. Anyone contemplating similar deliberations by selected panels on a nationwide basis can profit from a perusal of the conference procedures. The amount of ground covered in the three-day conference, the selection and relevance of the facts presented, and the core unit of agrement running through a diversity of points of view and minor qualifications constitute an impressive achievement. Any leader of community programs for the aged or director of research in the problems of aging will want to have this reference source within easy reach. Those facing old age personally will find therein encouragement, guidance, and a sense of security and pride in a country represented by such leadership both in the federal agency and in public and private institutions. Indeed, a word of praise is richly deserved for the excellent selection of registrants for participation in the conference.

The book suffers somewhat from lack of continuity and orderly progression in the development of concepts, from irregularities in chapter structure and in quality of writing, from the not infrequent repetition of ideas, and from a relative sparsity of facts presented and conclusions reached. But it compensates for these and other defects in the abundance of stimulating ideas and proposals and as a cross-section representation of contemporary American thought and interest in the problems and, also, in the challenge of aging. It is the opinion of this reviewer that both the conference and the book have been well worth the efforts expended and that such a conference should be repeated at a suitable time and place.

LEO W. SIMMONS

Cornell Medical School

PLOSCOWE, MORRIS. *Sex and the Law.* Pp. ix, 310. New York: Prentice-Hall, 1951. $3.95.

In this book a judge of great legal erudition and practical experience analyzes the limitations of social efforts to control sexual behavior by legislation. The author's survey of common and statutory law regarding marriage, annulment, divorce, illegitimacy, and sex crimes culminates in a number of interesting and to some in all probability provocative conclusions. In essence, these conclusions are that the existing law makes it too easy to get married and too easy to get divorced, that our law should be better prepared to deal with the problem of illegitimacy than it is, and that it needs a complete reorientation in the field of sex crimes. In the latter area the author recommends dropping many of the legal prohibitions concerning sexual activities which can be better controlled by agencies other than the law. He believes in confining the scope of control through the threat of severe penalties to the following four aspects of sexual activity: (1) heterosexual and homosexual acts in which force and violence or their threat is used to achieve sexual objectives; (2) heterosexual and homosexual acts involving children and adolescents; (3) heterosexual and homosexual acts which outrage public decency or give rise to public scandal; and (4) heterosexual and homosexual prostitution.

To laymen this book will render an important service in giving them a great amount of pertinent information about existing legislation and court practice in relation to sexual behavior. It will also provide them with some challenge for the formulation of public opinion in that respect. To lawyers it will give the significant if not happy experience of finding expounded by a member of their own profession the limitations which human nature and social conditions put upon the effectiveness of the law. To both groups it will give the rare pleasure of encountering detachment in the discussion of emotionally charged material and clarity in the presentation of legal complexities.

Another merit of the book is that the premises from which the conclusions and recommendations are drawn are always clearly stated. The reader is thus enabled to know in cases of his disagreement with the author whether the controversy is one over goals or one over methods.

The book is interestingly written with a wealth of documentation by case material which, however, is never presented in such a manner as to leave doubt about the abstract principle involved. It deserves welcome as an important and socially significant piece of work whether one is in agreement with the author or not. It is a work which gives the citizen confidence in the vitality and seriousness of social concern with which the legal profession on occasions examines its functions, its effectiveness, and its power of reform.

OTTO POLLAK

University of Pennsylvania

DEES, JESSE WALTER, JR., and JAMES S. HADLEY. *Jim Crow.* Pp. xiii, 529. Ann Arbor, Mich.: Ann Arbor Publishers, 1951. $4.00 cloth; $2.50 paper.

This reviewer has long wished that some competent scholar would write the story of racial discrimination in the United States, particularly in view of the changes which

have come about as a result of our participation in World War II. Thus the feeling of ancicipation with which he sat down to read *Jim Crow*, a study by "two trained social scientists—one a University professor . . . and the other a social worker . . . one white and the other a Negro." Evidently he expected too much.

While the authors have brought together a large mass of material, this material is taken from comparatively few sources. Each chapter is "adapted" or "adopted" (*sic*, p. 245) from other studies. Thus chapter 12 consists of twenty-seven pages summarized from the October 1949 issue of *New South* with no other authority cited. Chapter 13 is a sixty-four page summary of a report prepared by the American Jewish Congress and the National Association for the Advancement of Colored People with no other authority cited. These are typical. One wonders whether the studies from which these chapters are "adapted" really have garnered all the knowlege available on these subjects. At any rate the authors admit that they have not written their own book, occasionally using quotation marks extending over many pages (pp. 152–62, 199–215).

One wonders also whether the authors are ignorant of the laws regarding the use of the comma since the most elementary rules of punctuation are frequently unobserved. We cannot but deplore a university professor's violent disagreement with Webster in spelling. "Colier's magazine" (p. 63), "religeous" (p. 131), "front yeard" (p. 156), "stollen property" (p. 223), "hous of the legislature" (p. 225), "at lease eight" (p. 252), and "efficancy" (p. 263) are samples of individuality which leave a bad impression. Why is the word "South" capitalized in one place and put in lower case three lines farther down (p. 193)? Since the book is the product of an electroplate process taken directly from manuscript, perhaps the typist is at fault. A typist's work should be proofread before publishing. But not even bad typing can excuse lapses into incredible grammar (pp. 48, 119, 160, 196)!

Nor does the material appear to be consistent. On page 7 we find the statement: "Myrdal was amazed at the apparent hypocracy (*sic*) of the American people during a war with Hitler in what they said—a professed belief in racial equality—and actual practice." On page 71, "The Negro in America today is still a second-class citizen." This is substantiated by the consideration of the Negro slums (chap. 9) and the Truman Report, *To Secure These Rights* (199–215). Yet in chapters 12–14 nearly every southern state is mentioned as giving the Negro better educational facilities, hospitals, recreation, slum clearance and housing projects, extension of political privileges and civil rights, and ending discrimination in employment. If we were to judge by these chapters alone, our conclusion would be that the Negro is at least as well off as the white citizen of the lower economic group. We wonder if this really is true.

JOHN G. VANDEUSEN

Hobart College

RUBIN, MORTON. *Plantation County*. Pp. xxiv, 235. Chapel Hill: University of North Carolina Press, 1951. $3.50.

This is one of a series of studies of the *Modern Cultures of the South* organized by Professor of Anthropology John Gillin of the University of North Carolina and financed by the Julius Rosenwald Fund. Mr. Rubin presents a fluently written social anthropological survey of the organization of a southern community and the behavior, thoughts, and concepts of its people. The community was chosen as a typical one in the coastal plains or the old plantation cotton belt, and has 5,000 whites and 20,000 Negroes in its population. The author lived in this county in 1947 and 1948, returning to it in 1950, and carried on a thorough field study guided from Chapel Hill, and reported all findings to the University. The result is a study which is probably one of the best examples of the uniquely American procedure of the inductive research method of cultural anthropology applied to a difficult area with a sensitive pattern of biracial social standards. The study reveals most of the relevant facts with scientific candor and keeps aloof from sensational revelations or rash judgments of mores or institutions.

The book covers in meticulous detail several plantations, the small farms, the industries, the relations of whites and Negroes as well as the social statuses of whites and Negroes within their own races, the churches, the cultural patterns and social circumstances for youth, adulthood, and old age, and finally a survey of the culture of the plantation area. Throughout the book a fascinating process of change is revealed which today pervades the entire South. Not only does cotton give way to livestock and lumber and factories, but the entire institutional and social pattern is undergoing many changes. This is unobtrusively revealed and gives the impression of the operation of a powerful ferment to which there seems no end.

This is another most worthy contribution to our knowledge of the South by the University of North Carolina, and makes the reader impatient for the appearance of other studies in Professor Gillin's series.

KARL BRANDT

Stanford University

HOLLOWAY, MARK. *Heavens on Earth: Utopian Communities in America, 1680–1880*. Pp. xvi, 240. New York. Library Publishers, 1951. $4.75.

The utopian communities that were founded on American soil and lived, most of them, for a short time and then disappeared into the main current of American life have been of increasing interest to American historians in the new vogue for social history and of especial significance for the various American studies programs that are endeavoring to integrate the diverse fields of American culture. Professor Victor Bestor, for instance, has spent much time working over the material for the Fourieristic groups; the Shakers and several of the other religious communities have had their stories told; and recently Mr. W. R. Cross has analyzed in detail the part played in many of the vehement movements of the nineteenth century by the inhabitants of Central New York—the famous Burnt-over District.

This little book by Mark Holloway is a more popularly written account of the utopias of the two centuries marked off in the title. The story is interestingly told, but there is little new material, few footnotes, and a bibliography that is obviously shorter than the number of works that the author must have used, even if he relied, as he says, heavily upon the two books so long almost alone in the field —John Humphrey Noyes's *American Socialisms* and Charles Nordhoff's *Communistic Societies of the United States*, both of them a combination of primary and secondary material. Tribute is paid also to *The American Faith* by E. S. Bates, but there is little evidence that Mr. Holloway has done much research in the rich contemporary material for any of the communities.

The book starts with a sketch of the utopian ideal and in a few pages makes a rather vague connection between eighteenth and ninetenth century utopian groups and the utopian and escapist ideas through the ages. The first chapter sums up what is known of the communities founded in America in the colonial period, then in eleven chapters there are brief accounts of the Owenite, Fourierist, and Icarian secular socialist groups and of the religious communities such as the Shakers and the Rappists. The book ends with a glimpse of the post-1880 utopias and an estimate of the significance of the whole movement. Within these limits the story is interesting, if thin, and is well written with a sympathetic treatment that should make an appeal to the general reader, although any student working in the field will need to explore much farther in the rich literature on the subject.

Many of the obvious and sometimes amusing errors or slips are doubtless due to the great condensation necessitated in covering so much in such short compass. It is most unfair, for example, to call Governor Bradford and his associates of Plymouth an "oligarchy" when they endeavored to pay off the debts of the colony by control of the Indian trade, and it is difficult to see what that group could have done to further Boston "authoritarianism." The new life of Governor Bradford by Bradford Smith would have been helpful on this point.

No student of colonial history should make the statement (p. 31) that Boston

authoritarianism "reached its peak at the end of the seventeenth century"—the time of its obvious decline—or that the witchcraft trials could justifiably be called "Cotton Mather's trials."

It is possible that the connection implied on p. 99 between Count de Leon and the Zoarites is unintentional, but the evidence of any "signs of success" in the Frances Wright colony at Nashoba is unauthenticated and seems peculiar to the author who is, I think, equally unjustified in calling Nashoba an Owenite settlement (p. 114).

Even Professor Bestor would smile, I think, at the statement that Albert Brisbane "initiated a Fouierist movement *that swept a nation*," and the idea that Horace Greeley gave "*sober* advice" to the Fourierists is more than a little amusing. (The italics are reviewer's in both instances.)

The condemnation of the Jansonists (p. 168) is unduly harsh, and the reference to Oberlin students (p. 179) needs qualification or clarification to make it anything other than smart or slapstick humor.

The same tendency is seen in the remark (p. 183) that Oneida was chosen by Noyes as the site for his community because it was "near the Canadian border in case further flight should be necessary"—a statement true neither in fact nor location.

In general, it seems evident that the author either failed to understand or, perhaps, had no space to explain the reasons why the utopian idea was prominent in the minds of both Europeans and Americans in the early nineteenth century and why the combination of cheap land on the frontier, American perfectionism and revivalism, and a democratic way of life provided for a time a fertile soil for experiments caused largely by religious restrictions and revulsion from the unfortunate effects of rapid industrialization. There is no adequate tribute, either, to the enrichment of American culture from such a galaxy of "socialisms" which tempered, at least, the effects of what Professor Hacker has called *The Triumph of American Capitalism*.

ALICE FELT TYLER
University of Minnesota

HART, JOSEPH K. *Education in the Humane Community*. Pp. xiii, 172. New York: Harper & Brothers, 1951. $3.00.

Under the title "Education in the Humane Community," the John Dewey Society has published the last writing of Joseph Kinmont Hart, who passed away March 10, 1949. He was regarded as an outstanding exponent of progressive education in its community-centered interpretation. Throughout his career as a writer and teacher Professor Hart propounded the thesis that the school itself cannot adequately educate; genuine education of humane character needs to be rooted in the life of a real community. He held that the democratic task in education was not primarily a problem of teaching children in school, but of building a community within which children could not help but grow up to be democratic, intelligent, disciplined persons.

Professor Hart looked back to the small face-to-face village communities of Greece and of New England. In such communities, thought, nourished by a rich cultural heritage, achieved creative solutions as real problems of life were faced. But now industrialism has decimated our villages, and our overgrown cities are marked by individualism and cultural disintegration. Modern life does not supply the depth and wholeness which is prerequisite for morality and religion, and for the creative self-realization of the individual.

The achievement of a humane culture has three facets: First must come a restoration within our complex civilization of the small community which will give the growing child rootage in an actual, tangible, social reality. Second, we must build a school which will help the child enter into the larger world of humanity without losing his natural élan and will to live. Third, we must have a social development which will make it possible for the human individual to discover himself, and to discipline himself, for a creative part in the world's work.

The book looks towards the future, but it is qualified by a nostalgic idealization of the small communities of the past. The village community, with all its virtues, was —and still is—often the seat of prejudice and general backwardness. In any case, we cannot restore it. Our problem is how to develop a humane culture in the large-scale civilizations of the present day. To this problem, no very concrete answers are given; the author's main purpose was to locate and define the problem. It is not meet, in the present instance, to quarrel with this intent: the sincerity, the gentleness, and highmindedness which pervade the writing preclude an ungracious epitaph. Joseph Kinmont Hart has left us a thoughtful piece, somewhat sentimental perhaps, but fragrant with a tender hope.

I. B. BERKSON
College of the City of New York

BUCKLEY, WILLIAM F., JR. *God and Man at Yale*. Pp. xix, 240. Chicago: Henry Regnery Company, 1951. $3.50.

This extremely interesting and forcefully written book, by an alumnus who had just completed his four years of undergraduate study at Yale, is one of the most controversial publications about higher education since the issuance of the Harvard Report.

Buckley's major thesis is that Yale "derives its moral and financial support from Christian individuals and then addresses itself to the task of persuading the sons of these supporters to be atheistic socialists." To prove this thesis he candidly but unconvincingly describes Yale professors by name and quotes excerpts from identified texts used in their courses. The Departments of Religion and of Economics reap the most vigorous vituperation, but those of sociology, psychology, philosophy, and the social sciences, as well as specific extracurricular organizations, come within the author's caustic purview.

While Mr. Buckley would allow freedom of research, he is convinced that the teaching faculty of Yale "is morally and constitutionally responsible to the trustees of Yale, who are in turn responsible to the alumni and thus duty bound to transmit to their students the wisdom, insight, and value judgments which *in the trustees' opinion* will enable the American citizen to make the optimum adjustment to the community and the world." His remedy is simple: fire those who do not conform to the opinions of the trustees. Surprisingly enough in the light of the specificity of his citations, he states: "I shall not say what specific professors should be discharged."

The most obvious criticism of Mr. Buckley's analysis is that he has selected only those instances or quotations that prove his thesis and has conveniently or deliberately ignored all others. At the time the author was assembling his material, a committee of alumni completed its report on religious life at Yale and unanimously agreed that the religious atmosphere was remarkably wholesome. A member of the Yale faculty deliberately used Buckley's technique of quoting out of context and has shown that the economic texts criticized by Mr. Buckley as Keynesian could be proven to be in vigorous support of the most conservative authoritarianism of the capitalist class.

The smear technique of selecting isolated experiences and quoting out of context is not new. But it is unfortunate that one as young and as capable with his pen as Mr. Buckley should stoop to this level in his first book.

In this reviewer's judgment, the issues are much deeper than those treated by Mr. Buckley. It is not a matter of indoctrinating Christianity or failing to do so; it is, rather, assuring freedom to the student to make his own value-judgments based upon comprehensive knowledge and broad experience. It is not a matter of perpetuating individualism or promoting collectivism but rather that of instilling in each individual a sense of responsibility for his fellowmen whether expressed through person-to-person relationships or through representative government.

HURLEY, HELEN ANGELA. *On Good Ground: The Story of the Sisters of St. Joseph in St. Paul*. Pp. xvi, 312. Minneapolis: University of Minnesota Press, 1951. $3.75.

This volume sets down the history of the Sisters of St. Joseph in St. Paul, but at the same time it does much more, for it recounts the growth of the diocese of St. Paul under Bishops Cretin, Grace, Ireland, and Dowling. Since the Sisters of St. Joseph came to St. Paul at the very beginning of the diocesan history, the author wisely chooses to tell the story of her community in an indirect manner, citing the great contributions of the sisters as a companion piece to the work of the bishops, the priests, and the laity.

In November, 1851, four sisters of St. Joseph arrived by Mississippi River steamboat at the frontier landing in St. Paul. They had set out from the motherhouse at Carondelet near St. Louis and were the first sisters to arrive in the new diocese of St. Paul. Now, one hundred years later the community maintains in Minnesota and North Dakota numerous high schools, academies, grade schools, hospitals, orphanages, and schools of nursing, as well as the College of St. Catherine in St. Paul.

Sister Helen recounts with great accuracy and care the many incidents great and small which make up the history of her community, but she is at her best when she turns to the great figures of her narrative, Bishop Cretin, Archbishop Ireland, his sister Ellen, and Sister Antonia. Father Joseph Cretin had been sent to work originally among the Indians in Minnesota but soon found himself assigned to parish work in Prairie du Chien. Seven years later he became the first bishop of all of Minnesota territory and almost immediately he invited the Sisters of St. Joseph to assist him in his missionary labors. During the seven years of his career as a bishop he was closely associated with the Sisters of St. Joseph. This close relationship continued under Bishop Grace, but it was during the lifetime of Bishop Ireland that both the diocese and the community of sisters made the great strides that promised a bright future.

The pen of Sister Helen is at its best in describing Archbishop Ireland. She presents the "consecrated blizzard of the Northwest" with candor and understanding. She pays tribute to his greatness and personal sanctity but notes, too, that Ireland was outspoken to the point of rashness and was apt to overstate his case in pleading a cause. Few bishops ever made more of an effort to put themselves right with American public opinion, and perhaps none has had a better understanding of America and its people. Ireland regarded his great task as a simple one—to reveal the church to America and America to the church.

As for Ireland's relationship to the Sisters of St. Joseph, Sister Helen emphasizes that he was clearly their friend, and she regards it as a tribute to his personality that there is to this day almost no perception of the fact that for a full forty years he headed a veritable family dynasty which governed the Sisters of St. Joseph in St. Paul.

The other great figure that pre-empts a major part of this volume is Sister Antonia McHugh, who almost singlehanded raised the standards and stature of the teaching sisters in the United States. With great foresight and hard work she made the College of St. Catherine an institution to be envied and emulated. She sought and secured full accreditation for her institution and she insisted that Catholic parochial schools find their place as the equal of the public schools chiefly by providing the teaching sisters with as much or more training as public school teachers; moreover, she did everything in her power to raise the standards of teaching in Catholic high schools. The integrity of Sister Helen as historian again comes to the fore when she notes that Sister Antonia's efforts to make St. Catherine's another Vassar were not enough, for such a goal failed to consider the central purpose of any Catholic college—to make better Christians as well as to impart intellectual training.

This fine study of Sister Helen concludes with a series of excellent bibliographical notes and a complete index. The volume is a first class addition to the history of education in America.

Washington, D. C.

PHILOSOPHY AND RELIGION

SINCLAIR, ANGUS. *The Conditions of Knowing: An Essay Towards a Theory of Knowledge.* Pp. 260. New York: Harcourt, Brace and Company, 1951. $3.50.

Mr. Angus Sinclair's theory of knowledge has the merit of rejecting separate "realms" of the "subjective" and "objective." Distinctions of this sort have limited, not absolute or ultimate, import for conditions of knowing.

The theory proposed sets our from differences in interpretations of progress, order, purpose, laws, causality, probability, time, space, qualities, and the like. Emphasis on such differences leads to the strange conclusion that we cannot reliably discuss these subject matters, but only our own attitudes, the selections and groupings we make in our attention, or our own experience. On this approach, a theory of knowledge would basically consider "men" as having experience and knowledge; language would become little more than a "causative" device for the altering of attitudes; and logic would give place to the study of factors prominent in our experience and of techniques effective in producing satisfactory experiences.

The presentation of this theory neglects to follow out to a solution the traditional difficulties which it poses. Thus it takes the difference between an illusory and a real pyramid as exemplifying conditions of knowledge rather than peculiarities of perception which we may examine and explain. Again, this account sets up a sharp contrast between relationships of cause and effect and of means and ends in behavior. Above all, the theory fails to take into account that points of view cohere for all their relativity—and not only because we may happen to agree, but because of the nature of the things with which we deal; so that we may, despite differences say among astronomical or botanical or other interpretations, nevertheless distinguish stars from plants and even pursue metaphysical inquiries into space-time and qualities and the rest without being unduly disturbed by fabricated epistemological puzzles.

At the same time, this essay contains some important insights. To cite a few: metaphysics is not explanatory but analytical; epistemology does not have special knowledge totally differing in kind from the normal; the physicist's table with its primary qualities is not in another world than that of the common table vivid with secondary qualities; the present has both succession and simultaneity in it; and current disblief in inevitable progress is disbelief in inevitable decline also.

RICHARD HOPE
University of Pittsburgh

TAYLOR, A. E. *Socrates.* Pp. 192. Boston: The Beacon Press, 1951. $2.50.

This book by the late professor of moral philosophy in Edinburgh University has been published in this country to commemorate the 2,350th anniversary of Socrates' execution. It is however not a new publication, for it first appeared in England in 1932, more than a dozen years prior to the author's death in 1945; the American publishers should have stated these facts explicitly somewhere in the present edition.

The book is an expression of the interpretation of Plato and Socrates, which Taylor and the late John Burnet cultivated with extraordinary scholarship and vigor. Taylor assumes that the allegedly early dialogues of Plato are reasonably accurate historical accounts of the life and thought of Socrates; and the argument in the volume is based on this assumption. But though this premise is supported by considerations that carry some weight, they are not generally accepted by competent scholars as conclusive. In any event, more than two-thirds of the book deals with the life, the trial, and the death of Socrates as reported chiefly in the Platonic dialogues. On the other hand, sufficient background material is supplied concerning the political significance of Athens' decline as a consequence of the Peloponnesian War to give the reader a genuine understanding of the historical circumstances under which the life of Soc-

rates came to its tragic end. Taylor's account, it is almost superfluous to add, is engrossing and moving.

The final chapter of the book deals with the nature of Socrates' self-appointed "mission" and with his doctrinal contributions to philosophy. In agreement with Burnet, Taylor held that it was Socrates who created the conception of the soul which has since dominated European thought; and he maintained that Socrates' mission and ethical teachings were indissolubly related to this conception. Taylor also gives an unusually clear account of the Socratic theory of knowledge and science, and he explains with sympathy Socrates' turning away from the causal analysis of events as practiced by the ancient physicist-philosophers in favor of a thoroughgoing teleological approach to nature. Quite evidently Taylor did not believe that this latter turn of thought was a capital misfortune for the subsequent history of science. It is indeed pertinent to note that Taylor's judgments on various incidents in the life of Socrates, as well as on Socratic doctrinal tenets, were not uninfluenced by the circumstance that he was firmly committed to the ethical and theological teachings of Christianity.

ERNEST NAGEL
Columbia University

MONEY-KYRLE, R. E. ***Psychoanalysis and Politics: A Contribution to the Psychology of Politics and Morals.*** Pp. 183. New York: W. W. Norton & Co., 1951. $3.00.

Money-Kyrle is a British psychoanalyst who has written this brief book to show that the findings of psychoanalysis justify ethical absolutism rather than ethical relativism. He reports that "the changes produced in moral character by a deep analysis are always away from the authoritarian and toward the humanistic end of the scale." People are normal and rational when no part of their mental life is permanently excluded from consciousness.

The summary which is given of psychoanalysis depends mainly upon the theories and observations of Melanie Klein, and in consequence has a great deal to say about the aggressive, persecutory, and depressive characteristics of infancy and early childhood. Disturbances of character formation "consist of what is manifest in the operation of defence mechanisms against persecutory or depressive anxiety or both."

Three principal types are distinguished which have significant consequences for politics. Some authoritarians possess an exceedingly strict superego (conscience) which makes them feel inhuman in the pursuit of whatever they conceive to be their duty. Besides these obsessionals are certain hypomanics, in whom aims are pursued with ruthlessness unhindered by any sense of guilt. The "hypo-paranoids" continually project their feeling of guilt upon others, so that they are sustained through life by a sense of righteous indignation against the real or imaginary sins of others.

It is impossible to read an essay of this kind without obtaining many valuable insights into human growth, and to gain new hope concerning the long-run impact of self-knowledge upon the democratization of human affairs. However, it is odd to find an experienced student of human affairs who beleives in the "either-or" of rational persuasion *or* force in dealing with hostile ideologies (p. 26). Hostile ideologies have often been reconciled by the sharing of values which are ultimately held on a nonrational basis; and bearers of the same ideology have permitted themselves to diverge disastrously from one another over concrete applications. The grounding of the democratic aspiration on rational absolutes may be worthy and convincing exercise for some members of mankind. But it is doubtful that it is the most important, or even a necessary basis for the Good Society.

HAROLD D. LASSWELL
Yale Law School

BAUMGARDT, CAROLA. *Johannes Kepler: Life and Letters.* Introduction by Albert Einstein. Pp. 209. New York: Philosophical Library, 1951. $3.75.

This is a heart-warming insight into the lovable and moving personality rather than into the scientific discoveries of Johannes Kepler, one of the four great founders of modern physics and astronomy. The introduction by Albert Einstein tells how Kepler first determined the twin movements of the earth in planetary space and says: "Neither by poverty, nor by incomprehension of the contemporaries who ruled over the conditions of his life and work, did he allow himself to be crippled or discouraged. In addition, he dealt with a field of knowledge that immediately endangered the adherent of religious truth. He belonged, nevertheless, to those few who cannot do otherwise than openly acknowledge their convictions on every subject. . . . He had to realize clearly that logical-mathematical theoretizing, no matter how lucid, could not guarantee truth by itself; that the most beautiful logical theory means nothing in natural science without comparison with the exactest experience" (pp. 12 and 13).

In this introduction by Einstein, we detect this unconscious self-portrait and a reason why Einstein is particularly able to interpret Kepler to our times. Kepler's letters are full of such stirring ideas as: "The variety of the phenomena of nature is so great, the hidden treasures in the dome of the universe so rich, that nature should never run short in material for the human spirit . . . ought never come to rest, but that there should be always in this world a workshop open for the training of man's spirit."

This book may be read with equal interest by a person who knows nothing about astronomy or mathematics. Kepler's letters are more poetical, mystical, and philosophical than technical. About 90 per cent of the material is in Kepler's own words from his letters arranged and sympathetically explained by Carola Baumgardt. Their setting is made clear in relationship to Kepler's lifelong search for truth against as much intolerance in a German Protestant State in 1605 as would have been experienced in a totalitarian state today.

Although written 350 years ago the beauty of Kepler's character and the depth of his wisdom make these letters as fresh and vital and illuminating as if they had been written today.

OTTO TOD MALLERY
Philadelphia, Pennsylvania

VOGT, V. OGDEN. *Cult and Culture: A Study of Religion and American Culture.* Pp. ix, 269. New York: The Macmillan Company, 1951. $3.25.

Seldom has this reviewer read a book that contained so many penetrating insights as does this volume by the minister emeritus of the First Unitarian Church of Chicago. The author gives evidence of having read widely, particularly in the fields of history, the history and philosophy of religion, and anthropology, and he has done a great deal of careful thinking about the problems of our confused world. The book is divided into three parts, headed respectively, "Conceptual," "Critical," and "Constructive," about two thirds of the total space being devoted to the first, and fifty pages each to the last two. The book makes interesting reading, not only because it is crowded with ideas, but also because the sentences are concise, the chapters brief, and the style direct.

The first book, dealing with concepts, treats such subjects as the sources of culture, culture and civilization, culture and philosophy, culture and art, culture and commerce, and culture and government. Culture, the author states, is not a matter of leisure, "an overtone of refinement beyond storms and crises"; culture is a satisfaction in things of the spirit, with a bare minimum of material necessities. In other words, luxury is not culture. The mark of culture is familiarity with the best, and the truly cultured man is always at home no matter what his surroundings. Religion and geography are the two chief sources of culture. Religion plays the principal role in the formation of a social order. Culture must be both conservative and radical; it must be attached to some tradition of order, but not so much attached as to resist beneficial change. The first section closes with a chapter entitled "Primacy of the Cult" by which is meant that the rites and ceremonies of religion are the primary sources of political order and national unity.

Book two, devoted to criticism, is opened with a chapter on American unity, or rather American disunity, caused by a whole series of clefts—racial, religious, economic, intellectual, and educational.

The intellectual cleft is that between the "intelligent non-religious, and the non-intelligent religious"; the educational cleft results from our attempt to educate our children without and apart from religion; the religious cleft is due to the Roman Catholic challenge to the democratic principles upon which America was established; the racial cleft is between white and black, Jew and Gentile; the economic cleft, between labor and mangement. It is true that in many respects the United States seems to be the most divided nation on earth, for here we have a cross section of all the cultures of the world. In another sense we are the most unified of nations, united about the principle and practice of freedom and resistance to tyranny. (This last statement is not the author's.)

The final section is devoted to constructive suggestions as to how these clefts, which tend to destroy American unity, may be overcome, the final suggestion being the adoption of a national American ritual or cult in which all Americans could join, regardless of race or religion and economic status, a somewhat Pollyanna solution.

WILLIAM W. SWEET
Southern Methodist University.

MADDEN, WARD. *Religious Values in Education.* Pp. xiii, 203. New York: Harper & Brothers, 1951. $3.00.

The author states that "the problem is to find a religious outlook suitable to the modern temper." He then attempts to do two things seldom undertaken—to analyze supernaturalism and to demonstrate in class work how the creative social act satisfies the modern need of children and youth.

This creative social act, a modification of Henry N. Wieman's "creative event," the author holds will conserve the dynamic of a religious conviction without isolating man's mind from the pain of joy involved in realizing the value claim. With Clarles H. Cooley and George Mead he sets forth to discuss the social process, though he fails to use the terminology of the sociologists.

The varieties, contrasts, and diversities of life are constantly being transformed into a more inclusive whole. Under the proper teaching there can be created a richer variety and range which "result in new meanings." He finds insight emerging at the juncture of a metaphysical or religious assumption with a social event when, in that social event, integration and differentiation are operative. He defines the democratic group as one in which the creative social act can generate two values, namely the step in the direction of a goal predetermined or anticipated and the reformation of the persons involved. It is when leadership "becomes domination bent" and seeks to serve a leader's "vested interest that creativity—the Creator—itself is destroyed."

The creative social act, without being "supernatural," is "superhuman" in several respects. It is a part of the cosmos, of which man is but a part. It is only when the learner is possessed by a sense of profound "dependence upon the forces that generated man" and with which he "must work humbly" that he can merit the progress which religion labels "his destiny." He believes that a new self, as it were, emerges "within the vast ferment of the cosmos." Here he gets far off the beaten track delineated by Dewey, Childs, and other experimentalists. If he will take the next ten years to resolve the differences existing between the pragmatists and the theologians of the Niebuhr school, or even the Wieman followers, all religious educators will be greatly in his debt. He states that (p. 50) "The good participant —the one who is neither rigid nor herd-minded—is the one who is able to surrender to this spirit and to let it transform him, even while he does not lose his distinctive individuality. . . . There emerges a new self capable of more distinctive contributions to the common effort."

Madden finds that the dual nature of life as well as the dual nature of values are best symbolized in Christian idealism through symbols. He enumerates man finite yet able to transcend life, the Kingdom of God on earth yet not of it, God one yet also a trinity (p. 44). He offers several teaching situations, and the book is a philosophy of education under what

he terms "Modes"—valuation, communal, executive, aesthetic, and contemplative. His chapters are devoted to these "modes." He may seem to desire to have his cake and eat it, for he is at once mystic and classroom teacher. His effort to escape the inhibitions of "revealed" religion by deliberately making use of spiritual values in the environing reality is commendable. He hints that the theses of the sociologists may prove to be the salvation for our epoch, though he resorts to "the creative social act" and not to sociological motivation.

He states (p. 190) that the foregoing principles in his chapters on the modes "embody not a new religion"—but they "state the conditions by which young people, their teachers and others in the community are enabled to release the religious quality potential in their shared experiences." The public school teaching events are well stated, the situations carefully delineated, and the effects fairly well reported, though validation of course would have to wait upon farther measurement of progress. Nathaniel Cantor has performed a similar service on the collegiate level in his small text *Dynamics of Learning.* Should this thesis finally be worked into patterns of public school practice we might be on the way to a religion-on-its-merit instead of having continually to think in terms of religion-by-the-sect. While this is only an introductory text, it merits wide reading by sociologists as well as by teachers and religious leaders.

EDWARD W. BLAKEMAN
Pacific School of Religion

COMMONWEALTH OF NATIONS

CLARKE, C. F. O. *Britain Today: A Review of Current Political and Social Trends.* Pp. 248. Cambridge, Mass.: Harvard University Press, 1951. $3.00.

At a time when much is to be gained from better popular understanding of the problems of our allies this book may be of some value. Written by a journalist, who previously worked for Reuters and the Kemsley Newspapers, the book comprises the Lowell Lectures delivered to public audiences in Boston in 1950. It is clearly addressed to the layman and contains no facts or ideas of any special interest to the informed. It is intended to promote better popular understanding of the problems of postwar Britain.

Even for this purpose it seems a weak contribution. It is witty, urbane, and informative on the casual, chatty, and generally evasive level that characterizes British clubroom conversation. Americans who have lived in England will understand it without being informed. Those who have not will gain little understanding, and are apt to be irritated by the subtle, but pervasive note of condescension that Englishmen abroad love to employ, and the reaction to which they seem never able to understand. Children, it seems, should learn a few of the facts of life, but only those which they are able to understand, and which it is good for them to hear.

The total lack of dogmatic statements itself contributes to this effect. We learn that the Britisher has many faults and many virtues, and these run ad libitum the gamut of the more familiar clichés. These clichés deal with persons, the British psychology, British history, Empire, and Commonwealth. In this anthology of pleasant irrelevancies nothing stands out, nothing is clear, nothing is explained. One would not, for example, get from this book the slightest inkling of how or why Britain is currently having trouble at Abadan, the Sudan, Egypt, Malaya, or elsewhere. One could not imagine how the first or second world wars occurred, why the League of Nations folded, why the production drive in Britain has achieved such small results, why Labor *really* sought nationalization, nor why it has been turned out of office. This list of things it is important for Americans to know a little about, and concerning which they can learn nothing of importance here, includes virtually every important question from devaluation to Western Union. Any two or three of Howard K. Smythe's fifteen-minute weekly broadcasts from London would add far more to the American popular understand-

ing than all the pages of this pleasant, but frothy volume.

ROBERT A. BRADY
University of California
Berkeley, California

JONES, THOMAS. *Lloyd George.* Pp. xiii, 330. Cambridge, Mass.: Harvard University Press, 1951. $5.00.

Insofar as the statesman here described as "the most famous Welshman of all time" can be compressed into 290 pages of text this biography is well done. It is scholarly, impartial, and readable. It is not in the class known as official, because it is not based on the Lloyd George papers, but the bibliography shows an extensive use of published documents. The author, moreover, was long a close associate of Lloyd George who appointed him Assistant Secretary of the Cabinet in 1916; in this capacity and later as Deputy Secretary for some twenty years he was in a position to observe British politics from the inside.

The author's conclusion, which coincides with Winston Churchill's, is that Lloyd George more than any other man of the twentieth century shaped the fortunes of the British people both in peace and in war, because his early social legislation and his People's Budget were so important in Britain's social evolution, and because as prime minister he was the supreme architect of victory in a world war. The former contribution is the less well treated: thirteen pages provide only the briefest sketch of his contribution to the making of the Welfare State. The discussion of his great war services is more adequate. There is a good picture of the man who assumed command in a crisis and replaced flabbiness and muddle with resolution and system. Fuller, too, is the account of his moderation at Paris and his conciliatory efforts during the period of the Coalition government and international conferences. The years of exclusion and frustration which followed his fall receive a long chapter which shows him at first struggling to provide declining and divided liberalism with a program and the means for a return to power, but later outwardly resigned to a lonely position though to the day of his death secretly hoping to receive the call to guide his country again in its time of greatest peril.

The author's admiration for the courage and resolution, the vision and practical idealism, and the cleverness and charm of his subject at no moment blinds him to defects and shortcomings. The early demagogery, the dubious Marconi transactions, the many inconsistencies, the irresponsible and flippant handling of the Chanak crisis, the Lloyd George Party Fund, and the pollution of the honors system receive frank treatment. So, too, does the visit to Hitler when "his critical faculties were left in abeyance."

CARL F. BRAND
Stanford University

ROWSE, A. L. *The England of Elizabeth: The Structure of Society.* Pp. xv, 547. New York: The Macmillan Company, 1951. $6.50.

It is not surprising that the exuberant age of Elizabeth has attracted many colorful writers. Mr. Rowse writes in the great tradition. His volume is the first half of an attempt to make a synoptic view of the whole Elizabethan age. It is concerned with the structure of Elizabethan society, with its foundations on the land, its developments in industry, commerce, and finance, and its expansion—especially in its cities and most of all in London. Then come social classes, government, law, church, and, finally, education.

Everywhere he looks there is creativeness, confidence, and daring. The age is "tough, vigorous, pulsating with energy . . . the most remarkable in our history." Mr. Rowse knows it all intimately, from the humble cottager to the great Burghley and the still greater Elizabeth, and he loves what he knows. He has all the Elizabethan qualities himself, except the Elizabethan style. His style is his own, and it is an effective expression of his mood. It is capable of rising to great heights, as in his appreciation of the queen, and sinking to irritating asides. There can be no question but that Mr. Rowse has caught the spirit of the period and established himself, as by no earlier volume, as an outstanding writer.

He does not, in the strict sense, write history. His writing is (p. 158) "essentially a portrait." He gives us a cross section of England under Elizabeth; he is not interested in the processes of change so much as in the nature of the community at one fixed point in time. In many ways, he is in the great line of antiquarians—the Lambardes, Carews, Hookers, Camdens, and Stowes whom he obviously admires—to whom England owes so much of the material out of which history is made.

He is apt to explain the achievements of Elizabethan England in simple terms of national genius or geography; his understanding of the long preparation of the Middle Ages is not strongly displayed. On the other hand, he takes liberties which are no longer fashionable among historians: he loses no opportunity to point contrasts between what he likes in the age of Elizabeth and what he does not like in his own. The fact that he is so often right does not fully excuse him. "The responsible historian," he very properly reminds us (p. 222), "must adhere always to what is true and forego the pleasures of generalized reflection, still more the indulgence of contemporary political prejudice in the form of moral indignation."

In any case, he is not always right. We may all, for example, deplore the wars of religion of the sixteenth century; but should our moral indignation make us write of them: "Men were in for one of those gusts of convulsive idiocy when they kill one another for what they cannot know about"? Or, how seriously must we take the observation, relative to the Elizabethans (p. 173): "they *were* children, for all their gifts and all their ability. For the wise and adult do not quarrel"?

But these are only occasional deviations from a great theme expressed in the great manner. The range of Mr. Rowse's knowledge is truly impressive; even more striking is his ability to communicate what he knows. Most astonishing of all is his feeling: his feeling for England in 1588 and (we must add) in 1940. It is no small achievement for a writer to capture the spirit of the English people at two such high points of their life.

B. WILKINSON
University of Toronto

ROBERTSON, D. B. *The Religious Foundations of Leveller Democracy.* Pp. x, 175. New York: King's Crown Press, 1951. $2.75.

Mr. Robertson has undertaken yet another examination of the considerable body of a radical sectarian thought that emerged in England during the revolutionary era. He has made full use of the splendid collection of pamphlets available in the McAlpin collection and has given thoughtful, if not particularly critical, attention to the whole range of Leveller thought.

The author's discussion of the relation of Leveller thought to Puritanism is useful and in some particulars original. The formidable John Lilburne is treated sympathetically and carefully, though it is possible that Mr. Robertson, like some of Lilburne's own contemporaries, may be more swayed by his powerful if prolix rhetoric than the structure or quality of the thought warrants.

The central section of the book, dealing with Leveller thought on law and democracy, is useful and well documented. English political theory was undergoing a basic accommodation to the historical realities during the period of the Puritan revolution and the Levellers, and the other radicals loosely allied with them, were seeking to hasten as well as to expand this process of change.

Mr. Robertson's study suffers from looseness of organization and from a probably inevitable difficulty in keeping the focus of his argument on the specifically Leveller contributions to political and religious thought. As has been suggested, this short essay has much to commend it, and it is to be hoped that the author will continue his investigations in an important area of the history of ideas.

HUTCHINSON, F. E. *Cranmer and the English Reformation.* In "The Teach Yourself History Library" edited by A. L. Rowse. Pp. viii, 188. New York: The Macmillan Company, 1951. $2.00.

Since this little book is one of a series designed to aid a wider reading public in

its need, and what the editor confidently believes to be its desire, to read more history, it is not to be expected that it will provide new material for the specialist in the field. It does, however, tell an important story simply and well, and in small compass, yet with due regard for the findings of modern scholarship. The result is a useful little book.

In the main, both its organization and interpretation follow traditional lines. There are no surprises except perhaps that the Elizabethan Settlement is dealt with as an epilogue. One had always thought it more than a mere epilogue to the English Reformation. Perhaps since the book is also designed to be biographical it was thought better to end the story proper with Cranmer's trial and execution.

Indeed this biographical approach, chosen, it is said, as the "key-idea" to the series seems to have posed something of a problem to the authors of several of the volumes. It is likely that the editor is on sound ground when he calls it the most "congenial" approach to history for the general public; but the desired result is sometimes a difficult one to attain. In this case, for instance, in order to treat the English Reformation even briefly, it is necessary to include so much that had nothing to do with Cranmer, or to be more exact, with which Cranmer had nothing to do, that he must either be left out of a great portion of the work or else at times pulled in rather awkwardly. It seems sometimes as if the author has said to himself, "Dear me, I haven't mentioned Cranmer for pages and pages, I must bring him in more often, mustn't I?" In this dilemma, however, one's sympathies are with the author. What else could he do and stay within the intent of the series and the framework of his title?

The above problem is, of course, absent in the chapter on Cranmer's trial and execution which rightly take a central place in the story. Here also the interpretation holds pretty well to established lines. The events are recounted with the moving drama inherent in them, and Cranmer's recantations are held redeemed by the martyr's courage at the end. Throughout, Canon Hutchinson handles the controversial parts of the story in the same "charitable temper" he ascribes to Cranmer as participant. The "Elizabethan Settlement" is a term he finds "accepted and justifiable," though he is quick to point out that there was much that it did not settle.

The book closes with a good summary statement evaluating Cranmer's contribution to the later history of the English Church.

MILDRED CAMPBELL
Vassar College

STRAUSS, ERIC. *Irish Nationalism and British Democracy*. Pp. x, 307. New York: Columbia University Press, 1951. $4.25.

In the preface to this book the author states that his subject "is neither a restatement of Ireland's wrongs, grievous as they have been, nor an apologia for England's historical mission." On the contrary "the accent lies on *Ireland's* influence on *British* society, *British* politics and the *British* Constitution. . . ." This is, of course, an elaboration of the title of the study which implies that somehow Ireland has shaped the growth of British democracy.

Despite the author's disclaimer, the main part of the book is devoted to Irish grievances. Oft told tales are rehashed, and Ireland's ills are attributed to the English conquest, to colonialism, and to absentee landlordism. Oddly enough, England is blamed for "the destruction of mining" in Ireland (p. 76). On this point one might think that the lack of minerals ought to be worthy of consideration. Equally loose is the author's line of argument when he tries to explain (p. 205) why Ireland failed to compete successfully with Denmark in the English butter market.

The Irish home rule question hastened the departure of the Whig element from the Liberal party and brought about the passage of the Parliament Act of 1911. Both events promoted the growth of political democracy in Britain. But the author is not convincing when he tries to establish causal connections between Ireland and the three British parliamentary bills of the nineteenth century. Moreover, the acts which democratized the government of urban and rural areas are ignored.

A reader's confidence in Mr. Strauss's objectivity will be severely shaken when the following sentence is examined critically: "Gladstone began by advising Parnell's temporary retirement [from politics after the O'Shea divorce scandal] as a means of placating English opinion and ended by employing his formidable powers of pressure and persuasion to crush his ally of yesterday out of existence" (p. 208). By failing to state that Parnell's refusal to heed Gladstone's advice imperiled the cause of Irish home rule and made drastic action necessary, Mr. Strauss has put Gladstone's conduct in a false light.

Nor is Gladstone the only one whom this author treats somewhat arrogantly. O'Connell is accused of insincerity (p. 94) and Parnell of "strategic blindness" (p. 190), and Cardinal Manning is severely censured (p. 208).

Students familiar with the life of Friedrich Engels will be surprised to learn that he was an "unbiased observer of the English industrial scene" (p. 123). That the Irish problems had far-reaching effects on British politics after the union of 1801 is common knowledge, but that Ireland determined British progress toward political democracy is a thesis which needs stronger proofs than those which Mr. Strauss has been able to present.

PAUL KNAPLUND
University of Wisconsin

SANDERSON, GORHAM D. *India and British Imperialism*. Pp. 383. New York: Bookman Associates, 1951. $4.50.

It is difficult fully to fathom the author's underlying purpose in writing this strange book. There being no preface or foreword, the reader is not provided with the usual means for orientation. A clue can be found, perhaps, in the fairly extensive bibliography appended. This is remarkable on two counts: it does not contain the titles of several of the more authoritative works particularly pertinent to this subject, while it does embrace a list of "Selected Works Relating to Irish History." In view of frequent efforts throughout the book to correlate the misdeeds of the British in India with their misrule in Ireland, one can only surmise that the book may have been written more for subjective than for objective reasons.

The book describes an India of which the reviewer has had no previous knowledge. "In the halcyon days before British imperialism drained from India a large portion of her wealth," he writes, "the Indian people were a proud, courageous, clean, physically strong and noble nation. . . . The people of India, living their contented and productive lives for many centuries in thousands of small republics, owed much of their happiness and prosperity in Pre-British India to the enlightened, just and wise revenue laws and practices which the free Indian Government permitted them to enjoy" (pp. 31, 32).

A few other excerpts from typical passages will serve to illustrate the general tenor of the book. "The die of fate was already cast for the populous and prosperous free empire of India. . . . The long, bright day of independence, contentment and culture inevitably moves onward into the dark, long night of conquest, exploitation, destitution and death . . ." (p. 53). "The province of Bengal, until the advent of the British, was undoubtedly the richest land in the world. . . . British imperialism needed only thirteen years to bring destruction, destitution, death and imperial famine to the province . . ." (p. 102). "British imperialism was not a civilized institution. It was a heartless, inhuman, money-mad tyranny" (p. 104). "The inhuman mercenary exactions of the East India Company created a new type of rule for the governing of mankind. . . . Almost beyond the grasp of human imagination were the results in death, disease, human misery and mass torture which this policy brought upon the manifold millions of human beings in India . . ." (p. 131).

The author concludes with the observation that "within the elastic limits of British law and order there was always in England an environment of freedom and justice" (p. 345), but he believes that "the British Empire exists today half free and half enslaved" (p. 346). It is hardly nec-

essary to add that the book will be of much interest only to those afflicted with Anglophobia.

HALFORD L. HOSKINS
Library of Congress

SHUKLA, CHANDRASHANKER (Ed.). *Reminiscences of Gandhiji by Fortyeight Contributors.* Pp. 220. Bombay: Vora & Co., 1951. $2.00.

This is a fascinating little book about Gandhi from the pens of 48 contributors from both East and West "who," as Rajkumari Amrit Kaur states in the foreword, "would not write anything but what was strictly correct." There is a short paragraph biography of each author which helps the reader to estimate for himself the value of each contribution. From this joint effort emerges a well-rounded picture including quite a few little-known anecdotes concerning his personal life.

The title of "Mahatma," meaning Great Soul, first given him by the poet Rabindranath Tagore, distressed him, yet all who came into his presence, including this reviewer, instinctively realized his saintliness, his humility, and his utter lack of pretension and pose, "the pure spirit burning as a clear flame upon an altar to shed light in the darkness," "the overwhelming power of the streaming torrent of a morally disciplined man." As Lord Halifax testifies: "The man himself was larger than any of the attempts made to paint his portrait. He was concerned with the human problem of how the Indian poor lived. He was the natural knight-errant, fighting always the battle of the weak against suffering and what he judged injustice."

We also get glimpses of his worldly characteristics. We see him as a young man in England, upon being advised by his physician to drink beef-tea (forbidden to Orthodox Hindus) or die, replying: "If it were God's will that I should die, I must die but it could not be God's will that I should break the oath I made at my mother's knee before I left India." Upon his return to that country in 1931 for the Round Table Conferences, on one of the rawest days he wore only a loin cloth, a cotton shawl on his shoulders, and leather sandals on his bare feet. He often worked twenty hours a day for periods of months, but he could relax and go to sleep the moment after he expressed a desire to do so. Once, because he had no other free time, he paid a visit to a friend at five o'clock in the morning. He was completely approachable, and in the words of Countess Mountbatten, "he seemed to have time for everybody and everything," and the range of subjects on which he was consulted was infinite. We see Bapuji (little father) advising a typhoid sufferer to ease his pain by repeating the holy name Rāmnām, and himself successfully healing the sick with his nature cure method of "earth treatments." He disapproved of the modern type of education, and of his four sons, three were never sent to any regular "school" but were taught at home. The fourth had to run away, leaving a farewell letter, before he was permitted to prosecute his studies in an Ahmadabad school. He never liked having his grandson studying in college, considering that sort of education showy and unrelated to practical life.

While he admired some British personally, he was bitterly opposed to their rule, thought they were "clever politicians who would take advantage of the fact that things were left to rec llection" and not reduced to writing, and felt "suspicious of even their best actions."

Ghandi believed in the equality of all religions and that "Truth is God." He could never approve of violence and thought Ahimsa (nonviolence) was the means, and truth the end, but on one occasion he appeared inconsistent, unequivocally stating that the women of Assam could use knives and daggers to save their honor. He clearly stated that nonco-operation was not a weapon for those who found shelter in a negative attitude of life but a most positive action leading straight to success if principles were not compromised on the way. In spite of India's political independence, he felt Indians would remain slaves unless they overcame the more formidable enemies of greed and attachment. He agonized over the separation of Pakistan from India and the crimes that followed it and felt that political division on the basis of religion was apt to degrade both politics and religion. One of his last desires was to go to Pakistan on a mission of peace. On his final journey "millions prayed, millions sobbed unashamedly, and these millions belonged to all walks of life."

ALBERT E. KANE
Washington, D. C.

PEDLER, F. J. *West Africa.* Pp. viii, 208. New York: Frederick A. Praeger, 1951. $2.25.

Mr. Pedler, who is a specialist on finance and British colonial policy, must have had a lot of fun in writing the first half of this little book on West Africa. He shares that pleasure as he takes the reader with him on an impressionistic airplane trip over the vast territory from the Gambia to the Cameroons. One sees with him, as on a Cook's conducted tour, the forests, mountains, streams, and plains, the interior cities and the coastal ports, the dusky peoples and their ways of life. He listens to their history and traditions told in almost anecdotal form. He feels with the writer their poverty and observes the signs of recent wealth with intrusive hints as to why and how it came to be. He is introduced to native trade and foreign trader as these are intimately, almost chattily, described. He is lulled by the unexploited immensity of this little known region and by the bits of authentic information artfully woven into the narrative. The story appears innocent of purpose or design other than to make the reader see, feel, appreciate, and understand.

This charming backdrop seems to be the colorful stage-setting for a serious 68-page analysis of "the political scene," which is neither guileless nor descriptive but a thinly veiled defense of British colonial policy from Lord Lugard to Lord Hailey. It is obviously addressed to the British public in an attempt to create favorable backing for the reintegration of a crumbling empire, the restoration of British prestige. His favorable comparison of the administration of Colonial Nigeria and the Gold Coast with Free Liberia and Nationalized French Equatorial Africa from the standpoint of peace and progress is a part of this apology. While it may satisfy the wishful thinking of the British imperialist it leaves many unanswered questions with the impartial reader who has followed the long continued acrimonious demand of these very colonists for independence. Pedler's insistence on imperialism seems to center on the value to Britain of the growing West African trade. The fear of the growth of nationalism prompts the suggestion not of encouraging the war-born West African Union but of working out an "Organic Association" of Sierra Leone and Gambia with the United Kingdom.

The author has a facility for slurring over some of the most difficult political relationships in West Africa. For example, he dismisses the Ewe situation which has developed under the split mandate of Togoland with the statement that there will be "administrative dispositions which will mitigate the disadvantages." This at a time when the Ewe delegation was vociferating to the world before the Trusteeship Council of the United Nations about the "French reign of terror" and Britain's "economic exploitation" of the mandate and her "frustration of any effort by Africans to market their products."

If Mr. Pedler's book helps to mobilize British public opinion behind a defensible colonial policy, perhaps the polemic section of the book might be justified. One could wish, however, that he continued from page 126 to describe what he saw and felt and heard. The book is readable, comprehensive in coverage, and thought provoking.

CHARLES W. COULTER
University of New Hampshire

SLAVIC COUNTRIES

MEAD, MARGARET. *Soviet Attitudes Toward Authority: An Interdisciplinary Approach to Problems of Soviet Character.* Pp. 148. New York: McGraw-Hill Book Company, 1951. $4.00.

Miss Margaret Mead wrote this little book on the basis of materials developed by a research team of ten persons headed by herself. One of the main consultants

was Geoffrey Gorer, whose fantastic theory that the fundamental Russian character traits are derived from the swaddling of infants has received the endorsement of Miss Mead. Fortunately, the author does not bring this hypothesis directly into this study, but she has swaddled herself in other theories which appear almost as far-fetched.

In supporting the self-evident thesis that Soviet political pressures and teaching aim to have all citizens subordinate their personal lives to the achievement of socialism and the decisions of the Communist party, Miss Mead brings in much valuable documentary and source material. But her interpretations of this material are truly remarkable for one who purports to be presenting a scientific report. Thus in her treatment she makes the initial—and questionable—assumption that there is a traditional Russian character (shades of that poor, overworked "Russian soul"!), and then ascribes to it distinguishing qualities which seem fairly universal.

For example, to explain the general atmosphere of suspicion prevailing in the Soviet Union, the author puts enormous stress on the Communist idea that each individual possesses capacities for both good *and* bad; and claims that this expresses "in new form the traditional Russian assumption that all individuals are potentially both good and evil." But this is a psychological truism about human nature supported by naturalistic, anti-Communist philosophers like John Dewey; and it is likewise close to the *Christian* concept of the inherent possibilities in every human being for both sin and redemption.

Again, the author emphasizes the present re-establishment of parental authority in the U.S.S.R. as compared with the early years of the Revolution and interprets this development as an introduction into the home of dictatorial attitudes which "bear a closer resemblance to Stalin's relationship to every Soviet citizen." Yet I had thought that "Honor thy father and thy mother" was a precept highly valued throughout the world and not considered altogether outmoded even in democratic America. Miss Mead also suggests that Russians who smoke heavy pipes do so in order to conceal their facial reactions. Here of course is the key to the sinister pipe-smoking of Joseph Stalin.

A final most serious defect in this study is that while it might well be taken as applying to the entire Soviet population, actually it deals only with the Great Russians and does not cover, unless perhaps by indirect implication here and there, the 177 minority groups that make up almost one-half of the Soviet people. All in all, then, this book, though interesting, even stimulating, is unreliable in its basic assumptions, methods, coverage, and conclusions.

CORLISS LAMONT

New York City

MEISSNER, BORIS. *Russland im Umbruch: Der Wandel in der Herrschaftsordnung und sozialen Struktur der Sowjetunion.* Pp. 91. Frankfurt am Main: Verlag für Geschichte und Politik, Wilhelm Cornides, 1951. D.M. 10,50 paper; D.M. 12.— cloth.

Russia has experienced several revolutions since 1917. The profound internal social and political changes in the Soviet Union since the ascendancy of Stalin to power have transformed the October proletarian revolution "from below" into an autocratic revolution "from above."

The author of this informative volume traces with scientific thoroughness and scholarly objectivity the revolutionary transformations in the organizational structure and administrative functions of the Communist party, the secret state police, the Red Army, the Soviets, and various mass organizations under the Stalin regime. The original purposes of these agencies of Soviet power have been so profoundly altered, according to the author, that today they are no longer the bearers and expositors of a proletarian revolution. Instead they have become the ready instruments of a bureaucratic authoritarianism.

Fundamental to the creation of this transformation has been the role played by the new intelligentsia, schooled and indoctrinated under the expanded system of Russian higher education. The Marxian doctrine of the withering away of the state and the emergence of a classless society has yielded to the Stalinist thesis of "stationary dictatorship" and increasing social class stratification. The Communist party, once viewed as the vanguard of the proletariat, has become the foil and mouthpiece of a bureaucratic regime. The Red Army, one time defender of the proletarian revolution, has been transformed into the exponent of the military prowess of autocracy. The erstwhile position of workers and peasants in the supreme Soviets has given way more and more to that of the rising class of young intellectuals.

According to the author, the internal policy of the present day autocratic regime, with its bureaucratic veneer, has two main objectvies, namely to preserve and strengthen the existing authority and to enhance the economic and military power potential of the totalitarian state. Of secondary importance are catering to the needs of the people, assuring adequate living standards, and promoting individual progress and development.

As an outgrowth of the Second World War, the state police, military might, and bureaucratic administration have increased in importance under the Stalin autocracy while the social dependence of the Communist party hierarchy upon the new intellectuals has been strengthened. The broad masses have come into closer contact with a technically and culturally superior bourgeois-capitalistic environment. Fear of the consequences of such contact has allegedly contributed to the deliberate isolationism of the Stalin autocracy, since the policy of "equalling and surpassing" the industrial prowess of the United States has proved to be illusory.

These are typical conclusions reached by the author of this penetrating analysis of the social and political transformations which the Soviet Union has undergone and is continuing to undergo since the rise of Stalin to power. The well-documented interpretation of present-day Soviet political reality is devoid of any semblance of propaganda polemics. It presents a most revealing picture of the Stalinist revolution "from above."

It should be reassuring to those who fear the aggressive intentions of the Stalin dictatorship that, according to the author, so long as a cool realist such as Stalin is at the head of the Soviet state the Soviet Union will not unleash an adventurous global war unless, indeed, it should feel itself economically and militarily strong enough to take the concomitant risks. Since the continued armaments race may lead to national bankruptcy of the Soviet Union, as was intimated by Stalin in February 1951, it would appear that the transition from the cold war to peaceful coexistence is recognized by Soviet rulers as an urgent necessity of Soviet domestic policy.

An exact knowledge of the political and social forces at work in the Soviet Union and of their development is of decisive significance for an unbiased objective evaluation of present-day Russia. Such an evaluation is dispassionately presented in this scholarly volume.

KARL SCHOLZ

University of Pennsylvania

WESTERN CONTINENTAL EUROPE

GEIGER, THEODORE, and H. VAN B. CLEVELAND. *Making Western Europe Defensible.* Pp. viii, 85. Washington: National Planning Association (Planning Pamphlet No. 74), 1951. $1.00.

This slender volume is a cogent analysis of the economic, political, military, and psychological facts of life in western Europe. It is well reasoned and well documented. Its basic thesis rests on the undeclared policy of the United States not to allow the military potential of western Europe to fall into the hands of an unfriendly power.

Both World Wars were, of course, fought pursuant to this policy. Subsequently ECA help and now arms assistance further fortify it. The authors, however, persuasively argue that no amount of economic or military aid will create an effective defense in the absence of economic and political integration of western Europe.

Lack of confidence in government, distrust of currencies, dearth of venture capital, and numerous barriers to trade

have made the nations of western Europe weak both economically and politically.

Strong democratic governments with both the will and the means to resist Communism can come only with strong economies. And a strong economy in western Europe can only be built by knocking down the barriers which prevent the free flow of raw materials and finished products to the potential market of 160 million western Europeans.

While not denying the obstacles to unification in the old rivalries and jealousies of nationalism, the authors point out that Europe nonetheless has a common heritage of religious and political institutions, laws, and customs. And, in truth, much has already been accomplished in the direction of unification.

The European Payments Union and the European Consultative Assembly and Council of Ministers are already functioning. The Pleven plan for a European army controlled by a supranational authority would result in military integragation of Europe. The foreign ministers of France, Western Germany, Belgium, Holland, Luxembourg, and Italy recently approved such a step, as did the consultative assembly.

Similarly, the Schuman plan to pool European steel and coal production would be an enormous step toward the economic integration of western Europe. The French national assembly has already voted approval of that proposal.

Political leaders like Pleven and Schuman of France, Paul-Henri Spaak of Belgium, and Alcide de Gasperi of Italy are presently showing their acute awareness of the nature and importance of the problem. They are also showing the highest statesmanship in their efforts to bring about effective union.

It will come as a surprise to most Americans that the Congress wrote into ECA legislation a declaration committing the United States to promoting unification of western Europe. Individual congressmen have emphasized the urgency. England—playing an ancient game—has cast a cold and fishy eye on the whole business. Our own Department of State apparently has done nothing to support, implement, or execute the declared policy of Congress.

This book persuasively presents a sound doctrine. Every citizen will profit by its reading. It should be required reading for every candidate for President of the United States.

WALTER J. KOHLER
Governor, State of Wisconsin
Madison, Wisconsin

COLTON, JOEL. *Compulsory Labor Arbitration in France, 1936–1939.* Pp. xvi, 220. New York: King's Crown Press, 1951. $3.25.

Dr. Colton's able monograph presents a history of the French experiment in industrial arbitration from its origins in the sitdown strikes of June, 1936, until its wartime suspension. The first part describes the circumstances under which the labor-sponsored Popular Front government introduced compulsory arbitration despite French labor's traditional hostility to the very idea of arbitration. The study then proceeds to examine the nature of the system that was adopted and to explore the problems that arose out of its operation. Considerable attention is paid to such aspects as the adjustment of wages to rising prices through arbitration, the effect of compulsory arbitration on "the right to strike" as well as on the strike record, the enforcement of arbitration awards, and the working of the system in assisting in the conclusion of bargaining contracts. A final chapter analyzes the significance of the general strike of November 1938, which can be regarded as the dramatic conclusion of the Popular Front period. An examination of the role which arbitration played in the aftermath of the strike gives the author an opportunity to describe the general outlook of labor and management on industrial relations during the immediate prewar months.

The book presents a fine example of an essay in social history. Dr. Colton writes with skill and uses the available sources—government, union, and management documents, as well as earlier literature on the subject—with discerning judiciousness. Much of the material has never been made available before, at least not in English. Over the numerous French monographs which have analyzed the arbitration system at the period of its inception, the author has the advantage of writing with the perspective provided by distance both in space and time.

Although the study does not attempt to give a comparative analysis of social legislation, occasionally enlightening parallels are drawn between essential features of collective bargaining in the United States and in France. By comparing truly comparable over-all situations rather than special institutions or statutes, and by taking fully into account psychological intangibles coloring domestic and foreign experiences, the author avoids almost completely the pitfalls characteristic of all too many comparative essays.

The book states correctly that throughout the years under scrutiny industrial relations in France remained tense. "The arbitration system could do little to blunt the agressiveness and mutual distrust of both sides" (p. 118). Nevertheless the author feels that "there was justification for Léon Blum's assertion that the compulsory arbitration system was one of the most important social reforms introduced under his administration" (p. 155). Dr. Colton bases his conclusion on the belief that the arbitration system helped to diminish the number of disputes that might otherwise have flared into open conflict.

Yet the descriptive parts of the book clearly show how much arbitration in France, at all times only a shifting expedient adopted to meet situations it could not master, has contributed to increase confusion about the mutual objectives of labor and management and the role of government in democratic industrial society. And out of confusion there arose further unrest. How little the present-day French legislators are thinking of the earlier experiment in arbitration is demonstrated by the fact that the collective bargaining law of 1950 contains no provision whatsoever for industrial arbitration. As in many other respects the Fourth Republic manifests here its antagonism against the Third Republic by blunt protest. That this will not solve the problems of industrial relations in France is easily conceded. But the mere fact speaks ill for the historical importance of the institution so admirably analyzed by Dr. Colton.

HENRY W. EHRMANN
University of Colorado

LEWINSOHN, RICHARD. *Trusts et cartels dans l'économie mondiale.* Pp. 386. Paris: Librarie de Médicis, 1950. Pp. 750 fr.

The greater part of this book is of a descriptive character. It gives some useful information on the rise and growth of some of the giant enterprises in American as well as European industry. Producers' cartels of the European type are described in a separate section. There is, moreover, an account of intergovernmental commodity agreements relating to primary products such as wheat, sugar, rubber, and tin.

Thus the field covered by the book is very wide, and it can scarcely be said that any part of it is treated in great depth. Yet the author often manages to present interesting and significant details, for example, about the coffee "valorization" schemes in Brazil, or about the iron and steel industry in prewar Germany. There is a good summary of the formation of the European Steel Cartel, whose political background of Franco-German rapprochement in the years 1925–27 seems curiously reminiscent of the background of the Schuman Plan in the years 1950–52.

Most of the book appears to have been written before World War II: The attempt to bring it up to date has been somewhat perfunctory and certainly uneven. While, for instance, there is a discussion of some draft legislation introduced in France in 1950, there is no mention of Britain's "Monopolies and Restrictive Practices Act" of 1948. In most passages where reference is made to "the war" or to "postwar" developments, the reader will find, though sometimes not without a little trouble, that what is meant is World War I.

No strong views are expressed on the question of public control of monopolistic

organizations, though it is clear that the author is no friend of trusts and cartels. On the whole, his reaction is one of melancholy resignation in the face of a baffling and persisting problem. The forward march of monopoly (private or public) seems to be accepted as more or less inevitable. The author is, of course, well aware of the difference between American and European attitudes toward the control of restrictive business practices. At the same time, he misses no opportunity to point, almost gleefully, to the shortcomings and difficulties in the actual enforcement of antitrust legislation in the United States.

Written mainly for the general reader, this is an instructive and lucid account of the role of trusts and cartels in the world economy and in the leading industrial countries.

RAGNAR NURKSE
Columbia University

RUSSELL, FRANK M. *The Saar, Battleground and Pawn.* Pp. xi, 204. Stanford, Calif.: Stanford University Press, 1951. $5.00.

In this extension and elaboration of a study first published in 1826, Professor Russell critically traces political and economic developments in the Saar from the early beginnings to the present, in the series of "Stanford University books on World Affairs." His account focuses on the post-World War I settlement as a point of departure for a searching review of the development of French attitudes toward the Saar since that time. Russell, in taking issue with French intransigence in the earlier administration of the Saar, lays bare the roots of a later reaction which was due not so much to economic factors as to the violent upsurge of German nationalism in the Saar following the advent of Hitler. He correctly cautions against easy assumptions that the present more enlightened, though hardly less single-minded French approach automatically lessens this danger in the future—an observation which might call for a reference to the threat of the new unholy alliance of German nationalism with a doctrinaire socialism based on largely noneconomic attitudes. In their approach to the Saar question, German Social-Democrats, determined not again to succumb to encirclement by the extremes of the political left and right, now often appear willing to protect their flank by flaunting an aggressiveness designed to neutralize their appeal.

After the extensive wartime destruction of Saar mines and industries and the collapse of the German economy, French efforts toward ultimate integration of the territory fell on fertile grounds, particularly while the erstwhile standard bearers of nationalism were disfranchised. The Monnet Plan (not referred to in the book) brought the Saar the benefits of large investments in the coal and steel industries and the development of gas transmission lines. As a result, Saar coal production now exceeds prewar levels by some 40 per cent and, in fact, surpassed 1951 Organization for European Economic Co-operation objectives—the only member area to do so. However, with the revival of a sovereign Western Germany and particularly with the more effective anti-inflationary measures taken in that country, the relative economic advantages of membership in the franc area may easily diminish. Recognizing this, French administration has put equal stress on cultural and political *rapprochement*. While these trends are ably developed in the discussion, one wonders why the rather brief comments on the Schuman Plan do not more systematically set out the various means by which this plan proposes to neutralize the historic tensions of a political and economic nature which have made the Saar a pawn of power politics in the past. European integration, to be effective, must rest on a stable economic foundation, which neither France nor Germany alone is able to furnish, regardless of political relations. However, in the larger framework of a Western Union oriented toward the primary purpose of maintaining peace through economic strength, the inhabitants of the Saar may yet find an outlet for political aspirations which might else be forced into less desirable channels. It seems to this reviewer that in this respect the Schuman Plan presents a radical departure from earlier approaches to the Saar dilemma which may yet prove to hold the definitive solution.

It seems regrettable that the publishers have found it necessary to restrict circulation of this scholarly study by pricing it at $5.00, even though nearly 70 of its 200 pages consist of documentation.

ADOLPHE J. WARNER
New York City

LUXEMBURG, ROSA. *The Accumulation of Capital.* Translated from the German by Agnes Schwarzschild. In series "Rare Masterpieces of Philosophy and Science." Pp. 475. New Haven: Yale University Press, 1951. **$5.00.**

Rosa Luxemburg is one of the few outstanding personalities among European Marxists who did independent thinking within the Marxist tradition. Where she was orthodox, it was not in virtue of scriptural fetishism but in consequence of a fresh attempt to rethink problems. Sometimes this led her to a belief in the doctrine of the inevitable and automatic breakdown of capitalism and the "spontaneity theory" of working class revolt which was its corollary—notions more mystical than scientific. But she was not always orthodox. This volume is a criticism along Marxist lines of Marx's own attempt to solve the problem of expanded reproduction of total capital, that is, of what keeps capitalism a going concern when production is accompanied by accumulation of capital. Rosa Luxemburg argues that the premises of Marx's discussion and diagram of enlarged reproduction, legitimate enough for purposes of his analysis of the theory of value and individual accumulations of capital, are insufficient to explain the actual historical process of accumulation of aggregate social capital.

For purposes of his analysis Marx had assumed the universal hegemony of capitalism, or what is logically tantamount to the same thing, that it was an isolated, self-sufficient system subject to no external influences, and that capitalists and workers constituted mutually exclusive and exhaustive classes in the process of production. Rosa Luxemburg maintained that these assumptions were too parsimonious, that Marx could not make ends meet with them in explaining the historical facts, and that the problem could only be solved by recognizing that "the accumulation of capital, as a historical process, depends in every respect upon noncapitalist social strata and forms of social organization." Without foreign, external markets capitalism cannot continue to function, and the limits of its expansion are set by the available foreign markets. It is imperialistic by its very nature and the more it succeeds the greater its difficulties, and the sooner it must break down because of its "immanent contradictions."

Dr. Joan Robinson contributes a helpful introduction translating Marxian terms into current economic language. "For all its confusions and exaggerations," she says, "this book shows more prescience than any orthodox contemporary could claim." This prescience which is less than that found in Hobson, however, does not flow from any of the theoretical economic assumptions which she shares with Marx.

As an intellectual figure the stature of Rosa Luxemburg in the free world depends more upon her critical reflections on the Bolshevik Revolution and Lenin's transformation of "Soviet democracy" into a minority party dictatorship than on her economic contributions which are mainly of historical interest.

NORMAN, ALBERT. *Our German Policy: Propaganda and Culture.* Pp. 85. New York: Vantage Press, 1951. $2.50.

This is a very small book (only 70 pages of text) which aims to describe the American policy on the problem of the cultural reorientation of the German people. In an introductory chapter, the author discusses, in very broad terms, the gradual change from the 1945 Morgenthau-Vansittart objective of a pauperized, pastoral nation, reformed through the mailed fist, to the 1946 realization that democracy is only possible on a decent economic foundation. Within the short period of about a year, the premise of mass guilt and the attitude that nothing could be done with Germany until "a new set of German

mothers" appeared was replaced by the knowledge that most Germans did not feel guilty and that Germans were capable of reorienting their country toward democracy in the educational as well as economic, political, and social fields. The five succeeding chapters present a somewhat more detailed picture of this trend in American policy as it attempted to solve the problems of the press, book publishing, radio, motion picture, the theater, and music.

The aim of the book is modest and, hence, it is hardly unfavorable to say that the result certainly goes no further than the aim. Perhaps because Mr. Norman's story is so short, it is also easy to suggest that much has been omitted. And, yet, in a subject such as this, there are certain basic assumptions that need analysis. It is true, as the author states, that "There are those who consider Hitler to be the only true representative of the German people's immutable character," a war-making nation ravaging the world, but the subject needs further exploration. Some analysis of the nature of these Germans, even only one chapter, is a necessary introduction and must have been an essential taking-off point for any American policy on educational reorientation.

Several chapters—for example that on newspaper publishing—although including good descriptions of the regulatory and licensing processes, are written without sufficient reference to the human stories involved. Conversely, the chapter on policy toward the movies is excellent, because the author gives us from his peculiar vantage point his own evaluation of the elements which went into the formation of policy as well as his judgment of the impact on the German people.

RALPH F. BISCHOFF
New York University

RADBRUCH, A. *Langfristige Auslandskredite: Ein Beitrag zur Problematik der internationalen Kapitalbewegungen.* (Beiträge zur Finanzwissenschaft, Neue Folge, Band 4.) Pp. 224. Tübingen: Verlag J.C.B. Mohr (Paul Siebeck), 1949. DM 18.—.

Maintaining that the possibility of a smooth repayment of foreign long term credits (loans) depends on the economic structure of the debtor country, a novel approach to the transfer problem, Dr. A. Radbruch undertakes to investigate (a) the course of foreign credit in debtor countries in different stages of economic development and (b) whether the credit process in these economies makes possible an effective transfer of debt payments abroad.

As the tool for the analysis, the author develops the theory of foreign long term credit in the first of two parts of her work. Stated crudely, the essence of the theory is as follows: a foreign long term credit movement means a transfer of buying power from the creditor to the debtor nation for "productive" purposes. Productive employment—the vital phase of the credit process—means that the foreign loan will be invested in those industries of the debtor's economy that will produce "export capital" (that is, export goods that earn, or goods previously imported that save, foreign exchange), which alone makes possible the effective transfer of debt repayments and assures future equilibrium.

In the second part of the book lies Dr. Radbruch's original contribution to the subject. Here the author uses the concept of export capital to measure the productivity of a foreign credit by analyzing its flow through the individual phases of the credit process—the granting, utilization, and repayment of the loan—in debtor countries of different economic structures. The experience of debtor nations, particularly that of Canada from 1900 to 1913 and that of Germany from 1924 to 1928, provides the factual material. The analysis and empirical verification are carried out with care and in considerable detail.

For the purpose of analysis Dr. Radbruch classifies debtor nations into three categories: new capitalistic, half capitalistic, and capitalistic "overconsumption" countries—the concept "capitalistic" denoting the density of population and the degree of intensity of capital equipment of the specific economic area. Her analysis shows that prospects of debt repayment are most favorable in new capitalistic, or underdeveloped, countries with relatively rich, unexploited resources of raw materials demanded by industrial nations, and in half capitalistic countries in the process of industrialization. In these two categories of countries an inflow of foreign credit leads directly to formation of export capital.

In the capitalistic "overconsumption" countries, on the other hand, foreign credit does not contribute to formation of export capital; hence they face a transfer problem. England, France and Germany, and some other European countries comprise this category. These nations have lost their former economic leadership and creditor position. Since the war they have been forced to borrow abroad for reconstruction and other purposes. But their high wage levels have increased production costs to such an extent that they cannot compete in the world market. While production can be expanded through foreign credits and rising costs, the increased output is offset by the generally high propensity to consume. This helps to obtain a higher internal living standard, but does not provide for repayment of debt (that is, it does not form export capital). Since under such conditions a steady flow of credit into those countries cannot be expected, Dr. Radbruch believes that their borrowing abroad requires planned utilization of foreign credit and of internal distribution of income in order to assure the formation of export capital. Moreover, she favors foreign loan agreements which provide for repayment of debt by specific commodities.

Only a few brief comments can be made here. The author's conclusions regarding foreign borrowing by "overconsumption" countries probably were influenced by the immediate postwar experience. Further, the type of debtor-creditor relation which she favors in the case of these countries is restrictive in character not only as regards the immediate contracting parties, but also —and primarily—as regards the future of international investment. It may be noted that more appropriate solutions to the problem of foreign investment in the industrial countries in present circumstances were suggested, for example, by the Organization for European Economic Cooperation in two recent studies, *Report on International Investment* (1950) and *Intra-European Investments* (1951). Significantly, these documents stress the important part that private investment might play in the economic and financial recovery, as well as expansion, of those countries.

Regarding the new and half capitalistic countries, to draw conclusions from earlier experiences for the present situation appears scarcely justifiable. Conditions now are less favorable to foreign investment than before 1914, or even prior to World War II. The author seems to underestimate the risks to foreign capital in these areas. Also, there does not appear to exist a direct relation between foreign loans and formation of export capital, as may have been true in the earlier period. The aforementioned OEEC *Report on International Investment* indicates that precisely these countries cannot now be developed by private investment. Public investment will have to do the job because the future of the economies of the underdeveloped countries depends largely on nonrevenue-earning basic development.

Despite the foregoing observations, Dr. Radbruch's work—as an analysis of a particular episode in the history of foreign investment—is an important contribution to the literature on international capital movements.

ARTHUR LEON HORNIKER
Washington, D. C.

MAY, ARTHUR J. *The Hapsburg Monarchy, 1867–1914.* Pp. x, 532. Cambridge, Mass.: Harvard University Press, 1951. $6.00.

Among the numerous books which are now being published about the Hapsburg Monarchy, Professor May's comprehensive study of the period from "the great renunciation" after Sadowa and Sedan to the outbreak of World War I is certainly one of the best. Thanks to its high literary qualities that big volume is eminently readable.

The author's painstaking research is evidenced by his quotations from unpublished documents in the British Record Office and in the United States National Archives, which he uses not only in the discussion of political affairs but also in the survey of social, economic, and cultural developments to which he devotes much attention. Chapters and sections on the latter aspects "have been woven into the narrative." These brilliant essays necessarily interrupt the chronological account of political events, but they are highly welcome. Professor May has interpreted with admirable insight the involved conditions and ways of life in each half of the Dual Monarchy and in each of its various nationalities. He seems to be less well informed regarding some provinces, especially Galicia, than some others, such as Bohemia; but in every case he makes an earnest effort to maintain an objectivity almost impossible in dealing with the controversies and rivalries under consideration.

In his epilogue Professor May discusses the "schemes for reformation," but, of course, in less detail than appears in R. A. Kann's two-volume study on *The Multinational Empire* (Columbia University Press, 1950). And stressing here the "sources of strength" of the Monarchy, the author has apparently left for his next volume, which will cover the years 1914–19, his intrepretation of the deeper causes of the final catastrophe. However, the present work gives ample evidence that the fateful German alliance was indeed—much more than the introduction of universal suffrage—"a leap in the dark." It also shows clearly that, on the other hand, Foreign Secretary Baron A. Aehrenthal, "the most respected and most feared Austrian foreign secretary since Andrassy," assumed a very heavy responsibility when he abandoned as "too timid" the international policy of "his easygoing predecessor" Goluchowski, who, in agreement with Casimir Badeni (quoted in the conclusions), realized that "a State of nationalities can make no war without danger to itself."

O. HALECKI
Fordham University

LOCKHART, R. H. BRUCE. *Jan Masaryk, A Personal Memoir.* Pp. 80. New York: Philosophical Library, 1951. $5.75.

It is a part of human nature that people like to claim a friendship, and even an intimate friendship, with contemporaries of fame. There are many such persons all over the globe who assert that they have been close friends of Jan Masaryk. Actually, the number of people whom Masaryk himself would have called his friends probably could be counted on the fingers of one hand, and this reviewer certainly would not dare to claim this privilege. He thinks, however, that Sir Robert H. Bruce Lockhart takes a place among "the big five."

"Remember, if in difficulty or in need of frank counsel, we can always ask Bruce Lockhart for help. He understands us better than anybody else, even should he say *no* to our wish," Masaryk told me, sometime in 1940 when I served him as his private secretary. Lockhart's tender volume of personal memoirs proves that he understood well not only Czechoslovakia, but her son, Jan Masaryk, also.

To casual acquaintances made at diplomatic parties, official negotiations, international gatherings, Masaryk appeared as something of a playboy and joker. In fact, he was a man of lonely heart and mental isolation. His life was one of improvisation, his mind one of artistic genius, his heart one of humaneness concealed by roughness. None of these virtues would ordinarily make a good diplomat, and there were officials with striped pants sitting in various chancelleries whose stiff attitude and memorized knowledge did not allow them to understand Masaryk's unconventional approach to what they considered matters of a high-brow diplomacy. Yet it was his intuitive sense of seeing international affairs as basically human relations in which the lot of human beings is ultimately at stake which brought him and his country victory in some political battles, but which, if the struggle was lost, gravely depressed him.

Lockhart knew Masaryk for over thirty years and saw him in times of both success and defeat, of both joy and distress. He laughed at his jokes and shared his sorrows. In his book he presented his friend as he was—a bundle of nerves, sentiments, complexes, and complexities—in a carefully balanced picture which will answer many questions asked by Americans whenever Masaryk's name is mentioned.

The Czechoslovak people are suffering again under foreign domination—this time Soviet-Communist. During the war they turned their radio dials to the British Broadcasting Corporation to listen to Jan Masaryk who would never miss a broadcast and a chance to give them encouragement and hope. His voice was silenced by the Communist rulers. But they find some consolation and inspiration in hearing regularly from London the voice of his and their friend, Sir Robert Bruce Lockhart.

JOSEF KORBEL
University of Denver

OTHERS

BORTON, HUGH (Ed.). *Japan.* Pp. viii, 320. Ithaca: Cornell University Press, 1951. $4.00.

The mills of studying, writing, and deliberating about almost any topic of human inquiry grind only if there is a mass of ready reference data for them to turn upon. The difficulty is that the printed collections of such data can be, on the one hand, so massive that they are bothersome to handle and, on the other, so slim that they are useless to consult for any but the most elementary facts, names, and dates. The value of the new ready reference book, *Japan,* is that it succeeds in being both comprehensive and manageable, and that it points to a new way of being encyclopedic without being annoying—annoying in the manner of the typical multi-course collation of wisdom, which makes it impossible to bite at a fact without eating one's way through a vast series of meals. *Japan* avoids this annoyance by the simple trick of collecting twenty-three particular articles of the 1951 edition of the *Encyclopedia Americana* and printing them within the covers of one book. The book probably contains more facts of more variegated sorts about Japan than have ever before been brought within one-volume compass. Its success is so considerable that it makes this one volume an important aid to research and raises the question whether encyclopedias should not be issued in the form of a series of topical volumes rather than in the form of a series of alphabetical booby-traps, enticing the unwary into picking up oddments of information on topics not under consideration.

The consequence of bringing together many facts is, of course, the exclusion of many theories. For twenty authors to detail the outward facets of twenty-three topics is necessarily to overlook a great many hidden meanings and to pass by quite a number of details of the sort that are important only as they illuminate other events. Discussed at length, the Panay incident of December, 1937, could give light on the operations of the Japanese mind in war, diplomacy, economics, and personal relationship. But in an encyclopedia, the Panay can rate only half a paragraph. Perhaps no topic is more important than the social and cultural consequences of the U. S. occupation of Japan, but an encyclopedia has to cut this topic up among a dozen-odd writers. It has to settle for a discussion of what actually and openly took place, has to shun what may be taking place somewhat less obviously.

Within these limitations, *Japan* offers a number of impressive contributions. George B. Sansom, for instance, presents a remarkable précis of Japanese history; John F. Embree boils down his broad research on the Japanese people into just fifteen pages; Douglas G. Haring covers the Japanese way of life and still penetrates it; Hugh Borton, editor of the book, gives a coherent, knowing narrative of the rise of Japan as a modern state. It is significant that contributions such as these are impressive precisely because they are successfully encyclopedic: they proceed out of a recounting of many facts. The contributions which were least impressive to this reviewer seems to him to share a tendency to channel facts in accord with unstated theories. The book underlines

the new fact that an encyclopedia is the better for having the format of a book; it underlines also the old fact that an encyclopedia is the better for not being a book but a collection of facts.

HERRYMON MAURER
Princeton, New Jersey

SCHWARTZ, BENJAMIN I. *Chinese Communism and the Rise of Mao*. Pp. 258. Cambridge, Mass.: Harvard University Press, 1951. $4.00.

This is a much needed book. Numerous writers have described their personal experiences in Chinese Communist territories, but until recently, few attempts had been made to analyze the basic documentary evidence which Bolshevik leaders—Russian and Chinese—have themselves created. In accomplishing this task for the approximate period 1918–1934, Mr. Schwartz has demonstrated how the painstaking scholar can reconstruct from Communist records an objective history of a Communist movement and its rise to power.

Piecing the story together with exceptional patience, Mr. Schwartz shows how throughout the twenties Stalin and his agents in China failed to promote successful revolution on the basis of working class revolt. During this period, Moscow made Chinese Communist leaders and broke them, dictating nearly every turn and twist of the Chinese Communist policy. More often than not these policies failed, and, when they did, it was usually a Chinese Communist, rather than a Russian, who took responsibility.

Mao Tse-tung saw the peasantry, rather than the urban working class, as the main force of the Chinese revolution. But although the Stalinist hierarchy censured him for his first attempts at organizing peasant Soviets and building a peasant army, Mao remained a Communist, working always within a Marxist-Leninist framework. Mr. Schwartz shows, however, that Mao, like other Communist leaders before him, did not hesitate to improvise within that framework. Mr. Schwartz believes, moreover, that the greatest Maoist improvisation—the use of Chinese peasants as the main force of the revolutionary struggle—is actually a negation of fundamental Marxist-Leninist tenets.

This book should dispel any lingering illusions that the Chinese Communists are simply agrarian reformers or "a new kind of Communist." Mr. Schwartz also presents ample evidence to indicate that the Chinese Communist movement is considerably more than simply a Soviet Russian plot. For Mao Tse-tung and his followers, while remaining within the framework of Bolshevik ideology and Bolshevik discipline, have been peculiarly successful in adapting to Chinese conditions and in contributing to Bolshevik theory and practice.

There are minor points over which one might take issue with Mr. Schwartz. There is considerable evidence to suggest, for example, that Mao did not win control of the Chinese Communist apparatus in 1932 or 1933, as the author states, but at the Tsun-yi Conference of January, 1935. But this is an academic point. Mr. Schwartz has written a book which should be read and digested by every American who is interested in the problem of Asian Communism.

HUNTER, EDWARD. *Brain-washing in Red China: The Calculated Destruction of Men's Minds*. Pp. 311. New York: The Vanguard Press, 1951. $3.50.

Mr. Hunter has made an impressive contribution to our knowledge and understanding of the working methods of the Chinese Communists in the general field of education, propaganda, indoctrination, and thought-control. His study is based principally on interviews conducted in Hong Kong with refugees from Red China; and the first half of the volume records, in first-person, autobiographical style, the experiences of his anonymous informants. This source of information is supplemented by Mr. Hunter's own observations and by his analysis of the current literary output of the Chinese Communists. Despite its journalistic form and style, which make it lively reading, the book rings true and, in the opinion of this reviewer, it faithfully reflects and interprets the situation in Red China.

No feature of Communist totalitarianism is more horrifying than its unceasing and relentless struggle to capture and destroy the human mind. By what terrifying process can men be taught *not* to think for themselves? How can they be hypnotized to believe that black is white, war is peace, hate is love? How can they be led to doubt the integrity of their own minds and to accept the capacity of others to pass judgment on themselves and their friends and neighbors? The very fact that such questions can be asked is alarming evidence of the danger to which the whole tradition of liberalism, humanism, and democracy now stands exposed. Yet, while it can hardly be said that the Chinese Communists have fully succeeded in attaining the results they desire, Mr. Hunter leaves no doubt of the vigor and intelligence with which they have embarked on the task of remolding the educational and cultural tradition of the Chinese people.

The story of how the Chinese Communists proceed with the "calculated destruction of men's minds" is necessarily a complex one. The mere force of the police state is not sufficient, of itself, to paralyze the brain of man. "Brain-washing"—the process by which men's thoughts are changed and brought under control—could hardly be carried out except in the circumstances of a police state; force must stand in the background, and terror and intimidation must contribute to the pattern of mental exploitation. But the principal devices are the schools—public and party—the press, drama and literature, and the total cultural activity of the regime. Education, propaganda, indoctrination, and thought control become totally synonymous. "Brain-washing" makes enthusiastic converts out of doubters and is designed to obliterate the will to resist on the part of covert opponents. Much remains for the Chinese Communists to do before they can claim complete success, but meanwhile their program and activity raise formidable obstacles to the effort of foreign "voices" to reach through them to the people of China.

H. ARTHUR STEINER
University of California at Los Angeles

YOUNG, T. CUYLER (Ed.). *Near Eastern Culture and Society: A Symposium on the Meeting of East and West*. Vol. 15, "Princeton Oriental Studies." Pp. x, 250. Princeton: Princeton University Press, 1951. $4.00.

This charming and informative little volume deserves wider circulation than it is likely to receive. As a symposium on the meeting of the East and West by men of widely differing interests and competencies, this collection of essays, garnered from a conference on Near Eastern culture and society held at Princeton University in 1947 in connection with the celebration of its bicentennial, is of significant importance to all those interested in Near Eastern and Islamic culture.

In his introduction, "Near East Perspective: The Past and the Present," the editor, T. Cuyler Young, gives a definite and adequate preview of the various contributions and a thumb nail sketch of the contributors.

The volume is divided into two parts which differ greatly with respect to content and treatment. In both parts there is considerable variation in both quality and approach to the problems dealt with. In Part I Richard Ettinghausen's essay on "Islam Art and Archeology" contains twenty-five delightful illustrations, most of them showing the influence of Moslem art on that of Europe. The text is primarily for scholars, to whom it should be most useful. George Saxton's treatment of Islamic Science in chapter five is immensely stimulating and contains some very practical advice to research scholars. The essays on Islamic literature—Arabic, by Evon Grunebaum, and Persian, by Arthur J. Arberry—are written for scholars, not for the layman, and deal principally with the history of the evolution of western studies of these two great bodies of literature.

Part II deals in six essays with recent and contemporary times. T. Cuyler Young contributes two of these, both on Iran, one dealing historically with the "Interaction of Islamic and Western Thought in Iran" and the other on internal and international affairs of that troubled nation. Both essays are excellent. Abdulhak Adnan-Adivar's essay, chapter seven, on "Interaction of Islamic and Western Thought in Turkey" is rather superficial and not overly satisfying. Habib Amin Kurani has a far more satisfactory chapter (nine) on the same subject with respect to the Arab World. Mr. Kurani raises some interesting questions with respect to present trends of education in the Arab countries, dealing with the conflict between secular and religious education and the lack of educational training for skilled artisans. Chapter ten by Lewis V. Thomas, although its title "The National and International Relations of Turkey" is misleading, is first rate. It presents clearly some of the problems which confront the westernized Turkish leaders in their attempts to modernize and unify the Turkish people. Constantine K. Zurayk in chapter twelve gives a brief résumé of the Arab nationalist movement and the discontent of the Arabs following the peace settlements of 1919. He also briefly discusses the Arab reaction to Zionism and the movement towards Arab unity in relationship to the Arab League and the United Nations.

The conclusion consists of an essay by H. A. R. Gibb, "Near East Perspective: the Present and the Future." This is a timely and thought-provoking summary in which the author points out that "the utter failure to achieve a truly mutual relationship on the political front is due primarily to cultural rather than political antagonism."

WILLIAM YALE

University of New Hampshire

BISBEE, ELEANOR. *The New Turks: Pioneers of the Republic, 1920–1950.* Pp. xiv, 298. Philadelphia: University of Pennsylvania Press, 1951. $5.00.

From a redwood cottage in California Eleanor Bisbee has written the best analysis of the everyday Turk that has yet appeared in English. She spent some six years ending in 1942 in Turkey as a professor at the two American colleges in Istanbul. She returned home with a love of the Turkish people but without her notes about them—the notes were lost at sea. This volume largely depends, therefore, on her memories and on the help that Miss Bisbee has obtained from Turkish friends. Such collaboration has doubtless served to paint a more detailed and colorful picture; the perspective has likewise become rather more Turkish.

Contrary to foreign misconceptions, the Turks are a sensitive people, often quite introspective. They do not accept criticism readily. They like to believe their achievement to be as far advanced as their ideal. Their ideal is a progressive Western civilization. They have made vast strides in this direction—in political organization, in economic orientation, in industrial development. And they are remaking their social services, their hospitals, and their schools. But these are mechanical and material achievemnts. In outlook and in mode of life the progress is slower; the results are less tangible.

Miss Bisbee does a realistic job in showing the confusion in this transitional period of the past quarter century, the era of the New Turkey. Social habits are not remade by decree. Life in the home and on the farm, attitudes toward marriage and work and religion are slow to change. The government can proscribe Arabic script in public display. But it cannot excise a tradition based on Arabic literature; it cannot create a new literature overnight. The Turk may go through the civil marriage ceremony as required by law; he may write in a new and somewhat synthetic Turkish tongue; he may even work in a ministry of health and welfare or a social insurance agency. But this present generation, having abandoned the old, has yet to understand the new; it is confused. The leaves have grown faster than the roots. Sometimes Miss Bisbee makes this clear; sometimes she is too kind and generous to do so.

The book is not perfectly organized or perfectly documented: after all, it is largely the experience of one person; and it attempts too much in too short a space. But it says a great deal, and says it honestly. It makes you like the Turks, and they deserve to be liked. It gives you an understanding too, or at least the basis for a deeper and more personal understanding. For the casual traveler, actual or armchair, it is an interesting commentary. For the person who will live or work with Turks, it is required reading.

GEOFFREY MAY

Norton, Massachusetts

POOLE, BERNARD L. *The Caribbean Commission: Background of Cooperation in the West Indies.* Pp. xix, 303. Columbia: University of South Carolina Press, 1951. $5.50.

The title of this volume is so worded that it could be construed to fit a number of approaches to an interesting subject. What the author does is to set the background for the inauguration in 1946 of the four-power Caribbean Commission by tracing the long and complex development of the Caribbean possessions of Great Britain, France, The Netherlands, and the United States. The nearer Professor Poole advances to the creation of the Commission the more satisfactorily he accomplishes his task. His chapter dealing with the unilateral action of the home governments in regard to their Caribbean colonies following World War I is valuable. When he deals with Anglo-American co-operation in the area during World War II he is at his best and presents his story in such a way that the creation of the four-power Caribbean Commission in 1946 seemed the only logical step.

A far more qualified approval must be given the first six chapters, which comprise over half of the text and which attempt to treat historically the political, economic, and social problems of the Caribbean colonial area in general and in particular. This is a tremendous undertaking, and the fact that the finished product has any value perhaps reflects more discredit on previous scholarship than credit on the present writer. What Professor Poole has to say—and it is not a lot—about the area prior to the winning of independence by the great bulk of the hemisphere is so superficial and barren of research that it might as well have been omitted. Here as elsewhere in the volume one wonders how much better could have been the study had Professor Poole examined the vast store of literature on the area done in languages other than English.

Professor Poole discusses the economics of the region in a narrow sense of the term—land, crops, imports, exports, and wages. Little or nothing is said of banking, credits, and financing. He does not fix prices in relation to buying power, which is always frustrating. If the reviewer recalls correctly, foreign capital is 100 per cent damned in the best tradition of the 1930's.

Professor Poole, understandably, feels for the underdog—largely the Negro—of the area. In fact his personal feelings may have affected his objectivity on the subject. Very conceivably the race problem in the Caribbean could be even more complex than it is made to appear by Rex Tugwell, Paul Blanshard, or Eric Williams, all of whom are relied upon heavily for points of view as well as facts.

The volume contains only the barest suggestion that the Point Four program and the South Pacific Commission might benefit (as they actually have) from the experiences of the Caribbean Commission.

JOHN J. JOHNSON

Stanford University

WALLICH, HENRY C., and JOHN H. ADLER with the collaboration of E. R. Schlesinger, Florence Nixon, and P. J. W. Glaessner. *Public Finance in a Developing Country: El Salvador—A Case Study.* Pp. xviii, 346. Cambridge, Mass.: Harvard University Press, 1951. $6.00.

This is an intensive study of the public finances of an underdeveloped country subject to the pressures of the increasing emphasis upon social services and economic development. El Salvador has enjoyed fiscal and monetary stability for many years, even though it has had to suffer some of the consequences of the world-wide inflation.

Beside a summary and evaluation, there

are a dozen chapters, eight appendices, and an index. A wealth of statistical data are presented, 92 tables in all.

There follow some excerpts from the volume: "El Salvador is an export economy, with coffee, the chief crop, constituting about 82 per cent of total exports." "Although the production of coffee is the economically and politically dominant activity of the country, it accounts for only about 12 per cent of the total gross national product. . . ." "Large sectors of the population are relatively self-sufficient in most of the basic needs. . . ." "The government [relies] heavily upon taxes on foreign trade and other indirect taxes; income taxes and other direct taxes yield only small amounts." "[The country] has been able to withstand economic fluctuations successfully enough to maintain a balanced budget, a stable exchange rate, and freedom from exchange control for over fourteen years."

H. R. ENSLOW

Binghamton, New York

BLANKSTEN, GEORGE I. *Ecuador: Constitutions and Caudillos.* Pp. xiv, 196. Berkeley: University of California Press, 1951. $3.00 cloth; $2.00 paper.

This is one of the most realistic studies of governmental organization and functioning and political behavior in Latin America that has come to the attention of the reviewer. It should prove interesting and useful not merely to others working in the field of political science, but to geographers, economists, and sociologists as well. Indeed it is to be hoped that the little volume will be read by many of the 5 million college graduates in this country.

The author set for himself a substantial goal, and he executed his plan well. Unlike many works in the field, the book is not merely a painstaking analysis of constitutional provisions, such as some of the irreverent might call a "chewing over of old straws." Nor is it only an attempt to observe, record, and classify empirical facts about the political activities and behavior of the Ecuadorian people. Instead, it is a well-balanced combination of the two. By his penetrating study of the interplay between established constitutions and actual behavior patterns the author has provided a volume that long will be helpful to all those working in the field of Latin American studies.

A glance at the titles of the nine chapters into which the volume is divided gives a fair idea of the scope of the undertaking. The first two of them are introductory, with a general "Survey of the Republic of the Equator" presenting a brief summary of physical and political geography and a thumbnail sketch of the history of the country, and Chapter II, "The Ecuadorian Pattern," giving descriptions of the three principal regions and the Galápagos Islands. Chapter III, "Political Instability in Ecuador," is, in many ways, the most interesting and important chapter in the book. In it the details of the Caudillo system are given, and significant case studies of outstanding chieftains are presented. Chapters IV, V, VI, and VII are devoted to "Parties and National Elections," "The National Administration," "The National Legislature," and "The National Judiciary," respectively. Chapter VIII is given over to "Provincial and Local Government," and the conclusion appears as "The Ecuadorian System: A Recapitulation." It is more than a recapitulation, however, for it contains suggestions as to possible remedies as well as a brief diagnosis of the ills of the country. A ten-page bibliography and a brief index complete the volume.

A few words about the author's methodology and procedures are essential. A specialist in Latin American affairs, Blanksten served for several years in the Office of the Coordinator of Inter-American affairs in Washington. To get many of the materials used in the present study he went to Ecuador where his activities may be described in his own words: "During my six-month stay in Ecuador I visited all three continental regions of the country and lived with the people and their problems. Documentary materials are abundant in the republic, and I used them liberally; but this book is not pieced together from documents. I shared the life of the Sierra Indian in some of his villages; I attended sessions of congress and of a number of the courts; I lived in picturesque and formal Quito and in lazy, easygoing Guayaquil; and I bounced in a jeep through a part of the fabulous Oriente" (p. ix–x).

University of Florida

BUTLAND, GILBERT J. *Chile: An Outline of Its Geography, Economics, and Politics.* Pp. vii, 128. New York: The Royal Institute of International Affairs, 1951. $2.50.

This short volume is the first in a series of factual studies of several Latin American Nations sponsored by the Royal Institute of International Affairs. The textual materials go way beyond what one would expect from the subtitle, "An Outline of Its Geography, Economics, and Politics." Quality of description and analysis makes up for brevity. Throughout one gets the impression that the author is thoroughly familiar with his subject. The book is an up-to-date analysis of the geographical, economic, and political components of the nation.

One may say that the book is primarily a regional survey. In the first chapter the four main regions—the Desert, Mediterranean Chile, Forest Chile, and Atlantic Chile—are analyzed from the point of view of physical conditions. One might disagree with the inclusion of the southern part of Tierra del Fuego in the same region—Forest Chile—with the southern part of the central valley. Although the first chapter is the only one organized strictly on a regional basis, the reader is not left in doubt in the other chapters as to which region of the country the subject matter applies. A special feature of the volume is the regional distribution or location of the various elements treated.

An outline of Chilean history since 1925 illuminates the present political, economic, and social structure of the country. The latest available statistics are used in analyzing agriculture, mining, manufacturing, finance, and trade. In the last thirty years Chile has made significant progress in all these lines, despite the serious problems arising as a result of the world depression in the 1930's, World War II, and the unsettled conditions in the world in postwar years. The progress made to date lays the foundation for much greater progress in the future. The final chapter analyzes briefly, but effectively, Chile's relations with its neighbors, the United States and Europe, and the part Chile has played in the Pan-American System and in the United Nations Organization. Chile has not only strengthened democratic processes in social and political evolution, but it has also played an effective role in international affairs. With all, Chile has gained stature as a Latin-American Nation.

This little volume should appeal to the economist, geographer, political scientist interested in Latin America, and the industrialist interested in the Chilean market. The textual discussion is supplemented by seven simple, clear, effective maps and by many short statistical tables.

CLARENCE F. JONES

Northwestern University

BORAH, WOODROW. *New Spain's Century of Depression.* Pp. vi, 58. Berkeley: University of California Press, 1951. 75 cents.

In this comparatively brief paper the author interprets the movement of Mexican colonial economy in terms of demographic findings, and he shows that from 1576 until well over a century later New Spain had a contracting economy. This long period of depression was a major factor in molding the Mexican land and labor systems which became dominant in the seventeenth century and remained down to the Revolution of 1910. In this period the number of Indians diminished and the number of whites increased. The author points out that the long continued decrease of Mexico's Indians from the Conquest until the beginning of the eighteenth century must be accounted one of the important factors in Mexican history. He writes, "Had the aboriginal populations of Central Mexico borne the impact of conquest with little demographic loss, there would have been scant room for their conquerors except as administrators and receivers of tribute. Mexico today would be an Indian area from which, in the process of achieving independence from Spain, a

white upper stratum holding itself apart, like the British in India, could easily have been expelled."

The author does not claim to have produced a definitive piece of research in Mexican economic and social history. He has, however, developed a hypothesis which he hopes may be investigated further by himself or by other writers. The volume contains numerous charts and nearly twelve pages of notes. The study is published as volume 35 in the "Ibero-Americana Series" of the University of California Press. This is a thoughtful, ground-breaking piece of scholarship which may be continued by persons of like-minded interests.

LEWIS, OSCAR. *Life in a Mexican Village: Tepoztlán Restudied.* Pp. xxvii, 512. Urbana: University of Illinois Press, 1951. $7.50.

This book is of more than usual importance and interest for several reasons. First, it is an excellent example of community study in the modern anthropological manner. Lewis had the services of a crew of investigators, most of them Mexican field workers, and he made good use of his opportunities to produce a well-rounded ethnographic study which also explores the personality and social psychology of the people. Second, it is a restudy of a Mexican rural community made famous at the end of the 1920's by the pioneer investigations of Robert Redfield. Just as crucial experiments in the physical sciences must be constantly repeated and rechecked, so important field studies in cultural anthropology need to be followed up over the course of time and by others than the original worker. Lewis' book is one of the first such "repeat jobs" in cultural anthropology to be published. Dr. Redfield, far from taking a dog-in-the-manger attitude, set a noble example by giving the project his blessing and assistance. The present book is dedicated to him.

The aspect of the work which will attract the greatest attention among social scientists in general is the fact that Lewis' findings directly contradict those of Redfield at several important points and call for a reconsideration of Redfield's theories of "folk culture" and cultural change which have achieved wide acceptance during the past twenty years. Whereas Redfield found Tepoztlán to be homogeneous and peaceful, Lewis discovers class and wealth differences and a surprising amount of interpersonal and intergroup bickering and quarreling. Where Redfield sees culture change to be a fairly regular and orderly movement along an urban-folk continuum in which the folk culture gradually suffers increase in heterogeneity, secularization, and immorality, Lewis finds so many exceptions in the data that he rejects the theory as inadequate, without extensive revision, for interpretative and predictive purposes. Many other points of difference are explicitly discussed throughout the course of the book.

The present reviewer believes that this sort of honest examination of data from different points of view and the level-headed subjection of theory to empirical test is a healthy development and, in fact, the only way in which cultural science can move toward increased precision. It is essential, however, that scientists engaged in the mutual revision of each other's work avoid entangling their own egos with their science. Professors Lewis and Redfield have shown the rest of us how this can be done with mutual good will and with benefit to all.

JOHN GILLIN
University of North Carolina

LETTERS TO THE EDITOR

Dear Sir:

Through a friend I have just received a copy of the critique of my *Hart and the Chinese Customs*, which appeared in the September 1951 issue of THE ANNALS.

May I, first of all, express my gratitude for this sympathetic notice. Appreciation from a well-informed and well-qualified critic is always encouraging, and especially so when the book criticized deals with a subject which is no longer of popular interest.

I would, however, request permission to make a few remarks on points raised in the critique.

The book is admittedly very long, but whether it is unnecessarily so is another matter. Had I been writing solely, or even mainly, for pundits and Sinologues an attempt would have been made to treat the subject with classical economy and conciseness, and perhaps with even fuller documentation, but as the victim kept in view was any average reader who might wish, or be enticed, to read something well authenticated about Hart and his romantic career, it was thought that the diffuseness —made popular by some of our modern novelists—would be more likely to win acceptance. Present indications, however, tend to show that this assumption on the author's part is wide of the mark. Notes, references, and bibliographies are repellent to the average reader, who regards such impedimenta as highbrow. Besides today —at any rate in Great Britain—things Chinese are of little or no popular interest. A century, or even fifty years ago, it was very different.

It is, however, at the close of his article that the critic's bludgeon comes down with resounding force. "Because Dr. Wright scarcely availed himself of Chinese sources, the whole work carries a decidedly occidental, and especially official British slant. Only two collections of Chinese documents are listed in the bibliography, and they were apparently little used." To that accusation I must, with all due deference, take exception.

As a matter of cold fact I did make full use of the two specified Chinese collections of documents cited in the bibliography, though I admit that I did not clutter up the notes with references to them for the simple reason that, as I was not writing with my eye on the Sinologues, such references would not have contributed anything essential to the task I had in hand. The very absence of these references might have suggested to the Sinologue that the book was not meant solely for him.

Furthermore, I made use of important Chinese sources which I refrained from including in the bibliography because they are very difficult—in most cases now impossible—of access. I refer to the published and unpublished historical Annals of those Chinese provinces having old-time customs establishments. Back in 1915 I began to plough through the dusty sahara of the trade, customs, and taxation sections of these Annals; and when in Peking from 1920 to 1929—where I had the free run of whole series of these records—I made for my own use copious notes and translations from them. These manuscript notes fill a large box which I still have in my possession. While in Shanghai in 1918–1919 I was given permission to consult the manuscript of the then unpublished Annals of the Province of Kiangsu. Nowhere in the book have I made mention of these provincial Annals. Had I done so and listed them in detail in the bibliography, their inclusion would have been useless and would only have given the bibliography an even more pedantic appearance than it has.

When dealing with references to Chinese authorities it should not be overlooked that practically every reference denoted "I. G. Circ." is a reference to a primary Chinese source, as Hart's practice was to base his instructions in these circulars on the Chinese text—which he would quote in full—of dispatches or other communications received from his chiefs in the Tsungli Yamen, and later from the Wai-wu Pu and the Shui-wu Ch'u. To be on the safe side perusal of the Chinese text of a circular was a necessity. A glance at the seven volumes of "Documents Illustrative of the Origin, Development and Activities of the Chinese Customs Service" (listed in the bibliography!)—a full set of which was presented to the Columbia University library—would have made this quite clear to the critic. When all is said, the most authoritative documents for the purpose of my book are these circulars and Hart's private, semiofficial, and official correspondence.

Finally, I protest emphatically against the book being stigmatized as bearing an "especially *official* British slant" (Italics mine). Such a statement is obviously a misrepresentation. If the book has any slant or bias, it is pro-Chinese, a fact to which attention is drawn in the preface.

Hart was a severe critic of British policy in China, and this comes out again and again in the book. Witness the quarrel between Hart and Wade, the British minister, in the Taiwan and the Cadiz Hulk cases in Shanghai, against the verdicts of which Hart appealed, successfully, to the Privy Council in London. Witness Hart as an advocate—even in the sixties and seventies of last century, and in the teeth of British official opposition—urging the relinquishment of extraterritoriality. Witness the stand he made against Sir Claude Macdonald, the British minister, when the latter tried to bully the Chinese into accepting his scheme for the opening of the inland waterways of China to foreign penetration. Witness Hart's fight against the pretensions of British officials and merchants in Hong Kong and Kowloon. Witness his persistent struggle against the British government and the government of every country having import trade with China for the placing of China's import duty rates on a gold basis. Witness his defense of China's right during the negotiations for the Peace Protocol of 1901. Witness the publication of his book, *These From the Land of Sinim*, which by its frank and fearless criticism roused the wrath of British officials and merchants alike. Witness his strongly expressed disapproval of Sir Claude Macdonald's interference to have the post of inspector general secured for a British subject. And witness the cold shoulder reception that Hart had from the *official* world in London when he came home on leave in 1908. Where is the "especially official British slant" in all this? It would be more in accordance with fact to describe it as anti-British.

Very sincerely yours,

STANLEY F. WRIGHT

RUSSIA'S SOVIET ECONOMY

By HARRY SCHWARTZ, N. Y. Times Specialist on Soviet Affairs; also at Syracuse University.

- Presents an absolutely objective evaluation of the strength and effectiveness of the Soviet economy—its origins, organization, and operation.
- Surveys Soviet natural resources, Marxist-Leninist-Stalinist ideology, and pre-Soviet Russian economic history.
- Examines in detail the operation and organization of each major area of the Soviet economy: industry, agriculture, transportation, trade, finance, labor, foreign economic relations, etc.
- Profusely illustrated with charts, graphs, maps.

592 pages 6″ x 9″ Published 1950

GOVERNMENT BY THE PEOPLE: The Dynamics of American National Government

By JAMES M. BURNS, Williams College, and JACK W. PELTASON, University of Illinois.

- Here is a text that students will want to read—a study of American government that stresses *people and dynamic processes*, rather than minutiae of laws and institutions.
- Examines the major problems facing the American people today: the use and abuse of Congressional investigations, civil liberties for Communists, non-voting, public opinion polls, the role of TV, spending and taxes, defects of Congress, Presidential power, foreign policy balance between economic and military defense, etc.
- In a lively style, with numerous case studies to dramatize government at work, and a wealth of illustrations, cartoons and charts, the authors make facts meaningful and thought-provoking.

896 pages 6″ x 9″ Published February 1952

Conservation in 1952

By STEPHEN RAUSHENBUSH

CONSERVATION is in danger of becoming a lost cause.

As a cause, rather than a series of techniques, it started with two ideas. The first was the concept of a national patrimony, a God-given heritage and legacy which was to be handled by responsible stewards rather than by prodigal and wastrel sons. The second was that the advantages of our natural resources should be shared by all the citizens of the nation, not used primarily for the benefit of a few.

Today the emotional content of these old ideas survives mainly among the small farmers who love the land which gives them their living. It is their group of soil conservationists that holds that "the right to own carries the duty to conserve." But for most of the rest of the community, the two moving ideas of Theodore Roosevelt, Gifford Pinchot, and the host of great conservationists of the early part of the century seem to have lost attractiveness. The cause that rose from these ideas has been weakened. This is not to say that many things are not still done in the name of conservation. It is not to say that there are few sincere recreationists, or few people worried about the pressure of population on land, or few diligent technicians of soil and forest conservation. They are all present. They are all doing valuable jobs of sorts. They are simply no longer so sure of their community of interest or so confident of the national value of their work as were the old-time leaders.

CONTRARY FORCES

What happened? Some five distinguishable forces and events battered away at the old ideal.

First was the peculiar sequence of war-depression-war-defense that has extended over the past 38 years. The war and defense periods drained our resources at rates that were unthought of in the early conservation days. In those emergencies there was little possibility of considering slower rates of use. The greatest service to future generations seemed clearly to be that of mobilizing all our resources as rapidly as possible. Sandwiched between war emergencies was an agricultural, coal, and lumber depression that began in the middle 1920's. Owners and tenants had to exploit the land, the forests, and the coal in destructive ways to stay alive. They had few funds to maintain the national resource capital. Dust storms then transported topsoil from the Midwest to Washington, and a few starts were made (the Civilian Conservation Corps and the Soil Conservation Service) toward belated conservation; but then war and defense claimed the national surplus. In this whole sequence of war-depression-war-defense it became easier to preach conservation than to achieve it, and easier to ignore it than to preach it.

Second was the demonstration of the ability of our applied scientists to produce substitutes or find alternate sources. When lumber became scarce, light metals and useful clay products were available. When good range for our sheep became scarce, synthetic substitutes for wool appeared. As the soil resources were depleted or eroded, a host of seed, insecticide, and fertilizer improvements produced larger crops on less land. Internal combustion engines made land available that had previously been used for the maintenance of horses

and mules. When the more easily discovered petroleum resources approached exhaustion, new geophysical devices led to the discovery of other supplies. The popular faith now is that science will do everything for us, including the saving of our energy for more important purposes than the conservation of natural resources.

Third was the discovery that our exhaustible resources (conspicuously petroleum and high-grade iron ore) could be supplemented expeditiously and economically from abroad. The Rockefeller Board's report in 1950, *Partners in Progress,* pointed out that our heavy industry was dependent on imports for most of fifteen basic raw materials. It recommended American aid for development of these foreign necessities. We could become another England, importing raw materials, fabricating them, and exporting finished goods.

Not only did other world resources become available to us, while our financial position made it quite possible for us to obtain them on favorable terms, but international trade became more clearly a good and desirable thing. As a minor corollary, conservation of domestic resources in the sense of slower use, or use for higher-value purposes, seemed to become less important for our survival, or even, at the worst, another interference with international trade, world stability, and possibly peace.

Next was the fact that the nation experienced a fairly high standard of living, and during the past ten years an extremely high one, in spite of all the conservation failures and the heavy resource drains for war and defense. Prices of natural resources rose—some of them conspicuously above the general level—but increased incomes absorbed them without very much trouble, and were still high. These higher resource prices did not take us out of world markets for our finished goods. The organization and ownership of some resources became somewhat more concentrated; special tax privileges had to be given in order to induce oil and other mineral discoveries. Still, the benefits of the whole economic arrangement were largely shared—if not directly, then indirectly.

In the face of this situation, attention to the dark warnings of the prophets of shortages of land, oil, coking coal, and metals, of monopoly and of lower living standards, seemed both postponable and shiftable to those obviously benighted areas where population was more clearly pressing on resources.

It was only when the floods came roaring down the Missouri or the Kansas or the Ohio, or when material shortages inflated world prices disastrously, or when the threat of losing Middle Eastern oil resources appeared, that we had cause to remember the black prophecies. And these occasions did not come often. By and large, the people of the nation seem to have done extremely well, in spite of some serious neglects of the future and an accumulation of local ghost towns, eroded areas, and inflationary pressures circling out from raw materials.

Finally, the conservation ideal ran afoul of the fear that it might lead to too much governmental control. Even those who recognized clearly that the interests of time and society were not necessarily identical with the operations of the free market could also see that governmental action was not always a perfect solvent.

QUESTIONS OF FACT

The impact of these five happenings has been heightened by a number of disturbing questions about fact. The estimate of the United States Bureau of Mines that our coal reserves would last for many hundreds of years has been questioned in terms of the high costs of producing most of the reserves. Its figures that gasoline can be produced from coal at a cost of 14 cents a gallon have been challenged by the assertion of various industry groups that it may cost several times that much. The figures of the United States Forest Service indicating that our lumber and pulp supply is already inadequate for our needs and is growing more inadequate have been questioned sharply by the wood industries. The estimate of the Soil Conservation Service that we need to restore or rebuild several hundred million acres of rapidly or slowly eroding land has been doubted by technicians who put their trust in the methods by which production could be increased on the remaining land base. The United States Weather Bureau has expressed public doubts about the value of much of the cloud seeding that is now being undertaken in the arid West.

The confusion has been increased by the absence, from the end of World War I onward, of any common grouping of the various conservation interests. The conservation movement, like so much else in modern society, has been atomized. There are many separate groups, each devoted to some special purpose. But there has not been any inclusive association that attempted to find the similarities of all the resource situations, think out the major problems, and deal with them, or even to keep track of what were facts and what were special pleadings, and inform the public accordingly.

PAST AND PRESENT

To explain why conservation today is not quite so appealing a cause as it was in the first decade of the century is not to question the two ideas of wise use of a national patrimony and wide distribution of the benefits of that use. Those ideas are necessary for a nation that intends to survive and for a society that wishes to become a community. We shall come back to them in due time.

That time may come sooner than we now think. The scars left by the depression of the 1930's are so deep that it is hard for us to comprehend that we not only are out of it, but shall probably not again see anything of its magnitude of severity in our lifetime. Instead, we shall more probably see the growing population, the increasing demand, and the generally rising prices that can call for emergency conservation practices, as well as enable the resource owners to undertake them.

What the nation did for the major resource industries during the depression was conservation only in the life-saving sense, not in the sense of assuring stabilization of the land or forest base, or less wasteful physical recovery of minerals. The petroleum industry was allowed to step a little outside of the free market system by state-approved limitations of production. The agricultural industry moved out of it along the more difficult road of taxpayers' help to take surpluses off the market, the coal industry temporarily by a minimum price arrangement, and the forest industries, briefly under the National Recovery Administration, by price maintenance.

It was recognized at that time that many small farmers, coal mine operators, oil producers, and lumber companies were, in effect, outside of the business system. They could hardly be expected to act with foresight. They were not institutionally equipped to fend for themselves. They did not evaluate their own labor or their family labor at the market rate, nor withhold their products until price justified their efforts. They sought to maximize their incomes by maximizing production, gutted their resources in that endeavor, and were overwhelmed by the consequent glut. They had no credit resources to do otherwise. The social costs of over-

cutting and soil mining were loaded off onto their downstream neighbors, and later onto the general taxpayers.

The national consent that was given for these various breaks with the free market system did, along with other factors, result in higher incomes for resource owners, and these were recognized as a prerequisite for conservation. The gains to society from these actions became clear as the war and postwar demands grew. However, the gains could have been greater if good conservation practices had been a basic rather than a perfunctory part of the process of consent.

Since those days a considerable amount of conservation work has been done. It looks small against the backlog of things undone, but it is promising, in parts. The Southeast, for example, is a much greener and more prosperous-looking place than it was twenty or more years ago when it was still in the cotton rut. A large number of Soil Conservation Districts have been formed, and many of these are getting some work underway. The Bureau of Reclamation is saving a considerable number of older irrigation districts that have overused their water supplies. The United States Forest Service and the Bureau of Land Management have been able to make a small start on reseeding some of the public range. The Soil Conservation Service has at long last been able to undertake work on a dozen smaller watercourses.

All this is a fair start, but when it is put next to figures for private and public investment that may go as high as $25 billion for forest and soil work, $10 billion for reclamation work, and $60 billion for water control work, it looks small and inadequate.

NEEDS, PRICES, EFFICIENCY

Conservationists are bedeviled by three main questions whenever they look at that backlog. The first is, How is the national need to be met at reasonable prices when resource owners (particularly the small ones) refuse or are unable to adopt good conservation practices and the higher immediate costs that attend them? The answer found in the wood industries seems to be that it is not so to be met. The United States Forest Service finds that the cutting practices are still bad on about 60 per cent of the private forest land, and that the supply will be much less than the demand at reasonable prices for many generations to come. In addition, the social costs of clear-cutting, in the form of erosion and downstream flood damages, are still largely paid by others. The United States Forest Service has suggested state control, but if that fails, federal control, of cutting practices and reforestation. The woodworkers and the Congress of Industrial Organizations think federal control of both is necessary. The lumber and pulp industries oppose both suggestions. There has been almost no major public discussion of the matter in Congress for almost a decade.

The second question is, How can the governmental part of the conservation job be done efficiently? It was to this question that the Hoover Commission and the Cooke Commission (Water Resources Policy Commission) largely addressed themselves. The former aimed its heaviest guns at the competition between the Army Engineers and the Bureau of Reclamation in the Missouri Basin. It recommended uniting them into one agency to get rid of a rivalry which was carried on at the expense of the conservation ideas. Hardly was the ink dry on its report before the Department of Agriculture produced a conservation program of its own for the Missouri Basin. Without saying so, that report indicated a belief that hardly any of the basic soil and forest conservation work that was needed would be covered by the other agencies. Another $4 billion of private and public investment was required to meet those needs in addition to the water control projects (which may cost $6 billion) already authorized by Congress.

Considerable emphasis was added to this second question as a result of the Kansas and Osage River floods of 1951. For almost the first time, the people of the region who were interested in upstream conservation protested the emphasis laid on, and the money to be committed to, large flood-protection dams that did little or nothing for the farmers and upstream communities. The connection between forest and soil conservation and downstream water control had rarely been clearer. It was also the burden of the two thousand pages of the Cooke Commission's report: only in unified watershed work was there any efficiency, any maximizing of social benefits.

Another part of the answer may well lie in government aid in establishing credit facilities for small owners, that are tailored to the needs of soil, forest, and water conservation.

FOR WHOSE BENEFIT?

The third question is, For whose benefit should national aid to conservation and development be undertaken? This presents itself for answer in several forms. One of them relates to the big cities that have expanded into the natural flood plains of the rivers. Now they want their buildings in those flood plains protected at national expense. The more they have expanded into them, the more money they need. Every extra group of buildings in the flood plains becomes a justification for extra hundreds of thousands of dollars of flood control works—a fact which explains part of the $60 billion figure for future water control. To some conservationists this seems like putting a reward on carelessness. Should the process be allowed to go on? Should this aid be given free, or should the cities pay part of the costs? The corollary questions are underlined by the probability that Congress will, in our time, never have unlimited funds, and that each protective measure is at the expense of some other one, elsewhere.

The question also frequently takes form around the acreage limitation. In 1902, in the Reclamation Act, Congress apparently intended to declare for a wide sharing of the benefits from the use of national resources in the form of land or funds. It said that irrigation water obtained through the use of these funds should go only to 160 acres within one ownership. The social ideal of the time was the family-owned and family-operated farm, and it seemed that 160 acres of irrigated land, coupled perhaps with some nonirrigated land, was enough for a respectable living in the American way of the time.

Many of the owners of land in old irrigation districts that were developed before or independently of the Reclamation Act have overused their water supply. They now want federal loans and grants (reclamation works) to get more water on their land. Without the extra water, their land will lose great value. But they have established large properties, and they object to selling some of their land to veterans or to other newcomers who want to start in. They ask that the sharing provision be put aside. The more they have overused their water supply and let their properties run down, the more they need government funds and the less they are willing to accept one of the two conservation purposes of those funds. The reward for neglect is to be large.

Before the public are also the Army Engineers and the Bureau of Reclamation. The former, moving upstream

into competition with the Bureau on King's River and elsewhere, are able —because of a legislative lag—to offer the large landowners water without the requirement that the old conservation idea of sharing benefits be observed. In order to stay active in that region the Bureau may yet be forced to rise above principle and find competitive ways of its own to undo the intent and action of Congress as expressed in the Reclamation Act.

This type of erosion of one of the two original conservation purposes of that act seems to be a matter of indifference to the administration and Congress. Yet once the breach in the basic act and purpose is made, at King's River or on the older developments, the whole process of obtaining a social gain from the use of public funds and other resources is soon flooded out. Much of the justification for the use of public resources goes downstream with it. The question is bound to be raised: Why devote public money in ways that will cause the growth of factory farms, as long as there are more socially valuable conservation purposes to be served elsewhere?

"UNFINISHED BUSINESS"

The unfinished conservation jobs pile up in numbers and in size if we are once convinced that growing population and increasing industrialization both at home and abroad and consequently an expanding demand, along with generally higher prices, are our lot for the next quarter- or half-century.

The articles in this issue of THE ANNALS indicate a good number of those jobs. There is a high probability that we shall not be able to escape the stringencies involved and a consequent slowing-down of our rising standard of living without looking a little more closely at the end use of some of our natural resources. Conservation of materials for the essential needs may have to be obtained at the expense of the less essential parts of the economy. This is obviously the least desirable and most difficult way to conserve, but we may have to face up to it.

Minerals

In minerals, for example, practically none of the long-term predictions that take account of foreign supply and demand as well as our own allow us to think of an adequate supply at the relatively low prices to which we were once accustomed. Is it unreasonable to think about channeling available supplies to those places where they will make the greatest contribution to our economic growth? Can the producers of nickel and chrome, for example, find some way of diverting those metals away from luxury display on automobiles to more vital parts of our industrial organization? The conservation gain could be considerable, and perhaps more than could be accomplished through more expensive forms of conservation in primary and secondary recovery.

In addition, is there not some better conservation and supply method than the one which we are applying to marginal mineral operations? Copper is one illustration. In an emergency we pay premium prices for the production of high-cost Michigan copper. Without them it could not be produced. When the apparent emergency is over, the mines are idled and flooded. Large loans plus premium prices plus years of manpower and delay are needed to get them into operation again. Surely this is not the best process that can be devised by the mind of man. With a more or less permanent world copper shortage for the rest of the century, there seems to be some room and place for discussing the possibility of a more continuous multiple-price system.

Since much of our future mineral procurement is going to be in foreign fields, it can pertinently be pointed out that the attempt to obtain scarce minerals by handling marginal producers abroad on the same short-term basis that we have used on the Michigan copper producers is bound to flare back on us. The attempt to squeeze the marginal Bolivian tin producers down to the Malayan cost and price level (although undertaken for the laudable purpose of preventing the Malayan producers from living luxuriously at our expense under a high Bolivian price-umbrella) has probably done a great deal of good to our Argentine rivals in Bolivia, and to no one else. This is on a par with our post-Korean tendency to rush out, wave a check, double prices, and expect new sources of minerals to be opened up the next day. It is also tied up with the interesting but controversial concept that the ultimate function of all the raw materials in the world is that of supporting the high American standard of living.

Petroleum

The need for some serious rethinking of our petroleum conservation is underlined by Mr. George Lamb's estimate in this issue that there will be no petroleum at all available from any source for space heating or steam raising by 1975, and not quite enough to supply the demand for gasoline and motor oils by that time. With all allowance for necessarily wide ranges of error in any such estimate, and for past predictions of shortages that have not developed, this picture by a man who is perhaps the coal industry's leading economist should hardly be ignored. His estimate warrants all the study and revision the fuel industries can give it.

Implicit in his estimate is a changeover that may not only involve an investment within a short twenty-five years of enough resources to double the present coal production. It may affect also the values of all the residences, offices, and factories that would have to convert from oil or gas heat to electric heating. It may involve the values of continuing to equip new buildings and steam plants with oil or gas heat, as well as the value of new and old automobiles. It may finally, after the petroleum production peak has been passed, include one price race between gasoline and motor oil users (who cannot use coal) on the one hand, and the space-heating and steam-raising users (who can) on the other, and another price race between coal and petroleum in which the production costs of coal are not important.

If any such major transition is ahead of us, it seems impossible to escape the need, first, for pressing a series of conservation questions some time before that period begins. Are all the desirable conservation measures in oil production now being undertaken? To what extent do present prices and production quotas allow for really complete exhaustion of the fields without the necessity for closing down and waiting for higher prices before full secondary recovery can take place? What effect, if any, does the present tax privilege of the industry (the depletion allowance) have on conservation in the extraction process?

But here again it seems impossible to avoid the problem of end use. If, at some later time, the market is going to be called upon to create very high prices in order to achieve the objective of driving out most of the users of petroleum for space heating and steam raising, is it possible for the fuel industries to ease any such transition in advance, in ways that may be less costly to all groups of consumers than those involved in the double price race indicated, with all its probable wide repercussions on property

values? And if that is not possible for them to do, how can it be done?

Incidentally, what such a change-over and such a price race in the United States might do to world petroleum prices, and through them to the European economy, is worth a second thought. As little as 40 million tons of coal has stood between western Europe and Communism several times since 1946. Several times Europe has been forced to devote a large share of the American aid to purchasing American coal at high delivered prices. It will probably, by 1975, have to depend for energy largely on Middle Eastern oil. A doubling or tripling of the world fuel price because of marginal American demands might have explosive results.

Lumber and pulp

The probability of increasing shortages and prices in the lumber and pulp industries brings us sharply back to the question of obtaining some real conservation through reforestation, better cutting, and less wasteful use; for the price of end-use conservation is a completely undesirable censorship. We may know and regret that high-priced pulp has had a part in forcing a number of independent newspapers out of business, and that a good many forests are used to produce some hundred million comic books. The permanent national economic gain from that, or even from using a good-sized forest each week to enable all our department stores to say in four pages what they used to say in a half-page, may also be questioned; but there seems to be nothing the nation can afford to do about it. The main task remains in the conservation and replacement of the growing stock, and that seems to be one of the most neglected of all.

LACK OF BASIC FACTS

A series of other questions might be pressed about our soil, range, water, and watershed conservation work, and many of them are suggested by the articles in this issue. What is really astonishing in all this land and water work is that the nation has as yet not established any preference and priority list for its conservation aid. Congress may grant $400 and loan $100 on an acre of reclamation land without ever having before it any comparisons which indicate whether the same or greater crop results or social benefits may not be obtained for much less money on some presently eroded or undrained lands. The cost-benefit ratios of the various conservation and development agencies are not comparable, and often do not give adequate basis for determining the conservation needs, let alone the reasonable contributions which the benefited communities may be expected to make to this work. A by-product of our neglect is that really depressed areas, such as some of those in the Rio Grande Basin, can never get enough help to get off the ground, overcome their conservation failures, and become prosperous and independent.

THE TASK AHEAD

Enough has probably been said here and in the following articles to indicate that the conservation job is far from completed, but that, instead, a series of major problems and tasks stretch out before the people of the nation, and especially before the resource owners and the workers in their industries.

It will be noted that the problems spread across the resources. They also spread across the various specialized fields of study and the disciplines of the colleges and universities. Almost every one of them reaches across the curtains which committees of Congress and departments of the Executive Branch set about themselves, as well as across the borders of the professional societies. This fact may, in this specialized age, have something to do with our failure to grapple with them more thoroughly.

Findings by specialists

Specialists can contribute a great deal. It would seem highly desirable, for example, that the distinguished deans of our colleges of forestry be asked to sit together and sift out the truth and the facts in the controversy about the extent of bad cutting of our forest resources, and in the even more important related controversy about the supply-demand-price situation that we may expect within the next generation or so in forest products. That would be a very considerable national service, and should be undertaken promptly, with resources adequate to cover the field. It is long overdue. The nation certainly has a right to know, beyond what may be the self-interested claims of government officials or of industries, what the situation really is.

But specialists, as they themselves will readily admit, are not enough to provide all the value judgments that the nation needs. The problems are complicated, and in the end the whole society has to decide the purposes for which natural resources are to be used, and the costs which it is willing to pay to achieve these purposes.

Synthesis by learned and professional societies

In the premises, which include the present atomization of the conservation groups, it would be exceedingly helpful if the learned and professional societies were to take on this task. They would, first of all, have to go pragmatically, resource by resource, into the question of whether there is a dichotomy between society and time on the one hand, and the immediate interests of the resource owner on the other. When there is a serious difference, they would have to see what social engineering could be developed to reconcile both private and public interests. For those purposes they would need to group some of their ablest and most disinterested people together for quite a while. They would need to draw heavily on the resource owners and workers for counsel, and on the experts for work. They would need to take into account the international role, whatever it is, that Congress and the administration want the nation to play, and the demands on our resources involved in it. They would have to do some very independent thinking of their own.

Their findings would, I believe, carry far more weight with everybody, from the smallest farmer to the oldest senator, than the studies and thinking of either industry or government bodies; for they would be dependent on, or beholden to, neither. If they did their work well, the economy and the people of the nation would be the great gainers.

When they were through, a somewhat more united and deeply rooted conservation movement might be able to grow up, and that, too, would be helpful to the nation.

Stephen Raushenbush, Washington, D. C., is a consultant to the Public Affairs Institute. He was a member of the Preparatory Committee of the United Nations Scientific Conference on Resource Conservation and Utilization, and delivered the paper on Major Problems of Conservation and Development (1949). He was a senior resource economist in the United States Department of the Interior, 1937–47. He is the author of articles and studies on conservation problems, including Our Conservation Job (1949), The Ruhr (1949), Conserving and Developing Our Natural Resources (1950), and Better Conservation Work (1952). He is also the author of The March of Fascism (1939). He has in preparation a book on world resource patterns.

The Conservation Movement

By Robert O. Beatty

THE word "conservation" has come to signify a concept of human activity with all the characteristics of a true social movement. Like all words which are not self-defining or -delineating, its use has, however, become subject to widely varied interpretation and misuse to suit the needs and desires of assorted groups and individuals.

Even when used in its most common area today—that of husbanding natural resources—the strict dictionary definition is not a true reflection of intent of those groups and individuals which are concerning themselves with conservation, since it connotes a bottling up of resources without use.

Significance of the Term "Conservation"

As commonly applied by professional conservationists and for the purposes of this paper, conservation means development, with wise use or management in the best public interest, of our natural resources of soil, water, vegetation, wildlife, and minerals. It means further the restoration to sustained productivity of worn or damaged resources, where possible, and the management and utilization of renewable resources in such manner as to guard against depletion. Only in a limited field of activity, including the safeguarding of special reservations such as parks or established wilderness areas, does the connotation of preservation apply to an appreciable extent. Otherwise, it might best be summed up as meaning "to use without using up." [1]

We should not, therefore, accept the use of the term "conservation" without inspection of the scope or application intended in writing or speaking the word. For example, there exist many so-called "conservation clubs" whose chief interest is the harvest of fish and game, but whose activities make little, if any, contribution to the conservation of these resources. The bare fact that a man hunts or fishes does not, as the general public is inclined to assume, make him a "conservationist."

The term "conservation pool" is employed by the large dam building agencies of the Federal Government to designate the residue of water left in reservoirs, beyond which they will not be drawn down or depleted. By interpretation, such a pool may be appropriately named. To an observer but casually familiar with the broad aspects of conservation of resources, however, the term "conservation pool" would seem to employ a use and management of land and water definitely in the public interest, whereas quite the reverse may be true if the pool itself has been created at the expense of other public values such as productive agricultural land, fish and wildlife crops, or recreational and scenic resources.

Anyone wishing to familiarize himself with the ideas, ideals, and activities of the conservation movement as I have attempted to define it here should, therefore, be quite circumspect in his acceptance of the term, as well as in his own use of it.

[1] The problem of conserving the nation's mineral resources has received the least attention from the organized conservation groups to date, and then not so much in the interest of the minerals themselves, but more to conserve other resources which outmoded mining laws allow to be exploited. The conservation of mineral resources is tremendously important, of course, but beyond control of the rate of use and manner of taking, little can be done.

Conservation as a "Movement"

Dr. Carl C. Taylor, head of the Division of Farm Population and Rural Welfare, Department of Agriculture, has characterized, quite accurately, I think, resource conservation activities in the United States as a true social "movement" brought about by the need for economic adjustments compatible with the pressures of increasing population on limited resource wealth.[2] He points out that it is only beginning to take the form of a "people's movement," it heretofore having pretty much been propounded and supported by the scientists and technicians. As with all movements, it will not get very far unless it *does* become a full-fledged people's movement. A sizable number of lay organizations, mostly operating without profit and concerned with defending the public's interest in one or another natural resource, are currently in existence. Drawing membership from all walks of life, they are giving continuity, organization, and effectiveness to the task of conservation as a people's movement.

To the majority of the people, including many responsible and astute lay and professional leaders, the fact that conservation has actually achieved "movement" status and is rapidly growing in energy and influence will come as something of a surprise. This is not to their discredit, for it seems a fundamental characteristic of human nature that we concern ourselves only with those matters which affect or contribute directly to our wants, desires, or experiences.

It is difficult, for example, for the furniture dealer to comprehend, except in general terms, that the net figure in his monthly profit column is tied inescapably to a perpetual supply of timber resources of a quantity and quality suitable to maintain his line of chairs and tables. He looks and thinks no further than his supplier, and is seldom conscious of the fact that the method of harvesting a forest a thousand miles from his plant may have an important bearing on whether his company will be solvent ten years from now. In far too many cases he still doesn't care, to be sure, and is contributing little to ensure the perpetuation of the resources from which he draws his living.

Similarly, the average housewife, concerned with the day-to-day tasks of raising a family, going to market, preparing the meals, and many others, is alarmed at the price of hamburger (or steak, as the case may be!). But she is often unconscious of the fact that the way a rancher in Wyoming is utilizing publicly owned grasslands may ultimately have a bearing on her food budget; or, for that matter, that the supply of water coming from her tap is influenced in quantity and quality by how a farmer fifty miles away plows his furrows. A similar analogy can be drawn for almost any endeavor in our society, regardless of the product or service rendered.

I cite these oversimplified examples by way of challenging the student of economics, sociology, and politics to show me a single material item satisfying our physical needs, a single emotional sentiment, a single moral or spiritual thought or idea—in short, a single activity or belief of man in any field which is not directly or indirectly dependent upon or conditioned by the continuing supply, or absence, of a basic physical resource. All of these must stem from the soil, the water, the air, and the sunlight. We can do little about the air and the sunlight; the con-

[2] Carl C. Taylor, "Conservation as a Movement," *Journal of Soil and Water Conservation*, Vol. V, No. 3 (July 1950), pp. 103–5.

servation idea with all it portends is fundamentally concerned with maintaining and continuing a useful supply of soil and water and the resources which flow from them. It is as simple as that.

WHAT MAKES A CONSERVATION CONTROVERSY?

There are many and diverse opinions as to what are the best uses or methods of use of the soil and the water and their products. Therein lie the resource controversies which, in essence, are largely differences of opinion, or differences in interpretation of facts and their application. Both amount to about the same thing, and always bring the same results; that is, battles in which the conflicting views are aired publicly and which are usually resolved in favor of that side which can bring the most political, economic, or social pressure to bear. In many cases (with some notable exceptions) these controversies revolve around who shall have superior rights to natural resources held and administered in the public trust—the general public, or some special interest group or individual pressing for economic advantage. The notable exception is the difference of opinion between informed segments of public and government over the best use and development of our water resources.

This is one of the chief conservation problems, and perhaps the most controversial one, facing the nation today. The soil also is involved because, in management, land and water are virtually inseparable.

THE WATER PROBLEM

On one side are the adherents of federal control of water resources through huge multiple-purpose river basin developments, some on the pattern of the Tennessee Valley Authority, wherein the government decides the highest use of a given natural supply of water (power, irrigation, navigation, domestic supplies, recreation, or a combination thereof), decides how it shall be developed, who will get how much, and at what price. This is sometimes referred to as government "paternalism," and sometimes it is called "socialism." The effect is the same, whatever the term.

The other view, and one most closely approaching that held by the active and most widely recognized conservation groups concerned with the public interest, is pretty well summed up in the general conclusions of a report on the nation's water problems prepared by the Engineers Joint Council, composed of representatives of five of the nation's top engineering bodies. This report states:

> Consideration and control of the waters of the U. S. are in the national interest, but not necessarily a function of the federal government. On the contrary, that which can be done by the individual should be done by him and that which requires collective action should be done at the lowest governmental level practicable. The federal government should engage in the conservation and control of waters only when the collective action of all the people of the nation is necessary for accomplishment of objectives.[3]

In essence, these divergent views place the conservation organizations, most technical engineering talent, and most American business on one side of the fence, and the Army Corps of Engineers, the Bureau of Reclamation, and the other power producing and administrative agencies of the Federal Government, their respective lobbies, and advocates of valley authorities on the other. It is a striking example of how conservation problems delve into and

[3] Engineers Joint Council, *Principles of a Sound National Water Policy* (New York, July 1951), p. 20.

are affected by the political and social affairs of the nation; it is one of the many conservation problems which will only be solved when the people become sufficiently informed and aroused, one way or the other, to assert their collective political and social influence.

There are already built, being built, or authorized by Congress, federal dam building projects to cost more than 50 billion dollars. The Task Force on Natural Resources of the Hoover Commission reported extensively on the waste and duplication going on in the government's water development program, chiefly by the two agencies named above, and all at great cost to the taxpayer. This seems as yet to have had little effect, however. No legislation has been enacted, and little constructive revision of attitude and procedures has taken place designed to correct the objectionable practices pinpointed. Nor has much attention been given, up to now, to another factor that appears to be of growing importance—the annual recurring losses of foods and fibers which can *not* be produced from flooded acres.

One case history will serve to illustrate the point and show reasons for the considerable interest developing over this factor.

Far down the list of projects planned by the Army Corps of Engineers under the Pick-Sloan plan for the Missouri Basin is the Tuttle Creek Dam to be built across the Lower Blue River which flows out of Nebraska and joins the Kansas River at Manhattan. The reservoir would inundate 55,000 acres, and is proposed on the basis of flood control and sewage dilution benefits to Kansas City. At 1949 prices, the construction cost was $68 million.

The Army capitalized on the impetus given flood control activities by the July 1951 floods along the Kansas River, and dusted off the Tuttle Creek plans. Congress was asked for $5 million to start construction. The story of potential losses was then made generally public. It was shown that the Army anticipated $3 million annual benefits downstream, from flood mitigation and sewage flushing. Local residents had canvassed their neighbors in the 55,000 acres and determined from actual sales and appraised values that annual recurring losses in foods and fibers amounted to $6 million—more than twice the benefits claimed.

If the Tuttle Creek reservoir area may be taken as average, and fifty years considered a normal economic life of reservoirs under present eroding and silting conditions, the total national loss in foods and fibers from nonproduction would be in the neighborhood of $250 billions as a result of the construction of the $50 billion of dams and reservoirs authorized or built. Economists and engineers, after exhaustive calculations, might produce a different figure, to be sure. It seems certain, however, that the losses from this cause will be tremendous—this in an era when it is increasingly doubtful whether the foods and fibers can be spared from America's pantries and storehouses.

POLLUTION CONTROL

Another broad area of conservation interest, again having to do with our water resources, is the problem of how to control the assorted wastes of a growing economy which are all too often still deposited in the most convenient watercourse, be it by municipality (sewage) or industry (a wide variety of either toxic or "nuisance" effluents). The problem here is the twofold one encompassing, in broad generalities, public health (sewage wastes) and the recreational and other use benefits of clean waters (sewage and industrial wastes).

Much progress has been made in recent years in this field, with industry

particularly coming to take a more enlightened view of its responsibilities with regard to its use of public water supplies (general speaking, all surface water supplies belong to the public). There are still, to be sure, some 22,000 sources of pollution in the United States, divided nearly equally between 11,800 municipal sewer systems and 10,400 independent factory waste outlets.[4] More than two-thirds of the industries surveyed by the Water Pollution Control Division of the United States Public Health Service have reported that water pollution control conditions are either unimproved or getting worse. The waste from municipal and industrial sources together which is still discharged into our waters equals that from over 150 million people! About $500 million is necessary to do a thorough clean-up job on municipal pollution alone.

Nevertheless, under Public Law 845 (the Taft-Barkley Water Pollution Control Law), passed in 1948, a definite policy has been established by the Congress to deal with pollution matters. This is a necessary development of jurisdiction; for since watercourses do not conform to political boundaries, intervention by the Federal Government is required.

Controversy in this field is now largely restricted to local differences of opinion between the public and the polluter as to how fast a given municipality or industry should get its clean-up job done. In rare cases is it still a question of whether it *can* or should be done.

PUBLIC LANDS

Another broad area of conservation interest involves several natural resources; it concerns the best and wisest management of our vast public estate. The Federal Government owns and administers, ostensibly in the public interest, some 500 million acres of the land and water area of the United States and it territories. This land includes 89 million of the 461 million acres of commercial forest land and contains more than one-third of the nation's supply of standing commercial timber. Another 250 million acres is in range where one-fifth of the cattle and more than half the sheep raised in this country spend a part of their lives.[5] Administering these lands are such agencies as the United States Forest Service (106 million acres), United States Park Service (16 million acres), United States Fish and Wildlife Service (4 million acres), and the Bureau of Land Management (180 million acres).[6]

One controversy which reached heated proportions in 1947, and is by no means a closed issue today, concerns the nearly 180 million acres of public domain in the western states which a small minority of livestock operators have eagerly sought to control for their grazing. Initially, they proposed that the land be sold to them by the government. This proposal was effectively defeated by the conservation groups. Currently they are proposing that the government grant them additional concessions which appear to amount to virtually exclusive authority to graze national forest range lands *without* concurrent responsibility for maintaining the productivity of these lands or safeguarding other uses (including watershed protection, timber, and recreation).

Another conservation problem of some magnitude involving public lands has to do with private ownership within

[4] Public Health Service, *Water Pollution in the United States* (Washington: Government Printing Office), Part 2, p. 15.

[5] "Management of Public Land Resources," *Yale Law Journal*, Vol. 60 (March 1951), p. 455.

[6] *Area, in Acres of Lands in Federal Ownership*, Report No. 3116, 81st Cong., 2d sess., H. R., pp. 7, 8, 10.

our national parks and monuments on which anything from a tavern to a pig ranch can be, and often is, operated. Some 500,000 acres within our national parks are still privately owned, and in many cases these lands are being employed in a manner detrimental to the public values for which the parks were created. The problem of safeguarding for scientific and recreational use the ½ of 1 per cent of our land and water area which can still be classed as wilderness is also concerning conservationists in a great many areas.

Arguments on into the night could be developed around the wisdom of federal administration of such huge chunks of land. The record of development and use of forest and land resources privately held has been such in our short history, however, as to raise serious questions as to the wisdom of unbridled free enterprise in the exploitation of resources in the public domain. It is generally believed by students of conservation that the public interest in these resources must be safeguarded for the long-term good of the nation. To date this has taken the form of administration by federal agencies. This is not ideal, by any means, because of tendencies toward bureaucratic empire building and political "trading" which seem characteristic of the existing system. Nevertheless, the public still has a measure of control through pressures properly applied, and until a better plan comes along, it will have to do.

FOREST CONSERVATION

In forest management there have been significant trends and occurrences in the last three or four years which indicate that we are making progress toward bringing about a better use and management of our timber resources—this in spite of the fact that we are still cutting three saw-timber trees for every two that are growing to replace them in the forests of the nation as a whole. Significant last year was the decision of the United States Supreme Court which ruled against a private timber owner in Washington state who had appealed a law which forced him either to leave seed stock or to plant and reforest the acreage from which he took his lumber —his own land. The Supreme Court ruled in effect that he had a "pact with the unborn"—a responsibility to future generations in the way he used the land which belonged to him.[7]

This is not a squelching of private enterprise, in my opinion. It is merely common sense. It is unfortunate that it has to be done by law, but it indicates a trend in which men are beginning to realize that they have a certain stewardship of the land, a responsibility for it, not only today and in their own lifetime, but to those who come later. Twenty-six states now have some form of forest tax legislation which has partially ameliorated the impact of property taxes on forest lands, regulating cutting practices by private owners in such a way as to help to maintain a sustained yield in timber products. In New Hampshire, which enacted in 1949 a new forestry tax law, provision has been made for a premium, universally applicable, in the form of reduced taxes when cutting has been in accordance with specified forestry practices.

Still, this is a far cry from the old days fifty to seventy-five years ago, when the creed was "cut out and get out." Thousands of acres of dead stumps and burned-over land in the Lake states, in the Pacific Northwest, in New England, and in the South stand as mute testimony to this exploitive use of a highly important and basic resource, valuable not only for timber products but also in holding the water

[7] "Pact With the Unborn," *Outdoor America*, Vol. 15, No. 2 (Feb. 1950), p. 2.

on the land where it falls, thus reducing floods and maintaining water supply.

While we may not have a "timber famine," as Gifford Pinchot predicted, we have reached a point of inadequate supply of growing trees in terms of our real needs at a reasonable price. Unfortunately, the day of recognizing a timber famine has been postponed by the stored-up abundance in our virgin west coast forests. Atom bombs severing our east-west transportation arteries would leave little doubt of a timber famine on the eastern seaboard. The debate as to whether we actually have a timber famine, which is the chief area of controversy in this field, would be settled quickly.

WILDLIFE CONSERVATION

In wildlife conservation there are many current predictions that wildlife is on the way out and that the end of public hunting and fishing in this country is near at hand. Opinions are many that much of our wildlife will have vanished soon or reached the point where it will be unimportant, at least from the sportsman's point of view. True, we have lost several important species for all practical purposes; the buffalo, the passenger pigeon, the heath hen, the condor, and the whooping crane are among them. A current case is the Florida key deer—a tiny animal weighing not more than 30 pounds, of which there are probably not more than fifty now living on isolated keys. Steps are being urged upon Congress by state and national conservation organizations to preserve this final remnant.

Few people realize the impact which the harvest of fish and game crops has on the nation's economy. Arthur H. Carhart has pointed out, in a well-substantiated article, that the total expenditure of those hunting and fishing in the United States in 1950 was in the neighborhood of $9,200,000,000! It is interesting to note that the annual hunting dog bill alone is *greater* than what the whole American public spends attending football, basketball, baseball, boxing, horse racing, and all other spectator sports combined.[8]

Our future wildlife supplies, on which this large investment is based, are again tied to a basic problem of land and water maintenance in the face of growing population pressures. It is commonly expected that unless unforeseen conditions prevent it, the population of this country will reach 200 million by the year 2000. In addition to raising problems of feeding and clothing this populace (and a sizable number of other peoples of the world), growing population pressures have had a great impact upon our wildlife resources. In 1935 a total of about 10 million hunting and fishing licenses were sold in this country. Last year 16.5 million fishing licenses and 12.5 million hunting licenses were sold. Also, we have more leisure time to go out in pursuit of fish and game than in past years. At the same time, expanding agriculture, towns, industries, transportation, and other facilities are taking habitat away from the desired and sought-after game mammals, birds, and fishes. Something obviously has to give.

That is the big problem today—how to maintain habitat for the wildlife which we like to have around us for one or another purpose, in face of increasing pressures upon them. Basically, our wildlife resources will fluctuate with the way in which we handle and manage places where they live and the food they eat; that is, the soil, the forest, the vegetative cover, and the waters. It is important to us to have programs for the management of fish and game populations and other wildlife populations; nevertheless, thoughtful conservationists recognize that these are by-products of sound land and water management in the public interest.

[8] Arthur H. Carhart, "Hunting and Fishing is Bigger Business," *Sports Afield*, June 1951.

Again, the chief conflict in this area of conservation is over *what* products shall be produced from a given land and water area, and for whose benefit. For example, shall we produce X number of birds and mammals for the hunter to harvest or the nature lover to view, or shall we use that same area to produce cash crops of corn, wheat, or potatoes? We can do, and are doing, both. The controversies arise over how much land shall be delegated to each objective, and to what extent we can achieve both.

SOIL CONSERVATION

The conservation of soil resources is a broad field with which the public is becoming increasingly concerned, and rightly so. Soil conservation is basic to conservation of all other resources, and obviously to the continued health and prosperity of the people. Since the dark days of the thirties when we suddenly woke up to find much of the soil of the Great Plains blowing away on the wind, great strides have been made in the development and the putting into practice of techniques to conserve the thin layer of topsoil which represents survival to our civilization. The Soil Conservation Service has done an admirable job of getting the man on the land to recognize his responsibilities to himself, his neighbors, and the future, though, of course, the job is by no means completed.

An organization of the landowners themselves, the National Association of Soil Conservation Districts, has come into being with the chief purpose of spreading the soil conservation gospel in the common interest. This is a grass-roots organization, legally established, locally governed by landowners. There are over 2,300 Soil Conservation Districts now in existence in the United States.

The chief point of controversy in this connection is whether drainage, certain types of reforestation, and other soil conservation practices are inimical to wildlife conservation—this in spite of the fact that basically what is good for the land is also good for wildlife. Wildlife interests have questioned the desirability or need of widespread drainage of potholes used by waterfowl in the Lake and Plains states. This controversy is gradually being resolved through co-operative efforts of the Soil Conservation Service, the Fish and Wildlife Service, and the landowner (who is still being paid in some cases, with tax money alloted the Department of Agriculture, for draining his potholes), with the interested sportsman who wants to harvest the ducks keeping a watchful eye on the whole process.

HISTORY OF THE CONSERVATION MOVEMENT

The reader will now recognize, I trust, that conservation encompasses a great deal more than saving a few songbirds or producing a few more fish or animals for the sportsman to harvest. Historically, to be sure, the nature lovers and the sportsmen, one for aesthetic reasons, the other to perpetuate his harvest, gave the movement its initial impetus. By the time Theodore Roosevelt and Gifford Pinchot came along at the turn of the century, and broadened the concept of conservation to include more than just wildlife, the people were emotionally ripe for a crusade. That is precisely what occurred. Wildlife was the first resource product of the land and water to receive attention, because our early economy was hitched closely to it for a continuing supply of food, clothing, and other necessities. Next to receive attention were our forests

(the Pinchot crusade), and for thirty years the term "conservation" meant forest conservation to most people. In that era we established the National Forest system for timber and watershed management and protection, and the National Park system for the protection of wildlife, native flora, and scenic resources.

Next, stimulated by the specter of middle America blowing away in the dust bowl calamity of the early thirties, soil conservation became popular. The wildlife enthusiasts remained active and grew in organization and strength the while.

The technicians began to understand and to get across to the people the concept that all these resources were interdependent and that what we did with one affected another for better or for worse. A few technicians, administrators, and laymen developed what the late Aldo Leopold referred to as "an ecological conscience,"[9] and began to preach it to all who would listen. The understanding of man's relationship to man and to his environment developed into a full-fledged science called "ecology."

During the growth of the movement several lay organizations came into being, most of them to champion a particular aspect or resource in the conservation movement. These followed the professional societies, most of which already existed in the fields of forestry, fisheries, wildlife, mammals, birds, botany, ecology, soil, and others. Added together, their policies and programs pretty effectively encompass most aspects of resource conservation, and collectively they represent the organized public voice and public interest in our country's resources. The lay organizations (not the professional) are pressure groups, to be sure, but almost without exception they are pressuring in the public interest, rather than for any special group.

[9] Aldo Leopold, "The Land Ethic," in *Sand County Almanac* (New York: Oxford University Press, 1949), p. 207.

NATURAL RESOURCES COUNCIL FORMED

In 1948 these lay conservation organizations joined with the technical societies in establishing the Natural Resources Council of America to serve some thirty-five member organizations. This council, a service organization, proposed a public Policy for Renewable Natural Resources at the time of the Seventeenth North American Wildlife Conference on March 18, 1952 in Miami, Florida.

This statement can be considered a fair reflection of fundamental agreement by the member organizations on principles for the management of our renewable resources for the long-range economic and social welfare of the nation, and, as such, is being urged by the member organizations for adoption by Congress. It represents a definite milestone in the conservation movement in that it indicates a union of technicians and laymen in a common cause —a major achievement fundamentally necessary to such successes as the movement may ultimately enjoy.

The growth of the conservation idea will continue to take myriad forms, and controversies will rage over everything from using herbicides for clearing highway rights of way to how many sheep should be permitted to graze on a national forest. They must ultimately be resolved. Whether they are resolved for the public good over the long pull will in part depend upon how successfully the conservation forces can defend their stated principles and beliefs.

Inherent in this is the necessity for education—not only of future generations, but of the present. Needed is financial and other support to bring the public to a realization of conservation essentials before this society and civilization disintegrate, as have others in the past when they suddenly found the cupboard was bare. With many resources, the bottom of the barrel seems a long way off. With others, it is clearly just around the corner. Responsible industry has already awakened to the problem and is lending its support. More of the same on the part of professional and lay leaders in all walks of life—doctor, lawyer, preacher, merchant, housewife, union chief, professional politician, journalist—is necessary.

It is still too fashionable to deride the thoughtful student of population problems and resource wastage who may be inclined to overstress the adverse, but who, nonetheless, has pointed out that there *is* a limit to how much the land can produce in foods and fibers and that the day can come when there will be a smaller cut of the pie for each to have. How soon it may happen at the present rate of demand, I would not venture to guess. That it *can* happen here seems true. It strikes me as only common sense to take the conservation view and seek to guarantee, as far as humanly possible, that it will not do so.

Robert O. Beatty, Chicago, Illinois, is conservation director of the Izaak Walton League of America, Inc.; editor of Outdoor America; and secretary-treasurer of the Izaak Walton League of America Endowment, Inc.; and has been a free-lance writer for outdoor magazines for the past five years. He has done timber stand improvement work for the United States Forest Service, and has been a research assistant to the Institute for Fisheries Research, Michigan Department of Conservation, and to the Fish Division of the University of Michigan Museum of Zoology.

The Citizen's Part in Conservation

By JOHN H. BAKER

AMERICANS are tremendously interested in conservation. State legislators have said that they receive more mail about conservation legislation than about all other subjects combined. Laws have been put on the statute books as a result of citizen participation in conservation planning. The result is a more advanced body of conservation legislation in America than anywhere else in the world.

The greatest progress made in conservation in our generation has been growing recognition of its basic relation to human welfare—the broadening of horizons and the scope of operations and goals of the organizations working in the conservation vineyard. No longer, as a rule, can we afford to compartmentalize our thinking or action. We cannot expect thus to win, as a people, in the battle of life on this planet. No longer can we attain our ends by organizing for special purposes that represent a preferential interest conflicting with other preferential interests in the same general field.

The National Audubon Society, for example, endeavors to make people aware of the steady stream of life around them; of its beauty, richness, and complexity; and, above all, aware that they are part of this exciting pageant of events; that human life is affected in all sorts of ways by every plant that forms a seed, by every prairie dog that makes a burrow, by every dragonfly that emerges from its nymphal case; that man is, in fact, part and parcel of the biological picture, and can no more escape therefrom than from birth or death.

It is encouraging that we are getting down to fundamentals. Soil and water conservation is basic if our over-all resource picture is to improve. For too long, soil and water were orphans of the storm, and the situation is far from remedied yet. Ecology, though still dimly understood by the average layman, is slowly gaining public recognition and acceptance. The cries of "shoot the predators" and "build more game farms" are heard less often. It is finally becoming understood that game will not prosper unless it has suitable habitat, but will then prosper without any predator control other than that of man. Enlightened groups are now working to improve wildlife habitat in every possible way; they work with Soil Conservation Districts and other agencies to prevent soil erosion and abuse, because they know that wildlife needs healthy land as much as people do.

VARIETY OF GOALS

Most persons interested in natural resource conservation participate in the programs of the thousands of voluntary organizations, on national, regional, state, county, and local levels, that have been established to advance conservation objectives. Some have goals that are diametrically opposed to those of other groups that also regard themselves as conservation agencies. This is merely a reflection of the many differences of opinion about conservation matters. The disparity in viewpoint between, let us say, the Baptist preacher who espouses fundamentalism and the Unitarian minister's "realistic" approach is

no greater than is to be found in the conservation field. Despite their varying philosophies, often brought into sharp focus at legislative hearings, our conservation organizations do team up with reasonable effectiveness.

A listing of some of the national conservation organizations will give an idea of the variety of purposes they serve: American Forestry Association, Washington, D. C.; Conservation Foundation, New York City; Friends of the Land, Columbus, Ohio; Izaak Walton League of America, Chicago, Illinois; National Audubon Society, New York City; National Parks Association, Washington, D. C.; National Wildlife Federation, Washington, D. C.; Wilderness Society, Washington, D. C.; Wildlife Management Institute, Washington, D. C.

There are a number of others, many with specialized interests, such as the Sierra Club, the Wild Flower Preservation Society, Ducks Unlimited, Sport Fishing Institute, and the conservation committees of the Garden Club of America and the National Council of State Garden Clubs, Inc.

KEEPING INFORMED

Each national conservation organization concentrates on certain major objectives, though its scope of interest and influence may cover the entire conservation front. This is as it should be. Most executives of national conservation organizations make it their business to keep in close touch with key personnel of the governmental agencies charged with conservation work. Therefore the views of the organizations are usually well known to the departments and bureaus concerned. Much the same is true of Congress. Those legislators who are particularly concerned with conservation problems are kept informed as to the thinking of the conservation groups. Congressional committees frequently hold public hearings on controversial matters, and these are well attended by organizational representatives.

Somewhat the same situation exists on state and local levels. Most governors or state conservation departments have advisory committees that keep them abreast of grass-roots opinion. It is unfortunate that some of these committees are representative of special rather than public interest in the field. In some cases they reflect solely the point of view of those whose main objective is harvesting more game now, not later.

Occasionally someone suggests that perhaps greater effectiveness could be achieved by co-ordinating or merging the major national conservation groups into one superorganization. This is advocated on the ground of "efficiency." With human nature operating freely in a democracy, the chances that such a plan would produce desirable results are practically nil. There would be great dissension over emphasis, both in policy and in application of funds. A single agency probably could not command the financial support that is given to the combination of present voluntary organizations. At present there is a good spirit of give-and-take among the various groups. Any two of them may be in complete disagreement one month and work hand in hand on another issue the next month.

PERSONAL PARTICIPATION

It has been estimated that some ten million Americans pay dues to conservation organizations. It is through membership in, and financial support of, the national conservation organizations and their local branches, chapters, or affiliates that John Q. Public has the best opportunity to further conservation. In the local groups he can have

the satisfaction of personal participation in specific projects, and pride in personal accomplishment.

The individual may find himself on a committee of his local organization to survey the need of conservation in his community and its environs. If so, he is likely to sustain a series of shocks. He may discover that most of the timber products used in his area were not grown there, nor in his state, nor even in his nation. He may find deep scars on the land and observe that only a fraction of the farmers are using soil conservation methods. If he wonders at the paucity of wildlife, his questions will be answered by the drained marshes and barren fence rows that are symbols of modern farming. In our rush to put every acre to use in producing even greater farm surpluses, we have made it hard going for wildlife. The old wooden and stone fences supported vines and shrubs that offered abundant food and cover. The potholes bred ducks, muskrats, and a variety of other wildlife. The modern farm may produce a few bushels more of potatoes or corn, but one can hardly believe that it is a better place to live than the farm of yesteryear.

BRANDYWINE VALLEY ASSOCIATION

Because state lines are, after all, artificial political boundaries, some organizations are regional in nature. With the development of what is called the "watershed approach" to conservation planning, it seems logical that regional organizations will increase. A good example is the Brandywine Valley Association.

Some years ago a group of civic-minded men and women took a long, hard look at the 330-square-mile area where they lived. They decided that the Brandywine Valley in Pennsylvania and Delaware, where reside some 200,000 people, was not receiving the sort of treatment that befits a good home. Because they had the common sense to realize that their health and prosperity depended to a considerable extent on the natural resources of their region, they formed the Brandywine Valley Association. According to their own statement, it was organized to provide a common meeting ground on which ideas and information could be exchanged and progress measured. The association's program encourages and aids the people of the Bandywine Valley to reduce soil erosion and silting, lessen flooding and drought damage, decrease stream pollution, improve and protect existing woodland, reforest marginal lands, and preserve wildlife and natural beauty.

The work of the Brandywine Valley Association is largely educational, as is that of most conservation organizations. Members of its full-time staff attend meetings and demonstrations throughout the valley and succeed in arousing interest in conservation problems that are so close at hand that few people see them.

It did not take the association long to discover that no matter how valuable improved procedures are, they have to be sold to the landowners or industries involved; so it is helping to acquaint the residents of the valley with the ways in which they can utilize the services of conservation agencies. The organization has steered clear of partisan affiliations of any kind. It has enlisted as backers many of the most influential citizens of the Brandywine Valley. Certainly no one can deny that the valley is a better place today because of active citizen participation in conservation planning.

REACHING THE CHILDREN

Whenever conservationists meet at conventions, lamentations are heard on all sides about the failure of our school systems to teach conservation effectively. It is alleged that most of our problems today result from this shortcoming, and that the conservation future will not be very rosy unless remedial action is taken. Back in 1911 the National Audubon Society decided to do something about this matter. Illustrated material for children and program aids for their teachers were made available, and over nine million American and Canadian children will have enrolled as members of Audubon Junior Clubs by April 1952. The great majority of these are alive today, and it is reasonable to deduce that their combined thinking has had, and is having, measurable beneficial effect on governmental policies and legislation.

In 1936 the society launched its summer camp program for adults, especially designed to be of practical aid to school personnel, youth leaders and camp counselors, recreation and playground personnel, conservation chairmen of societies and clubs, and others with a hobby or professional interest in nature. These camps are more than natural history schools. They are concerned with more than simply stimulating hobbies or professions. They aim to develop majority public opinion favoring intelligent treatment and wise use of our natural resources, so that there may be constructive legislative results, with popular enforcement.

The society is working on the leverage principle, imparting a knowledge of successful teaching techniques to teachers and other youth leaders, each of whom may be expected to reach an average of thirty youngsters during the ensuing year. Some six hundred persons graduate each year from the three camps now operating in Maine, Connecticut, and California. Picture, then, the influence to be attained by a dozen such camps geographically distributed throughout the continent, graduating annually some three thousand youth leaders possessing opportunity to reach, each school, troop, or club year, some ninety thousand young people. Bear in mind that the camps cater to new students each summer, so the effect tends to snowball rapidly.

If, in a two-week session, the society conveys to each student comprehension of the interrelationships of soil, water, plants, and animals and an awareness of their impact on human welfare; imparts to them knowledge of successful teaching and leadership techniques, not by listening, watching, or reading about them, but by trying them out in the field under guidance; develops in them a wonderful spirit and the feeling that they have never had a better time in their lives; causes them to wonder how we can give them so much for so little and send them home with new zest in life and a will to further conservation in their own communities—if these things are accomplished, we have gained our principal objectives.

Upon returning to Minneapolis from the Audubon Camp of Connecticut, several school teachers decided that direct action was advisable. With official blessing, they formed a conservation committee in the Minneapolis public schools. Teachers from different grade levels, principals, and supervisors are on the committee. They meet regularly to discuss ways of integrating conservation into the curriculum and to exchange their own experiences and ideas. It augurs well for the future.

PROGRESS DESPITE LIMITATIONS

It is not possible to cover with thoroughness in this article all the ways in which citizens, through the organizations they have formed, take part in conservation activities. Nevertheless, public opinion continues to lag many years behind the findings of science in

conservation work. It has been said with some truth that our greatest problem now is not so much to conduct more research to find more facts, as to do the educational job necessary to acquaint the public with the known facts, so that the policies of governmental conservation agencies may be up to date.

Virtually every conservation organization is carrying on work that is made possible by the interest and support of individual citizens banded together to accomplish certain purposes. Only a handful of these groups are endowed, and those inadequately. The others are operating on shoestrings. The few organizations in the conservation field that are sometimes inaccurately described as "wealthy" have tiny endowments when compared with even small-sized colleges or museums. The largest present endowment of a conservation organization is less than three million dollars.

Despite the limitations under which conservation organizations work, a tremendous amount of progress has been made. Conservation has evolved from a philosophy propounded by people who were regarded as cranks into an accepted doctrine that now finds wide public support. No realist can afford to do much boasting about what has been accomplished, because so much remains to be done. We can all rejoice, however, in the fact that large numbers of citizens are now participating in conservation work. We shall doubtless see the day when conservation will be the way of life in America.

John H. Baker, New York City, is president of the National Audubon Society, and is chairman of the Committee on Conservation advisory to the Secretary of the Interior. He has been a breeder of Aberdeen-Angus beef cattle on a farm in Dutchess County, New York, since 1930. He is editor of Audubon Guide to Attracting Birds (1941).

Our Future Dependence on Foreign Minerals

By ALAN M. BATEMAN

A GLANCE at the history of the development of leading industrial nations reveals that their rise has coincided with the utilization of their mineral resources, notably coal and iron ore. Those countries abundantly supplied with diversified mineral resources became the great industrial nations, and the politically and militarily strong ones. It is no accident that large industrial centers sprang up in central England, in the Ruhr, in France, and in the United States around the Great Lakes, in Pennsylvania, and in Alabama. For there, coal and iron ore met, and the fusion of the energy of fuels and the solidity of metals spelled industrial growth that developed into industrial might. Today, similar developments are taking place in Russia. Those who hold the purse strings of mineral resources hold power.

It is startling to realize that the rise of the industrial age has so accelerated the demand for minerals that we have dug and consumed more mineral resources within the period embraced by the two world wars than in all preceding history. This insatiable demand for minerals to feed the hungry maw of industry and armament has made sources of supply that we used to think were adequate, now look relatively small, and sources of large supply are becoming fewer and fewer.

Our domestic mineral reserves have suffered deep inroads in the building of our economy, and the war demand made still further inroads. Our former bountiful mineral supplies of which we were justly proud now show serious depletion. Every automobile, building, machine, ship, train, tank, or plane requires its quota of many kinds of minerals, and of course armament is absolutely dependent upon them. Without a steady flow of minerals our industrial life and our national security would be jeopardized. Consequently, the distribution and ownership of mineral resources become of prime importance.

Despite intensive mineral exploration in this country, and expanded aggressive research in metal recovery, the use of substitutes, and other conservation measures, it is inevitable that the United States will more and more have to depend upon foreign sources of minerals. This demand will increase not only because of normal depletion of our ore reserves, but also because our increasing population will continue to demand houses, rapid transportation, and more labor-saving devices in the home, on the farm, and in the factory—and all of these require metals and minerals in large quantities. Should the bells of war toll again, the mineral situation would become even more acute. Thus, the United States must look more and more to increasing quantities of minerals from foreign sources. It means that we shall be forced into the British pattern of importing minerals in order to fabricate materials for export, to pay for mineral imports. This requires a different foreign policy.

But let us turn now from generalities to the lessons taught by World War II.

WARTIME MINERAL SITUATION

World War II brought a rude shock. We found that our smugly assumed domestic mineral abundances turned out

to be woefully inadequate to meet wartime requirements. The dozen strategic minerals of prewar time jumped to five dozen, because quantities of nearly every mineral used in industry had to be imported. During World War II we had to turn to fifty-three countries for imports of some sixty different minerals, of which twenty-seven came exclusively from foreign sources. We had to import six million tons of copper, lead, and zinc alone, three metals of which we had thought we had enough, and manganese at the rate of 1½ million tons a year. We get another shock when we glance at a few figures for twenty of the most vital minerals that form the basis of wartime and peacetime industry. Of these, we were 100 per cent dependent upon foreign sources for eight of them; 85 to 100 per cent dependent for six of them; 37 per cent dependent for copper and zinc, and 44 per cent for lead. It is startling to realize that in the postwar years the demand for most of these same twenty minerals for peacetime and defense developments is just as great as, or greater than, during actual war conditions, and it will be much greater in another twenty-five years.

Another interesting study was made by experts of the United States Geological Survey and the United States Bureau of Mines and published in 1948 as the *Mineral Resources of the United States*.[1] This revealing document portrays the ratio of production to consumption in 39 minerals during the periods 1935–39 and 1940–44. Before the war, production equaled or exceeded consumption in 11 out of 39 minerals, but several of these are common and not vital minerals. But for the more critical minerals, in 12 out of the total of 39, domestic production yielded only 50 to 100 per cent of our needs; for 6 it ranged from 10 to 50 per cent; and for the last 10, from 0 to 10 per cent.

The present and probable future rate of domestic consumption of minerals is vastly greater than in the 1935–39 period. Then, steel production, as a gauge of industry, ranged from 28 to 50 million tons annually; today it exceeds 102 million tons. Since then there has been a population increase of about 15 million people; there are more homes, higher wages, and labor shortages, and these spell demand for mineral-consuming labor-saving and luxury articles. The home, the farm, and the factory have become more mechanized. All of this means an increase in the future demand for metals and minerals vastly greater than the consumption of 1935–39.

It is timely now to glance at the present situation as to our well-being in available domestic supplies of these materials so basic to industry and defense.

PRESENT MINERAL SITUATION

Even more revealing, however, is another set of figures prepared by the same experts that give the reserves of 41 minerals expressed as years of life based on the 1935–44 rate of domestic consumption (reserves divided by average consumption). This brings out startlingly that, although there is a life of half a century or more for 15 of these 41 minerals, 3 of them would last only 33 to 39 years, and the remaining 26 have an indicated life of less than 25 years. Of the latter, 9 have a life of less than 10 years, and for 8 there are no reserves. These are telling estimates, and it is important to note that the long-life minerals include many substances of minor critical importance, such as helium, or substances of unrestricted sources of supply, such as salt and magnesium. The real backbone

[1] Public Affairs Press, Washington, D. C., 1948.

minerals such as copper, lead, and zinc are all too short—19, 10, and 20 years of life respectively. And these figures were prepared as of 1944!

Even though these estimates of reserves were too low, and in my opinion they are, they would still indicate near-future domestic shortages even if they were increased by 50 to 100 per cent. I think these figures of reserves will be extended through increased technology, the development of more scientific methods of mineral exploration, and conservation measures.

This picture of United States mineral resources is the result of the long-continued heavy drain upon them in the building and defending of a great industrial nation. In addition, we are pouring out vast quantities of goods manufactured from minerals to supply foreign aid, such as machines, railroad, mining, and agricultural equipment, and goods for electricity, power, transportation, and factories. The irony is that the more we build our industrial and military power, along with that of other countries, the faster we exhaust the very basis of this power. And, unfortunately, most of the goods we ship abroad carry out raw materials that do not return to us.

THE OUTLOOK

We have to face clearly the fact that under increasing mineral developments we are approaching a crisis in our mineral situation. Despite intensive domestic mineral exploration, technology betterments, substitutions, and the wiser use of scarce metals and minerals, the United States will have to become more internationally minded with respect to minerals and more cognizant of foreign mineral potentialities. Indeed, its foreign policy should be oriented to help eliminate existing trade barriers and stimulate the flow of minerals to this country.

A critical period is the next twenty-five years during which our increase in consumption over production of minerals will be steadily mounting and our domestic production of many minerals will be rapidly waning. The expected divergence of consumption over domestic production unquestionably will stimulate further conservation measures and the development of substitutes that will tend to lessen the normal divergence. Table 1 gives, for twenty-six critical minerals, the actual dependence upon foreign sources for the three full years of World War II and an estimate of the dependence upon foreign sources in 1975.

Table 1 does not include several mineral commodities of which indicated United States resources are more than sufficient to supply United States needs over the next quarter-century. Those include magnesium from sea water, nitrates obtained largely from the air, and natural gas, helium, coal, salt, phosphate, potash, and molybdenum. Neither does the table include several minor metals such as arsenic, bismuth, and cadmium, or platinum and uranium, each of which must largely be supplied for United States consumption from foreign sources. Altogether, of 71 mineral substances currently on the national stockpile purchase list, only 8 are produced in any large quantity in the United States; and the Defense Production Administration lists in critically short supply some 44 metals, 9 chemical minerals, and 18 nonmetallic minerals.

The figures in Table 1 of the percentage of dependence upon foreign ores in 1975 are of necessity estimates. These estimates take into consideration the probable consumption demand by 1975, the estimated domestic produc-

TABLE 1—DEPENDENCE ON FOREIGN MINERALS (PER CENT) IN WORLD WAR II AND IN 1975

Mineral	Per cent foreign during World War II	Per cent foreign in 1975	Probable chief foreign sources
Antimony	83.2	94	China, Mexico, Bolivia, Peru
Bauxite (aluminum)	18.18	85	Surinam, British Guiana, Jamaica, Indonesia
Beryl	90.6	90	Brazil, India, Argentina, Africa
Asbestos (strategic)	100.0	100	Rhodesia, S. Africa
Chrome	89.6[a]	100	S. Africa, S. Rhodesia, Turkey, New Caledonia, Philippines, Cuba
Cobalt	85.6	90	Belgian Congo, Rhodesia, Canada
Corundum	100.0	100	S. Africa
Copper	37.6	65	Chile, N. Rhodesia, Belgian Congo, Canada
Diamonds (industrial)	100.0	100	Congo, Angola, S. Africa, Brazil
Fluorspar	2.0	50	Mexico, Africa
Graphite	100.0	100	Madagascar, Ceylon
Iron ore	2.0	35–45	Venezuela, Canada
Lead	44.2	70	Mexico, Peru, Australia, Canada
Manganese	85.5[a]	80	India, Africa, Brazil, Cuba
Mercury	43.2	80	Italy, Spain, Mexico, Canada
Mica (strategic)	88.0[a]	95	India, Brazil
Quartz (radio)	99.0	100	Brazil
Nickel	100.0	100	Canada, Cuba, New Caledonia, Celebes
Petroleum	0.0	50	Venezuela, Middle East, Canada
Tantalum-columbium	99.0	99	Brazil, Congo, Nigeria
Sulphur	0.0	50	Canada, Mexico, Europe
Tin	100.0	100	Malaya, Indonesia, Bolivia, Congo
Titanium	26.0	80	Canada, India, Norway
Vanadium	32.4	25	Peru
Tungsten	61.1	70	China, Bolivia, Brazil, Portugal
Zinc	36.7	60	Mexico, Peru, Australia, Canada

[a] The remainder, from domestic sources, was mostly unusable; therefore these figures in reality should be higher.

tion, and probable substitutions and replacements. Some of these may now be considered in a little more detail.

THE STEEL-MAKING MATERIALS

The making of steel requires primarily coal and iron ore, but also several other mineral constituents, chief among which are manganese, fluorspar, and graphite. In addition, there are a number of alloying constituents absolutely essential to the making of the special steels required today for the manufacture of machines, equipment, and armament. Chief among these are chrome, manganese, nickel, cobalt, tungsten, molybdenum, and vanadium.

Of these steel-making constituents, coal, of course, is in abundance; but United States sources of high-grade iron ores are now beginning to run short. Already we are turning to imports of iron ore from Venezuela, Canada, and Chile, and in another twenty-five years the United States will have to lean quite heavily on Venezuela, Canada, and perhaps Brazil for high-grade ore.

Fully alive to the situation, United States steel interests are initiating the mining and milling of the low-grade taconite ores—at a capital cost of 200 million dollars for each 5 million tons of production. Every ton of steel produced requires some 12 to 14 pounds of manganese to make sound metal. Our production today is a small fraction of the total required, but there is hope that processes presently under investigation may in the future recover some of the manganese now wasted in steel-making slags. The production of fluorspar required for the purification of steel has dropped from an excess over consumption during World War II to an estimated 62 per cent of consumption in 1951; [2] and graphite for steel-making crucibles must still come largely from far-off Madagascar and Ceylon. Of the alloying metals mentioned, the United States is sufficient only in molybdenum and partly so in vanadium, and the existing shortages of today will grow much larger in another twenty-five years when demand may increase from 30 to 50 per cent over the present. It is true, of course, that new alloying substitutes such as boron will displace the need for some of the deficient alloying metals.

THE INDUSTRIAL (NONFERROUS) METALS

One of the most striking reversals in United States domestic supplies is that of copper, lead, and zinc, three basic metals which we hardly dreamed could ever be in short supply. Today around a third of our needs must come from foreign sources, and in another twenty-five years our imports are expected to jump to between two-thirds and three-quarters of our domestic requirements, taking into account that considerable aluminum will be substituted for copper, and plastics for lead.

The use of aluminum is expected to grow by leaps and bounds, with attendant shrinkage of domestic bauxite supplies and greater leaning on foreign high-grade bauxite. As long as high-grade bauxite is available, it will be the preferred source of aluminum ore; but the industry can change over, at a cost, to the use of lower-grade clays and aluminous rocks as a source of the metal.

Tin is almost nonexistent in the United States, and none may be expected. The chief sources of free-world tin lie in areas of political unrest and uncertain future security. Consequently, United States consumers of tin have been bending every effort to make themselves independent of imported tin as far as possible. The wise use of tin and the development of electroplating with thin coatings, and of substitutes, is so reducing the needs for tin that it is even possible the demands twenty-five years hence may not appreciably exceed those of today.

Titanium, the metal of the future, will make up in part for some of the expected deficiencies in other metals. United States reserves will diminish sharply over the next twenty-five years, and the titanium center of the world will shift to Quebec, where reserves are sufficient to supply the entire world demand.

MINOR METALS

Among the critical minor metals are antimony, mercury, tantalum-columbium, silver, and platinum metals, each of which is presently deficient in the United States, and the shortage will be intensified in the future. The United States will always be dependent upon foreign sources for supplies of these minerals, although domestic production partially meets the needs for mercury, silver, and antimony. Silver, whose industrial and military photographic uses have been climbing steadily, falls far short of meeting current domestic demands, and the outlook for the future is for a much greater deficiency, to be made up largely from Mexico and

[2] U. S. Bureau of Mines.

Canada. Substitutes will be needed to meet world demands. Tantalum-columbium are relatively new metals in the industrial demand. Columbium is intensely sought at present for heat-resisting alloys for jet plane use; but the present United States demand so far exceeds total world supply that new, less effective, alloys must be developed for replacement.

NONMETALLIC MINERALS

Of the critical industrial nonmetallic minerals shown in Table 1, strategic asbestos, beryl, corundum, industrial diamonds, strategic mica, and radio quartz are largely nonexistent in the United States, and foreign sources will have to be depended upon for 90 to 100 per cent of future supplies. Sulphur has been an excess mineral of which the United States has supplied most of the world demand; but no such pleasant condition can hold twenty-five years hence. By then, the brimstone sulphur of the prolific Gulf Coast salt domes will have been largely exhausted, and the United States will have to develop economical processes for the extraction of sulphur from sulphur-bearing minerals, or rely on imported sulphur.

The nonmetallic group of critical minerals offers the best opportunity for the development of substitutes and replacements. Owing to the development of synthetic quartz crystals and synthetic and built-up mica, we are no longer wholly dependent upon foreign sources for all uses of these strategic materials. Likewise, corundum and asbestos offer opportunity of being in part replaced by other, less effective substitutes.

FREE-WORLD SOURCES FOR FUTURE NEEDS

A brief study of the last column of Table 1 reveals that the chief foreign sources that might meet the future mineral needs of the United States are chiefly Latin America and the dominions and colonies of the western European nations. More particularly, the British Commonwealth countries contain in abundance those minerals for which the United States will find itself dependent upon foreign sources. The United States and the Commonwealth together own or control about three-quarters of the free-world mineral resources. Moreover, the dominions and colonies of the Commonwealth include vast, slightly prospected, hinterland areas underlain by rocks geologically favorable for the discovery of extensive additional mineral resources to supply future world needs.

It is noteworthy that of 32 chief critical minerals the British Commonwealth has a surplus of 24, is deficient in 7, and lacks only 1. Of the same minerals the United States is deficient in 18 and has a surplus of 9. Rather strikingly, of the 18 minerals in which the United States is deficient, 13 are abundant in the Commonwealth; and all 5 that we lack are in excess in the Commonwealth. Conversely, several of the Commonwealth deficiencies are surplus in the United States. Thus, each complements the other in mineral supplies. If each desires to maintain its political security and peacetime industrial development, it follows that they must ever be closely associated in foreign policy, international trade, and naval strength to protect supplying sea lanes. If the Commonwealth were to fall, it would be almost as disastrous for us as for them.

The European North Atlantic Treaty countries by themselves are woefully deficient in most of the essential minerals of industry. However, the countries of the British Commonwealth and the overseas empires of France, Belgium, Portugal, and the Netherlands together with the United States as a group are completely self-sufficient for all their mineral needs for the future. What one lacks, the others have. Unfortunately, however, their mineral resources are widely scattered on all the continents, and ocean voyages of thousands of miles are required to transport the needed materials to the centers of consumption. This means millions of tons of shipping that has to be protected in the event of emergency. This, in turn, spells large navies and air forces. Remove this mineral traffic, and industry largely ceases.

The United States could not support herself industrially in the future as an isolationist country, even if she had free access to all the minerals of the Western Hemisphere; for she would still lack some thirteen important industrial minerals which are supplied to her by the North Atlantic Treaty countries. Thus, there are basic mineral reasons, as well as political ones, why our security and industrial future must be closely tied in with those of Europe and our navies and air forces must jointly control the seas. If Europe should be overrun by an unfriendly power that could control the destinies and resources of the European dominions and colonies, our industrial life would wither and our national security be placed in jeopardy. Our military aid to Europe therefore is not, as many infer, a purely one-sided affair; it safeguards our future industrial development and security.

RUSSIA'S MINERAL SITUATION

In contrast to the United States, Russia is now practically self-contained in the minerals of industry. Her deficiencies of World War II have now been largely made up by the inflow of minerals from the Iron Curtain countries. Lead and zinc flow from Poland, East Germany, and the Balkans; chrome, molybdenum, and antimony from the Balkans; uranium from Czechoslovakia and East Germany; nickel from former Finland; tungsten, antimony, tin, lead, zinc, graphite, copper, and others from Manchuria and China. This inward diversion of minerals, not to return, not only has removed supplies that formerly fed western Europe, but largely makes up Russia's own deficiencies. These minerals, together with Russia's own great resources in the critical industrial minerals, make her entirely independent of sea-borne mineral supplies. In this, Russia stands alone among all industrialized nations. Moreover, the few minerals that Russia does lack are those that move in such small quantities that they can be transported by airplane or submarine.

Russia's actual and potential minerals, which she herself controls, combined with her large population rapidly becoming industrially minded, make her potentially a colossal industrial giant of the future, and perhaps the leader of the world.

OUR FUTURE COURSE

The United States' growing dependence upon foreign mineral supplies, which will be greatly accentuated in the future, forcibly brings home the necessity of the following steps, mostly conservation:

1. Intensive research into all methods of conservation of mineral resources.
2. A wiser use of scarce minerals.
3. Prevention or elimination of loss or waste of minerals during mining.
4. Improvement in mining methods and mineral processing.
5. Better and more extensive use of recovery of metals from scrap.
6. Extensive research into the development of substitutes and replacements for scarce metals and minerals.
7. The further development of inhibitors and protectors to help save metals from corrosion.

8. Revision of rigid military specifications to diminish the use of scarce mineral products for purposes for which their properties are not essential.

9. Revision of domestic mining laws to permit geophysical and geochemical exploration over large areas.

10. Inauguration of a system of domestic taxation, both state and federal, to serve as incentive for mineral exploration, both at home and abroad.

11. Pursuit of a long-range program for the development and utilization of domestic marginal mineral deposits.

12. Adoption of measures to ensure an adequate flow of foreign minerals to the United States.

13. More extensive investigations of foreign mineral resources and potentialities.

14. The building up of an adequate stockpile of strategic and critical minerals for military and essential civilian needs.

Alan M. Bateman, Ph.D., New Haven, Connecticut, is chairman of the Department of Geology at Yale University. Professional investigations have taken him to most mineral-bearing countries of the world. He was Director of Metals and Minerals of the Foreign Economic Administration during World War II, and has served on numerous government agencies and missions. He is editor of Economic Geology and author of Economic Mineral Deposits (1942, 1950), The Formation of Mineral Deposits (1951), and seventy-five papers on mineral deposits.

What Is Involved in Metals Conservation Today?

By HOWARD A. MEYERHOFF

THE concept of conservation was founded upon moral issues, and textbooks on the subject have never wholly freed themselves from this approach. The fact of the matter is, conservation must always be defined in realistic terms, and in answer to the question, "conservation for what?"

VARIOUS VIEWS OF CONSERVATION

In the case of natural resources, there can be but one answer for Americans. Since the beginning of World War I we have used more of our nonrenewable resources—notably the solid and liquid fuels, the metals, and industrial or nonmetallic minerals—than in all our previous history. They have been the foundation of an industrial civilization envied but unrivaled either in history or in geography. The maintenance of this civilization does not seem to trouble the average citizen, whose experiences with shortages are associated with the extraordinary military demands of World War II, and whose ignorance leads him blissfully to assume that American ingenuity can meet any demand for finished products, except in the dire straits of an all-out war. He lumps the raw materials in the same category as labor, transportation, capital, and management—all of them secondary to the problem of having sufficient income to purchase what he wants.

The problems of conservation are thus pushed back upon the manufacturer, who tends to define the term as the assurance of an uninterrupted flow of raw materials adequate to support the consumer, who is the American public, in the style to which he has become accustomed.

Government agencies like the Bureau of Mines, the United States Geological Survey, and the Department of Agriculture, created to assure discovery, development, and production of raw materials, have, of course, refined this practical objective of industry. To them, conservation involves the efficient production and use, with a minimum of waste, of the raw materials necessary to maintain the American way of life, which is essentially the American standard of living.

The academician has distilled and idealized the concept of conservation still further. He is struggling to abandon the notion of conserving natural resources for posterity, though he clings to it—wisely, to be sure—in the case of recreational, wildlife, forest, and water resources. But in the case of raw materials he has been forced to the realization that he has not the faintest idea how technology may transform the wants of man within the next generation, and, like Roger Adams in his retiring presidential address before the American Association for the Advancement of Science,[1] he is inclined to anticipate a "synthetic future" for the human race. Under these circumstances he tends to define conservation in somewhat the same terms as the government conservationist, but more circumspectly in terms of the past and the foreseeable future. To him, not only should minerals be produced and used without waste, but production and use should be correlated with known and estimated reserves. However, he like-

[1] *Science*, Feb. 15, 1952.

wise has the maintenance of the American way of life and the American standard of living as his measure, though he is inclined to extend American standards to the other nations of the world.

On the domestic scene, academicians and government agencies have essentially a common purpose, which may be stated, with some oversimplification, as the efficient development and full utilization of domestic raw materials with due consideration of the relation between the rate of production and total known reserves. On the international scene, academicians have more in common with the users or manufacturers, though the latter are motivated to a greater degree by economics than by the concept of conservation.

Since the late thirties some government agencies have developed a growing appreciation of foreign supplies of raw materials, and this concern was first expressed in protest against the monopolistic grip of British-Dutch interests upon the production, distribution, and price of native rubber from southeast Asia. The action of the tin cartel aroused comparable resentment; but it took the impending and actual shortages of World War II to implement programs of foreign exploration and development in which United States government experts officially participated. Foreign activity has continued, but at a greatly reduced tempo; and much of it is now on diplomatic levels in connection with Economic Cooperation Administration and Point Four programs. Industry, on the other hand, has broadened its international horizons and has intensified its exploratory and exploitative projects in those parts of the world that are still open to western enterprise.

Domestic use of industrial raw materials must now be viewed as an international operation. It has not been easy for conservationists to shift their sights from the limited confines of the United States, its territories, and its possessions, to encompass the entire world outside the communist countries. But now that large proportions of our raw materials are coming from lands outside our political control, conservation must be considered as an international problem, and in no field is this viewpoint more essential than in the conservation of metals.

THE COMPLACENT ATTITUDE

There is no need to go beyond the years of depression in the thirties to encounter in American thinking the complacent attitude of self-sufficiency in regard to essential metallic minerals. It was recognized that domestic supplies of a few of the metals were inadequate to meet the industrial demand, but these deficiences were not considered a serious problem. Manganese and tin were the two most troublesome minerals, for manganese is indispensable in the steel industry, and glassware and other types of food containers have never been satisfactory substitutes for tin-coated cans.

Likewise, the evolution of ferrous metallurgy created increasing demands for alloying metals, of which the United States possessed only one in ample and commercial quantities—namely, molybdenum. However, the tonnages required for the manufacture of commercial steel were not large, and in a world where exploration, exploitation, and commerce were unrestricted, problems of supply were readily solved.

In such a world the villains were not the Communists, who were ready and willing to supply manganese for use in American steel mills. Rather, they were the British and the Dutch, who made the most of natural monopolies to restrain trade and raise prices in tin and diamonds, not to mention rubber and quinine.

American industry found it expedient to keep a watchful eye and, where possible, a controlling interest on the foreign developments, for in this way catastrophe had been averted in the American copper industry when the rich deposits of Peru and Chile were brought into production. In the same spirit the Bethlehem Steel Company's tidewater venture at Sparrows Point, Maryland, was watched with considerable interest and some suspicion, for Bethlehem proceeded to draw its supply of iron ore from foreign operations in Spain and Sweden, and from mines more or less under its own control in Cuba and Chile.

Perhaps the conservation of our own finite reserves of bauxite in Arkansas was one of the factors that prompted the aluminum industry to draw upon Dutch and British Guiana for supplies of raw material, but the copper industry experienced panic and consternation when, in the depths of the depression, British, Belgian, and French interests inaugurated large-scale extractive operations along the Rhodesian-Congo boundary. A four-cent tariff warded off disaster for domestic copper producers, and the South American producers were saved only by accelerated industrial production in anticipation of war in 1937.

With the advent of World War II the production facilities of domestic mines were badly strained, and for a time we enjoyed the illusion that the mining industry's inability to meet our needs was due in large part to the shortage of manpower. Since the war, as we have taken inventory of our mineral assets, there has been a slow and reluctant realization of the fact that the domestic reserves of most metals are extremely limited, especially when measured against the annual rate of extraction and industrial consumption. In no other field of mining operation is the transformation as striking as it is in the case of iron ore, and an analysis of developments during the past ten years will provide a pattern into which conservation measures will be cast, not only with respect to iron ore, but also with respect to the ores of the base metals, copper, lead, and zinc.

RESERVES OF IRON ORE

During the boom years of the 1920's iron ore production approximated a peak of ninety million tons. About 85 per cent of this total came from the mines in the Lake Superior district, where reserves were known to be adequate for at least twelve to fourteen years. Thanks to the tax policy of the state of Minnesota, it was not expedient to know any more about subsurface reserves, because taxes were levied upon the owners of unmined ore, and they were based upon proved tonnage. Depression hit the mining districts here, for annual production dropped to a dismal ten to twelve million tons of newly mined ore in the early thirties, and many of the mining communities shriveled to little more than ghost towns. Business picked up later in the decade, and during World War II the annual extraction of iron ore broke the records established in the late twenties.

The heavy drain on the iron ranges of the Lake Superior district has continued since the war, and one by one the mining companies have found it increasingly difficult or impossible to establish the existence of new reserves as rapidly as ore is being mined. Routine drilling, designed merely to extend knowledge of known deposits and to assure a minimum of ten years' supply in any given operation, has been supplemented by new exploration. Known deposits have been explored more thoroughly, and engineering ingenuity has been brought to bear upon the attractive but difficultly accessible deposits of

Steep Rock Lake. The industry has gone even farther afield, and reports of iron ore along the Labrador-Quebec boundary in the Ungava Peninsula have been investigated, with the spectacular discovery that this district, with its formidable climate and its awkward geographic location, probably contains the largest reserve of high-grade hematite ore ever discovered on the North American Continent. The elaborate plans for the development of these deposits have required the revision of economic principles which have long been applied to the iron and steel industry, but there seems little doubt that these deposits will soon be worked during the short summer season and will be disgorging ten million tons or more of iron ore over a railroad that will connect the mines with the Saint Lawrence estuary, 238 miles away.

While one group of operators combed the Pre-Cambrian rocks of North America, applying the modern airborne magnetometer to peer through the glacial drift of the upper lake country, another group looked to Latin America for the solution of its raw materials problem. The Bethlehem Steel Company led the way through its developments in Cuba and Chile; and just as submarine warfare broke into full fury in the Caribbean, this company completed preparations to mine and to ship ore from the Pre-Cambrian Guiana Highlands south of the Orinoco River in Venezuela. Bethlehem's discoveries in Venezuela have since been extended by the United States Steel Corporation, which has undertaken a rival operation in this same general region.

Current interest in Venezuela is the outcome of cautious and exhaustive economic analysis. For several decades the large and rich hematite deposits of Brazil have been known, and during the war years American capital and technological skill were applied to a dual-purpose project—that of erecting a steel mill at Volta Redonda to supply Brazilian needs for steel products, and providing transportation facilities that would permit the export of some Brazilian ore. The fact that the two major operating companies of the United States turned their postwar attention to Venezuela rather than to Brazil is an eloquent commentary on the relative economic advantages of ore production in these two countries. However, the fact remains that one of the largest reserves available to the nations of the Western Hemisphere still lies on the periphery of economic availability in Minas Gerais in Brazil.

MILLING AND METALLURGICAL IMPROVEMENTS

American iron ore producers are not so unimaginative as to think that the discovery of new reserves is the only solution to the problem of impending shortage. For many years they have been interested in the possibilities of beneficiating low-grade ores, and in the Adirondacks beneficiation went beyond the experimental stage nearly twenty years ago. By means of efficient milling operations, deposits in that region that had been abandoned because they could not compete qualitatively with Lake Superior iron ore were reopened, and were milled to such good effect that concentrates could be shipped by rail to mills along Lake Erie and in the Pittsburgh district in competition with hematite from Michigan, Wisconsin, and Minnesota. Likewise, the impressive tonnages of low-grade ore—taconite—in the upper lake country presented a challenge that prompted a great deal of experimentation. Only within the past two years has the problem been effectively solved, and now the taconite deposits seem destined to have commercial significance. To the extent that they can be utilized in competition with the higher-grade ores in the same area, they comprise an impressive extension of our iron ore reserves.

Competition from other metals and from plastics has also been an incentive to metallurgical and engineering research in the steel industry. Variations in furnace treatment and in milling have yielded new types of steel with distinctive properties. In ferrous metallurgy, progress in the study of alloying metals has reached a point where ferrous alloys are no longer the products of empirical recipes but are the results of scientific experimentation. Special properties can now be imparted to steel forms, making it possible for them to compete in many uses with lighter-weight aluminum. And recent developments have made it possible to utilize the titaniferous iron ores and so extend our reserves substantially by the addition of these hitherto unusable deposits.

MEASURES FOR SUPPLYING IRON ORE

The problem of guaranteeing ample supplies of iron ore for American industry is thus being solved in several ways:

1. Foreign deposits are being explored and exploited, not only to supply American mills with raw materials, but also to supply some of the countries concerned with the basic ingredient of domestic steel industries. Conservation is thus effected by importing ore that curtails the drain on United States reserves, and by providing such nations as Chile and Brazil with steel mills that can supply part of the local demand and thereby reduce the export of finished and semifinished steel products from the United States.

2. Private interests and appropriate government agencies have renewed their efforts to find hitherto unknown deposits of iron ore within the confines of this country. Some confidence is felt that geophysical techniques can penetrate the comparatively thin cover of glacial drift and vegetation which mask the iron-bearing Pre-Cambrian formations of the Lake Superior country; and it is probably only a matter of time before the search will be extended to areas in which the overburden consists of younger sedimentary rocks that are not too thick for the economic recovery of ore which may be buried beneath them. In 1951, for example, the United States Geological Survey published the results of aeromagnetic studies in northern Minnesota, and at least half a dozen different localities have been mapped and have been designated as promising for more detailed and definitive ground surveys.

3. Milling techniques have been evolved or improved to the point where concentrates of commercial grades can be obtained by treatment of otherwise uncommercial ores. Technological improvements of this kind brought several Adirondack magnetite deposits into production some time ago, and it now looks as if the taconite deposits of Minnesota will acquire commercial utility and can thus be added to the domestic reserve.

4. Metallurgical research is moving in at least two different but important directions. It is being applied to ores that contain troublesome ingredients—for example, the titaniferous iron ores. And by physicochemical advances in the development of ferrous alloys, it is promoting conservation through the development of alloys that require smaller quantities of iron to yield products of comparable strength, hardness, toughness, and similar qualities.

RELATION TO CONSERVATION

Obviously, not all of these measures fit strictly within the definition of conservation, however liberal that definition may be. The utilization of foreign

ores may conserve domestic reserves, but it is not conservation from the standpoint of world reserves. The discovery and development of new domestic deposits may increase our proved resources, but it is hardly conservation. Yet conservation may result from an extension of mining operations, specifically to the smaller bodies of iron ore. Until the mines of the Lake Superior district were opened, the American steel industry depended upon relatively small deposits of iron ore in the Adirondack and Appalachian regions for its major sources of supply. Some of these deposits were mined out; others were mined to the economic limits of depth; others were abandoned because the cost of extraction made the product noncompetitive with iron ore from the Lake Superior country. As noted above, several of the old Adirondack properties have been reopened, but chiefly because improved milling methods greatly increased the reserve of commercial ore and thus provided sufficient reserves for the maintenance of large extractive operations over a minimum period of fifteen to twenty years. Although none of the Adirondack deposits is large in comparison with the Mesabi Range in Minnesota, mine production can scarcely be characterized as small.

In quite a different category, however, is the interest that has been shown during the past two or three years in the small magnetite deposits of northern New Jersey and southeastern New York. Simply stated, the problem here is to determine how small a mining operation can be and still be economic. Some of the ore bodies that have been studied were mined a century or more ago; others were never utilized, either because there was no need for additional tonnage, or because they were commercially unattractive even under contemporary economic conditions. If it should prove feasible to exploit these rather numerous small deposits, the operation will fit under the definition of conservation, because use will be made of raw material that was thrown into the economic discard nearly a century ago.

ATTITUDES OF MINING PROFESSION

The possibility of using the small iron ore deposits in the Appalachians brings up the entire question of official attitude toward marginal mines. The mining fraternity has a strangely inconsistent attitude toward marginal operations; and, as might be expected, there is the usual alignment of small operators against big industry. The large operators have achieved substantial economies by the magnitude of their operations. Through combinations of good management and adequate capital they have either acquired large properties through purchase or concession, or have consolidated adjacent but independent properties to which they have thereupon applied integrated, unified development.

In the latter situation many an independent has found himself forced to sell his property to the large operator, because he could not compete in the labor market, he was unable to command minimum transportation facilities, he was at a disadvantage with respect to smelting facilities and costs. The large operator was rarely helpful in situations of this kind, and the suspicion that his methods may have been designed to force the small operator out was not infrequently well founded. On the other hand, the economies of unit operation of a single, integrated ore body are so well known that they need little argument in their support. With respect to marginal mines, this is not the problem.

The mentality of the mining profession constitutes a unique brand of psychology, in which faith and hope have always been dominent ingredients. Until the Federal Government introduced subsidies into the national economy, independence was a third trait in mining psychology; but from the tone of reports emanating from mining districts and from mining states—for example, from such organizations as the Colorado Mining Association—it looks as if the spirit of independence has been displaced by the all but universal cry for guarantees of security. One gets the impression that every would-be miner who has had the energy and ingenuity to open a hole in the ground feels that he is entitled to a government guarantee that he will not lose money in the operation. Demands for subsidy are nearly always bolstered by statistics that reveal shortages of metals, by appeals to public interest in national security, by denunciations of reciprocal tariff arrangements whereby metals of foreign derivation may compete with domestic raw materials, and by protest against the financial support given foreign mining operations under the Marshall plan and Point Four programs.

The entire problem of government support for marginal mining operations has become so confused in domestic political issues and debatable foreign policies that it is almost impossible to view it dispassionately and in proper perspective. The writer does not pretend that he has done so in the brief remarks that follow.

QUESTION OF SUBSIDIES

For those metals, like iron, copper, lead, zinc, and silver, in the production of which the United States has been essentially self-sufficient, and the reserves of which are still large, even if not entirely adequate for future needs, the principle of subsidies for marginal mining operations is unsound. A single reservation to this statement may be made. During the depression several large mines came perilously close to failure and to abandonment, even though subsurface reserves were far from exhausted. A mine abandoned is a mine lost unless operations are resumed before deterioration of the underground workings and the equipment sets in. It is definitely worth while to maintain properties in good working condition if they are still capable of supplying a substantial percentage of our normal production. During World War II experience indicated that the tonnage produced in small marginal mines was in general obtained at an expenditure of money, equipment, and manpower that was far from commensurate with the returns. Saner wage and manpower policies in our major mining districts would have enabled the larger operations to yield equivalent tonnages at a much lower expenditure of money and equipment.

From the standpoint of the national economy, the same principle applies in the case of those metals of which our reserves are inadequate for our needs. However, against the practical considerations of economics must be weighed the problem of supply in the event of a national emergency. Security demands the assurance of supplies under any and all conditions; and to meet this situation, marginal mining and stockpiling may logically and legitimately enter the picture.

MANGANESE AND TIN

Perhaps manganese offers as good an example of the problem as any of the scarcer metals, for most of the world's high-grade reserves are located in the Eastern and Southern Hemispheres, and the two largest are in the Soviet

Union. The importance that Germany attached to manganese can be gleaned from the fact that the mining districts along the Dnieper were the last areas to be abandoned by German troops in the retreat from Russia. From the American standpoint the uncertainty of Soviet deliveries, which reflects official Soviet policy, has been brought forcibly to the consciousness of industrialists and government officials, and the latter not only have aided in assuring a dependable flow of manganese from remote foreign deposits that can be economically operated, but also have vigorously—if not wisely—attempted to increase domestic production from small, low-grade deposits which could not survive in a free, unsupported market, and which could not supply minimum needs in a stringent emergency.

There is clearly some sense in encouraging continued production in such a district as Batesville, Arkansas, and of improving flotation and other milling methods that may bring submarginal deposits within the pale of exploitation and emergency use. At the same time, stockpiling should also be undertaken with a finite objective—namely, to meet minimal needs of the steel industry for a specific period of time, presumably the maximum period during which we may, under most adverse military conditions, find ourselves cut off from our regular sources of supply and reduced to the limited tonnages available from every utilizable domestic deposit and from nearby foreign deposits that can be retained under military control.

In the case of the few metals, like tin, that occur so sporadically and sparingly that any commercial production in the United States has never been successfully achieved, stockpiling provides the only assurance of emergency supplies. Any attempt to operate currently known domestic deposits should be branded as economic idiocy. A case history of tin during the past war should provide Americans with many pointers on solving the problems posed by materials in short supply, but only three phases of the story relate to conservation. First was the effort to conserve tin by making it go farther. It was found that by electroplating, food containers retained all their efficacy with only one-third as much of the metal; and additional savings have been effected by employing some nonrusting substitute, like shellac, for the exteriors of tin cans. It was also found possible to salvage tin even where it was merely a thin coating, and for a time this secondary tin was a most important factor in ensuring minimal supplies.

ELEMENTS IN CONSERVATION

Saving, salvage, and substitution are basic elements in conservation, and they call for all the technological ingenuity at our command if we are to supply Americans in the style to which they are now accustomed and to raise living standards elsewhere in the world. The mineral frontier, which seemed endless in its capacity to yield new sources of raw materials, has all but disappeared insofar as new deposits are concerned. It can be expanded within limits by luck and by the shrewd application of modern and only partly developed exploration techniques. Technology will also enable us to expand our reserves to the extent that metals can be won economically from smaller and/or lower-grade deposits. But in these efforts we are merely finding more raw materials to feed the insatiable furnaces that supply the needs and the luxuries of modern living. It is equally imperative to make what we have go farther by using less without sacrificing effect or efficiency; by reuse through salvage; and by substitution of replaceable raw materials where the same purposes can be equally well served. These kinds of conservation must play an ever increasing part in our metals economy unless we wish to contemplate a future of rigid rationing of many raw materials.

Howard A. Meyerhoff, Ph.D., Washington, D. C., is administrative secretary of the American Association for the Advancement of Science. He formerly served as professor of geology at Smith College, geologist for the Scientific Survey of Puerto Rico and the Virgin Islands, consulting geologist for the Puerto Rican Bureau of Mines and also for the Dominican Government, mediator for the National War Labor Board, chairman of the arbitration board in a large ship repair concern, and technical adviser on the subsurface survey, City of Springfield, Massachusetts. He is author of The Geology of Puerto Rico (1932) and co-author of Flow of Time in the Connecticut Valley (1942).

The Fuel Complex: A Projection

By George A. Lamb

THE United States consumes over 40 per cent of the fuel and water-power energy produced in the world. This energy—processed into many forms of solids, liquids, and gases, besides electricity—provides heat, powers machinery, and satisfies numerous needs that make the country's economy run.

Energy supply was the least of worries during the development of the American economy. The country had abundant resources of coal, petroleum, natural gas, and water power, which permitted a wide choice of energy products to the consumer. Domestic requirements could be readily supplied and export orders fully met. Perhaps, it may be said, this was the situation until several years ago.

The United States has been on an import basis with respect to petroleum since 1948. Its coal and natural gas reserves produce as required, but petroleum reserves have tended to become niggardly about output. Imports of petroleum and its products represent only 12 per cent of the total domestic oil demand. But that they have grown rapidly, and that large amounts of American capital are invested in foreign oil, point to the reality that imports are an established fact in domestic petroleum supply, and their importance will expand. It means that the United States has become sensitive to world supply conditions, and will become more so with regard to petroleum, the largest source of energy it utilizes.

The United States requirements in the world fuel market transactions are modest against those of most countries. World fuel resources of a magnitude that can produce for export are confined to a few areas. Today, the United States is the only country that can offer a substantial tonnage of exportable coal. Venezuela and the Middle East cover the countries that have surplus petroleum in volume. As a result, there are many countries that supplement their indigenous energy supply by competing for fuels in the few areas of surplus. More and more the fuel outlook must be gauged with reference to world requirements and supply if realistic evaluations are to be made.

Energy Requirements

During 1950 the world required energy from the principal sources in the following amounts:

Coal	1.62	billion metric tons
Petroleum	3.99	billion barrels
Natural gas	7.20	trillion cubic feet
Water power	0.32	trillion kilowatt hours

In addition, the energy supplied by a miscellaneous group consisting of wood, peat, waste material, and other sources, for which reliable figures are not available, may be as large as that contributed by natural gas and water power together; but this group has few potentialities in terms of prospective world technology. Its resources are limited and its fuels are inefficient compared to what is needed in the growing energy requirements.

Converting the principal world energy to a common basis, heat value expressed in terms of British thermal units, coal supplied 57 per cent against 28 per cent by petroleum. Natural gas and water power contributed 9 per cent and 6 per cent, respectively.[1]

[1] Heat value is an inadequate standard for measuring accurately the importance between energies, since it fails to account properly for efficiency in end uses. It is a convenient index, however, and serves satisfactorily for making general comparisons among energy sources, if allowance is made for its shortcomings.

The 1950 world consumption of energy derived from the principal sources was equivalent to 2.9 billion tons of coal or 14.3 billion barrels of petroleum. On a per capita basis, it was 1.2 tons of coal or 6.0 barrels of petroleum.

The extent to which energy consumption varied between continents and countries is noteworthy.[2] North America, mainly the United States, plus western Europe consumed 66 per cent of the energy while representing 18.6 per cent of the population.[3] Eastern Europe—that is, the Soviet Union and its satellite countries—required 17 per cent of the energy while having 13.9 per cent of the population, although estimates are necessarily rough because of the sketchy material available on that area. On the other hand, South America, Asia, Africa, and Oceania combined used only 17 per cent of the energy although they had two-thirds of the world's population.

During 1950, differences by certain countries in per capita consumption of energy derived from the principal sources, expressed in tons of coal equivalent, are found in the following: United States 8.1; Canada 6.6; United Kingdom 4.5; France 2.3; Union of South Africa 2.3; Soviet Union 1.7; Japan 0.8; Brazil 0.2; and India 0.1. Although these figures have the disadvantage usually attributed to averages, the per capita figures do provide a general index for energy utilization which reflects comparative general industrial development. Stated otherwise, they point to a large potential increase in energy use should there be even a modest relative advance in industrialization throughout the greater part of the world.

Sources of Energy

In 1950 the main source of energy consumed in the United States was petroleum, but in the other more industrialized countries of the world it was coal. Western Europe, like the Soviet Union and its dominated countries, depended upon petroleum for only 13 per cent of its total energy requirements. Barrels of petroleum products used per capita in certain countries were: 15.7 in the United States; 2.4 in the United Kingdom; and 1.7 in France and the Soviet Union. Today, Europe consumes coal and petroleum in proportions similar to what they were in the United States during the early twenties.

There are other sources of energy yet to be utilized, one of which is oil shale. Although still to be established on a commercial scale, shale has been explored sufficiently to indicate it as the most promising material for initial synthetic oil production in the United States. Nuclear energy has prospects for general use, though this may not come about on a substantial basis for some time.[4] Solar energy likewise finds many that consider its future promising, but its development lags behind that of

[2] Basic energy data are taken from publications of the U. S. Bureau of Mines, and the United Nations, except as indicated.

[3] Population data are from the U. S. Bureau of Census and the United Nations. In certain cases it is estimated in part. For example, the world population taken from these sources and conveniently listed on page 1 of the *Economic Almanac 1951–1952* (National Industrial Conference Board) amounts to 2.37 billion in 1949. It is assumed to be approximately 2.4 billion in 1950.

Also see statement of Mr. Philip Sporn, president of American Gas and Electric Co. and chairman of President Truman's Committee on Atomic Energy, reported in *The Wall Street Journal*, Jan. 18, 1952, p. 8.

TABLE 1—APPARENT CONSUMPTION AND SUPPLY OF COAL AND PETROLEUM BY CONTINENTS AND SELECTED COUNTRIES, 1950

	Coal (million metric tons)	Petroleum (million barrels)
North America		
United States	448	2,372
Other	42	262
Total consumption	490	2,634
Excess or deficit in production	+33	−375
South America		
Venezuela	[a]	33
Other	8	161
Total consumption	8	194
Excess or deficit in production	−3	+454
Europe		
Western Europe	515	450
Russia & E. Europe	435	328
Total consumption	950	778
Excess or deficit in production	−6	−437
Asia		
Middle East	4	76
Other	116	117
Total consumption	120	193
Excess or deficit in production	+1	+455
Africa & Oceania		
Total consumption	52	194
Excess or deficit in production	−1	−94
Grand Total	1,620	3,993
Excess or deficit in production[b]	+25	+3

[a] Less than 500,000.

[b] Excess is due to fuel in transit and in storage.

nuclear energy. It appears that during the rest of the century, if not longer, most of the energy supply will continue to be derived from coal and petroleum.

ENERGY GROWTH

World production of the principal energy sources has increased steadily since World War I, although at different rates. Natural gas, produced and used mainly in the United States, has had the most rapid rate of advance. Petroleum products have had a continually expanding world market which reflects developments of motor vehicles, aircraft, and other mechanical applications. The growth of water power for electric power generation has tended to slacken since the thirties, following years of speedy development. Coal's increase is attributed largely to the demand for solid fuels in Europe.

FUEL PROJECTIONS
